# Preface

The role of foreign direct investment initiatives is pivotal to effective enterprise development. Globalization, accelerated by information technologies, has increased the speed of business transactions and has reduced the distances between international businesses. This growth has transformed the realm of foreign investment in countries around the world, calling for a methodological approach to planning feasible capital investment proposals in general and foreign direct investment projects.

Staying informed of the most up-to-date research trends and findings is of the utmost importance. That is why IGI Global is pleased to offer this four-volume reference collection of reprinted IGI Global book chapters and journal articles that have been handpicked by our senior editorial staff on this topic that will shed light on critical issues related to the importance of global stocks to economic structures and the effects that these holdings have on the financial status of nations by providing both broad and detailed perspectives on cutting-edge theories and developments. This reference is designed to act as a single reference source on conceptual, methodological, technical, and managerial issues and provide insight into emerging trends and future opportunities within the global business market.

*Foreign Direct Investments: Concepts, Methodologies, Tools, and Applications* is organized into eight distinct sections that provide comprehensive coverage of important topics. The sections are:

1. Fundamental Concepts and Theories;
2. Development and Design Methodologies;
3. Tools and Technologies;
4. Utilization and Applications;
5. Organizational and Social Implications;
6. Managerial Impact;
7. Critical Issues and Challenges; and
8. Emerging Trends.

The following paragraphs provide a summary of what to expect from this invaluable reference tool.

Section 1, "Fundamental Concepts and Theories," serves as a foundation for this extensive reference tool by addressing crucial theories essential to the understanding of foreign direct investments. Introducing the book is "Incentives to Attract Foreign Direct Investment in Emerging Economies: A Causality Analysis for the Indian Case," by Ishita Ghoshal (Symbiosis International University, India) and Ishita Ghosh (Symbiosis International University, India): a great foundation laying the groundwork for the basic concepts and theories that will be discussed throughout the rest of the book. Section 1 concludes and leads into the following portion of the book with a nice segue chapter, "The Fundamentals of Neuroeconomics" by Kijpokin Kasemsap (Suan Sunandha Rajabhat University, Thailand).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section 2, "Development and Design Methodologies," presents in-depth coverage of the conceptual design and architecture of foreign direct investments. Opening the section is "An Integrated Model of Perceived Risk and Risk-Reducing Strategies in the Tunisian Stock Market: Risk-Behavior Model," by Azza Béjaoui (University of Sousse, Tunisia) and Adel Karaa (College of Business Administration, University of Hail, Saudi Arabia). Through case studies, this section lays excellent groundwork for later sections that will examine present and future applications for foreign direct investments. The section concludes with an excellent work by Nkem Okpa Obaji (Department of Business Administration, Nigerian Turkish Nile University, Abuja, Nigeria), Aslan Amat Senin (Faculty of Management, Universiti Teknologi Malaysia, Johor, Malaysia), and Mercy Uche Olugu (Department of Statistics, Federal School of Statistics, Ibadan, Nigeria), "Supportive Government Policy as a Mechanism for Business Incubation Performance in Nigeria."

Section 3, "Tools and Technologies," presents extensive coverage of the various tools and technologies used in the implementation of foreign direct investments. The first chapter, "IFRS Harmonization and Foreign Direct Investment," by Javier Vidal-García (University of Valladolid, Spain) and Marta Vidal (Complutense University of Madrid, Spain), lays a framework for the types of works that can be found in this section. The section concludes with "Quantum-Inspired Computational Intelligence for Economic Emission Dispatch Problem" by Fahad Parvez Mahdi (Universiti Teknologi Petronas, Malaysia), Pandian Vasant (Universiti Teknologi Petronas, Malaysia), Vish Kallimani (Universiti Teknologi Petronas, Malaysia), M. Abdullah-Al-Wadud (King Saud University, Saudi Arabia), and Junzo Watada (Universiti Teknologi Petronas, Malaysia). Where Section 3 described specific tools and technologies at the disposal of practitioners, Section 4 describes the use and applications of the tools and frameworks discussed in previous sections.

Section 4, "Utilization and Applications," describes how the broad range of foreign direct investments efforts has been utilized and offers insight on and important lessons for their applications and impact. The first chapter in the section is "The Determinants of Foreign Direct Investment Outflows From Turkey," written by Raif Cergibozan (Kırklareli University, Turkey) and Caner Demir (Kırklareli University, Turkey). This section includes the widest range of topics because it describes case studies, research, methodologies, frameworks, architectures, theory, analysis, and guides for implementation. The breadth of topics covered in this section is also reflected in the diversity of its authors, from countries all over the globe. The section concludes with "Quality Action to Accelerate Fair Accessibility Through Law of Telecommunication: Global Village Setting," by Agus Pramono (Universitas Diponegoro, Semarang, Indonesia), P.L. Rika Fatimah (Universitas Gadjah Mada, Yogyakarta, Indonesia), and Ivan Lanovara (TS Scholar, Kajang, Malaysia), a great transition chapter into the next section.

Section 5, "Organizational and Social Implications," includes chapters discussing the organizational and social impact of foreign direct investments. The section opens with "Information Asymmetries in the Context of Restatement Announcements," by Pierangelo Rosati (Irish Centre for Cloud Computing and Commerce [IC4], Dublin City University, Ireland), Pietro Mazzola (SDA Bocconi School of Management, Italy), and Riccardo Palumbo (University "G. d'Annunzio" of Chieti-Pescara, European Capital Markets CRC, Italy). This section focuses exclusively on how these technologies affect human lives, either through the way they interact with each other or through how they affect behavioral/workplace situations. The section concludes with "Strategic-Spatial Analysis of the Implementation of Business Opening Politics of Mexico," by José G. Vargas-Hernández (University of Guadalajara, Mexico).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section 6, "Managerial Impact," presents focused coverage of foreign direct investments in a managerial perspective. The section begins with "Transcontinental Strategies and Strategic Choices" by Reza Aboutalebi (University of Surrey, UK), Hui Tan (Royal Holloway, University of London, UK), and Reshma Trupti Lobo (University of South Wales, UK). This section serves as a vital resource for developers who want to utilize the latest research to bolster the capabilities and functionalities of their processes. The chapters in this section offer unmistakable value to managers looking to implement new strategies that work at larger bureaucratic levels. The section concludes with "Major Macroeconomic Dynamics for Labor Market in Turkey: A Causality Analysis" by Mustafa Karabacak (Uşak University, Turkey) and Oytun Meçik (Eskişehir Osmangazi University, Turkey).

Section 7, "Critical Issues and Challenges," presents coverage of academic and research perspectives on foreign direct investment tools and applications. The section begins with "Does Trust Matter for Foreign Direct Investment Decisions?" by Sibel Bali Eryigit (Uludag University, Turkey). Chapters in this section will explore theoretical approaches and offer alternatives to crucial questions on the subject of foreign direct investments. The section concludes with "Transnational Acceleration of Local Startups: Portugal's Building Global Innovators (BGI) Model," by Luís Carvalho (European Institute for Comparative Urban Research, The Netherlands), Nuno Camacho (Erasmus University Rotterdam, The Netherlands), Gonçalo Amorim (MIT Portugal, Portugal), and José Paulo Esperança (BGI – IUL MIT Portugal Accelerator, Portugal).

Section 8, "Emerging Trends," highlights areas for future research within the field of foreign direct investments, opening with "Diffusion of Technology via FDI and Convergence of Per Capita Incomes: Comparative Analysis on Europe and the MENA Region" by Sumru Oz (Koc University, Turkey). This section contains chapters that look at what might happen in the coming years that can extend the already staggering amount of applications for foreign direct investments. The final chapter of the book looks at an emerging field within foreign direct investments, in the excellent contribution, "Place-Based Subnational Development: Unpacking Some of the Key Conceptual Strands and Normative Dispositions," by Nick Gray (Northumbria University, UK) and Lee Pugalis (University of Technology Sydney, Australia).

Although the primary organization of the contents in this multi-volume work is based on its eight sections, offering a progression of coverage of the important concepts, methodologies, technologies, applications, social issues, and emerging trends, the reader can also identify specific contents by utilizing the extensive indexing system listed at the end of each volume. As a comprehensive collection of research on the latest findings related to using technology to provide various services, *Foreign Direct Investments: Concepts, Methodologies, Tools, and Applications* provides government officials, economists, managers, financial professionals, researchers, administrators, and all audiences with a complete understanding of the development of applications and concepts in this field. Given the vast number of issues concerning usage, failure, success, policies, strategies, and applications of foreign direct investments in countries around the world, *Foreign Direct Investments: Concepts, Methodologies, Tools, and Applications* addresses the demand for a resource that encompasses the most pertinent research in technologies being employed to globally bolster their knowledge and applications.

## ABSTRACT

*The study delves into a diagnostic check for macroeconomic factors that may cause and explain outward FDI flows to India as a representative of the emerging economies. The seventeen top investing economies to India across the period from 2008-14 reveal that overall FDI outflows, inflation, exchange rate and growth of the economy affect FDI outflows to India in the long run where only exchange rate has a causal effect. Also, the above-mentioned variables except growth along with the size of the economy has significant effect on the extent of FDI flows to India from the economies considered for the study.*

## INTRODUCTION

Foreign Direct Investments (FDI), a key component of foreign private capital flows, has been an important means to financing investments and growth in the emerging economies. Such inflows often exceed official sectoral financing within the economy and have continued to remain an important engine of growth in a majority of the Emerging Market Countries (EMC) of the current global economy. Foreign private capital flows, and in particular short-term flows, can, however, be unpredictable as is evident

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

from the recent financial crises. In this light, it has become imperative to understand the trends in FDI flows to EMCs. Insights into investment decisions and structural changes that may affect the trends and direction of such flows have become the prevailing pointers in recognising net private flows to emerging markets and can possibly be a source of negotiating economic stability at times of volatility in global capital markets (The World Bank, 2003).

China and India are the largest emerging markets in the current global economy (Jain, 2006). Around the mid-2015, the World Bank estimated that while China was the leading Emerging Market Country (EMC), India will be poised to overtake China with a 7.5 per cent projected growth rate (Times of India, 2015). The World Bank also anticipated that China would grow at 7.1 per cent while other EMCs would grow by 4.4 per cent in 2015, with a likely rise to 5.2 per cent in 2016, and 5.4 per cent in 2017. Although the "carefully managed" slowdown would continue in China, the oil importing Indian economy would move ahead because reforms helped in stimulating the market confidence and falling oil prices reduced economic liabilities (World Investment Report, 2015).

In 2015, the World Bank Chief Economist, Kaushik Basu opined that

*… slowly but surely the ground beneath the global economy is shifting. China has avoided the potholes skillfully for now and is easing to a growth rate of 7.1 per cent; Brazil, with its corruption scandal making news, has been less lucky, dipping into negative growth; growth in South Asia is expected to continue firming to 7.1 per cent this year, led by a cyclical recovery in India and supported by a gradual strengthening of demand in high-income countries. (Times of India, 2015)*

India's gain from the declining global oil prices has enabled the country to improve its fiscal and trading accounts. Implementation of subsidy reforms and the easing of monetary policy has helped the country raise business and investor confidence, thereby attracting new capital inflows. The "Make in India" initiative since late 2014 has been a vital impetus to the inflow of funds and boosting economic growth (The Economist, 2014).

Regional studies pertaining to Asia submit that India is poised to be the next economic super-power, surpassing China soon (Thirlwell, 2004). Whether this prediction holds any water, is a matter of time. However, it is undeniable that the importance of the Indian economy as a key driver in the global economic growth will remain a force to reckon with (Chandler & Zainulbhai, n.d.) (Asia House, 2013) (Sanghoee, 2015) (Forbes, 2015) (LSE IDEAS, 2012). It is in this light, that the chapter aims to investigate the determinants of inward FDI in India from its highest investing partners.

The chapter is divided into two main parts – a) the importance of India in the global economy and how investment inflows will help the economy grow b) the empirical analysis to understand short run and long run relationships amongst the variables considered and estimate the extent of the effects.

## BACKGROUND

In the last few years, the global economy has slowed down considerably. Foreign Direct Investment (FDI) in 2014 recorded a decline of 16 per cent (approximately, 1.2 trillion). The decline has been fraught with economic and geopolitical instability, creating various policy driven uncertainties for investors world-wide; large disinvestments have also off set new global investments. New investments were also offset

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

by some large divestments. The drop in FDI flows was particularly concerning when compared to the global growth in GDP, trade, gross fixed capital formation and employment. However, since 2015, an upward trend in FDI has been noted. In fact, the current FDI flows are responsible for almost 40 percent of external development finance to developing and transition economies. The UNCTAD predicts FDI flows to touch $1.4 trillion in 2015 and further on at $1.5 trillion in 2016 and $1.7 trillion in 2017, respectively. Some cited reasons are growth prospects in the United States, the demand-side stimulation in the economies because of the recent spiraling down of oil prices and various macroeconomic and trade policies that have been relaxed and reformulated to accommodate trade and investment liberalization and promotion between trading partners. The current macroeconomic forecasts for the world economy estimate that multinational corporations (MNCs) will have a wave of profitability and cash reserves in the forthcoming years of the current global business cycle. This expectant outlook will also fuel higher FDI flows. However, the recent instabilities surrounding the European Union (namely, the BREXIT and its aftermath), other geopolitical insecurities and susceptibilities in emerging economies may soon dampen this optimism in the near future for the world investment climate (World Investment Report, 2015) (World Investment Report, 2016).

A cursory look at FDI inflows by geography clearly indicates that developed nations have continued to receive record high investments in 2014, while developing and emerging nations fell flat as far as this economic variable goes. Remarkably, it was noticed that while the developing regions of Asia drove the inflows to the developed nations (where FDI reached a record high of USD 681 billion in 2014), FDI flows to Asia grew by 9 per cent (USD 465 billion in 2014). East, South-east and South Asia – all witnessed a surge in FDI inflows. It is notable that economic giants of this region, China and India, both enjoyed considerable rise in FDI inflows. While China's inflows went up by 4 per cent in 2014, India's went up by a significant 22 per cent. However, given the geopolitical insurgencies in West Asia, there was a downward trend in the FDI inflows for the sixth consecutive year.

In terms of regional groupings, FDI is essentially determined by larger global macroeconomic trends, economic performances of the members in the partnership among themselves and vis-à-vis the world economy and other geopolitical factors. Increasing long term cooperation and supporting a common climate for foreign investments, do augment the inflows, as well. Extra-regional FDI is also attracted by a larger and unified market size that such regions offer. In spite of these inherent merits, it was noticed that most economic clusters experienced a fall in inflows till around 2014. However, notably, the Association of Southeast Asian Nations (ASEAN), witnessed a 5 per cent increase in inflows, and the Regional Comprehensive Economic Partnership (RCEP), an increase of 4 per cent. Also, while the share of intra and extra regional FDI is largely dependent on the particular characteristics of the regions themselves, total inflow of FDI in the developing and emerging clusters are still very low. In comparison, ASEAN has shown a significant pull in the inflow of FDIs. The APEC economies reached $652 billion in 2014, accounting for more than half of global FDI flows, while intra-APEC FDI flows and stocks are significant, at about 40 per cent of inward stock that was noted during 2009–2011.

## Top Investors and Invested Sectors in India

Table 1 provides estimates published by the Reserve Bank of India (RBI) in the latter part of 2015. Various aggregated values provided here may be different from the figures specified by the World Investment Reports. This is due to methodological differences.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Some cursory observations from this data and other more recent developments, show the following:

- In the last decade, Mauritius, Singapore and USA have consistently remained the top three investors in India (The Reserve Bank of India, 2016).
- While the trend in inflows have gone up, there has been a dip in the inward FDI in the years 2011-12 and 2012-13. This was possibly due to the political uncertainties and policy changes anticipated with a change in Government (The Reserve Bank of India, 2015).
- It is interesting to note that in spite of the various bilateral and regional trading agreements that India has engaged in with other nations (some of the significant ones being SAFTA, EU-India, ASEAN-India), barring Singapore, Mauritius and Japan, so far the inflows have not been very robust from these trading partners ("Department of Commerce, Government of India", 2016).
- With the launch of the "Make in India" initiative in the late 2014, there seems to be an upswing in the inflows with new trade and investment policies in place ("Economic Survey 2015-16", 2016) ("Department of Commerce, Government of India", 2016).
- There are some 18 trade partnership negotiations underway with India and another nine that have been recently made operational. The improvement in the inflows may well be considerably high in the long run, other economic factors remaining conducive ("Department of Commerce, Government of India", 2016).
- As recently as February 2016, the Economic Survey of India (2015-16) declared that FDI inflows in India increased by 31 per cent to USD 24.8 billion between April-November, 2014. The survey also pointed out that more than 60 per cent of the FDI equity inflows of USD 24.8 billion during 2015-16 (April-November) came from Singapore and Mauritius. Since the launch of the "Make in India" initiative in September 2014, there has been a 40 per cent increase approximately in FDI inflows between October 2014 and June 2015, vis-à-vis the analogous period of the previous financial year. With the aim to open up and streamline the FDI policy while boosting the ease of doing business climate in the country, the government has undertaken various reforms, since. It has also been noted that after the introduction of the initiative, FDI inflows have consistently increased into sectors like computer software and hardware, services, trading, automobile industry, construction activities, chemicals and telecommunications. Over this development, countries such as Japan, China, France and South Korea have confirmed their intent of substantially investing in India in various industrial and infrastructure projects in the offing.

Another important observation is that India's services sector has remained the most significant in terms of its contribution to the FDI inflows into the country. Almost 66.1 per cent of the country's gross value added growth in 2015-16 has been attributed to FDI inflows from this sector. Regardless of the economic slump in the post crisis period of 2010-14 India showed the fastest growth in its services sector, recording a Compound Annual Growth Rate (CAGR) of 8.6 per cent and just tipping over the Chinese who were at 8.4 per cent. Also, India's services sector growth in 2014 was at 10.3 per cent while the Chinese were at 8.0 per cent (DNA, 2016) (Live Mint, 2016) (The Economic Times, 2016) ("Foreign Direct Investment", 2016).

## MAIN FOCUS OF THE CHAPTER

### Drivers of FDI Inflow and Outflow: A Literature Review

The determinants of FDI inflows have been empirically tested in many studies, so far. The broad classification of variables that were set out by UNCTAD and used by (Walsh & Yu, 2010) are market size, labour cost, trade openness, infrastructural facilities, gross capital formation, labour force, macroeconomic stability, growth prospects, etc. The following table summarizes the nature of determinants and variables that could be responsible for FDI inflows.

The spurt in FDI in the last decade has given rise to a few generalized theories that determine the global flow of funds between nations. One, the heterogeneous methods to understanding international production (Dunning, 1986) and the classical model for determinants of FDI stems from the formerly done research by Dunning (1981) which provide an extensive analysis based on ownership, location and the internationalization (OLI) paradigm. In 1993, Dunning had put forward that FDIs are driven by access to income generating assets, early mover entry, internalization of net benefits necessitated by the costs of transactional market failures being higher than administrative costs of operating a foreign branch, and the location of production advantages such as access to capital, access to skilled and abundant labor, control over transfer price, reduction in exchange risks, lag and lead payments, and so on, which will remain attractive as long as there are gains to be made from operating in different locations. All these advantages must be favorable enough to outweigh the costs of setting up and operating from a foreign operation (Penrose, 1994) (Dunning, 2001) (Dunning, 2009) (Al-sadiq, 2013).

Two, according to the theory of internationalization (Rugman & Dunning, 1973) (Rugman, 1987), FDI takes place because Multi-National Corporations (MNCs) want to substitute external markets with internal markets that are more efficient (such as, intra-firm transactions). This helps them avoid difficulties that arise with differences in transaction costs, time lags, bargaining and buyer uncertainties,

*Table 2. FDI determinants (as given by UNCTAD)*

| Determining Variables | Examples |
|---|---|
| Policy variables | Tax, trade, privatization and macroeconomic policies |
| Business variables | Investment incentives |
| Market related economic determinants | Market size, growth and structure |
| Resource related economic determinants | Raw materials, labour costs and productivity |
| Efficiency related economic determinants | Transport and communication costs and labour |

and other externalities in the goods and factors markets. The movement of funds continue till marginal benefits and costs equalize (Horstmann & Markusen, 1995) (Kindleberger, 2002).

Three, according to several experts, FDI is an outcome from the imperfections that exist in the market structure of the world – concentration and agglomeration of firms and economies of scales that come into being because of competition and comparative advantage. FDIs may also be an outcome of the firms' specific competencies stemming from managerial skills, brand name, superior marketing distribution, bargaining and political power, access to raw materials, and patent-protected technology. Kindleberger (1969), Hymer (1972) and Horaguchi and Toyne (1990) have worked observing such market imperfections and conclude that the movement of investments may substantially depend on these factors.

According to Arbatli (2011), cross-country and over-time variations in FDI inflows can be split into two categories, namely, global push factors and country-specific pull factors. Many studies have established that global push factors are central to the explaining of capital flows to EMCs, hence making the regulation of their outcomes important in the purview of domestic policies. The importance of global economic conditions has also gained importance with the recent global economic crisis and the subsequent decline in FDI inflows.

The country-specific pull factors that are usually classified as a) fixed or structural factors such as whether the country is an oil exporter or not, its location and the average level of education; b) political factors including existence of conflict, labour strikes, and/or protests; c) macroeconomic factors such as inflation, the share of exports, and the real exchange rate; and d) economic policy variables including corporate tax rates, tariff rates, exchange rate policy, and whether there are capital account restrictions.

1. **Global Push Factors:**
    a. Growth in capital exporting countries on FDI flows to EMCs have been somewhat ambiguous. While higher income growth in developed nations allow for expansions into other markets and are associated with easier internal financing conditions, it may also make investment in the domestic economy relatively more attractive. Usually, 3 to 4-year moving averages of real GDP growth account for lag effects due to implementation and planning times associated with FDI.
    b. International liquidity helps in understanding the effects of credit conditions in advanced countries on FDI flows. Lower interest rates are expected to increase FDI flows, making it easier for firms to finance investment projects.
    c. Risk environment indicate the global risk appetite is also a common push factor that could affect FDI flows to EMCs.
2. **Country Specific Pull Factors:**
    a. **Fixed or Structural Factors:**
        i. The size of the domestic market can play a role in drawing FDI, where firms decide to invest in the host country to capture a share of the domestic market. This variable is also related to the capital-to-labor ratio and, hence, the productivity of capital. Countries with a low level of per capita income might invite more inflows, consistent with a higher marginal product of capital.
        ii. Several studies have established a strong empirical correlation between educational level in the host country and FDI inflows. Policies encouraging investments in human capital, augmenting skill sets and generic education usually attract FDI. A certain level of educational fulfilment is vital to a country's ability to draw FDI and to maximise

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the human capital spill overs that take place due to the presence of MNCs in the host country. The minimum level of education required will depend on the industries present in the host country and according to other characteristics of the host country's enabling environment. By its self, education unlikely to make FDI inflows attractive but it remains a vital variable in determining inflows when considered in tandem with other key macroeconomic concerns (Usman, 2014) (Bellak, Leibrecht, Stehrer 2009) (OECD, 2003). Lipsey (2000) also captures a positive effect of FDI on growth and has a strong interaction with the level of schooling in the host country.

iii. Oil importing nations are affected by the global prices of oil and this can affect the nation's trading account (and GDP) significantly.

iv. Most studies that have used the Gravity equation to determine FDI, have traditionally used location (distance between the home and host countries). Amongst a host of variables that can be added to the augmented gravity model, the fundamental variables are size and distance – the crux of the model (Podda, 2016) (Marku, 2014) (Pagano & Volpin, 2004) (Shatz, 2000).

b. **Political Environment and Institutions:** Many studies have shown a negative relationship with FDI inflows and political uncertainties and corruption. While quantifying and measuring such risks can be vague, biased and difficult, there are indices that rank countries according to political stability, domestic and conflicts, law and order norms (even labour laws), ease of doing business, global competiveness and bureaucracy (Arbatli, 2011) (Bénassy-Quéré, Coupet & Mayer, 2007) (Rose-Ackerman & Tobin, 2003) (Henisz 2000). A study by Bevan and Estrin (2000, 2004) that measured determinants of FDI inflows to transition economies, namely, the central and eastern parts of Europe, considered factors such as country risk, labour cost, host market size and gravity factors for the duration 1994 to1998. The investigation concluded that country risks are influenced by private sector and industrial development, government balance, reserves and corruption. A dummy variable employed for capturing the key announcements of progress in the EU agreement seemed to directly affect the FDI inflows.

c. **The Macroeconomic Environment:** The macroeconomic environment and policies in EMCs have improved consistently over the last decade. This can clarify the overall positive trend and the sharp rise in inflows in the 2000s. However, an important concern that remains is examining the effects of macroeconomic variables on FDI and the feedback effect from FDI to macroeconomic variables, especially in the case of economic growth.

i. In a review done by (Ghosh & Chakrabarti, 2016), it was noted that many empirical studies reported that market size indicates potential for consumption and hence, trade. It can be measured by Gross Domestic Product (GDP), GDP per capita income, and size of the middle class population. These are expected to be positive and significant determinants of FDI flows. Literature made available through studies undertaken by Lankes and Venables (1996), Resmini (2000), Bevan et al. (2000), Garibaldi et al. (2002), Nunes, Oscategui, and Peschiera (2006), and Sahoo (2006) – all point towards the same findings. In contrast, Holland and Pain (1998) and Asiedu (2006) have found out that growth and market size are insignificant determinants of FDI flow (Narayanamurthy, Perumal, & Kode Chandra, 2010). It has also been empirically observed that the rate of growth and FDI inflows are positively related. There can also be feedback effects from FDI (both current and past) on economic growth in return (Arbatli, 2011). Also, Duran (1999) found

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

that some of the key variables that drive FDI were the market size, the growth rate of the economy, the country's wealth and savings, its macroeconomic stability and trade openness, among others. Dunning's work (the OLG paradigm), as mentioned earlier, is seminal in the case of determinants of FDI. Therefore, FDI tends to flow to the countries with larger market size and higher economic growth rates in which larger economies of scale could be provided for FDI to exploit their ownership advantages (Culem, 1988). Also, a country which has a stable macroeconomic condition with high and sustained growth rates will receive more FDI inflows than a more volatile economy. The proxies measuring growth rate are GDP growth rates, industrial production index, interest rates, inflation rates (Amaya & Rowland, n.d.) (Dadush, Dasgupta, & Ratha, 2000).

ii. Low inflation rate is makes FDI inflows more attractive. Domestic inflation will affect the net returns and hence the investment decisions of the MNCs. It is a safe assumption to say that inflation rates and FDI inflows are inversely related. In 2010, Dabla-Norris et. al., found results in their study that are concurs with this relationship (International Monetary Fund, 2010).

iii. Many studies have reported that the effect of export orientation on FDI inflows may be indefinite since it would be differently dependent on horizontal and vertical FDI. International trade tends to boost and support FDI. Much of FDI is export oriented and may also require the import of complementary, intermediate and capital goods. Most MNCs are now trading through Global Value Chains (GVC). In either case, volume of trade is augmented, thereby increasing trade openness (Lankes & Venables, 1996; Sahoo, 2006). Trade openness can be proxied as the ratio of the total trade by GDP (Nunes et al., 2006).

iv. The exchange rates levels and their volatility can affect FDI inflows significantly, as well as, the total amount of foreign direct investment that takes place and the allocation of this investment spending across a range of countries. When a currency depreciates (say in the host country), it can be advantageous in terms of FDI inflows in two ways. One, it lowers the domestic wages and production costs relative to the home country. Keeping all other factors constant, the country undergoing the real currency depreciation has improved "locational advantage" or attractiveness as a location for receiving productive capacity investments. Two, with this new-found "relatively" lower wage situation, the exchange rate depreciation improves the overall rate of return for the host country. Also, the change in the real exchange rate can help assess the effects of competitiveness on FDI flows. This may be more important if the investment is oriented towards the export market (Goldberg & Kolstad 1994) (Abbott, Cushman, & Vita, 2012). (Goldberg & Klein, 1997) (Udoh & Egwaikhide, 2010).

v. Gross capital formation is a strong determinant of FDI receipts (Ranjan & Agrawal, 2011) (Sridharan, Vijayakumar & Rao, 2009). Krkoska (2001) and Lipsey (2000) found that there was no significant impact on FDI with an increasing rate of capital formation. This finding is purely from the dataset that they used for the study. However, a positive or negative and significant relationship between FDI and capital formation is anticipated.

vi. The host country's infrastructural quality plays a significant role in attracting FDI receipts. Loree and Guisinger (1995) assessed the determinants of FDI by United States towards developed nations from 1977 to 1982 and concluded that the host country policy

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

related variables are significant in developed countries and infrastructure seems to be an important determinant for all the regions. Similar studies have been conducted by for developing and emerging economies and show similar results – quality of infrastructure in the host country is a vitally important factor for FDI inflows (Rehman, Ilyas, Alam & Akram, 2011) (Subramanian, Chakrabarti, Sairam & Kuntluru, 2012) (Shah, 2014).

vii. Yeyati (1996) and later, Torre, L. D., Schmukler and Yeyati (2002) have examined the extent of business cycles and interest rate cycles of developed countries and their impact on FDI inflows for the period 1980 to 1990. They considered the determinants of bilateral FDI using the Gravity model and found that FDI flows from US and Europe move counter cyclical to the business cycle in the home country, while the interest rate cycles are the important determinants of FDI inflows. Jansen and Stokman (2004) found that countries that have comparatively intensive FDI relations, also have more synchronized business cycles during 1995–2001. Before 1995, they found a positive association between FDI linkages and output co-movement, but this may partly reflect the effects of trade relations. Moreover, more intensive FDI links were also associated with a greater vulnerability to lagged output spill overs from abroad, whereas trade links are not. Policy implications of this study were a) that there is an underlying tendency for business cycles to exhibit greater co-movement in the future, and b) that policy makers need to incorporate the FDI linkage among economies in their models and analytical framework for policy analysis.

viii. In two independent studies for Ghana and Malaysia, Andinuur (2013) and Roslan (2013), have respectively found out that while there exists a unidirectional causal link for GDP and FDI to inflation, there was no such relationship for inflation to GDP and FDI. Also, a unidirectional causality was discovered running from GDP to inflation and all causality observed were statistically significant. In another study for the ASEAN 5, it was observed through VAR techniques that there was a clear negative relationship with inflation rates and FDI receipts (Siddiqui & Aumeboonsuke, 2014). In an IMF working paper of 2002, Garibaldi et al. studied the FDI and Portfolio investment flows to 26 EMCs in Eastern Europe including the former Soviet Union from 1990 to 1999. The estimates from the study indicated that the FDI flows are well explained by standard economic fundamentals, including inflation.

ix. Higher the labour costs in the home country, more likely it is to seek a destination for FDI, while the higher the labour force participation rate (LFPR) is, it will increase the GDP and lead the nation to investing abroad. FDI often takes a form of capital flows from a parent company to its foreign affiliate by relocating technical factors from one region to another and substituting capital movement with labour mobility in host regions while profiting from domestic markets. Ethier (1986) suggests that one more driving force could be uncertainty and asymmetric information (Latorre, 2008).

d. **Economic Policies:** According to Arbatli (2011), trade policy and agreements, capacity of the home country and capability of undertaking outward investments, costs and returns on investments, exchange rate classifications, restrictions in capital account transactions related to FDI, corporate tax rates and other taxes, etc., are also key factors in attracting FDI[1].

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Methods and Materials

Ideally a comprehensive set of macroeconomic and policy variables are required to understand their effects on FDI inflows. Data non-availability and disparity in the time frame and intensity of reforms, policies and trade agreements across countries pose a big challenge for such analysis.

Based on the above discussion, the study concentrates on the following variables:

- Annual foreign direct investment flows from the 17 home countries to India over the years (outward FDI from the 17 countries into India)
- Annual trade as a ratio of GDP of the home countries (to capture trade openness)
- Annual GDP at market prices of the home country (to capture the market size of the home country)
- Net outflows of annual foreign direct investment of the home country in current US$
- Annual percentage growth rate of the home country
- Annual percentage of consumer price index (to capture inflation)
- Labour force participation rate as a percentage of the total population aged above 15 years (modelled ILO estimate) (to capture the capacity of the home country)
- Annual gross fixed capital formation as a percentage of GDP of the home country (to capture the capacity of the home country)
- Real effective exchange rate index (2010 = 100) of the home country

It was not feasible to include infrastructure index, ease of doing business, corruption index, political stability, business cycles, trading policies, etc. as determining factors of outward FDI due to paucity of data and difficulty in measurement for the countries considered in the study. Also, the existence of trading agreement between India and the individual home countries could not be considered. The countries selected for the study account for the highest FDI inflows to India despite many of them not having any trade agreement with India currently. Trade agreements with many of these countries are under negotiation.

## Model

For empirical analysis, the following linear equation is estimated using country-wise data for 2008-2014. As per the nature of the data, the study has used the panel data estimation technique to estimate the following model to show the impact of various macroeconomic indicators of the home countries on FDI inflows into India from these countries.

$$\log\left(FDI_{it}^{India\ Inflows}\right) = a + b_1 Trade_{it}^{Ratio} + b_2 \log\left(GDP_{it}\right) + b_3 \log\left(FDI_{it}^{Outflows}\right)$$
$$+b_4 \log\left(Growth_{it}^{Rate}\right) + b_5 Inflation_{it} + b_6 \log\left(LFPR_{it}\right) + b_7 \log\left(Capital_{it}^{Fixed}\right) + b_8 REER_{it} + \varepsilon_{it}$$

where, $\log\left(FDI_{it}^{India\ Inflows}\right)$. is the log of the annual foreign direct investment flows from the 17 home countries to India over the years; $Trade_{it}^{Ratio}$ is the annual trade as a ratio of GDP of the home countries; log($GDP_{it}$) is the annual GDP at market prices of the home country; $log\left(FDI_{it}^{Outflows}\right)$ is the log of net outflows of annual foreign direct investment of the home country in current US$; $\log\left(Growth_{it}^{Rate}\right)$ is

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the annual percentage growth rate of the home country; $Inflation_{it}$ is the annual percentage of consumer price index; log($LFPR_{it}$) is the log of the labour force participation rate as a percentage of the total population aged above 15 years (modelled ILO estimate); $\log\left(Capital_{it}^{Fixed}\right)$ is the log of annual gross fixed capital formation as a percentage of GDP of the home country; $REER_{it}$ is the real effective exchange rate index (2010 = 100) of the home country.

## Data

Data for the above mentioned variables were collected from World Development Indicators provided by the World Bank. Panel data for 17 countries ranging from 2008-2014 has been used for the analysis.

## Tools and Tests

The authors have used panel data estimation methods to find the relationship defined above. The following illuminates the methodology used for the study.

### Panel Data Unit-Root Tests

The authors have used panel data unit root tests to check whether the variables are stationary or not. Several statistical methods (Levin, Lin and Chu 2002; Im, Pesaran and Shin, 2003; Choi, 2001; Breitung, 2000; and Hadri, 2000) are constructed to test for unit roots in panel data. Among those the study has employed Levin-Lin-Chu test and Im-Pesaran-Shin tests to check for stationarity in the variables.

#### *Levin-Lin-Chu (LLC) Test*

The model is:

$$y_{i,t} = \alpha_i + \rho_i y_{i,t-1} + \varepsilon_{it}, \text{ t = 1, 2, . . ., T; i = 1, 2, . . ., N}$$

It proposes a panel based ADF test which restricts $\rho_i$ by keeping them identical across cross sections as follows:

$$\Delta y_{i,t} = \alpha_i^* + \rho_i^* y_{i,t-1} + \sum_{j=1}^{\rho_i} \theta_{ij} \Delta y_{i,t-j} + \varepsilon_{it}$$

The null and alternative hypotheses are defined as:

**$H_0$**: $\rho_i=\rho=0$ for all i, against
**$H_A$:** $\rho_1=\rho_2=\ldots=\rho<0$ for all i, with test based on statistics: $t_\rho = \hat{\rho} / SE\left(\hat{\rho}\right)$

The LLC unit root test suggests that both the variables are stationary at first difference in the case of developing as well as developed countries.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

### *Im-Pesaran-Shin (IPS) Test*

The model is: $y_{i,t} = \alpha_i + \rho_i y_{i,t-1} + \varepsilon_{it}$, t = 1, 2, . . ., T

The null and alternative hypotheses are defined as:

**$H_0$:** $\rho_i = 1$, i = 1, 2, . . ., N i.e. each series in the panel contains a unit root for all i
**$H_A$:** $\rho_i < 1$, for at least one i

They use separate unit root tests for the N cross-section units.

The DF regression:

$$y_{i,t} = \alpha_i + \rho_i y_{i,t-1} + \varepsilon_{it}$$

or the ADF regression:

$$\Delta y_{i,t} = \alpha_i + \rho_i y_{i,t-1} + \sum_{j=1}^{\rho_i} \theta_{ij} \Delta y_{i,t-j} + \varepsilon_{it}$$

is estimated and the t-statistic for testing $\rho i = 1$ is computed. Let $t_{i,T}$ (i = 1, 2, . . ., N) denote the t-statistic for testing unit roots in individual series i, and let $E(t_i,T) = \mu$ and $V(t_i,T) = \sigma^2$.

Then $\overline{t}_{N,T} = \frac{1}{N}\sum_{j=1}^{N} t_i, T$ and $\overline{W} = \sqrt{\frac{N\left(\overline{t}_{N,T} - \mu\right)}{\sigma}} \Rightarrow N\left(0,1\right)$

$\overline{W}$ converges in distribution to a standard normal variate sequentially, as T→ ∞ first and then N→ ∞. The IPS test is a way of combining the evidence on the unit root hypothesis from N unit root tests performed on N cross-section units. The test assumption is that T is the same for all cross-section units and hence *E (ti,T)* and *V (ti,T)* are the same for all *i*, so the IPS test is applied only for balanced panel data. In the case of serial correlation, IPS test proposes using the ADF t-test for individual series.

## Panel Cointegration

### *Pedroni's Residual Cointegration Test*

To test the cointegration relationship, Pedroni's method (1999, 2004) which extends the idea of residual based cointegration, proposed by Engle and Granger (1987) is used. Pedroni's formulation allows for the heterogeneity across the cross-sections by permitting individual specific fixed effect, slopes and deterministic time trend for each cross-section. To test the cointegration, following bi-variate regression equation is estimated:

$$Y_{jt} = a_j + \delta_{jt} + b_t + \beta_j X_{jt} + e_{jt}$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Under the null hypothesis of no cointegration in heterogeneous panels i.e. $e_{it}$ is non-stationary, Pedroni develops seven different test statistics based on the estimated error term $e_{it}$ in equation. These are divided in two groups. The first group, "within dimensions" contains four test statistics termed as panel-v, panel-p, panel-t non parametric (PP) and panel-t parametric (ADF). The second group "between dimensions" contains three test statistics termed as group-p, group-t non parametric (PP) and group-t parametric (ADF).

The estimated statistic will be the average of the individual statistics. The rejection of null of no cointegration indicated that the cointegration holds at least for one individual. After the calculation of the panel cointegration test statistics, Pedroni shows that the standardized statistic is asymptotically normally distributed as follows:

$$K = \frac{\left(K_{N,T} - \mu\left(N\right)^{\frac{1}{2}}\right)}{\left(V\right)^{\frac{1}{2}}} \Rightarrow N\left(0,1\right)$$

He reports the critical values for μ and v for different values of number of regressors in cointegration relationship.

### *Johansen Cointegration Test for Two Variables (Fischer-Type Test)*

Johansen (1988) proposes two different approaches; one of them is the likelihood ratio trace statistics and the other one is maximum Eigen value statistics, to determine the presence of cointegration vectors in non-stationary time series. The trace statistics and maximum eigenvalue statistics have shown in equation below:

$$\lambda_{trace}\left(r\right) = -\mathrm{T}\sum_{i=r+1}^{N}\ln\left(1-\hat{\lambda}_i\right)$$

$$\lambda_{max}\left(r,r+1\right) = -\mathrm{T}\ln\left(1-\hat{\lambda}_{r+1}\right)$$

where T is the sample size. For the trace test tests the null hypothesis of at most r cointegration vector against the alternative hypothesis of full rank r = n cointegration vector, the null and alternative hypothesis of maximum eigenvalue statistics is to check the r cointegrating vectors against the alternative hypothesis of r+1 cointegrating vectors.Using Johannsen's (1988) test for cointegration, Maddala and Wu (1999) consider Fisher's (1932) suggestion to combine individual tests, to propose an alternative for testing for cointegration in the full panel by combining individual cross-sections tests for cointegration.

If $\pi_i$ is the p-value from an individual cointegration test for cross-section i, then under the null hypothesis for the whole panel,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$-2\sum_{i=1}^{N} ln\left(\pi_i\right)$$

is distributed as $\chi^2_{2N}$.A big benefit is that the test can handle unbalanced panels. EViews reports $\chi^2$-value based on MacKinnon-Haug-Michelis (1999) p-values for Johansen's cointegration trace test and maximum eigenvalue test.

Further, to estimate the long run relationship between the heterogeneous cointerated panels, Panel Fully Modified Least Square (FMOLS) method is used. This methodology allows consistent and efficient estimation of cointegrating vector and also addresses the problem of simultaneous bias. The cointegrated regression for estimation is:

$$Y_{it} = a_i + bX_{it} + e_{it}; \;\; X_{it} = X_{i,t-1} + e_{it}$$

## Panel Causality for a Pair of Variables

Granger causality is checked in both the panels to analyze the causality hypotheses explained in section 1. In case of long-run relationship, panel Vector Error Correction Model (VECM) is used while panel Vector Auto Regression (VAR) method is used in case of no cointegration. The conventional Granger causality tests raise two critical issues for a panel data case, both dealing with the potential heterogeneity of the individual cross sections. The first source of heterogeneity is cross sectional variation due to the distinctive intercepts; such heterogeneity may be addressed with a fixed effects model (i.e. it is controlled by introduction of individual effects in the model). The more crucial case is where heterogeneous slope coefficients should be considered (i.e. should be controlled by introducing individual dimension for regression slopes in the model). The second source of heterogeneity affects the causality relationships. For instance, for some individuals the introduction of past values of may improve the forecast on, whereas for others there may be no improvement. Therefore, we should distinguish two subgroups of individuals according to the causality relationships between and. If this heterogeneity is not considered, the test of causality hypothesis may lead to a fallacious conclusion concerning the relative size of the two subgroups. In a nutshell, the Granger causality for panel data sets should consider the different sources of heterogeneity of the data-generating. A newly suggested theory of Granger Causality in Panel by Hurlin and Venet (2001) is used here to test causality which controls for both sources of heterogeneity. The procedure has three main steps, which are related to the homogeneous non-causality (HNC), homogeneous causality (HC) and heterogeneous non-causality (HENC) hypotheses. Following model is estimated:

$$\Delta \ln energy_{it} = \sum_{k=1}^{p} a_k \Delta \ln energy_{i,t-k} + \sum_{k=1}^{p} b_k \Delta \ln gdp_{i,t-k} + \lambda_i + \mu_{it}$$

$$\Delta \ln gdp_{it} = \sum_{k=1}^{p} a_k \Delta \ln gdp_{i,t-k} + \sum_{k=1}^{p} b_k \Delta \ln energy_{i,t-k} + \lambda_i + \mu_{it}$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Homogeneous Non Causality hypothesis refers to the case in which there is no linear causality between dependent variable and explanatory variable for any cross section (the null hypothesis states non-existence of causal relationships across all cross sections, N).

$$\mathbf{H_0}: \; b_k^i = b_k^j = 0 \quad \forall_i \epsilon \left[1, N\right], \quad \forall_k \epsilon \left[1, p\right]$$

$$\mathbf{H_1}: \; b_k^i \neq 0 \; \exists \left[1, k\right]$$

To test these Non-linear restrictions, the following Wald statistic is computed:

$$F_{HNC} = \frac{\left(RSS_1 - RSS_\mu\right) / N_p}{RSS_\mu / \left[NT - N\left(1+p\right) - p\right]}$$

where, RSS1 denotes the sum of squared residuals obtained under the null hypothesis, $RSS_u$ denotes the sum of squared residuals produced by unrestricted model. If the HNC hypothesis is not accepted, Homogeneous Causality hypothesis is tested which says that there exists causality between per capita GDP and per capita energy consumption for all cross sections (the null hypothesis states existence of causal relationships across all cross sections, N).

$$\mathbf{H_0}: \; b_k^i = b_k^j \forall_i \epsilon \left[1, N\right], \forall_k \epsilon \left[1, p\right]$$

$$\mathbf{H_1}: \; b_k^i \neq b_k^j \exists \left[i, j, k\right]$$

with the F-statistic being:

$$F_{HNC} = \frac{\left(RSS_2 - RSS_\mu\right) / \left[\left(N-1\right)p\right]}{RSS_\mu / \left[NT - N\left(1+p\right) - p\right]}$$

where RSS2 denotes the sum of squared residuals under the null hypothesis. If the HC hypothesis is also rejected, Heterogeneous Non Causality hypothesis is tested which means that least one cross section unit does not indicate a causality relationship between two variables (the null hypothesis states non-existence of causal relationship for each cross section unit).

$$\mathbf{H_0}: \; b_k^i = 0 \quad \forall_i \epsilon \left[1, N\right], \forall_k \epsilon \left[1, p\right]$$

$$\mathbf{H_1}: \; b_k^i \neq 0 \; \forall_i \epsilon \left[1, N\right], \forall_k \epsilon \left[1, p\right].$$

with the F-statistic being:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$F_{HENC} = \frac{\left(RSS_{3,i} - RSS_{\mu}\right) / p}{RSS_{\mu} / \left[NT - N\left(1+2p\right) - p\right]}$$

where RSS3,i denotes the sum of residual squares obtained from model when one imposes $b_k^i = 0$ for all k ϵ [1,p], for each i. These N cross-sectional tests allow to us to identify the individuals for which there are no causality relationships.

## Panel Vector Error Crection Model (VECM)

In case of long-run relationship, panel VEC method is used to get the direction of causality between the variables. Following are the steps to conduct this analysis:

**Step 1:** Estimate $Y_{it} = a_i + b_t X_{it} + e_{it}$ and obtain residuals;
**Step 2:** Estimate Granger causality model with a dynamic error correction term (residuals obtained from step 1)

$$\Delta Y_{it} = a_{1j} + \sum_{k=1}^{m} a_{11ik} \Delta Y_{it-k} + \sum_{k=1}^{m} a_{12ik} \Delta X_{it-k} + b_{1i} ect_{it-1} + \mu_{it} \quad (1)$$

$$\Delta X_{it} = a_{2j} + \sum_{k=1}^{m} a_{21ik} \Delta X_{it-k} + \sum_{k=1}^{m} a_{22ik} \Delta Y_{it-k} + b_{2i} ect_{it-1} + \mu_{it} \quad (2)$$

where Δ is first difference, m is the lag length, eit-1 is error correction term and b is speed of convergence parameter for each individual. Sources of causation can be identified by testing for significance of the coefficients on the lagged variables in Equations (A) and (B). First, by testing H0: $a_{12ik} = 0$ for all *i* in Equation (A) or $H_0$: $a_{22ik} = 0$ for all i in Equation (B), Granger weak causality is evaluated. Masih and Masih (1996) and Adjaye (2000) interpreted the weak Granger causality as 'short run' causality in the sense that the dependent variable responds only to short-run shocks to the stochastic environment. Another possible source of causation is the Error Correction Term (ECT) in Equations (A) and (B). In other words, through the ECT, an error correction model offers an alternative test of causality (or weak exogeneity of the dependent variable). The coefficients on the ECTs represent how fast deviations from the long run equilibrium are eliminated following changes in each variable. If, for example, b1i is zero, then Y does not respond to a deviation from the long run equilibrium in the previous period. It is also desirable to check whether the two sources of causation are jointly significant, in order to test Granger causality. This can be done by testing the joint hypotheses H0: a12ik = 0 and b1i = 0 for all i in Equation (A) or H0: a22ik = 0 and b2i = 0 for all i in Equation (B). This is referred to as a strong Granger causality test. The joint test indicates which variable(s) bear the burden of short run adjustment to re-establish long run equilibrium, following a shock to the system (Adjaye, 2000). If there is no causality in either direction, the 'neutrality hypothesis' holds.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Panel Vector Auto Regression (VAR)

To check for causality in case of no long-run relationship, panel VAR is used. Following fixed effects model is estimated:

$$\Delta Y_{it} = \sum_{k=1}^{p} a_k \Delta Y_{it-k} + \sum_{k=1}^{p} b_k \Delta X_{it-k} + \lambda_i + \mu_{it}$$

$$\Delta X_{it} = \sum_{k=1}^{p} a_k \Delta X_{it-k} + \sum_{k=1}^{p} b_k \Delta Y_{it-k} + \lambda_i + \mu_{it}$$

where, p= lag length, $\lambda_i$: country fixed effects-controls the potential heterogeneity of cross sections.

## Panel ARDL Approach: Multivariate Analysis

To test for panel unit roots in multivariate analysis, the study have used LLC and IPS tests again to check whether the variables are stationary or not. Let us consider the following AR(1) processfor panel data:

$$y_{it} = \rho_i y_{i(t-1)} + X_{it}\delta_i + \varepsilon_{it}$$

where i=1,2,…N cross-section units or series, that are observed over periods t=1,2,…T. The $X_{it}$ represent the exogenous variables in the model, including any fixed effects or individualtrends, ρi are the autoregressive coefficients, and $\varepsilon_{it}$ the errors are assumed to bemutually independent idiosyncratic disturbance. If | ρi| < 1, yi is said to be weakly (trend) stationary. On the other hand, if | $\rho_i$| = 1 then $y_i$ contains a unit root. For purposes of testing, there are two assumptions that we can make about the ρi .First, one can assume that the persistence parameters are common across cross-sections so that $\rho_i = \rho$ for all i. The Levin-Lin-Chu (LLC), Breitung and Hadri tests all employ this assumption. Alternatively, one can allow pi to vary freely across cross-sections. The Im-Pesaran-Shin (IPS), and Fisher-ADF and Fisher-PP tests are of this form.

After determining the level of integration of all variables, the study proceeds to the application of panel ARDL to estimate the long-run and short-run relationships between regression variables. Autoregressive Distributed Lag (ARDL) models are standard least squares regressions which include lags of both the dependent variable and independent variables as regressors (Greene, 2008). Although, ARDL models have been used in econometrics for decades,they have gained popularity in recent years as a method of examining long-run and cointegrating relationships between variables (Pesaran and Shin, 1999). In panel settings with individual effects, standard regression estimation of ARDL models is problematic due to bias caused by correlation between the mean-differenced regressors and the error term. This bias only vanishes for large numbers of observations T, and cannot be corrected by increasing the number of cross-sections, N. To address this problem, a number of small T–large N, dynamic panel data GMM estimators have been developed (for example, Arellano-Bond, 1991). In large datasets, these assumptions underlying dynamic GMM are often inappropriate, and the estimator breaks down. In these cases, a

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

popular alternative is the Pooled Mean Group (PMG) estimator of Pesaran, Shin and Smith (PSS, 1999). This model takes the cointegration form of the simple ARDL model and adapts it for a panel setting by allowing the intercepts, short-run coefficients and cointegrating terms to differ across cross-sections. The model can be written as:

$$\Delta y_{i,t} = \phi_i EC_{i,t} + \sum_{j=0}^{q-1} \Delta X_{i',t-j'} \beta_{i,j} + \sum_{j=1}^{p-1} \lambda_{i,j} \Delta y_{i,t-j} + \varepsilon_{i,t}$$

where

$$EC_{i,t} = y_{i,t-1} - X_{i,t'} \theta$$

It is assumed that both the dependent variable and the regressors have the same number of lags in each cross-section. For notational convenience, it is also assumed that the regressors X, have the same number of lags q in each cross-section, but this assumption is not strictly required for estimation. The following log-likelihood function is then derived:

$$l_t(\varphi) = -\frac{\mathrm{T}_i}{2} \sum_{i=1}^{N} \log\left(2\pi\sigma_i^2\right) - \frac{1}{2} \sum_{i=1}^{N} \frac{1}{\sigma_i^2} \left(\Delta Y_i - \phi_i EC_i\right)' H_i \left(\Delta Y_i - \phi_i EC_i\right)$$

where

$$\Delta Y_i = \left(\Delta y_{i,1}, \Delta y_{i,2}, \ldots\ldots \Delta y_{i,T_i}\right)'$$

$$EC_i = \left(EC_{i,1}, EC_{i,2}, \ldots\ldots EC_{i,T_i}\right)'$$

$$H_i = \left(I_{T_i} - W_i \left(W^{'W_i}\right)^{-1} W_i'\right)^{-1}$$

$$W_i = \left(\Delta Y_{i,-1}, \Delta Y_{i,-p+1}, \Delta X_1, \Delta X_{i,-1} \ldots\ldots \Delta X_{i,-q+1}\right)$$

$$\Delta X_i = \left(\Delta X_{i,1}, \Delta X_{i,2}, \ldots\ldots \Delta X_{i,T_i}\right)'$$

where the jth lags of $\Delta Y_i$ and $\Delta X_i$ as $\Delta Y_{i,-j}$ and $\Delta X_{i,-j}$, respectively. This log-likelihood can be maximized directly. However, there exists an iterative procedure. Initial least squares estimates of θ based on the regression $\mathrm{Y_t} = \theta \mathrm{X_t}$ (where $\mathrm{Y_t}$ and $\mathrm{X_t}$ are the stacked forms of $\mathrm{y_{i,t}}$ and $\mathrm{x_{i,t}}$) are used to compute

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

estimates, using the first-derivative relationships, of $\Phi_i$ and $\sigma_i^2$. These estimates are then used to compute new estimates of θ, and the process continues until convergence. Given the final estimates of θ, $\Phi_i$ and $\sigma_i^2$, estimates of $\beta_{i,j}$ and $\lambda_{i,j}$* may be computed.

## Panel Causality through Panel Granger Test

In the pairwise causality tests with the stationarised data, the bivariate regressions in a panel data context take the following form:

$$x_{i,1} = \alpha_0 + \alpha_{1,i} x_{i,t-1} + \ldots + \alpha_{l,i} x_{i,t-1} + \beta_{1,i} y_{i,t-1} + \ldots + \beta_{1,i} y_{i,t-1} + \varepsilon_{i,t}$$

where t denotes the time period dimension of the panel, and i denotes the cross-sectional dimension. The different forms of panel causality test differ on the assumptions made about the homogeneity of the coefficients across cross-sections. The first is to treat the panel data as one large stacked set of data, and then perform the Granger Causality test in the standard way, with the exception of not letting data from one cross-section enter the lagged values of data from the next cross-section. This method assumes that all coefficients are same across all cross-sections, i.e.:

$$\alpha_{0,i} = \alpha_{0,j}, \alpha_{1,i} = \alpha_{1,j}, \ldots\ldots\ldots \alpha_{l,i} = \alpha_{l,j} \forall i, j$$

$$\beta_{1,i} = \beta_{1,j}, \ldots\ldots\ldots\ldots \beta_{l,i} = \beta_{l,j} \forall i, j$$

A second approach adopted by Hurlin and Dumitrescu (2012) makes an extreme opposite assumption, allowing all coefficients to be different across cross-sections:

$$\alpha_{0,i} \neq \alpha_{0,j}, \alpha_{1,i} \neq \alpha_{1,j}, \ldots\ldots\ldots \alpha_{l,i} \neq \alpha_{l,j} \forall i, j$$

$$\beta_{1,i} \neq \beta_{1,j}, \ldots\ldots\ldots\ldots \beta_{l,i} \neq \beta_{l,j} \forall i, j$$

This test is calculated by simply running standard Granger Causality regressions for each cross-section individually. The next step is to take the average of the test statistics, which are termed the $\overline{W}$ statistic. They show that the standardized version of this statistic, appropriately weighted in unbalanced panels, follows a standard normal distribution. This is termed the $\overline{Z}$ statistic. The authors have relied on the first version of the test. The p-values of the statistic are reported below.

## Analysis

The empirical results with data of 17 developed and developing countries across 2008-2014 is reported below.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Unit Root Tests

The first step is to check for presence of unit roots in all the variables using LLC and IPS tests. The results are shown in Table 3.

The results of Table 3 help us to specify the order of integration for each variable. The same is reported in Table 4.

As per the results of the unit root tests, FDI Outflow, Growth Rate, Inflation, Inflows to India and REER are stationary at first difference, i.e. integrated of first order. Capital formation and LFPR are stationary at second difference, i.e. integrated of second order. Only Trade GDP Ratio and GDP are stationary at level, i.e. integrated of zero order.

## Cointegration

As explained earlier, if two variables are stationary at first difference, i.e., integrated of first order, then there may exist a long-run relationship between them. To check the same, cointegration results for FDI Inflows to India with each of the other 3 variables that are integrated of one order are given in Table 5.

The results show that FDI Outflow, Growth rate, Inflation and REER are cointegrated with FDI Inflows to India, i.e., these variables have long-run relationships with FDI Inflows to India.

Further, to estimate the long-run relationship between the heterogeneous cointegrated panels in case of developing countries, Panel Fully Modified Least Square (FMOLS) method is used. The result is given as follows:

$$\log\left(FDI_{it}^{India\ Inflows}\right) = 5.002\log\left(FDI_{it}^{Outflows}\right)$$
$$-5.505\log\left(Growth_{it}^{Rate}\right) - 31.414Inflation_{it} + 15.246REER_{it} + \varepsilon_{it}$$

The above result explains that if FDI Outflows of the home country increases by 1 percent then FDI Inflows to India increases by 5.002 percent; if Growth Rate of the home country increases by 1 percent then FDI Inflows to India decreases by 5.5 percent; if Inflation of the home country increases by 1 unit then FDI Inflows to India decreases by 31.4 percent; and if the REER of the home country increases by 1 unit then FDI Inflows to India increases by 15.24 percent.

*Table 6. Panel causality test results*

## Causality

The pair-wise causality results for FDI Inflows to India and all the other variables under scrutiny are reported in Table 6.

The results show that only REER of the home country causes FDI Inflows to India. The rest of the variables, i.e., ln (FDI Outflow), Growth rate, Inflation, Trade GDP ratio, ln(GDP), ln(K) and ln(LFPR) do not show any causal relationship towards FDI Inflows to India.

## Estimation

In order to estimate the relationship running from all the I(1) and I(0) variables to FDI Inflow to India, an ARDL model is constructed. Capital formation and LFPR are not included in the model since they are I (2) and therefore, cannot be fit into an ARDL model. Prior to that it was necessary to ascertain the optimal lag length to be used for estimation. Models were estimated with various possible lag lengths and the model with lag 1 demonstrated the minimum AIC and BIC values. Hence, we restricted ourselves to estimate the ARDL model with lag 1. The residuals from this model were collected (which will represent the long run relationship in the ARDL model). Two models were constructed, one with the lagged values of the explanatory variables only and the other with lagged values as well as current values of the explanatory variables. The results are reported below:

$$lnindiainflowsd1 = -1.1142 - 0.0071 * growthrated1\left(-1\right)$$
$$+0.1401 * inflationd1\left(-1\right) + 0.0126 * lnfdioutflowd1\left(-1\right)$$
$$+0.0495 * lngdp\left(-1\right) + 0.0027 * reerd1\left(-1\right) - 0.0001 * trade_gdp_ratio\left(-1\right) + 1 * ect$$

where, Inflation and the error correction term are statistically significant, showing that in the short run only inflation of the home country has significant effect on FDI outflows to India and there is a significant long run relationship running from all the explanatory variables of the home country to FDI outflows to India. The significant error correction term explains that the disequilibrium in FDI outflows to India is being adjusted annually towards its final equilibrium.

$$lnindiainflowsd1 = -0.6918 - 0.0005 * lnfdioutflowd1\left(-1\right) - 0.0394 * growthrated1\left(-1\right)$$
$$+0.1027 * inflationd1\left(-1\right) - 9.5780 * lngdp\left(-1\right) - 0.0167 * reerd1\left(-1\right) - 0.0003$$
$$*trade_gdp_ratio\left(-1\right) + 0.0138 * growthrated1 - 0.1333 * inflationd1 - 0.0186 * lnfdioutflowd1$$
$$+9.6041 * lngdp - 0.0828 * reerd1 - 0.0002 * trade_gdp_ratio + 1.0212 * ect$$

where, past values of growth rate, inflation, GDP, current values of inflation, FDI outflows, GDP, REER and the error correction term are statistically significant. This shows that current growth rate of the home country, past values of FDI Outflows and REER, both current and past values of inflation and GDP affect FDI inflows to India significantly in the short run. Also all of these variables affect FDI inflows to India significantly in the long run. The significant error correction term explains that the short run disequilibrium in FDI outflows to India is being adjusted annually towards its final equilibrium.

## Summary of Results

The results above show that FDI Outflow, Growth rate, Inflation and REER affect the FDI outflows from the home countries to India in the long-run. However, only REER causes the FDI outflow. The estimation of the model reveals that when only the past values of the macroeconomic indicators are considered, only inflation affect outward FDI significantly in the short run. The adjustment of FDI outflows to its long run equilibrium from the short run fluctuations are seen to occur in a significant manner. When the model is estimated with past as well as current values of the indicators, current growth rate of the home country, past values of FDI Outflows and REER, both current and past values of inflation and GDP affect FDI outflows from the selected countries to India. In this model too, the adjustment from short run fluctuations to the long run equilibrium occurs significantly.

Current growth rate of the home country has adverse effect on FDI inflows to India because higher growth rate is associated with more developed economies. The more developed the economy becomes, it may choose to invest in other developed economies rather than in a developing economy like India. Previous year's FDI outflows shows a negative impact on outflows to India. This may be due to the expectation of a cyclical behaviour of overall FDI outflows. A rise in the previous year's outflows may lead to believe that in the current period flows should fall following the cyclical nature of the variable. A rise in the past value of REER leads to fall in outflows to India since rise in the exchange rate depreciates the local currency making investment in terms of USD more expensive than before which may make the country reluctant towards outward FDI. Anticipation of stickiness in the average exchange rate may be the triggering factor in such a scenario. A rise in previous period's inflation leads to a rise in the dependent variable, however, current inflation shows negative impact. Higher current inflation will make the currency weaker making it disadvantageous for the economy to invest abroad. Past GDP displays negative relation while current GDP shows positive effect. If the current size of the economy increases it would imply that the markets have expanded as well as capacity, making it conducive to invest in other countries. In both the models, the adjustment component being statistically significant, it may be said that the short run ups and downs of outward FDI flows from these economies get nullified rapidly and takes the variable closer to the equilibrium value implying a naturally stable mechanism.

## SOLUTIONS AND RECOMMENDATIONS

Between 2010 and 2014, there has been a lot of criticism that India has faced about its inward FDI situation. In spite of its large market size, affordable labour costs, abundance of work force and a promising growth path, India could not capitalize on these positives. Large tariff and non-tariff barriers (high import tariffs and exit barriers for firms, stringent labour laws, inferior infrastructure, centralised decision-making, and a limited number of export-processing zones, etc.) dampened the impetus to bring in the FDI receipts that the nation had potential for. In November 2011, India's central government announced retail reforms for both multi-brand stores and single-brand stores and paved the way for retail innovation and competition with multi-brand retailers such as Walmart, Carrefour and Tesco. It also allowed single brand majors such as IKEA, Nike, and Apple to participate in such innovation. However, most MNCs interested in setting up shop in India still seek clarifications on clauses like sourcing from Indian SMEs and infrastructure investments by them in India (Wall Street Journal, 2011).

India continues to be far behind China and the other nations of the BRICS, in the ease of "Doing Business" rankings of 2016 (Doing Business, 2016). Although India is better off than China in the Corruption Perceptions Index (CPI) of 2015 (Corruption Perceptions Index, 2015), the rankings are paltry in the "Global Enabling Trade Index" of 2014 (Global Enabling Trade Index, 2014) and the "Global Competitiveness Index" rankings of 2015-16, as well (Global Competitiveness Index, 2016)

However, in spite of these dismal figures and circumstances, India has recently beaten China[2]as the top FDI destination (Times of India, 2016). The FDI Intelligence Report 2016, said that with $63 billion of FDI announced in 2015, India has taken the top rank in the list of countries in terms of Greenfield capital investments, specifically across the coal, oil and natural gas and renewable energy sectors (*The FDI Report*, 2016). Additionally, according to the report, India's project numbers increased by 8% to 697, although they still lagged behind China's 789 projects. The report also said that "for the first time in many years, China was a laggard on regional FDI growth rather than an engine: it saw a 23 per cent decline in capital investment and a 16 per cent drop in FDI projects due to plateauing economic growth and rising costs" (Financial Times, 2016) (Smart Investor, 2016).

On April 11, 2016, the RBI has also declared that FDI in the country increased to USD 42 billion during April-February in 2015-16, up 27.45 per cent from the inflows in the corresponding period of the previous financial year, and as of today India saw a record 53 per cent increase in FDI in last two years as the investment climate brightened due to steps taken to foster growth, price stability and fiscal prudence which also improved the overall macroeconomic stability (First Post, 2016).

From struggling to be an attractive FDI destination to "pipping China at the post", it has been a hard but a fast faced and worthwhile journey for India. Measures taken by the government to foster economic growth, price stability and fiscal prudence have improved the overall macroeconomic stability and brightened the investment climate in the country over the last two years. The global economic indices and rakings that have been a poor show for India will gradually make a turn-around, as well. The Finance Minister of India has been on record saying that "Improving the ease of doing business is a "work in progress", and adding measures have also been initiated to ensure that the system itself is more transparent" (Times of India, 2016).

India is projected to require around USD 1 trillion in the 12th Five-Year Plan (2012–17), to fund infrastructure growth covering sectors such as highways, ports and airways. This would require support from FDI flows. As mentioned earlier, during 2014, foreign investment was witnessed in sectors such as services, telecommunications, computer software and hardware, construction development, power, trading, and automobile, among others, with services taking the lead (Foreign Direct Investment, 2016). According to the "World Employment and Social Outlook: Trends 2015" report published by the International Labour Organisation (ILO), job creation in the coming years will mainly stem from the services sector. This also is another reason for India to look forward to an economically positive future (World Employment and Social Outlook Trends, 2015).

With a philosophy based on the four principles of new processes, new infrastructure, new sectors and a new mind-set, the "Make in India" initiative aims at making India a global hub of manufacturing, design and innovation, has been taken by the government. The initiative is set to boost entrepreneurship, not only in manufacturing but in relevant infrastructure and service sectors as well. The Department of Industrial Policy and Promotion (DIPP), in consultation with various central ministries, state governments, industry leaders, and other stakeholders, has formulated a strategy for increasing the contribution of the manufacturing sector to 25 per cent of the GDP by 2020; while, an exhaustive plan of action has been drawn out to improve "ease of doing business" (indiabudget.nic.in, 2016). With all the buzz that

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the economy has created in the last couple of years, India should record a robust growth rate from all the investments (among others) that in the offing.

## FUTURE RESEARCH DIRECTIONS

This study does not capture a robust time period post the implementation of the "Make in India" initiative. While India is on its path to take a giant economic leap, at least in terms of FDI receipts, there are many socio economic factors that still need addressing and overhauling. Formal investigations involving trade agreements, trade policies, socio-economic and geo-political factors – all put together to build a comprehensive panel causality study that considers a time frame between 2006 to 2026 (say) – should provide a 360-degree view and a more wide-ranging understanding of how the factors responsible for inward FDI work in India, specifically. It will also help in determining if the new wave of trade and investment reforms have truly made the desired substantial and sustainable impact on the economy or not; and whether complementary economic factors and policy measures can be further introduced or refitted to augment the flow of FDI into the nation.

## CONCLUSION

India is standing at the gateway to a new wave of economic success. With a young and educated working population, there is a huge talent pool and human capital to tap from. India is also endowed with vast natural resources. If the gaps between the demand and supply sides of the economy can be filled in skilfully, there is very little that can actually stop India from becoming the next economic super-power.

## KEY TERMS AND DEFINITIONS

**Causation:** Indicates that one event is the result of the occurrence of the other event; i.e. there is a causal relationship between the two events. This is also referred to as cause and effect.

**Emerging Economies:** An emerging market economy is a nation's economy that is progressing toward becoming advanced, as shown by some liquidity in local debt and equity markets and the existence of some form of market exchange and regulatory body. Emerging markets are not as advanced as developed countries but maintain economies and infrastructures that are more advanced than frontier market countries.

**FDI Outflows/Inflows:** FDI net inflows are the value of inward direct investment made by non-resident investors in the reporting economy. FDI net outflows are the value of outward direct investment made by the residents of the reporting economy to external economies.

**Foreign Direct Investment (FDI):** FDI takes place when there is an existence of a controlling proprietorship in a business enterprise in one country by an entity based in another country.

**Gross Capital Formation:** Capital accumulation/formation refers to the stock of capital and/or its growth, usually by augmenting saving and investment at the macroeconomic level. The gross measurement of capital formation is usually calculated before deduction depreciation.

**Horizontal and Vertical FDI:** Horizontal FDI, where multi-plant firms duplicate roughly the same activities in multiple countries, has been distinguished from vertical FDI, where firms locate different stages of production in different countries.

**Host/Home Country:** A country where a company that is based in another country has business activities.

**Inward Foreign Direct Investment (FDI):** When a foreign entity invests in a local economy by purchasing another business or establishing new operations for an existing business.

**Market Size:** In economic terms, a proxy for the potential market size can be expressed as Gross Domestic Product (GDP). The confines of a market (in the context of the chapter) are the economic size of the concerned country trying to attract FDI.

**Mergers and Acquisitions (M&A):** A general term that refers to the consolidation of companies or assets. While there are several types of transactions classified under the notion of M&A, a merger means a combination of two companies to form a new company, while an acquisition is the purchase of one company by another in which no new company is formed.

**MNCs/MNEs:** A multinational corporation (MNC) or enterprise (MNE) is an organization that owns or controls production of goods or services in one or more countries other than their home country. It can also be referred as an international corporation, a "transnational corporation", or a stateless corporation.

**Panel Data:** This term is used in Econometrics and Statistics, for multi-dimensional data frequently involving measurements over time. Time series and cross-sectional data are special cases of panel data that are in one dimension only (one panel member or individual for the former and one-time point for the latter).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Real Exchange Rate:** R is defined as the ratio of the price level abroad and the domestic price level, where the foreign price level is converted into domestic currency units via the current nominal exchange rate (E). Formally, R= (E.P*)/P, where the foreign price level is denoted as P* and the domestic price level as P.

**Trade Openness:** The inward and/or outward orientation of an economy to trade with other countries. Some determinants of trade openness are trade barriers, import-export, infrastructure, technologies, scale economies, and market competitiveness.

## ENDNOTES

1 The authors have not considered economic policies in the model and hence, have not elaborated upon the section.

2 China was neck and neck with USA in terms of inward FDI flows and second in ranking for such receipts, till India recently beat China at around mid-2016.

**Rafael Hernandez Barros**
*Complutense University, Spain*

## ABSTRACT

*Investing means using funds to start a venture or acquire part of an existing one in hopes that in time the business will accrue profits for the entrepreneur. Often, entrepreneurs opt to purchase companies' stocks. To be able to select the right – profitable – stocks to buy, one requires knowledge of modern portfolio theory, computational investing, stock brokerage, mutual funds, bonds, value investing, how capital gains are taxed, how to trade stocks and options online, and how to use diversification to allocate online investments.*

## INTRODUCTION

The Modern Portfolio Theory is a result of the ingenious efforts of Harry Markowitz. In 1952, Markowitz pioneered the concept by publishing an article, "Portfolio selection," in the *Journal of Finance*. Through the piece, he demonstrated how diversification of stock reduces portfolio risk (Strong, 2009, p. 156). In other words, a single investment is exposed to risk due to the fact that several factors create high uncertainty and, as a result, lower expected returns. Examples of such factors are time, resources, manpower, and so on. Thus, Markowitz proposed a model that ensures capital is spread across a variety of investments so as to cushion entrepreneurs against any unfavorable returns resulting from one or several securities.

To gain a better understanding of Modern Portfolio Theory, it is important to understand the key terms applicable in the model. Firstly, risk is the variability in outcomes based on the expected return. Hence, it is measured by calculating the standard deviation ($\sigma$) of a percentage of the return ($r_i$). Optionally,

DOI: 10.4018/978-1-7998-2448-0.ch002

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

risk can be determined by computing variance ($\sigma^2$), which is the square of standard deviation. Secondly, expected returns (E ($r_i$)) is a function of probability ($p_i$) and percentage of the returns ($r_i$) expected from the security. In this case, the expected returns of a portfolio is a summation of individual returns ($\sum p_i r_i$) of several securities. Thirdly, a security includes a finance lease, commercial loan, trade receivable, credit card, and so on. Fourthly, a portfolio is a collection of investment items such as bonds and stocks that require capital allocation. Fifthly, covariance ($\sigma_{ij}$) is a measure of the relationship that exists between variables (Francis and Kim). A positive covariance denotes that the variables progress in a similar direction. In other words, it shows positive correlation. Sixthly, an investment item's weight ($w_i$) is the ratio of the funds allocated to the stock to the total amount invested in the entire portfolio. Finally, portfolio risk ($\sigma_p$) is a logical expression that is based on the covariance and variance of securities in a portfolio.

Markowitz's diversification concept is useful in portfolio analysis. In this case, assets that have a positive correlation can be combined with an aim of reducing risk. Hence, that ensures that none of the returns of the portfolio is forfeited. In other words, the risk of the portfolio reaches its lowest value when the correlation between assets is at a minimum (Francis & Doncheol, 2013, p. 5). That remains the case even if the risk associated with individual assets is high.

According to Markowitz, diversification needs to be done strategically. In this case, an entrepreneur should invest in assets in different industries (Strong, 2009, p. 149). For instance, the investor should buy shares in manufacturing, mining, and service sectors. The reason for that is that companies that sell the same goods or services occasionally perform poorly and hence investors that diversify their portfolios by buying assets in the same industry stand to lose. Conversely, by investing in different sectors, poor performance in one industry does not affect the returns from other industries.

The significance of diversification can be illustrated using a portfolio containing two investment assets, A and B. Suppose the expected returns for asset A ($E(r_A)$) is 8%, while that of asset B ($E(r_B)$) is 24%. Also, suppose that the standard deviation for asset A ($\sigma_A$) is 22%, while that of B ($\sigma_B$) is 44%. Additionally, assume that the weight of asset A ($w_A$) is 2/3, while that of asset B ($w_B$) is 1/3. In this case, the expected return of the portfolio (E ($r_p$)) can be determined by the following calculations.

$$E(r_p) = w_A E(r_A) + w_B E(r_B)$$

$$E(r_p) = 2/3(8/100) + 1/3(24/100) = 0.0533 + 0.0800$$

$$E(r_p) = 0.1333 = 13.33\%$$

As shown in the example above, the expected return of the portfolio is a weighted average of the expected returns of the assets A and B (Graham & Smart, 2012, p. 219). This means that by investing in two different assets from different industries, the entrepreneur gains favorable returns from the portfolio. Thus, diversification of the portfolio improves the expected returns.

Markowitz also demonstrated the effect of diversification on portfolio risk. According to him, portfolio risk can be determined using the formula below.

$$\sigma_p = \sqrt{(w_A^2\sigma_A^2 + w_B^2\sigma_B^2 + 2w_A w_B \sigma_{AB})}$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In this case, $\sigma_{AB}$ is the covariance of returns. For demonstrative purposes, let the values of $\sigma_{AB}$ be +0.095, -0.095, and 0 and the weighted values and standard deviations of the assets A and B remain as given in the previous example. Thus,

$$\sigma_p = \sqrt{(w_A^2\sigma_A^2 + w_B^2\sigma_B^2 + 2w_Aw_B\sigma_{AB})}$$

$$\sigma_p = \sqrt{[(2/3)^2(0.22)^2 + (1/3)^2(0.44)^2 + (2*2/3*1/3*\sigma_{AB})]}$$

$$\sigma_p = \sqrt{[0.02151 + 0.02151 + 4/9*\sigma_{AB}]}$$

$$\sigma_p = \sqrt{[0.04302 + 4/9*\sigma_{AB}]}$$

If $\sigma_{AB} = +0.095$, then $\sigma_p = 0.6982$. Secondly, if $\sigma_{AB} = -0.095$, then $\sigma_p = 0.0282$. Lastly, if $\sigma_{AB} = 0$, then $\sigma_p = 0.2074$. Therefore, positive covariance increases portfolio risk, while a negative covariance reduces it. Thus, according to Markowitz's Modern Portfolio Theory, the diversification of stock results in the reduction of the risk of the portfolio, especially if the variables have negative covariance (Khan and Jain).

## BACKGROUND

Computational investing is another topic that provides insights on investing and stocks. It includes a collection of theories that have effectively been used as strategies for investing. For instance, John Bogle's passive investment approach recommends that entrepreneurs should allocate resources to assets that have minimum trading expenses. The reason for that is that active involvement in market-stock trade cannot match the returns of the market (Laopodis, 2013, p. 32). In other words, Bogle advocates for a long-term view approach to investing – one should pay attention to taxes and costs. Therefore, according to him, a well-diversified portfolio is an assortment of low-cost assets that have been in the market for a considerable number of years. That is, investors should adopt a buy-and-hold strategy.

Another theory of computation investing is value investing. According to Warren Buffet, who developed the idea, investors should exercise discipline, intelligence, and patience in relation to buying stock (Laopodis, 2013, p. 32). In other words, the entrepreneurs should purchase shares of reputable companies only.

Thirdly, computational investing includes active investing. The theory aids in analyzing the general proceeds obtained in the security market by engaging in regular trading. In this case, trading normally involves utilizing mutual funds to acquire certain securities. Unfortunately, the pricing models of market securities are not accurate and hence may cause losses (Voges & Pope, 2006, p. 432). The shortcomings of the models can be detected and resolved by experienced investors. Hence, active investing means one should consult a professional before buying stock.

Therefore, computation investing contains complex theories, which means that entrepreneurs should adopt the use of other tools to guide them in buying stock. Computer applications are instrumental in this regard. They make it easy to analyze and interpret information that is useful for decision making. For instance, Mathematica, which relies on the use of statistics, differential equations, calculus, and other mathematical functions, is utilized in market analysis. It can solve problems related stock options and thus is relevant to day traders (Wellin, Gaylord, & Kamin, 2005, p. 8).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Machine learning provides another means of managing information pertaining to investments. It entails the creation of structures and models that can provide useful information from raw data. The data is derived from a considerable number of securities that are influenced by a number of fundamental technical factors. In other words, the inputs are collected and then a model created to predict their future values. Thus, machine learning aids in the classification as well as regression analysis of the stock market (Balch).

The models used in machine learning may be linear in nature (Balch). Linear models can be described by the linear equation below.

$y = m(x) + b$

In this case *y* is the output, *x* is the input or independent variable, *m* is the gradient of the line, and b is a constant or y-intercept, which means that it is the value of *y* when *x* is zero. *m* is calculated by diving the change in output that occurs after a change in input. Thus, the linear equations can be applied in the pricing of stock, particularly in the Capital Asset Pricing Model (CAPM).

In the CAPM, the linear equation takes the form $E(R_i) = R_F + [\beta \times (E(R_M)-R_F)]$. In this case, $R_F$ is the risk free rate of return, $E(R_M)$ represents the proceeds from the market portfolio, $\beta$ is the beta coefficient, and $[E(R_M)-R_F]$ is the market risk premium – an extra return for reimbursing investors for risks taken in clinging to a portfolio of assets in the market. When an asset yields expected returns, its beta coefficient is one (Kürschner 4). If the asset's returns exceed expectations, then its beta coefficient is greater than one. In that respect, if the returns are below market expectations, the asset's beta value is less than one. Hence, the CAPM has extensively been used by investment firms to measure financial performance.

Polynomial and data driven models can also be used in machine learning. The polynomial model consists of more than one parameter, each of which should be well identified. The model is non-linear in nature and hence quite fast in runtime. In comparison, data driven models are designed to function in query fashion and hence are multi-dimensional – allow users to add new input variables with time. To predict the future value of a stock, the mean of the dependent values must first be computed, which makes data driven models slow in runtime compared to polynomial models (Balch). The dependent variables that are typically used in the model include the profit/earnings (P/E) ratio.

## MAIN FOCUS OF THE CHAPTER

### Open a Stock Brokerage Account Online

Some of the concepts discussed in Modern Investment Theory and computational investing are useful to stock brokers, especially when opening an online account. A stock broker is an individual or company that trades in shares on behalf of a client. If the interaction between the client and the broker is through a website, the broker is referred to as an online broker. The online service allows the investor to allocate some funds to the brokerage firm for the purchase and sell of stock. Normally, the transactions occur on order basis, that is, the client must request the broker to buy or sell profitable shares. Apart from trading in shares, a significant number of online brokers also provide other support services such as tax reporting, creation of financial statements, and so on. Optionally, an investor may decide to do the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

online trading independently (Magliolo xvii). That means the entrepreneur will need to open an online stock brokerage account. To succeed in such a venture, the entrepreneur must consider several factors.

Firstly, the investor needs to acquire a portfolio tracking tool, which is a set of online tools that provide information on the trading of stock. Hence, the tool allows investors to keep a close eye on the performance of their stock while shopping for additional profitable investments. The portfolio tracking tool can be treated as an additional expense to the cost of opening an online brokerage. However, an effective method would be to treat portfolio tracking as a support service provided by an online broker (Hart, 2005, p. 36).

Secondly, transaction costs are incurred in operating the online brokerage account. Normally, the online broker that hosts the independent stockbrokerage account charges a specific amount for each transaction executed. In other words, an online broker may provide the portfolio tracking tool at a low cost, but charge the investor highly per transaction (Hart, 2005, p. 42).

Apart from that, some hosts charge for stop-sell order requests. Therefore, investors should take time to compare the charges of different hosts to ensure that they get value for their money.

Thirdly, the type of account matters. Often, investors have the option of opening either an individual retirement account (IRA) or retail account. Before opening an IRA, the entrepreneur should consult a tax advisor because some of the transactions done through the account are taxable. For instance, if a transfer of funds is done from the investor's IRA to an online broker's IRA, there are no tax penalties or consequences. However, taxes apply if the investor withdraws money from an online brokerage IRA. Conversely, transferring funds to a retail account has no tax implications. Similarly, the purchase of stock through the use of funds in the retail account has no tax implications. However, the income from the stocks sold through the account is taxable (Hart, 2005, p. 50).

Additionally, investors expect returns in form of dividends from companies in which they own shares. The dividends may be scrip dividends or dividend re-investment plans (DRIP). For the investors that subscribe to the scrip-dividend policy, the expected cash returns are automatically converted to new shares. Conversely, for those in DRIP, the cash dividends are first sent to a scheme administrator who then may use the funds to acquire the company's shares through the stock market or send the money to the stakeholders. Therefore, before opening an online account, the investor should consider the reinvestment service offered by the host (Hobson, 2012, p. 15).

Also, the investors need to determine the means through which they will fund their online brokerage accounts. Firstly, capital may be sourced from savings. In this case, keeping money in bank accounts yields low annual interest. Depositing the money into an online brokerage account will result in better cash benefits. Secondly, the IRA is also a source of funding. In this case, the funds can be transferred from an existing IRA to the online brokerage IRA mentioned earlier. Thirdly, the investors can opt to make direct deposits. In this regard, the cash-in-hand that they possess should be greater than or equal to the bare minimum required to open the online brokerage account. Given that the option will force the entrepreneurs to develop a working plan on how to make regular deposits into the account, discipline is required (Hart, 2005, p. 55). The investors can obtain additional hard cash from gifts, financial assets converted to money, extra income, refunds, and so on.

Therefore, before opening an online brokerage an account, one must consider several things. These include the type of account to be opened, transaction costs involved, and customer service. The investor should also take into account how the online brokerage shall be funded, the cost of the portfolio tracking tool, and the dividend re-investment policy provided. Once these queries have been addressed, the next

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

step is to open an online brokerage account (Hart, 2005, p. 57). In reference to that, it is worth noting that managing a profitable stock investment portfolio requires thorough knowledge of ways of investing.

## Investing in Stocks

Equity investment – investing in stocks – refers to the value of assets and cash that an individual, company, or group puts into another entity. The amount of funds contributed determines the ownership or level of influence the investor has in the venture. This level of influence can also be referred to as shares. Thus, the more shares an entity purchases, the greater its equity stake. Equity investments are often handled by professional investors that administer large portions of money on behalf of amateur investors. The professional investors carry out such activities through private equity (PE) firms. Hence, private equity refers to the shares of individuals in a listed or unlisted company (Kumpf, 2013, p. 17). Equity investors benefit in two ways. Firstly, they make gains when the stock prices increase. Secondly, they receive dividends periodically. An increase in stock prices yields the most benefits and thus the entrepreneurs mainly buy shares of companies in hopes that the stock prices will rise. There are other aspects of private equity that must be addressed before one understands investing in stocks.

The private equity firms utilize three investment approaches that are based on maturity of portfolio entities and volume of equity purchased by the PE companies. Firstly, the firms allocate venture capital to young firms that have a potential of rapid growth. Normally, the venture capital is a small sum of money and hence the PE firms do not acquire a majority stake in the entity. Secondly, by providing growth capital, the companies acquire a minority stake in mature firms. Finally, the PE firms use buyouts to gain control of mature organizations (Kumpf, 2013, p. 17).

Buyouts can further be split into management buy-ins and management buy-outs. Management buy-ins are driven by outsiders, while management buy-outs are initiated by insiders. In a management buy-in, the private equity firm establishes its own management team, whereas in a management buy-out, the existing management is retained (Kumpf, 2013, p. 18).

Given that it is not easy to identify the best companies to invest in, investment tools are required. In this case, the Magnet Stock Selection Process (MSSP) is of great value. The MSSP is a technique designed to blend momentum, value, and growth to optimize long-term returns (Kimmel, 2009, p. 124). Magnet is an acronym that defines each of the factors considered in the selection process.

M stands for management and momentum. In this case, the entrepreneurs should invest in firms that have capable managers. The management should exemplify leadership, innovativeness, and success in the marketing of products. Additionally, whether or not the management owns a significant portion of the stock of the business, they should prove that they have always acted in the best interest of their shareholders. Momentum refers to the relationship between stock price and the market as a whole (Kimmel, 2009, p. 125). The entrepreneurs should conduct trend analysis of the share price performance for a few consecutive months and only invest in the venture if the evaluation shows strong performance.

A stands for acceleration of revenues and earnings. In this case, the PE firms should only buy shares of companies that regularly achieve at least a 15% increase in quarterly earnings and revenues (Kimmel, 2009, p. 125). This standard effectively eliminates big companies that dominate their industries, but fail to sustain quick growth rates. Acceleration of growth can also be shown by gross profit (GP) margin. The GP margins should continually rise each year (Kimmel, 2009, p. 126). A decline in GP margins shows that the firm is facing financial challenges.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

G stands for growth at a discount, which is shown by the price/earnings (P/E) ratio. In this case, the growth of a company should be twice its P/E ratio (Kimmel, 2009, p. 126). This ensures that investors do not spend more than they should on stocks.

N stands for new product or management (Kimmel, 2009, p. 126). In this respect, the rapid rise of a company's share price shows that something innovative is happening. In other words, it indicates that the management is making strategic decisions that create growth prospects. Normally, if new products are not developed or no strategic decisions are implemented, the growth potential of an entity is constrained. Also, new management can be a source of novel ideas that may propel a company forward.

E stands for emerging products or industrial opportunities (Kimmel, 2009, p. 125). In this case, if new product lines are developed, then a company can look forward to growth. That is because new lines require capital, innovation, and personnel. A firm invests in new products to enhance its already existing lines. In this respect, opportunities are created and risks are taken to generate additional returns. Thus, investors should regard such changes as a sign of potential for growth for the company. In other words, investing in the stock of such firms may result significant returns in the long run.

Lastly, T stands for timing. The stock acquisition should be done at the right moment. In this case, the opportune time is when the share price declines. Investors should also invest in businesses during initial public offerings or when shares are sold at a discount. By acquiring the shares at such periods, the investors will reap significant rewards after the share prices appreciate in future (Kimmel, 2009, p. 125). In other words, as the companies grow, the entrepreneurs' equity also increases.

Thus, equity investment is an avenue for wealth generation. This is especially the case if approaches such as MSSP are effectively used in the selection process. One must also accept that private equity firms play a crucial role in identifying favorable investments. That is because the entities employ skilled personnel to identify successful businesses. Also, it is indisputable that the private equity managed by the PE firms aids upcoming and mature enterprises overcome financial limitations and hence ensure work is done properly (Loewen, 2008, p. 43). That said, to fully understand the subject of investing and stocks, one needs to consider other topics apart from equity. For instance, it is paramount to discuss bonds and mutual as well as exchange trade funds.

## Investing in Mutual Funds, Bonds and Exchange Traded Funds

It is important to have a diversified investment portfolio. The reason for that is that occasionally particular industries face challenges such as competition that reduce the anticipated returns. Apart from stocks, mutual funds, bonds, and exchange traded funds are viable investment options.

Mutual funds are created by a group of people who wish to invest in particular projects. There are benefits that arise from having such a pool of funds. Firstly, professional fund managers are employed to handle the invested funds. They diversify the holdings, thus reducing risk (Northcott, 2009, p. 12). The investors select the management and fund based on the anticipated risk and returns.

There are costs associated with mutual funds. These include operation and remuneration expenses. Normally, the expenses are covered by paying a regular fee, which is a percentage of the annual charge. The charge varies depending on size of the fund; larger funds have smaller expense ratios. However, different mechanisms may be employed by other funds (Northcott, 2009, p. 18). In this case, all expenses and costs are disclosed in a prospectus.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Mutual funds can be categorized into two types. Firstly, there are open-end funds. In this case, the sale of shares to investors is done without undue restraint. Also, the open-end fund managers decide how best to use the new money received. The options available in this regard include purchasing new securities or increasing the fund's shares in existing assets (Northcott, 2009, p. 27).

Secondly, there are closed-end funds, which have some restrictions. For instance, an investor may only be able to purchase shares in the concerned enterprise if some existing stakeholders of the entity are willing to sell theirs. This is due to the fact that the closed-end funds have a predetermined number of shares (Northcott, 2009, p. 28). Also, the entrepreneurs value their shares based on future price expectation. In contrast, the value of the shares of the open-end funds is determined by the market price of shares already sold and value of existing securities within the holding.

In this respect, mutual funds are used to invest in shares or bonds. In the case of shares, the companies targeted may be large, medium, or small cap. Cap means capitalization and thus the categories are based on market valuation. For instance, a medium cap firm is one that is valued from $2 billion to $10 billion. Therefore, a small cap company is one that is worth less than $2 billion (Northcott, 2009, p. 66). Large cap companies, those worth more than $10 billion, are considered less risky than small cap enterprises.

The mutual funds can also be used to purchase bonds. Bonds yield fixed returns. The amount of income generated depends on contractual requirements and solvency of the issuer of the bonds (Maeda, 2009, p. 15). Bonds may be provided by particular organizations or bond funds. In this case, the company bonds are considered risky due to the fact that in the past major companies exited the market after selling bonds.

In relation to investing in bonds, the entrepreneurs may opt to be active traders or buy-and-hold investors. Active trading is expensive because it involves regular transactions. Conversely, the buy-and-hold investors keep their bonds until they mature. As a result, the entrepreneurs earn interest.

There are other factors that should be considered in relation to investing in bonds. Firstly, the entrepreneurs should be aware of their risk tolerance. This can be determined by extensive analysis of the bond-returns. In this case, the volatility of returns is reduced by acquiring low yield bonds. Secondly, the bond maturity period is an important factor to keep in mind. For instance, some bonds may mature after 10 years, which means that the money will be unavailable for that long (Maeda, 2009, p. 17). In other words, purchasing a bond means lending your money to a corporation or government entity for a defined period in exchange for interest on the principal amount. Thus, it is imperative to conduct extensive research to identify high-yield bonds.

Besides the bonds and mutual funds, the entrepreneurs should consider investing in exchange trade funds (ETFs). ETFs are variations of mutual funds. However, unlike the case is with conventional mutual funds, the investors who put their money into the ETFs do not have to submit the money through financial agents. That is because the management of the funds is based on a fixed set of rules that determine the types of individual stocks held in a portfolio. In other words, the ETFs are passively managed and hence stock selection is updated on specified dates (Appei, 2009, p. 3). Another difference between the ETFs and regular mutual funds is that the individual investors can purchase the ETFs through the stock market, while mutual funds are managed by fund managers. In this respect, the investor is wholly responsible for transactions concerning the ETFs.

The ETFs have other characteristics. For instance, the value of shares traded is determined by the market price of the stock on the transaction date. Also, investors have to pay a broker's commission fee for the purchase of the ETFs. The cost of purchasing the ETF shares is low compared to the expenses incurred in acquiring regular stocks because of active competition. In reference to that, it is worth noting that all mutual funds, including the ETFs, attract sales charges.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Another advantage of the ETFs is that the sale and purchase of new shares is done on an investor-investor basis. This means that one investor sells shares to another entrepreneur in exchange for cash. Thus, updating the records is easy (Appei, 2009, p. 5).

Mutual funds, bonds, and exchange trade funds are all viable investments. However, each of the forms of investment bears its own risks. Additionally, the entrepreneurs must consider the costs associated with the investments among other factors before selecting one.

Investing and stocks is a wide subject. It covers the Modern Portfolio Theory, which advocates for diversification of investments to minimize portfolio risk. Secondly, it includes computational investing that provides several models used to analyze data for effective decision-making. Also, it addresses opening an online brokerage account. The subject provides information on the use of the portfolio tracking tool, transaction costs involved in the establishment of the account, and so on. Additionally, by studying the chapter, learners discover the significance of the MSSP approach to investing. Finally, the subtitle on mutual funds, bonds, and ETFs shows how pools of funds can be utilized to make investments.

## Value Investing

Another subject that needs to be addressed while discussing investing and stocks is value investing. Basically, it refers to the purchase of securities at a price that is lower than their intrinsic worth. That is, the cost of the shares is determined by the primary business value. This also means that the investor does not rely on the stock market to establish the true worth of a certain stock. Instead, the entrepreneur check's the firm's earnings. To gain a better understanding of the topic, one needs to review its fundamental aspects.

Generally, the investors who apply value investing opt to buy shares in companies that have declining stock prices, but are destined to experience greater returns in time. In this regard, such investors hope to make significant profits by selling the shares when the companies' earnings will force their share prices to rise (Browne, 2007, p. 25). For instance, in the 1950s, Berkshire Hathaway Inc., a textile company, was facing financial challenges. As a result, the price of its shares gradually declined. Warren Buffet, a former student of Columbia Business School, noted that previously the company showed great potential in terms of returns (Browne, 2007, p. 27). Thus, he prompted his father to acquire a considerable number of shares in the company to gain a controlling stake. At that time, the firm's shares traded for only eight dollars. Because of his father's stake in the business, Buffet was able to join Berkshire. By the 1960s, he had become part of the management and thus was able to influence decision-making. Buffet began remodeling Berkshire and hence in a short while the company's share value rose to $ 18. Decades later, the company sold its stocks at $90,000 per unit.

To be successful in value investing, one needs to be cognizant of several indicators. The investor needs to monitor the targeted firm's cash flow, profits, and sales. That is because doing so will enable the entrepreneur to identify the right time to acquire the stocks of a firm that trades at a discount for a lengthy period (Browne, 2007, p. 28).

The theory of value investing was introduced by Benjamin Graham. In 1934, while lecturing at Columbia Business School, Graham came up with a set of principles for guiding investors who wanted to engage in the venture (Greenwald et al., 2004, p. 38). According to him, stocks should be bought when they are trading on sale basis. That is, when a company is selling its shares at a discount. This is the principle that a considerable number of mutual fund managers apply. That is, the mangers use growth funds to invest in new fast growing firms and spend value funds in purchasing shares that are on sale (Browne, 2007, p. 43). As expected, with time, the investments made through value investing – value

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

funds – yield greater returns. Secondly, the investors should first establish the true value of the target company. This can be done by calculating the total cash flows of the business. Given that future cash flows are included in the computations, the investor needs to make assumptions with respect to market conditions (Greenwald et al., 2004, p. 38). However, basing the value of a firm on probable factors may not reveal the true value of its assets or potential. Thus, the value investors prefer calculating a firm's worth using its intrinsic value.

The intrinsic value of the organization can be established by valuing the company's assets. In this case, the valuation is done using the business' financial statements. Firstly, some assets are adjusted to reflect their current prices. Thereafter, total liabilities are deducted from the sum of current assets/ inventory, cash, and receivables. The figure obtained is referred to as the reproduction cost (Greenwald et al., 2004, p. 14). A desirable security is a stock that retails at a price that is lower than the reproduction cost. Graham describes such a stock as net-net stock.

The intrinsic value of a firm can also be determined by assessing the organization's earnings power. In this case, the investors should first establish the company's inflow of earnings over a considerable number of previous years. Next, they should use the established trend to predict the firm's business cycle (Greenwald et al., 2004, p. 14). Then the figure obtained is compared to the reproduction cost. The company has earnings power if the value is greater than the intrinsic worth that was determined by assessing the organization's assets. That is, provided its corrected net worth is less than the reproduction cost. If that is the case, the firm's stocks become desirable.

Another thing that Graham suggests that investors should consider in relation to value investing is investment biases. The biases are influenced by legislative policy or size – number of investors who have confidence in the organization. Established laws may prevent an institution from acquiring stocks of particular businesses. Often, governments enact laws to prevent companies or individuals from investing in socially irresponsible ventures. In this case, an organization may be considered socially irresponsible because it violates environmental and safety policies among others (Greenwald et al., 2004, p. 21). Consequently, such firms experience a decline in their share prices. This forces the organizations to reform. A good time to invest in such organizations is when it becomes evident that the restructuring is progressing well.

In regard to size, the herd mentality determines investment into some entities. Generally, institutions do not make investment decisions. Rather, it is individuals – managers – who work for the organizations that decide the stocks to acquire. Normally, the institutional managers play safe. In other words, they purchase the stocks preferred by other organizational leaders. That is, they apply the principle of safety in numbers. A majority of the other managers make investments that are not risky to protect their jobs. In other words, the administrators sell the shares of companies that underperform and acquire the stocks of organization's that continuously increase their returns (Greenwald et al., 2004, p. 24). In this respect, one can see that the investors that rely on investment biases – the institutional managers– cannot engage in value investing. The entrepreneurs that engage in the venture need to know how to account for profits – capital gains.

## How Capital Gains are Taxed

The purchase and sale of stocks results in profits, also known as capital gains. Usually, the capital gains are taxable. Unfortunately, a significant number of online investors remain unaware of that fact because

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

they do not have tax consultants. Thus, to avoid breaching the law, such entrepreneurs need to know the tax classes that they fall in and the methods they can use to account for the profits they make.

The type of taxation applied on the capital gains depends on whether the returns are long-term or short-term. Generally, the tax rates for long-term capital gains are lower than the rates applied to the short-term profits; the specific laws that established that policy came into effect between 2009 and 2012 (Krantz, 2013, p. 72). For the long-term capital gains, if an individual's ordinary tax rate is higher than or equal to25%, then the utmost capital gains tax (CGT) rate that can be applied on the profits the person makes is 15%. Otherwise, a maximum capital gain rate of 0% is charged if the individual's income tax rate is below that figure. For the short-term gains, the CGT rates that apply are shown in Table 1 below.

Additionally, the capital gains may be realized or unrealized. For investors that have a taxable brokerage account, a taxable event occurs as a result of capital appreciation. Capital appreciation basically refers to a rise in share prices. For instance, if an online investor acquires shares for $20 and the price of the stocks later rises to $80, then the capital appreciation would be $60. By selling the shares, the entrepreneur would realize capital gains, which are taxable. However, if the investor holds on to the shares, the capital appreciation is referred to as unrealized capital gains, which are not taxable (Krantz, 2013, p. 68).

It is not enough to know the tax class that one falls in. The online investors need to offset and keep track of the capital gains to evade penalties. Offsetting capital gains means deducting capital losses from the long-term plus short-term profits that result from the sale of shares. Evidently, if the capital losses exceed the gains, the investor would have made a net loss and thus the taxes would not apply. In this respect, tracking down the capital gains is essential. That is, the online investor should take note of the dates when the shares were bought and sold (Krantz, 2013, p. 75).

Still, the entrepreneur needs to fulfill another requirement. The Internal Revenue Service (IRS) requires one to have a reporting mechanism for capital gains. In this case, the online investor has several alternatives. To begin with, the entrepreneur can use personal finance software. For instance, Intuit developed Quicken is an application that can generate capital gains worksheets. The software presents the required data in accordance with the tax preparation guideline (Krantz, 2013, p. 76). Optionally, the online investor can provide the required information by using the portfolio-tracking tool. This web-based application compiles all information required to compute taxes.

*Table 1. Income tax rates for short-term capital gains*

| Tax Rate | Married Filing Jointly or Qualified Widow(er) | Single | Head of Household | Married Filing Separately |
|---|---|---|---|---|
| **10%** | $0 - $18,150 | $0 - $9,075 | $0 - $12,950 | $0 - $9,075 |
| **15%** | $18,150 - $73,800 | $9,075 - $36,900 | $12,950 - $49,400 | $9,075 - $36,900 |
| **25%** | $73,800 - $148,850 | $36,900 - $89,350 | $49,400 - $127,550 | $36,900 - $74,425 |
| **28%** | $148,850 - $226,850 | $89,350 - $186,350 | $127,550 - $206,600 | $74,425 - $113,425 |
| **33%** | $226,850 - $405,100 | $186,350 - $405,100 | $206,600 - $405,100 | $113,425 - $202,550 |
| **35%** | $405,100 - $457,600 | $405,100 - $406,750 | $405,100 - $432,200 | $202,550 - $228,800 |
| **39.6%** | over $457,600 | over $406,750 | over $432,200 | over $228,800 |

Source: Bankrate, *What is your tax bracket?* Bankrate, 2014, Web, 16 Sept. 2014.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Another alternative is to utilize an online brokers' website. Such sites keep information on the dates transactions were conducted, reveal whether the gains were realized or not, and so on (Krantz, 2013, p. 77). At the end of year, the online brokerage may mail the data to the investor. The investors can then forward the records to the IRS. This is a new development. Initially, it was the duty of brokers to get such data for their clients.

There are more options. For instance, the online investors may use web-based calculator sites to compute the capital gains. In this case, the entrepreneur keys in data on the sale and purchase of stocks and then the site automatically determines the net capital losses and gains. The online investor then downloads the summarized data for use in filing returns. Finally, the investor can use a dedicated online site that optimizes tax strategies. For instance, GainsKeeper is one of the reputed web-based sites that provide services for reducing taxes. Generally, such sites suit active traders who can afford to pay for the cost of the services (Krantz, 2013, p. 77).

## How to Trade in Stocks Online

Online stock trading is another important subtopic of investing and stocks. This type of trade is to some extent similar to regular transactions that involve one walking into a shop, picking the required items, paying for them, and leaving. That is, the online traders select the shares they prefer and electronically transfer the sum required for the purchase. Once the money is received, the sale is reflected. However, online trading has some complications because the prices of stocks are set in real time (Krantz, 2013, p. 129). Thus, the online investors have to use the following options in trading through the internet.

Firstly, the entrepreneurs can trade their stocks online through market orders. In this case, they have to instruct their stock brokers to sell their stock. Normally, the brokers are requested to sell the shares at the highest price that a willing customer is ready to pay. As a result, such orders are quickly executed (Krantz, 2013, p. 129). Given that it is easy to find such willing buyers, the online investors pay a small commission for the brokers' services.

Secondly, stocks can be traded online through limit orders. In this case, the online investors are allowed to set the prices at which they are willing to purchase or accept the sale of stock (Schwartz, 2010, p. 156). For instance, consider an entrepreneur who owns 40 shares, each valued at $100. Suppose the price of the stocks is declining and hence the investor estimates that soon the value of a share will plunge to $70. In this case, the online investor can sell the shares in two ways. The first option is through the market order, which was discussed above. However, that may not give the best returns since the buyers may momentarily offer lower prices than the projected minimum. Optionally, the online investor could set the lowest selling price at $85 to minimize losses. Thus, so long as the decline proceeds as expected, the limit order is the preferable alternative. When the shares' price falls to $85 per unit, the broker will sell all stocks if possible. Limit orders are not based on price alone. Some investors give a deadline within which to sell the stocks (Krantz, 2013, p. 129).

Sometimes, one may not obtain the returns expected after the sale of shares through the limit orders. This is because the shares' price may decline so rapidly that the seller is unable to place the stocks on sale at the agreed price. In this case, the broker may only sell a restricted number of stocks. The rest of the shares are kept in the investor's portfolio. Thus, the limit orders provide a false sense of security.

Online investors can also use stop market orders to trade online. This type of order is similar to a limit order in that a minimum buying or selling price is set. However, for the stop market orders, when shares' price reaches the designated value, the orders are converted into market orders (Krantz, 2013, p.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

130). For instance, using the previous example, the broker may be instructed to execute a stop market order when the stocks' price reaches $85. In this case, if the value of shares suddenly plunges to $80 per unit, the online broker would still have to sell the shares at that price.

Fourthly, the shares can be traded through a stop limit order. This option is similar to a stop market order. However, once the defined price is exceeded, the stop limit order is converted into a limit order (Krantz, 2013, p. 130). Thus, the stop limit order prevents the sale of shares if the value of the stocks falls beneath the limit price. To elaborate further, still using the same example, suppose the activation price for selling stocks is $85 and the limit value is $75. When the shares' value falls below $85 per unit, the order becomes a limit order. Hence, when the price reaches $75, the broker is supposed to sell every available stock at that price (Krantz, 2013, p. 130). However, a further decline in price would result in no sale at all. That is, the remainder of stock is kept in the online investor's portfolio.

Lastly, the online stocks can be traded through a trailing stop. This type of order basically follows the market. For a favorable market, rising stock prices, the online investor instructs the broker to retain the shares until the value of the securities reaches a predetermined value. This order is referred to as a trailing sell stop. For a bearish market, the broker is expected to sell the shares as the stocks' price approaches a set minimum value (Pardo, 2008, p. 85). This order is known as an exit trailing stop. Thus, the online investors continuously search for positive yields during the stocks' transaction life.

## How to Trade in Options Online

Apart from stocks, options can also be traded online. An option is a financial instrument that gives one the right to sell or purchase a precise quantity of underlying stock at a prearranged price within a defined time period. The option seller is not legally obliged to carry out all the tasks stipulated in the contract when the financial instrument is handed over to a buyer. The online trading of options is done through screen-based or electronic methods. In the United States of America, there are several institutions – exchange companies – that specialize on options trading. They include the International Securities Exchange (ISE), Boston Options Exchange (BOX), and NASDAQ. The online trading of options has advantages as well as prerequisites that are worth discussing in details (Fontanills & Cawood, 2009, p.43). The online trading of options yields more benefits to the online investor than full-service or traditional brokerage. For example, for this type of trade, commission expenses are lower. That is, the traditional broker may charge $100 for a round turn, whereas an online brokerage charges only several dollars (Fontanills & Cawood, 2009, p. 45). In this case, a round turn refers to each deal or sale. Normally, a commission cost is charged on all orders. The charge applied varies depending on the service being offered. Also, the commission expenses decrease as the services offered to the investors increase. Another advantage of the online trading of options is that the online investors receive considerable support in terms of information as opposed to what happens in traditional brokerage. In other words, the entrepreneurs have access to applications that generate data on tax deductible costs and so on. However, the technique has some disadvantages. For instance, new traders need the services of online brokers that specialize in order-taking only. It is not easy to find such experts.

The online investors must fulfill other requirements to be able to successfully trade in options through the internet. Firstly, they need a computer, internet service provider, portfolio tracking tool, and an online brokerage account. Additionally, the investor should have knowledge on how to assess stocks. The valuation of shares is normally done through fundamental analysis of the equities. That is, the investor must review the targeted company's earnings, assets, changes in management, income statements, and so

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

on (Fontanills & Cawood, 2009, p. 64). If the analysis shows that the market value of the stock is lower than its real worth, demand for the equity increases. Conversely, if the market price of the organization's stocks is higher that its calculated true value, demand decreases.

Also, the online option traders need to assess the extent of competition among firms that operate in the sector. For instance, high-tech firms operate in extremely competitive environments, which means the organizations can only survive by continuously unveiling new products. This makes investing in the companies risky as projects often fail, which results in significant losses. In this regard, the active online traders should study such industries in depth to be able to forecast the success of the companies they intend to invest in (Fontanills & Cawood, 2009, p 55). In this case, the necessary information about these types of firms is readily available; the online investors can find the data in investment websites such as Optionetics.

Besides that, the options investor should consider the type of broker to employ. There are three categories of brokers namely: discount, options specialty, and full-service brokers. The full-service brokers charge relatively high fees. This is because they conduct research on annuities, bonds, stocks, and other long-term investment options. In other words, they give advice on the best options to trade. The discount brokers charge relatively low fees since they rarely give recommendations on investment options (Benklifa & Olmstead, 2013, p. 33). As the name suggest, the option specialty brokers particularly cater to the needs of the online option investors. That is, they give advice on competition and so on. However, the differences among the brokers in terms of services provided are gradually diminishing. This is because internet tools are slowly integrating the services provided by the brokers and hence, eventually, one broker will be able to provide all the services.

Fourthly, a trading platform is crucial. A trading platform is an application that provides option and stock quotes in real time. Thus, an effective one allows the investor to transact directly. In addition, a good platform displays several option exchange firms and bid or ask prices of the companies. Thus, independent online traders use the platforms to identify favorable exit and entry option prices (Benklifa & Olmstead, 2013, p. 56).

Therefore, to be a successful online trader of options, one must have sufficient knowledge on several subjects. Firstly, the investors should know the types of brokers that exist and the services they offer. A broker can be a full-time, option specialty, or discount broker. Secondly, the online options trader should be aware of the commissions charged by the different types of brokers. Thirdly, a trading platform that provides information on the targeted stocks' prices is required. Lastly, before trading in options online, the investor should analyze the concerned company. Given that several types of online investment options exist, it is important to understand how to use diversification to reduce the risk involved in selecting each.

## How to Use Diversification to Allocate your Online Investments

The online investors, those who own portfolios that contain stocks that are traded through the internet, are at risk of facing fluctuating returns. They can prevent severe losses caused by market volatility through diversification. Diversification means that the investors should acquire stocks in companies that operate in different industries and have operations worldwide. Additionally, the entrepreneur should buy a variety of assets from companies of different sizes and obtain investment advice from several sources. If that is done, the investors can be certain that a deep plunge in the price of particular shares will not destroy their portfolios (Sindell, 2005, p. 318).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Each of the diversification approaches has specific benefits. To begin with, assets include stocks, bonds, mutual funds, exchange trade funds, options, and other financial instruments. Buying a variety of the assets allows the investor to benefit from the unique characteristics of each. For instance, mutual funds are managed by experts. Secondly, the purchasing of shares of companies that operate in different sectors safeguards a portfolio from unfavorable policy changes and so on (Sindell, 2005, p. 318). Thirdly, the buying of stocks of companies that conduct their business globally protects one from the challenges created by the weakening of the currency of particular country. For instance, if the US dollar declines in value, worldwide investments may be more profitable. Also, by investing across the world, the online investors reduce the impact of natural disasters and so on. Lastly, investing in firms of different sizes enables the entrepreneurs to take advantage of steady growth, which is associated with large organizations, the quick growth of small institutions, and the consistent returns of medium-sized corporations.

The online investors have access to several sources of information on diversification. Particularly, web-based institutions offer excellent advice on the subject. For instance, Fidelity provides online worksheets that aid the investors to select different assets according to the risk associated with each (Sindell, 2005, p. 318). NETirement.com provides an online calculator for use in assessing the assets' risks based on preset average returns of the investments.

## CONCLUSION

Investing and stocks is a wide subject. It covers the Modern Portfolio Theory, which advocates for diversification of investments to minimize portfolio risk. Secondly, it includes computational investing that provides information on the models used to analyze data for effective decision-making. Also, it addresses opening an online brokerage account. The subject provides information on the use of the portfolio tracking tool, transaction costs involved in the establishment of the account, and so on. Additionally, by studying the chapter, learners discover the significance of the MSSP approach to investing. Besides that, the subtitle on mutual funds, bonds, options, and ETFs shows how pools of funds can be utilized to make investments. In Apart from that, value investing shows how underpriced stocks can become significant. The subtitle on how capital gains are taxed enables the online investors to know the types of taxes that are applied on returns that result from the trading of shares online and methods they can use to report the profits. The chapter gives learners an opportunity to learn about other aspects of online investing including the trading of stocks and options through the internet and diversification of online investments, which reduces risk.

## KEY TERMS AND DEFINITIONS

**Bonds:** A debt investment in which an investor loans money to an entity which borrows the funds for a specified period of time at a fixed interest rate.

**Mutual Funds:** An investment vehicle that is made up of funds from many investors with the objective of investing in stocks, bonds, money market products and similar assets.

**Online Trading:** Individual investors buy and sell stocks over an electronic network through a brokerage company.

**Portfolio Management:** Professional asset management of different securities to reach investment goals.

**Stocks:** Defines the ownership certificate of any company. A share means the stock certificate of a particular company.

**Value Investing:** The strategy of selecting stocks that trade for less than their intrinsic value.

# Chapter 3
# The Use of Technology in Organizations

**Jorge Ramirez**
*Tecnológico de Monterrey, EGADE Business School, Mexico*

## ABSTRACT

*Multinational Corporations (MNC) face the challenge of compete in the new interconnected business environment. In particular technology is recognized as a factor that boost productivity and competitiveness and drives the business connectivity which in turn involves cross-borders goods, services and financial flows. MNC is recognized as being possessed of high-tech assets, and also, resources including capital, management skills and R&D capabilities and subsidiaries can get them, from its holding company, and they transfer technology to local businesses. A knowledge transfer, running parallel to the technology transfer take place benefiting to the local economy. Foreign Direct Investment (FDI) is considered as the primary vehicle to facilitate technology transfer (and underlying knowledge flows) toward emerging countries. The ultimate goal of the MNC is related to leverage technology and knowledge transfer in order to maintain a competitive edge and move toward even higher value-added activities.*

## INTRODUCTION

Cemex, the world's third largest cement company, reached their size thanks to the use of a technique called "The Cemex Way", a corporate philosophy that allows the Mexican company to transfer and obtain the knowledge from an acquired foreign company. Originally designed as a computer system that allows Cemex CEO, Lorenzo Zambrano, to know in real time how the cement plants were performing, "The Cemex Way" today is one of the best examples of how a Multi National Corporation (MNC) can transfer technology using the Direct Foreign Investment (FDI) to create a competitive advantage based in knowledge to their subsidiaries along the world. Zambrano, as many others Multi National CEO's, learned the value of information in an interconnected world. A world in which the difference between a company based on a developed nation and a global leader based in a country like India, Mexico or

Brazil is not as clear as before. Technology has been part of the success, because thank to it, these organizations have been able to take advantage of the knowledge and innovation regardless of where they are located. (Stewart, 2015)

The knowledge can flow from the parent company to the subsidiary and from the subsidiary to the local companies or vice versa, leveraged by through Direct Foreign Investment (FDI) and technology, the mix will determine different scenarios that describe the way in which organizations create or absorb knowledge. The challenge for the MNCs will be decide which of these scenarios will has the potential to increase their productivity and innovation in line to find their own "Cemex Way".

In this chapter the use of technology in the Multinational Corporation (MNC) is addressed. An interconnected world is emerging and that circumstance implies an increase in worldwide goods, services and financial flows. Technology is well recognized as an enabler of these flows and the MNC faces the challenge to diffuse knowledge across borders taking advantage of the transfer of technology that takes place among headquarters and its subsidiaries. Governments of emerging economies recognize MNC as having superior technology so in recent years have changed their public policies to open the doors to foreign investment. FDI plays the principal role as the technology transfer facilitator. In this chapter the 3M case is presented in order to understand how the following factors; FDI, the factors driving productivity and competitiveness within a country and the country's particular stage of economic development are enablers of technology and knowledge transfer. Also this case helps to understand how using the matrix *Knowledge transfer based on technology and FDI*, helps to select what technology transfer strategy is appropriate to compete. A final section clarifies that MNC must not just use technology to compete, but to diffuse knowledge associated to those technology transfers in emerging countries.

## AN INTERCONNECTED WORLD

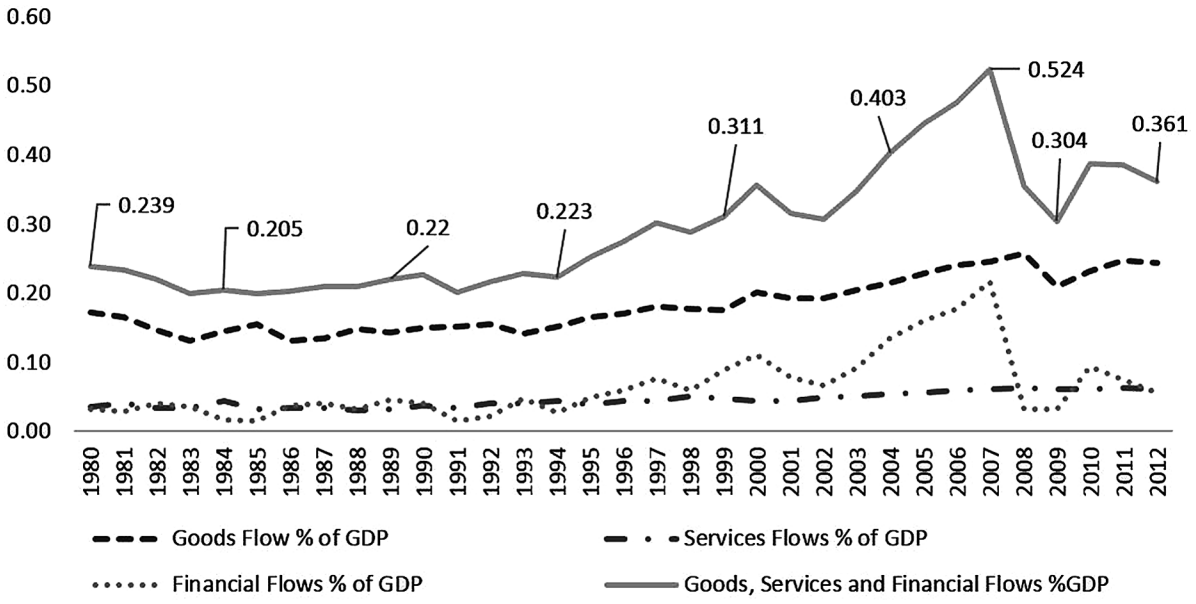
The rapid advances in technology and infrastructure (nowadays mainly cloud-based), coupled with the pervasiveness of the Internet have brought unexpected growth in ICT access and connectivity to the enterprises around the world, causing major changes in global business scenario. According to the Telecommunication Development Bureau, a business division belonging to International Telecommunication Union (2015), between 2000-2015 global Internet penetration grew 7 fold from 6.5% to 43%, meaning that globally 3.2 billion people are using the Internet and from those about 2 billion come from developing countries. Even though the rate of Internet penetration in emerging countries is increasing quickly (25% per year over 5% in developed countries), this is due to the still low Internet penetration in emerging countries (35% in most of the emerging countries against 70% on average in developed countries) (Nottebohm, et al., 2012).

The Mobile broadband is certainly the most dynamic market segment, reaching an overall 47% mobile penetration in 2015 (a value that increased 12 times since 2007). By end 2015, there are more than 7 billion mobile cellular subscriptions, corresponding to a penetration rate of 97%, up from 738 million in 2000, Mobile-broadband penetration levels for developing countries are around 39 active subscriptions per 100 inhabitants, however in the Americas it is one of the highest (77.6), ranking second globally (ITU, 2015), In developing countries global subscriptions increased from 53% in 2005 up to 73% by 2010, such that the development path taken by emerging countries is partly a result of the high levels of mobile phone adoption(Nottebohm, et al., 2012). Bock et al (2015), emphasized that this new business environment is deeply impacted by a whole new universe of connectivity "that's local (it's always

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

where you are), personal (tailored to your needs and preferences), social (all your friends are there as well)—and it's always on (Continuous access to information)" bringing about a shift towards an increasing mobile, flexible and interconnected business environment (Cisco, 2014). Multinational Corporations (MNC) – an entity evolved from its national origins to the state of having business activities in more than one country (Porter, 1980) (Kogut & Zander, 2003) – have been affected by this new interconnected business environment, due to the inherent nature of its operations requiring constant communication and information exchange among subsidiaries and parent (Aghina, De Smet, & Heywood, 2014). MNC compete using technologies exploiting this new interconnected business environment, enabling the rise of a new type of MNC that emerge not only in developed countries but have recently emerged from developing countries such as Brazil, India, China, South Africa and Mexico (Santiso, 2007). In some sectors these companies are global leaders beating corporations from developed countries. Examples include: Mittal (India), which in 2006 took control of its competitor Arcelor – headquartered in Europe – and due to this action, Mittal became the leader in the steel sector. Similar examples include: Cemex (Mexico) competing against Lafarge (France) and Holcim (Switzerland), Companhia Vale Do Rio Doce (Brazil) spearheading international rankings, along with the Anglo-Australian company BHP Billiton and the British-Australian company Rio Tinto Group. (de la Torre, Didier, & Pinat, 2014). Underlying the success of these companies is their ability to generate and utilize effectively technological resources (Manolopoulos, Dimitratos, Young, & Lioukas, 2009). The old-fashioned focus where the MNC only seeks profit maximization with different pricing strategies (Magee, 1981) has been evolving to include the dissemination of knowledge across borders where the company develops their activities, using its technology and organizational efficiency. With this productive knowledge, the company is seeking a competitive advantage (Kogut & Zander, 2003). Research pointed out that creation and exploitation of technology is one of the main reasons explaining the success and growth of MNC (Manolopoulos, Dimitratos, Young, & Lioukas, 2009) within a newly interconnected environment that forms a digital ecosystem (Dreischmeier, Close, & Trichet, 2015). Digital ecosystems is a network of companies, individual contributors, institutions, and customers that are interconnected and collaborate (Bock, Field, Zwillenberg, & Rogers, 2015) in the processes of the organization and encompasses different value-chains in different industries and countries in order to increase efficiency and innovation (Dreischmeier, Close, & Trichet, 2015), (World Economic Forum, 2015). Waterman, Peters, & Phillips (1980), established such ecosystems as a framework where structure, people (skills, staff, style and shared values) and processes (systems) perform work to produce specific products/services (Alter, 2013). In these so-called ecosystems, companies are no longer functional silos, they share information throughout the chain, integrating processes, people and technology among different businesses, industries and even countries. In this new interconnected world, emerging countries face a great challenge and several opportunities since the economies of developed countries are more connected than their counterparts in the emerging countries (McKinsey Global Institute, 2014).

Given both the growing business connectivity in emerging markets and the growing impact of mobile technologies, an increasing share of global economic activity involves cross-border flows. Today, 35% of cross-borders goods, up to 20% more than in 1990. In 2012, the combined value of trade in goods and services plus financial flows reached $ 26 trillion, equivalent to 36% of global GDP, compared to $ 5 billion, 23% of the world GDP in 1990 as shown in Figure 1. More than a third of all financial investments in the world are international transactions, and one fifth of Internet traffic is trans-boundary (McKinsey Global Institute, 2014).



EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Unquestionably, we live in an interconnected world where economies of developed countries remain more connected to these cross-border flows than emerging economies do, Germany tops the list while Hong Kong ranked second and the United States in third place; nevertheless, this situation is rapidly changing. By 1990, developed economies had 54% of all trade in goods, but in 2012 the flows fell to 28% due to the increased participation of emerging economies in world trade. Among the emerging economies increasingly connected to these flows of economic transactions are Brazil, China, India, Morocco and Saudi Arabia. As of 2014, emerging economies account for 40% of the goods flows. (McKinsey Global Institute, 2014)

## MULTINATIONAL COMPANIES AND TECHNOLOGY

Before 1980s, governments from developing countries considered that the MNC invested in their countries just to take advantage from laxer local environmental regulations, cheap labor force and to exploit the offer of relatively cheap natural resources. Regarding the technology that MNC was bringing to the host country, it was considered mostly obsolete and/or harmful for the environment (they could even be prohibited in their home country); thus, local governments imposed strict controls or even severe legal restrictions restricting the MNC activity. Nowadays, this situation has changed in many emerging countries, because it is now well recognized that MNC (especially in the most dynamic and knowledge-intensive sectors) have technological assets and knowledge that can help emerging countries to close the technological gap (Chudnovsky & Lopez, 2003). This point of view is extremely important because technology is an enduring good, which is used by modern organizations to compete; its importance is such that current views consider that the corporate resources must be dedicated to its creation, going after

*Figure 1. Worldwide goods, services and financial flows as percentage of the GDP, 1980-2012*
*Source: McKinsey Global Institute analysis, World Trade Organization.*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the final purpose of generating future benefits, i.e., the enterprise must become a *Technology Producing Company* (TPC) (Magee, 1981). In this point of view, technology is also regarded as a public good, which once created, can be used by other companies (or the same subsidiaries of the MNC). Some authors (Kogut & Zander, 2003), (Teece, 1977) argue that technology is not a public good because the estimated technology transfer cost, - i.e. the cost of sharing technology with other companies or subsidiaries of the MNC-, can vary from 2% up to 59% of total costs. These costs are derived from the coding and teaching of complex knowledge to the recipients; reason why these costs are reduced with each technology transfer and with the experience of the technology receptor. However while this situation does not involve reducing performance of the TPC, technology can be considered as a public good (Magee, 1981).

MNC are recognized as specialists in the generation of sophisticated technologies since yields are higher for these technologies than for simpler technologies; as a result, they require highly skilled labor in the creation and ownership of such sophisticated technology work. The abundance of this highly skilled labor in developed countries gives them a comparative advantage in the creation and exportation of new technologies. On the other hand, emerging countries need simple production processes and simple products. Moreover, the MNC can hardly provide the technology that is most useful to these countries, as simpler technologies are easier to copy than sophisticated technologies (Magee, 1981).

The presence of a dominant firm in the industry promotes R&D activities and investment in innovation because the appropriability costs are lower for these structures in the industry. Driffield, Love, & Yong (2014) report two direct effects of MNC's R&D activities, as shown in Table 1; (1) it contributes directly to innovation and knowledge creation; and (2) it forms the basis for the absorption capacity of technology from their subsidiaries.

Thus, the MNC is more efficient in the technology transfer through its own subsidiaries than through cross-border markets, this has been named "the appropriability problem" and is studied in detail within the appropriability theory of the Multinational Corporation that talks about creation and appropriation from the yields of the private inversions in the information market. Chudnovsky and Lopez (2003) consider that as a result of this appropriability problem, the subsidiaries of MNCs in emerging countries often have more advanced technologies and management practices than local businesses usually have; however, MNC occasionally makes the mistake of importing technologies and procedures without any kind of adaptation to the local conditions (Jaguli, Malek, & Palil, 2014); as a result, the local companies take the responsibility of fitting the standards, technologies and management problems of the country (Magee, 1981) with the risk of underestimating the time and resources needed to compete with these technologies globally (Baumgartner, Hatami, & Vander Ark, 2012). MNC should be able to understand the context of the emerging market in which it is located, find the best partners – the company gets greater benefits if it is integrated with key members of their local supply chains (Sanders, 2008)– and develop talent. Khanna (2014) refers to this as contextual intelligence: the ability to understand the limits of our knowledge and adapt that knowledge to a different environment from which it was developed.

*Table 1. Benefits arisen from MNC's R&D activities*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The degree to which emerging economies benefit from these tangible and intangible assets owned by multinationals, has become a key issue in the research and policy for social and economic development agenda (Chudnovsky & Lopez, 2003). Literature mentions three specific benefits; Firstly, MNC activities in emerging countries have the potential impact of increased competition in domestic markets, forcing local companies to improve their productivity through the optimization in the use of existing technologies or by adopting new technologies. Secondly, local companies can make use of superior technologies and management practices belonging to multinational companies through imitation or by hiring workers trained by multinational companies. Third, if the subsidiaries of the MNC develop innovation activities in emerging countries, they can generate improved human capital (Chudnovsky & Lopez, 2003), (Kogut & Zander, 2003). Technology transfer lies in the heart of the growth of MNC (Kogut & Zander, 2003), and this perspective is well-known by the governments of emerging countries, which is why according to the new perspective discussed at the beginning of this section, encourage multinationals to establish themselves locally and expect to generate technology transfer to the local businesses (Glass & Kamal, 1999). In general, the MNC brings these emerging countries not only technology, but also, its resources including capital, management skills and R&D capabilities (Jaguli, Malek, & Palil, 2014), as shown below in Table 2.

However, this model assumes that subsidiaries can get technology from its holding company, and they transfer technology – whether by accident or strategy – to local businesses. In practice, there is no guarantee that these conditions are fulfilled, as not all MNC employ cutting edge technology, nor all subsidiaries automatically have access to the technology from its parent (Driffield, Love, & Menghinello, 2010), or just that the parent is not willing to share this technology in order to prevent it from being transferred to third parties or imitated through reverse engineering. The latter is a real threat for MNC, so much that Glass & Kamal (1999) consider putting limitations to imitations is a valid strategy in order to protect the development of innovative products or process innovation. Despite these inherent risks and costs, transfer of technology represents a strategy used by MNC to gain local market share (Saldanha, Mello, Knemeyer, & Vijayaraghavan, 2015).

Local businesses can obtain technology from MNC generally through four forms:

1. Purchase of technology in contractual forms (patents, licenses, turnkey contracts, etc.)
2. Joint ventures between local firms and multinationals (including what has been termed ‘strategic partnerships’). Different studies (Luo & Wang, 2012), (Jaguli, Malek, & Palil, 2014) have shown that this relationship between MNC and local businesses is considered an appropriate channel for the technology transfer.

*Table 2. Benefits that a MNC gives to a country in which it operates*

| | |
|---|---|
| 1 | *Increase competition*. Local companies uses (or adopt) technology to increase competitiveness in order to beat MNCs and local competitors. |
| 2 | *Use of superior technology and processes*. Local companies copy superior technologies coming from MNC through imitation or hiring MNC’s workers. |
| 3 | *Improved human capital*. Local workers acquire the knowledge generated by MNC’s innovation activities. |
| 4 | *General resources.* Capital, management skills and R&D capabilities |

Source: Prepared by the author based on; Diffusion of environmentally friendly technologies by multinational corporations in developing countries, Chudnovsky & Lopez, 2003. Knowledge of the Firm and the Evolutionary Theory of the Multinational Corporation, Kogut & Zander, 2003 . and Do MNCS’ high quality and standard requirements matter? A channel for vertical spillovers., Kogut & Zander, 2003.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. Reverse engineering, by imitation, copy, etc. (without the consent of MNC).
4. Foreign direct investment (FDI). Considered one of the most important. Modern theory of Technology Transfer in MNC, measures the growth of the apparent productivity in the host economy, associated with foreign direct investment (Driffield, Love, & Menghinello, 2010), (Jaguli, Malek, & Palil, 2014).

The choice between these four forms of technology transfer depends mainly on:

- The overall strategy of the MNC
- Factors driving productivity and competitiveness in a country in combination with
- The country particular stage of economic development

This combination of factors determines whether there are local companies with endogenous innovation capacity (Chudnovsky & Lopez, 2003). Recent studies (Driffield, Love, & Yong, 2014) suggest that the technology transfer from the MNC is most effective when the subsidiaries are located in the same regional block as the headquarters. A very high proportion of the flow of goods in the world is made within one of the three main regional blocks: Europe, North America and Asia. Although as noted above, the growth of commodity flows in emerging blocks such as Asia and South America, has been increasing. It is estimated that in 2025, the annual revenue only for the concept of trans-border e-commerce could reach $250 billion and up to 350 billion dollars, against the current $80 million dollars. Asia will account for 40% of the trans-border income, while in North America will account for 20% and South America for 10%. (van Heel, Lukic, & Leeuwis, 2014). So far, the empirical work enables to infer the existence of a knowledge transfer running parallel to the technology transfer from a MNC with advanced technology to a subsidiary in a developing country (Driffield, Love, & Menghinello, 2010). The flow of technology transfer between the parent and the subsidiary where the four possible types of knowledge flow that can occur in an MNC are shown in the Table 3.

It may be observed from the Figure 2 that Quadrant 2 represents the standard situation where a multinational company operates its superior knowledge in an emerging country by transferring knowledge to their subsidiary(ies). Quadrant 3 represents the situation in which knowledge flows from the subsidiary(ies) to the parent company. In the latter situation, the subsidiary is not limited to the adaptation of technology, but it becomes an active technology developer, either because MNC has developed a local research center or merely due to their business strategy, the MNC has developed a "listening post" designed to source knowledge from the host country. Driffield, Love, & Menghinello (2010) describes it as " Placing the R&D near the principal research and innovation clusters enables the absorption of

*Table 3. Technology transfer flows*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

learning due to the geographical proximity to such sites. The research center gathers information about emerging country technology, in order to be transferred to the headquarters". It is a real challenge for the MNC go for a flow of knowledge different that the one presented in quadrant 2 because the company rarely commits resources for R&D outside their home country and little evidence has been found that the use of Information Technology (IT) contributes to decentralize the R&D activities in MNC; on the other hand, there seems to be tendency to centralize R&D using IT, just in their own home country or just in subsidiaries within developed countries, discouraging innovative activities from local firms and subsidiaries (Kumar, 1996).

The way in which knowledge flows in the matrix depends equally on the three reasons mentioned above (1) the overall strategy of MNC, (2) the factors driving productivity and competitiveness in a country in combination with (3) a country's particular stage of development. Particularly, technological readiness, workforce preparation and that the country finds itself in the innovation-driven stage (the final stage of economic development of a country) play an important role in the R&D of the local company to generate knowledge directly. Although being in quadrants 1 and 3 of the matrix may be an indicative of the country's technological development; one must be careful with this affirmation since this is also an indicative of privately owned knowledge which usually cannot flow to local businesses (Driffield, Love, & Menghinello, 2010).

Generally, MNC are recognized to have specific advantages with technology that enable them to overcome a potentially unfavorable position relative to domestic firms in foreign markets. Such benefits typically include the possession of information technology or knowledge of a process in which technology is involved, the management capacity, skilled labor in the use of technology, and their ability to perform R&D. However, MNC can also take from the host country's national companies their superior knowledge of local markets as well as consumer preferences and business practices because they possess superior intangible productive assets, a reputation, or even a greater technological knowledge than the MNC (Jaguli, Malek, & Palil, 2014). Moreover, although it is traditionally recognized that the multinational corporations have superior technology, literature (Driffield, Love, & Yong, 2014) reports models that are not based on the assumption that knowledge and/or technology flow only from the parent company to the subsidiary and subsequently to the domestic industry as a 'secondary' effect, but conversely the knowledge or technology flows to the MNC from the national companies, which is known as "reverse spillovers".

The reverse flow occurs when a host country has a significant presence of Multinational Enterprises who have chosen the country for its superior knowledge in technology. In these conditions it is reasonable to expect that the "reverse spillovers" arise either among local companies and national subsidiaries of the MNC or between domestic and foreign MNC subsidiaries (Driffield, Love, & Yong, 2014). Nevertheless, evidence of such "reverse spillovers" in emerging countries remains inconclusive although there have been documented cases of technology transfer and learning between MNCs and their suppliers and subcontractors in emerging countries, these studies rarely reveal that multinational was able to extract all the benefits from new technology generated among their suppliers. Additionally, there is no clear evidence of side effects, such as the use of MNC's employee skills at local companies (Chudnovsky & Lopez, 2003). However, it would be rash to consider that these inverse flows occur only among developed countries. Research on "reverse spillovers" in emerging countries is still a research subject currently in development; for instance, (Luo & Wang, 2012) report the presence of these "reverse spillovers" in regions of China where no sophisticated technology or R&D centers are found.

## ACCESS TO TECHNOLOGY THROUGH DIRECT FOREIGN INVESTMENT

If the technology was developed in the emerging country is an irrelevant issue, because the real issue is that companies operating within the country should have access to this technology and the ability to absorb and use it. In this sense, it is widely recognized that foreign direct investment (FDI) is considered as the main vehicle to facilitate technology flows toward emerging countries (Glass & Kamal, 1999), (Jaguli, Malek, & Palil, 2014). Foreign direct investment is the transfer of an intermediate good, which accounts the competitive advantage of a company that may well be either the knowledge that underlies the technology or superior management activities (Kogut & Zander, 2003). Nowadays, most emerging countries look favorably foreign direct investment as a part of a more open and favorable government policy towards international market businesses (Chudnovsky & Lopez, 2003). This policy change is reflected in the growing number of bilateral trade agreements that have been recently negotiated. Certainly, there are many elements that may help explain why a developing country can be interested in attracting foreign direct investment – it is recognized that FDI is multifactorial; therefore, the implications for the local industry can be equally diverse (Driffield, Love, & Yong, 2014)–; nonetheless, technology/ knowledge transfer is one of the dominant factors, among several others (Glass & Kamal, 1999), due to the belief that the main advantage of a business takes to foreign markets is its possession of superior knowledge (Kogut & Zander, 2003). The first theory that examined the effects of FDI was the theory of industrial organization (Hymer, 1976). This theory analyzes how FDI affects local businesses in a country. Theoretically, the arguments suggest that FDI can generate positive *spillovers* to local firms through knowledge and technologies. *Spillovers* are defined as the indirect effects in the productivity that occur in domestic firms as a result of transfer intangible assets to the affiliate (Sinani & Meyer, 2004). It is noteworthy that FDI is an important external source for the dissemination of knowledge and thereby promotes competition in the local industry because usually when the MNC invests in a foreign country, it often takes leading and patented technology as well as advanced production skills to successfully compete with local businesses, and these are the comparative advantages that can be transferred to local businesses (Jaguli, Malek, & Palil, 2014).

### Case Study[1]: High Technology Markets and Emerging Economies

Minnesota Mining and Manufacturing Co. was founded in 1902 pursuing the goal to extract the mineral corundum from a mine called Crystal Bay at Minnesota. Swiftly the company turned to other materials and other products and nowadays 3M employs 88,000 people worldwide and produces more than 60,000 products. By 2013 3M topped $31.8 billion in sales around the world (international sales $20.1 billion accounts 63% company's total sales), 86 national subsidiaries and 70 international affiliates (3M company information, 2015). Due to 3M Company's policies, several of these affiliates are based on countries classified as emerging economies. Different criteria as those from International Monetary Fund, BRICs+, N-11 (Next eleven), FTSE Group and Russell Investments list China as a country that has some characteristics of a developed market, but does not meet standards to be a developed market. Notwithstanding that, due to its high growing rates, China may be classified as a developed country in the near future.

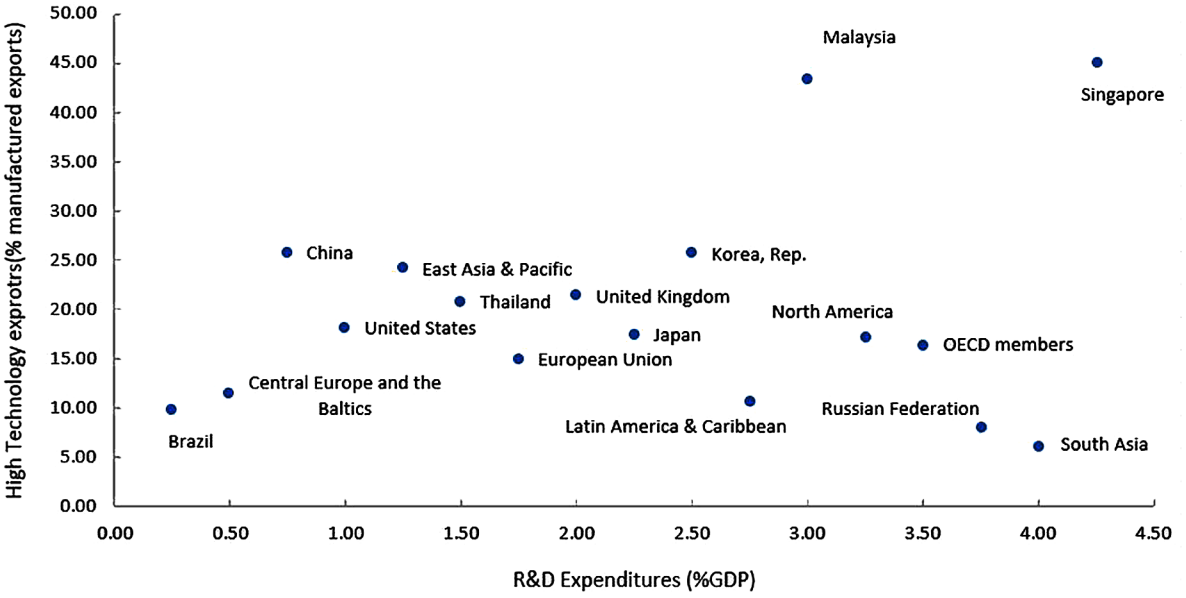
Since 1984 3M started to set up operations in China and has grown to a $3 billion business, (about 10% of 3M's global business just below $9.5 billion from USA). The company's China R&D center is already the largest one 3M has outside the US and since September 2013 is as a separate business-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

region; *the greater China region* (China, Hong Kong, Taiwan and Mongolia form the new area known as the Greater China region). 3M subsidiaries are basically local organizations and *greater China region* has 33 or 35 big business units from a division standpoint. All are managed on a local basis, because as Francis Hu, COO of 3M China says "With only a couple of exceptions, virtually all in the management team are local. Localization doesn't only mean people", in product development subsidiary is leveraged by technology/knowledge transferred by headquarters, "but the aim is always local products. From a strategy standpoint, we want to be very local". Business environment is changing rapidly in China, Hu saw the need to reallocate resources to the fast growing water purification business, growing it from RMB 6 million to RMB 25 million in two years. Another fast growing business areas in China, are; automotive (Great Wall Motors, a Chinese auto company is doing well in this sector), security and medicine. 3M China faces serious threats from competition, Hu argue at this point "the improvement of the local companies was surprising to us. So you think about having two groups: the foreign company trying to be local; the local company is trying to be high-tech or move up in the portfolio. I think the (local) group is doing better than the (foreign) group".

The concept of competitiveness has been commonly applied to two levels of analysis, the enterprise level and the national level. The general definition of competitiveness refers to the advantage (or the disadvantage) of the products or services of an organization or a country in the international markets (Hult, 2012). It is considered that competitiveness in high technology markets is closely related to the absorption and creation of technology capabilities of the company as well as various factors such as level of infrastructure of the company/industry and skilled labor, among others. From this perspective, *how 3M in China compete in the high-tech market*? *What technology transfer strategy is appropriate to select in order to make the company competitive in high-technology markets*?

*How companies in emerging countries compete in the high-tech market*? Empirical evidence shows illustrative cases such as South Korea and Taiwan where companies received strong government support to transfer technology to their national companies during their industrialization process, as well as cases like Malaysia and Thailand who chose to become exporters of high-tech components based on their cheap and highly skilled labor force. A more illustrative example is found in India where technology was adapted for local consumption and in turn generated an industry in the area of computer software. Some countries have developed their own technologies such as Brazil (aviation, electronics and computers), India (software) and Malaysia (electronics). In some cases, the strategy should evolve as the environment changes. An example of this is the case of the automotive components industry in India, which at first started with foreign companies either working collaboratively or as joint ventures and later evolved to integrate themselves into the global industry value chain with the ultimate goal of succeeding in the creation of their own knowledge.



The chance for emerging countries to compete in high-tech markets depends on the factors driving productivity and competitiveness within a country and are in turn influenced by the country's particular stage of economic development (mentioned earlier). Particularly relevant are; the absorptive capacity of technology and FDI as enablers of technology and knowledge transfer, and that the country is in the innovation-driven stage (or as a minimum the MNC has a R&D center in the host country). It is noteworthy that a positive correlation was found between investment in R&D and high-tech exports of a country (Alvarez & Marin, 2013) as shown in Figure 2.

This begs the question *what technology transfer strategy is appropriate select in order to make the company competitive in high-tech markets*?

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 2. R&D expenditures vs. High technology exports*
*Source: The World Bank IBRD-IDA*

To answer this question an adjustment was made to the array *of knowledge flow resulting from the technology transfer* involving internal and external factors in technology transfer. Two factors should be considered:

- The technological capacity of the company that involves at least two levels; creation and absorption technology. This factor represents the innovation level at the company and accounts for internal factor.
- The FDI as an external factor to exploit a competitive advantage. Similarly it involves two levels; inward and outward flows. It represents the role of MNC.

The combination of these two positions of internal and external factors define selection strategies of knowledge transfer based on technology and FDI as shown in the following Table 4:

In the matrix there are two quadrants of interest for emerging economies namely CI and AO. Quadrant CI encompasses those countries with sufficient innovation capability to create technology and have inward FDI to the country. The relationship between MNC and innovation in the company usually generates involuntary *spillovers* by transferring technology to other local companies. In this situation local businesses may have a learning experience as a result of the *spillover* effect.

Additionally, quadrant AO represents those economies that break into international markets through outward FDI, despite these economies usually have a delay in developing technology compared with developed countries. Learning abroad would be the most relevant process in this quadrant.

The central idea for emerging economies lies in the determination of the transit possibilities to the more dynamic quadrants, moving from AO to CI and to CI to CO; for example, it is remarkable how during 1960-1990 period, the so-called Asian Tigers, Singapore, Hong Kong, Taiwan and Korea were

able to leap from quadrant AI to quadrant CO, going through significant increases in FDI flows and achieving high rates of growth and industrialization.

According to Hu, 3M China plans to face threats in the high-tech market using the so called location management strategy, which consists of (1) taking advantage from government drive-innovation policies; as far as China in in the innovation-driven stage (2) being local, (3) putting more resources into technology and R&D; 3M china is updating from quadrant AO to quadrant CO "(We) have to start to think of the alignment with many local companies: customers and suppliers; trying to become part of them … from a manufacturing standpoint, we're going to move over to the west, reason is not cost because 3M is not a low-cost manufacturer … the government is promoting investment, promoting (the) industrialization of those regions so we follow our customers" pointed Hu.

There is substantial evidence to say that technology transfer flows (and underlying knowledge) are a motive for FDI in a country (Guillén & García-Canal, 2011). In MNC, the knowledge transfer usually moves from the headquarters based in a developed country toward a subsidiary based in an emerging country. However, it can also occur as a trans-boundary flow from a developed country with low R&D capacity or like a reverse flow from subsidiaries in the host country to developed countries or else as reverse spillovers.

## KNOWLEDGE: THE FINAL QUEST

MNCs have left the old approach based on the market scavenging and the hunt for resources, moving toward a modern vision of efficiency and pursuit of knowledge (Dunning, 2006) where FDI is done not only to exploit the technology in the emerging country where it is taken, but to achieve a technology transfer that implies a transfer of knowledge that is used as a competitive advantage in the local economy or even at their home country (Driffield, Love, & Yong, 2014). Thus, MNC is proven to be an efficient (and effective) way to create and transfer knowledge across borders and the FDI is performed to achieve the transfer of an intermediate good called knowledge, which embodies the advantages of a company, either as knowledge underlying technology, production processes or other management activities in the company, (Kogut & Zander, 2003). Caves (1971) was the first one to establish this relationship when he pointed out that "the company producing a differentiated product controls knowledge about serving the market that can be transferred to other national markets for this product at little or no cost." Alvarez and

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Marin (2013) further added the condition that "this market is imperfect." However, the cost of the flow condition should be analyzed carefully. As noted in the previous section, technology is a public good and the underlying knowledge has the property of being likewise a public good (Buckley & Casson, 1976), i.e. that can be transferred to a marginal cost zero, so that is easily transferred and difficult to protect. Glass and Kamal (1999) point out that MNC's workers can disseminate their knowledge to local businesses when they change employers, so the MNC should pay a premium wage to avoid leakage of its workers to local businesses. This policy usually does not favor local workers who do not earn this bonus. However, Teece (1977) argues, that the transfer cost is not close to zero (or zero) in all cases; actually, in his research he states that the characteristics of knowledge itself determine the costs and the transfer mode. These characteristics, understood as tacit knowledge and implicit knowledge, are extremely relevant in the context of technology transfer. The information is often delivered through documents that describe the necessary procedures for the use of technology. This information is structured and can be stored (explicit knowledge), but in many cases technology involves factors that are not possible to structure; for example, the knowledge that the engineers and workers who work in the foreign subsidiary of MNC possess (tacit knowledge). Companies create knowledge (tacit and implicit) and use it to produce technologies and successful products (Ichii, Hattori, & Michael, 2012).The main determinants of transfer costs are the degree of previous experience with technology transfer, the country's particular stage of economic development, and the number of companies using similar technologies. These variables capture the direct experience with the transfer of technology, the understanding of its use over time, and the common knowledge of its properties (Dhanaraj, Lyles, Steensma, & Tihanyi, 2004); thus, they represent approximate measures of tacit knowledge transfer. Kogut and Zander (2003) indicate that somehow, the MNC specializes in internal transfer of tacit knowledge. Seen from an "absolutist about coding position," this tacit knowledge can be codified, but the costs of doing so are higher (Ancori, Bureth, & Cohendet, 2000) than the oldest technologies or simple technologies that are often better coded, so they are less costly to transfer. The less easily to be codified and more difficult it turns out to teach the technology, the more likely the transfer is going to be more expensive. This result implies that the choice of transfer mode is determined by the efficiency of the multinational firm in transferring knowledge in relation with other companies, and not to relative to an abstract transaction market (Kogut & Zander, 2003). The activities of FDI and the creation/assimilation of technology enable the MNC to specialize in the transfer and recombination of knowledge. One effect reported by Sjöholm (1999) derived from these transfers is that knowledge, unintentionally overflows (*Spillover*) horizontally or vertically to local businesses. Furthermore, there is empirical evidence that shows examples of these spillovers in emerging countries such as shown by Schoors & Bartoldus (2001) in Hungary; Lopez-Cordova (2003) in Mexico; and Javorcik (2008)in Lithuania. Javorcik himself notes that these *spillovers* are more likely to occur vertically as EMC can benefit from the improved performance of its suppliers. This improvement of local companies supplying EMC leads to the production of a greater variety of intermediate goods, which enables the emerging economy gain a comparative advantage in producing more sophisticated end products (Jaguli, Malek, & Palil, 2014). This situation is illustrated in the modified matrix of knowledge flow resulting from the technology transfer between the parent, and the subsidiaries with the inclusion of spillovers and local businesses as shown below in Table 5.

The top row describes knowledge flows from the headquarters of the MNC to its foreign subsidiary. This flow can generate spillovers to local firms (quadrant 1) or not (quadrant 2). In both cases there is utilization of the knowledge, but in the second case, this does not represent an advantage for the emerging economy. Quadrant 3 represents a special situation, where despite the absence of knowledge

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 5. Technology Transfer flows Parent/Subsidiaries/Local companies*

| | | Transference from subsidiary to local companies | |
|---|---|---|---|
| | | **Yes** | **No** |
| Transference from parent to Subsidiary | **Yes** | (1) Harnessing knowledge with spillovers | (2) Harnessing knowledge without Spillovers |
| | **No** | (3) Only Spillovers from subsidiary | (4) No knowledge transfer or Spillovers |

Adapted from (Driffield, Love, & Menghinello, The Multinational Enterprise as a Source of International Knowledge Flows: Direct Evidence from Italy, 2010)

transfer from the parent to the subsidiary, the latter is able to provide knowledge generated internally (in an intentional or accidental way) to local businesses. Quadrant 4 is the situation where there is no flow of knowledge in any way. This last situation can happen when a government policy, to avoid losing a competitive advantage, or other factors limit the cross-border knowledge flow.

A MNC in an emerging country must compete based on its superior technology and knowledge. This implies that the company has the ability to generate and transfer tacit knowledge that is difficult to imitate. Thus, the MNC must take care not only of the competitiveness of other companies and market demand, but the degree to which its advantage cannot be replicated by competitors or at least it cannot be replicated more quickly through imitation by its competitors.

Evidence from literature demonstrates the importance of technology, or expressed in a better way, knowledge flows (flows underlying technology) represent for the MNC. There are many activities derived from the ideas displayed in this chapter that MNC can be implement in its relations between parent, subsidiary and local companies (including, but not limited to improving the quality of local product suppliers, supporting local suppliers to meet international quality standards) that are not covered here, but it is left to the reader go deepen their study.

## THE CHALLENGES FOR MNC

Technology has been the basis of many productivity increases in the enterprise. Emerging countries can improve their productivity not merely by adapting exogenous technologies transferred from parent MNC but taking advantage from underlying knowledge at the technology transfer in cross-borders flows. Knowledge is particularly important for emerging economies as they approach the innovation-stage. In the long run, MNC competitiveness can be largely enhanced by technological innovation. Innovation is therefore the ultimate goal of a MNC. In the end, it is not the objective to adapt or even create technology, and certainly, it is not about being provided by the parent or home country knowledge. In the broadest sense, the real challenge for MNC is related to apply knowledge to maintain a competitive edge and move toward even higher value-added activities.

As mentioned earlier, through the location of subsidiaries in technologically advanced regions, MNCs can gain access to knowledge embedded in the region. These subsidiaries gain access to knowledge from two distinct contexts; (1) the MNC headquarters and the other subsidiaries; and (2) an external environment of regional or host country firms (Almeida & Phene, 2004). A research carried out by Phene & Almeida (2008) suggests that subsidiaries absorb significant knowledge from home country firms and from firms in other countries, with a more limited access to the production of knowledge. Nevertheless,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

host country knowledge is critical to the scale and quality of innovation while the knowledge absorbed from other subsidiaries and the parent company within the MNC does not lead to increased innovation. However, recent literature (Cowden & Alhorr, 2013), (Mahajan, 2014) offers strong evidence to consider that more disruptive innovation will be discovered through the firm's internal network rather than through an open networks. Specifically, research indicates that the most disruptive innovations will be discovered in subsidiaries that pursue local market initiatives in emerging markets than in the headquarters at their home country.

While MNCs traditionally dominate high-end markets in many industry segments, there is a strong competition at the lower-end and middle markets, and an increasing number of companies are becoming innovative and can often compete fairly aggressively at high-end markets; thus, innovation has become absolutely critical to the long term success of MNCs. Since MNC subsidiaries play a limited role in MNC innovation, emerging economies (especially those that are not in the innovation-stage) face the challenge to harvest the power of innovation Min Zhou & Patrick Berbon (2012) refer three best practices to meet this challenge; (1) Create an ecosystem that encourages ingenious innovation, which consists of supportive government policies, foreign-educated returnees and a vibrant venture capital system, (2) Product/Service customization; consumers are increasingly more demanding of products that are tailored to their unique tastes and habits, and (3) Developing new technologies and business models rooted in very practical approaches to the market. As far as the key role of innovation as a driver of economic growth and well-being is widely recognized, MNC needs educated and strongly motivated people in order to build an innovation-driven enterprise. Workers with advanced degrees are an essential resource for innovation. MNC should not only consider the importance of FDI, knowledge transfer and an innovation-driven approach, but going beyond and setting up the right environment in place that will nurture, promote, and enable the human factor (Dutta, Lanvin, & Wunsch-Vincent, 2014). The need to understand the role that the human factor along with technology/FDI and FDI plays a critical role in innovation, so the MNC is able to compete in the interconnected world.

## KEY TERMS AND DEFINITIONS

**Emerging Countries:** Are low-income, rapid growth countries using economic liberalization as their primary engine of growth. They satisfy two criteria; a rapid pace of economic development, and government policies favoring economic liberalization and the adoption of a free-market system (Hoskisson, Eden, Ming Lau, & Wright, 2000).

**Foreign Direct Investment (FDI):** Is an investment made by a multinational corporation MNC or entity based in one country, into a company or entity based in another country for which the foreign investor has control (owning 10% or more of the business) over the company purchased. (Duce, 2003). FDI comes in three types: Horizontal: where the company carries out the same activities abroad as at home, Vertical: when different stages of activities are added abroad and Conglomerate: where an unrelated business is added abroad. This is the most unusual form of FDI as it involves attempting to overcome two barriers simultaneously - entering a foreign country and a new industry. FDI can take the form of greenfield entry that implies assembling all the elements from scratch or takeover that is often covered by the term 'mergers and acquisitions' (M&As) but internationally, mergers are vanishingly small, accounting for less than 1 per cent of all foreign acquisitions. (Financial Times, 2016). Literature (OECD, 2013)shows that FDI creates direct, stable and long-lasting links between economies. Inward foreign direct investment (FDI) will serve as a channel for knowledge and technology transfer to the host country (Hallin & Holmström Lind, 2012).

**Innovation:** For this chapter, the author takes the Innovation definition from Czarnitzki and Kraft (2011): Innovation is the efficient use of the scarce resource knowledge. Knowledge in turn is the result of a firm's own R&D or information spillovers from outside. Information spillover possibly result i.e. from research activities conducted by research institutions, suppliers or customers but the most important source is perhaps information from competing companies.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Knowledge Transfer:** Knowledge is composed of know-how and skills that reflect a firm's capacity to deploy resources to bring into effect a desired end (Leszczyńska & Pruchnicki, 2003), and exist two dimensions of knowledge in organizations: explicit and tacit. (Nonaka, 1994). Knowledge transfer includes mostly transfer of tacit knowledge such as knowhow, management, and technical skills so they ensure learning of new information, technical and organizational skills and it is quite different from technology transfer which involves rather the transfer of capital goods such as machinery and equipment. In a new perspective Kogurt and Zander (2003) indicated Firms are social communities that specialize in the creation and internal transfer of knowledge, which helps to achieve firm's superior productivity (Driffield, Love and Menghinello, 2010).

**Multinational Corporation MNC:** The multinational corporation is defined in some sense arbitrarily by where frontiers are drawn, however a generally accepted definition is " a business enterprise comprising entities in two or more countries linked by ownership or significant control which enables decision making permitting coherent policies and a common strategy across national boundaries" (Winston, 2011). A firm becomes a multinational "when the same knowledge is exploited at several different locations, involving several different countries", thus, an MNC may be viewed as a complex pattern of interdependent activities, linked by knowledge flows and intermediate products. (Hoskisson, Eden, Ming Lau, & Wright, 2000).

**Spillovers:** Traditionally, the multinational corporation (MNC) is ascribed superior technologies and management skills that allow it to compete successfully against local firms however when MNC introduce superior technology, that will "spill over" to local firms. This unintentional transfer of knowledge, are widely believed to benefit firms in the host country, resulting in, e.g., productivity growth among domestic firms (Hallin & Holmström Lind, 2012), moreover there is a positive relationship between intentional knowledge diffusion and unintentional knowledge spillovers. In econometric literature Spillovers effects are events in one context that occur because of something else in a seemingly unrelated context (Wikipedia contributors, 2015). Technological knowledge spillover is the phenomenon by which a group of geographically proximate MNC' inventory of self-generated technological knowledge leaks out to MNC subsidiaries or other member firms within a cluster (Tsai-Ju, 2015) and are defined as the indirect effects in the productivity that occur in domestic firms as a result of transfer intangible assets to the affiliate (Sinani & Meyer, 2004).

**Technology Flows:** As Manyika et al (2014) stated: "Global flows have been a common thread extending through the mercantilist and colonial eras, from trade routes of old such as the renowned Silk Road through the industrial revolutions that swept across Europe and North America in the 18th and 19th centuries to the more recent rise of emerging economies." But today the web of cross-border Goods, services and financial exchanges has exploded in scope and complexity. Goods and services and financial flows are the sum of imports and exports of goods and services for each country; and financial flows are the inflows and outflows of foreign direct investment, equity and bond flows, and cross-border lending and deposits. Underlying these are technology supporting the mentioned flows and a cross-border technology flow is undertaken in parallel to the Goods and Services flows. Technology flows refer to the average of technological payments and receipts. Trade in technology comprises four main categories: transfer of techniques (through patents and licenses, disclosure of know-how); transfer (sale, licensing, franchising) of designs, trademarks and patterns; services with a technical content, -including technical and engineering studies as well as technical assistance; industrial R&D. (OECD, 2011).

# Chapter 4
# The Role of Governance on Outward Foreign Direct Investment in Emerging Market Economies

**Adem Gök**
*Kırklareli University, Turkey*

## ABSTRACT

*Emerging market economies have clear deficit in governance infrastructure and also have an increasing trend in the amount of foreign direct investment (FDI) outflows compared with advanced countries. Hence the main issue of the study is to identify the determinants leading to the increase in FDI outflows with special emphasize given to the role of governance infrastructure. Thus, the aim of the study is to analyze the effect of governance infrastructure together with other control variables on FDI outflows in emerging market economies. It is found that improvement in all measured aspects of governance infrastructure leads to increase in FDI outflows from emerging market economies and governance infrastructure, human capital and physical infrastructure are base factors for MNCs taking outward FDI decision from emerging market economies. It is also found that FDI outflows from emerging market economies are not market or efficiency seeking; instead they are resource, labor or finance seeking.*

## INTRODUCTION

There are several benefits that the home countries derive from outward FDI. First, and most distinctive, is that the stream of income, mainly in the form of repatriated profits, from foreign earnings through affiliates in host countries. Second, it creates employment and contributes to growth in home country if outward FDI complements home country production as such as affiliates in host country import intermediate products or inputs from the parent company in home country. Third, MNCs may learn new skills and technics from exposure to host countries through outward FDI. (Nourbakhshian et.al., 2012; Behbehani and Al Hallaq, 2013), Fourth, outward FDI allows MNCs to explore new global markets, to

generate higher profits and incomes through the production and sales in host country markets (Bukari, 2016). Fifth, efficiently utilized and managed abundant natural resources in host countries decrease costs and increase the price competency of MNCs (Bukari, 2016). Finally, affiliates in host countries generally use production techniques that are developed and patented in home country R&D base; hence it is another stream of income for home country.

Governance infrastructure of a country may affect outward FDI in two ways. First, and most distinctive, is the positive impact of quality of governance on outward FDI both in the short and long run. The effect of governance on FDI is through the effect of institutions on investment environment of a country and through the decreasing transaction costs, production costs and uncertainty (Bellos and Subasat, 2012). Second effect is the negative short run effect of governance infrastructure on outward FDI mainly referred as escape response of outward FDI due to low quality of governance in home countries (Klimek, 2015; Witt and Lewin, 2007).

The main issue of the study is to identify the determinants leading to the increase in FDI outflows with special emphasize given to the role of governance infrastructure. Thus, the aim of the study is to analyze the effect of governance infrastructure together with other control variables on FDI outflows in emerging market economies.

The study claims that governance infrastructure as a base factor has positive significant effect on outward FDI in contrast to studies maintaining escape response argument. Hence, the study builds a new theoretical perspective for the outward FDI before delving into the empirical analysis.

Next section presents background for the study. A new theoretical perspective for FDI theory is developed in third section. Fourth section explains how governance is measured in thesis. Fifth section presents data, variables and methodology used in thesis. Statistical analysis is carried out in sixth section. Seventh section presents empirical analysis. Last section provides concluding remarks.

## BACKGROUND

There are numerous studies in the literature that have concentrated on the role of governance on inward FDI. The studies examining the role of governance on outward FDI or considering governance as a determinant of outward FDI are limited (Globerman et. al., 2006; Witt and Lewin, 2007; Kayam, 2009; Das, 2013; Subasat and Bellos, 2013; Klimek, 2015). Also, there are other studies in the literature analyzing the effect of host country governance on outward FDI of home countries such as Mishra and Daly (2007). This type of studies is not included in the empirical survey.

Globerman et. al. (2006) found statistically significant positive effect of governance on outward FDI in both emerging and transition European economies and emerging markets for the period 1995-2001. They used principal component analysis of six main WGI governance variables as a proxy for overall governance performance of the countries. They had only three-year data for each governance indicator, hence they extrapolated them which may lead to biased results since 57% of governance data were extrapolated.

Witt and Lewin (2007) argued that outward FDI is an escape response from perceived misalignments between firms' needs and home country institutional environment in advanced industrialized nations in the context of societal coordination. The main drawback of their study is that the conclusion they reached does not base on an empirical analysis. Instead they reviewed the literature on IB without even employing meta-analysis based on the selected studies.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Although Kayam (2009) concluded that improvement in government stability, investment profile and bureaucracy quality decreases outward FDI as an escape response, her estimation results do not support. In total of sixty five developing and transition economies in four regional clusters for the period 2000-2006, bureaucracy quality has no statistically significant effect on outward FDI in any cluster, investment profile has statistically significant negative effect on outward FDI only in two regions and finally government stability has statistically significant negative effect on outward FDI only in one region. Hence only three out of twelve regression supports her conclusion.

Das (2013) found that increase in home country political risk leads to increase in outward FDI as an escape response in his analysis of fifty-six developing economies for the period 1996-2010 with panel random effect estimation technique.

In a bilateral panel regression analysis, Subasat and Bellos (2013) found that high corruption, improvement in bureaucratic quality and democratic accountability in home countries leads to increase in outward FDI directed to fifteen Latin American countries for the period 1980-1996.

Klimek (2015) found that deterioration of governance in home countries increases outward FDI in developing countries for the period 1996-2010.

All studies above except Witt and Lewin (2007) used fixed or random effect panel regression technique, hence they all have endogeneity problem resulting from reverse causality problem or multicollinearity issue between governance variables and control variables used in the regression. Also, the studies analyzing developing countries include least developed countries leading to biased results for the analysis since the governance infrastructure in least developed countries are totally different from developing countries and takes the lowest values compared to all countries.

## MAIN FOCUS OF THE STUDY AND PROBLEMS ENCOUNTERED

Emerging market economies have clear deficit in governance infrastructure and also have an increasing trend in the amount of foreign direct investment (FDI) outflows compared with advanced countries. The main issue of the study is to identify the determinants leading to the increase in FDI outflows with special emphasize given to the role of governance infrastructure. Thus, the aim of the study is to analyze the effect of governance infrastructure together with other control variables on FDI outflows in emerging market economies. The study claims that governance infrastructure as a base factor has positive significant effect on outward FDI in contrast to studies maintaining escape response argument. Hence, the study builds a new theoretical perspective for the outward FDI before delving into the empirical analysis.

There are numerous studies in the literature that have concentrated on the role of governance on inward FDI. The studies examining the role of governance on outward FDI or considering governance as a determinant of outward FDI are limited.

This limited literature analyzing the role of governance on outward FDI has following drawbacks as;

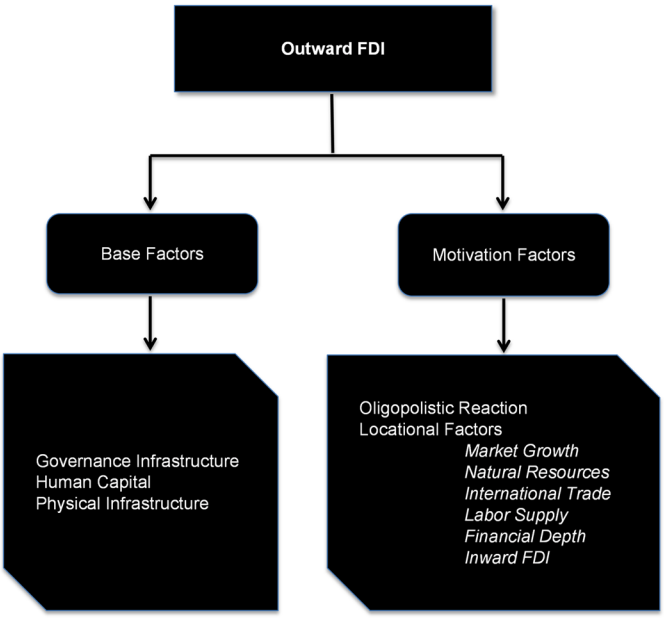
- All of them employ fixed or random effect panel regression technique, hence they all have endogeneity problem resulting from reverse causality problem or multicollinearity issue between governance variables and control variables used in the regression.
- None of the studies consider lag of outward FDI as a potential determinant of outward FDI. Hence all of the analyses employed are static panels, not dynamic panels.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The studies analyzing developing countries include least developed countries leading to biased results for the analysis since the governance infrastructure in least developed countries are totally different from developing countries and takes the lowest values compared to all countries.
- Most of the studies use WGI (2016) governance variables that are mainly devised for inquiring the role of governance on growth, rather than role of governance on outward FDI. Another problem with these indices is that they encompass 31 different datasets with sub indices under same name or similar indices from different databases. Hence there exists a high multicollinearity. Also, another disadvantage is that some datasets do not include same indices for all countries; some specific only to African countries or the datasets do not contain all the years. Hence there is a high asymmetry when all countries involved.

## SOLUTIONS AND RECOMMENDATIONS

How the study tackles those drawbacks in the previous section is as follows;



The study employs System GMM analysis that allows both overcoming endogeneity problem and including lag of FDI outflows as a possible determinant of FDI outflows. Hence it is not static but dynamic panel analysis.

- The study excludes least developed countries from the analysis based on difference in governance infrastructure that developed in the historical context. Least developed countries are generally ex-colonies, did not find a chance to establish their own governance structures since they are ruled by the regimes of colonizers for many years. When they thought they won their independence, they were ruled by totalitarian regimes left behind and supported by advanced countries of today for sustaining political stability of the region or securing their economic interests (Beyer, 2008; Etzioni, 2008). The colonial state and extractive institutions persisted even after independence (Acemoglu et.al, 2001). Developing countries generally are not colonized as in the case of least developed countries; they are just occupied. They are not extractive states; most of them are either founder or part of great civilizations in the past. Main problem is that most of them could not adapt their historical and cultural inheritance, customs, economic practices, belief and legal system with modern practices and standards of advanced countries, but they have made an effort to catch up advanced countries, hence they have better governance infrastructure compared with least developed countries. Thus including least developed countries into the analysis leads to biased results.
- Four governance indices are created in the study based on two different databases as ICRG (2011) and FRH (2011). All the sub-indices are totally distinct from each other; hence there is less multicollinearity issue. All of the sub-indices are available for all countries starting from 1996. Hence the governance clusters are symmetrical in the sense that, any sub-indices used for any country will be used for other countries too. Kaufman et al. (2011) recognizes the fact that other definitions of governance may of course be relevant for other purposes and encourages users with different objectives to combine their sub-indices in different ways more suited to their needs. Hence, four aspects of governance are determined that have potential to influence FDI decision of MNCs. Hence, the aim of the study is to measure the role of governance on FDI outflows just based on these aspects of governance. It is more clearly in this way, which sub-indices are used for aggregate indices for which purposes.

*Figure 1. Determinants of outward FDI*

## THEORETICAL PERSPECTIVE

Figure 1 presents that any outward FDI decision taken by individual investor or MNC depends on two factors as base and motivation. Without the base that the home country offers to investors, any motivation behind the outward FDI decision may not put into practice. FDI theories in the literature has either totally excluded the base factor or partially included it as other determinants of FDI. Most of the studies in the literature have concentrated on the motivation factor behind the FDI decision.

### Base Factors

Base factors include governance infrastructure, physical infrastructure and human capital that the home countries offer to investors.

#### Governance Infrastructure

Governance infrastructure of a country may affect outward FDI in two ways. First, and most distinctive, is the positive impact of quality of governance on outward FDI both in the short and long run.

The effect of governance on FDI is firstly through the effect of institutions on investment environment of a country and secondly through the decreasing transaction and production costs, and uncertainty (Bellos and Subasat, 2012).

Formal institutions such as constitutions, prudential laws, regulations, government policies and informal institutions such as traditions, habits, customs affect the perception and willingness of investors, they limit opportunism, build transactional trust in financial transactions, and ultimately influence international players to engage in cross border transactions (North, 1990).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Governance helps determine policy formulation and implementation that, in turn, determine whether or not there is a sound, attractive business environment for investment and production. (World Bank, 2003, p.10)*

Good policies and good administration of policies are needed to influence investment climate of a country and one without the other would be ineffective (World Bank, 2003).

High quality of governance infrastructure offers domestic enterprises favorable conditions to become strong and competitive for foreign expansion by allowing them to close deals with host countries' administration (Klimek, 2015).

Klimek (2015) also argues that governance infrastructure of home countries may significantly influence development opportunities of its multinationals abroad if the acquirers were operating in a more transparent and reliable institutional framework, especially to overcome the obstacles that are mainly raised by the national security of the host countries.

Second effect is the negative short run effect of governance infrastructure on outward FDI mainly referred as escape response of outward FDI due to low quality of governance in home countries (Klimek, 2015; Witt and Lewin, 2007).

Witt and Lewin (2007) argue that in times of rapid changes in the extra-institutional environment, slower rate of institutional change due to higher levels of societal coordination increases the probability of misalignments between firms' needs and home country's institutional environment that leads the increased propensity of firms to take outward FDI decision as a means of escape to other (host) countries in which institutional environment is perceived to be in closer alignment with firms' needs (Witt and Lewin, 2007).

*Institutions may propel or even force the outflow of capital from particular locations. Poor institutions may induce home country capital to look for better and safer conditions in a host country. In this case, the low quality of institutions in the home country will be positively correlated with high level of outflows…Corporations headquartered in a risky location will consider opportunities to transfer some of its assets abroad. (Klimek, 2015, p.102)*

The risk of expropriation, expectation of unlawful acts by the government, inhospitable conditions for new entrants, possible consequences of financial crises or difficult conditions in a home country are other factors that may encourage firms to relocate some of its assets abroad as an escape reason (Klimek, 2015)

It is claimed that this second effect of governance infrastructure on outward FDI may only occur in the short run since after a point, these MNCs will eventually move their parent company to another country where there exists a well established governance infrastructure and after that point is reached, it is no more possible to talk about outward FDI for the initial home country. Hence the long run relationship between governance infrastructure and outward FDI is still positive; low quality of governance is a structural impediment for flourishing of MNCs to increase outward FDI to affiliates in host countries.

## Human Capital

The quality of human capital in home country determines the skill level of management, workers and innovation capabilities of research personnel in R&D bases of the parent company. Since innovation capabilities of parent company determines the extent of outward FDI by protected knowledge and man-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

agement capabilities determine marketing, advertising, communication and transportation costs through internalization of MNCs, high level of human capital is a base factor that increases outward FDI through foreign operations of the parent firm.

### Physical Infrastructure

Not only the quality of physical infrastructure in host countries, but also the quality of physical infrastructure in home countries where FDI is originated matters since the quality of physical infrastructure are associated with greater accessibility and reduction in transportation costs. (Khadaroo and Seetanah, 2007)

Erenburg (1993) argues that if physical infrastructure were not extended to local and multinational enterprises publicly, then these enterprises would be operating with less efficiency, as they would have to build their own infrastructure leading to duplication and wasting of resources.

## Motivation Factors

FDI decision of a typical foreign investor is taken at least considering one motivation factor as;

### Oligopolistic Reaction

According to Knickerbocker (1973), FDI is an interactive kind of corporate behavior by which rival firms in an industry composed of a few large firms countering one another's moves by making similar moves themselves.

*Either the countering firms acquire about the same advantages as the firm that made the initial move, so that a new competitive balance is established in the industry, or the countering firms force the firm with the advantage to forego exploiting it by the threat of intensifying competition in the industry to the point where all rivals suffer. In this case the old competitive balance is restored. (Knickerbocker, 1973, p.6)*

### Locational Factors

#### *Market Growth*

The literature has mainly focused on the negative effect of market growth on outward FDI decision of MNCs based on market seeking motive. Low level of growth is considered as a sign of weaker performance of home economy leading investors to interest in locations offering better prospects by allowing diversification with higher returns (Klimek, 2015). Also, high level of growth not only attracts investors from abroad, but also encourages domestic firms to invest locally, hence leading to decreasing amount of outward FDI (Globerman et.al., 2006).

But, it is claimed that high growth rate in home country increases investment opportunities of parent company in the form of outward FDI due to the higher amount of abundant capital ready to invest in locations that bring higher returns (Klimek, 2015).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Given the higher growth and structural transformation of many developing countries, we can expect further expansion of outward FDI as these countries aspire to become significant regional or global players. (Das, 2013, p.9)*

### *Natural Resources*

High level of available natural resources not only attracts investors from abroad as in the form of inward FDI, but also encourages domestic firms to invest locally, hence leading to decreasing amount of outward FDI according to resource seeking motive. Thus, low level of available natural resources in home countries leads to increase in FDI outflows.

### *International Trade*

International operations of MNCs are generally established to replace exports or to produce imports and in some cases, international operations occur only because there is actual or potential trade. International trade brings enterprises of one country into contact with enterprises of another country, which often causes conflict. International operations are one means of resolving this conflict. Not only advantages lead to trade but also trade leads to advantages. A firm may establish distribution channels or may establish differentiated product through its export activities, which improves its advantages leading to foreign operations (Hymer, 1960).

### *Labor Supply*

Low level of labor supply in home country both leads to higher wages and lower quality of human capital unable to meet the necessary skill set for domestic operations of parent company. Hence MNCs established in home country will seek foreign markets with available or abundant labor supply that results in increase in FDI outflows based on labor seeking motive.

### *Financial Depth*

Tight regulations on financial markets, uneasy access to financial capital in the form of credits and liquid assets in home country makes parent company hard to borrow locally in order to finance its investments. Hence MNCs established in home country will seek foreign markets where well-established financial markets exist, leading to increase in FDI outflows based on finance seeking motive.

### *Inward FDI*

Increasing level of FDI inflows in a country indicates that as a host country, it is an attraction center for foreign investors, hence domestic firms and MNCs that established their parent company in that home country are less inclined to take outward investment decision in foreign locations, instead they try to expand their operations in their home market first. Hence the trend in FDI inflows should be the first indicator for home country MNCs to expand their international operations.

Since FDI inflows in transition countries are generally market or resource seeking, MNCs investing in these countries do not establish R&D centers since it is not technology intensive FDI as in developed countries, instead the knowledge embedded in the production process are protected by patents. Hence MNCs established in transition countries cannot increase their FDI outflows because there are no or few spillover effects from FDI inflows.

## MEASURING GOVERNANCE

Reviewing the literature, all the studies examining role of governance on FDI based on either just one index like corruption, political stability, etc. or aggregate indices as Kaufman et al. (2011), La Porta et al. (1997), etc.

Different authors led to different conclusions based on countries included, data span, estimation techniques and governance indices used. There are both similar and contrasting results with respect to these differences.

Aggregate indicators drawn from a variety of sources should provide more precise measures of governance than individual indicators (Globerman and Shapiro, 2002). It is possible to measure the effect of different aspects of governance on outward FDI by this way. That's why four aggregate governance indicators created by sub-indices taken from ICRG and FRH databases used in the study.

The three governance indicators; political stability, administrative quality and public voice are based on governance indicators developed by Aysan et.al. (2006). But, the reason to include these indicators, the motivation behind using them and the sub-indices of the indicators differ from Aysan et.al. (2006). Governance indicators used in the study are as follows:

### Political Stability Index (PSI)

This index is constructed to measure the safety of political environment in home countries. This index is the average of three indices from ICRG (2011); government stability, external conflict and internal conflict.

Since the FDI decision of MNCs based on motivations and concerns different than short-term capital flows, politically unstable countries are not preferred as home countries to initiate outward FDI.

If the home country of the MNCs, which initially is politically stable, turns into unstable either because of internal and external conflict, or the impaired government, MNCs either decreases their size on the home country by increasing outward FDI or shifts their bases to politically more stable countries.

Government stability is the most important aspect of political stability. Since MNCs initiate foreign operations from home country, based on current government policies, they want home country governments to be stable and realizing promised policies in order to earn profits based on those outward FDI decisions initiated before.

The internal conflict is the indicator of how the public in the home country reacts against government; it is the outcome of policies of current and past governments. MNCs do not want operate in home countries that lack of internal peace, with conflict and civil warfare in everyday life.

Due to external conflict, MNCs do not want to establish their operation bases in home countries that are under the high probability of constant warfare or conflicts with neighbor countries.

### Economic Stability Index (ESI)

This index is constructed to measure the sustainability of FDI due to economic stability of the home countries. This index is the average of six indices from ICRG (2011); risk for budget balance, risk for current account, risk for exchange rate stability, risk for foreign debt, risk for inflation and risk for international liquidity.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Economic stability is another important aspect of governance, since MNCs consider the costs and returns on outward FDI projects. If an economy is governed by inadequate and inconsistent economic policies and turns into unstable one, it constitutes the major cause of unpredictable high costs. Returns on FDI projects, which seems profitable at the beginning turn into losses mainly due to exchange rate risks and inflation. Bad economic governance increases uncertainty and risks, which are detrimental to foreign operations. Hence MNCs either relocate its operation base to economically more stable home country or just make outward FDI if they predicted that the time required to exploit full return on FDI comes before the time of the economy in the home country becomes unstable.

## Administrative Quality Index (AQI)

This index is constructed to measure the quality of the relationship between investor and the administrative / bureaucratic institutions of the home country, and the protection of investor rights. This index is the average of three indices from ICRG (2011); investment profile, bureaucracy quality and corruption.

MNCs taking outward FDI decision in a home country evaluate the performance of bureaucracy based on how responsive is the system to the need of investors, does it take too much time and effort even to initiate simple steps of investment plans, do investor have to deal with lots of unnecessary formalities and red tape. The bad quality of bureaucracy is a detrimental factor for foreign operations, since it increases the time for implementation of investment plans; hence it increases the costs of investment due to time lags.

Another important factor is the role of corruption in carrying out investment plans of MNCs. It increases the cost of outward FDI; hence it is a detrimental factor.

MNCs also consider the protection against expropriation, contract viability by the risk of unilateral contract modification or cancellation, and payment delays by the extent that profits can be transferred out of the host country to home country bases. These sub factors define the investment profile of a home country and it constitutes an important role for MNCs taking outward FDI decision since they show the extent of protection of investor rights.

## Public Voice Index (PVI)

This index is constructed to measure the protection of consumer rights against investors and investor rights against government. This index is the average of three indices; democratic accountability from ICRG (2011), political rights and civil liberties from FRH (2011).

MNCs internalize external markets through outward FDI and they import products from their own foreign affiliates in the host countries. The type of products and services supplied by MNCs to home country markets are highly sensitive to the preferences of consumers since the consumer rights in the home country are well protected. Any reduction in the quality of goods and services offered to domestic consumers or any harm given to environment or public health is confronted with public reaction either by the legal system which provides those rights to consumers through lawsuits or by democratic actions through boycott, rallies, assembly against MNCs. Since MNCs take this reality into account at the planning stage of their investment, increasing protection of consumer rights either through legal system or democratic rights of the public do not constitute a detrimental factor for FDI outflows in these countries. On the contrary, they enlarge the preference set of consumers, which lead to increased amount of FDI outflows by MNCs. This is the mechanism for the protection of consumer rights against investors in home country.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Democratic institutions provide checks and balances on elected officials, which in turn reduce arbitrary government intervention and lowers the risk of policy reversal and strengthen private property protection. (Asiedu and Lien, 2011, p.1)*

Hence home countries governed by democratic regimes are preferred by MNCs to establish their bases of operation, which initiates outward FDI. This is the mechanism for the protection of investor rights against government of home country.

## DATA AND VARIABLES

The study covers fifty-two emerging market economies by excluding all least developed countries for the period 1996-2010. See Table 3 in Appendix 1 for the list of emerging market economies covered in the study. See Table 4 in Appendix 2 for the source of the variables.

## STATISTICAL ANALYSIS

### Trend in FDI Outflows

Figure 2 both presents total FDI outflows from three different country clusters in million dollars and total FDI outflows from three different country clusters as a percentage of all FDI outflows in the world. Advanced, developing and least developed countries all have an increasing trend in total FDI outflows. While the FDI outflows from advanced countries had increased trefold, the FDI outflows from developing countries had increased sixfold during the period 1996-2010. Also, the share of total FDI outflows from developing and least developing countries had increased, the share of total FDI outflows from advanced countries had decreased as a percantage of all FDI outflows in the world.

According to Figure 3, average FDI outflows as a percentage of GDP from emerging market economies had doubled with an increasing trend. Inspecting one standard error bands indicate that emerging market economies had experienced divergence with respect to this indicator. Divergence is highest in 2003 and 2009; right after financial crises. Kuwait in 1998 and 2003, Bahrain in 2009 have the lowest, Bostwana in 2001, Bahrain in 2004, Kuwait in 2007 and 2009 have the highest level of FDI outflows as a percentage of GDP.

### Trend in Governance Infrastructure

Figure 4 presents four different aspects of governance in emerging market economies as political stability (psi), economic stability (esi), administrative quality (aqi) and public voice (pvi). Emerging market economies have the highest performance in political stability compared with other governance variables. The economic stability of these countries has a clear increasing trend despite the financial crises experienced in this period. There is no increasing or decreasing trend in other governance variables. These countries have clear deficit in governance infrastructure especially in administrative quality and public voice.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 2. Total FDI outflows and FDI outflows as a percentage of world*
*Source: Author's own calculation based on UNCTAD (2016).*
*Note: The right axis for LDCs.*

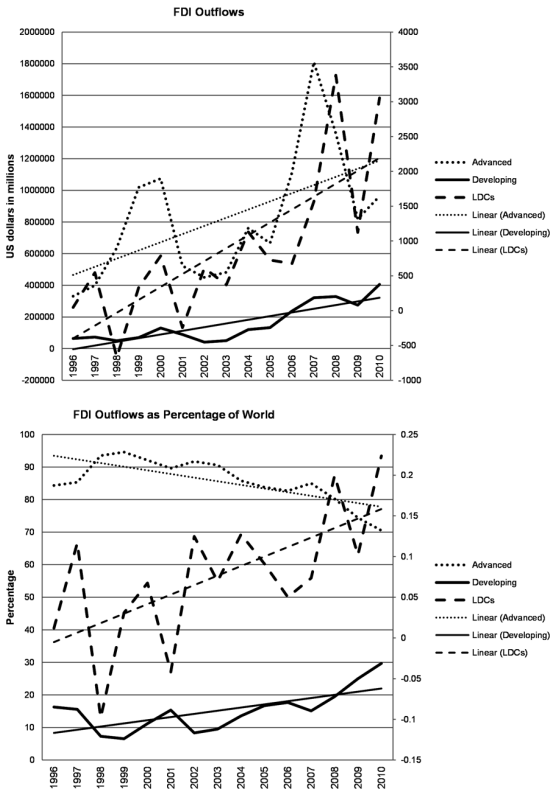

*Figure 3. FDI outflows as a percentage of GDP*
*Source: Author's own calculation based on UNCTAD (2016).*

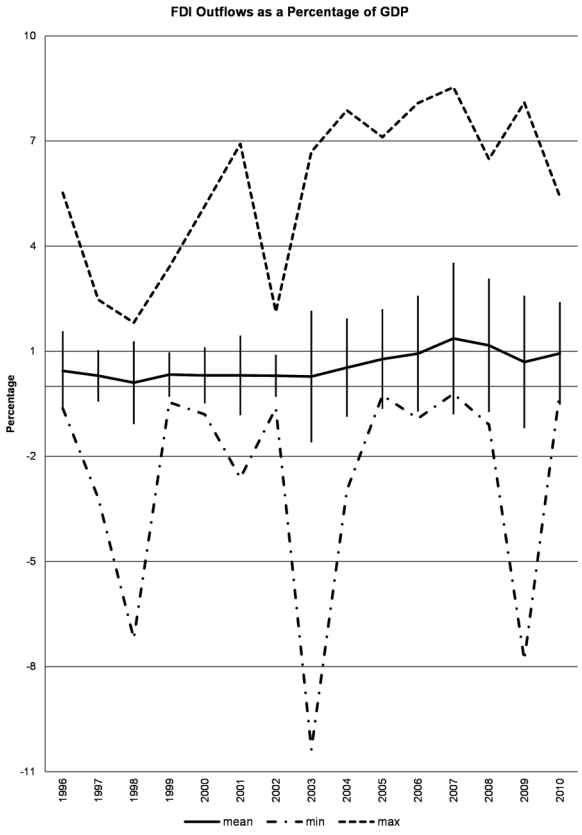

Figure 5 presents the comparison of governance indices of emerging market economies and developed market economies. Except for economic stability (esi), emerging market economies have performed worse than developed market economies for all other governance variables. It seems that emerging market economies have closed the gap in economic stability relative to the developed market economies.

## EMPIRICAL ANALYSIS

### Empirical Model

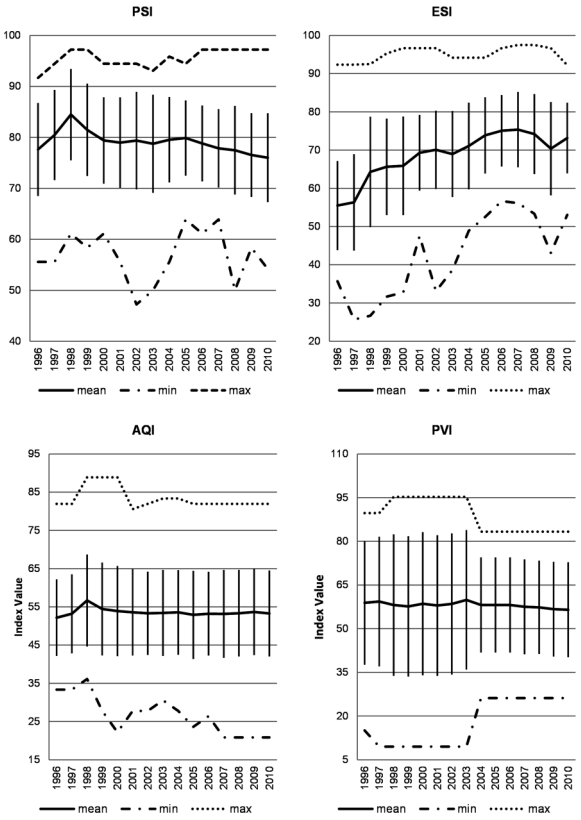
The general model to be estimated with System GMM is as below;

$$y_{it} = \propto y_{i,t-1} + X'_{it}\beta + \varepsilon_{it} \quad (1)$$

$$\varepsilon_{it} = \mu_i + \nu_{it} \quad (2)$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 4. Average governance performance for emerging market economies*
*Source: Author's own calculation based on ICRG (2011) and FRH (2011).*



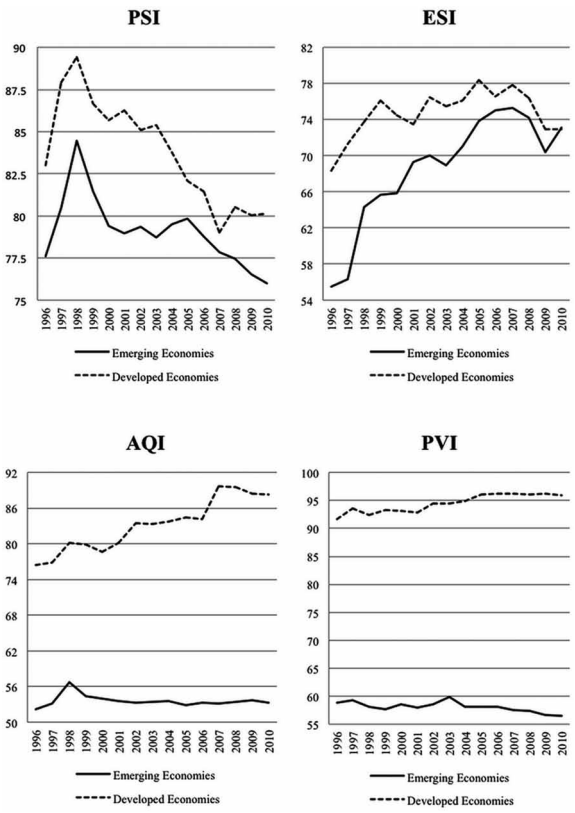


*Figure 5. Average governance performance for emerging and developed market economies*
*Source: Author's own calculation based on ICRG (2011) and FRH (2011).*

$$E\left(\mu_i\right) = E(\nu_{it}) = E(\mu_i \nu_{it}) = 0 \tag{3}$$

The disturbance term $\varepsilon_{it}$ has two orthogonal components as the fixed effects, $\mu_i$ and idiosyncratic shocks, $\nu_{it}$

$$\Delta y_{it} = \left(\propto -1\right)\Delta y_{i,t-1} + \Delta X'_{it}\beta + \Delta \nu_{it} \tag{4}$$

Assuming that changes in any instrumenting variable w are uncorrelated with the fixed effects (Roodman, 2009).

$$E\left(\Delta w_{it}\mu_i\right) = 0 \tag{5}$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The System GMM estimator that is developed by Arellano and Bover (1995), Blundell and Bond (1998) augments the Difference GMM estimator that is developed by Arellano and Bond (1991) by making an additional assumption of the first differences of instrument variables are uncorrelated with the fixed effects (5), which allows the introduction of more instruments. Hence it can dramatically improve efficiency by building a system of two equations; one is the original equation (1), the other is the transformed one (4). While Arellano and Bond (1991) instruments differences with levels, Blundell and Bond (1998) instruments levels with differences (Roodman, 2009).

Validity depends on the assumption that the $v_{it}$ is not serially correlated. But if the $v_{it}$ is serially correlated of order 1 then, for instance, $y_{i,t-2}$ is endogenous to the $v_{i,t-1}$ in the error term in differences, $\Delta\varepsilon_{it} = v_{it} - v_{i,t-1}$, making it a potentially invalid instrument. The researcher would need to restrict the instrument set starting with third lag or longer. If the researcher finds second order correlation, he or she would need to start with even longer lags (Roodman, 2009).

Reduced From Equation;

$$OFDI_{it} = \propto OFDI_{i,t-1} + \beta_1 BASE_{it} + \beta_2 MOT_{it} + \varepsilon_{it} \tag{1.1}$$

$$\varepsilon_{it} = \mu_i + \nu_{it} \tag{1.2}$$

$$E\left(\mu_i\right) = E(\nu_{it}) = E(\mu_i \nu_{it}) = 0 \tag{1.3}$$

$$\Delta OFDI_{it} = \delta \Delta OFDI_{i,t-1} + \phi \Delta BASE_{it} + \lambda \Delta MOT_{it} + \nu_{it} \tag{1.4}$$

$$E\left(\Delta w_{it} \mu_i\right) = 0 \tag{1.5}$$

$OFDI_{it}$ represents FDI outflows for country i in year t. $OFDI_{i,t-1}$ represents FDI outflows for country i in year t-1 to measure the oligopolistic reaction. $BASE_{it}$ represents governance indicators, human capital and physical infrastructure as base factors. $MOT_{it}$ represents motivation factors for country i in year t. GDP growth is included as a motivation factor in all regressions since FDI, governance and growth are three concepts interact with each other according to literature.

Model 1 is the benchmark model including lag of FDI outflows, all governance indicators, human capital, physical infrastructure and FDI inflows.

Models 2-5 include governance infrastructure as the only base factor, GDP growth and all other motivation factors. All motivation factors other than lag of FDI outflows and GDP growth are regressed in separate models.

## Estimation Results

According to our benchmark Models 1.1, 1.2, 1.3 and 1.4 in Table 1; improvement in all aspects of governance infrastructure leads to increase in FDI outflows in emerging market economies. Politically and economically more stable home countries with high administrative quality due to efficient and uncor-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

rupted bureaucracies and more democratic institutions providing check and balances against arbitrary government intervention creates more investment friendly business environment and secure both investor and consumer rights, leading to increase in outward FDI. The results of the study support the findings of Globerman et.al. (2006) with respect to aggregate governance infrastructure and Subasat and Bellos (2013) with respect to administrative quality and public voice. The findings of the study are in contrast with the literature on outward FDI as an escape response to deterioration in governance infrastructure in home countries (Das, 2013; Witt and Lewin, 2007; Kayam, 2009; Klimek, 2015).

Model 1.2 in Table 1 suggests that improvement in human capital in home country increases FDI outflows by enhancing skill level of management, workers and technical staff by increasing innovative capabilities of the parent company and decreasing marketing, advertising, communication and transportation costs due to better management capabilities. Since there is a statistically significant positive relationship between human capital and FDI outflows, FDI outflows do not base on efficiency seeking motive; instead human capital is a base factor positively contributing to expanding foreign operations of MNCs.

Improvement in physical infrastructure leads to increase in FDI outflows from emerging market economies due to greater accessibility and reduction in communication and transportation costs according to Model 1.8 in Table 1. Hence it will not be a misleading conclusion that physical infrastructure is a base factor for outward FDI decision of MNCs.

All models in Table 1 reveal that there is a statistically significant negative relationship between FDI inflows and FDI outflows in emerging market economies. Increasing level of FDI inflows indicates that these countries are attraction center based on either resource or market seeking motive for MNCs established abroad, hence MNCs established in these countries first try to exploit these locational attractions by increasing domestic operations of parent company leading decrease in FDI outflows.

All of the estimation results in Table 1 and 2 reveal that lag of FDI outflows has statistically significant positive effect on current FDI outflows, which confirms the oligopolistic reaction by suggesting that outward FDI is an interactive corporate behavior in an industry where a few large firms counter one another's moves by making similar moves themselves (Knickerbocker, 1973)

According to the estimation results both in Table 1 and 2; statistically significant positive relationship between market growth and FDI outflows suggest that FDI outflows from emerging market economies do not base on market seeking motive. Higher growth rates in home countries increase investment opportunities of parent company in the form of outward FDI due to the higher amount of abundant capital ready to invest in locations that bring higher returns. The results of the study do not support Globerman et.al. (2006) who found no statistically significant effect of growth on outward FDI. But our result support Klimek (2015) in his estimation result with dependent variable of per capita FDI outflows instead of outward FDI stocks.

The estimation results of Model 2.1 in Table 2 present that there is a statistically significant negative relationship between available natural resources and FDI outflows in emerging market economies. Hence decreasing level of available natural resources in home countries leads to increase in FDI outflows based on resource seeking motive.

There is a statistically significant negative relationship between labor supply and FDI outflows in emerging market economies according to Model 3.2 in Table 2. Low level of labor supply in home countries both lead to higher wages and lower quality of human capital unable to meet the necessary skill set for domestic operations of parent company. Hence MNCs established in home country will seek foreign markets with available or abundant labor supply that result in increase in FDI outflows based on labor seeking motive.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Inspection of Model 4.3 in Table 2 reveals that international trade substitutes FDI outflows in emerging market economies due to statistically significant negative relationship between international trade and FDI outflows. Increasing amount of international trade due to higher amount of exports replace FDI outflows from home countries. The findings of the study contrast with Das (2013) who found that increase in trade openness proxied by our measure leads to increase in outward FDI and Globerman et.al. (2006) who found that international trade complements outward FDI.

Hansen test of over-identification is under the null that all instruments are valid. All of the independent variables are treated endogenously. Appropriate lags of endogenous variables were instrumented according to AR(#) test of serial correlation.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The result of Model 5.4 in Table 2 presents that there is a statistically significant negative relationship between financial depth and FDI outflows in emerging market economies. Decreasing amount of financial depth due to tight regulations on financial markets, uneasy access to financial capital in the form of credits and liquid assets in home country makes parent company hard to borrow locally in order to finance its investments. Hence MNCs established in home country will seek foreign markets where well-established financial markets exist, leading to increase in FDI outflows based on finance seeking motive.

## FUTURE RESEARCH DIRECTIONS

The main drawback of the study is that the analysis cover the period 1996-2010, hence the effect of deterioration in governance infrastructure in several Middle East emerging market economies on outward FDI after 2010 could not have been analyzed due to data unavailability. A further study with available governance data covering 2010-2015 may be necessary to conclude that the relationship between governance infrastructure and FDI outflows changed or not in emerging market economies.

## CONCLUSION

It is found that total FDI outflows in million dollars and total FDI outflows as a percentage of all countries in the world both have increasing trend in emerging market economies. Average FDI outflows as a percentage of home country GDP has doubled during the period under analysis. These countries generally have clear deficit in different aspects of governance infrastructure. Also on average, they have an increasing economic stability despite global financial crises occurred in this period.

According to the empirical findings, improvement in all aspects of governance infrastructure leads to increase in FDI outflows in emerging market economies. Politically and economically more stable home countries with high administrative quality due to efficient and uncorrupted bureaucracies and more democratic institutions providing check and balances against arbitrary government interventions create more investment friendly business environment and secure both investor and consumer rights, leading to increase in outward FDI. Hence governance infrastructure together with human capital and physical infrastructure are base factors for home country MNCs. It is also found that FDI outflows from emerging market economies are not market or efficiency seeking; instead they are resource, labor or finance seeking. And international trade, especially increase in exports, replaces FDI outflows. The results also support oligopolistic reaction behavior of MNCs in taking outward FDI decision. Finally, it is found that increase in FDI inflows leads to decrease in FDI outflows since MNCs established in emerging home country markets first try to exploit locational advantages before expanding their foreign operations.

## KEY TERMS AND DEFINITIONS

**Administrative Quality Index:** The index value of administrative quality in home country taking values between 0 and 100.

**Economic Stability Index:** The index value of economic stability in home country taking values between 0 and 100.

**Financial Depth:** The ratio of liquid assets as a percentage of home country GDP.

**Governance Infrastructure:** The quality of home country institutional capabilities.

**Human Capital:** Availability of educated human resources in home country.

**International Trade:** Total volume of exports and imports as a percentage of home country GDP.

**Labor Supply:** Availability of population aged 15-65 that are currently employed or in search of a job in home country.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Natural Resources:** Availability of total natural resource rents as a percentage of home country GDP.

**Physical Infrastructure:** Availability of energy, water, communication and transportation infrastructure in home country.

**Political Stability Index:** The index value of political stability in home country taking values between 0 and 100.

**Public Voice Index:** The index value of public voice in home country taking values between 0 and 100.

# Chapter 5
# The Fundamentals of Neuroeconomics

**Kijpokin Kasemsap**
*Suan Sunandha Rajabhat University, Thailand*

## ABSTRACT

*Neuroeconomics is an emergent multidisciplinary field that strives to understand how and why humans make decisions. The field brings together behavioral methods and sophisticated computational theories from microeconomics, an understanding of emotional influences on behavior from psychology, and human functional neural imaging from neuroscience. This chapter presents the fundamentals of neuroeconomics, thus describing the concept of neuroeconomics; neuroimaging applications; neuroeconomics and loss aversion; neuroeconomics and temporal discounting; neuroeconomics of decision making in humans and animals; neuroeconomics, behavioral economics, and irrationality; neuroeconomics and utility theory; neural systems in economic decision making; neural systems in reward system; neural systems in cognitive control system; game theory, strategic interaction, and neuroeconomic studies; and the types of evidence about economic behavior.*

## INTRODUCTION

Neuroeconomics is an interdisciplinary field that incorporates psychology, economics, neuroscience, and computational science to investigate how people make decisions (Sharp, Monterosso, & Montague, 2012), and Davis (2010) states that the field is a new research program in economics in virtue of its adoption of neuroscience as a basis for the investigation of economic questions. Neuroeconomics focuses its approach in identifying some neuronal correlations specific to choices (Sebastian, 2014), and is the newest area of the economic sciences focusing on how the human brain interacts with its institutional and social environment to make economic decisions (McCabe, 2008).

Zak (2004) forwarded that neuroeconomics is a natural extension of bioeconomics, and the former is the study of evolved mechanisms that are in decision making at the neural level of the brain (Vromen, 2007). The application of conceptual structure and experimental techniques widely used in neuroscience to the study of economic behavior (Glimcher & Rustichini, 2004), neuroeconomics includes the

theoretical and methodological developments of cognitive neuroscience, computational neuroscience, psychology, and economics to accomplish the examinations of the brain processes when individuals make economically relevant decisions (Montague, 2007; Sanfey, Loewenstein, McClure, & Cohen, 2006).

The strength of this chapter is on the thorough literature consolidation of neuroeconomics. The extant literature of neuroeconomics provides a contribution to practitioners and researchers by describing a comprehensive view of the functional applications of neuroeconomics to appeal to the different segments of neuroeconomics in order to maximize the business impact of neuroeconomics in the decision-making process.

## BACKGROUND

Neuroeconomics is a new field in economics (Glimcher, 2003; Montague & Berns, 2002), and its original program was to provide a test for a large number of competitive theories of decision making (Rustichini, 2009). Neuroeconomic methods combine behavioral economic experiments to parameterize aspects of reward-related decision making with neuroimaging techniques to record the corresponding brain activity (Sharp et al., 2012). In economics, the transfer of neuroscientific insights and methods led to the emergence of neuroeconomics (Hubert, 2010). Whereas traditional economic research explains behavior primarily through theoretical constructs such as utility or preferences, neuroscience considers the physiological aspects and somatic variables that affect decision making.

Neuroeconomics makes the positivistic assumption that the key to explaining human behavior is to understand the neural and physiological processes (Riedl, Hubert, & Kenning, 2010). Neuroeconomists recognize the specific brain activation during the perception of different marketing stimuli (Koenigs & Tranel, 2007). One of the most important intellectual challenges of neuroeconomic research is the translation of theoretical constructs into neurophysiological categories (Hubert, 2010). The integration of neuroscientific approaches and methods into economic research has led to the preliminary findings regarding economic marketing theory and practice (Kenning & Plassmann, 2005). In marketing research, the notion of neuroeconomics has gained attention because the interdisciplinary perspectives to explain the buying decisions are accepted in consumer research (Lee, Broderick, & Chamberlain, 2007).

## THE FUNDAMENTALS OF NEUROECONOMICS

This section describes the concept of neuroeconomics; neuroimaging applications; neuroeconomics and loss aversion; neuroeconomics and temporal discounting; neuroeconomics of decision making in humans and animals; neuroeconomics, behavioral economics, and irrationality; neuroeconomics and utility theory; neural systems in economic decision making; neural systems in reward system; neural systems in cognitive control system; game theory, strategic interaction, and neuroeconomic studies; and the types of evidence about economic behavior.

### Concept of Neuroeconomics

Neuroeconomics has its root in behavioral economics, a scientific subfield of economics that has adopted psychological research on social, cognitive, and emotional factors to better understand economic

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

decisions (Mohr, Li, & Heekeren, 2010). Bermejo et al. (2011) stated that neuroeconomics is a new science that studies the brain processes involved in taking decisions, particularly related to economy. Neuroeconomics and neuromarketing are the emerging interdisciplinary fields at the interface between neuroscience, psychology, economics, and marketing (Sebastian, 2014).

Neuroeconomics relies on the two problematic steps; namely, the inference from brain activities to the engagement of cognitive processes in experimental tasks, and the presupposition that such inferred cognitive processes are relevant to economic theorizing (Bourgeois-Gironde, 2010). The first step only constitutes the reverse inference fallacy proper and ways to correct it include a better sense of the neural response selectivity of the targeted brain areas and a better definition of relevant cognitive ontologies for neuroeconomics. This second way allows the increased coherence between the cognitive processes involved in neuroeconomics experiments and the theoretical constructs of economics.

Economic decision making is a complex process of integrating and comparing the various aspects of the economically relevant options. Neuroeconomics has made the important progress in grounding these aspects of decision making in neural systems (Mohr et al., 2010). This progress includes the linking of the subfields of economics such as finance (Knutson & Bossaerts, 2007) and marketing (Plassmann, O'Doherty, & Rangel, 2007) with neuroscientific research methodologies. A wide range of studies in animals and humans have identified the neural mechanisms emphasizing the descriptions of value, reward, and risk, which are the important factors affecting economic behavior (Platt & Huettel, 2008; Rangel, Camerer, & Montague, 2008).

Economic decision making is considered as a type of value-based decision making, where the values of different actions are first compared, and the action selected is that corresponding to the highest value (Weber & Johnson, 2009). Two major competing classes of models in economic decision making have been proposed (d'Acremont & Bossaerts, 2008; Glimcher, 2008). The first class of models – utility based models – which includes the expected utility theory and the prospect theory (Kahneman & Tversky, 1979), proposes that decision makers first determine the value and the relative weight of each possible reward and then calculate the overall value of a choice option as the weighted sum of possible outcome values. The second class of models – namely risk-return models – proposes that decision makers first determine the expected reward of each of the alternatives and the associated risk (e.g., variance of rewards), and calculate the value of the alternative as the risk-corrected expected reward (Bell, 1995; Sarin & Weber, 1993).

Both classes of models consider both reward and risk, which is explicitly defined in risk-return models and implicitly influences the value of an alternative in utility-based models via the curvature of the utility function. However, a third factor influences the value of a choice alternative which is specified in the models of intertemporal choice (Kirby, 1997; Laibson, 1997). In addition to the factors that are explicitly specified in models of risky decision making, there are a number of additional second-order factors which do not directly affect the value. These include subject-related factors such as anticipatory emotions (Loewenstein, Weber, Hsee, & Welch, 2001), cognitive abilities, and object-related factors such as framing (Tversky & Kahneman, 1981). Cognitive abilities (e.g., working memory capacity and processing speed) influence the integration of information while estimating risk or expected reward (Mohr et al., 2010).

Neuroeconomics-derived theoretical predictions about the optimal adaptation in a changing environment provide an objective metric to examine psychopathology (Sharp et al., 2012). Neuroeconomics provides a multilevel research approach that combines performance (behavioral) measures with intermediate measures between behavior and neurobiology (e.g., neuroimaging) and uses a common

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

metaphor to describe decision making across the multiple levels of explanation. The potential payoff of neuroeconomics has been debated in different fields (Glimcher, Camerer, Fehr, & Poldrack, 2008).

The most visible debate has been within economics with some economists arguing for the transformative potential of neuroeconomics (Camerer, 2007), and others arguing to keep economics mindless (Gul & Pesendorfer, 2008). Neuroeconomics seeks to ground microeconomic theory in details about how the brain works (Chorvat & McCabe, 2005; Zak, 2004). Glimcher (2004) stated that neuroeconomics can bring a critical inspection concerning economic models and economic behavior. The dopaminergic and serotoninergic brain systems have been identified as the important neurotransmitter systems involved in economic behavior (Mohr et al., 2010). Like dopamine, serotonin sustains significant changes during the adult lifespan (McEntee & Crook, 1991).

The perspectives of neuroeconomics-inspired models that have emerged in the economics literature (Brocas & Carrillo, 2008; Fudenberg & Levine, 2006) presumably argue in favor of the former neuroeconomic concern. The extent to which neuroeconomics can inform consumer research (Egidi, Nusbaum, & Cacioppo, 2008), neuroscience (Camerer, 2008), psychology (Loewenstein, Rick, & Cohen, 2008), public policy (Hoffman, 2004), and basic business practices (Shane, 2009) is broadly recognized. Neuroeconomists have investigated several topics of interest to consumer researchers such as spending decisions (Knutson, Rick, Wimmer, Prelec, & Loewenstein, 2007), investment decisions (Kuhnen & Knutson, 2005), the price placebo effect (Plassmann, O'Doherty, Shiv, & Rangel, 2008), charitable giving (Harbaugh, Mayr, & Burghart, 2007), and self-control (Hare, Camerer, & Rangel, 2009). A great deal of contemporary decision research in economics, business, psychology, and neuroscience accepts the notion that emotions play a significant role in decision making (Reimann & Bechara, 2010).

## Neuroimaging Applications

Neuroimaging includes the use of various techniques to either directly or indirectly image the structure and function of the nervous system. Neuroimaging is a relatively new discipline within medicine and neuroscience. In exploring the decision making process, a growing number of researchers use an array of tools that record the electrical activity and metabolic activity of the human brain and electroencephalograph (EEG), transcranial magnetic stimulation (TMS), functional magnetic resonance imaging (fMRI), positron emission tomography (Sebastian, 2014). These tools are utilized to explain the neurobiological mechanisms of the decision-making process (Pradeep, 2010; Zurawicki, 2010).

The investigation of whether neuroscientific methods can define the topics of interest to consumer researchers is acknowledged to some extent as described by the fMRI-based studies published in various marketing journals (Hedgcock & Rao, 2009). Neuroeconomic methods combine the behavioral economic experiments to parameterize the aspects of reward-related decision making with neuroimaging techniques to record the corresponding brain activity (Sharp et al., 2012). By explaining economic behavior and decision theory, an attempt is made to elaborate a model that explains in a more accurate way how people make decisions (Glimcher & Rustichini, 2004). Hsu et al. (2005) indicated that neuroeconomics has begun to abandon its near-exclusive reliance on fMRI data in favor of utilizing the multiple methods to better determine causality.

There has been a movement of experimental work on self-control in social psychology where it is primarily conceived as a limited capacity that functions like a muscle (Baumeister, Vohs, & Tice, 2007), although there are great limitations to this concept (Kurzban, 2011). Within systems-level neuroscience research, a common approach relies on simple model tasks taxing behavioral inhibition that are easily

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

paired with neuroimaging such as go/no-go and stop-signal tasks (Monterosso, Piray, & Luo, 2012). Given a systematic mapping between brain function and brain structure, imaging data becomes simply another dependent variable that can be utilized to test between theories (Henson, 2005). Henson et al. (1999) used an imaging experiment to test a dual process model of recognition memory against a single process model.

## Neuroeconomics and Loss Aversion

One phenomenon of particular interest to both consumer researchers (Novemsky & Kahneman, 2005) and neuroeconomists is loss aversion which refers to the tendency for losses to have greater hedonic impact than comparable gains. One interesting aspect of human decision making is a strong aversion to potential loss. Context effects refer to everything that biases an individual's affective forecast at the moment of the forecast such as the individual's environmental situation (Schwarz & Strack, 1999) and the motivational state (Buehler, McFarland, Spyropoulos, & Lam, 2007). Individuals fail to empathize with the requirements of their future selves, leading to a discrepancy between predicted utility and experienced utility (Lades, 2012).

Behavior in both risky and riskless contexts regularly reveals that individuals treat losses as if they were more effective than comparable gains (Rick, 2011). If losses are experienced no more intensely than comparable gains, then loss-averse behavior is misguided on both monetary and affective grounds (Kermer, Driver-Linn, Wilson, & Gilbert, 2006). In risky contexts, loss aversion can help to explain widespread risk aversion (Kahneman & Lovallo, 1993), as well as the so-called "St. Petersburg Paradox" (Camerer, 2005). In riskless contexts, loss aversion is normally advocated to explain the endowment effect (Thaler, 1980).

Loss aversion can help to analyze a broad range of phenomena, including the sunk cost fallacy, the attraction effect, the compromise effect, anticipated and experienced regret (Kardes, 1994), the status quo bias (Samuelson & Zeckhauser, 1988), brand choice (Hardie, Johnson, & Fader, 1993), labor supply (Camerer, Babcock, Loewenstein, & Thaler, 1997), the equity premium puzzle (Benartzi & Thaler, 1995), organ donation decisions (Johnson & Goldstein, 2003), and incumbency biases in elections (Quattrone & Tversky, 1988). Loss aversion is diminished for money or goods systematically allocated for exchange (Novemsky & Kahneman, 2005), gambles with small amounts of money (Harnick, Van Dijk, Van Beest, & Mersmann, 2007), gambles whose probabilities are concluded from outcome feedback (Erev, Ert, & Yechiam, 2008), and unattractive goods (Brenner, Rottenstreich, Sood, & Bilgin, 2007). Sellers with considerable marketplace experience (List, 2003) or influenced by incidental sadness (Lerner, Small, & Loewenstein, 2004) or positive mood (Zhang & Fishbach, 2005) tend to acknowledge reduced loss aversion.

## Neuroeconomics and Temporal Discounting

Temporal discounting, at a behavioral level, refers to the intertemporal reward preferences often characterized by a decrease in reward value as a function of the delay to its receipt (Rachlin & Green, 1972). Bickel et al. (2007) stated that temporal discounting, considered as a measure of one's location on the continuum of impulsive decision-making to self-control, represents the interaction of these valuation systems and their associated neural networks. The neuroeconomic approach applies the mathematically tractable economic formalizations to the nervous system and focuses on basic economic concepts

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

such as utility (Kable & Glimcher, 2007), risk (Platt & Huettel, 2008), and temporal discounting (Kim, Hwang, & Lee, 2008), thus providing quantitative frameworks for examining the neural mechanisms emphasizing cognitive processes.

Temporal discounting has been examined with tasks that arrange other sequences of questions, questionnaires, and single-item choice assessments (MacKillop, 2013). Bickel et al. (2014) explained that these procedures, although all measuring preferences for smaller sooner versus larger delayed rewards, have been referred to with a variety of different names including delay of gratification, delay discounting, impulsive choice, intertemporal choice, and time preference.

## Neuroeconomics of Decision Making in Humans and Animals

Decision making refers to the process of using preferences, selecting and executing actions, and evaluating outcomes (Ernst & Paulus, 2005). Decision making requires the coordinated activity of motivational, emotional, and cognitive circuitry to weigh alternatives, take actions, and learn from feedback (McCabe, 2008). All animals and humans have an instinctive desire to explore their environment which requires neural mechanisms that detect rewards, identify punishments, and learn policies that map the predictive state representations onto a distribution of actions (McCabe, 2008).

Decision making includes preference formation, action selection, and execution and evaluation of outcomes (Sharp et al., 2012). Neuroeconomics, a discipline that marries the mathematical formalisms of classical economics, the psychophysical methods of behavioral economics, and contemporary neurosciences (Glimcher, 2009), provides a descriptive test of the functionality-based classification scheme for defining mechanistic pathologies in decision making (Kalenscher & van Wingerden, 2011).

In designing a cognitive neuroscience experiment, the experimenter must decide whether or not to study human or nonhuman brains (McCabe, 2008). Nonhuman brains are often used as models of the human brain based on the evolutionary hypothesis that the human brain evolved over time by extending homologous functions, and computations, in predecessor brains (Gazzaniga, Ivry, & Mangun, 2002). In nonhuman brains, the experimenter can use the lesion experiments, genetic manipulations, neuronal stimulation of specific neurons, and single-cell recordings methods to measure neuronal signals and neuronal connectivity in order to reconstruct neuronal mechanisms and learn how they compute (Gazzaniga et al., 2002).

Concerning the single-unit recordings methods in animals and neuroimaging in humans, the striatal dopaminergic signaling is critical for reward-related processing, motivation, and learning (Montague, Hyman, & Cohen, 2004). The dysfunctional dopaminergic signaling disrupts the reward anticipation in drug addiction (Schultz, 2011). Morris et al. (2006) indicated that the firing rates of midbrain dopamine neurons compute economic decision parameters (e.g., reward probability, reward delay, and reward uncertainty). Dopaminergic signaling is included in assessing the economic costs and benefits of upcoming rewards.

Neurons in rodent nucleus accumbens encode anticipated reward benefits without encoding response costs to achieve the reward (Gan, Walton, & Phillips, 2010). The nucleus accumbens has a significant role in the cognitive processing of motivation, pleasure, and reinforcement learning, and thus has significant role in addiction. The economic computations by the mesolimbic dopamine system contribute to addiction and other motivation-related disorders (Chang, Barack, & Platt, 2012).

Temporal discounting describes a time-dependent devaluation of economic value (Green & Myerson, 2004), and is a phenomenon observed across multiple species including rodents, monkeys, and humans

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Hwang, Kim, & Lee, 2009). When provided an option to choose an immediate but smaller reward over a larger reward with a longer delay, animals reliably prefer the immediate option (Myerson & Green, 1995). Addicted individuals discount more than non-addicted individuals (Schultz, 2011). Single-unit recordings in monkeys demonstrate that neurons in the striatum mediate computations underlying temporal discounting (Cai, Kim, & Lee, 2011).

Cardinal et al. (2001) indicated that the rats with nucleus accumbens lesions display severe difficulty in choosing a delayed reward option in an intertemporal choice task, suggesting a critical role of nucleus accumbens in computing economic values of rewards in time. Parkinson et al. (1999) stated that the nucleus accumbens lesions do not abolish the reward sensitivity altogether but impair the implementation of an optimal strategy as if these animals cannot accurately compute temporally discounted utility to guide decisions. Neural correlates of temporal discounting are found in the prefrontal cortex (Kim & Lee, 2011).

## Neuroeconomics, Behavioral Economics, and Irrationality

Behavioral economics has its roots in the law of demand which states that the demand for a commodity decreases in a mathematically defined manner as its unit price increases (Hursh, 1984). Rowland et al. (2008) indicated that economists have used behavioral economics concepts to understand economies and consumer behavior, and it has become clear that groups of humans do not function in an economically optimal manner, defined, for example, as paying the least possible unit price among an array of choices. Behavioral economics emerges against the backdrop of the dominant normative approach to economic modeling recognized as the rational choice theory (Monterosso et al., 2012). Economic evaluation is often complicated by quality or perceived quality of goods, or too many concurrent choices (Wansink, 2004). The field of consumerism is the study of why people make particular choices in the particular markets (Dagevos, 2005).

Bickel et al. (2012) indicated that modern behavioral economic and neuroeconomic approaches consider addiction to function, in part, as a possible valuation disorder wherein normal decision-making mechanisms become dysfunctional, resulting in pathological reward processing. The study of human choice behavior and the neurobiology has received attention in recent neuroimaging studies (Padoa-Schioppa & Assad, 2006). Neuroeconomics seeks to understand the neural basis of decision making (Glimcher, 2003). In some situations, humans strongly deviate from statistical optimality in their judgments, and exhibit inconsistent or irrational preferences (Summerfield & Tsetsos, 2015).

Humans choosing among economic alternatives are often unduly swayed by irrelevant contextual factors, leading to inconsistent or intransitive decisions that fail to maximize potential reward (Kahneman, Slovic, & Tversky, 1982). Rationality is operationalized with a small set of minimum requirements that need to be satisfied for behavior to be coherent and orderly over time (Arrow, 1986). When measurement of brain function became affordable and accessible, many behavioral economists welcomed the idea of incorporating brain data into modeling, in the hope that modeling could be improved by identifying neurobiological gears between input and output. Irrational economic behavior can arise if the brain computes and represents stimulus value relative to the context provided by other previously (Stewart, Chater, & Brown, 2006) or currently available options (Louie, Khaw, & Glimcher, 2013).

Behavioral economists have collaborated with neuroimaging researchers seeking to identify brain correlates of behavioral economic phenomena, especially the sources of irrationality (Breiter, Aharon, Kahneman, Dale, & Shizgal, 2001). Concerning irrationality, the deficiencies in many contexts motivated

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

a breakaway group of economists and psychologists to pay special attention to irrationality to develop more descriptively accurate alternatives (Camerer & Loewenstein, 2004). These divergences include non-normative probability weighting (Edwards, 1954), incomplete search of option space (Simon, 1967), reference dependence in utility judgments (Kahneman & Tversky, 1979), weighing delays nonuniformly (Laibson, 1997), and emotional state dependent utility (Loewenstein, 1996).

## Neuroeconomics and Utility Theory

Although decision makers are reported to have difficulties in making comparisons among multidimensional decision outcomes, economic theory assumes a unidimensional utility measure (Witt & Binder, 2013). The decision makers' difficulties can be explained once the motivational aspects of utility (e.g., wanting) are disentangled from the experiential ones (e.g., liking) and the features of the different brain processes involved are recognized (Witt & Binder, 2013). At the essence of microeconomic theorizing lies the concept of individual preferences. It is the outcome of a century-long transformation of utility theory and its core notions (Bruni & Sugden, 2007).

In behavioral economics (Winkielman & Berridge, 2003), the two qualities of utility as motivator and experienced reward are identified with the concepts of wanting and liking, respectively. The motivational aspect of choosing an action can be identified with the notion of wanting (Berridge, 1999), which relates to appetite or incentive motivation in biology. The incentive value of an action (e.g., the reward) expected in terms of enjoying pleasures or relief from pain related to the forward looking preferences. Unless entirely random, the choice of an action is contingent on some form of expectations (Kahneman, Wakker, & Sarin, 1997). The wanting and liking features are not causally independent of each other and possess different neural correlates (Knutson & Peterson, 2005).

Without going into the details of brain imaging (e.g., EEG, TMS, fMRI, and positron emission tomography), studies on reward processing have opened up to some extent what was previously a "black box"; namely, the brain activities that are triggered when an individual encounters a rewarding object (McClure, York, & Montague, 2004). By considering how pleasure is coded in the brain (Kringelbach & Berridge, 2010), the neurobiology of reward can differentiate between the three psychological components of reward (Berridge & Kringelbach, 2008). The components are the learning, liking, and wanting. Individual organisms learn that goal objects are rewarding because of their affective (hedonic) qualities and because of the incentive salience (the wanting) that is attached to these hedonic qualities. All three component parts (learning, liking, and wanting) are mediated by the interactive neural systems (Witt & Binder, 2013).

While different tasks in general activate different brain regions, rewarding stimuli seem to consistently activate the same specific regions. Dopamine systems project from the ventral tegmental area to the nucleus accumbens (i.e., a part of the ventral striatum), amygdala, and frontal cortex and from the substantia nigra to the dorsal striatum (Becker & Meisel, 2007). The substantia nigra is a brain structure located in the mesencephalon (midbrain) that plays an important role in reward, addiction, and movement.

Besides these core areas, the orbitofrontal cortex (i.e., a part of the prefrontal cortex), the ventral pallidum, and the ventral striatum play an important role as the brain substrates of reward processing. The orbitofrontal cortex has been found to receive the direct input from primary taste and olfactory cortices as well as from higher-order visual and somatosensory areas (Kringelbach, 2005). It is an ideal place for the storage of reward values of sensory stimuli (McClure et al., 2004). The amygdala seems to be involved in processing the intensity of positive and negative stimuli. The ventral striatum plays an important role

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

concerning rewards because of its connection with the mesencephalic (midbrain) dopamine system and the orbitofrontal cortex and amygdala (Holland & Gallagher, 1999).

The release of the neurotransmitter dopamine from the ventral tegmental area on the nucleus accumbens has been recognized as the mediating pleasure (Salamone, Correa, Farrar, & Mingote, 2007). The release of dopamine does not seem relevant for generating liking (Robinson & Berridge, 2003). Activation or suppression of mesolimbic dopamine systems does not change the liking of sweet tastes (Leyton, 2010). Lesions that eliminate dopamine in the nucleus accumbens do not impair the liking either (Berridge & Robinson, 1998). Dopamine plays a role in reward processing by mediating the wanting and learning (Caplin & Dean, 2008).

## Neural Systems in Economic Decision Making

Evidence from a range of fMRI studies indicates that the ventral striatum and the ventromedial prefrontal cortex are implicated in the representations of reward (Elliott, Newman, Longe, & Deakin, 2003). These brain regions are not only shown to code for the reward itself at the time of its delivery, but also activated by reward-predicting stimuli in the anticipation of reward (Preuschoff, Bossaerts, & Quartz, 2006). In the context of risk processing, many studies have shown the following four key regions to be involved: the anterior cingulate cortex, the anterior insula, the dorsolateral prefrontal cortex, and the ventral striatum (Rushworth & Behrens, 2008). The anterior insula plays an important role in affective influences on decision making (Winkielman, Knutson, Paulus, & Trujil, 2007) and is related to the aversive emotions such as disgust (Adolphs, 2002). Risk-related activity in the anterior insula can reflect the processing of affective responses to risk, as suggested by some theories on risk (Loewenstein et al., 2001).

Basic neuroeconomic games allow for the modeling of the effects of beliefs and affect on reward processing (Sharp et al., 2012). Delgado et al. (2005) used a neuroeconomics game (e.g., trust task) to show that prior social and emotional information on trust game partners modulates reward responses in the brains of healthy adults. Sharp et al. (2011) showed that the modulation of insula responses is absent in the brains of boys with externalizing behavior problems. King-Casas et al. (2008) indicated that the norms used in perception of social gestures are pathologically perturbed among individuals with the borderline personality disorder, with differential insula activation in these patients compared with normal control subjects. The contribution of neuroeconomics games is the largest in the domain of social interaction (King-Casas & Chiu, 2012) where social-cognitive research with traditional methods has struggled to find ways to reach the real-life social interaction with ecological validity.

Neuroeconomics has started investigating the effect of delayed rewards resulting in partly ambiguous results (Ballard & Knutson, 2009). Neuroeconomic tasks are designed to more closely mirror the physical mechanisms of reward processing by tapping directly into utility functions while outcome uncertainty during anticipation in a monetary reward task is probed (Knutson, Bhanji, Cooney, Atlas, & Gotlib, 2008). Declerck et al. (2013) indicated that the motivation to cooperate generated by the reward system in the brain (extending from the striatum to the ventromedial prefrontal cortex), is modulated by two neural networks: a cognitive control system (centered on the lateral prefrontal cortex) and a social cognition system (including the temporo-parietal junction, the medial prefrontal cortex, and the amygdala) that processes trust and threat signals.

The mesolimbic reward system is formed by dopaminergic projections emanating from cell groups in the ventral tegmental area in the midbrain which loop through the limbic nuclei, the dopamine-rich nucleus accumbens in the ventral striatum, and connect to the ventromedial prefrontal cortex (Tekin &

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Cummings, 2002). This medial dopaminergic pathway is applied to facilitate the affective and appetitive behavior (Schultz, 2002) and incentive motivation (Depue & Collins, 1999). It is activated when people receive or expect to receive a reward (Tricomi, Rangel, Camerer, & O'Doherty, 2010).

The ventromedial prefrontal cortex is implicated when subjects make an active choice and select the most valuable option (Rangel & Hare, 2010) and has been recognized to have a more general role in response selection and action planning (Schoenbaum, Setlow, & Ramus, 2003). Hare et al. (2008) stated that the brain region acts as an information aggregator, comparing and selecting the best option from a set of alternatives. However, the brain region responds to the reward value of a single item, when there is no choice required and no immediate alternative with which to compare (Knutson, Taylor, Kaufman, Peterson, & Glover, 2005).

## Neural Systems in Reward Systems

The reward, called experienced utility in economics, is unidimensional as regards its neural correlates, lending support to the unidimensional measure for utility. Reward is processed along a single final common pathway in brain regions (McClure et al., 2004). The brain converts multidimensional payoff records into one single common currency (Kringelbach & Berridge, 2010). The plausibility of the common currency hypothesis of reward does not seem to be affected (Leknes & Tracey, 2008). The neural currency is the foundation of experiencing the reward associated with the goal objects (Witt & Binder, 2013). Basic research on the neuromodulation of reward processing (Schultz, 2006) indicates that economic decision making (e.g., reward processing) is influenced by dopamine (Fiorillo, Tobler, & Schultz, 2003).

While dopamine is associated with incentive motivation and wanting, the intense pleasurable feelings, gratification, and liking systematically involve the opioids and the gonadal steroids oxytocin and vasopressin (Declerck et al., 2013). In the striatum, the nucleus accumbens shell has been recognized as a site of integration of incentive information because it receives projections from many corticolimbic structures and contains opiate and oxytocin receptors (Depue & Morrone-Strupinsky, 2005). Functional interactions between dopamine and opioids (Depue & Morrone-Strupinsky, 2005) and between dopamine and oxytocin (Skuse & Gallagher, 2008) contribute to the hedonic effects accompanying reward, but these contributions appear to be independent of dopamine's role in assessing the salience of reward cues (Depue & Morrone-Strupinsky, 2005).

Fehr and Camerer (2007) indicated there is the extensive overlap of activation in the striatum between rewards for oneself (e.g., receiving or expecting a sum of money) and rewarding others (e.g., voluntarily giving money away). Izuma et al. (2010) confirmed with an fMRI experiment that the ventral striatum is activated when publically donating money to charity as well as when privately receiving money. For the brain, extrinsic lucrative rewards are equivalent to the intrinsic affective rewards stemming from socially motivated decisions (Declerck et al., 2013). Within the medial system, the ventromedial prefrontal cortex is well-positioned to serve as an interface between emotional and motivational processes, and therefore to shape the anticipation of reward. Being a highly connected integration center, it represents what a current choice is worth to the decision makers (Fellows, 2007) in accordance with their own moral goals (Hare et al., 2009). Regarding the emotional input of the ventromedial prefrontal cortex, Tekin and Cummings (2002) indicated that the medial system mediates the empathic and motivated behavior.

Dopamine neurotransmission in the reward system plays a critical role in the process of evaluating whether or not on its value, the cooperative decisions making can be maintained or interrupted to be replaced by decisions that lead to more satisfying outcomes (Declerck et al., 2013). The dopamine-rich

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

caudate nucleus, previously linked to learning and memory, is an essential component in the reinforcement of actions potentially leading to reward (Tricomi, Delgado, & Fiez, 2004). The dopamine-rich caudate nucleus is involved in updating information to either modify future behavior in accordance with environmental changes, or to keep the status quo as long as expectations are met (Delgado, 2007). Decisions to donate effectively activate the oxytocin-rich subgenual area that is a brain region connected to the mesolimbic dopamine reward system related to the social attachment formation (Bartels & Zeki, 2004).

Both ventral striatum and dorsal striatum integrate inputs from other networks, including regions located in the lateral prefrontal cortex implicated in cognitive control (Staudinger, Erk, Abler, & Walter, 2009), and the temporal parietal junction included in the social cognition (Hare, Camerer, Knoepfle, & Rangel, 2010). Baumgartner et al. (2008) stated that the activity in the dorsal striatum can be developed by oxytocin or by information regarding the trustworthiness of others. Oxytocin, the neurotransmitter involved in the trusting behavior (Kosfeld, Heinrichs, Zak, Fischbacher, & Fehr, 2005), can interact with dopamine release in the ventral striatum to affect the social motivation (Skuse & Gallagher, 2008).

## Neural Systems in Cognitive Control System

Paralleling the medial dopaminergic system, which is related to the forming expectations of reward, runs a lateral dopaminergic pathway that originates in a different population of cells in the ventral tegmental area and connects the substantia nigra in the midbrain with the dorsal striatum and stimulates the lateral regions of the prefrontal cortex (Tekin & Cummings, 2002). This lateral system evolved in full more recently during primate evolution and supports the executive functions which are crucial to adapt the goal-directed behavior to the changing environmental contingencies (Previc, 2009). The dorsolateral prefrontal cortex is an essential component of the working memory and executive functions (Miller & Cohen, 2001) and provides the cognitive capacities needed to resolve the conflict generated by the mixed intentions of a social dilemma (Carter & van Veen, 2007). An additional function of the dorsolateral prefrontal cortex is to provide the impulse control to resist the immediate selfish dedication in order to acknowledge the greater cooperative benefits at a later time (McClure et al., 2004).

Working in harmony with the dorsolateral prefrontal cortex, the dorsal anterior cingulate cortex is included in the conflict monitoring whenever there are the competing motives such as those presented in the social dilemmas (Carter, Botvinick, & Cohen, 1999). The dorsal anterior cingulate cortex is located in the posterior medial part of the frontal cortex and interconnected with the dorsolateral prefrontal cortex and the ventral striatum (Alexander, DeLong, & Strick, 1986). The human orbitofrontal cortex is an important brain region for the processing of rewards and punishments, which is a prerequisite for the emotional and social behaviors which contribute to the evolutionary success of humans (Kringelbach & Rolls, 2004). McClure et al. (2004) hypothesized that the discrepancy between the short-term and long-term choices in human time discounting reflects the differential activation of distinguishable neural systems. McClure et al. (2004) measured the brain activity of participants as they made an array of intertemporal choices between early and later monetary rewards. The early rewards have a lower value than the later rewards (McClure et al., 2004).

## Game Theory, Strategic Interaction, and Neuroeconomic Studies

Game theory is the formal study of decision making where several players must make choices that potentially affect the interests of other players. Game theory provides models, known as games, to study

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the interactions with formalized incentive structures (Braeutigam, 2005). Such games are of profound theoretical importance in economics where individual wishes to model the processes in which the optimality of a course of economic action is affected by decision makers and competitors (Glimcher, 2002). Game theory relates to strategic thinking implicit in the notion of equilibrium and common knowledge of rationality (Griessinger & Coricelli, 2015). The emergence of bounded rationality models (Gigerenzer & Selten, 2002) and the behavioral game theory provide a theoretical framework in order to solve the neural roots of strategic reasoning and emphasize the decision-making mechanisms involved in social interaction. Game theory defines the strategic interactions as games representing decisions between agents where individual's payoffs depend on the other's actions, thus extending the model of individual's decision making to the understanding of the interactions in multi-agents situations (Griessinger & Coricelli, 2015).

The Nash Equilibrium, also called strategic equilibrium, is a list of strategies, one for each player, which has the property that no player can unilaterally change his or her strategy and obtain a better payoff. Several experimental and empirical studies show behavioral responses that deviate from the prescription of standard game theory and report the evidence of non-equilibrium play (Costa-Gomes, Crawford, & Broseta, 2001). Equilibrium play in normal form games corresponds to a distinctive pattern (in terms of transitions in the visual information acquisition between own and other player's payoffs), and any deviation generates non-equilibrium responses. Quantal response equilibrium (QRE) belongs to a class of bounded rationality models that relaxes the assumption of the best response and considers errors in choices, keeping the assumption of statistically accurate beliefs and equilibrium responses (McKelvey & Palfrey, 1995). QRE theory has several features in common with findings in recent neuroeconomics literature on noisy and stochastic choice (Haile, Hortacsu, & Kosenok, 2008). QRE can be reduced to a form of bounded accumulation models (Dickhaut, Rustichini, & Smith, 2009), a class of models that has been proven relevant to capture under a common theoretical framework stochasticity in value-based decision, reaction time, and visual fixation (Krajbich, Armel, & Rangel, 2010).

Neuroeconomic studies of coordination games have taken advantage of the established correlations between the populations of neurons in various brain areas and the mental processes in an attempt to validate theoretical models of how people solve the coordination problems (Bourgeois-Gironde, 2010). Coricelli and Nagel (2009) identified the neural substrates of strategizing in the beauty contest games. The successful strategic reasoning in that game effectively correlates with neural activity in the medial prefrontal cortex (Coricelli & Nagel, 2009). Jeankins et al. (2008) examined the repetition suppression of a brain region in cognitive tasks that consist in the introspection of individual's own mental states versus inferences about whether other people are having similar mental states. The neural bases of the human mentalizing ability have immediate neuroeconomic importance in order to clarify the cognitive basis of strategizing as it is captured by game theory (Singer & Fehr, 2005).

Sanfey et al. (2003) investigated by the neural basis of economic decision making in the ultimatum game by using the fMRI. The subjects act as responders in a game where they can either accept or reject an offer made by a proposer who decides how to split a given sum of money between the two. Standard utility theory (Frank, 2003) predicts that the responders accept any offer in this game, on the grounds that any monetary gain is better than none. The unfair offers have a significant chance of being rejected when the proposer is a human being as opposed to a computer (Sanfey et al., 2003). Activity in anterior insula is significantly increased for the rejected unfair offers, suggesting a key role for the emotion in choice and decision making (Braeutigam, 2005).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Smith et al. (2002) utilized the positron emission tomography to study neuronal responses in subjects choosing between risky games (i.e., known payoffs with well-defined probabilities) and ambiguous games (i.e., known payoffs with undefined probabilities). The main finding in that study is a behavioral interaction effect between outcome structure (e.g., risk and ambiguity) and payoff structure (e.g., loss and gain). The interaction effect observed in that study is contrary to standard economic reasoning, where individual assumes the evaluations of outcomes and payoffs to be independent (Braeutigam, 2005). McCabe et al. (2001) applied the fMRI to study the neuronal mechanisms indicating the cooperation in the two-person reciprocal exchange. The observations made in that study suggest that in a game of trust and reciprocity, the cooperative subjects considerably exhibit more activity in the frontal pole (e.g., Brodmann area 10 in neural systems) than non-cooperative players. The main finding in that study can bear on the studies of pervasive developmental disorders (e.g., autism) associated with deficits in theory of mind processes (Siegal & Varley, 2002).

Rilling et al. (2004) tested the possible role of the dopamine prediction error in evaluating the outcome of a cooperative decision in the fMRI experiment using the prisoner's dilemma paradigm. The prisoner's dilemma is a classic non-zero sum game often used to investigate cooperation in evolutionary biology, social psychology, and behavioral economics. Two players have to independently choose to cooperate (C) or defect (D) and will be awarded a sum of money in the function of the choices that they make. There are the four possible outcomes of the game: both players cooperate (CC); both players defect (DD), player 1 cooperates and player 2 defects (CD), or vice versa (DC).

The payoffs for these different outcomes are such that DC > CC > DD > CD. When played only once, DC is the dominant strategy because, irrespective of the strategy of the other player, a rational player has no incentive to deviate from this choice. The brain contrasts between reciprocated and unreciprocated cooperation indicated that only reciprocated cooperation activated the ventral striatum and the ventromedial prefrontal cortex (Declerck et al., 2013). This activity reflects a positive prediction error (i.e., the discrepancy between reward estimate and actual outcome) from which the player can learn whether to keep on cooperating or to switch to a different strategy (Declerck et al., 2013).

The intrinsically rewarding value of cooperation without remuneration has been illustrated with fMRI. Decety et al. (2004) compared the neural correlates of cooperation and competition during a computer game whereby players had to construct a target pattern either alone, with another person (cooperation) or against another person (competition). Compared to competition, cooperation is associated with increased activity in the ventromedial prefrontal cortex and the posterior cingulate cortex. Decety et al. (2004) interpreted these results to be consistent with prepositions that people seek cooperation because it is socially more rewarding than competing. Krajbich et al. (2009) stated that the role of the ventromedial prefrontal cortex in generating positive affect from social interaction is confirmed by a study of patients with the ventromedial prefrontal cortex lesions.

The ventromedial prefrontal cortex patients are less generous and less trustworthy in a battery of economic games concerning the inability to experience social emotions (Bechara & Damasio, 2005). The hedonic rewards deriving from cooperation result from the fact that many people are intrinsically motivated to cooperate out of fairness considerations (Tabibnia & Lieberman, 2007). People are motivated to make decisions they consider to be morally right (Declerck et al., 2013). Moral judgments whether or not it is right to seize the life of one person to save several others activate the ventromedial prefrontal cortex. Patients with the ventromedial prefrontal cortex lesions are more likely to authorize utilitarian responses (Young & Koenigs, 2007).

## Types of Evidence about Economic Behavior

Neuroeconomics provides three types of evidence regarding economic behavior as follows: (1) evidence which suggest the influence of new variables that are implicit, underweighed, or missing in the rational choice theory; (2) evidence which show mechanisms that implement the rational choice (e.g., utility maximization and the Bayesian integration of information), typically in tasks that are highly sculpted to make decisions that are useful for survival across species (e.g., vision, food, sex, and safety); and (3) evidence which support the kinds of variables and parameters introduced in behavioral economics in terms of time discounting, ambiguity aversion, nonlinear probability weighting, and limited strategic thinking. Firstly, the goal at the evidence for new psychological variables is to show that understanding biology and the brain can make fresh predictions about observed choices. Debates between rational choice and behavioral models usually revolve around psychological constructs, such as loss aversion (Kahneman & Tversky, 1979), the role of learning and limited strategic thinking, a preference for immediate rewards, and precise preferences over social allocations, which have not been observed directly.

Secondly, the evolution regarding evidence for the rational choice principles has either created neural circuits which reach the Bayesian rational choice, or learning mechanisms that generate the Bayesian rational choice with sufficient experience in a stationary environment, putting to use the highly developed capacities for sensory evaluation (e.g., vision, taste, and smell), memory, and social imitation. Platt and Glimcher (1999) found the remarkable neurons in monkey's lateral intraparietal cortex correlated with the expected value of juice rewards, triggered by a monkey's eye movement (Bayer & Glimcher, 2005). Deaner et al. (2005) stated that monkeys can reliably negotiate the juice rewards with exposure to the visual images.

Thirdly, the behavioral economics principles concerning evidence for behavioral economics principles explain the four areas in which neuroscience has established the tentative neural foundation for ideas from behavioral economics which are derived from experiments and field data. The four areas of behavioral economics principles involve time discounting, ambiguity aversion, nonlinear probability weighting, and limited strategic thinking.

1. Time discounting: Extensive experiments with animals, and later with humans, established that the discount factor put on future rewards is closer to a hyperbola, $1/(1+kt)$, than an exponentially-declining discount factor $\delta^t$.
2. Ambiguity aversion: In subjective expected utility theory, the willingness to take bets on events is taken to reveal subjective probabilities of those events. The Ellsberg Paradox showed that for a small majority of subjects, when two events are equally likely but poorly understood, the revealed decision weights seem to combine judgment of likelihood and an additional factor which leads to an aversion to betting under ambiguity.
3. Nonlinear probability weighting: In the expected utility theory, the utilities of gamble outcomes are weighted by their probability p. But many experimental studies suggest that people actually weight probabilities nonlinearly with a function $\pi(p)$, overweighting low probabilities and underweighting probabilities close to the certainty effect.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. Limited strategic thinking: In game theory, players are in equilibrium when they guess correctly what other players will do. When their beliefs about other players' strategies match the actual strategies others choose. Camerer et al. (2004) described an alternative cognitive hierarchy theory in which players use various steps of strategic thinking. Some step-0 players randomize, other step-1 players anticipate randomization and best-respond to it, step-2 players best-respond to a mixture of step-0 and step-1 players, and so on. Since the highest-step players anticipate correctly the distribution of what other players will do, their beliefs are in equilibrium, but the beliefs of lower-step thinkers are not in equilibrium because they do not guess correctly what higher-step players will do.

## FUTURE RESEARCH DIRECTIONS

The strength of this chapter is on the thorough literature consolidation of neuroeconomics. The extant literature of neuroeconomics provides a contribution to practitioners and researchers by describing a comprehensive view of the functional applications of neuroeconomics to appeal to the different segments of neuroeconomics in order to maximize the business impact of neuroeconomics in the decision-making process. The classification of the extant literature in the domains of neuroeconomics will provide the potential opportunities for future research. Future research direction should broaden the perspectives in implementation of neuroeconomics to be utilized in the knowledge-based organizations.

Practitioners and researchers should acknowledge the applicability of a more multidisciplinary approach toward research activities in implementing neuroeconomics in terms of knowledge management-related variables (e.g., knowledge-sharing behavior, knowledge creation, organizational learning, learning orientation, and motivation to learn). It will be useful to bring additional disciplines together (e.g., strategic management, marketing, finance, and human resources) to support a more holistic examination of neuroeconomics in order to combine or transfer existing theories and approaches to inquiry in this area.

## CONCLUSION

This chapter presented the fundamentals of neuroeconomics, thus describing the concept of neuroeconomics; neuroimaging applications; neuroeconomics and loss aversion; neuroeconomics and temporal discounting; neuroeconomics of decision making in humans and animals; neuroeconomics, behavioral economics, and irrationality; neuroeconomics and utility theory; neural systems in economic decision making; neural systems in reward system; neural systems in cognitive control system; game theory, strategic interaction, and neuroeconomic studies; and the types of evidence about economic behavior.

Research in neuroeconomics has revealed the potential representations of value and costs within the brain. Understanding how the brain uses information about uncertainty when making decisions, and the brain circuits and chemicals involved in that process, effectively form the foundation for this emerging field. Studying the brain's decision-making processes using a combination of techniques from the fields of psychology, neuroscience, and economics, neuroeconomics determines the practical understanding of the brain's decision-making processes, thus challenging age-old assumptions to support more tailored research, treatment options, and greater insight into how and why judgments are formed.

Regarding neuroeconomics, the studies of decision making in social environments have explained the emotional components of decision making that may help to explain some deviations from optimal decision making in humans. Neuroeconomics brings together behavioral methods and sophisticated computational theories from microeconomics, an understanding of emotional influences on behavior from psychology, and human functional neural imaging from neuroscience. It is essential for modern organizations to understand their neuroeconomics applications and develop a strategic plan to regularly check their practical advancements of neuroeconomics toward achieving improved organizational performance.

## KEY TERMS AND DEFINITIONS

**Behavioral Economics:** The study of the effects of social, cognitive, and emotional factors on the economic decisions of individuals and institutions and the consequences for market prices, returns, and the resource allocation.

**Decision Making:** The cognitive process resulting in the selection of a course of action among several alternative scenarios.

**Game Theory:** A model of optimality taking into consideration not only benefits less costs, but also the interaction between participants.

**Loss Aversion:** People's tendency to strongly prefer avoiding losses to acquiring gains.

**Nash Equilibrium:** A stable state of a system that involves several interacting participants in which no participant can gain by a change of strategy as long as all the other participants remain unchanged.

**Neuroeconomics:** An interdisciplinary field that seeks to explain human decision making, to analyze the ability to process multiple alternatives, and to choose an optimal course of action.

**Neuroscience:** The scientific study of the nervous system.

**Utility Theory:** A theory used in economics that holds the belief that an item or service's utility is a measure of the satisfaction that the consumer will derive from the consumption of that particular good or service.

# Chapter 6
# An Integrated Model of Perceived Risk and Risk-Reducing Strategies in the Tunisian Stock Market: Risk-Behavior Model

**Azza Béjaoui**
*University of Sousse, Tunisia*

**Adel Karaa**
*College of Business Administration, University of Hail, Saudi Arabia*

## ABSTRACT

*This chapter examines the antecedents and consequences of the perceived risk of investors towards the Tunisian stock market. A questionnaire was developed and distributed to 411 individual investors chosen by 24 brokerage firms. Using the structural equation model, we operationalize the risk following the psychometric paradigm according to subjective variables (i.e. familiarity and controllability). Results prove that controllability is a significant factor in the formation of perceived risk. We also show that several factors related to the investor, the listed companies and to the stock market can influence the perceived risk by the investor towards the Tunisian stock market. Similarly, we find that perceived risk leads to intensive information search, good performance and a strong reinvestment intention. These results attest the importance of the risk perception in the decision-making process.*

## INTRODUCTION

Risk is a very important topic of investing since apprehending what it is and how it is measured is crucial for developing an investing strategy (Ricciardi, 2004). For this end, many researchers continue to look for a more thorough understanding of what constitutes risk and how it should be measured and priced in

financial markets. In spite of previous and subsequent researchers, there is no widely accepted definition in the extent literature. Earlier studies such as Lopes (1981) and March and Shapira (1987) consider risk as the product of the consequences of an event and it probability of occurrence whereas other studies like Kaplan and Garrich (1981) define risk as the sum of danger and opportunity. By emphasizing on a 'negative connotation', some researchers prefer to define risk as virtually expected loss after a decision making (Loppe, 1988), or everything that leads to involuntarily harm (Cuny and Gaillard, 2003), or the possibility of harm, loss, destruction or an undesirable event (Ricciardi, 2004). The lack of consensus about straightforward definition of risk is not without impact at the empirical level. Indeed, academic research in finance distinguishes two different approaches of risk namely: traditional and behavioral approaches. The traditional approach of risk is based on the Efficient Markets Hypothesis and the rationality of investors. Under these assumptions, investors process information instantaneously and the prices entirely reflect all existing information (Fama, 1965a and 1965b). Besides, investors make financial decisions based on their own approach toward risk and to the actual degree of risk (Ricciardi, 2004). In this regard, Garland (2002) pinpoints that persons focus on objective risk "they have in minds that have been confirmed scientifically utilizing the obtainable knowledge and data". Indeed, objective risk is quantitative which relies on past occurrences of an event and incorporates into numerical assessments to estimate risk. So, the traditional approach of risk is based on quantitative (or objectives) measures (e.g. beta, standard deviation, semivariance, skewness, and kurtosis) which rely on a number of observations (i.e. long-term data over a specific time period) and are generally computed from sophistically statistical methods.

On the other hand, the behavioral approach of risk is based on the behavioral finance theory which is "an interdisciplinary field, developing theoretical basis, know-how, and research from the diverse making sciences of psychology and behavioral economics" (Ricciardi, 2008). Individuals make irrational decisions due to their limitations of capacity to process the information (Simon, 1986) and are influenced by heuristics, cognitive factors and affective issues. Moreover, behavioral finance scholars claim that the objective aspect of risk within decision-making and an individual's understanding of it, known as subjective (or perceived risk), are not necessarily the same (Ricciardi, 2004). So, the behavioral approach of risk attempts to pay more attention to a person and explore risk, not at the aggregate or market level, but at the individual level. In this respect, McDonald and Stehle (1975) pinpoint that "perceived risk is an exante measure which may be based on past returns, fundamental analysis, present hunches and all other information that portfolio managers and analysts believe to be germane". So, the behavioral approach of risk develops subjective measures of risk based on methods of experimental, exploratory, or survey research or psychometric paradigm.

Interestingly, the present research attempts to contribute to this line of research through an investigation of the risk perception of individual investors in the Tunisian stock market. In this respect, we study the risk perceived by investors toward the stock market by proposing a risk-behavior model which includes the antecedents and consequences of perceived risk. In the marketing literature, the perceived risk consists of two distinct components, namely: uncertainty and importance (or significance) of consequences (Mallet, 2000; Dandouau, 2000; Verhage et al., 1990; Mitchell and Greatorex, 1989) causing the information search and reduction of the amount at stake (risk-reducing strategies) in order to decrease risk (Cho and Lee 2006; Taylor, 1974; Cox, 1967a). For instance, Taylor (1974) claims that "uncertainty about the outcome can be reduced by acquiring and "handling" information. Uncertainty about the consequences can be dealt with by reducing the consequences through reducing the amount at stake or putting off the choice". So, we examine the information search and reduction of amount at stake as two

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

different modes of behavioral responses to attenuate the perceived risk of individual investors. Also, we investigate the effect of risk perception on the investment behavior through the investment performance and the reinvestment intention.

Aside from consequences, we examine factors related to listed companies (the perceived quality of disclosed information and the satisfaction with yield reallocation), the investor (investor's individual profile) and the stock market (the information asymmetry and social influences) as key antecedents of the perceived risk.

From empirical standpoint, sets of questions were identified as items in questionnaire (distributed to individual investors). In particular, we use the two-dimension psychometric model of Slovic (1987) (i.e. familiarity and controllability) as a measure of risk perceptions for Tunisian individual investors.

The outline of the paper is as follows. Section 1 exhibits the model development as well as the empirical literature of risk perception. In section 2, we expose the data set used in this research. The different estimation results are provided in section 3. Discussion is reported in section 4.

## SECTION 1. RISK-BEHAVIOR MODEL DEVELOPMENT

The following section reports the empirical literature of risk perception in the investment context and discusses conceptual grounds for the different constructs and relationships described in our model.

### 1.1. Risk Perception in the Investment Context: Some Empirical Evidence

The risk perception can be defined as an assessment of risk in an uncertain investment environment (Mahmood et al., 2011) which may or may not actually prove because of many factors (Douglas and Wildavstry, 1982). Traditionally, Gooding (1975) attempted to study the risk perception in the investment context. By testing if investors perceive difference among nine stocks in terms of risk and return. To do this, a survey was mailed to randomly selected participants (professors, portfolio managers and individual investors) based on their investment related to experience and education. Results show that "while investor groups' average stock perceptions are highly related to relevant risk and return measures, significant differences may exist between portfolio managers and nonprofessional investors' average multidimensional perceptions". Subsequently, many studies attempt to examine and explain the differences of risk perception between investors (e.g. Yates and Firer, 1997 ; Gendron and Genest, 1993 ; Capstaff, 1989 ; Mear and Firth, 1988 ; Farrelly et al., 1984, 1985, 1987 ; Firer et al., 1986). For example, Farrelly et al. (1985) investigate the relationship between perceived risk and the accounting based proxies for risk identified by Beaver et al. (1970). Results prove that leverage, variability in earnings and current ratio explained 79% of the variation in average perceived risk. Farrelly et al. (1987) try to identify the accounting variables which predict risk classes as defined by investors' risk ratings. Results display that the debt ratio has a positive relationship with risk ratings whereas profit margin, return on equity, times interest earned, book value and current ratio have a negative relationship with risk perceptions.

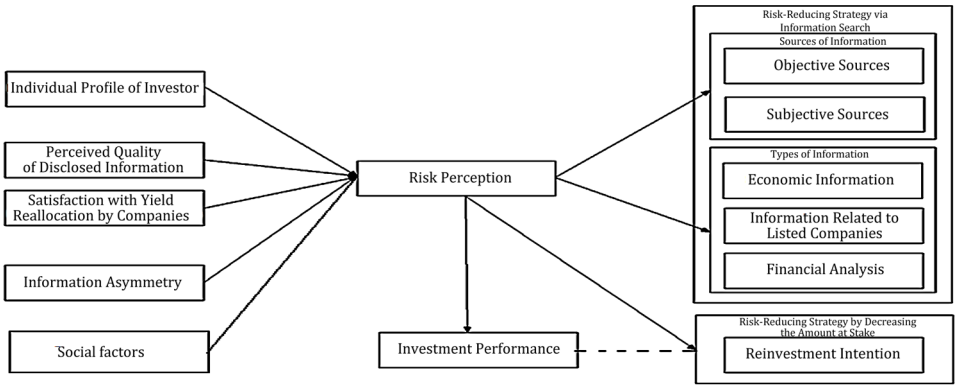
Firer et al. (1986) attempt to study the risk perception of individual and institutional investors in the Johannesbourg stock exchange. By means of questionnaires, they show no significant differences in the risk perception between the two sets of investors. Firer et al. (1986) also display that individual's risk perceptions are correlated with other measures of risk. Moreover, Mear and Firth (1988) show that six accounting variables (e.g. liquidity ratio, industry concentration, profitability) explain approximately

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

93% of the variation in the mean risk perceptions by developing a regression model. Results show that earning variability, total risk, four year price performance and familiarity with the firm explain the risk perceptions of financial analysts. In particular, knowledge and familiarity with stocks are factors that influence the risk perception. This finding was confirmed by Yates and Firer (1997). Besides, Gendron and Genest (1993) examine the impact of socioeconomic and institutional factors on the risk perception of portfolio managers. They display the importance of some factors (e.g. management quality) in the risk perception. Recently, Veld and Veld-Mercoulova (2008) study the risk perceptions of individual investors by asking experimental questions to 2226 members of a consumer panel. Results prove that most investors implicitly use more than one risk measure to assess the market risk. Vlaev et al. (2009) pinpoint the influence of some factors on the risk perception of investors.

Another studies point out the importance of psychological factors in the formation of the risk perception and investment decisions (e.g. MacGregor et al., 2000 ; MacGregor and Slovic, 1999 ; Olsen, 1997 ; Slovic, 1983). For example, MacGregor et al. (2000) attest that imagery and affect influence the risk perception of investors. Olsen (1997) show that four risk features which investors assign to their perceptions of risk are the concern for a large loss, the feeling of control, the potential for a below-target return and a perceived degree of knowledge. Other contextual factors can influence the risk perception of investors (MacGregor et Slovic, 1999).

Mahmood et al. (2011), Cho and Lee (2006) and Wang et al. (2006), among others, prefer to study the risk perception of investors by proposing a conceptual model in order to highlight this "complex psychological process" (Yates and Firer, 1997). Indeed, Mahmood et al. (2011) develop a psychological based investment model which includes past investment experience of investors, variations in regulatory policies, information asymmetry, sensational attitude, marital status and gender. These antecedents affect the reinvestment intentions of investors and their return propensity and risk perception. Moreover, Wang et al. (2006) develop a risk perception centered model for psychological mechanism of investment behavior. The proposed model encompasses factors (variations in policies related to stock market, information asymmetry, satisfaction with information dissemination by listed company and satisfaction with yield reallocation by listed company) which influence the investment behavior of Chinese individual investors (investment performance, reinvestment intention and investment satisfaction) via the risk perception toward the stock market. To measure the risk perception of investors, Wang et al. (2006) use the two-dimension psychometric model of Slovic (1987). By using a 42-item questionnaire distributed to 1547 investors, results display a speculative orientation and a low level of risk perception among investors. On the other hand, Cho and Lee (2006) investigate the role of perceived risk in consumers' adoption of risk-reducing strategies in the context of household investment decisions. Results display that higher self-efficacy, greater wealth position and risk-taking propensity lower an individual's perceived risk for investing in the stock market. Cho and Lee (2006) also find that perceived risk increases the amount of information search and transaction frequency whereas it reduces the proportion of assets invested in the stock market.



## 1.2. Conceptual Framework

The model investigated in this study is depicted in figure 1. The proposed model encompasses the antecedents and consequences of the perceived risk when investing in the stock market.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 1. Conceptual Model of Antecedents and Consequences of Perceived Risk*

The model (figure 1) is based on the following propositions: **(1)** The investor's individual profile (factor related to investor), the perceived quality of disclosed information and satisfaction with yield reallocation by listed company (two factors related to company) and the information asymmetry (factor related to stock market) influence the investor's risk perception; **(2)** The risk perception affects the behavior intended to manage uncertainty and significance of consequences; **(3)** The risk perceived by the investor has an impact on his investment performance.

As reported in figure 1, the proposed model rests on the following propositions: **(1)** The investor's individual profile (factor related to investor), the perceived quality of disclosed information and satisfaction with yield reallocation by listed companies (two factors related to company) and the information asymmetry and social influences (factors related to stock market) influence the investor's risk perception; **(2)** The risk perception affects the behavior intended to manage uncertainty and significance of consequences; **(3)** The investment performance plays a mediating role in affecting risk perception's impact on reinvestment intention.

### 1.2.1. Definitions of Perceived Risk

Despite of the abundance of research studies on risk perception, it is still difficult to pinpoint a straightforward definition of perceived risk. To illustrate this, Mallet (2001) reveals that "*the vagueness which characterizes the concept of perceived risk stands out as well at the level of the proposed definitions as at the level of its various facets*". Besides, Brunel (2002) reports that "*if there is no agreement around the definition of the perceived risk, there does not exist either of consensus relating to nature even contents of the latter*". Nevertheless, some attempts to define the perceived risk exist in the literature. Indeed, Bauer (1960) introduces the perceived risk by indicating that "consumer behavior involves risk in the sense that any action of a consumer will produce consequences which he cannot anticipate with anything approximating certainty, and some of which at the least are likely to be unpleasant". So, the perceived risk involves two components: the uncertainty and the negative consequences (losses). As matter of fact, Cox and Rich (1964) assert that perceived risk is "a function of two main factors, namely the amount at stake in the purchase decision, and the individual's feeling of subjective certainty that he/she will "win" or "lose" all or some of the amount at stake". As reported by Kogan and Wallach (1964), the perceived risk includes "[…] two somewhat different facets: a "chance" aspect where the focus is on probability:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

and a "danger" aspect where the emphasis is on severity of negative consequences". By emphasizing on the first component, Yates and Stone (1992) point out that there is no risk if there is no uncertainty. More explicitly, a decision situation is so-called risky when a person is uncertain about consequences of his choices (Cox, 1967a). Such a situation is likely on the one hand when possible outcomes generated by a decision vary considerably (Libby and Fishburn, 1977) and on the other hand, obtaining the desired results is strongly affected by chance. The degree of such uncertainty is judged differently from one person to another (i.e. perceived risk) (Cho and Lee, 2006). So, if the immanent uncertainty of a decision situation corresponds to objective risk, then perceived risk would be a subjective and biased evaluation of this objective risk encouraging afterward a decision-maker to choose a particular behavior (Dowling and Staelin, 1994).

Perceived risk also has a second component: significance of consequences. According to Dandouau (2000), uncertainty is "*a necessary but not sufficient condition, in order to have risk perception. Perceive uncertainty without buyer having to bear any consequences does not lead to represent his choice problem in terms of perceived risk*". The consequences relate to how the financial losses related to negative consequences are harmful (Mitchell, 1999). Cox (1967a) indicates that potential losses include the unachieved goals, loss incurred in the purchase (e.g. money and time), the penalties imposed on the person by his environment and other hazards associated with the purchase. In particular, if this loss affects significantly their financial situations, then people will tend to perceive such a risky decision situation.

Sitkin and Pablo (1992) define risk perception as a decision maker's assessment of the risk inherent in a situation. In this regard, Sitkin and Weingart (1995) refer perceived risk to "an individual's assessment of how risky a situation is in terms of probabilistic estimates of the degree of situational uncertainty, how controllable that uncertainty is, and confidence in those estimates". According to Ricciardi (2004), perceived risk is a person's opinion of the likelihood of risk related to engaging in as specific activity. Perceived risk seems to be an individual's biased assessment of a risky situation and its assessment is dependent on one's psychological and situational features.

## 1.2.2. Antecedents of Perceived Risk

Slovic (1988) reports that many factors that may influence the person's risk perception. Indeed, "several factors influence it, but some of the models suggested for risk perception have failed to explain more than a small fraction of it" (Sjöberg, 2000). In marketing research, these factors can be classified according to belonging to the characteristics of the individual, the product and the situation (e.g. Mallet, 2004; Volle, 1995). We attempt to identify factors influencing risk perception in the investment context as belonging to the investor, the listed company and the stock market.

### *1.2.2.1. Antecedent Related to Investor*

Among factors that influence risk perceived by investor is his individual profile. This profile can be defined in terms of two personality traits namely: self-confidence and optimism. According to Ricciardi and Simon (2000), the self-confidence can be depicted as "the belief in oneself and one's abilities with full conviction". Wright (1975) considers self-confidence as the individual's ability to think after observations over time, in order to understand several problems of everyday life. Self-confident individuals perceive themselves as able to manage and cope with inherent risk of investing in the stock market. So, the self-confidence can influence the way the investors perceive risk towards the stock market. Opti-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

mism is defined as "the overestimation of one's chances or one's ability" (Page, 2009). According to Weinstein (1980), individuals have unrealistic views of their own abilities. Many studies attest its existence in students' behavior (Grimes, 2002), professionals' behavior (Olsen, 1997), managers' behavior (Malmendier and Tate, 2005, Cooper et al., 1988; Larwood and Whittaker, 1977) and investors' behavior (Barber and Odean, 2001, Gervais and Odean, 2001; Bernatzi and al., 1999). This personality trait may affect the risk perceived by a person. This was confirmed by Roy and Tvszka (2005) who argue that "a robust finding on risk perception is that most people tend to be optimistic in evaluating their own future. That is, comparing to objective criteria, people assign too high probabilities to their attainments of desired outcomes". Kouabenan et al. (2006) report that optimism is an obstacle to assessing risk in the extent where people feel they are less exposed to risk than others. Moreover, Kouabenan et al. (2006) point out that "this perception is underpinned; it seems, by some overestimation of his personal ability to cope with risks involved and to perception rather poor capabilities of others to manage them". Thus, optimistic people tend to perceive risk level lower than pessimists in the investment context. Therefore, we posit the following hypothesis:

**H1:** The higher the optimism and self-confidence of investor the lower the perceived level of risk toward the stock market

#### *1.2.2.2. Antecedents Related to Listed Company*

a. Perceived Quality of Disclosed Information by Listed Company

The quality of information transmitted to the stock market play crucial role in the financial theory. Indeed, Rogers (2008) indicates that "well-functioning capital markets rely on high quality disclosure". According to Djongoue (2007), it is deemed relevant when it offers the opportunity to its users to evaluate all events in a correct manner (past, present and future). In this regard, Boisselier and Mekaoui (2005) reveal that the choice of disclosure strategy is an important constraint which a company has to deal with in the response of the stock market's expectations. Therefore, the quality of information delivered to stock market is the only guarantee to satisfy investors. Moreover, Declerck and Martinez (2004) indicate that "the information disclosure aims to better developing company by improving perception of investors and other market participants". Gao (2008) asserts that information disclosure influences the investor's perception. As a matter of fact, he reports that "while disclosure reduces the risk of per unit investment, it could increase the total investment."

Unlike the previous studies which explore the quantitative aspect of the information reporting, we focus on the impact of the disclosed information's perceived quality on the investor's risk perception. The perceived quality of disclosed information can be defined as the individual judgment experienced by the investor toward the information communicated by the listed company. In other words, it could indicate the level of information's quality as it was perceived, in a subjective way, by investor. Perceiving good quality of disclosed information leads to a lower level of risk perceived toward the stock market. Moreover, Wang et al. (2006) specify that "good quality of information disclosure (e.g. transparency, timely release, integration and authenticity) could reduce investors' risk perception". We thus formulate the following hypothesis:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**H2.1:** The higher the perceived quality of disclosed information by listed companies the lower the perceived level of risk toward the stock market.

b. *Satisfaction with Yield Reallocation by Listed Companies*

Satisfaction with yield reallocation by listed company is an antecedent of perceived risk related the features of listed companies. Investors can be concerned with the manner in which listed companies reallocate the profits from their activities. Thus, the choice of particular strategy in terms of reallocation of profits inevitably determines the relationship between the company and the investor. In fact, we can define satisfaction with yield reallocation as judgment experienced by an investor with respect to the choice of company's reallocation of profits. Given the importance of this element for market participants, satisfaction with yield reallocation by listed companies could exert significant influence on their risk perception. People satisfied with yield reallocation by listed companies perceive lower level of investment risk compared to persons who are less satisfied, as stated in the following hypothesis:

**H2.2:** The higher the satisfaction with yield reallocation by listed companies the lower is the perceived level of risk toward the stock market.

### *1.2.2.3. Antecedents Related to the Investment Context*

In marketing research, many studies show that antecedents related to purchase situation may affect individual's risk perception (Mallet, 2004; Dowling and Staelin, 1994; Lumpkin and Dunn, 1990; Dash et al., 1976). For example, Mallet (2004) reveals that "*purchase situation in which is consumer influences on risk he perceives*". Besides, many psychological studies display that risk perception can be highly influenced by the context in which individuals find themselves when making their decisions (e.g. Cohen et al., 2007).

a. *Information Asymmetry*

The stock market (i.e. investment situation) can influence the risk perceived by the investor. Specially, information asymmetry is retained as an explanatory factor of risk perception. The information asymmetry refers to a situation where investors in stock market do not all have the same information; some investors are more informed than others. Liao et al. (2010) argue that information asymmetry refers to a situation where financial market participants have a set of unequal information. More explicitly, Chan et al. (2008) indicate that it exists when groups of investors hold different information; i.e. informed investors have private information while the uninformed investors have only publicly available information. Sveral studies investigated the information asymmetry between investors has been studied (e.g. Brown and Hillegeist, 2007; Chen, 2003; Admati and Pfleiderer, 1988, Kyle, 1985; Grossman, 1976). For example, Cheng (2003) reveals that information asymmetry is a salient feature of information on China's stock markets. Okpara (2010) indicates that "the level of information asymmetry can be characterized by the risk of trading with a privately informed investor". Thus, the less the investors share the same information, the more they perceive a high level of risk toward the stock market. Therefore, we posit the following hypothesis:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**H3.1:** The greater the information asymmetry in the stock market, the lower the perceived level of risk toward the stock market.

b. Social Influences

The interpersonal relationships play generally an important role in a decision-making situation. Indeed, many researchers report that several social factors influence the risk perception of customers in the purchase situation (e.g. Poumadère, 2000). In the making-decision situation, people often rely on information which they collect from others. Leaders, family, reference groups, among others, can be one source of such influence since, through their knowledge; they can attenuate their risk perception. In the investment context characterized by high uncertainty, persons can reduce the risk perception of investors. Thus, we expect that social factors can influence negatively the perceived risk of investors toward the stock market, as stated in the following hypothesis:

**H3.2:** The social factors reduce the perceived level of risk toward the stock market.

## 1.2.3. Consequences of Perceived Risk

According to Ingene and Hughes (1985), the risk perception leads to risk-reduction activities. The perceived risk can be handled by using two different risk-reducing strategies. The first strategy is to diminish uncertainty through information search and the second strategy is to attenuate vulnerability by decreasing the amount at stake.

Besides, a person who invests in the stock market will inevitably seek to make gains. Cognizant of this fact, we attempt to investigate the impact of risk perception on investment behavior.

### *1.2.3.1. Information Search*

The relationship between perceived risk and information search activity was studied by several researchers in marketing (Cho and Lee, 2006; Murray, 1991; Lutz and Reilly, 1973; Sheth and Venkatesan, 1968; Cox, 1967a). For example, Murray (1991) indicates that "in the purchase decision process, search information behavior is motivated in part by perceived risk and consumer's ability to acquire relevant information which purchase uncertainty can be addressed". By attempting to explain this link, Cho and Lee (2006) note that high perceived risk drives individuals into a distressed and anxious state which thereafter incites them to pursue problem solving activities. Thus, they use information search as a problem-resolving strategy in order to mitigate perceived risk (Dowling and Staelin, 1994). Nevertheless, other researchers reject the existence of this link. In particular, Volle (1995) indicates that high risk perception causing more information search is questionable. Gemunden (1985) points out that the half of empirical studies in the risk perception literature rejects positive relationship between perceived risk and information search. Some proposals for explanation were provided by Simon (2000) such as the existence of information costs, a degree of risk perception below a minimum threshold, potential dissonance generated by additional information. According to Cho and Lee (2006), the absence of the relationship between the risk perception and information search is due to decision situations examined in previous studies which characterized by relatively low levels of risk (e.g. products that were bought

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

routinely). That is why the consumer does not seek the information. In contrast, in another decision contexts where the level of risk is relatively high (e.g. investment in stock market), risk perception leads necessarily to important search information.

a. *Information Sources*

Each investor must bear the risk associated with fluctuating securities prices. So, searching for information is an essential activity in order to make the investment decisions (Lin and Lee, 2004). In this regard, Loibl and Hira (2009) pinpoint that risk of financial loss and high costs caused by the revision of a bad investment decision motivate investors to seek information. More precisely, Engel et al. (1993) and Locander and Hermann (1979), among others, indicate that information search would be equivalent to consult information sources. Several typologies of sources exist in the information search literature. For instance, Engel et al. (1993) classify information sources as either an internal source or external source. Internal information search is applied when individuals use information already stored in memory while external search involves gathering information from the environment.

In this study, external information can be categorized as objectives and subjective sources. In the investment context, the objective sources comprise the periodic reports, the websites specializing in information as well as the ratings agencies. The subjective sources include investor's entourage (friends, colleagues ...) and word of mouth. To cope with a high perceived risk, an investor who seeks information prefers to consult not only a particular source but different information sources. As matter of fact, Murray (1991) indicates that "consumers use various amounts and types of information sources to reduce perceived risk, depending on the amount and type of risk". Individuals seek information from a variety of sources when they perceive risk (Cox, 1967a). We thus predict the following hypothesis in our context:

**H4:** The higher the perceived level of risk toward the stock market the higher the number of information sources consulted.

b. *Information Types*

Perceived risk determines not only the number of information sources consulted but also the type of information used by the investor. By attempting to reduce uncertainty surrounding the decision situation, consumers will use more diverse types of information (Murray, 1991). The same behavior could be observed as well in the stock market given that information allows to limit uncertainty surrounding the investment situation. So, when facing high perceived risk, investor tends to use more different types of information. The information used by the investor is classified in three categories. The first category includes economic information (e.g. fluctuation of interest rate ...). The second category contains information related to listed companies (e.g. publication of financial statements...). Finally, the last category encompasses the financial analysis provided by engineering consulting firms and brokerage firms. So, we formulate the following hypothesis:

**H5:** The higher the perceived level of risk toward the stock market the greater the different types of information.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

#### *1.2.3.2. Decrease in the Amount at Stake*

Risk perception could be reduced by diminishing the amount at stake or vulnerability associated with adverse outcomes. Such behavior is intended to decrease the impact of negative consequences which result from a decision-making. In this study, the key behavior would be to revise the intention of reinvestment on the stock market. In social psychology, the intention is the best predictor of an individual's behavior since person can incorporate independently relevant factors which may influence current behavior (Fishbein and Ajzen, 1975). Among these factors, we could retain risk perception. Individuals perceiving a high level of risk would tend to change their intention to reinvest in the stock market. Like Lehu (2004), we could define reinvestment intention as the disposition of an investor to renew the next time his investment's experience in the stock market. So, we posit the following hypothesis:

**H6:** The higher the perceived level of risk toward the stock market the lower the perceived level the reinvestment intention in the stock market.

#### *1.2.3.3. Investment Performance*

By opting for investment in stock market, each investor tries to make profitable his financial placements. Thayer (2008) indicates that "[…] one universal factor in making an investment decision is the desire to realize a positive return". Swanson and Lin (2005) point out that investment performance is the result of the investor's behavior in stock market. Although the research is limited, performance achieved by an investor in the stock market (i.e. investment performance) can be affected by risk perception. By investigating the psychological mechanisms of risky investment behavior of 1547 individual investors in Chinese stock markets, Wang et al. (2006) show a positive relationship between risk perception and investment performance. Thus, higher risk perception can engender higher investment performance. Perceiving a high level of risk toward stock market leads the investor to carry out a good investment performance. In this study, we attempt to examine if the investment performance play a mediating role in the relationship between risk perception and reinvestment intention, as stated in the following hypothesis:

**H7:** The investment performance plays a mediating role between the risk perception and the reinvestment intention.

## SECTION 2. QUESTIONNAIRE, DATA AND OPERATIONALIZATION OF CONSTRUCTS

### 2.1. Questionnaire

Questionnaire is the most commonly used tool in survey research. In this study, the questionnaire is distributed to individual investors via the brokers in the Tunisian stock market. The Tunisian stock market was founded in 1969 and was privatized in 1994. It has been an electronic pure order driven market. Orders are placed by investors via 24 brokers. The Tunisian stock market is a pure order driven market without market makers and operates as continuous market for the more actively traded stocks and a call auction (fixing) for the less liquid stocks. In 2015, the Tunis stock exchange lists 78 stocks.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The trading system used by the Tunisian stock market provides a good transparency; in that the five best quotes on the sell and buy sides of the book with the corresponding cumulated volumes are available to investors in real time via computer screens. However, the limit order book is entirely visible to regulatory authorities and brokers. In 1969, the stock market represents 23% of Tunisia GDP and the share of foreigners in stock market capitalization represents 21.92%. To encourage many companies to access on the stock market, a law was promulgated by reducing the rate tax to 20% during 5 years for companies that issues more than 30% of their capital. Finally, the questionnaire was structured around seven themes as follows:

**Theme 1:** Knowledge about the stock market ;
**Theme 2:** The individual's behavior when making an investment decision ;
**Theme 3:** Factors that may change the investor's behavior ;
**Theme 4:** Information (information search, perceived quality of disclosed information, satisfaction the yield by companies, asymmetric information) ;
**Theme 5:** Risk perception ;
**Theme 6:** Investment behavior (performance, satisfaction investment, reinvestment intention) ;
**Theme 7:** Sociodemographic characteristics.

## 2.2. Description of Data

The data set used to examine the proposed conceptual framework was collected by using a self-administered questionnaire to the individual investors in the Tunis Stock Exchange. Surveyed individuals were chosen by twenty-four brokers in the Tunisian stock market. About 600 questionnaires were distributed among which 487 were recovered, showing a response rate of 81%. Nevertheless, after counting, seventy questionnaires were removed because of a high number of non-responses. Finally, only 411 questionnaires were considered to be exploitable.

### 2.2.1. Typology of Respondents

Table 1 reports the key sociodemographic features of individual investors including gender, age, status, employment and income.

Table 1. summarizes the main social sociodemographic characteristics of individual investors. The majority of investors are men who generally are between 40 and 49 years old. Most of investors are married with children and earn between 1000 and 1500 TND.

80.3% of investors were men while women represented only 19.7%. The most important age group in the sample is that of 30-39 years (37%), followed by the 40-49 years (27.5%) and then those aged 20 to 29 (20.2%). Finally, the least important age group is that of more than 60 years (4.1%). Moreover, the majority of respondents are married and has children (54.4%). Besides, the sample includes senior officials (40.1%), middle managers (28.6%), employees (12.1%), freelancers (12.1%), retirees (4.7%), students (2.2%) and unemployed persons (0.2%). Finally, 26.5% of respondents earn between 1500TND and 2000TND while only 5.3% have incomes below 500TND.

### 2.2.2. Characteristics of Investment Behavior in Stock Market

Table 2. reports the features related to knowledge of investors about the Tunisian stock market and their investment behavior.

Table 2. summarizes the main characteristics of individual investors in terms of investment behavior. In general, the majority of respondents think that have professional knowledge and lost money by investing in a financial asset. Besides, 40.3% of respondents are quite satisfied with their investments and they are quite satisfied with the Tunis Stock Exchange.

2.7% of respondents admit that they do not have any knowledge on the investment in stock market, whereas only 37.8% feel they have professional knowledge, although the majority of investors (94.4%) believe that a better knowledge of the investment in the stock market makes the investment more profitable. Also, most respondents (98.8%) indicate that they already invested in the stock market via one or more investment channels (internet, banks, private manager or others) while less than 2% of investors (1.2%) are inexperienced. Moreover, 29% of respondents have experience ranging between 2 and 5 years followed successively by those with more than 10 years (25.8%) and between 5 and 10 years (20.9%) while those having only experience of 1 and 2 years and less than one year are respectively about 14.4% and 10%.

Only 79% of respondents lost money by investing in a financial asset. Besides, the majority of respondents (76.6%) choose one broker, whereas 21% opt to two or several financial institutions when investing in the Tunis Stock Exchange. Meanwhile, 38.8% of the individual investors spend less than 25% of their savings to invest in a financial asset. 31.7% and 15.1% of respondents devote between 25% and 50%, 50% and 75% respectively for investment.

| **Investment horizon** | No idea<br>Short term<br>Medium term<br>Long term | 8.8<br>32.3<br>49.4<br>9.5 |
| **Average holding period of a security** | Less than 3 months<br>Between 3 months and 6 months<br>Between 6 months et one year<br>Between one year et 3 years<br>More than 3 years | 21.2<br>30<br>26.6<br>17.1<br>5.1 |

| **Investment experience** | | | | |
|---|---|---|---|---|
| Less than one year | Between 1 and 2 years | Between 2 and 5 years | Between 5 and 10 years | More than 10 years |
| 10% | 14.4% | 29% | 20.9% | 25.8% |

| **Investment Satisfaction** | | | | | |
|---|---|---|---|---|---|
| | Not at all satisfied | Unsatisfied | Somewhat satisfied | Satisfied | Quite satisfied |
| Investment satisfaction last year | 7.6% | 21.4% | 40.3% | 24.8% | 5.9% |
| Satisfaction about the Tunisian stock market | 5.1% | 18.8% | 38.6% | 30.6% | 6.8% |

Results also show that almost half of respondents (49.4%) invest in the medium term. 32.3% and 9.5% of people invest respectively in the short and long term. Moreover, we find that 30% of investors keep, on average, a stock between 3 and 6 months, while 26.6% hold it from 6 months to one year. However, 21.2% of respondents hold it less than 3 months while 17.1% preserve it between one year and 3 years.

We also note that 40.3% of respondents are quite satisfied with their investments last year while only 7.5% are not satisfied at all. In addition, 6.8% of respondents are completely satisfied with the investment on the Tunis Stock Exchange whereas 5.1% are unsatisfied. The majority of the individuals are quite satisfied with the Tunis Stock Exchange (38.6%).

## 2.3. Operationalization of Constructs

First, the exploratory factor analysis (or principal component analysis) is used to purify and test the homogeneity of the constructs. Specifically, the principal component analysis is useful because it allows us to identify the dimensions (Churchill, 1979). Evrard et al. (2003) report that the principal component analysis allow "from a theoretical point of view [...] to pass measures to theoretical concepts that can be measured directly; variables are considered to be combinations of a number of unobservable common underlying factors (latent variables)". Then, the confirmatory factor analysis enables us to verify the factor structure extracted from the exploratory phase. In this regard, Roussel et al. (2002) reveal that unlike the exploratory factor analysis with "a posteriori factor structure" confirmatory factor analysis defines "a priori factor structure that we are trying to confirm". According to Gerbing and Hamilton (1996), the confirmatory factor analysis offers the opportunity to test "strictly a model that must be specified a priori". In this study, confirmatory factor analysis was conducted using the structural equation modeling[1].

Exploratory and confirmatory factor analyzes of the different constructs were performed on the data set (N = 411) through SPSS version 17 and AMOS version 18 respectively. The following section reports results of exploratory and confirmatory factor analyzes.

### 2.3.1. Measures of Perceived Risk's Antecedents

As previously indicated, the antecedents of perceived risk are:

- Individual Profile of Investor
- Perceived Quality of Disclosed Information
- Satisfaction with Yield Reallocation by Companies
- Information Asymmetry
- Social Factors

#### *2.3.1.1. Measure of Individual Profile of Investor's Construct*

To operationalize the individual investor profile, we ask each respondent to self-assess personality traits (Table 3). In this respect, we use the semantic differential (i.e. the Osgood scale) which takes the form of a 5-point bipolar scale. The scale is thus encoded from (-2) to (+2) where the neutral point is zero. The two antonyms adjectival words are placed on the two extreme points (e.g. cautious - go-getter).

Table 3. reports the different personality traits. In this table, two antonyms adjectival words are placed on the two extreme points.

*Table 3. List of Items of the Individual Investor Profile's Measure*

| Items | Investor's Individual Profile |
|---|---|
| **TRAIT_PERS1** | Cautious Person/Go-Getter Person |
| **TRAIT_PERS2** | Intuitive Person/ Cartesian person |
| **TRAIT_PERS3** | Pessimistic Person/ Optimistic Person |
| **TRAIT_PERS4** | Skeptical Person / Confident Person |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Following a first principal component analysis on data (N = 411), the item TRAIT_PERS1 (Cautious /Go-Getter) and the item TRAIT_PERS2 (Intuitive/Cartesian) should be removed given their very poor communalities (0.442 and 0.10 respectively). A second factor analysis with varimax rotation shows that items are related and are therefore factorizable (KMO = 0.500 and Bartlett's sphericity test is significant). Results show hence that the investor's individual profile is a one-dimensional structure. Factor explains 76.971% of the variance of the concept. Reliability of the construct is satisfactory ($\alpha > 0.5$ and Jöreskog's rhô is close to 0.7). Table 4 below summarizes all the results obtained from the exploratory factor analysis.

By performing a principal component analysis of the data (Table 4), we find one-dimensional structure of the concept of Investor's individual profile.

Table 5 reports results of confirmatory factor analysis which allows us to confirm one-dimensional structure of the concept.

By performing a confirmatory component analysis of the data (Table 5), we show the one-dimensional structure of the concept of Investor's individual profile.

Table above includes the standardized (i.e. column 5) and non-standardized (i.e. column 3) loadings related to the items (i.e. column 2) of the factor (i.e. column 1). Results show that the factor loadings are significantly different from zero since all values of t-statistics (or CR) are greater than 1.96 for a significance level of 0.001. These results are then satisfying in order to confirm the factor structure extracted from the exploratory phase.

By checking that all loadings are significantly different from zero, we can a priori ensure the convergent construct validity. The coefficient of convergent validity ($rh\hat{o}_{vc}$=0.531) shows hence that the average variance extracted for this factor is acceptable.

*Table 4. Results of Exploratory Factor Analysis on the Individual Profile's Investor*

*Table 6. List of Items of Perceived Quality of Disclosed Information's Measure*

| Items | Perceived Quality of Disclosed Information |
|---|---|
| **QUAL_PERC_INF1** | Complete information |
| **QUAL_PERC_INF2** | Transparent information |
| **QUAL_PERC_INF3** | Authentic information |
| **QUAL_PERC_INF4** | Real-time information |
| **QUAL_PERC_INF5** | Relevant information |
| **QUAL_PERC_INF6** | Timely information |
| **QUAL_PERC_INF7** | Regular information |

### *2.3.1.2. Measure of Perceived Quality of Disclosed Information's Construct*

The perceived quality of disclosed information's construct is created using seven items (Table 6). Investors are asked to assess the degree of (dis)agreement according to a 5-point Likert scale to the following question: "Do you think that the information disclosed by listed companies is…"

Table 6 reports the different items used to measure the concept of the perceived quality of disclosed information.

After conducting an exploratory factor analysis, the item QUAL_PERC_INF7 (i.e. regular information) is removed due to the communality (i.e. 0.466) is less than 0.5. A new factor analysis on the remaining 6 items converges to a one-dimensional structure of the perceived quality of the disclosed information. This structure explains 61.299% of the concept (Table 7). Furthermore, the perceived quality of the disclosed information's construct is deemed reliable (i.e. $\alpha = 0.872$) since the exclusion of any item does not improve the coefficient of internal consistency. The Jöreskog's rhô coefficient exceeds 0.7 confirming consequently the good reliability.

All results in Table 7 allow us to retain the one-dimensional structure of the concept of perceived quality of disclosed information.

*Table 7. Results of Exploratory Factor Analysis on Perceived Quality of Disclosed Information*

| **Perceived Quality of Disclosed Information** | | | | | |
|---|---|---|---|---|---|
| **Items** | **Loading** | **Communality** | **MSA** | **Cronbach's Alpha** | **Jöreskog's Rhô** |
| **QUAL_PERC_INF1** | 0.794 | 0.630 | 0.872 | **0.872** | **0.866** |

| **QUAL_PERC_INF3** | 0.802 | 0.643 | 0.853 | | |
| **QUAL_PERC_INF4** | 0.737 | 0.543 | 0.920 | | |
| **QUAL_PERC_INF5** | 0.791 | 0.625 | 0.855 | | |
| **QUAL_PERC_INF6** | 0.725 | 0.526 | 0.844 | | |
| **Eigenvalue** | 3.678 | | | **KMO = 0.860** | |
| **Bartlett's Sphericity Test** | $\chi^2$=1068.183; *d.f*=1; *p*=0.000 | | | | |
| **Explained Variance** | **61.299%** | | | N = 411 | |

*Note*: *d.f*: degree of freedom.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 8. reports results of confirmatory factor analysis which allows us to confirm one-dimensional structure of the concept.

Results in Table 8 show the one-dimensional structure of the concept of the perceived quality of disclosed information.

All factor loadings are significantly different from zero (i.e. t > 1.96). In addition, the convergent construct validity is good ($\rho_{vc}$= 0.522). These results lead us to validate the one-dimensional structure extracted from the principal component factor analysis.

### *2.3.1.3. Measure of Satisfaction with Yield Reallocation's Construct*

Satisfaction with Yield Reallocation was measured by considering five items simultaneously. The satisfaction's degree of investors with reallocated yield (ranging from 'not at all satisfied' to 'very satisfied') was assessed via a 5-point Likert scale. Respondents were asked to answer the question "Are you satisfied with the yield reallocation of listed companies?". Table 9 reports the five items which measure the concept of satisfaction with yield reallocation of listed companies.

Table 9. reports the different items used to measure the concept of the yield reallocation of listed companies.

After the first principal component factor analysis, there was a deletion of two items REAL_YIELD4 (i.e. the yield reallocation as split) and REAL_ YIELD 5 (i.e. the yield reallocation as reinvestment in future projects), since the communality is less than 0.5 (respectively about 0.446 and 0.4). Results from a new factor analysis (Table 10) display that three items are factorisable (KMO = 0.662 and Bartlett's

*Table 8. Results of Confirmatory Factor Analysis and Test of Convergent Validity related to the Perceived Quality of Disclosed Information*

| | QUAL_PERC_INF6 | 1.000 | | 0.615 | |

*Notes*: - *** Signification Level: 0.001 ; - CR: CRITICAL RATIO.

*Table 9. List of Items of Satisfaction with Yield Reallocation of Listed Companies' Measure*

| Items | Satisfaction with Yield Reallocation of Listed Companies |
|---|---|
| **REAL_ YIELD1** | Yield Reallocation as Dividend |
| **REAL_ YIELD2** | Yield Reallocation as Allocation of Shares |
| **REAL_ YIELD3** | Yield Reallocation as Cash Capital Increase |
| **REAL_ YIELD4** | Yield Reallocation as Split |
| **REAL_ YIELD5** | Yield Reallocation as Reinvestment in Future Projects. |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 10. Results of Exploratory Factor Analysis on Satisfaction with Yield Reallocation*

| Satisfaction with Yield Reallocation by Companies | | | | | |
|---|---|---|---|---|---|
| **Items** | **Loading** | **Communality** | **MSA** | **Cronbach's Alpha** | **Jöreskog's Rhô** |
| **REAL_ YIELD1** | 0.846 | 0.715 | 0.671 | **0.810** | **0.824** |
| **REAL_ YIELD2** | 0.908 | 0.824 | 0.612 | | |
| **REAL_ YIELD3** | 0.802 | 0.644 | 0.738 | | |
| **Eigenvalue** | 2.183 | | | **KMO = 0.662** | |
| **Bartlett's Sphericity Test** | $\chi^2$=443.183; *d.f*=3; *p*=0.000 | | | | |
| **Explained Variance** | **72.752%** | | | N = 411 | |

*Note*: *d.f*: degree of freedom.

sphericity test is significant). So, we show the one-dimensional structure of satisfaction with yield reallocation. Furthermore, this factor explains 72.752% of the concept with satisfying reliability (i.e. α= 0.810 and ρ= 0.824).

Results in Table 10 display the one-dimensional structure of the concept of satisfaction with yield reallocation by companies.

The confirmatory factor analysis enables us to confirm the one-dimensional structure extracted from the exploratory factor analysis. Results are reported in Table 11.

All results in Table 11 permit us to confirm the one-dimensional structure of the concept of the satisfaction with yield reallocation by companies.

Results show that coefficients are significantly different from zero (i.e. t > 1.96). This reassures us a priori the convergent validity. By computing the coefficient of convergent validity ($\rho_{vd}$), we find that the extracted average validity for this factor is good since $\hat{rho}_{vc}$ is equal to 0.615. Hence, we can validate the factor structure obtained from the exploratory phase.

### *2.3.1.4. Measure of Information Asymmetry*

Asymmetric information plays critical role in the finance theory. However, Hautcoeur (1994) reports that there is a paucity of attempts to directly measure it. This is attributed to the degree of information asymmetry which is not directly observable (Liao et al., 2010). Therefore, researchers most often use variable proxies (Clarcke and Shastri, 2000).

*Table 11. Results of Confirmatory Factor Analysis and Test of Convergent Validity related to Satisfaction with Yield Reallocation*

| Factor | Items | Non Standardized λ | CR | Standardized λ | $\rho v_c$ |
|---|---|---|---|---|---|
| ***Satisfaction with Yield Reallocation by Companies*** | REAL_YIELD1 | 1.157 | 12.649*** | 0.734 | **0.615** |
| | REAL_ YIELD2 | 1.398 | 12.262*** | 0.940 | |
| | REAL_ YIELD3 | 1.000 | | 0.651 | |

*Notes*: - *** Signification Level: 0.001 ; - CR: CRITICAL RATIO.

*Table 12. List of Items of Social Factors' Measure*

| Items | Social Factors |
|---|---|
| **SOCIAL_ FACT1** | Your relatives (children, parents, spouses) |
| **SOCIAL_ FACT2** | Your friends and knoweledge |
| **SOCIAL_ FACT3** | Your mood |
| **SOCIAL_ FACT4** | Avariation of your fortune |
| **SOCIAL_ FACT5** | Weather |
| **SOCIAL_ FACT6** | An investment advisor |

There are three main categories of information asymmetry's measures, namely: measures based on analysts' forecasts (Brennan and Subrahmanyam, 1995; Elton et al., 1984; Blackwell and Dubins, 1962), measures of investment opportunities (Chung and Charoenwong, 1998; Collins and Kothari, 1989) and measures of market microstructure (Huang and Stoll, 1997; Lin et al., 1995; Choi et al., 1988). In this study, information asymmetry is measured by asking investors to answer the following closed question: "Do you think that the Tunisian stock market is characterized by asymmetric information?" ('no idea'; 'the asymmetry does not exist in the Tunisian stock market'; 'we hear of information asymmetry but it was not supported by evidence'; others). In order to ensure that the question is understood by respondents, information asymmetry is defined in our questionnaire as follows: "The information asymmetry corresponds to the idea that the same information is not shared equally by all agents".

### *2.3.1.5. Measure of Social Factors*

We measure social factors by using six items simultaneously. Social factors were measured by considering five items simultaneously. Each item was assessed via a 5-point Likert scale ('never', 'not at all', 'quite frequently', 'often', 'always'). Table 12 shows the six items measuring social factors.

Table 12. reports the different items used to measure the concept of social factors.

After the first principal component factor analysis, there was a deletion of three items SOCIAL_FACT4 (i.e. a variation of your fortune) and SOCIAL_ FACT3 (i.e. your mood) and SOCIAL_FACT5 (i.e. weather) since the communality is less than 0.5. Results (Table 13) from a new factor analysis prove that three items are factorisable (KMO = 0.662 and Bartlett's sphericity test is significant). So, we show the one-dimensional structure of social factors. Besides, factor explains only 72.752% of the concept with acceptable reliability (i.e. $\alpha$= 0.500 and $\rho$= 0.500).

Results in Table 13 indicate that we can retain one dimension for the concept of social factors.

The confirmatory factor analysis allows us to confirm the one-dimensional structure obtained from the exploratory factor analysis. Results are reported in Table 14.

Results in Table 14 clearly show the one-dimensional structure of the concept of social factors.

Results show that coefficients are significantly different from zero (i.e. $t > 1.96$), which reassures us a priori the convergent validity. By calculating the coefficient of convergent validity ($\rho_{vc}$), we conclude that the extracted average validity for this factor is acceptable since $\hat{rho}_{vc}$ is equal to 0.505. Hence, we can validate the factor structure obtained from the exploratory phase.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Notes*: - *** Signification Level: 0.001 ; - CR: CRITICAL RATIO.

## 2.3.2. Measures of Perceived Risk's Consequences

As previously reported, the consequences of perceived risk are:

- The sources of information ;
- The types of information ;
- The reinvestment intention ;
- The investment performance.

### *2.3.2.1. Measure of Information Sources' Construct*

Information sources are measured by using items reported in Table 15. Respondents must assess, using a scale ranging from "not at all important" to "very important", the degree of importance it attaches to the question "Before your investment decisions, you consult ...".

Table 15. reports the different items in order to measure the concept of the information sources.

By performing a principal component factor analysis on the data, no item has been deleted since they all have a high communality. All items are factorisable (KMO = 0.648 and Bartlett's sphericity test is significant). Besides, there are two distinct dimensions namely: Objectives Sources (SOURC_OBJ) and Subjective Sources (SOURC_SUB). This bidimensional structure is used to explain 64.030% of the variance of the concept.

The reliability of construct's information sources is considered relatively good since the values taken by the Cronbach's alpha and Jöreskog's rhô coefficients exceed 0.7. Table 16 shows all the results already mentioned.

*Note*: *d.f*: degree of freedom.

By performing the principal component analysis of the data (Table 16), we show the bidimensional structure of the concept of information sources.

Next, we attempt to confirm the bidimensional structure of information sources' construct obtained from exploratory factor analysis. To do this, we conduct a confirmatory factor analysis on all the data (N=411). Table 17 summarizes all the results.

Results in Table 17 allow us to retain two dimensions in order to measure the concept of information sources.

From Table 17, results indicate that the loadings are all significantly different from zero since all values of t-statistics (or CR) are strictly greater than 1.96. Moreover, the converging construct validity of information sources is acceptable since $\hat{rho}_{vc}$ for each dimension is greater than or equal to 0.5 (0.646 and 0.5 respectively for the subjective and objective sources). So, we can confirm the two-dimensional structure for information sources' construct.

### *2.3.2.2. Measure of Information Types' Construct*

The information types are measured using a set of items which are shown in Table 18. Investors are invited to assess the degree of importance that they attach to the question "When making your investment decisions, you use the following information ...".

Table 18. reports the different items used to quantify the concept of information types.

After purification items, three independent dimensions are found: Economic Information (INF_ECQ), Information related to Listed Companies (INF_COMP) and Financial Analysis (ANAL_FIN). Results also show that items are factorisable (KMO = 0.790 and Bartlett's sphericity test is significant). Items

*Table 18. List of Items of Information Types' Measure*

| Dimensions | Items | Information Types |
|---|---|---|
| **ECONOMIC INFORMATIONS** | **INF_ECQ1** | The information about the fluctuation of policy interest rate |
| | **INF_ECQ2** | The information about the fluctuation of inflation rate |
| | **INF_ECQ3** | The information about the fluctuation of rates of economic growth |
| | **INF_ECQ4** | The macro-economic information |
| | **INF_ECQ5** | The micro-economic information |
| | **INF_ECQ6** | International information (economic, political ...) |
| | **INF_ECQ7** | The information related to public persons, parallel information |
| **INFORMATIONS RELATED TO LISTED COMPANIES** | **INF_COMP1** | Provisional statements |
| | **INF_COMP2** | Information about future investment of the company |
| | **INF_COMP3** | Information about top management |
| | **INF_COMP4** | Consultation of financial statement |
| | **INF_COMP5** | Information about capital transactions |
| | **INF_COMP6** | Monitoring the price evolution |
| | **INF_COMP7** | Rumors on the stock market |
| **FINANCIAL ANALYSIS** | **ANAL_FIN1** | Analysis communicated by engineering office |
| | **ANAL_FIN2** | Analysis communicated by brokerage firms |
| | **ANAL_FIN3** | Echoes |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

INF_ECQ6 (international information) INF_ECQ7 (information related to public persons, parallel information) INF_COMP5 (Information about capital transactions) INF_COMP7 (rumors on the stock market) and ANAL_FIN3 (echoes) are deleted because their communality is less than 0.5. Item INF_COMP6 (monitoring the price evolution) is removed due to its communality is less than 0.5 (i.e. 0.435). Furthermore, the three factors alone are enough to explain 67.956% of the variance of the concept. Table 19 summarizes these results.

Results in Table 19 related to loading, communality, Cronbach's alpha as well as the Jöreskog's rhô indicate that three factors can measure the concept of information types.

The reliability of the information types' construct is satisfying since the values taken by the Cronbach's alpha and Jöreskog's rhô coefficients exceed 0.7.

Results in Table 20 show the three factors can measure the concept of information types.

Table 20. shows that loadings are all significantly different from zero. Besides, the convergent validity's rho of each dimension is greater than or equal to 0.5. Hence, we can validate the tridimensional structure of the information types' construct retained from the exploratory analysis.

### *2.3.2.3. Measure of Reinvestment Intention*

In order to operationalize the reinvestment intention, we adopt the measure proposed by Wang et al. (2006), we measure the reinvestment intention. Indeed, each respondent must answer to the question "What is your investment plan in the stock market next year? while choosing one of the answers: Invest more; Keep the same setting; Reduce investment and ultimately Withdraw from the stock market.

#### *2.3.2.4. Measure of Investment Performance*

Following again Wang et al. (2006), the investment performance is measured using a closed question. Indeed, each investor is asked to answer the following question: "What was your investment performance of the previous year?" (Gain; Neither gain nor loss; Loss).

### 2.3.3. Measures of Perceived Risk

Slovic (1987) indicates that people have "intuitive judgments of risk typically named perceptions of risk". Risk Perception seems to be "*more complex than that depicted by the most common conceptions*" (Cadet and Kouabénan, 2005). Renn (1992) suggests that individuals perceive risk as a multidimensional phenomenon. Hence, risk perception cannot define as the product of probability and consequences. Slovic (1992) reveals that risk is subjective and does not exist independently of cultures and minds of human beings.

Many psychology studies attempt to understand and assess people's perceptions towards risks by developing the psychometric paradigm (Fischhoff et al., 1987; Lichtenstein et al., 1978; Slovic et al., 1979, 1980, 1985). According to Slovic (1987), the psychometric paradigm uses "psychometric scaling and multivariate analysis techniques to produce quantitative representations or 'cognitive maps' of risk attitudes and perceptions". Results show that there are major differences between lay people and experts in terms of risk perception. In particular, lay persons assess any risk event from two dimensions namely familiarity and controllability.

According to Gigerenzer and Todd (1999), familiarity is "a degree of knowledge or experience a person has respect to a task or object". In this regard, Ricciardi (2004) reveals that familiarity is "an inclination or prejudice that alters individual's perception of risk". Other than familiarity, controllability is broadly defined as "the ability to foresee and navigate potential hazards, thus erasing risk in a material way" (Natalier, 2001). Slovic (1987) affirms that controllability is the most important factor in

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

risk perception. Indeed, people tend to perceive less risk for situations where they feel they can control them. Thus, we use these two factors in order to quantify the risk perceived by investors. In operational terms, familiarity and controllability were measured by a set of items representing the instruments necessary for investment (e.g. financial ratios, fluctuation of interest rates...) but as the two dimensions of perceived risk can be distinguished from each other. Once measured, we believe that the degree of familiarity and controllability of tools used for investment in stock market determine risk perceived by investors. In other words, these two dimensions are not manifestations of perceived risk but conversely are constructive (or formative) of this construct. Thus, we assume that the perceived risk is a second-order formative construct.

#### *2.3.3.1. Measure of Familiarity's Construct*

The concept of familiarity is measured using seven items reported in Table 21 below. For each item, the degree of familiarity of investors has been assessed based on a 5-point Likert scale (ranging from 'not at all familiar' to 'very familiar'). In order to ensure the understanding of the term by investors, we define the familiarity in the questionnaire as "the feeling of the individual about situations that he has personal knowledge".

Table 21. reports the different items used to quantify the concept of familiarity.

By conducting an exploratory factor analysis, item FAM7 (excessive speculation) should be removed, since the communality was low (0.251). Results related to a second exploratory factor analysis are reported in Table 22 below. Ensuring that the items are factorisable (KMO = 0.886 and Bartlett's test is significant), one-dimensional structure explain 62.088% of the variance of the concept of familiarity.

Results in Table 22 related to loading, communality, Cronbach's alpha as well as the Jöreskog's rhô indicate that one factor can measure the concept of familiarity.

The Reliability of construct is satisfying since Cronbach's alpha is equal to 0.876. This is confirmed by the Jöreskog's rhô which exceeds 0.7 (i.e. 0.863).

#### *2.3.3.2. Measure of Controllability's Construct*

The construct of controllability is measured by using seven items listed in Table 23. These items are assessed on a 5-point Likert scale (ranging from 'not controlled' to 'very controlled').

Table 21 reports the different items used to quantify the concept of controllability.

*Table 21. List of Items of Familiarity' Measure*

| Items | Familiarity |
|---|---|
| **FAM1** | Fluctuation of Interest Rate |
| **FAM2** | Knowledge of the Stock Market |
| **FAM3** | The Bond Market |
| **FAM4** | The Management of Listed Companies |
| **FAM5** | The Intervention of the Authorities in the Financial Market |

*Table 22. Results of Exploratory Factor Analysis on Familiarity*

| Familiarity | | | | | |
|---|---|---|---|---|---|
| **Items** | **Loading** | **Communality** | **MSA** | **Cronbach's Alpha** | **Jöreskog's Rhô** |
| **FAM1** | 0.786 | 0.619 | 0.884 | **0.876** | **0.863** |
| **FAM2** | 0.756 | 0.572 | 0.907 | | |
| **FAM3** | 0.821 | 0.674 | 0.872 | | |
| **FAM4** | 0.800 | 0.640 | 0.882 | | |
| **FAM5** | 0.820 | 0.673 | 0.873 | | |
| **FAM6** | 0.740 | 0.548 | 0.905 | | |
| **Eigenvalue** | 3.725 | | | **KMO = 0.886** | |
| **Bartlett's Sphericity Test** | $X^2$=1076.627. .p=0.000 | | | | |
| **Explained Variance** | **62.088%** | | | N = 411 | |

*Note*: *d.f*: degree of freedom.

*Table 23. List of Items of Controllability*

| Items | Controllability |
|---|---|
| **CONT1** | Fluctuation of Interest Rate |
| **CONT2** | Knowledge of the Stock Market |
| **CONT3** | The Bond Market |
| **CONT4** | The Management of Listed Companies |
| **CONT5** | The Intervention of the Authorities in the Financial Market |
| **CONT6** | Financial Ratios |
| **CONT7** | Excessive Speculation |

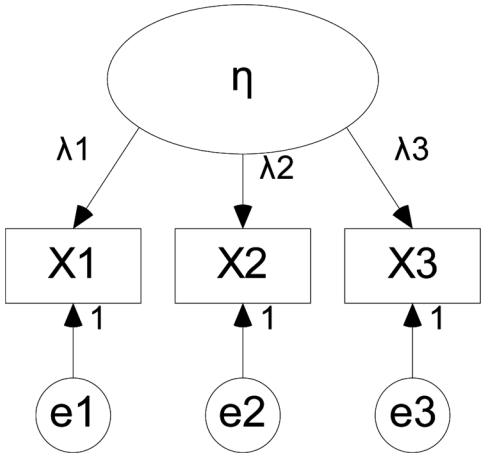
A first principal component factor analysis allows us to exclude the item MAT7 (excessive speculation) due to its low communality (0.356 <0.5). A second factor analysis leads to one-dimensional structure which can explain 61.614% of the concept.

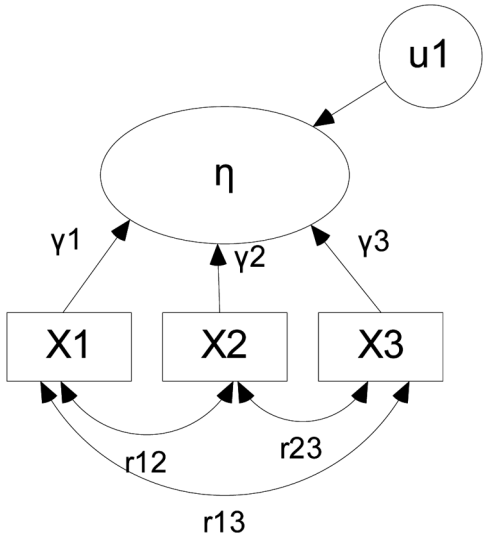
The reliability of the concept is satisfying since the value of the Cronbach's alpha is acceptable (i.e. 0.874). The Jöreskog's rhô is greater than 0.7 (i.e. 0.863) which allows us to further confirm the good reliability of the construct. Table 24 below summarizes results related to the exploratory factor analysis.

By performing the principal component analysis of the data (Table 24), we show the one-dimensional structure of the concept of controllability.

### *2.3.3.3. Specification of Perceived Risk's Measurement Model*

Many researchers define the formative measurement model compared to reflective model (e.g. Diamantopoulos et al., 2008; Lacroux 2008; Crié, 2005). For example, Crié (2005) reveals that the formative measurement model specifies that "the observed variables are multiple causes of the concept which they determine by minimizing the residue of the structural equation" whereas the reflective indicator is "a reflection of the construct that accounts for their observed variance and covariance". As reported





EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

by Lacroux (2008), in reflective construct, "indicators are assumed o represent the influence of latent underlying construct, the causal relationship is supposed to operate from construct to its indicators". However, a formative construct is "a combination of indicators, not necessarily correlated, contributing to 'shape' the latent construct. The causal relationship to these 'formative' constructs is reversed: It proceeds from indicators to latent construct".

As previously indicated, we assume that the measurement model of perceived risk is a formative model. This construct is as a combination of two factors, namely familiarity and controllability. These two variables are not manifestations of the perceived risk. They are constitutive (or formative) of the perceived risk.

Results of the confirmatory factor analysis are reported in Table 26. The first part of Table reports the results of the reflective first-order model. The second part indicates results of formative second-order model.

Table 26. comprises two parts. The first part reports the results of the reflective first-order model. Our results show two different constructs of familiarity and controllability. The second part displays results of formative second-order model.

From the first part of Table 26, all factor loading relating the items $FAM_i$ and $CONT_i$ ($i = 1,..., 6$) to the two respective factors Familiarity and Controllability are significantly different from zero ($t > 1.96$). Besides, the convergent validity of each construct is acceptable since $\rho_{vc}$ are just above 0.5 (0.514 and 0.513 for the familiarity and controllability, respectively). Hence, we can retain the two measures used in the measurement model of perceived risk.

*Table 26. Results related to Perceived Risk's Measurement Model*

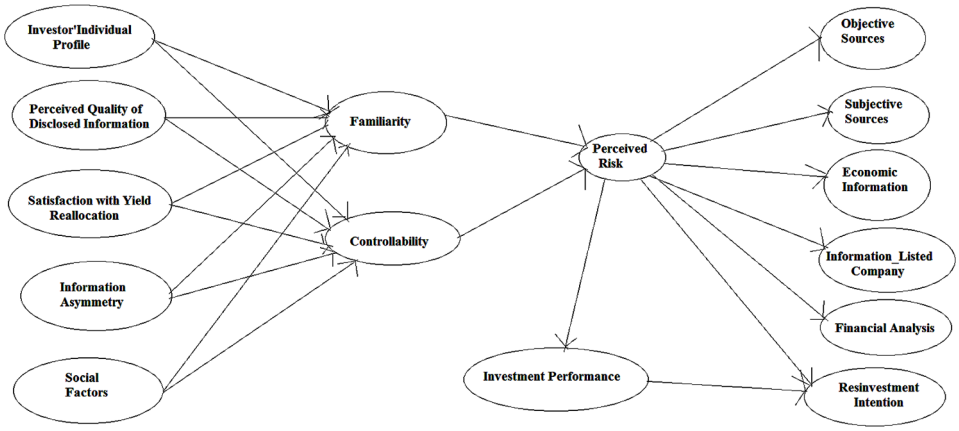
EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

From formative perspective, the second part of Table 26 contains standardized (i.e. column 4) and non-standardized (i.e. column 2) coefficients $\gamma_i$ (structural parameters) that capture the effect of both latent variables (Familiarity and Controllability) on the perceived risk (i.e. column 1). We note that the relationship between familiarity and perceived risk is positive and significant ($\gamma_1$= 0.784). However, the effect of controllability on perceived risk is negative and significant ($\gamma_2$= -0.249, $t$ = -5.121, $p$ = 0.001). On the one hand, an increase in the degree of familiarity of investors with investment tools does not cause inevitably a corresponding increase in the level of controllability of these instruments. On the other hand, the more the investor knows and does not control the necessary instruments for investment, the higher the perceived risk is towards the stock market. Clearly, the perception of risk is high when investor knows but does not control the tools necessary for investment by an investor. This finding is not surprising since Wang and al. (2006) argue, from a mapping of risk perceptions, that Chinese investors have a low perceived risk when they feel familiar and control some sources of risk existing in the stock market. In contrast, their risk perception is high when they are familiar and do not control other sources of risk. So, we can conclude that both latent variables, Familiarity and Controllability, are formatives of the construct 'Perceived Risk'.



## SECTION. 3: RISK-BEHAVIOR MODEL

Since the measurement model of perceived risk is a formative model, factors influencing risk perception will be subsequently considered as antecedents of familiarity and controllability. More explicitly, as depicted in figure 2, the investor's individual profile, perceived characteristics of listed companies and information asymmetry will affect risk perception through familiarity and controllability of tools necessary to investment.

Figure 2. reports the risk-behavior model which illustrates the relationships between different constructs.

Before explaining results of model estimation, it is necessary to first introduce the structural equation method.

*Figure 2. Integrated Model of Antecedents & Consequences of Perceived Risk*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## 3.1. Overview of Structural Equation Method

Since Jöreskog (1969), Keesling (1972) and Wiley (1973) first developed the statistical model of structural equations, it has become a fairly sophisticated statistical method. It is frequently used by many researchers in various fields such as psychology, marketing. The structural equation method attempts to examine the causal relationships in a complex theoretical model (Hoyle, 1985). According to Kaplan (2000), the structural equation models are a class of methodologies trying to represent certain assumptions about the average, variance and covariance of observed data in terms of a smaller number of structural parameters defined by an underlying theoretical model.

Raykov and Marcoulides (2006) pinpoint that the structural equation modeling which attempts to examine and quantify the substantive theories. Byrne (2006) reports that the structural equation modeling conveys two important aspects of the procedure: (a) « that the causal processes under study are represented by a series of structural (i.e. regression) equations » and (b) « that these structural relations can be modeled pictorially to enable a clearer conceptualization of the theory under study ».

Researchers propose several appellations to depict this method such as "structural equation models with latent variables" (Jöreskog and Sorbom, 1989), "model analysis of covariance structures" (Valette-Florence, 1988) or "structural equation models" (Pedhazur and Schmelkin, 1991).

Due to its ability to treat concomitantly a set of dependence relations, structural equation models are the most appropriate to be used in the current study. Unlike other conventional approaches (i.e. regression), this method allows to simultaneously estimate the multiple interrelated dependence relations and incorporate the measurement errors directly in the estimation process (Roussel et al., 2002).Also, Hair et al. (1998) indicate that taking into account measurement errors permits to estimate more accurately regression coefficients in comparison to classical methods. The structural equation method enables us to assess the model fit.

## 3.2. Evaluation of Model Fit

Assessing the quality of a model's fit to the observed data requires the use of the adjustment indices. Measures of goodness of fit typically summarize the discrepancy between observed values and the values expected under the model in question. To this end, researchers use three types of indices namely the absolute, incremental and parsimony indices. Table 27 reports the main results.

*Table 27. Model Fit*

| *Type of Index* | *Index* | *Observed Value* | *Key Value* |
|---|---|---|---|

Table 27. reports results of calculation of different indices (absolute, incremental and parcimony indices) to assess the model fit.

Results prove that RMSEA is less than 0.08 (equal to 0.070) and GFI is greater than 0.9 (equal to 0.951). So, our conceptual model can reproduce accurately the data. Besides, the value of CFI (equal to 0.930) is acceptable since it is above the key value. This shows therefore the good fit of the model tested against the restrictive model (or basic model) in which all the observed variables are not correlated (Roussel et al., 2002). These results are confirmed by the values of the parsimony indices. Indeed, the $\chi^2/df$ less than 5 (equal to 2.986) and PNFI greater than 0.5 (about 0.611) indicate that the model is parsimonious. In other words, the selected model shows a good fit for each estimated coefficient. Thus, the model is acceptable and fits satisfactorily with empirical data.

## 3.3. Estimation Results and Interpretation

Table 28. reports results of the non-standardized and standardized coefficient estimates as well as the value of t statistics (CR).

Table 28. reports results of the estimation of the conceptual model. All coefficients are statistically significant.

First, results indicate that the investor's individual profile has a significant and positive effect on familiarity ($\beta = 0.165$, $t = 2.632$, $p = 0.01$) and controllability ($\beta = 0.168$, $t = 2.601$, $p = 0.01$) which

*Table 28. Structural Relationships in the ModelLire phonétiquementLire phonétiquement*

*Notes*: -***Significance level: 0.001 ; -**Significance level: 0.01; -CR: *CRITICAL RATIO*.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

leads us to keep R2.1 and R2.2. Thus, we can support H1. Second, we find that the perceived quality of information disclosed by listed companies has a positive and significant influence not only on familiarity ($\beta = 0.363$, $t = 6.113$, $p = 0.001$) but also controllability ($\beta = 0.275$, $t = 4.836$, $p = 0.001$), retaining R3.1 and R3.2. Consequently, we can support H2.1. Third, the effect of satisfaction with yield reallocation by listed companies on familiarity and controllability is positive and significant (respectively $\beta = 0.205$, $t = 3.892$, $p = 0.001$, $\beta = 0.259$, $t = 4.038$, $p = 0.001$). Thus, we support H2.2. Fourth, we report that information asymmetry has a positive and significant impact on familiarity ($\beta = 0.273$, $t = 5.495$, $p = 0.001$). In addition, the effect of information asymmetry on controllability is significant and positive, instead of being negative ($\beta = 0.260$, $t = 5.130$, $p = 0.001$). Therefore, we reject H3.1. Results show that social factors do not affect both familiarity and controllability, rejecting R4.3 and R4.4. Therefore, we do not support H3.1.

Results also suggest to retain R5.1indicating that perceived risk has a positive and significant effect on the number of objective sources ($\beta = 0.901$, $t = 11.199$, $p = 0.001$). We also find that risk perception increases the number of subjective sources ($\beta = 0.628$), retaining R5.2. Therefore, we support H4. Results show that the higher the perceived risk of investor is, the more he will try to use simultaneously the economic information ($\beta = 0.656$, $t = 10.197$, $p = 0.001$), information related to listed companies ($\beta = 0.866$, $t = 11.567$, $p = 0.001$) and financial analysis ($\beta = 0.671$, $t = 10.415$, $p = 0.001$). We retain R6.1, R6.2 and R6.3. The hypothesis H5 is supported. We also find that risk perception has a significant and positive, instead of being negative, effect on the reinvestment intention ($\beta = 0.178$, $t = 3.321$, $p = 0.001$). This result leads us to reject H6. Results also display the risk perception influences positively investment performance ($\beta = 0.192$, $t = 3.650$, $p = 0.001$), retaining R8.2. Thus, we support H7.

Lastly, we check the possibility that investment performance plays a mediating role between risk perception and intention to reinvest. According to Baron and Kenny (1986), a mediator variable is defined as "the generative mechanism through which the focal independent variable is able to influence the dependent variable of interest". A mediator variable sheds light on the relationship between the independent variable and the dependent variable.

Mathematically, we estimate two different models. In the first model (constrained model), we impose two simultaneous constraints on the regression coefficients,

$$\beta_{PERC_RISQ \rightarrow INVES_PERF} = 0 \text{ and } \beta_{PERC_INVES \rightarrow INTEN_REINV} = 0,$$

whereas at the second model (complete model) no constraint has been imposed. Results obtained from estimating two models are reported in Table 29.

Results of the estimation of different coefficients (Table 29) indicate the partial mediator between risk perception and reinvestment intention.

The relationship between investment performance and reinvestment intention is significant and positive ($\beta = 0.193$, $t = 3.931$, $p = 0.001$). Besides, perceived risk has always significant and positive effect on intention to reinvest. Nevertheless, while passing from constrained to complete model (i.e. when investment performance is taken into account), we find that the influence of risk perception on intention reinvestment becomes weaker ($\beta = 0.178 < 0.214$) but remains significant ($\beta = 0.178$, $t = 3.321$, $p = 0.001$). So, we support that investment performance plays role of a partial mediator between risk perception and reinvestment intention.

## SECTION. 4: LESSONS FROM RISK-BEHAVIOR MODEL

This research investigates the interactions between antecedents of risk perception, perceived risk and behavioral responses induced by risk in the investment context. Results of this study leads to the following implications.

### 4.1. Antecedents of Perceived Risk

Results show that when the investor is familiar and does not control the tools necessary for investment in stock market his risk perception is high. Conversely, when investor is familiar and controls these instruments he perceives a low level of risk towards the stock market. We explicitly recognize that the controllability is a significant factor in the formation of perceived risk. This finding is confirmed by Slovic (1987) which highlights its importance in the risk perception.

Results also indicate that individual profile of investor is positively related to familiarity and controllability of investment tools. These findings confirm that a self-confident and optimistic investor believes he knows and controls instruments necessary for investment. So, he will perceive a low level of risk towards the stock market. We explicitly recognize that these two personality traits (self-confidence and optimism) play a crucial role in risk perception through the two psychometric variables (familiarity and controllability).

Besides, the perceived quality of disclosed information and the satisfaction with the yield reallocation by listed companies display a positive relationship with familiarity and controllability. The more the investor perceives that listed companies transmit to the stock market good quality information (e.g., relevant, complete) the more he feels familiar and controls the tools of investment. Similarly, a great satisfaction with yield reallocation encourages better understanding and controlling of the tools of investment. Hence, the perceived quality of disclosed information and satisfaction with yield reallocation by listed companies both strengthen the familiarity and controllability of investment instruments. Henceforth, the investor's risk perception toward the market will be even lower.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Lastly, results do not support that the more the market participants do not share the same information the higher the degree of familiarity and controllability of investor. This could be explained by the fact that an investor who feels more informed than others tends to feel more familiar with and controls the tools of investment. Therefore, he will perceive a lower level of risk toward the stock market. AS argued by Wang et al. (2006) "investors' risk perception was not increased by asymmetric information although they knew that information asymmetry would greatly influence their decision". Besides, the social factors do not affect the familiarity and controllability of investment tools. That is, the existence of investment advisor, family, among others, do not reduce the perceived level of risk toward the stock market. Contrary to many studies which prove the impact of social factors in the purchase situation, the current study do not support the relationship between the social influences and the perceived risk of investors.

## 4.2. Behavioral Responses to Perceived Risk

The proposed model suggests that risk perception influences the activity of information search and investment behavior.

The activity of information search is measured through the information sources and types. Results indicate that the higher the perceived risk of investor the higher the investor will consult various information sources. Thus, we show that as perceived risk increases, a greater number of information sources are consulted. The current study was not limited only to information sources but it was interested in the type of information. Indeed, results suggest that by facing a high perceived level of risk toward the stock market the investor will tend to use different types of information (economic information, financial analysis, information relative to listed companies). In other words, investor uses various types of information in order to decrease his perceived risk. We conclude that the link between risk perception and information search can be established within the investment context. This finding is confirmed by Cho and Lee (2006) who argue that "the link between perceived risk and the extent of information search (a link that has often been rejected in the extant literature) can be established within the context of investment".

Results also indicate that a higher perception of risk has simultaneously created a strong intention to reinvest in the stock market and higher investment performance. Facing a high level of perceived risk, investors reinforce (rather they decrease) their intention to reinvest. This behavioral response clearly shows that investors do not seek to reduce the vulnerability associated with negative outcomes. Although they perceive a high risk toward the stock market, investors do not adopt the second risk-reducing strategy (i.e. decrease in the amount at stake) in the investment context. However, persons with higher perceived risk toward the stock market have a higher investment performance. According to Wang and al. (2006), these results can explain the frequent stock exchange behaviors prevailing on the stock markets. Moreover, we find that investment performance can play the role of partial mediator between risk perception and intention to reinvest. Although the perceived risk towards the stock market is high the investor seeks to reinvest more by making frequent stock trading under the attraction and reinforcement of returns generated from the invested funds.

## CONCLUSION

In this study, the proposed model examines the antecedents and consequences of perceived risk in the investment context. Results show that controllability plays a crucial role in the formation of perceived

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

risk. Moreover, we find that the individual profile of investor, the factors related to the listed company and the stock market have an impact on perceived risk. A future study could examine the effect of other variables on risk perception such as investment experience and sociodemographic characteristics of investors (age, gender, income ...). Besides, we conclude that investors seek to mitigate the perceived risk toward the stock market through information search. The attraction of returns generated from the invested funds strengthens the reinvestment intention of investors in spite of the fact that they perceive risk toward the stock market. Thus, the specific context (i.e. the stock market investment) leads the investor not to adopt the second risk-reducing strategy namely the decrease in the amount at stake.

Our research could be extended by including the concept of the ethic in the investment context. In marketing research, many researchers consider the ethics is a very important. Unfortunately, the questionnaire of this study does not comprise items related to ethical attributes perceived by the individual investors. A future study would examine the relationship between the perceived ethics toward the stock market and the risk-reducing strategies.

## KEY TERMS AND DEFINITIONS

**Controllability:** The ability to foresee and navigate potential hazards, thus erasing risk in a material way.

**Decrease in the Amount at Stake:** The decrease of vulnerability associated with adverse outcomes.

**Familiarity:** A degree of knowledge or experience a person has respect to a task or object.

**Formative Construct:** A combination of indicators contributing to form the latent construct. The causal relationship proceeds from indicators to latent construct.

**Information Search:** The activity that each investor must do to make the investment decisions. Search for information is to consult information sources.

**Risk Perception:** A person's assessment of the risk inherent in a situation.

**Risk-Reducing Strategies:** Two different modes of behavioral responses to decrease the risk perception of decision's maker.

**Structural Equation Method:** The method that attempts to examine the causal relationships in a model.

## ABSTRACT

*This study explores the personality traits, perceived personal control, behavioral biases, culture, and socio-demographics in determining individual equity investor's risk assumption attitude. The study uses a survey approach to collect responses from small equity investors. A conceptual model is developed and hypotheses are tested through structure equation model (SEM). The result identifies personality traits, perceived personal control, behavioral biases, cultural factor and socio-demographic variables as strong determinants of small equity investor's risk assumption attitude.*

## INTRODUCTION

Risk is a difficult construct to define. The outcomes of risk depend on the situation and the decision maker. Risk assumption attitude involves participation in certain activities that might results in harm, loss or undesired outcomes (Ricciardi, 2004). Risk assumption attitude often referred as risk appetite, risk tolerance, risk acceptance and risk propensity is decision maker's general disposition to a particular risk in a consistent way (Roskowzki and Davey 2010). Kahneman and Tversky (1979) also hold that individual investor tend to seek risk in loss realm and avoid risk in profit realm. Risk assumption attitude varies among different people depending their personality traits, personal control, behavioral

factors, cultural factors and other socio-demographics including; age, gender, income level, financial needs, investment objectives, investment strategies. Slovic (1987) holds that the construct of risk means somewhat different among different people.

Identifying determinants of small investor's risk attitude is an important part of research in behavioral finance. It provides better understanding of various factors that influence risk assumption attitude of individual equity investors. It enables investment professionals to offer customized financial services and investment instruments that best match the risk assumption attitude of individual equity investors. It also facilitates regulatory authorities to improve legislations while having better understanding of investors' risk attitude.

The current study provides significant contribution by identifying the determinants of investor's risky attitude in a developing country's context. The study extends the model of investor's risk assumption attitude proposed by Dulebohn (2002). The study introduced some new variables in the existing models of individual investor's risk assumption behavior.

## BACKGROUND, CONCEPTUAL MODEL AND HYPOTHESES

### Personality Traits and Risk Assumption Attitude

#### Openness to Experience

Researches in behavioral finance provide ample evidence regarding influence of personality traits on investor's behavior, for instance Goldberg (1999), and Lin (2011) examined the role of personality trait on investor behavior. This study has used big five personality traits including, openness to experience, conscientiousness, extraversion, agreeableness, and neuroticism proposed by Costa & McCrae (1992). The first personality trait considered in this study is openness to experience. Openness to experience personality trait allows investors to come up with new ideas, and use active imagination in investment decision making. The investors who are open to experience are overconfident and tend to assume higher risk in their investment decision making (Barber and Odean, 1999). Nicholson et al. (2005) also noted the relationship between openness to experience personality trait and investor's risk behavior. Gullone and Moore, (2000); Markey et al. (2006); and Deck et al. (2008) also examined the role of personality traits (openness to experience, conscientiousness, agreeableness, extraversion and neuroticism) in understanding investor's risk propensity. The study also assumes significant association between openness to experience and investor's risk assumption attitude.

#### Conscientiousness

Conscientiousness investors believe more in themselves. They feel confident to perform job thoroughly and believe to produce results better than other investors. Conscientiousness investors exhibit overconfidence bias in investment decision making. Conscientiousness is considered as striving force for achieving excellence and competence (Costa and McCrae, 1992). Conscientiousness personality trait aspire investors to use money as a tool to impress and inspire others (Lim and Toe, 1997). Nicholson (2005) believe conscientiousness as a force that influence investor's risk investment behavior. Mayfield et al. (2008) also asserted conscientiousness as personality trait that influences investment behavior of

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

individual investor. Lin (2011) also describes the significance of conscientiousness on Taiwanese investors' behavior. The study also examines the role of conscientiousness in determining risk assumption attitude of individual equity investor.

## Extraversion

Investors with extraversion personality traits are communicative talkative, more outgoing and social in nature. Such types of investors feel more confident and enjoy risk taking in their investment decision making. Extraversion personality trait, allows investors to think more optimistically and feel energetic while investing. Nicholson (2005) also asserted that extraversion personality motivates investors to resume higher risk. Filbeck et al. (2005) also investigated the effect of extraversion personality trait on investor's risk propensity. Mayfield et al. (2008) and Lin (2011) also associated extraversion personality trait with individual investor behavior. However the nature of influence of extraversion on investor's risk assumption attitude is not conclusive for instance Filbeck et al. (2005) found the negative influence of extraversion on investor's risk behavior whereas Mayfield et al. (2008) found a positive association between extraversion and investor's risk behavior. This study also proposes the role of extraversion personality trait in determining individual equity investor's risk assumption attitude.

## Agreeableness

Investors with the agreeableness personality trait are forgiving in nature, considerate and kind to others. Such type of investors are modest, tolerate and friendly, they often make their decision on information easily available in the market which lead them to herd behavior (Lin, 2011). In stock markets where the majority of investors is inclined towards the risky investment behavior, the other investors with agreeableness personality traits would follow them due to their considerate nature. Nicholson et al. (2005) also examined the influence of agreeableness personality trait on investor's risk behavior.

## Neuroticism

The last personality trait considered in this study is neuroticism. Investors with neuroticism personality traits tend to get worried a lot and get nervous easily. They find it hard to handle stress efficiently when faced with complex situations. Neuroticism personality trait also influence investor's risk assumption attitude, Lin (2011) identified that such investor are inclined to sell their stock holdings in advance due to fear of loss. Nicholson (2005) and Deck et al. (2008) also examine the influence of neuroticism on investor's risk attitude. Overall, openness to experience and extraversion motivate investors for risk taking, whereas, agreeableness, conscientiousness and neuroticism discourages investors to resume higher risk in their investment decision making (Nicholson, 2005). On the basis of this theoretical discussion, the study proposes the following hypothesis.

**Hypothesis 1:** There is a significant relationship between personality traits and investor's risk assumption attitude.

## Perceived Personal Control

### Internal Locus of Control

Internal locus of control refers to individual beliefs about the outcomes of one's actions depends on his/her decision skills or some external factors that are beyond control. Locus of control is an important dimension of perceived personal control (Greenberger and Strasser, 1991). Researches in behavioral finance have associated internal locus of control with investor's risk assumption attitude (March and Shapira, 1987; and Shapira, 1995). Dulebohn (2002) also considered an internal locus of control as determinants of individual investor's risky behavior. Dulebohn and Murray (2008) also considered an internal locus of control as a determinant of investor's risk assumption behavior.

### Financial Self Efficacy

Self-efficacy is personal belief that one can achieve and succeed a given task and related to self-confidence, motivation, optimism and belief that one can achieve various challenges in life (Bandura 1997, 2006). Financial self-efficacy is another dimension of perceived personal control considered in this study. Dulebohn (2002) used self-efficacy in his model of investor's risky investment behavior. This study has introduced financial self-efficacy in this model. Financial self-efficacy is more relevant to investor behavior than self-efficacy only (Lown, 2011). Financial self-efficacy also influence investor's risk assumption attitude, investors with a higher level of financial self-efficacy feel confident to assume higher risks in their investment decision making. Krueger and Dickinson (1994) noted a strong and significant correlation between self-efficacy and investor's risky behavior.

### Knowledge of Investment Principles

The literature supports the relationship between knowledge of investments and investors risky attitude. For instance Wang (2009) identified two types of knowing; objective and subjective. Objective knowledge is concerned with knowledge/information investor posses whereas subjective knowledge refer to the knowledge is the degree of confidence investor has on his/her knowledge. According to Brucks (1985) investors with a high level of knowledge regarding financial market find it easier to process market information and make accurate decisions. Wang (2009) holds that investors with higher knowledge of investment principles are more prone to higher financial risks because of their confidence in the financial market. The following hypothesis can be extracted from the above discussion.

**Hypothesis 2:** There is significant relationship between perceived personal control and investor's risk assumption attitude.

## Behavioral Factors

### Overconfidence

Small investors tend to be overconfident about their risky decision making skills. There are two types of over confident; miscalibration and better than average effect. Miscalibration refers to state of mind when

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

investors are too confident about their knowledge and skills to investment decision making. Better than average means that the investor believes that he/she is having more knowledge and expertise regarding investment decision making than other investors (Vledder, 2010). Overconfident investors do excessive trading and display aggressive trading behavior (Baker and Nofsinger, 2010). Lichtenstein et al., (1981) holds that overconfidence behavior is sever when investor analyze various stock prices. Webber and Milliman (1997) identify that investor's overconfidence behavior determines the success or failure of investment decisions. The above mentioned studies postulate that investor overconfidence behavior influence investor's risk assumption attitude.

### Herding Behavior

Herd behavior refers to investors' attitude to follow other investors trading plan without adequate information and appreciation of risk-return tradeoff. In herding behavior traders imitates each others. Herd behavior influences the trading behavior of individual investors in stock markets (Bikhchandani and Sharma, 2001). Herd behavior accelerates market volatility, destabilizes the market and increases the vulnerability of financial markets (Shiller, 1990; Morris and Shin, 1999; and Persaud, 2000). Herd behavior is also identified as a source of fluctuations, bubbles, and crashes in the stock markets (Topol, 1991). Herd behavior is practiced highly in small stock markets where investors lack financial skills. In volatile stock markets like Pakistani stock markets, investors imitates others investors who invest in risky stocks without taking into account the technical and fundamental factors. Bearden et al. (1989) also investigated herd behavior among individual equity investors, and identified that investors display herd behavior to conform the expectation of other investors. Investor exhibit herding behavior due to lack of confidence in their trading skills and assessment of risk involved in investing. The following hypothesis can be framed from this discussion.

**Hypothesis 3:** There is significant relationship between behavioral biases and investor's risk assumption attitude.

## Cultural Factor

### Uncertainty Avoidance

Investor's risk assumption attitude is also influenced by cultural factors. Different definitions and dimensions of culture have been identified by various scholars. The study used Hofstede (1983) model of national culture. Hofstede (1983) proposed four dimensions of national culture including; individualism versus collectivism, power distance, uncertainty avoidance, and masculinity versus femininity. Later on another dimension of national culture, long-term orientation versus short-term orientation was also incorporated in Hofstede (1983) model of national culture. This study considers only one dimension of national culture i.e. uncertainty avoidance due to its higher relevancy with investor's risk assumption attitude.

**Hypothesis 4:** There is significant relationship between uncertainty avoidance and investor risk assumption attitude.

## Scio-Demographics and Investor's Risk Assumption Attitude

Socio-demographic variables such as age, education, income level, investment objectives, investment strategies and investor type, also plays important role in determining risk assumption attitude of individual equity investor. Studies including Sahm (2007); Hayat et al. (2007); and Lin (2011) identified the influence of investor demographics on investor risk behavior. Studies on investor risk behavior indicate female as more risk averse than male investors. To quote few, Powell and Ansic (1997); Gustafson (1998); Donkers & van Soest (1999); Slovic (1999); Barber and Odean (2001) and Weber et al. (2002) indicate male investors having more risk assumption propensity than female investors. Age is also considered another determinant of investor's risky attitude. Finance literature postulates that young investors are more risky than older investors. Previous studies also identified age as strong factor that influence investor's risk behavior, for instance Lewellen et al. (1977); Dulebohn (2002); Vledder (2010) found age as the primary determinant of investor's risky behavior. Another important determinant of investor's risky attitude among demographics is the investor's level of income. Investors with higher levels of income are generally expected to exhibit the risky attitude in the financial decision making. Financial risk taking requires some additional monetary resources that can supplement investor in case of any loss. Investors with meager financial resources find it hard to take risky investment decision due to their inability to bear higher losses. Previous studies in literature also support this notion, for instance, Lewellen et al. (1977); Barber and Odean (2001) put forward income as factor that influence investor's risk assumption attitude. The other socio-demographic variables considered in this study are investment objectives which include considering stock market as a platform of saving for retirement, investing in the stock exchange as a hobby after retirement, building financial buffer, to satisfy the speculative nature, and to grow one's capital. Another socio-demographic variable is investment strategies which include; using technical analysis, fundamental analysis or a combination of both, using one's own intuition and taking advice from some investment professional in investment decision making. Based on the above discussion, we propose the following hypothesis:

**Hypothesis 5:** Individual equity investor's risk assumption attitude is influenced by his/her socio-demographic factors.

# RESEARCH METHOD

## Sample and Data Collection

The study examines the determinants of small equity investor's risk assumption attitude. The unit of analysis is a small individual investor engaged in trading shares in the stock exchange. The individual equity investors are selected for Lahore Stock Exchange of Pakistan. The data are collected through self-administered structured survey questionnaire technique. A total of 500 questionnaires were distributed to individual equity traders registered with various member/brokers on the Lahore Stock Exchange. Amongst the distributed questionnaires, only 287 completed questionnaires were received back with a response rate of 57% response rate.

## Measures

The instrument to measure big five personality traits including, openness to experience, conscientiousness, extraversion, agreeableness, and neuroticism is adopted from Costa & McCrae (1992) as used by Lin (2011). The instrument consists of 15 items measured in 5 point Likert scale (1 does not apply to me at all to 5 strongly apply to me). The instrument to measure internal locus of control is adopted from Levenson (1981) and measuring levels of knowledge towards stock investment is taken from Vanguard Funds Group (Updegrave, 1996). The measure of financial self-efficacy from is derived from as used by Schwarzer and Jerusalem (1995) Lown (2011), the scale consists of six items (1 for strongly disagree to 5 for strongly agree). The study includes two behavioral biases; over confidence and herding behavior. The instrument to measure these variables is taken from Hon-Snir et al. (2012). The instrument is based on the work of Scharfstein & Stein (1990); and Devenow & Welch (1996). Cultural factor includes the uncertainty avoidance dimension of culture only. The instrument to measure uncertainty is taken from Hofstede (2001). The instrument consists of 4 items measured at 5 points Likers scale. Investor's socio-economic demographics are also considered as a determinant of investor risk assumption attitude in this study. Investor's socio-demographic variables are selected on the basis of studies conducted by Hayat et al. (2007); Lin (2011). The demographics includes, age, gender, marital status, income, investor type, investment objective, investment frequency and stock market investment experience.

## Procedure

The data analysis techniques used in this study includes, reliability and validity testing, correlation analysis and regression analysis. The statistical techniques are applied through SPSS and AMOS software. Cronbach alpha is calculated to analyze reliability through SPSS and Confirmatory Factor Analysis (CFA) is applied through AMOS to examine the validity of measurement scales used in this study. Structural equation model (SEM) technique is also performed to analyze data and test hypotheses proposed in this research.

# RESULTS AND DISCUSSION

## Preliminary Analysis

The results of preliminary analysis given in Table 1 show validity and reliability analysis, computed through AMOS and SPSS. The factor loading is calculated from Confirmatory Factor Analysis to examine the validity of data and measurement scales used in this study. The results of the factor loading analysis depict that only one item of overconfidence scale is having value -0.992, depicted with gray shade. The standard criteria for measuring the validity requires the factor loading value should be ($\geq$ 0.40), therefore this item should be deleted from scale to have good results from our analysis. All other items have scored factor loading higher than 0.40, which postulates good overall validity of data used in this study. The results of reliability analysis also exhibit good results, the Cronbach alpha of all variable is well above 0.50. Nunallay and Bernstein (1978) hold that the value of Cronbach alpha should be greater than 0.5 and reflects the acceptable reliability of data in social sciences.

## Hypotheses Testing

Figure 2 provide the results of hypotheses tested in this study. The study used five exogenous variables – personality traits, perceived personal control, behavioral biases, cultural factor and socioeconomic demographics, and one endogenous variable – risk assumption attitude. The SEM model obtained good model fitness with CMIN (Chi-Square) = 1431.342, Degree of Freedom (DF) = 371, probability level (p-value) = 0.000, CMIN/DF 3.858. Various statisticians, for instance Wheaton et al. (1977) and Marsh and Hocevar (1985) argued value of CMIN/DF as standard measure for model fitness should be less than 5 and between 5 and 2 for good model fitness. The model fitness of SEM is also within 5 to 2; hence this study also achieved good model fitness. Gerbing and Anderson (1992); and Hair et al. (2003) also used another measure for model fitness and proposed that the model fitness ratios including GFI, CFI and NFI should be closer to 0.90 and the value of RMSEA should be less than one. The model fitness ratios are also satisfactory according to these criteria's as well as therefore, data can be used for further analysis.

## Personality Traits and Investor's Risk Assumption Attitude

The standardized coefficients of path analysis between determinants of investor's risk assumption attitude are presented in Figure 1 and 2 respectively. Figure 1 describe the results of hypotheses testing among determinants of investor's risk assumption attitude. The determinants included in this model are; personality traits, perceived personal control, behavioral biases and cultural factor. The role of investor's socio-demographics in determining risk assumption attitude is presented in Figure 2. The study found positive and significant relationship between personality trait openness to experience and individual investor's risk assumption attitude ($\beta = 0.60$ and p-value = 0.000). This finding supports our H1 and establishes that personality traits determine the risk assumption attitude of individual equity investors'. Lin (2011) also noted significant influence of personality traits on individual equity investor's decision making for the cases of Taiwan.

## Perceived Personal Control and Investor's Risk Assumption Attitude

The next hypothesis proposed in this study consider perceived personal control as a determinant of investor's risk assumption attitude. Perceived personal control consists three dimensions including; internal locus of control, financial self efficacy and knowledge of investment principles. The study found a significant relationship between perceived personal control and investor's risk assumption attitude ($\beta = 0.24$ and p-value = 0.040), we therefore accept our H2. Dulebohn (2002) also identified perceived personal control as a determinant of investor's risk propensity.

## Behavioral Biases and Investor's Risk Assumption Attitude

The study also proposed behavioral biases including; herding behavior and overconfidence as determinants of small equity investor's risk assumption behavior. The empirical evidence found significant influence of behavioral biases on investor's risk assumption attitude ($\beta = 0.51$ and p-value = 0.000), supporting our H3. Many previous studies also support this finding, for instance, Hayat et al. (2007) noted the influence of overconfidence on investor's risky behavior Overconfident investors tend to trade aggressively and assume a higher risk attitude (Barber and Odean, 1999, 2000; Baker and Nofsinger, 2010).

## Cultural Factor and Investor's Risk Assumption Attitude

Cultural factor also influence investor's risk assumption attitude. The investors tend to avoid uncertainty do not resume higher risk in their investment decision making. Whereas the investors having lower level of uncertainty avoidance seeks more risky investment alternates to yield higher returns. The study found a significant influence of uncertainty avoidance on individual equity investor's risk assumption attitude ($\beta = 0.95$ and p-value = 0.000), which supports our H4 as depicted in Figure 1. Kwok and Solomon (2006) noted that investor's risk assumption attitude varies in different countries having diversified national cultures. Velleder (2010) hold that people belonging to countries with higher uncertainty avoidance, tend to avoid risky behavior in financial investment decision making.

## Socio-Demographics and Investor's Risk Assumption Attitude

Investor's socio-demographic variables including; age, education, income level, investment objective, investment strategies, information source and investor type are also considered as determinants of investor's risk assumption attitude in this study. The study found significant influence of investor's socio-demographic variables on investor's risk assumption attitude with their values ($\beta = 0.50$ and p-value $< 0.05$), ($\beta = 0.33$ and p-value $< 0.05$), ($\beta = 0.36$ and p-value $< 0.01$), ($\beta = 0.22$ and p-value $< 0.01$), ($\beta = 0.22$ and p-value $< 0.01$), ($\beta = 0.17$ and p-value = 0.000), ($\beta = 0.09$ and p-value $< 0.05$), respectively. Previous studies have also analyzed role of investor demographics in determining investor's risky investment behavior, for instance, Sahm (2007); Hayat et al. (2007); and Lin (2011) identified the influence of investor demographics on investor risk behavior Figure 2 presents the structural equation model of investor socio-demographics and investor's risk assumption attitude.

*Figure 2. Structural relationship of investor's socio-demographics and risk assumption attitude*

## CONCLUSION

Risk is ubiquitous in behavioral finance and much attention has been given in the literature to measure risk. This study also attempts to identify the factors that determine the risk assumption attitude of individual equity investors. The study found personality traits including openness to experience, extraversion, agreeableness, conscientiousness and neuroticism having a significant relationship with investor's risk assumption attitude. Perceived personal control is also having significant influence on investor's risk assumption attitude. Behavioral biases, including herding and overconfidence have also significantly influenced investor risk attitude. Culture is also observed as a determinant of investor's risky attitude. Investor's socio-demographic variables including; age, education, income level, investment objectives, investment strategies and investor type also determine in one way or another, the risk assumption attitude among individual equity investors.

### Research Implications

The implications of this research are manifold. It provides a theoretical framework that identifies the psychological, behavioral and socio-demographic factors influencing investor's risk assumption attitude. The study empirically tested the proposed theoretical model and explained the statistical significance

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

of various factors that influence investor's risk assumption attitude. The study also provides important findings for investment professionals, stock market regulators, equity investors and research scholars on investor behavior.

## Future Research

The study examined the collective influence of personality traits on investor's risk assumption attitude. The future research may investigate the role of each personality trait in determining the risk assumption attitude on individual equity investors'. Only one dimension of national culture is considered in this study, future research may also incorporate other related dimensions of national culture that can influence investor's risk assumption attitude. Moreover, a detailed analysis of investor's socio-demographic variables can also provide interesting information toward investor's risky behavior.

## ACKNOWLEDGMENT

This article was funded by the Deanship of Scientific Research (DSR) at King Abdulaziz University, Jeddah. The Authors, therefore, acknowledge with thanks DSR for technical and financial support.

# Chapter 8
# Overcoming Challenges to Long-Term Financing:
## A Behavioral Perspective

**Hazik Bin Mohamed**
*Stellar Consulting Group, Singapore, Singapore*

## ABSTRACT

*A concern that has emerged repeatedly in the support for long-term sustainable development is the insufficient availability of long-term finance for projects such as infrastructure. This paper considers some of the possible strategies to overcome obstacles (cognitive or otherwise) to ensure the provision of long-term financing. The author discusses several behavioral interventions to surmount hurdles both from the demand and supply sides as well as creating enabling environments for better access to finance. This effectively requires challenging the rationale underlying private financial flows that are driven by short-term profits and rents, and strengthening mechanisms for mobilizing and allocating both domestic and external finance for value creation and development over a longer time horizon. It also involves properly designed projects that contractually distributes risks and shares returns within economically rational financing structures and create the right incentives for the various partners.*

## 1. INTRODUCTION

Private financial markets cannot be relied upon to fully fund long-term investment projects because such investments typically involve longer tenures and entail greater risk and uncertainty about eventual outcomes, even while they create significant positive externalities for the rest of the economy (UNCTAD, 2015). These factors produce differences between private profitability and social returns on such investment. Also, private financial markets seldom finance directly such classes of borrowers like start-ups or small and medium-sized enterprises (SMEs), or activities whose returns are not immediately evident and at times cannot be readily calculated. This negatively affects activities that could be crucial for future growth and which could produce considerable social benefits, such as innovation, technological progress and environmental protection.

Financing for purely public goods necessarily requires appropriate public domestic revenues, and in the context of external financing this is most likely to be supported by official development assistance (ODA) or other forms of development cooperation. In the case of warrant goods and services, as well as other activities with large positive externalities, a mix of public and private arrangements is involved, usually some degree of explicit or implicit government subsidies, which in turn would require either internal or external resources, usually channelled through the public coffers. Finally, there are some activities that generate changes in productive structures and are potentially profitable (such as some kinds of infrastructure investment), which are nevertheless avoided by private investors because of uncertainties associated with lumpy investment requirements with large initial costs, long gestation periods and perceived risks.

This article considers some of the possible strategies to overcome obstacles (both cognitive and otherwise) to ensure the provision of long-term financing. Also, greater financial integration has not delivered on expectations of easier access to the kind of long-term financing needed to boost growth and development. In section 2, we suggest ways on how to facilitate long-term financing activities, both in public as well as private sector using variable forms of funds, including those from sovereign wealth funds and multi-lateral development banks. In our scope of discussion, we argue for necessary change in traditional practices of financial risk-assessment and enriching them with a behavioural orientation, as well as the specification of possible useful tools, and a reassessment in investment focus and horizon. In section 3, we discuss several interventions from behavioral perspectives to surmount hurdles both from the demand and supply sides as well as creating enabling environments for better access to finance via suitable long-term capital market instruments as well as regulatory improvements.

## 1.1 Challenges to Long-Term Financing

In providing for long-term financing, the challenge lies in promoting a financial system that incentivizes sustainable development. Both domestic and international private sources (banks, institutional investors, direct investors) and public resources will be necessary. Public and private resources should, however, not be necessarily seen as substitutes, as they have different investment objectives. Despite small (but growing) pockets of socially conscious investors, most private capital remains driven by the profit motive. As a result, the private sector will under-invest in public goals when the expected return underperforms other investment opportunities on a risk adjusted basis. Hence it is important to recognize plainly that public financing and public sector policies are instrumental to a long-term financing strategy.

Another challenge in channelling investor funds into long-term projects like infrastructure, is the apparent mismatch between investment demand and the supply of finance — there is a lack of properly structured projects. For instance, infrastructure investments entail complex legal and financial arrangements, requiring a lot of expertise (BIS, 2014). Building up the necessary expertise is costly, and investors will only be willing to incur these fixed costs if there is a sufficient and predictable pipeline of infrastructure investment opportunities. Otherwise, the costs can easily outweigh the potential benefits of investing into infrastructure over other less complex asset classes.

A few common economic characteristics differentiate long-term project assets like infrastructure from other asset classes. These characteristics also make it more difficult to match investment demand and financing supply:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Even though the direct payoffs to an owner of an infrastructure project may not cover its costs, the indirect externalities can still be hugely beneficial for the economy as a whole. Externalities include large benefits of infrastructure services to a wide range of other sectors. Such benefits are fundamentally difficult to measure. Even if they can be measured, charging for them may not be feasible;
2. Long-term projects are often complex and involve a large number of parties. Such projects like infrastructure often comprises natural monopolies such as highways or water supply, and hence governments want to retain the ultimate control to prevent an abuse of monopoly power. This requires complex legal arrangements to ensure proper distribution of payoffs and risk-sharing to align the incentives of all parties involved. But any measures needed to restrict monopoly power must still ensure that governments respect pre-agreed contracts;
3. Many infrastructure investments generate cash flows only after many years and the initial phase of an infrastructure project is subject to high risks. In addition, the uniqueness of certain long-term projects like infrastructure in terms of the services they provide makes infrastructure investments less liquid. These three elements — the time profile of cash flows, high initial risks and illiquidity — make purely private investment complicated and expensive.

Although infrastructure investments are likely to be highly profitable for the economy as a whole, they are especially subject to market failures. As a result, infrastructure investment from the private sector in many cases cannot be realised without some form of public support or government assurance. This may take the form of co-financing or some form of insurance. In turn, the necessary involvement of a wide range of parties in infrastructure projects — construction companies, operators, government authorities, private investors, insurers and the citizens most directly affected — make it a complex but essential task to design an efficient set of contracts which should include tackling issues such as the incentive-compatibility of contracts, the nature of contingencies and the proper distribution/sharing of risks among the different parties. The quality of institutions in place and the rule of law are often determining factors in the supply of such financing, even when a project on its own appears to be financially viable.

## 2. LONG-TERM FINANCE FOR SUSTAINABLE DEVELOPMENT

For the purpose of financing long-term sustainable development, long-term investment should meet two main criteria: the investor's time horizon should be sufficiently long to finance long duration assets, say 10 to 20 years, and the investor should be able to hold a position through economic cycles and downside events.

In other words, long-term investors should have the ability not only to buy long-term liquid assets, but to buy and hold long-term illiquid assets. Short-term investors that need liquidity are often willing to pay a higher price for liquid assets; hence long-term investors can buy cheaper illiquid assets, and earn the higher return, or the 'liquidity premium'. During the 2008 global financial crisis, this liquidity premium jumped to levels not seen in decades as investors around the globe demanded cash (UNTT, 2015). More broadly, long-term investors can play a stabilizing role in the market because they act counter-cyclically to liquidity cycles. In summary, stability and sustainability can be and are actually mutually reinforcing.

## 2.1. Public-Private Partnerships for Development

A public-private partnership (PPP) is a contract between a government and a private company under which the private company finances, builds and operates some element of a service which was traditionally considered a government domain. In some forms of PPP, the private company even "owns" the underlying assets needed to provide the service for a period of time. The company is paid over a number of years, either through charges paid directly by users, or by payments from the public authority, or a combination of both. PPPs have been used widely in developed and developing countries over the past 20 years, and are currently seeing a revival of interest in the context of negotiations on finance for development and the UN Sustainable Development Goals (UNCTAD, 2015). There are hopes that engaging the private sector in this way can help multiply capital into sustainable development projects.

PPPs may appear to be effective in terms of generating and implementing infrastructure projects when public budgets are constrained. If properly managed, they can also improve the efficiency of the public service through the technical expertise provided by the private sector (ECLAC, 2015).

PPP investment has been concentrated in relatively few countries and sectors. Almost 60 per cent of the total private participation in projects recorded in developing countries was in China, Brazil, the Russian Federation, India, Mexico and Turkey (by order of magnitude). This is an indication that PPP investors are not dissimilar from other institutional investors, preferring large and dynamic markets to the more vulnerable economies where financing needs are greatest. According to UNCTAD, of the developing regions, Latin America has traditionally hosted the largest share of PPPs and still accounted for 45 per cent of the total in 2013. Only 10 per cent of the total went to Africa, although in sub-Saharan Africa investments have been steadily rising (primarily because of investments in telecoms) (see Figure 1).

*Figure 1. Private Sector Participation in Infrastructure, 1985-2013 (Billions of US$). Note: Regions in chart A are the source of investments referenced to the year of implementation (Source: UNCTAD calculations based on World Bank Private Participation in Infrastructure Project Database (as on July 2015)).*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Also, PPP investments have been concentrated in relatively few sectors, with telecoms accounting for 37 per cent of the total, or US$58 billion, in 2013, and energy for 37 per cent of the total, or US$59 billion (chart B). Water and sanitation are among the most needed infrastructure services to relieve human suffering, and yet they are the least likely to be financed through this method, having received a mere US$3.5 billion in 2013 (see also UNCTAD, 2013). Predictably, most commercial interest has been directed to ICTs and energy-related activities, while socially challenging sectors attracted almost no private investment (AICD, 2010). It appears that PPPs are more likely to invest in brownfield projects (changing ownership of assets that already exist) than in completely new greenfield projects or risky transformative activities such as those related to climate change (WEF, 2014). Also, for the 128 PPPs in its sample, the World Bank concluded that it was not possible to show how much risk was being borne by the private or public partners because "downstream contingent liabilities are rarely quantified at the project level" (IEG, 2014: 40). This is partly due to a lack of standardized financial reporting, which makes it difficult for both investors and governments to accurately judge the risks involved in PPP projects.

However, proponents of PPPs relates to their greater efficiency and ability to deliver better value for money[1]. Similarly, the European Investment Bank states that a "PPP project yields value for money if it results in a net positive gain to society which is greater than that which could be achieved through any alternative procurement route" (European Investment Bank, 2015). According to measures of business performance during the construction phase, most of the PPPs supported by the World Bank were successful in the sense of being completed on time or within budget, with 62 per cent of those reviewed by the IEG rated satisfactory or better. However, broader measures that indicate longer term sustainability over the lifetime of a project are not estimated. Out of 128 projects studied, only 10 recorded results of service quality, 8 recorded results in terms of efficiency, and 1 reported fiscal results. Improved access to services for the poor could be confirmed in only about 10 per cent of cases (IEG, 2014). Clearly, more research and data analysis are required to understand advantages of PPPs better as they may remain a useful source of long-term financing for development, given the paucity of other external resources.

## 2.2. Sovereign Wealth Funds

Many national governments or regional authorities that have been accumulating large amounts of foreign assets in recent years have established sovereign wealth funds (SWFs) as a more profitable way to use such assets instead of further increasing their international reserves. The total value of these public assets currently stands at more than US$7 trillion (SWF Institute, 2015; UNCTAD, 2015). This has raised hopes in some quarters that SWFs could complement the existing sources of development finance, particularly since more than 40 of the 52 SWFs established since 2000 are based in developing countries and 32 of them hold more than US$10 billion in assets. Their total assets were estimated to be nearly US$6 trillion in March 2015 (SWF Institute, 2015), 87 per cent of which were funds from SWFs in only seven developing countries (China, Kuwait, Qatar, the Republic of Korea, Saudi Arabia, Singapore and the United Arab Emirates).

Apart from the funds held for macroeconomic stabilization purposes only (which therefore hold swiftly deployable, highly liquid instruments such as government bonds or cash), many SWFs are mandated to build up capital reserves for future generations, and can therefore consider deploying their remaining funds for equity and "alternative investments" that are illiquid and long term. Some are even explicitly expected to support national or regional development through investments in infrastructure. SWFs typically have more freedom in their choice of asset classes compared with more risk-averse funds

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

operated by central banks, pension funds and other funds. Such portfolio choices by various SWFs are: the Norwegian Government's SWF recently pledged to exit global equities in coal, Singapore's Temasek Holdings has investments in national and regional infrastructure, and the Fund for Productive Industrial Revolution in Bolivia has investments in medical, cement and food industries, among others.

In practice, few SWFs take advantage of this freedom to invest in ways that would support developing countries' long-term investment needs. Instead, their investment decisions mirror those of private market players, favouring some countries (e.g. China, the United Kingdom and the United States) and what they deem to be low-risk and short-term market sectors (Inderst and Stewart, 2014; IPE and Stirling, 2013). And while more than half of all SWFs invest some resources in infrastructure (typically in energy, transport and telecommunications), these investments are again mostly in developed countries (Inderst and Stewart, 2014).

SWFs' decision-making processes are not well known, as fewer than half disclose details of their activities (Bauer, 2015). However, since the declared aim of SWFs is typically to save for their country so that future generations may benefit from today's (possibly windfall) successes, this necessarily requires an emphasis on long-term and low-risk investments that yield positive returns, whether in social or financial terms.

## 2.3. Multi-Lateral Development Banks

Multilateral development banks have played and can continue to play a crucial role as providers of long-term financing that is not delivered by private lenders. Typically, transformative development requires, among other things, large-scale projects of long maturity, which involve risks that private banks are unwilling to assume, especially when their own liabilities are short term in nature. Development banks (both national and multilateral) are specifically designed to compensate for these shortcomings of private capital flows and markets for social returns that are bigger than private returns. They have a clear mandate to support development-oriented projects that typically require long-term finance and a funding base whose liabilities are predominantly long term too. Their capital is, for the most part, owned by highly rated sovereigns, which permits the banks to borrow long term in financial markets at relatively low costs. In addition to their provision of long-term finance, development banks act as "market makers" by creating and providing financing instruments that better spread risks, both between creditors and borrowers and over time, including through co-financing with private investors.

Development banks can also help to overcome some of the informational deficiencies facing the private sector by assisting in the screening, evaluation and monitoring of projects. Unlike private banks, development banks tend to have in-house technical and managerial expertise which allows them to participate in decisions involving choice of technology, scale and location. This reinforces their ability to leverage resources, as they can attract other lenders that do not have the same technical capabilities to assess a project's viability and potential. Development banks, therefore, have unique features that give them a strong comparative advantage over private financial institutions, including the tools to mitigate specific risks that the private sector is unwilling to take on, and the ability to exploit the complementarities between them and their private partners effectively (Buiter and Fries, 2002).

These banks are generally mandated to provide credit on terms that render industrial and infrastructural investment viable. They provide working capital and finance for long-term investments, sometimes in the form of equity. To safeguard their investments, they often closely monitor the activities of the firms to which they lend, sometimes nominating directors to the boards of those firms.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Over more than half a century, the World Bank and various regional development banks such as the Asian Development Bank (ADB), the African Development Bank (AfDB), the Inter-American Development Bank (IADB) and EIB, have played a vital role in financing long-term projects around the world. They have helped to fill some financing gaps, especially in large-scale infrastructure projects, and, more recently, in social and environmental projects. Despite their presence, however, given the relatively modest size of their loans, they have been able to only slightly reduce these gaps[2]. One of the ways to increase loan capacity and reduce financing gaps is to extend appeal of such projects to residents of member countries (through the AfDB for African countries for instance) — extending it to the resident public reaches out to a larger base of capital where individually they may have smaller capital (savings or investible funds) but collectively it may be quite substantial. The extension to partake (which also extends risk-sharing) in such financing may be administered by member countries which is eventually funneled back to the initiating institution. Also, if the residents share into an infrastructure investment, there is a great deal of financial inclusion that takes place, instead of returns being limited to institutional investors. Small stable returns to micro-investors can possibly turn lives through wealth accumulation in the long run.

## 3. BEHAVIORAL PERSPECTIVES AND REQUIRED ENABLERS

Insights from behavioral economics, psychology and documented game-theoretic experiments reveal that human behaviors are shaped by habits, inclinations and conflicts between intentions and actions. Analysis of individual decision-making that is grounded in psychology and behavioral economics offers a different view where one can analyze successes and failures of choices. This approach also provides an opportunity to improve product design and cost-effectiveness of development programs (Datta & Mullainathan, 2012) and similarly, to encourage long-term investment. Evidence has shown that loss aversion — a stronger dislike of a monetary loss than the pleasure of an equal-sized gain — and mental accounting — ways in which individuals and households categorize and evaluate their financial transactions — play an important role in financial decision-making (Thaler, 1999).

Behavioral finance emphasize the social, cognitive, or emotional factors that lead investors to depart from the rational behavior that traditional economists presume. Marketing techniques and product design features that take into account cognitive biases can have surprisingly strong effect on demand. For investing, the media plays a crucial role in shaping markets and subsequently framing choices for investors. This role of the media on people's perceptions underlies the global marketing industry, which highlight and colour events mentally and emotionally to affect people's financial decision-making (Davis, 2005; Elliot et al, 2012). If investors are given consistent information from different media, they weigh the information more heavily, or when media coverage highlights specific issues or "angles" it gives selective attention or perceived importance to a given issue, which subsequently influences investors' judgments.

When faced with huge amounts of data and information and an array of decision problems, people are incapable of doing the complex optimization calculations that are expected of them under standard finance theory. Instead, they rely on a limited number of cognitive strategies or heuristics that simplify the complex scenarios faced by them in making decisions. By nature, heuristics are imperfect and consequently will result in biases and errors (on risk/return or valuation of assets for instance). These imperfections are inherent in everyone and are based on our beliefs, social interactions, the information consumed that frame choices. Behavioral intervention opportunities come from these areas — to shape

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the information consumed by investors, to start conversations on multi-lateral benefits of risk-sharing and socially-responsible investments to balance the profit motive, and construct those choices in a way that investors would want to and likely choose.

## 3.1. Institutional Investor Behavior

Collective effects of large groups of individual investors and traders on financial decision-making have been reviewed to grasp the understanding of what constitutes as market forces. Institutional investors (endowment, hedge and mutual funds, insurance companies, investment banks, pension funds, SWFs, etc.) are the best candidates for keeping markets efficient because they have the ability, knowledge and capital required to move markets but yet in many situations institutional investors have incentives to "ride" rather than trade against mispricings (Ramadorai, 2010). They do not even attempt to arbitrage apparent market inefficiencies in the process of making returns for their investors.

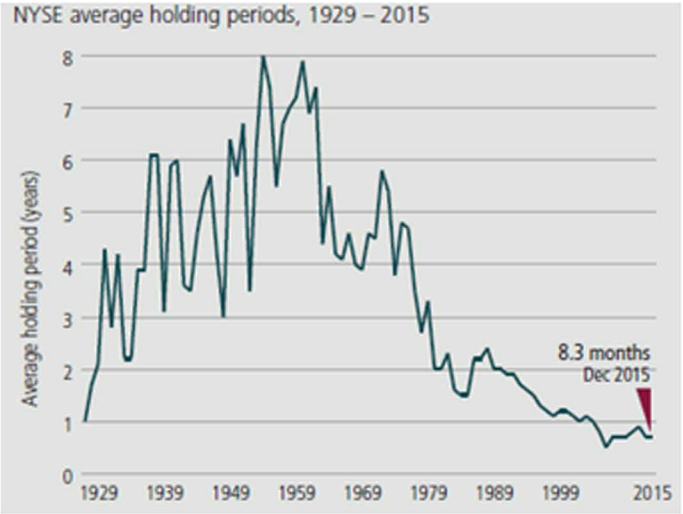
Shiller and Pound (1989) used a questionnaire to survey institutional and individual investors. They found that direct interpersonal communication is very important in one's investment decision-making process. Hence, people who have information, and can use it well, will be 'better off' than people who do not, because information is what enables arbitrage, market control and speculation — all of which are short-term investing strategies.

Also, it should be noted that analysts, money managers, and pension plan executives often promote or invest in glamour stocks for a variety of inappropriate reasons that may betray the interests of their clients. Analysts may have conflicts of interests, leading them to recommend growth stocks; money managers may offer advice to investors that promote their own careers; and excitement over emerging technologies may lead advisers to select glamorous, but unwise, investments (Billett et al, 2012).

### 3.1.1. Investor Time Horizon: Short-Termism

The shrinking time horizon in the investment market is evident. Stocks are being held for shorter periods than at any time since the 1920s, as the New York Stock Exchange (NYSE) average holding period data shown in Figure 2. On average, a stock is being held for approximately 8 months. This reflects investment transactions driven by both individuals and institutional investors.

It would be expected that professional investment managers take a more long-term perspective but data suggests otherwise; the average holding periods of investment managers of stocks in equity mutual funds is 1.56 years. This data comes from Morningstar Direct which reflects largest 20 US open-end equity mutual fund categories as of 1 December, 2015. Holding periods were calculated by taking 1 over the most recent average annual turnover ratio for different categories[3].



A number of reasons have been posited for the short-term investor behavior observed, which include incentives, media and financial reporting and decision-making biases:

- **Incentives:** A significant proportion of investment management professionals (43%) receive more than half of their compensation based on their annual performance[4]; similarly, nearly 80% of investment management professionals surveyed have less than half of their compensation based on longer-term performance measures. The incentive structure in place encourages the manager to take excessive risk in order to optimize his or her compensation in the current period. The risks taken may not be appropriate for the portfolio and are also likely not reflective of the fact that most

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

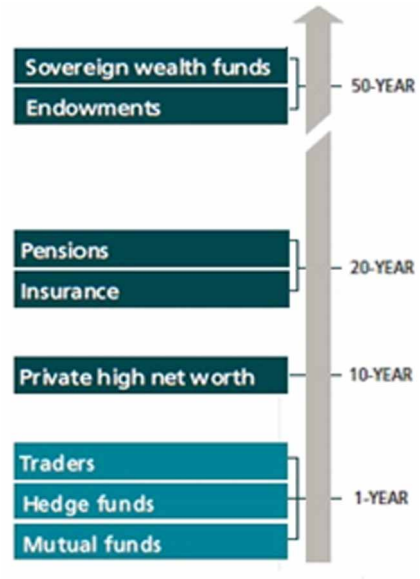
*Figure 2. Investors are holding stocks for shorter time periods (Source: Ned Davis Research, December 2015)*

clients have a time horizon that is longer than eight weeks. Furthermore, investment performance in short time frames are more likely driven by market noise than relevant investment signals;

- **Media and Financial Reporting:** The media, analysts and various pundits churn out a vast amount of information and commentary on the markets. While investors need information from various sources to make decisions, it is important to make a distinction between general market noise and pertinent investment signals. The emphasis on quarterly earnings is another example of the short-term focus of the investment community. While there is an abundance of short-term earnings estimates, there is a dearth of longer-term estimates, i.e. beyond three years. The lack of sell-side research that extends beyond the near term, along with the additional uncertainty implicit in taking a longer-term view, suggests that there is a role for independent research focused on adding value over longer time horizons. Additionally, the market trend of reduced trading commissions could be placing additional pressure on brokerage firms to increase short-term trading volume;
- **Decision-making Biases:** The field of behavioral finance has stressed the psychological reasons why individuals fall prey to certain decision-making pitfalls, including short-term behavior that prejudices long-term investment performance. These include loss aversion, which refers to one's tendency to strongly prefer avoiding losses to acquiring gains; the availability bias that occurs when one makes judgments about the probability of events based on how easy it is to think of examples (the availability heuristic operates on the notion that if something can be recalled, it must be important); and the party effect, or recency bias, which operates when stock market participants evaluate their portfolio performance based on their perspective on recent results. These biases, along with others, result in less than optimal results for the investor in the longer-term.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

### 3.1.2. Lengthening Investor's Time Horizons



When the investment time horizon of clients were examined — ranging from high net-worth private clients to pension funds, insurance companies, endowments and sovereign wealth funds — it was found that the clients typically have time horizons of a decade or more, and, in many instances, have an explicit multigenerational objective. For example, endowments, foundations, sovereign wealth funds and many private HNWIs fall into a group that invests for both current and future generations. This suggests that it would be rational for these investors, in particular, to adopt a longer-term perspective in their investment practices. The increased short-term focus of investors indicates a misalignment with those asset owners with a long-term time horizon (see Figure 3).

Also, investment managers with a longer-term view and a focus on stock selection can find abundant investment opportunities. Figure 4 shows the return dispersion for stocks held for various time periods ranging from one day to five years. There is greater return dispersion between the tenth and ninetieth percentiles as the holding period extends, bolstering the view that there are more opportunities for differentiated performance when one holds securities for three to five years.

Forward total cumulative returns around the mean in US$ within the 10th to 90th percentile range.

Logically, it is difficult for a portfolio manager to profitably trade markets on a weekly basis because stocks tend to move in tandem in the short term and the opportunity to add value after trading costs is very limited. However, beyond five years there is much greater return dispersion, which creates the potential for investment managers to benefit from. This time horizon arbitrage opportunity may be a significant factor in generating long-term performance. Over a longer time period, there is an opportunity for investors to focus on meaningful investment signals that point to sustainable earnings growth in the medium-to-long term and express differentiated views that translate into positive performance.

### 3.1.3. Brownfield to Greenfield Projects

Traditional infrastructure-market players, such as governments and public utility companies, are under financial pressure, and their budgets are strained. They are increasingly looking to private investment to fund infrastructure projects. PPPs can offer a number of benefits, including a whole-life costing approach that optimizes construction, operation and maintenance costs, better risk management and efficient project delivery. Well-structured PPPs can help ensure that greenfield projects are delivered on time and within budget and at the same time generate attractive risk-adjusted returns for investors.

To secure this greenfield premium, investors must ensure that the risks associated with a project are properly managed. Greenfield projects need to begin with a clearly defined contractual framework that allocates risks to the most natural owners. Strict contract frameworks bring structure and discipline to the execution of greenfield infrastructure projects. Also, experienced project owners know that construction risk associated with greenfield projects is typically greater than brownfield projects. By choosing experienced contractors and by establishing fixed prices and specific design and build deadlines, project managers and investors can protect against the delays and cost overruns that can plague infrastructure projects. For investors to secure long-term returns, contracts must address the key risks inherent to all infrastructure projects, not only greenfield projects. Examples include revenue and volume risk, which relate to the effective use of the infrastructure at expected tariff levels (for instance, road traffic), or the availability and affordability of a critical input (for example, gas supply to a gas-fired power plant). These risks can be managed through risk-sharing mechanisms like disclosing minimum traffic volumes from public authorities and long-term off-take agreements.

Political risk assessment and management is also essential over the long term. An infrastructure asset is captive by essence, and its performance relies on the willingness of local counterparties to respect the commitments made at inception.

## 3.2. Designing Effective Behavioral Interventions

Behavioural economics offers new perspectives on interventions that authorities or regulatory institutions could use, for behavioural and other problems in the market. Ordered from least to most interventionist, there are four ways in which these institutions could tackle behavioural problems related to short-termism:

- **Provide Long-term Returns Information:** Require financial institutions or financial-reporting (media) firms to provide information on long-term returns as compared to quarterly or annual reporting;
- **Modify the Choice Options:** Adjust how choices are presented to investors. ESG or SDG benefits should be presented along with profitability. Choices can be linked to a social good or corporate responsibility;
- **Manage Product Distribution:** Require long time horizon products to be promoted or sold through heavily-monitored channels or through proven sound structures like asset-backed structures and performance-based risk-sharing models;
- **Control Speculative Products:** Restrict speculative product features or whole products that appear designed to exploit, or products that mimic long-term investment features but inculcate short-termism.

The behavioural intervention toolkit for long-term investment can be expanded by using more 'nudges' — small prompts that, if designed well, have low costs and can lead to better decisions by biased investors without restricting choice. Providing information or changing the choice environment can be nudges. As these less interventionist measures do not constrain consumer choice, they are preferable, if they are effective in preventing short-term misinformation. Understanding how the investor make decisions can also improve the effectiveness of elevating ESG or SDG goals. Investor psychology, like consumer psychology, is nuanced, and specific interventions can succeed or fail based on small details. Interventions should therefore ideally be tested in practice before implementation, possibly using randomised controlled trials (RCTs). Often investor biases are just one part of a problem, and a package of market-wide or structural measures will be required.

Applying behavioural interventions bring additional challenges too. Difficult questions that need to be tackled are: what is in the investor's versus the project's versus society's best interests, and how effective are less interventionist measures, such as nudges, or more interventionist measures, such as regulatory enforcement? When choosing between different measures, or no intervention at all, the author recommends to assess their costs and benefits, to the extent that this is practically possible. He proposes a modified variety of factors that should be considered:

1. Negative and positive impacts of financial innovation for long-term growth;
2. The impact on the investor's incentives to learn and align to SDG goals;
3. Preferences and risk assessment between the different types of brownfield and greenfield projects;
4. Whether the problem is one for the regulator or best left to the government.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Traditional impact assessment approaches, for example, for estimating benefits to the society, may need to be adapted when biases are present (both the investor as well as the beneficiaries, including regulatory biases even). Integrating insights from behavioural perspectives with traditional intervention and market failure analysis has much scope for helping regulators choose the best interventions.

## 3.3. Enabling Environment for Long-Term Financing

Despite its potential benefits, there are cyclical and structural impediments to long-term investment. For instance, the current environment of low interest rates and uncertainty over future growth prospects and over policy developments can hinder the willingness of institutional investors to invest in long-term assets. Population ageing may have also reduced the risk appetite and time horizon of investors.

However, governments and other competent authorities such as the regulators and supervisors of institutional investors can play a key role in facilitating long-term investment by creating an enabling environment. The government can create appropriate and consistent policies around a framework that addresses regulatory and institutional impediments to long-term investment and avoid interventions that may distort the proper functioning of markets.

### 3.3.1. Pipeline of Investment Opportunities

Investors will only develop internal knowledge and skills in a specific sector, such as infrastructure, if concrete investment opportunities exist. Similarly, government agencies must establish clear guidelines and reasonable timelines from project announcement to award in order to convince investors to explore and engage, whilst developing their expertise and skills. In order to make development risk manageable for investors, procurement agencies must avoid any false starts when launching infrastructure projects. This will be instrumental to building credible pipelines of investable opportunities and enabling institutional investors to actually engage.

### 3.3.2. Transparency into Cashflows

PPP frameworks, and in particular, contracted cash flows, provide this visibility and also ensure predictability. Predictability, in addition to the natural correlation of cash flows to inflation, contributes to the attractiveness of PPP projects for institutional investors seeking assets that match their long-term goals. By providing greater and enduring visibility to investors, typically under contractual arrangements akin to PPPs, governments could attract long-term investors by providing some investment predictability.

### 3.3.3. Financial Regulation, Valuation and Tax Treatment

Policymakers at both the national and international levels could work to create regulatory frameworks that include mandatory practices that financial institutions may adopt, such as guidelines for making business operations more sustainable at all levels. For example, stock exchanges may promote sustainability among their listed companies by making ESG disclosure part of their listing requirements. On a domestic level, policymakers could encourage the development of a long-term investor base, focused on 'gap sectors' and illiquid asset classes such as infrastructure and renewable energy, which incorporate ESG criteria.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Solvency, accounting and funding requirements for institutional investors should avoid creating incentives for pro-cyclical investment strategies. Any risk-based solvency rules should reflect the suitability of long-term assets for asset-liability management purposes, taking into account the level of predictability of cash flows.

The tax environment and policies should remain stable and avoid creating impediments to long-term investment by institutional investors, including cross-border investment. They should also be subject to regular monitoring to prevent abuse, in particular in terms of international competition and regulatory arbitrage.

In addition, risk-sharing measures by home countries and international organizations can help mobilize private financing in infrastructure projects in developing countries. Finally, countries can take measures to better align private sector incentives with longer-term investment goals, such as new direct co-investments for primary intermediaries, or new financing instruments which would be more attuned to the long-term investment needs of infrastructure.

### 3.3.4. Address Market Failures

Government agencies can play a key role in addressing market failures, either directly or through public development banks. They can act as facilitators and provide credibility to infrastructure projects. By funding transactions or supporting active market players, development banks (like ADB and the World Bank) provide a powerful signal to the private sector. Their presence suggests political support and stability over the long term. In addition, dedicated financial instruments — such as guarantee instruments, long-term funding, seed investment, and early-development stage facilities — can encourage long-term investment.

Regulatory and supervisory authorities overseeing institutional investors and other actors within the investment management chain should monitor the governance, agency relationships, remuneration, and risk management mechanisms underpinning long-term investment and take adequate prompt measures when relevant. They should, where appropriate, provide guidance to institutional investors regarding the governance and risk management requirements to meet long-term investment objectives.

## 4. CONCLUSION

The main obstacle to financing long-term development is not the lack of financing capacity but rather, the question is how to move resources from suitable financing sources to entities that require them in a structurally and contractually sound manner that meet both demand and supply side objectives. Project finance has tended to be geographically concentrated in high and middle-income countries and in sectors in which profitability is more assured, rather than in risky projects or projects with long gestation periods that may be more necessary for industrialization and development. With behavioral understanding of investors (their inherent cognitive biases and consumption of financial media bias) coupled with an enabling environment, the financing of long-term projects like infrastructure can be encouraged through incentives skewed towards longer time horizons, better long-term investment information through media and finance reporting, and interventions to counter decisions biased towards the short-term. Channel-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

ling private and sovereign wealth and savings into productive investments with longer time horizons, including greenfield projects, will be essential for the global economy to grow and to continue to do so sustainably and responsibly.

## ENDNOTES

[1] Value for money is achieved when an infrastructure project can generate greater positive net gain to society than if the project were to be procured via a conventional (other than PPP) approach.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

This happens when a PPP project is able to generate (1) cost efficiencies, through lower construction, operational and/or maintenance costs; (2) time savings, through an earlier completion of the project; and/or (3) quality enhancements, through enhanced service provision.

[2] In 2014, gross disbursements by EIB (US$78 billion) and the World Bank (US$44 billion) were by far the most significant, compared to IDB and ADB (about US$10 billion) and AfDB (almost US$5 billion), as noted in the banks' annual reports.

[3] The different categories include diversified emerging markets, global real estate, domestic and foreign small/mid/large blends, small and mid-cap growth, small and mid-cap value, health, technology.

# Chapter 9
# Mutual Fund:
## Marketing Mix and Promotional Strategies

**Shalini Chhabra**
*Aklank Girls P. G. College, India*

## ABSTRACT

*Mutual funds provide various facilities that make saving and investing simple, accessible and affordable, by using professional management, diversification, variety of products, liquidity, affordability, convince. Moreover, strict government regulation and full disclosure of information makes the investment more secures in India. In India mutual funds market the key area of interest of market experts are understanding the investor's expectations and meeting those expectations. The mutual fund sector is one of the fast growing sectors in Indian economy and has tremendous potential for sustained future growth. The present era of exponential growth has seen changes, refinements and innovation etc. the industry needs to identify the expectation and houses of the investors and meet their expectations in a better way by overcoming the challenges the mutual fund industry is facing. Keeping in view that ever increasing competition of similar or alternative product, marketing has been concerned the most vital area of operation of Mutual funds industry. Mutual fund Marketing is different from marketing of other goods. The present chapter tries to explore the marketing strategies adopted by Mutual funds, the different 7 Ps that are involved by the various mutual funds for attracting the investors.*

## CHAPTER OBJECTIVES·

- To understand the Concept of mutual funds, ·
- To study the Elements of Mutual Fund Marketing Mix and the 7 Ps concept,
- To study the preferred distribution channels of mutual funds industry
- To study methods adopted by mutual funds for the promotion and advertisement,
- To study the challenges faced by the mutual fund industry related to Marketing strategy.

## INTRODUCTION

A mutual fund is a financial intermediary that pools the savings of investors for collective investment in a diversified portfolio of securities. A fund is "mutual" as all of its returns, minus its expenses, are shared by the fund's investors (Meena, 2011). The Securities and Exchange Board of India (Mutual Funds) Regulations, 1996 defines a mutual fund as a fund established in the form of a trust to raise money through the sale of units to the public or a section of the public under one or more schemes for investing in securities, including money market instruments. According to the above definition, a mutual fund in India can raise resources through sale of units to the public. It can be set up in the form of a Trust under the Indian Trust Act. The definition has been further extended by allowing mutual funds to diversify their activities in the following areas: · Portfolio management services · Management of offshore funds · Providing advice to offshore funds · Management of pension or provident funds · Management of venture capital funds · Management of money market funds · Management of real estate funds A mutual fund serves as a link between the investor and the securities market by mobilizing savings from the investors and investing them in the securities market to generate returns. Thus, a mutual fund is akin to portfolio management services (PMS). Although, both are conceptually same, they are different from each other. Portfolio management services are offered to high net worth individuals; taking into account their risk profile, their investments are managed separately. In the case of mutual funds, savings of small investors are pooled under a scheme and the returns are distributed in the same proportion in which the investments are made by the investors/unit-holders. Mutual fund is a collective savings scheme. Mutual funds play an important role in mobilizing the savings of small investors and channelizing the same for productive ventures in the Indian economy.

## BACKGROUND

The growth of the mutual fund industry in India can be divided into four phases: Phase I (1964-87), Phase II (1987-92), Phase III (1992-97), and Phase IV (beyond 1997).

### Phase I

The mutual fund concept was introduced in India with the setting up of UTI in 1963.The Unit Trust of India (UTI) was the first mutual fund set up under the UTI Act, 1963, a special act of the Parliament. It became operational in 1964 with a major objective of mobilizing savings through the sale of units and investing them in corporate securities for maximizing yield and capital appreciation. This phase commenced with the launch of Unit Scheme 1964 (US-64) the first open-ended and the most popular scheme. UTI's investible funds, at market value (and including the book value of fixed assets) grew from Rs 49 crore in1965 to Rs 219 crore in 1970-71 to Rs 1,126 crore in 1980-81 and further to Rs 5,068 crore by June 1987 (Tarun and Bodla,2001). Its investor base had also grown to about 2 million investors. It launched innovative schemes during this phase. Its fund family included five income-oriented, open-ended schemes, which were sold largely through its agent network built up over the years. Master share, the equity growth fund launched in 1986, proved to be a grand marketing success. Master share was the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

first real close-ended scheme floated by UTI. It launched India Fund in 1986-the first Indian offshore fund for overseas investors, which was listed on the London Stock Exchange (LSE). UTI maintained its monopoly and experienced a consistent growth till 1987. (Sarish, 2012)

## Phase II

The second phase witnessed the entry of mutual fund companies sponsored by nationalized banks and insurance companies. In 1987, SBI Mutual Fund and Can bank Mutual Fund were set up as trusts under the Indian Trust Act, 1882. In 1988, UTI floated another offshore fund, namely, The India Growth Fund which was listed on the New York Stock Exchange (NYSB). By 1990, the two nationalized insurance giants, LIC and GIC, and nationalized banks, namely, Indian Bank, Bank of India, and Punjab National Bank had started operations of wholly-owned mutual fund subsidiaries. The assured return type of schemes floated by the mutual funds during this phase was perceived to be another banking product offered by the arms of sponsor banks. In October 1989, the first regulatory guidelines were issued by the Reserve Bank of India, but they were applicable only to the mutual funds sponsored by FIIs. Subsequently, the Government of India issued comprehensive guidelines in June 1990 covering all 'mutual funds. These guidelines emphasized compulsory registration with SEBI and an arms length relationship be maintained between the sponsor and asset management company (AMC). With the entry of public sector funds, there was a tremendous growth in the size of the mutual fund industry with investible funds, at market value, increasing to Rs 53,462 crore and the number of investors increasing to over 23 million. The buoyant equity markets in 1991-92 and tax benefits under equity-linked savings schemes enhanced the attractiveness of equity funds. (Jayadev, 1996).

## Phase III

The year 1993 marked a turning point in the history of mutual funds in India. Tile Securities and Exchange Board of India (SEBI) issued the Mutual Fund Regulations in January 1993. SEBI notified regulations bringing all mutual funds except UTI under a common regulatory framework. Private domestic and foreign players were allowed entry in the mutual fund industry. Kothari group of companies, in joint venture with Pioneer, a US fund company, set up the first private mutual fund the Kothari Pioneer Mutual Fund, in 1993. Kothari Pioneer introduced the first open-ended fund Prima in 1993. Several other private sector mutual funds were set up during this phase. UTI launched a new scheme, Master-gain, in May 1992, which was a phenomenal success with a subscription of Rs 4,700 crore from 631akh applicants. The industry's investible funds at market value increased to Rs 78,655 crore and the number of investor accounts increased to 50 million. However, the year 1995 was the beginning of the sluggish phase of the mutual fund industry. During 1995 and 1996, unit holders saw an erosion in the value of their investments due to a decline in the NA V s of the equity funds As stated in the research paper of (Tarak, 2012). Moreover, the service quality of mutual funds declined due to a rapid growth in the number of investor accounts, and the inadequacy of service infrastructure. A lack of performance of the public sector funds and miserable failure of foreign funds like Morgan Stanley eroded the confidence of investors in fund managers. Investors perception about mutual funds, gradually turned negative. Mutual funds found it increasingly difficult to raise money. The average annual sales declined from about Rs 13,000 . crore in 1991-94 to about Rs 9,000 crore in 1995 and 1996.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Phase IV

During this phase, the flow of funds into the kitty of mutual funds sharply increased. This significant growth was aided by a more positive sentiment in the capital market, significant tax benefits, and improvement in the quality of investor service. Investible funds, at market value, of the industry rose by June 2000 to over Rs 1,10,000 crore with UTI having 68% of the market share. During 1999-2000 sales mobilization reached a record level of Rs 73,000 crore as against Rs 31,420 crore in the preceding year. This trend was, however, sharply reversed in 2000-01. The UTI dropped a bombshell on the investing public by disclosing the NAV of US-64-its flagship scheme as on December 28,2000, just at Rs 5.81 as against the face value of Rs 10 and the last sale price of Rs 14.50. The disclosure of NAV of the country's largest mutual fund scheme was the biggest shock of the year to investors. Crumbling global equity markets, a sluggish economy coupled with bad investment decisions made life tough for big funds across the world in 2001-02. The effect of these problems was felt strongly in India also. Pioneer m, JP Morgan and Newton Investment Management pulled out from the Indian market. Bank of India MF liquidated all its schemes in 2002. The Indian mutual fund industry has stagnated at around Rs 1,00,000 crore assets since 2000-01. This stagnation is partly a result of stagnated equity markets and the indifferent performance by players. As against this, the aggregate deposits of Scheduled Commercial Banks (SCBs) as on May 3, 2002, stood at Rs 11,86,468 crore. Mutual funds assets under management (AUM) form just around 10% of deposits of SCBs. The Unit Trust of India is losing out to other private sector players. While there has been an increase in AUM by around 11% during the year 2002, UTI on the contrary has lost more than 11% in AUM. The private sector mutual funds have benefited the most from the debacle ofUS-64 of UTI The AUM of this sector grew by around- 60% for the year ending March 2002. Types of Mutual Fund Schemes The objectives of mutual funds are to provide continuous liquidity and higher yields with high degree of safety to investors. Based on these objectives, different types of mutual fund schemes have evolved (Umarani, 2012).

## TYPES OF MUTUAL FUNDS SCHEMES

### Functional Classification of Mutual Funds

#### Open-Ended Schemes

In case of open-ended schemes, the mutual fund continuously offers to sell and repurchase its units at net asset value (NAV) or NAV-related prices. Unlike close-ended schemes, open-ended ones do not have to be listed on the stock exchange and can also offer repurchase soon after allotment. Investors can enter and exit the scheme any time during the life of the fund. Open-ended schemes do not have a fixed corpus. The corpus of fund increases or decreases, depending on the purchase or redemption of units by investors. There is no fixed redemption period in open-ended schemes, which can be terminated whenever the need arises. The fund offers a redemption price at which the holder can sell units to the fund and exit. Besides, an investor can enter the fund again by buying units from the fund at its offer price. Such funds announce sale and repurchase prices from time-to-time. UTI's US-64 scheme is an example of such a fund. The key feature of open-ended funds is liquidity. They increase liquidity of the investors

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

as the units can be continuously bought and sold. The investors can develop their income or saving plan due to free entry and exit frame of funds. Open-ended schemes usually come as a family of schemes which enable the investors to switch over from one scheme to another of same family.

### Close-Ended Schemes

Close-ended schemes have a fixed corpus and a stipulated maturity period ranging between 2 to 5 years. Investors can invest in the scheme when it is launched. The scheme remains open for a period not exceeding 45 days. Investors in close-ended schemes can buy units only from the market, once initial subscriptions are over and thereafter the units are listed on the stock exchanges where they dm be bought and sold. The fund has no interaction with investors till redemption except for paying dividend/bonus. In order to provide an alternate exit route to the investors, some close-ended funds give an option of selling back the units to the mutual fund through periodic repurchase at NAV related prices. If an investor sells units directly to the fund, he cannot enter the fund again, as units bought back by the fund cannot be reissued. The close-ended scheme can be converted into an open-ended one. The units can be rolled over by the passing of a resolution by a majority of the unit--holders.

## Interval Scheme

Interval scheme combines the features of open-ended and close-ended schemes. They are open for sale or redemption during predetermined intervals at NAV related prices. Portfolio Classification Here, classification is on the basis of nature and types of securities and objective of investment:

1. **Income Funds:** The aim of income funds is to provide safety of investments and regular income to investors. Such schemes invest predominantly in income-bearing instruments like bonds, debentures, government securities, and commercial paper. The return as well as the risk is lower in income funds as compared to growth funds.
2. **Growth Funds:** The main objective of growth funds is capital appreciation over the medium-to-long- term. They invest most of the corpus in equity shares with significant growth potential and they offer higher return to investors in the long-term. They assume the risks associated with equity investments. There is no guarantee or assurance of returns. These schemes are usually close-ended and listed on stock exchanges. Functional Portfolio Geographical Other Open-Ended Event Income Funds Domestic Sectoral Specific Close-Ended Scheme Growth Funds Off-shore Tax Saving Interval Scheme Balanced Funds ELSS Money Market Special Mutual Funds Gilt Funds Load Funds Index Funds ETFs PIE Ratio Fund
3. **Balanced Funds:** The aim of balanced scheme is to provide both capital appreciation and regular income. They divide their investment between equity shares and fixed nice bearing instruments in such a proportion that, the portfolio is balanced. The portfolio of such funds usually comprises of companies with good profit and dividend track records. Their exposure to risk is moderate and they offer a reasonable rate of return.
4. **Money Market Mutual Funds:** They specialize in investing in short-term money market instruments like treasury bills, and certificate of deposits. The objective of such funds is high liquidity with low rate of return.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Geographical Classification

### Domestic Funds

Funds which mobilize resources from a particular geographical locality like a country or region are domestic funds. The market is limited and confined to the boundaries of a nation in which the fund operates. They can invest only in the securities which are issued and traded in the domestic financial markets.

### Offshore Funds

Offshore funds attract foreign capital for investment in 'the country of the issuing company. They facilitate cross-border fund flow which leads to an increase in foreign currency and foreign exchange reserves. Such mutual funds can invest in securities of foreign companies. They open domestic capital market to international investors. Many mutual funds in India have launched a number of offshore funds, either independently or jointly with foreign investment management companies. The first offshore fund, the India Fund, was launched by Unit Trust of India in July 1986 in collaboration with the US fund manager, Merril Lynch.

## Others

### Sectoral

These funds invest in specific core sectors like energy, telecommunications, IT, construction, transportation, and financial services. Some of these newly opened-up sectors offer good investment potential.

### Tax Saving Schemes

Tax-saving schemes are designed on the basis of tax policy with special tax incentives to investors. Mutual funds have introduced a number of tax saving schemes. These are close--ended schemes and investments are made for ten years, although investors can avail of encashment facilities after 3 years. These schemes contain various options like income, growth or capital application. The latest scheme offered is the Systematic Withdrawal Plan (SWP) which enables investors to reduce their tax incidence on dividends from as high as 30% to as low as 3 to 4%.

### Equity-Linked Savings Scheme (ELSS)

In order to encourage investors to invest in equity market, the government has given tax-concessions through special schemes. Investment in these schemes entitles the investor to claim an income tax rebate, but these schemes carry a lock-in period before the end of which funds cannot be withdrawn.

### Special Schemes

Mutual funds have launched special schemes to cater to the special needs of investors. UTI has launched special schemes such as Children's Gift Growth Fund, 1986, Housing Unit Scheme, 1992, and Venture

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Capital Funds. 5. Gilt funds: Mutual funds which deal exclusively in gilts are called gilt funds. With a view to creating a wider investor base for government securities, the Reserve Bank of India encouraged setting up of gilt funds. These funds are provided liquidity support by the Reserve Bank.

### Load Funds

Mutual funds incur certain expenses such as brokerage, marketing expenses, and communication expenses. These expenses are known as 'load' and are recovered by the fund when it sells the units to investors or repurchases the units from withholders. In other words, load is a sales charge, or commission, assessed by certain mutual funds to cover their selling costs. Loads can be of two types-Front-end-load and back-end load. Front-end-load, or sale load, is a charge collected at the time when an investor enters into the scheme. Back-end, or repurchase, load is a charge collected when the investor gets out of the scheme. Schemes that do not charge a load are called 'No load' schemes. In other words, if the asset management company (AMC) bears the load during the initial launch of the scheme, then these schemes are known as no-load schemes. However, these no-load schemes can have an exit load when the unit holder gets out of the scheme before a I stipulated period mentioned in the initial offer. This is done to prevent short-term investments and redemptions. Some funds may also charge different amount of loads to investors depending upon the time period the investor has stayed with the funds. The longer the investor stays with the fund, less is the amount of exit load charged. This is known as contingent deferred sales' charge (CDSL). It is a back-end (exit load) fee imposed by certain funds on shares redeemed with a specific period following their purchase and is usually assessed on a sliding scale.

### Index Funds

An index fund is a mutual fund which invests in securities in the index on which it is based BSE Sensex or S&P CNX Nifty. It invests only in those shares which comprise the market index and in exactly the same proportion as the companies/weightage in the index so that the value of such index funds varies with the market index. An index fund follows a passive investment strategy as no effort is made by the fund manager to identify stocks for investment/dis-investment. The fund manager has to merely track the index on which it is based. His portfolio will need an adjustment in case there is a revision in the underlying index. In other words, the fund manager has to buy stocks which are added to the index and sell stocks which are deleted from the index. Internationally, index funds are very popular. Around one third of professionally run portfolios in the US are index funds. Empirical evidence points out that active fund managers have not been able to perform well. Only 20-25% of actively managed equity mutual funds out-perform benchmark indices in the long-term. These active fund managers park 80% of their money in an index and do active management on the remaining 20%. Moreover, risk adverse investors like provident funds and pension funds prefer investment in passively managed funds like index funds.

## MARKING MIX OF MUTUAL FUNDS INDUSTRY

In case of Mutual fund, Returns are determined by Managerial efficiency and investment strategy. Mutual fund marketing strategies is successful if it creates confidence among potential investors and strengthens their desire to put their money with a particular fund.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Product

Mutual fund as a product is the investment, which the investors hold. The steps, which are involved in the formulation of the schemes or product designing, are conceptualization, drafting, test marketing, approval and authorization of the scheme. Since mutual fund is a service, there is a little element of physicality. Physical evidence is the Mutual fund documents and the statements that are received periodically. Mutual fund managers want to deliver good quality at a reasonable cost, but the managers cannot make any promises about the future performance of the investment since a mutual fund is not a consumer product with consistency of performance. There are number of mutual fund schemes that are floating in the market. One mutual fund house deals in many schemes. The product line of the mutual fund houses ranges from 30 to 300 schemes in India as market segmentation is done to cater to all the specific investment demands of the customers. Market segmentation increases product differentiation, limiting competition to the funds belonging to the same category, while fund proliferation increases market coverage. It relies either on the creation of many funds in order to hide the poor performers merging them into the best ones. Sponsors of the mutual funds make efforts to differentiate their products and bring in recognition of their brand names in the consumers as it leads to product identification at the market place. It is seen that Mutual funds in India have been quite successful in brand policy and brand identification.

## Place

Place or the marketing channel describes the groups of individuals and companies, which are involved in channelizing the flow and sale of product and services from the provider to the eventual customer. In mutual fund also there are channels broadly defined as ‘direct’ or ‘indirect’. Direct channels involve the movement and sale of products directly between the provider and the customer as in the traditional branch network, whereas in the case of indirect channels product flows via intermediaries and middlemen. Traditionally mutual fund has been via the branch network, but now different approaches are adopted.

## Promotion

With globalization the entry of multinational corporations propelled due to which the market changed into a buyers’ market and due to the sudden competition growth, the domestic mutual fund industry was shaken. Promotional efforts should be stimulating and motivating enough to generate interest in and promote a positive attitude towards a Mutual fund house so that they will be considered favorably in comparison with the competitors. As there are so many players in the Mutual fund Industry, to choose one mutual fund over the other becomes very difficult for the investors. This has led the mutual fund to follow aggressive promotional techniques. Besides leading National Dailies, funds regularly advertise in business newspapers and magazines.

## Pricing

Price competition involves using low prices as a competitive tool to attract customers. As the price of the mutual fund is dependent upon the price of the underlying shares. Therefore it is the distribution cost not the manufacturing cost in Mutual fund that separates one competitor with another. One of the advantages of Mutual funds that it discloses its entire fee charged.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## People

Mutual fund marketers need to develop a high level of inter personal skills and customer oriented attitude in employees for the simple reason that employees in services are the key to service experience. All employees in the mutual fund house have an effect on the sale of the products. This is true of frontline a staff that has direct control with customers; they provide the link between the Mutual fund and the investors. To the investor they represent the Mutual fund company. Success of mutual fund is highly dependent upon the relationship of the investors with the employees as there is a little difference between the products the different fund houses are offering, it is mainly the commitment that a mutual fund house makes.

## Physical Evidence

The allocation of greater amount of space in a mutual fund house is likely to have a positive relationship between the company and the investors. Physical evidence also means the offer documents and Mutual fund statements that the investors are provided with. In order to have a better relationship with the investors, the statements should be regular, easily understandable and all the facts should be mentioned in it.

## Process

Process means the process through which the investors' money is invested in different schemes and the returns are provided to them. The process should be less complex. The revision of schemes should not be a very frequent task as it leads to increase in cost. The mutual fund houses make efforts to standardize the process. In order to customize the process, so lot of different schemes is coming into market.

## DISTRIBUTION CHHANELS

There are number of distribution channels that are existing and the channels are still expanding. The channels can be divided into the following heads:

- Direct Marketing.
- Personal selling.
- Telemarketing.
- Direct Mail.
- Selling through intermediaries like brokers, agents, banks, etc.

Joint calls According to SyedSahabuddin, the essentials of a Good Distribution System are:

- Product selection should be done carefully.
- Internal sales staff should be carefully selected.
- Right targeting of customers should be done. A proper strategy based on a demographic study will lead to a smooth, seamless customer penetration and sales volumes.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Proper training - Training is the key on which the entire distribution revolves. It is essential that sales force should be continuous trained in this dynamic environment.
- Educating/ counseling the customer about products is required keeping in mind rising customer expectations and increasing buyer expertise.

## ADVERTISEMENT OF MUTUAL FUNDS

Nowadays the Advertising content has changed. Now they are concept selling ads which used to be selling specific schemes that defined objectives /goals. Thus an advertising campaign must have the following elements present:

- Creating awareness of the product,
- Comparative advantage of the product,
- Future potential of the product,
- Past performance of similar products,
- Superiority of the fund in relation to others in the area of asset management and performance servicing.

However, One of the limiting factor that prevents Mutual Fund advertising is the regulatory framework. For instance, the MF are required to mention the fund objective in very clear terms in the offer document, and risk factor also to be mentioned. SEBI also prohibits any content that mislead the investors. All the Mutual fund have to first understand the meaning and implications of the SEBI Guidelines pertaining to mutual fund Marketing before designing a Marketing strategy.

## METHODS ADOPTED BY AMC FOR PROMTION AND CAMAIGNING OF MUTUAL FUNDS

### Through Advertisement

Each AMC spends a lot of money in order to advertise for its Mutual Fund. The amount spend is high in case New Fund Offers. Various mediums of advertisement use are given below:

- Television and Radio,
- Print Media,
- Hoardings.

According to Kaushik Raja, the following are the forms of advertising adopted by Mutual Funds.

1. Tombstone Advertisement,
2. Product Launch Advertisement,
3. Advertisements through Hoardings/Posters,
4. Advertisements through Audio-Visual Media.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

### Online Blogs

Various AMC's promote their product through online blogs. They advertise their product on various online sites.

### Telephonic Calls

Almost all the distributors promote the Mutual Fund with the help of telephone. They have the phone numbers of existing clients and potential clients. A trained person makes a call to the clients and promotes the Mutual Fund.

### By Providing More Commission to Distributors

The distributor gets a variable commission from the AMC when they sell their Mutual Fund. The commission varies from 0.5% to 5%. Thus by providing more commission to the distributor, the AMCs influence the distributor to promote their products only.

### By Putting Canopies

This method is adopted by both distributor and AMCs in order to campaign for the product. They put canopy at a place where they could interact with maximum number of probable clients

### Credit Rating Agencies Report

Rating agencies give ratings to the mutual fund according to their performance. Agencies like Money control rates the Mutual fund that also acts a promotional tool for the fund and facilitates its investment

## MARKETING STRATEGIES ADOPTED BY MUTUAL FUNDS

(For selling and distribution). According to him the present marketing strategies of mutual funds can be divided into three main headings:

1. **Direct Marketing:** This constitutes 20 percent of the total sales of mutual funds. Some of the important tools used in this type of selling are:
   a. Personal Selling,
   b. Telemarketing,
   c. Direct mail,
   d. Advertisements in newspapers and magazines,
   e. Hoardings and Banners.
2. **Selling Through Intermediaries:** Intermediaries contribute towards 80% of the total sales of mutual funds. These are the distributors who are in direct touch with the investors. They perform an important role in attracting new customers. Most of these intermediaries are also involved in selling shares and other investment instruments. They do a commendable job in convincing investors to

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

invest in mutual funds. A lot depends on the after sale services offered by the intermediary to the customer. Customers prefer to work with those intermediaries who give them right information about the fund and keep them abreast with the latest changes taking place in the market especially if they have any bearing on the fund in which they have invested. Most of the funds conduct monthly/ bi-monthly meetings with their distributors. The objective is to hear their complaints regarding service aspects from funds side and other queries related to the market situation. Sometimes, special training programs are also conducted for the new agents/ distributors. Training involves giving details about the products of the fund, their present performance in the market, what the competitors are doing and what they can do to increase the sales of the fund.

3. **Joint Calls:** This is generally done when the prospect seems to be a high net worth investor. The BDA and the agent (who is located close to the HNIs residence or area of operation) together visit the prospect and brief him about the fund. The conversion rate is very high in this situation, generally, around 60%. Both the fund and the agent provide even after sale services in this particular case. Meetings with HNIs is a special feature of all the funds. Whenever a top official visits a particular branch office, he devotes at least one to two hours in meting with the HNIs of that particular area. This generally develops a faith among the HNIs towards the fund.

## Methods Adopted Asset Management Companies According to Distribution Network

### Get in Touch with Customers

Various AMC directly contact the customers through various database. Then the AMC convince the client to invest in their mutual fund. Many of the times due to promotion the customers also contact AMC for investment. Most of the Mutual fund houses are following this route.

### Online Investment

Some mutual fund Web sites allow customers to invest online. However, the customer must have an account with the banks AMC have partnered with. For example, Prudential ICICI Mutual Fund allows customers to buy funds online if he have a banking account with any of the following banks: Centurion Bank, HDFC Bank, ICICI Bank, IDBI Bank and UTI Bank.

### Through Distributors

Each AMC sell its products through various distribution channels. The distributor in turn gets a variable commission from the AMC .The distributor have a client base of their own in which they promote the mutual fund. Some of the major distributors are India infoline Limited, Karvy, Sharekhan, Religare, Blue Chip India Limited.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

### Through Banks

Some of the AMCs are sister concern of the bank example Prudential ICICI Mutual Fund is a sister concern of ICICI BANK. These AMCs aggressively promote their mutual fund to their client and develop a interest in them to invest in mutual fund in order to get higher returns.

### Through Online Finance Portals

Some of the AMCs sell their Mutual Fund through online trading account example ICICI Direct sell funds online through online trading account. But the client must have a trading account with them. Some of the AMCs which sell their product through online trading accounts are: HDFC Securities, ICICI Direct, Kotak Street

## MARKETING OF MUTUAL FUNDS AND ITS CHALLENGES

When we consider marketing, we have to see the issues in totality, because we cannot judge an elephant by its trunk or by its tail but we have to see it in its totality. When we say marketing of mutual funds, it means, includes and encompasses the following aspects:

- Assessing of investors needs and market research
- Responding to investors needs;
- Product designing;
- Studying the macro environment;
- Timing of the launch of the product;
- Choosing the distribution network;
- Preparing offer documents and other literature;
- Getting feedback about sales;
- Studying performance indicators about fund performance like N A V;
- Sending certificates in time and other after fia1es services;
- Honoring the commitments made for redemptions and repurchase;
- Paying dividends and other entitlements.

Creating positive image about the fund and changing the nature of the market itself. The above are the aspects of marketing of mutual funds, in totality. Even if there is a single weak-link among the factors, which are mentioned above, no mutual fund can successfully market its funds. Conclusion: Mutual Fund Marketing is different from marketing of other goods. The present study try to explore the marketing strategies adopted by mutual funds, the different 7Ps that are involved in the marketing of mutual fund and also the Marketing strategies that are involved by the various mutual fund houses for attracting the investors. Mutual funds are not absolutely free to choose their material fro advertisement or promotion, as SEBI has issued some mandatory guidelines for the fund houses. Mutual fund houses are more dependent on the intermediaries and presently the fund houses are using all the available option for advertisement and promotion.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## CONCLUSION

Mutual fund Marketing is different from marketing of other goods. The present chapter tries to explore the marketing strategies adopted by Mutual funds, the different 7 Ps that are involved by the various mutual funds for attracting the investors. Mutual funds are not absolutely free to choose their material for advertisement or promotion, as SEBI has issued some mandatory guidelines for the fund houses. Mutual fund houses are more dependent on the intermediaries and presently the fund houses are using all the available option for advertisement and promotion.

# Chapter 10
# Foreign Direct Investment Opportunities in Infrastructure Development:
## A Study on India

**Madhuri Malhotra**
*Loyola Institute of Business Administration, India*

## ABSTRACT

*India's rising growth trajectory requires rapidly expanding infrastructure facilities to support it. The availability of efficient infrastructure services is an important determinant of the pace of market development and output growth. Access to affordable infrastructure services for consumption purposes serves to improve household welfare, particularly among the poor. The potential contribution of infrastructure to economic growth and poverty reduction has not been fully realized, and existing infrastructure stock and services fall far short of the requirements. The Government recognises the fact that domestic resources alone may not be adequate to sustain the required expansion in infrastructure, and hence it has followed a strategy to create incentives for Foreign Direct Investment in infrastructure sector. This study examines the current state of infrastructure in emerging India, use of FDI is infrastructure sector and policy measures to be taken up to speed up infrastructure growth in India.*

## INTRODUCTION

Infrastructure sector is a one of the key drivers of Indian economy. The sector is highly responsible for propelling India's overall development. A country's economic development is directly related to its infrastructural development. Infrastructure of a country can be divided into two parts- primarily as physical and social infrastructure. Social infrastructure consists of better education facility, better health services availability etc. The Reserve Bank of India has defined infrastructure sector as power, telecommunications, railways, roads including bridges, sea port and airport, industrial parks, urban infrastructure

Copyright © 2020, IGI Global. Copying or distributing in print or electronic forms without written permission of IGI Global is prohibited.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

(water supply, sanitation and sewage projects), mining, exploration and refining, cold storage and cold room facility, including for farm level pre-cooling for preservation or storage of agricultural and allied produce, marine products and meat. The physical infrastructure facilities in India are not adequate to meet the increased demand at present. In most cases, India's infrastructure is of poor quality, by world standards. Traditionally, infrastructure was the exclusive province of the public sector, with large, state-owned enterprises (SOEs) being responsible for investment and service delivery. These entities were costly and inefficient providers of infrastructure services. International organisations such as World Bank, has encouraged privatization which has been a major component of the economic reform programmes pursued by many developing countries over the past two decades. Privatization is perceived to provide better use of resources, more efficient operations, reduced financial burden on government and increase in the level of foreign and domestic private investment (World Bank, 1995). Private sector has become increasingly involved in the financing and delivery of infrastructure services. A large number of developing countries have introduced private participation into their infrastructure industries. Of the total quantum of FDI flows across the globe, a large fraction has gone into infrastructure projects. Growing pressures on Government budgets and a general concern about the quality of service provision by incumbent entities saw an explosion of private sector FDI into infrastructure, particularly in the developing countries. Between 1990 and 1998, infrastructure projects in the developing countries attracted about US$ 63 billion through the following routes: Privatisation sales, Concessions, Leases and other contractual agreements, new capacity creation through build-operate-transfer (BOT) Agreements. The bulk of infrastructure FDI in terms of quantum of investment has flowed into the telecom and power sectors. There are two routes available for foreign direct investment in India: (i) Automatic route under which companies receiving Foreign Direct Investment need to inform the Reserve Bank of India within 30 days of receipt of funds and issuance of shares to the foreign investor (ii) For sectors that are not covered under the automatic route, prior approval is needed from the Foreign Investment Promotion Board (FIPB). The Table below lists the FDI ceiling under automatic route in India.

Government of India promoted FDI in infrastructure through increase in proposed investment limit in FDI sector to US$1000 billion in coming years. More than 70% of it is expected from private and foreign players. For infrastructure sector, India is relying mainly on private sector investment through Public Private Partnership. The PPP is planning to invest more than US$ 400 billion in infrastructure sector in the next 5 years. The Government of India is also planning to set up a dedicated panel to enhance the approval process of infrastructure projects. As per the research reports, an investment inflow of more than US$1 trillion will be required in different projects such as harbour, highways and power plants and more than 1.8 trillion US$ will be required to be invested in infrastructure projects in India.

*Table 1. FDI Ceiling under automatic route*

| | Sector | Percent |
|---|---|---|
| 1 | Telecom | 49 |
| 2 | Electricity generation, transmission and distribution (except nuclear power) 100 | 100 |
| 3 | Roads and Highways | 100 |
| 5 | ports and harbours | 100 |
| 6 | Civil Aviation | 100 |

Source: Department of Industrial Policy and Promotion, Government of India. www.dipp.nic.in

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Indian power sector itself has an investment potential of US$ 250 billion in the next 4-5 years, providing immense opportunities in power generation, distribution, transmission and equipment. The Indian construction equipment industry is expected to grow US$ 5 billion by 2020, from current size of US$ 2.8 billion (Indian Construction Equipment Manufacturers' Association (ICEMA) Report). Foreign Direct Investment (FDI) received in construction development sector from April 2000 to December 2015 stood at US$ 24.18 billion, according to the Department of Industrial Policy and Promotion (DIPP).

## PAST SCENARIO AND STUDIES

Research evidence suggests the importance of FDI inflows into infrastructure sector in India. Vijaykumar *et al.* (2010) examines the factors determining FDI inflows of BRICS countries using annual dataset from the period 1975 to 2007 using panel data analysis and finds that the market size, labour cost, infrastructure, currency value and gross capital formation are among the potential determinants of FDI inflows of BRICS countries. The Economic Stability and Growth prospects (measured by inflation rate and Industrial production respectively), Trade openness (measured by the ratio of total trade to GDP) seem to be the insignificant determinant of FDI inflows of the BRICS countries.

Sanu (2013) in his study on India, concluded that Infrastructure is the basic physical and organizational structures needed for the operations of a society or enterprise or the services and facilities necessary for an economy to function. He defined infrastructure a set of interconnected structural elements that provide support for the development of the economy. The author reported that foreign investment in infrastructure remains low even after efforts taken up by the Government of India in promoting an investor friendly environment. The research paper discussed infrastructure deficiency of India, the foreign direct investment in Infrastructure sector.

Agarwal (2015) focussed on the importance of good social and physical infrastructural facilities for rapid economic growth, rapid human development, and poverty reduction. His study compares the levels of development of the social and physical infrastructure in India with those in other major emerging countries as well as developed countries. The study finds that India substantially lags behind other emerging countries in the access to and quality of health facilities, education, and vocational or skill training,, probably a key reason why India has been so slow in eliminating poverty. Similarly, India's physical infrastructure also lags behind other emerging countries, especially in the sphere of electricity access and consumption per capita, internet access, level of air travel, and quality of sea ports. Given the urgent need for rapid development of our social and physical infrastructure, the study tries to identify key challenges to infrastructure development and discusses some possible ways in which some of these challenges can be addressed.

Expanding infrastructure investments are viewed as critical adjuncts to the policy of stepping up the growth rate of the economy. This is coupled with the view that domestic sources alone may not be adequate to provide commensurate resources. Table 2 and 3 highlight the increase in FDI flows in India during 2013 and 2014 in aggregate and sector specific. There is a 61% increase in FDI inflows as compared to 2013. Recently, the Reserve Bank of India has allowed overseas investors, including foreign portfolio investors (FPIs) and non-resident Indians (NRIs), to invest up to 26 per cent in insurance and related activities via the automatic route. "Effective from February 4, 2014, foreign investment by way of FDI, investment by foreign institutional investors (FIIs)/FPIs and NRIs up to 26 per cent under automatic route shall be permitted in insurance sector," as per the RBI. Long-term investors who are registered with

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Securities and Exchange Board of India (SEBI) are also deemed as eligible investors. In an effort to bring in more investments into debt and equity markets, the RBI has established a framework for investments which allows FPIs to take part in open offers, buyback of securities and disinvestment of shares by the Central or State governments. Under a new scheme named 'Foreign Portfolio Investment', the RBI said portfolio investors, which includes FIIs and qualified foreign investors (QFIs) registered as per SEBI guidelines, will be called registered foreign portfolio investors (RFPIs). In 2013, FDI was witnessed in sectors such as automobiles, chemicals, computer software and hardware, construction development, pharmaceuticals, power, services, and telecommunications. France, Germany, Japan, Mauritius, the Netherlands, Singapore, the UK, and UAE invested in India during that year.

The 1990s saw an unprecedented increase in private foreign investment in infrastructure projects in developing countries. Much of this investment was in the telecommunications and electricity industries. For the private sector, infrastructure investment is associated with a sizeable investor risk linked to the long-term sunk cost characteristics of infrastructure projects. Although India has seen growth in FDI inflows in infrastructure, it still ranks 89 in basic infrastructure as per the Global Competition Report 2011-12. This indicates poor development compared to other countries of the world. A major improvement is required in the areas of physical and social infrastructure to sustain further progress and high rate of economic growth. To meet this need for infrastructure improvement, the Government of India raised the investment in infrastructure from 4.7 per cent of GDP to around 7.5 - 8 per cent of GDP in the eleventh five year plan, and further plans to double the investment in infrastructure from INR 20.5 trillion to INR 40.9 trillion during the Twelfth Plan period, raising the share of infrastructure investment in GDP to more than 10 per cent. If these infrastructure investment plans are properly implemented, they can propel India's economic growth to a higher trajectory. While direct investments into infrastructure certainly forms one part of the government's new strategies, the budget also includes some important measures aimed at improving the environment for private infrastructure investment as well. The recent financial budget proposed creation of a 'National Investment in Infrastructure Fund' with an initial annual allocation of USD3.25 billion. The fresh allocation of USD2.25 billion to roads and USD1.6 billion to railways is also intended to improve liquidity in the system. The current state of FDI equity inflow in various sectors is depicted in Table 4. It is evident that service sector is the one attracting the highest FDI equity inflows, followed by construction, software and telecommunication sector respectively. Still there is lot of scope for the equity FDI in infrastructure sector.

*Table 2. FDI Equity inflows during the financial year 2014-15*

## SCOPE FOR FDI IN INDIA

With the concept of "Make in India", proposed by the Indian Government, India has now become a vibrant market for manufacturers. For the products that are made out of the initiative, there is a strong domestic market with increasing demand. Infrastructure sector is where foreign investments can come in a big way. The major objectives behind the Make in India initiative are job creation and skill enhancement in 25 sectors of the economy, including automobiles, aviation, biotechnology, chemicals, construction, defence manufacturing, electrical machinery, electronic systems and mining. According to the Department of Industrial Policy and Promotion, FDI inflows under the approval route (which requires prior government permission) increased by 87% during 2014-15 with an inflow of $2.22 billion. More than 90% of FDI was through the automatic route. In 2015, foreign institutional investment rose by 717% to $40.92 billion. A state-wise analysis of FDI inflows by the economic survey shows that Delhi, Haryana, Maharashtra, Karnataka, Tamil Nadu, Gujarat and Andhra Pradesh together attracted more than 70% of total FDI inflows to India during the last 15 years. States with vast natural resources like Jharkhand, Bihar, Madhya Pradesh, Chhattisgarh and Odisha have lagged behind. To make the recently launched Make in India initiative a success, the states have a critical role in facilitating FDI in different sectors. Singapore, Mauritius, the Netherlands and the US account for the major share of FDI inflows into India.

Out of FDI equity inflows of $24.8 billion during 2015-16 (April-November), more than 60% came from two geographically small countries, Singapore and Mauritius. Government reforms will improve the returns on investment for the private sector, acting as an incentive for them to further undertake investments in infrastructure. With this policy impetus, India is in a relatively strong position to channelizing investment into infrastructure. According to a recent report by the Government of India, infrastructure sector of India will attract an investment of more than US$1.1 trillion in the next five years. This also includes ambitious projects such as National Highway Development Project (NHDP). In the next five years, an investment inflow of around US$75 billion will be required to boost the infrastructure sector in India which is projected to expand at 20% every year. Over the next decade, more than 90 million jobs would be generated across different sectors in India, which would create a need for more than 8 million square feet of office space. This would be one of the key attractions for foreign players who are looking for opportunities to invest in industrial infrastructure sector. Recently, the Indian cabinet has given its approval for private investment in Indian Railways (state-run) for constructing new plants and lines with enhanced capacity. This reform will help foreign players to connect railways with industrial plant, mines and port by offering services at lower costs. The Government of India has also projected the Indian Railways Vision 2020 which targets to tackle the issues related with infrastructure, by opening up doors for NRIs to invest in Indian infrastructure sector.

## Inward FDI Patterns of BRICS

The rise in FDI inflows to BRICS took place from 2003 to 2008, growing from US$77 billion to US$281 billion, in which China and the Russia were having the highest share. The FDI inflows to BRICS increased from US$77 billion in 2003 to US$252 billion in 2014, in which China was having the highest share. There is 50 percent of FDI flows of BRICS go to China, followed by Brazil 24 percent, India 13 percent, Russia 8 percent and 2 percent in South Africa in 2014. Figure 1, highlights that inward FDI flows were higher in China followed by Brazil, Russia, India and South Africa in the year 2014. The global slowdown of 2008-09 negative impact on the inward flows of FDI on all BRICS nations, but it has improved over the time.

*Figure 1. Inward FDI flows in BRICS countries in 2005-2014 (Million US$)*

## SCOPE OF FDI IN INFRASTRUCTURE

In the Government of India's initiative to promote FDI in India, a 100% FDI is allowed under automatic route for infrastructure development in power sector; Foreign Direct investment of 100% is permitted under automatic route in infrastructure related to petroleum products, natural gas pipelines and petroleum refining by private sector; 49 percent FDI is allowed under Government route in any petroleum refining in Public Sector Undertaking (PSU). A 100 percent FDI is permitted under automatic route in setting up new and established industrial park. In order to ensure quicker execution of major projects, the Government of India has declared a single window clearance mechanism for issue and review of clearance associated with important projects under the Cabinet secretary. The clearance board is established on the lines of Foreign Investment Promotion Board (FIPB), which would act as investment tracker and problem solver for all the infrastructure projects worth more than US$150 million. The clearance board will possess representatives from ministries of defence, commerce, home, coal, environment and forest and department of space. The Indian Cabinet Committee on Investment is trying to ease bottleneck which restrict the expansion of infrastructure sector in the country. In order to attract private and foreign investment, some more sectors like telecommunication, oil, gas storage and irrigation have been allowed for viability gap funding under the scheme called 'Support to PPP in Infrastructure'. As per the budget 2016-17, India is planning to invest Rs 2.21 trillion in creating and upgrading infrastructure. Infrastructure investment is the fifth support pillar in the transformation of India, and the Govt. is speeding up construction of new roads and upgrading state highways to national ones. The total expenditure outlay for roads and railways in 2016-17 is around Rs.218,000 crores. Total capital expenditure outlay for infrastructure during 2016-17 is expected to be Rs.221, 246 crore. Recently, the Indian government has approved 9 different road projects worth US$ 2 billion to be implemented by State Governments under Public Private Partnership model. Indian Finance Ministry is ready to fund 20% of financial requirement, while the other 20% would come from Highways Ministry. Foreign investment may be invited in order to make all the projects financially feasible. According to the Government report, allocation for roads and railways is Rs.40, 000 crore each, an increase of Rs.14, 031 crore and Rs.10, 050 crore respectively over the year 2016. The government plans to streamline the regulatory structures across different sectors of infrastructure and tap additional financial resources. The finance minister announced the formation of an investment and infrastructure fund and tax-free bonds for raising funds for investment in rail, roads and irrigation. The year 2016-17 focuses on infrastructure development.

## CONCLUSION AND POLICY IMPLICATIONS

FDI investment in infrastructural sector is promoted by the Government of India. India is witnessed as one of the major FDI markets. Till recently, infrastructure was not taken as the main FDI Avenue, but with the policy changes in the recent budget, favourably impacted the investment level in the infrastructure sector in India. Foreign direct investment (FDI) in India has received a dramatic boost from the launch of the Make in India initiative, according to the latest Economic Survey. After the September 2014 launch of the initiative, which seeks to promote manufacturing and attract foreign investment, there was an almost 40% increase in FDI inflows from October 2014 to June 2015 over the year-ago period.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

India's infrastructure development is set to accelerate, backed by the underlying commitment that extra fiscal allowance will be channelled primarily into infrastructure spend. The Government has taken systematic initiatives to address the bottle necks in infrastructure development. The Indian Government's success in infrastructure provision will be measured not by the quantum of funds invested, but on how infrastructure contributes to the achievement of India's economic, social and environmental objectives. Challenges in infrastructure provision are not unique to India. Uncertainty, scarcity of available funds for investment, and competing priorities put challenges to all governments in infrastructure planning and delivery. Sustainability requires that future generations are not compromised by the investment decisions of current generations. Sustainably managing infrastructure through the appropriate pricing, funding and prioritisation frameworks is important to ensure the benefits that accrue from the significant investment. The combination of domestic private foreign investment and foreign direct investment is likely to propel India's economic growth momentum in future.

## KEY TERMS AND DEFINITIONS

**Economic Growth:** Economic growth is an increase in the capacity of an economy to produce goods and services, compared from one period of time to another. It can be measured in nominal or real terms.

**Emerging Market:** An emerging market is a country that has some characteristics of a developed market, but does not meet standards to be a developed market. This includes countries that may become developed markets in the future or were in the past.

**Financial Sector Reforms:** Financial sector is the backbone of any economy and it plays a crucial role in the mobilisation and allocation of resources. The main objectives of the financial sector reforms are to allocate the resources efficiently, increasing the return on investment and accelerated growth of the real sectors in the economy.

**Foreign Direct Investment:** Foreign direct investment (FDI) is an investment in a business by an investor from another country for which the foreign investor has control over the company purchased.

**Infrastructure:** basic physical and organizational structures and facilities (e.g. buildings, roads, and power supplies) needed for the operation of a society or enterprise.

**Physical Infrastructure:** Physical infrastructure refers to the basic physical structures required for an economy to function and survive, such as transportation networks, a power grid and sewerage and waste disposal systems.

**Social Infrastructure:** Social Infrastructure is a subset of the infrastructure sector and includes assets that accommodate social services.

# Chapter 11
# The Role of Strategic Outsourcing in Global Business

**Kijpokin Kasemsap**
*Suan Sunandha Rajabhat University, Thailand*

## ABSTRACT

*This chapter reveals the role of strategic outsourcing in global business, thus describing the theoretical and practical concept of strategic outsourcing; the management theories related to strategic outsourcing; the applications of Business Process Outsourcing (BPO) and Information Technology Outsourcing (ITO); and the significance of strategic outsourcing in global business. The fulfillment of strategic outsourcing is vital for modern organizations that seek to serve suppliers and customers, improve business performance, enhance competitiveness, and reach continuous achievement in global business. Therefore, it is necessary for modern organizations to explore their strategic outsourcing, establish a strategic plan to usually check their practical advancements, and immediately respond to strategic outsourcing needs of customers in modern organizations. The chapter argues that applying strategic outsourcing in global business has the potential to increase organizational performance and attain business goals in the digital age.*

## INTRODUCTION

Outsourcing has become one of the most popular operations strategies in recent years that allows companies to reduce capital costs concerning customer requirements in the global marketplace (Kakabadse & Kakabadse, 2005) and to improve organizational performance (Bustinza-Sanchez, Arias-Aranda, & Gutuerrez-Gutierezz, 2010). Outsourcing is critical to the growth of a nation's economy (Corbett, 2004). Strategic outsourcing includes the integration of the firm's different functions to the firm's strategic decision-making level (Su & Gargeya, 2012).

There are a lot of studies on outsourcing and its strategic influence to sustainable growth in the organizations (Demirtas, 2013). Outsourcing is broadly recognized in management literature (Kotabe, Mol, Parente, & Murray, 2012; Petersen, Handfield, & Ragatz, 2005). Gunasekaran et al. (2015) stated that outsourcing, an operations strategy that influences the performance of a supply chain, has become

an important component of global operations management. Resources of both the outsourcer and the outsourcee are important in turning potential complementarities into higher outsourcing performance (Unal & Donthu, 2014).

The strength of this chapter is on the thorough literature consolidation of strategic outsourcing. The extant literature of strategic outsourcing provides a contribution to practitioners and researchers by describing a comprehensive view of the functional applications of strategic outsourcing to appeal to different segments of strategic outsourcing in order to maximize the business impact of strategic outsourcing in global business.

## BACKGROUND

Outsourcing was initiated in the 1950s but became viable in the 1980s, when organizations used outsourcing as a process of reducing costs related to service-oriented operations (Lacity & Hirschheim, 1993) which were normally non-core business processes. Outsourcing has become a common strategy in the information system/information technology (IS/IT) field in recent years (Chen, Wang, & Wu, 2011). Outsourcing has moved from a non-core business activity to more critical business activities such as design, manufacturing, marketing, human resource management, and logistics. Current advancement in technology has made procurement a very specialized service (Camperi, 2005).

Outsourcing is strategically important (Jennings, 2002; Quinn & Hilmer, 1994). Outsourcing initiative becomes strategic when it is aligned with the organization's long-term strategies (Greaver, 1999; Shy & Stenbacka, 2003). Most organizations have tried to cope with enormous challenges such as the globalization of markets and the rapidly changing technology (Dirani & Kuchinke, 2011). Sourcing plays a significant role in a company's strategic decision-making process (Baum, Locke, & Smith, 2001; Kang, Wu, & Hong, 2009). Tactical plans (e.g., reducing costs, transforming fixed costs to variable, and liberating capital) are the basic reasons for turnings to an outsourcing service provider (Ventkatesan, 1992).

## ROLE OF STRATEGIC OUTSOURCING IN GLOBAL BUSINESS

This section describes the theoretical and practical concept of strategic outsourcing; the management theories related to strategic outsourcing (in terms of resource-based view, resource-advantage theory, transaction cost theory, the capability approach, knowledge-based theory, agency theory, and social exchange theory); the applications of BPO and ITO; and the significance of strategic outsourcing in global business.

### Concept of Strategic Outsourcing

Outsourcing is viewed as ongoing purchasing of services and parts from an outside company that is provided by the outsourcing company (Linder, 2004). Ellram and Billington (2001) defined outsourcing as the transfer of activities and processes conducted to an external party. Outsourcing refers to contracting a particular processor function in an organization to an external firm (Kotabe & Zhao, 2002). Outsourcing includes any good or service that organizations procure from outside their firms (Momme, 2002). Outsourcing is recognized as a tool for business transformation (Kumar & Arbi, 2008).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Outsourcing is a useful way to adapt the firm's boundaries by restructuring its activities in order to stimulate the growth of its core business (Bustinza-Sanchez et al., 2010). Outsourcing involves the use of external providers and is a highly strategic decision with the ability to affect the competitive advantage (Gilley & Rasheed, 2000). Cost saving is a primary reason for outsourcing (Lau & Zhang, 2006; McCarthy & Anagnostou, 2004). Outsourcing makes it possible to control costs and achieve greater efficiency (Gonzalez, Llopis, & Gasco, 2013). Firms evaluate outsourcing to determine whether current operating costs can be reduced and whether the resources saved can be reinvested in a more competitive process, focusing on the core competence (Espino-Rodríguez & Lai, 2014).

Gilley and Rasheed (2000) classified outsourcing strategies into two types: core activity and peripheral activity. Power et al. (2006) divided the activities according to whether they are process-oriented or project-oriented activities, based on the attributes of each task. McIvor (2005) categorized the activities into non-critical and critical activities, based on the ability of an organization to achieve a competitive advantage. Quinn (1999) stated that there are three types of competences called core competences, essential competences, and non-core competences. Cox (1996) explained that the basic competences are made up of highly specific assets that are necessary to attain the firm's strategic goals.

Prior studies have examined the effects of vendor relationships on a client's competitive advantage (Kotabe, Martin, & Domoto, 2003), and advocated the importance of effective client-vendor relationship management for the outsourcing success (Berger & Lewis, 2011; Rai, Maruping, & Venkatesh, 2009). Project management and client-specific capabilities are critical for the success of outsourcing (Ethiraj, Kale, Krishnan, & Singh, 2005; Feeny, Lacity, & Willcocks, 2005). Considerable efforts have been devoted to investigating the role of a vendor's value proposition potential and the relational factors in outsourcing success, such as the vendor's capabilities in providing value proposition (Levina & Ross, 2003), partnership quality (Lee & Kim, 1999), relationship governance (Poppo & Zenger, 2002), cultural differences (Berger & Lewis, 2011), social embeddedness (Rai et al., 2009), and relational asset and capability (Fink, 2010).

Outsourcing service quality is central to both the vendor and client's concern (Poston, Kettinger, & Simon, 2009; Ramachandran & Gopal, 2010). Previous studies have recognized service quality as one of the critical indicators for outsourcing success (Grover, Cheon, & Teng, 1996; Kim, Chen, & Aiken, 2005). Clients tend to form long-term partnerships with their vendor, which facilitates the vendor's learning about the client's specific requirements and forging client-specific capabilities, thus achieving higher service quality (Grover et al., 1996).

There are four basic types of offshore outsourcing: BPO, ITO, offshore software development, and knowledge process outsourcing (KPO). Offshore outsourcing is the practice of hiring an external organization to perform some business functions (e.g., outsourcing) in a country other than the one where the products and services are practically developed. Offshore outsourcing can be contrasted with offshoring, in which a company moves itself entirely to another country, or where functions are performed in a foreign country by a foreign subsidiary.

As offshoring activities gain impetus spanning various industries in global business, more research is needed to better understand the specific success factors associated with this strategic device (Kenney, Massini, & Murtha, 2009; Mudambi & Venzin, 2010). The use of offshoring as a strategic device is typical among firms from advanced economies because it helps clients' firms reduce productions costs in the short run (Maskell, Pedersen, Petersen, & Dick-Nielsen, 2007), and has potential to become a strategic device for value co-creation in the long run (Contractor, Kumar, Kundu, & Pedersen, 2010; Liesch, Buckley, Simonin, & Knight, 2012).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Offshore outsourcing occurs when firms relocate business functions that previously were performed in-house to independent service providers located overseas (Mukherjee, Gaur, & Datta, 2013). The process of offshore outsourcing includes the firm-specific disintegration of different functions or activities, the pursuit of suitable locations for suitable service providers, and the externalization of outsourcing processes to an independent provider in a foreign country (Kedia & Mukherjee, 2009).

In the context of offshore outsourcing, the process of value creation remains a central issue (Kedia & Mukherjee, 2009; Liesch et al., 2012). The value creation is the principal purpose of business (Conner, 1991). Global sourcing is an organizational design issue which encompasses both ends of the firm's value chain and the need to explore the firm-specific mechanisms that create value by offsetting the complexities and uncertainties regarding process (Manning, Lewin, & Massini, 2008).

Performance measures and metrics (PMMs) are the basic managerial tools for decision making in any organizational environment, including outsourcing (Gunasekaran et al., 2015). PMMs in outsourcing can be applied to the offshore outsourcing, nearshore outsourcing, and onshore outsourcing (Bunyaratavej, Hahn, & Doh, 2007; Hahn, Bunyaratavej, & Doh, 2011; Schmeisser, 2013), as well as pre-outsourcing stage decisions, during-outsourcing stage decisions, and post-outsourcing stage decisions. Outsourcing is a highly strategic decision toward achieving organization's sustainable growth (Holcomb & Hitt, 2007). Outsourcing enables a company's resources to be improved by achieving better quality services (Espino-Rodríguez & Padron-Robania, 2004). Outsourcing reduces both direct costs and opportunity costs (Corbett, 2004).

Greaver (1999) stated that strategic outsourcing takes outsourcing to a higher level by asking fundamental questions about outsourcing, core competence, and competitive advantage. Strategic outsourcing must be assessed for its effects on competitive advantage and its congruence with decisions (Rumelt, Schendel, & Teece, 1994). Strategic outsourcing can be characterized by a close link between outsourcing processes and the key success criteria of organization (Quelin & Duhamel, 2003). Strategic outsourcing integrates the different functions of a firm including engineering, purchasing, operations, logistics, and marketing (Gottfredson, Puryear, & Phillips, 2005).

Firms outsource operations ranging from IT management to entire functions such as logistics and supply chain management (Gunasekaran et al., 2015). Most of the research papers reviewed on outsourcing deal with issues in IT (Bapna, Barua, Mani, & Mehra, 2010; Hsu & Wu, 2006; Weiner, Vogel, & Amberg, 2010). Yang et al. (2007) stated that the potential determinants of outsourcing include cost savings, a focus on strengths and flexibility, information security, loss of management control, labor unions and morale problems, vendor's service quality, market maturity, and other firms' outsourcing decisions. Bertrand (2011) stated that outsourcing reduces productions costs and increases flexibility. Recent management literature stresses the significance of flexibility in modern competitive landscapes (Lahiri & Kedia, 2011; Mudambi & Tallman, 2010). By divesting its unwanted resources, the offshoring firm can achieve greater flexibility and create value. Firms must develop the core competencies and human capital to achieve strategic flexibility and modularity (Hitt, Keats, & DeMarie, 1998).

At the pre-outsourcing stage, decision making is based on whether outsourcing, being a major strategic decision, will permit organizations to develop and leverage the capabilities required to compete in today's global business environment. McIvor (2008) presented a practical framework that managers can use in the pre-outsourcing phase to identify suitable outsourcing strategies for their processes. Since companies are increasingly opting to outsource, supplier selection has become a major strategic decision (Huang & Keskar, 2007; Kannan & Tan, 2003). The following performance measures have been suggested for supplier selection such as product-related measures (e.g., reliability, responsiveness,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

and flexibility), supplier-related measures (e.g., cost status, financial status, assets, and infrastructure), and society-related measures (e.g., safety and environmental perspectives) (Gunasekaran et al., 2015).

At the during-outsourcing stage, outsourcing performance depends on the sharing of knowledge and resources, on the collaboration between the outsourcee and outsourcer. Aksin and Masini (2008) explained that the effectiveness of the shared-services project depends on the degree of complementarity that exists between the needs of a company and the specific capabilities developed to address the needs. The following factors have been considered to influence shared services: environmental factors (e.g., environmental dynamism, environmental heterogeneity, IT infrastructure, and firm size) and managerial decisions (e.g., offshoring, outward orientation, outsourcing, shared service organization (SSO) concentration, commitment, and the type of service monitoring mechanisms that are utilized) (Gunasekaran et al., 2015).

At the post-outsourcing stage, cost efficiency, profitability, productivity, switching costs, adaptation costs, transaction costs, and return on investment (ROI) tend to be used in terms of financial PMMs (Jiang, Belohlav, & Young, 2007; Mao, Lee, & Deng, 2008; Tate & van der Valk, 2008). In terms of non-financial PMMs, Tarakci et al. (2009) studied the learning effects based on maintenance outsourcing. Learning occurs when the contractor performs preventive maintenance that results in reduction in time and costs (Tarakci et al., 2009). Mao et al. (2008) found that trust has a significant effect on project quality, but little on cost adherence. Cai et al. (2009) presented a systematic approach for improving supply chain performance management through an iterative accomplishment of key performance indicators. Tate and van der Valk (2008) explained that quality improvements in both process and service delivery lead to decreased costs and this will enhance customer satisfaction and improve the company's buying performance at the post-outsourcing stage.

Most of the extant outsourcing frameworks (Javalgi, Dixit, & Scherer, 2009; Jiang, Frazier, & Prater, 2006; Marshall, McIvor, & Lamming, 2007) tend to focus on the pre-outsourcing stage of the decision-making process (Westphal & Sohal, 2013). Practitioners and researchers have attempted to classify the outsourcing decisions from different perspectives (Jiang & Qureshi, 2006; Mantel, Tatikonda, & Liao, 2006; Sanders, Locke, Moore, & Autry, 2007). Han et al. (2008) presented a theoretical framework for outsourcing decisions that include the firm's capability (e.g., technical and managerial capability, organizational relationship capability, and vendor arrangement capability), interaction processes (e.g., information sharing, communication quality, and collaborative participation), relationship intensity (e.g., trust and commitment), and performance (e.g., outsourcing success). Jiang and Qureshi (2006) emphasized the importance of considering intangibles and the strategic impact while making decisions about insourcing and outsourcing, similar to make-or-buy decisions.

Logistics outsourcing or third-party logistics is regarded as using external companies to perform all logistics functions, including transportation, distribution, warehousing, inventory management, order processing, and material handling, that have been executed within an outsourcing firm (Razzaque & Sheng, 1998; Sink & Langley, 1997). Logistics outsourcing functions can be treated as non value-added activities because they are critical to the smooth running of the business, but not a unique ingredient of the overall product (Sink & Langley, 1997).

Good relationships between an outsourcing recipient and a provider contribute to the outsourcing success. The less successful relationships increase the cost of outsourcing (Vorontsova & Rusu, 2014). Firms tend to outsource those activities to the external companies or the third-party logistics service providers, and focus on value-added activities to develop sustainable competitive advantage (Ho, He, Lee, & Emrouznejad, 2012). The selection of the third-party logistics service provider is a critical step in

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the logistics outsourcing process because an appropriate third-party logistics service provider will help the outsourcing firms reduce capital investment in facilities, increase the flexibility of the outsourcing firms in adapting to changes in the market, reduce inventory, improve the on time delivery (OTD), and reduce transportation cost (Liu & Wang, 2009; Razzaque & Sheng, 1998).

## Management Theories Related to Strategic Outsourcing

The management theories related to strategic outsourcing (in terms of resource-based view, resource-advantage theory, transaction cost theory, the capability approach, knowledge-based theory, agency theory, and social exchange theory) are described.

### Resource-based View

Outsourcing decision frameworks are most often approached with theoretical starting points taken from the resource-based view (RBV), either singularly or combined (Busi & McIvor, 2008). The RBV argues that firms' specific assets are heterogeneous, meaning they become competitive by focusing on resources that are rare, highly valuable for customers, and imperfectly imitable (Barney, 1991; Peteraf, 1993). According to the RBV, organizational resources generate unique capabilities, thus increasing a firm's competitive advantage (Amit & Shoemaker, 1993). Competitive advantage is a function of the resources that a firm develops toward implementing its marketing strategy (Wernerfelt, 1984).

The use of the RBV in outsourcing frameworks raises the question of what should be considered as a core competency and should be kept in-house (Quinn & Hilmer, 1994). A focus on people as a source of superior performance has gained notable prominence in the offshoring contexts (Kenney et al., 2009). Broedner et al. (2009) stated that keeping competencies in-house can outweigh the outsourcing cost advantages. Other peripheral activities can be outsourced in order to lower costs and access world-class innovation capabilities (Baloh, Jha, & Awazu, 2008; Quinn, 2000). The RBV is useful for understanding the link between outsourcing, resource allocation, and the resulting performance (McIvor, 2009).

The RBV emphasizes that firms are heterogeneous in terms of their internal resources (Peteraf, 1993). Only resources with the characteristics of heterogeneity and immobility (i.e., the degree of transferability between firms) can offer a basis for sustaining competitive advantage (Barney, 1991). According to Barney (1991), a competitive advantage can be sustained by resources that are (1) valuable for customers in contexts in which the firm operates, (2) rare compared to those of competitors, (3) difficult to imitate, and (4) have no equivalent substitutes available. Regarding RBV, Gilley et al. (2004) stated that the outsourcing of human resource activities has a positive effect on performance. Outsourcing enhances the value of the IT firms (Wang, Gwebu, Wang, & Zhu, 2008). Lai et al. (2008) found a positive relationship between technology capability and competitive advantage.

If a company's resources and skills are combined and used in the right manner, they are most likely to generate a competitive advantage for the company. Outsourcing procedures start when an organization lacking resources and skills seeks a vendor in order to address this shortage (Vaxevanou & Konstantopoulos, 2014). Alvarez-Suescun (2010) proposed a combined model on the basis of the RBV and the transaction cost theory that may interpret the procedures of IT task outsourcing. Barthelemy and Quelin (2006) proposed a model founded on the RBV and to a lesser extent on the transaction cost theory, in order to interpret the stages of preparation, vendor selection, relationship management, and reconsideration.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Resource-Advantage Theory

Resource-advantage theory is an integrative model that incorporates several perspectives such as RBV, dynamic capabilities, competitive-advantage theory, and competency arguments (Hunt, Lambe, & Wittmann, 2002). Resource-advantage theory categorizes resources as the human, physical, financial, legal, organizational, informational, and relational perspectives (Hunt, 1997). Resource-advantage theory considers dynamic capabilities and resources (Hunt & Morgan, 1995). Resource-advantage theory can be considered as a well-grounded theoretical model that can be applied to partnership relationships such as alliances, joint ventures, and outsourcing (Unal & Donthu, 2014). Superior performance can be attained by joining resources with firms that complement resource assortments (Teece, 1988).

## Transaction Cost Theory

Transaction cost analysis (TCA) takes the efficiency considerations into account in outsourcing a task (Rindfleisch & Heide, 1997). According to Williamson (2008), the three dimensions of transaction include (1) asset specificity, which is the degree to which an asset can be redeployed to alternative uses without a decreased productive value; (2) uncertainty of the transaction, which is the frequency of disturbance; and (3) the frequency with which the transactions occur. Williamson (2008) stated that, of the three factors, asset specificity will have the most explanatory value because it creates dependency for both parties. TCA considers economic rationales for companies to organize some transactions in either in-house or external governance (Williamson, 1985).

TCA is a dominant process of understanding outsourcing decisions over the last three decades (Holcomb & Hitt, 2007). Transactions can be handled without costs, which arise when resources must be allocated to organize transactions between parties (Johanson & Mattsson, 1987). Walker and Weber (1984) studied make-or-buy decisions for the United States automobile industry firms with the support of TCA. Tate and Ellram (2009) drew on TCA and studied six Fortune 500 companies to develop a supplier selection framework for purchasing offshore services. One of their key proposals was that there is a high risk of opportunism and supplier failure if the outsourcing firm's training and investments are inadequate. Holcomb and Hitt (2007) suggested that considering cost motives alone limits the outsourcing analysis. Quinn and Hilmer (1994) suggested the requirement to consider the strategic vulnerability that can arise while considering outsourcing.

## The Capability Approach

The capability approach is a theoretical framework that entails two core normative claims: first, the claim that the freedom to achieve well-being is of primary moral importance, and second, that freedom to achieve well-being is to be understood in terms of people's capabilities, that is, their real opportunities to do and be what they have reason to value. A firm's ability to manage capability is an important determinant of value creation in an increasingly competitive, complex, and uncertain global marketplace (Karim, 2009; Sirmon, Hitt, Ireland, & Gilbert, 2011). Organizational capability view argues that firm-specific capabilities result in competitive advantage through efficient knowledge creation and knowledge exploitation (Nonaka, 1994; Teece 2007). Prahalad and Hamel (1990) defined capabilities as the collective learning in the organization, and especially the ways to coordinate diverse production

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

skills and incorporate multiple technology streams. Willcocks et al. (1995) investigated the strategic implications of outsourcing.

Client-specific capabilities refer to a stable pattern of collective activities and routines (Zollo & Winter, 2002) in dealing with a specific client, generated through repeated interaction with the client (Ethiraj et al., 2005; Levina & Ross, 2003). Client-specific capabilities can be considered as a result of investment in human assets specificity, embedded in tacit knowledge and routines that are developed through accumulating specialized information and know-how (Dyer & Singh, 1998; Ethiraj et al., 2005). Client-specific capabilities reflect mutual idiosyncratic understanding of the effective communication and collaborative routines (Fichman & Levinthal, 1991; Simeon, 2010). Client-specific capabilities can promote relational performance through higher communication effectiveness, lower transaction cost, greater service differentiation, higher quality, and faster service responsiveness (Asanuma, 1989; Dyer & Singh, 1998). For vendors, investing in client-specific capabilities and maintain trust as an effective informal self-enforcing safeguarding mechanism can result in attractive returns in terms of better service quality (Deng, Mao, & Wang, 2013).

Firms that can accumulate distinctive assets and capabilities achieve a competitive advantage over competitors (Barney, 1991; Lahiri, Kedia, & Mukherjee, 2012). Baden-Fuller et al. (2000) proposed a decision-making model for the stage of preparation based on the capability approach, aiming to improve the organization's competitiveness. Pati and Desai (2005) proposed a decision-making framework for outsourcing, focusing on the stage of preparation. The capability approach is used in conjunction with other theories such as the knowledge-based theory (Lee, 2001) and in research projects that use multiple theories to substantiate their models (Gottschalk & Solli-Sæther, 2006).

## Knowledge-based Theory

The knowledge-based theory is applied to outsourcing in order to demonstrate that the exchange of knowledge at the stage of the outsourcing relationship is a factor that contributes to the success of the outsourcing agreement (Vaxevanou & Konstantopoulos, 2014). Lee (2001) proposed a model by utilizing the knowledge-based theory and interpreted the relationship management among the two contracting parties of the outsourcing procedure. Thatcher et al. (2011) stated that knowledge management skills influence the success of an outsourcing procedure at the stages of vendor selection, transition, relationship maintenance, and reconsideration.

In alliance management literature, an external partnership leveraging capability is identified as a source of competitive advantage (Dyer & Singh, 1998; Kedia & Lahiri, 2007). Learning from external partners generates both proximate and distal benefits, such as improving productivity, incremental innovations, and particular dynamic capabilities that consistently improve competences in stable environments by increasing the efficiency of knowledge searches, absorption, and combination (Mudambi & Tallman, 2010).

## Agency Theory

Agency theory specifies mechanisms which reduce agency loss (Eisenhardt, 1989). According to the agency theory (Lafontaine, 1992), asymmetric information and opportunism result in high agency costs. The agency theory contributes to the substantiation of a variety of strategic goals such as quality management (Zu & Kaynak, 2012). The agency theory focuses on the preparation of the most effective

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

contract able to regulate the financial aspects and obligations of the shipping company and the agent (Vaxevanou & Konstantopoulos, 2014).

### Social Exchange Theory

Early social exchange theory applications in family science arose out of the work of sociologists (Blau, 1964; Homans, 1961) who focused on the rational assessment of self-interest in human social relationships. Individuals seek rewards and avoid punishments. Social exchange theory proposes that social behavior is the result of an exchange process. The purpose of social exchange is to maximize benefits and minimize costs. When interacting with others, individuals seek to maximize profits for themselves while minimizing costs. Because it is not possible to know the actual rewards and costs involved in interacting with another before interactions occur, individuals guide their behavior through their expectations for rewards and costs. Social exchange is a constant mutual process in the context of which the actions of individuals or organizations depend on the reward reactions caused (Gottschalk & Solli-Sæther, 2006).

## Applications of Business Process Outsourcing and Information Technology Outsourcing

### Concept of Business Process Outsourcing

Business process outsourcing (BPO) refers to the delegation of one or more IT-enabled business processes to an external supplier who becomes responsible for managing the processes to achieve its client firm's defined and measurable set of performance goals (Bharadwaj, Saxena, & Halemane, 2010; Susarla, Barua, & Whinston, 2010). For example, banks may outsource their credit card application processing to third-party vendors to simultaneously minimize processing costs and improve customer experience. The standardized business involves high valued-added activities (e.g., engineering and research and development), and product design are moving to offshore external vendors (Jensen & Pedersen, 2011; Mudambi & Venzin, 2010). Global spending on BPO has significantly increased during the past decade (Rai, Pavlou, Im, & Du, 2012; Srivastava & Teo, 2012). The benefits of BPO include access to specialized resources, cost advantages, innovations, and higher quality services from service providers (Benlian & Hess, 2011; Mani, Barua, & Whinston, 2010).

Recent BPO projects (e.g., business analytics) require more knowledge-intensive activities compared with BPO activities (e.g., human resources, marketing, and supply chain functions) that have been examined in previous studies (Lacity, Solomon, Yan, & Willcocks, 2011). The knowledge-process outsourcing projects support the client's long-term and strategic goals that are related to innovation and competitive actions (Mani et al., 2010; Rai et al., 2012). BPO involves strategic processes (e.g., customer analytics) to facilitate innovation and business transformation, which business processes require the ongoing knowledge contribution from clients and customers (e.g., BPO requirements) and the services provider (e.g., business domain and the knowledge of process improvement) (Rai et al., 2012).

BPO emphasizes process-oriented knowledge sharing that requires not only the client's context-specific knowledge that is essential to perform the particular business process but also the service provider's knowledge about how to manage and execute the business process (Rai et al., 2012; Susarla et al., 2010). Long-standing relationships and effective governance mechanisms (e.g., behavior control) are required

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

to ensure partners' contribution and to fully realize BPO goals and the associated benefits (Mani et al., 2010; Rustagi, King, & Kirsch, 2008).

Srikanth and Puranam (2011), while studying the distributed work setting of BPO, identified a distinct set of coordination mechanisms that can offset the adverse performance consequences of interdependence between onsite and offshore locations. Andersson and Pedersen (2010) emphasized the importance of appropriate coordination and control mechanisms that can create value by mitigating the costs arising from the complexities concerning offshoring. Offshoring is an organizational design issue which involves the significant reconfiguration of a firm's value chain activities and value is created through the development of firm-specific capabilities that help in the process of subsequent reintegration (Larsen, Manning, & Pedersen, 2013).

## Concept of Information Technology Outsourcing

Information technology outsourcing (ITO) is the use of a third party to successfully deliver the IT-enabled business process, application service, and infrastructure solutions for a cost-effective business outcome (Samantra, Datta, & Mahapatra, 2014). ITO is a common outsourcing activity for many organizations (Yang & Huang, 2000). The decision to outsource IT functions has been proved beneficial toward gaining increasing advantage in global business (Abdullah & Verner, 2012). ITO is defined as a decision taken by an organization to contract out or sell some or all the organizations' IT assets, people, and business activities to a third party vendor, who provides and manages these business activities (Lacity & Hirschheim, 1993; Loh & Venkatraman, 1992).

In the private sector the major international trend toward ITO from the early 1990s through to 2012 has been driven by a range of financial, business, technical, and micro-political factors (Clark, Zmud, & McCray, 1995; Kern & Willcocks, 2001). IT becomes one of the most common resources drawn upon to standardize work procedures and smooth information flows, and to make more efficient organizational procedures (Cordella & Willcocks, 2012). ITO uses external third parties to source IT services such as IS planning and management activities, data centers, telecommunications, and network management (Grover, Cheon, & Teng, 1994).

Karami and Guo (2012) proposed an integrated multi-criteria decision making (MCDM) framework for selecting IT service provider in IS outsourcing. Abdullah and Verner (2012) developed a risk framework for strategic IT development outsourcing from the clients' perspective. The critical risk factors (e.g., complexity, contract, execution, organizational environment, and user) are identified as the influencing factors on the outcome of strategic IT system development outsourcing projects. Rusu and Hudosi (2011) presented a design of ITO tool that includes a procedure concerning transaction cost theory for exploring the risk exposure in ITO. Susarla (2012) investigated renegotiation design in contracts for outsourced IT services using a sample of 141 ITO contracts. Contractual flexibility and rent seeking are analyzed in order to measure the effectiveness of ITO contracts. Zhang and Huang (2012) presented a fuzzy risk evaluation method for IT service outsourcing in which the risk factors are evaluated by fuzzy value and the risk grades of risk factors are calculated by fuzzy linguistic values.

Thouin et al. (2009) utilized transaction cost economics of ITO examining the effect of level of low asset specificity on firm level financial performance. Alaghehband et al. (2011) assessed transaction cost theory-based ITO models in terms of faithfulness and concluded that the ITO models hardly capture all the essential elements of transaction cost theory. Chou and Chou (2009) developed an IS outsourcing life cycle model considering various risks factors encountered during the three contracting phases (i.e.,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

pre-contract phase, contract phase, and post-contract phase). Chou and Chou (2011) explained several issues regarding innovation outsourcing, uncertainty, risks, productivity, and quality perspectives. Shi et al. (2011) proposed a linear mixed model (LMM) approach for outsourcing decisions recognizing heterogeneity among the experts in risk perception. Fan et al. (2012) proposed a methodology to identify ITO risk factors and their importance in decision-making process.

### Relationship between Business Process Outsourcing and Information Technology Outsourcing

Although the prior ITO literature has examined outsourcing relationship management, there are crucial distinctions between BPO and ITO that indicate that additional research efforts must be made to better understand how to manage BPO relationships (Lacity et al., 2011; Rai, Keil, Hornyak, & Wullenweber, 2012). The knowledge required to be integrated between the client and the service provider is different between BPO and ITO (Chou, Techatassanasoontorn, & Hung, 2015). Knowledge integration in ITO is goal-oriented and focuses on the provider's knowledge and expertise in reaching the client's goal such as performance of IT operations and IT development.

Although ITO emphasizes IS department performance (Arnett & Jones, 1994) and the client's technical and methodological capability (Kotlarsky, Oshri, van Hillegersberg, & Kumar, 2007), BPO objectives, in contrast, are more diverse and can extend beyond the technical focus of ITO projects. Both ITO and BPO research has highlighted the importance of satisfaction and commitment in outsourcing success (Goo & Huang, 2008; Han et al., 2008). Whereas satisfaction tends to be transitory (Choudhury & Sabherwal, 2003), commitment tends to be stable and reflects a more comprehensive assessment of the client's willingness to undertake efforts to develop and maintain lasting relationships with its provider (Goo & Huang, 2008; Levina & Su, 2008).

## Significance of Strategic Outsourcing in Global Business

The outsourcing evolution has been the primary focus of the early period of outsourcing, which emphasized efficiency through the division of work between different firms (Hatonen & Eriksson, 2009). Outsourcing has continued to be a key theme in the purchasing and supply chain literature (Westphal & Sohal, 2013; Zheng, Knight, Harland, Humby, & James, 2007). Firms have implemented the outsourcing strategies not only as a cost reduction tool but also as a strategic initiative for securing core competitiveness (Freytag & Kirk, 2003; Kremic, Tukel, & Rom, 2006). Firms have expanded the scope of their outsourcing to include their key functional cores (e.g., research and development, product design, and marketing) (Kaipia & Tanskanen, 2003).

Firms engage in offshoring to increase service quality, fend off competition, and augment their existing RBV by acquiring qualified human capital around the world (Demirbag & Glaister, 2010; Doh, Bunyaratavej, & Hahn, 2009). As offshore outsourcing moves to the next level and includes more value-added activities, the realization of such diverse objectives may become challenging, giving rise to complex questions such as how it can create business value (Doh, 2005; Mudambi & Venzin, 2010). Larsen et al. (2013) stated that that many companies have started to understand the difficulties and complexities associated with managing a globally dispersed organization. It is important that firms select appropriate outsourcing providers to increase the success rate of outsourcing (Li & Wan, 2014).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The strategic intent of outsourcing is to secure and deploy multiple competitive advantages (e.g., cost reductions, innovativeness, and flexibility) in a turbulent market environment (Kremic et al., 2006; Quinn,1999). Holcomb and Hitt (2007) indicated that outsourcing under the strategic perspective implies that firms trust intermediate markets to provide specialized capabilities that supplement existing capabilities deployed along the firm's value chain. A developed supplier market is a basic outsourcing requirement (Rehme, Nordigården, Brege, & Chicksand, 2013). The outsourcing literature has predominantly assumed the existence of a developed supplier market and has addressed markets that are characterized by dominant supplier opportunism (Holcomb & Hitt, 2007; McIvor, 2008). A non-developed supplier market may occur in global sourcing situations where a key question is to plan what should be manufactured where and how supplier capacity and capabilities can be developed, particularly in low-cost countries (Kumar, Zampogna, & Nansen, 2010; Oke, Maltz, & Christiansen, 2009).

Kang et al. (2012) classified outsourcing strategies into two primary categories: efficiency-seeking outsourcing strategies and innovation-seeking outsourcing strategies. Using these outsourcing strategies, firms are not only able to transfer their non-core activities to specialized external experts to achieve efficiency (Harland, Knight, Lamming, & Walker, 2005; Kotabe, Mol, & Murray, 2008), but they try to build their organizational innovation capabilities through interorganizational collaboration (Chen et al., 2011; Hsuan & Mahnke, 2011). Organizational innovation, knowledge management, and strategic orientation are correlated with organizational performance in modern organizations (Kasemsap, 2014a). Organizations aiming to increase organizational innovation and achieve business goals should focus on developing organizational learning, knowledge management, and knowledge-sharing behavior (Kasemsap, 2014b). Outsourcing typically transfers production functions of goods and services to external providers (Araz, Ozfirat, & Ozkarahan, 2007).

Outsourcing research has primarily focused on outsourcing decisions and on outsourcing outcomes (Lacity, Khan, Yan, & Willcocks, 2010). Outsourcing decisions range from the most fundamental make-or-buy decision to more nuanced decisions regarding sourcing specific IT functions and strategic processes (Arnett & Jones, 1994; Grover et al., 1994). Outsourcing outcomes is measured in a number of business perspectives, including the client's general perceptions of the success, relationship quality, business performance, and IT management capability (Gopal, Mukhopadhyay, & Krishnan, 2002; Lee & Kim, 1999). Executives and managers desiring to enhance their organizational success should consider creating IT, technical alignment, IS capabilities, and IS effectiveness (Kasemsap, 2015a). The managerial practices of IT, knowledge management, and project management efficiently support each other in order to achieve planned goals (Kasemsap, 2015b).

Outsourcing relationships have been examined from a number of perspectives, including economic perspectives (e.g., transaction cost economics), strategic perspectives (e.g., resource dependency theory), and social perspectives (e.g., social exchange theory) (Goo, Kishore, & Rao, 2009; Han et al., 2008). Bharadwaj et al. (2010) investigated a successful outsourcing relationship from both an economic and a strategic perspective using transaction cost economics and RBV theories. Goo et al. (2009) explored factors that influence commitment in ITO, including formal contract factors (e.g., service level agreement) and relational governance factors (e.g., relational norms). Risk assessment appears to be an important contributor to the success of an ITO venture (Samantra et al., 2014).

The improvements in the technology of communication relate to international specialization and a tendency toward a vertical fragmentation of production across national borders (Leahy & Montagna, 2012). Outsourcing is a business decision that involves top management (Greaver, 1999). Outsourcing influences the resources allocated to business units and the level of vertical specialization of the firm's

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

activities such as strategic corporate decisions (Grant, 2002). Outsourcing reduces the cost of assets, facilitates core competencies to reduce production costs, and leads to strategic flexibility (Gunasekaran et al., 2015).

Outsourcing externalizes activities by engaging suppliers located outside the firm and avoids the requisite investments associated with internalization (Mauri & de Figueiredo, 2012). The decision of outsourcing effectively attaches special significance in the strategic formulation in the firm (Patil & Patil, 2014). The outsourcing of non-core activities allows the firm to gain focus on activities which provide distinct competitive advantage, thus becoming leaner (Quinn, 1999). The outsourcing of non-core activities leads to increased strategic flexibility (Hitt et al., 1998; Shimizu & Hitt, 2004).

Theoretical framework explaining outsourcing derives from transaction cost economics (Klein, Crawford, & Alchian, 1978; Williamson, 1971), which examines conditions for efficiency under which firms prefer to buy in the external markets rather than make internally. Transaction cost economics proposes that firm-specific assets are a crucial determinant in the decision to vertically integrate (David & Han, 2004; Shelanski & Klein, 1995). Firm specific-assets cannot be easily redeployed outside a given relationship and do not have a higher value to other parties involved in a transaction (Mauri & de Figueiredo, 2012). The decision to invest in these firm-specific assets, implies an irreversible commitment (Ghemawat, 1991).

Outsourcing allows linkages in the supply chain to become more parallel than serial with the outcome that flexibility is added through increased sourcing alternatives (Mauri & de Figueiredo, 2012). The quest for flexibility is enhanced by advances in IT that reduce the costs of external transactions and facilitate coordination along contractors in the supply chain (Hitt, 1999; Rangan & Sengul, 2009). Flexibility is reached by establishing modular production systems (Kotabe, Parente, & Murray, 2007; Parente, Baack, Hahn, & Parente, 2011). In dynamic industries under pressure from foreign competition, sustainable capabilities are obtained through deintegration and flexible contracting with external suppliers (Hutzschenreuter & Grone, 2009).

For efficiency-seeking outsourcing, output control, and process control are appropriate in creating successful outsourcing practices (Kang, Wu, Hong, Park, & Park, 2014). Applying proper organizational control mechanisms is essential for achieving effective inter-firm cooperation as well as for achieving intended organizational goals (Hartmann, Trautmann, & Jahns, 2008; Senja & Mika, 2009). A lack of effective control over suppliers presents a crucial risk factor that may result in less than desirable outsourcing outcomes (Harland et al., 2005; Kotabe et al., 2008). Firms transfer non-core activities to external organizations that possess the required levels of expertise and the economies of scale in order to achieve operational efficiency and cost reduction goals (Jiang et al., 2006; Kotabe & Murray, 2004).

Formal control (e.g., process control and output control) plays an important role in reducing outsourcing risks and opportunistic behaviors, especially in transient economies (Li, Liu, Li, & Wu, 2008). Process control enhances innovativeness because it provides guidance tools and stimulates creative ideas (Poskela & Martinsuo, 2009). Effective organizational control measures are necessary in order to effectively implement outsourcing strategies (Chen, Park, & Newburry, 2009). Implementing outsourcing strategies successfully requires a suitable choice of organizational control strategy (Kang et al., 2014). Output control is a useful option for implementing an efficiency-seeking outsourcing strategy (Das & Teng, 2001; Eisenhardt, 1985). The precise knowledge of transformation process by which inputs are transformed into outputs as a results of behaviors facilitates the exercise of process control as a process of achieving desired output results (Chen et al., 2009; Turner & Makhija, 2006).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social control is a useful option for effectively implementing innovation-seeking outsourcing strategies due to low measurability characteristics (Das & Teng, 2001; Ouchi & Maguire, 1975). Social control is useful when encouraging suppliers to internalize norms and goals through repeated interactions, thus reducing uncertainty and discrepancy in innovation-seeking outsourcing (Jaworski,1988). Social control provides openness, autonomy, and creativity because it encourages the clear communication of organizational vision and task goals (O'Reilly & Tushman,1997). Social interaction is required to adjust detailed outsourcing specifications and solve problems because the tasks in innovation-seeking outsourcing have more flexible and complex characteristics (Hoecht & Trott, 2006).

## FUTURE RESEARCH DIRECTIONS

The strength of this chapter is on the thorough literature consolidation of strategic outsourcing. The extant literature of strategic outsourcing provides a contribution to practitioners and researchers by describing a comprehensive view of the functional applications of strategic outsourcing to appeal to different segments of strategic outsourcing in order to maximize the business impact of strategic outsourcing in global business. The classification of the extant literature in the domains of strategic outsourcing will provide the potential opportunities for future research. Future research direction should broaden the perspectives in implementation of strategic outsourcing to be utilized in the knowledge-based organizations.

Practitioners and researchers should acknowledge the applicability of a more multidisciplinary approach toward research activities in implementing strategic outsourcing in terms of knowledge management-related variables (e.g., knowledge-sharing behavior, knowledge creation, organizational learning, learning orientation, and motivation to learn). It will be useful to bring additional disciplines together (e.g., strategic management, marketing, finance, and human resources) to support a more holistic examination of strategic outsourcing in order to combine or transfer existing theories and approaches to inquiry in this area.

## CONCLUSION

This chapter revealed the role of strategic outsourcing in global business, thus describing the theoretical and practical concept of strategic outsourcing; the management theories related to strategic outsourcing (in terms of resource-based view, resource-advantage theory, transaction cost theory, the capability approach, knowledge-based theory, agency theory, and social exchange theory); the applications of BPO and ITO; and the significance of strategic outsourcing in global business. Strategic outsourcing paves the way for leading companies to compete globally and increase profitability into the new millennium. Strategic outsourcing means asking a third-party vendor to work for company on a contractual basis. Strategic outsourcing occurs when companies purchase products or services from outside suppliers, rather than performing the same work within their own facilities, in order to cut costs.

The benefits of strategic outsourcing involve (1) cost savings: many businesses embrace outsourcing as a way to realize cost savings and improve cost control over the outsourced functions; (2) staffing levels: the reasons for outsourcing are to achieve headcount reductions and minimize the fluctuations in staffing that may occur due to changes in demand for a product or service; (3) flexibility: companies outsource to reach greater financial flexibility, since the sale of assets that formerly supported the out-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

sourced functions can improve companies' cash flow; (4) knowledge: outsourcing effectively gains access to new technology and outside expertise; and (5) business innovation: outsourcing helps companies innovate in processes, skills, and technology, thus mediating financial risk through the vendor, in order to achieve competitive advantage.

Strategic outsourcing requires a strong understanding of organization's capabilities and future direction. The fulfillment of strategic outsourcing is vital for modern organizations that seek to serve suppliers and customers, improve business performance, enhance competitiveness, and reach continuous achievement in global business. Therefore, it is necessary for modern organizations to explore their strategic outsourcing, establish a strategic plan to usually check their practical advancements, and immediately respond to strategic outsourcing needs of customers in modern organizations. Applying strategic outsourcing in global business has the potential to increase organizational performance and attain business goals in the digital age.

## KEY TERMS AND DEFINITIONS

**Business Process Outsourcing:** The contracting out of a particular business function to an outside company in order to reduce business costs.

**Horizontal Integration:** The merger of companies at the same stage of production in the same or different industries.

**Information Technology Outsourcing:** The transferring of information technology-related business functions from internal staff to outside contractors.

**Offshore Outsourcing:** The work done for a company by people in another country that it typically done at a much cheaper cost.

**Offshoring:** The moving of various operations of a company to another country for reasons such as lower labor costs and more favorable economic conditions in that other country.

**Outsourcing:** The contracting or subcontracting of non-core activities to free up cash, personnel, time, and facilities for activities in which a company holds competitive advantage.

**Resource-Based View:** A way of viewing the company toward approaching strategy.

**Transaction Cost Theory:** A theory accounting for the actual cost of outsourcing production of products and services including transaction costs, contracting cost, coordination costs, and search costs.

**Vertical Integration:** The merger of companies at different stages of production in the same industry.

# Chapter 12
# Network Analysis for Economics and Management Studies

**Lucio Biggiero**
*University of L'Aquila, Italy & CIRPS, Italy*

## ABSTRACT

*Sociology and other social sciences have employed network analysis earlier than management and organization sciences, and much earlier than economics, which has been the last one to systematically adopt it. Nevertheless, the development of network economics during last 15 years has been massive, alongside three main research streams: strategic formation network modeling, (mostly descriptive) analysis of real economic networks, and optimization methods of economic networks. The main reason why this enthusiastic and rapidly diffused interest of economists came so late is that the most essential network properties, like externalities, endogenous change processes, and nonlinear propagation processes, definitely prevent the possibility to build a general – and indeed even partial – competitive equilibrium theory. For this paradigm has dominated economics in the last century, this incompatibility operated as a hard brake, and presented network analysis as an inappropriate epistemology. Further, being intrinsically (and often, until recent times, also radically) structuralist, social network analysis was also antithetic to radical methodological individualism, which was – and still is – economics dominant methodology. Though culturally and scientifically influenced by economists in some fields, like finance, banking and industry studies, scholars in management and organization sciences were free from "neoclassical economics chains", and therefore more ready and open to adopt the methodology and epistemology of social network analysis. The main and early field through which its methods were channeled was the sociology of organizations, and in particular group structure and communication, because this is a research area largely overlapped between sociology and management studies. Currently, network analysis is becoming more and more diffused within management and organization sciences. Mostly descriptive until 15 years ago, all the fields of social network analysis have a great opportunity of enriching and developing its methods of investigation through statistical network modeling, which offers the possibility to develop, respectively, network formation and network dynamics models. They are a good compromise between the much more powerful agent-based simulation models and the usually descriptive (or poorly analytical) methods.*

## INTRODUCTION: DIFFERENT DISCIPLINARY PERSPECTIVES

Network analysis research has become so vast that it is almost impossible to give a synthesis of its developments and scope of applications. This impossibility holds also if restricting the review to Social Network Analysis (SNA), under which we can include network-based approaches in anthropology, psychology, sociology (SOC), and economic sciences in a broad sense, which can be further distinguished into economics (ECON), and management and organization sciences (MOS). The first three have been matter of many studies, even (to a less extent) from a historical perspective, while the latter two, which are the specific subject of this volume, have been not yet well reviewed, especially from a historical perspective. Moreover, the few existing contributions are very recent, in particular those concerning network economics, and while some contrasts SOC and ECON (Jackson, 2010a, 2010b) - with the partial exception of Knoke (2012), who restricts the view of network economics only to few themes - no one contrasts ECON and MOS. As it often happens, even though two scientific areas are largely overlapped[1], they remain encapsulated into the respective disciplinary boundaries, so hindering a fruitful cross-fertilization. Most researchers in one area do not know the works in the other area. Therefore, the main aim of this chapter is to fill in this gap by directly contrasting ECON and MOS perspectives on network analysis.

There are various accounts of the history of network analysis in general, and SNA in particular. Among the former there is Barabasi's (2002) fortunate and popular book, and the classic Biggs *et al.* (1976). Among the latter there are many contributions (Berkowitz, 1982; Leinhardt, 1977; Marsden & Lin, 1982; Scott, 1992), some of which quite recent (Freeman, 2004; Prell, 2011). Leaving aside books dedicated to specific methodological or real topics, there is a certain number of handbooks (Borgatti *et al.*, 2013; Hanneman & Riddle, 2005; Knoke & Kuklinski, 1982; Scott, 1992; Wasserman & Faust, 1994; and the more recent Borgatti *et al.*, 2013; Knoke & Yang, 2008; Robins, 2015; Scott & Carrington, 2011). And of course a lot of readings (Carrington *et al.*, 2005; Wasserman & Galaskiewicz, 1994; Wellman & Berkowitz, 1988; among the many). There are also many books and papers dealing with both fields of social and natural sciences (Barabasi, 2002; Biggiero, 2011; Bornholdt & Schuster, 2003; Caldarelli, 2007; Dehmer & Emmert-Streib, 2009; Lewis, 2009; Newman, 2010; Newman *et al.*, 2006), but with few exceptions they are written by mathematicians or physicists.

Although the mathematical base of network analysis is graph theory, and so even developments outside mathematics and physics (MAPH) must be based on this ground, substantially different stories took place in the development of SNA and graph theory[2] during the 80 years between the thirties of last century and these last years. An appropriate treatment of this subject would deserve an accurate and extensive research far beyond this section and also beyond a full dedicated paper, but in extreme synthesis we can say that the story told by mathematicians and physicists, like Barabasi (2002), Watts (2003) and Newman 2010), describe a network analysis which, besides the pioneering work by Euler and some early studies in the thirties, was systematized by Erdős and Rényi during the fifties. Their work – and that of their followers - focused mostly on random or regular graphs, until in the nineties Barabasi (2002), Barabasi & Albert (1999) on one side, and Watts (2003, 2004a, 2004b) and colleagues (Watts & Strogatz, 1998; Newman, 2001, 2005) on the other side discover the peculiarity and wide diffusion in social and natural networks of, respectively, the scale-free and the small-world topology. Indeed, scale-free topologies had been discovered already in the fifties by the economist Nobel Prize Simon (1955; Simon & Bonini, 1958), who indeed exploited previous studies from economics (Gibrat, 1931; Pareto, 1896) and linguistics (Zipf, 1932)[3]. And the small-world structure was baptized as such by the sociologist Milgram (1967; Travers & Milgram, 1969) in his studies in the sixties, which were

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

further somehow anticipated by others few years before[4]. These "discoveries", and more generally the crucial relevance of "irregular" topologies to understand real networks, had a remarkable impact on network analysis applied to natural sciences. Moreover, MAPH authors underline the remarkable shift, occurring during the nineties, of the focus from a pure static analysis of mathematical and statistical properties of random networks to the processes with which irregular topologies *can be* generated: the famous preferential attachment mechanism for the scale-free structure and the rewiring mechanism for the small-world structure are such examples.

The story told by some SNA scholars (Freeman, 2004; Wasserman & Faust, 1994; Prell, 2011; Scott, 1992) is quite different: besides some precursors at the turn of the 20th century, a substantial impulse came already in the thirties with Moreno's work (1937), and right after in the forties and fifties mostly in US and UK with various research groups. Some of them were more familiar with (and oriented to use) graph theory and some other less, but all were sharing the common convincement that the explanations for – or at least the understanding of – social phenomena had to be discovered primarily – albeit not exclusively - into social structures. As in most structuralist perspectives, the role of the subject were not neglected, especially in the research area working on ego-networks, but it was argued that an actor's behaviour is constrained and also induced and influenced by his relational pattern and the position covered into the whole structure. This shared structuralist view is apparent in some SNA book (Berkowitz, 1982; Marsden & Lin, 1982) and papers titles, and exemplary underlined by Wellman & Berkowitz's (1988b) introduction to their edited influential book on social structures. They argue that structural analysis "is less and more than network analysis": less because network analysis provide powerful tools and theories, and more because structural analysis includes also rather different fields, like general systems theory, cybernetics, etc., which at that time could appear far from SNA[5], and includes also methods far from those typical of network analysis. Wellman (1988) remarks that network analysis is not only a method(ology) or a metaphor, but rather "a comprehensive paradigmatic way of taking social structure seriously by studying directly how patterns of ties allocate resources in a social system". A position that seems due more to the need to claim attention into the scientific landscape than to a real substance.

Though some mathematician and physician, like Harary and White, has been fully enrolled into SNA, others were just collaborating to one or more groups. They were supporting a theoretical, methodological and epistemological framework rather different from that that was being developed in graph theory. Two differences appear particularly interesting. The first one is that the major interest was less on random graphs, and more on networks that could realistically approximate social structures. The second one is the acknowledgment of the relevance also of nodes' attributes, and hence the interplay between the strength of positions with the peculiar characteristics of the node covering those positions. Things are moving towards a major interaction between SOC and MAPH even though maintaining some methodological and epistemological differences, which are well mirrored in its respective approaches to modelling network analysis. Recently, SNA needs to go more deeply into understanding the causes and antecedents of network formation a modelling methodology[6].

As addressed by Freeman (2004), Wasserman & Faust (1994), Prell (2011) and Scott (1992), methodological knowledge acquisition of SOC from MAPH started since the fifties with many works made by Harary, systematized into two important books (Harary & Norman, 1953, and Harary *et al.*, 1965). Recent good examples of such a MAPH direct involvement as researchers and not just as tool-givers are into the field of network analysis applied to international trade (see below next section). In particular, scale-free and small-world properties have been re-discovered and then intensively investigated by physicists and mathematicians, and then empirically applied with growing diffusion in SNA. More

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

generally, these contributions come with a relatively recent renewed interest of physicists, statisticians, and mathematicians for a direct involvement into the theoretical development of social sciences. This phenomenon is all but new, if we think that, especially in economic theory, mathematicians have been directly (and often, primarily) involved in building theoretical pillars of social sciences. However, now there is an effort so extensive and numerous that two new branches have been nurtured: sociophysics and econophysics (Aoyama *et al.*, 2011; Chakrabarti *et al.*, 2006; Chatterjee & Chakrabarti, 2008; Cockshott *et al.*, 2009). Nevertheless, it is not yet clear whether this is an episodic intensification of an endemic phenomenon or a more systematic change in the dynamics of contemporary science.

For SNA history and concepts have been widely investigated, the main aim of this chapter is giving a picture of the way in which network analysis has been applied in ECON and MOS. Then I will proceed with discussing the "modelling revolution", which is in full development during last 15 years. The focus will be mostly on ERGM (Exponential Random Graph Models) and SAOM (Stochastic Actor-Oriented Models). Next, it will be underlined that statistical models of network analysis can combine and reconcile methodological individualism and structuralism. Finally, it is argued that the embrace of network analysis will force economics – and especially the general equilibrium research program - to depart from its neoclassical foundations.

## NETWORK ANALYSIS IN ECONOMICS

This section has two objectives: providing suggestions to explain the very late engagement of economics into network analysis, and depicting the main developments that such an involvement has taken from the beginning of this century. Both purposes are necessary because, with few exceptions (Knoke, 2012), SNA historical profiles have substantially neglected network economics, and because during last 15 years network economics literature exploded and applied to a number of different fields of applications (Jackson, 2014a, 2014b). Indeed, it is quite singular that the apparently network-like structure of economic phenomena has been neglected so long and rather systematically by mainstream economics. The explanation offered by Jackson (2014a), who adduces only "practical" reasons, like the lack of relational data or computing power, is not fully convincing, because other disciplines, like sociology, psychology, etc. had to face with the same problem, but they found that obstacle not so decisive. Moreover, other branches of economic theory, since Pigou's neoclassical economics (Screpanti & Zamagni, 2005), adopted network analysis to some extent, especially into the field of transportation problems. Was not there a lack of relational data? The main reason could have a rather different nature: a theoretical nature, lying on two main forms of incompatibility with mainstream economics. The first one occurs between the structuralist epistemology beneath SNA, which implies also a methodological structuralism, incompatible with the methodological individualism of standard economics[7]. The second one is standard economists' suspect – or perhaps reasonable doubt - that the acknowledgment of the network nature of economic phenomena makes its treatment incompatible with the obtainment of a general competitive equilibrium.

The second objective of this section is to outline the landscape of current network economics. There is only one contribution (Goyal, 2007) that covers (almost all) the main sectors in which current network economics is developing, but it is not very recent, and network economics is extremely rapidly growing. Knoke (2012) discusses SNA and ECON, but this latter field is rather under-treated, being mostly shifted on the MOS side, which is quite far from what is currently meant as network economics. In fact, his book titles "Economic networks", which concerns only one of the three main branches of network

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

economics[8]. Conversely, Jackson (2008, 2010) presents SOC and network economics rather extensively, but he substantially neglects MOS. Therefore, though there is here space for only a brief discussion, this is a good occasion to fill in this gap and give a short outline of network economics and MOS network analysis, so to favor their reciprocal acknowledgment and comparison. To these aims, this section is divided into a first part dedicated to the first objective – explaining network economics delay - and a second part dedicated to outline the main sectors of network economics.

*Explaining network economics delay*. Excepted for applications mostly focused on transportation networks among which the pioneering contribution by Pigou in 1920 and some others published right after König's book on graph theory in 1936[9], the attention dedicated by economists to network analysis has been episodic until the end of nineties, and almost always limited to spatial and transportation problems. To see a substantial focus enlargement it is necessary to wait until last twelve years. Therefore, it could be argued that within social sciences economics has been the last one to adopt network analysis[10], and this is apparently paradoxical if one thinks that, intuitively, individuals and firms and banks and even nations are strongly interconnected. And it's even more surprising, if one considers that early economists' approaches (Screpanti & Zamagni, 2005; Landreth & Colander, 2001), like the *Tableau economique* of the French School in the second half of eighteen century or the Marx's schemes of simple and extended production are precisely matrices, and thus, economic networks. Further, recent Arrow's (2009) lapidary judgment that "network theory … may not be all that useful or needed" weighs as a rock on network economics. And this is even more relevant not only because of his prestige, but also because he has been among the founders of the Santa Fè Institute (Arrow *et al.*, 1988; Arthur, 2010; Blume & Durlauf, 2006; Waldrop, 1992), where complexity economics has been nurtured and network theory largely employed.

Nevertheless, during the last 15 years network economics is rapidly growing and extending to many areas of interest: two dedicated journals – the *Review of Network Economics*, and the *International Journal of Management and Network Economics* - and many special issues of important journals, like the *International Journal of Industrial Organization*, the *Review of Economic Design*, etc., mark the great attention paid to this research area. Not to say innumerable contributions, many of which appeared on top journals, like *American Economic Review*, *Journal of Economic Theory*, *Econometrica*, etc.

Hence, it remains to explain why such an enthusiasm came so late respect to other SNA areas. I speculate that the incompatibilities with neoclassical economics in general, and standard economics in particular, rose by structuralist methodology and network-related mathematical implications are the main reasons. An acknowledgment of complex networks properties prevent the acceptance of the theoretical assumptions required by general economic equilibrium, either in neo-Walrasias or in non-Walrasian versions (Bridel, 2012; Hahn & Petri, 2002; Ingrao & Israel, 1990; Kirman, 1976; Loasby, 1991; Screpanti & Zamagni, 2005; Zamagni, 1993). Consequently, this dominant economic paradigm hindered or overlooked a methodology like network analysis – and in particular its SNA formulations - that is incompatible with its fundamental methodological and conceptual/epistemological requisites. Indeed, this fact is typical of normal sciences, which try to protect its hard kernel (Kuhn, 1962)[11]. Consistently, observations, theories, facts, approaches and views that endanger the achievement of its goals, have been discharged or neglected by standard economics.

Indeed, economic theory is a large family[12] with a major group constituted by various types of neoclassical economics, and other minority approaches, like the neo-Marxian and, (relatively) more recently, evolutionary and cognitive economics (Dopfer, 2005; England, 1994; Foster, 1997; Foster & Metcalf, 2001; Gigerenzer, 2008; Gigerenzer & Selten, 2001; Hodgson, 1993, 2000; Kirman, 2011; Loasby, 1991; Witt, 1993). Neoclassical economics approaches share three common views (Landreth

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

& Colander, 2001; Screpanti & Zamagni, 2005; Zamagni, 1993): one is methodological individualism (Udehn, 2002), according to which the basic unit of analysis is the *independent* individual; another one is the theory of utility-value, according to which the source of value is a good's utility (and scarcity) and capital is a productive factor perfectly and fully substitutable with labour; and the third is individuals' selfishness, according to which individuals pursue their own goals and interests, regardless of others' needs, goals and desires[13]. Within this majority group, which includes also Austrian economics and game theories, the mainstream is represented by neo-Walrasian approaches to general economic equilibrium (Bridel, 2012; Hahn & Petri, 2002; Ingrao & Israel, 1990; Kirman, 1976). This theoretical framework is so diffused that likely in almost all departments or business schools or masters in economics, that one is the main point of reference for teaching. So much, that it might be labelled "standard" economics, which can be found in all basic courses of microeconomics everywhere, at least in its version of partial equilibrium analysis.

Standard economics, especially in its version of *general competitive equilibrium*, adds to the three shared views of neoclassical "family" approaches some further fundamental requisites (Hahn & Petri, 2002; Ingrao & Israel, 1990; Kirman, 1976; Loasby, 1991; Screpanti & Zamagni, 2005; Zamagni, 1993): i) economic agents are not simply *independent* individuals pursuing their interests, but also so *cognitively strong* to be able to find optimizing solutions; ii) information must be completely (or almost completely) free and available[14]; iii) given the two previous conditions and a set of strong constraints[15], there should be a set of prices of all goods and services that optimize resource allocation and individual utility preferences; iv) such a set of prices should be a fixed point with the characteristics of stability (and hopefully, also of unicity) calculated respect to the system of differential equations describing the economic system. In short, economic theory is a price theory that defines the set of prices that keep the economic system in a stable (and hopefully unique) equilibrium state, such that all resources are efficiently (optimally) allocated and individuals' preferences efficiently (optimally) satisfied.

In a static approach, the entire economy can be assimilated to an immense auction where – with or without the support of an auctioneer, depending on the specific theoretical approach – with a series of declarations an adjustment – bargaining, in some theoretical approaches - process leads to an equilibrium point. There, price calibration – possibly negotiation in some theoretical approaches - stops and exchanges take place. However, for preferences and technologies do change – and as well states of nature changes, due to the discovery of new mines, to accidental events, etc. – the auction should be "convened" again, and restarted. As a consequence, *market exchanges are spot events that, moving from a given equilibrium point, occur any time that a change of the set of preferences, resources and technologies happens*. In fact, in a dynamic perspective, in order to find optimal solutions, economic agents continually change their counterparts, be them suppliers or buyers. Indeed, due to its substantial mathematical difficulty and to its endangering effects on the accomplishment of standard economics goals, dynamic approaches have been quite unexplored, and left more visited by other neoclassical approaches, like Austrian economics, or by sectoral and "softened" applications[16].

As can be seen, respect to the basic neoclassical "family", standard economics requires four more essential constraints, and it focuses on demonstrating the existence, uniqueness and stability of a general economic equilibrium. These demonstrations are so fundamental because, if they lacked, it could not be argued that self-interest, competition, and market mechanisms guarantee the perfect (efficient) allocation of resources and satisfaction of preferences. In short, it could not be argued any more that capitalism is an efficient governance mechanism, especially if left on its own dynamics. The effectiveness and efficiency of the "invisible hand" would vanish.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

There is a plethora of strong criticisms to the whole family of neoclassical approaches, and in particular to standard economics. Leaving aside those more related to technical aspects concerning the mathematical requisites and problems affecting the uniqueness and the stability of a fixed point, most criticisms focus on the absolute unrealism of its empirical requisites. Just to mention a few, let remind that information is not free, and often neither available, especially concerning future states of nature. On the other hand, the fulfilment of general economic equilibrium requires to know supply and demand (and production technology) of all goods under each state of nature. For instance, recalling a Hahn's famous example, in order to calculate umbrella prices today, one would need to know the demand and supply of any kind of umbrella in all future rainy days in Cambridge. Even if one would be less ambitious, who could "estimate" the demand of oil and gas in 2050? Further, due to their cognitive bias (Gigerenzer, 2008; Gigerenzer & Selten, 2001; Kahneman *et al.*, 1982), individuals are not able to correctly estimate neither well known information nor facts. Moreover, most problems cannot be optimized because they have a multicriteria nature (Biggiero & Laise, 2003)[17]. Still, capital and labour cannot be substitutes one another in all circumstances, and cannot move freely over territories.

Because of these and other reasons, mainstream economics has been challenged by many sides: neo-keynesian economics as concerning macro-economics, ecological economics as concerning environment and natural resources issues, behavioural and cognitive economics as concerning decision-making and information processing, MOS as concerning firms strategy and organization, neo-Schumpeterian and evolutionary economics as concerning growth and innovation, etc. Another set of criticism, which concerns not only standard economics but also many streams of applied economics, comes from experimental economics (Kagel & Roth, 1995; Plott & Smith, 2008), either with real or virtual labs experiments. Nevertheless, as it can be expected during decline phases of normal sciences, the "protective belt" (Lakatos, 1978) around its core concepts enlarges considerably and progressively appeal to a disproportionate use of unrealistic and ad-hoc hypotheses. As a result, notwithstanding the innumerable and conclusive criticisms, standard economics continues to dominate teaching courses, and – to a far less extent – to influence applied researches.

Let's focus on the aspects that involve directly the network view, because some of the issues just mentioned could be combined with the network view, and indeed it is what is happening in most network economics. A view of the economy as composed by networks contrasts frontally with many of the fundamental requisites of neoclassical – and even more with standard – economics. The most important points of incompatibility are the following three. If economic agents are interconnected into a multiplicity of relationships, among which also social and psychological ones, then it is hard to argue that they are independent and that they limit connections only to price declarations. Moreover, spot exchanges contrast with the (relatively stable) relationships that characterize real markets, and especially inter-firm relationships in industries and territories (see below the section on MOS network analysis). Not to say that, by definition, (radical) methodological individualism is incompatible with (radical) structuralism, which was SNA methodological and epistemological ground[18]. Thirdly, social and economic networks are characterized by many reciprocal connections and cyclical patterns, and thus, in a dynamic perspective, they should be seen as recursive nonlinear networks. This means that, not only there are network externalities, but also that network dynamics follows nonlinear ways, and both these characteristics vanish any attempt to find single, and especially, stable fixed points, as pursued by the standard economics research programme.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

A strong support of this argument concerning the standard economics "epistemological reluctance" to tackle with networks lies in its late and difficult development of a theory of the firm, and even later and more difficult development of a theory of organization. As well known, in general competitive equilibrium models there is no space for firms and organizations: only single consumers or producers confront to find equilibrium prices into a "fictitious universal and pervasive auction". Marshall and the Anglo-American research tradition were more aware that a theory of the firm could not be lacking, but a convincing micro-foundation of industrial economics and a sound orthodox rationale for building a theory of firm had to wait for the late fifties. Given the self-evident existence of firms – which from the beginning of the 20th century were rapidly assuming the form, size and *structure* of giant companies - this "theoretical hole" was lying as an embarrassing missing point in the whole edifice of standard economics. In his 1937 seminal paper on "The nature of firm" Coase was just trying to find a way to fill in that gap by linking the existence of firms to the presence and effects of transaction costs. An argument that remained relatively unfollowed until Williamson (1975, 1981, 1985, 1994, 1996) put it (at the beginning of the seventies) at the ground of transaction cost economics and organizational economics.

Other approaches to an economic theory of the firm and economic theory of organization, with few anticipations during the sixties (like that of Alchian, 1965), consolidated in the seventies with the theory of teams (Alchian & Demsetz, 1972; Marschak & Radner, 1972) and the theory of property rights (Furubotn & Svetozar, 1972; Hart & Moore, 1990), which have been developed into various forms of agency cost theory (Fama, 1980; Holmstrom & Milgrom, 1991; Jensen & Meckling, 1976) and mechanisms of design theory (Hurwicz, 1973; Hurwicz & Reiter, 2006)[19]. All these approaches are somehow orthodox with neoclassical economics, because they try to remain as closest as possible to its principles and possibly also to standard economics. In fact, such an orthodoxy was still keeping the economic theory of the firm and the economic theory of organization so far from real empirical problems and so late respect to other theoretical perspectives, that still in 1992 a prestigious scholar like Radner put the goal of persuading economists of the importance of analysing management and organization structures as a priority[20]. Conversely, approaches linked to innovation and evolution on one side, and to bounded rationality and behavioralism on the other side followed a more heterodox perspective respect to standard economics, converging currently into the galaxy of evolutionary and cognitive economics (Antonelli, 2011, 2014; Dopfer, 2005; Dosi *et al.*, 2000; Foster & Metcalf, 2001; Nooteboom, 2010; Saviotti, 1996, 2003; Teece, 2012)[21].

What mostly matters here within the extremely rich and complex history of the economic theories of firm and organization is that all of them have been forced to face with the fact that organizations – regardless whether profit or not-for-profit – are (more or less stable) structures connecting workers and managers with objects (machines, materials, ideas, information). Therefore, they are socio-technical and cognitive networks[22] (Carley, 1999; Monge & Contractor, 2003). This structural, deep and evident nature is incompatible with standard economics, as argued above, because it is unavoidably structuralist, and hence its theorization was always uneasy within standard economics. This is further confirmed by the efforts made by organizational economics, especially in its more orthodox versions, to dissolve the network nature of organizations into the same theoretical framework used for standard economics. Organizations and firms become a sort of special auctions where labour contracts are negotiated, and the typical network properties, which require a minimum of stability to produce its effects, are annihilated by supposing fast and spot contracts or by simply neglecting network properties. Needless to say, many of the (above listed) usual unrealistic hypotheses are required and adopted by these theories.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The late development of an economic theory of firms and organizations shortly preceded the explosive development of network economics (which is discussed here below). That delay does not depend, of course, *only* on the incompatibility of networks with standard economics, but that latent theoretical conflict plausibly contributed to it.

*Last but not least*. Last comers into the field of social sciences to massively adopt network analysis, once the chains of general competitive equilibrium have been broken, economists have enthusiastically engaged with this methodology. In a short survey of network economics Shy (2011) lists the following topics: consumer demand under network effects, compatibility decisions and standardization, technology advances in network industries, two-sided markets, information networks and intellectual property, and social influence. Various forms of network externalities are put at the core of network economics (Economides, 1996; Nagurney, 2009; Nagurney & Dong, 2002; Saberi, 2010; Schuett, 2010). In an even narrower definition Bobzin (2006) delimits network economics to virtual and real transportation networks, including information as things that can be transported. In recent times, Goyal (2007) and Jackson (2010) delimit the field of network economics in a much broader way. After considering all these contributions, network economics can be divided into three main research streams: network formation, economic networks, and economic networks optimization. All the three are producing a growing number of contributions, and here below some of the main will be sketched.

*A first branch is network formation modelling*, which aims at building models that show how some simple rules lead an actor's decision to link to other actors to maximize his utility function. According to Jackson (2003), for most models define actor's behaviour in terms of strategic behaviour, we can call this branch of network economics as Strategic Network Formation Models (SNFM). Indeed, this emphasis on network formation is all but new, because into MAPH many models of network formation have been proposed and extensively applied, from the random graph models (Bollobas, 1985; Dorogovtsev & Mendes, 2003) to preferential attachment (Albert & Barabasi, 2002; Barabasi, 2002), or network rewiring (Watts, 1999; Watts & Strogatz, 1998), to mention just the most renowned[23].

In general, in SNFM linking provides costs and payoffs, which usually vary with (topological or geographical distance). At node's level networking goes on until an agent is in balance between costs and payoffs, and at network level the process stops when all nodes are balanced and equilibrium is reached. Underlying the lack of strategic models within SNA literature, Jackson (2003) remarks the "birth of a literature that uses game theoretic reasoning to develop such models of self-organizing network relationships"[24]. Respect to non-network games, here the whole network value and allocation rules and efficiency will depend not only on agents number and (when considered) differences, but substantially also on network structure. Equilibrium is defined in terms of Nash equilibrium, and then systematic problems in these models concern the frequent case of the existence of multiple equilibria instead of a single equilibrium point, of its stability, and (even more) of its efficiency. In fact, only under very strict hypotheses on agents' attributes and behaviour it becomes possible to accomplish the three objectives all together: just one stable and efficient equilibrium. Besides the usual categorization in cooperative and noncooperative games, another important distinction is made between pairwise and non-pairwise games. The former means that incumbent links can be deleted only one-by-one, and that to be established the consent of both players is needed, and any deviations can occur pair-by-pair. These were the early models to be created (Aumann & Myerson, 1988; Myerson, 1991), but it resulted difficult to converge to stable states. Hence, in further developments these constraints were relaxed, and the formation of coalitions allowed. Notice that in these models value allocation is separated and postponed to when net-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

work stabilizes and the whole value is determined. Therefore, some models (Currarini & Morelli, 2000) allow to jointly determine link formation and value allocation between two players through a bargaining process conditioning their value shares to the possibility to establish a link.

Other models (Jackson & Watts, 2002a) introduce some sort of dynamic link formation, where - starting from a random link distribution - players add or delete links depending on a contingent evaluation whether their new "ego-network" increases or reduces their payoff. The process goes on until no player finds convenient to add or delete a link. Clearly, the possibility to reach a stable state strongly depends on players' rationality (Page & Kamat, 2003): if they are provided by perfect rationality and under many other (mostly inexplicit) hypotheses, then it becomes not too difficult to build a game converging to a stable state.

Examples of applications range widely: friendship networks explored through the (pairwise) connections model (Jackson & Wolinsky, 1996), where links benefits typically deteriorate with distance, but costs hold only for maintaining direct relationships. Another model interprets network topology as geography, so to build a spatial connections model (Johnson & Gilles, 2000). By considering agents as countries, Furusawa & Konishi (2007) build a model on the formation of free-trade agreements network, where a link establishment gives the benefit of eliminating trade barriers. Two other fields investigated by network economics - that it is not possible to discuss in this paper, but that it is important to mention - are those of social learning and public goods. Bala & Goyal (1998, 2001; Goyal, 2003, 2007) proposed a model of social learning networks, with various extensions. Bramoullé & Kranton (2007) developed a first network model on public goods that are non-excludable along social or geographic links. Besides these, there are models on labour networks, buyer-seller networks, co-authorship, etc.

An interesting and recent contribution is that of Gallo (2012) on small-world networks with segregation patterns and brokers, who innovates and enriches previous SNFM (Jackson & Rogers, 2005, 2007). It represents a substantial advancement of network economics towards two directions: one is that of behavioural economics, because – drawing from a previous model (Galeotti *et al.*, 2006)[25] - in a SNFM it introduces agents heterogeneity under the form of a distinction between those with unlimited and those with bounded rationality. In fact, the majority of network economics models implicitly assume that agents have a complete knowledge of the network in which they are embedded. The other advancement is towards SNA and MOS by considering the problems of segregation (Girvan & Newman, 2002) and structural holes (Burt, 1992). Agents' utility to build connections decays with distance, in accordance with Bloch & Jackson (2007), but being conditioned by their cognitive capacity, agents' choices and benefits do not necessarily correspond to the real topology. Further, Gallo introduces the concept of cognitively stable networks, which are an adaptation of the concept of pairwise Nash stability (Calvò-Armengol & Ilkiliç, 2010), because equilibrium does not depend on the real network structure, but rather on that that is perceived by agents according to their cognitive "mapping" of the network. This way "for a broad range of the parameters, all the cognitively stable networks belong to a family of network architectures that are structurally richer and more realistic than equilibrium/stable networks previously characterized in the strategic network formation literature" (Gallo, 2012: 3). Finally, Gallo demonstrates that all the cognitively stable networks have a small-world and scale-free topology, and segregation patterns with brokers connecting the segregated communities[26].

The same logic of SNFM is followed by the mechanisms design approach (Hurwicz & Reiter, 2006), which deals not only with industrial problems, but it enlarges the spectrum to any problem of collective decisions. Analogously to game theory approaches, problems are reformulated into this perspective by bringing it at the abstraction level required to be formalized within a typical neoclassical framework,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

and hence to accomplish its usual objectives of finding an equilibrium, which (possibly) should be also efficient and stable[27]. The low degree of correspondence with real-world characteristics is, as usual, the price to pay for that accomplishment[28].

*Another branch of network economics identifies this field as economic approaches to economic networks,* usually applied to industries or phenomena whose products or services are characterized by one or more of the following aspects (Shy, 2001): complementarity, compatibility and standards, consumption or production externalities, switching costs and lock-ins. In particular, network effects[29] and externalities are usually stressed as key factors[30], especially in Internet, computer software and telecommunications sectors, but also in audio-video, airlines, and banking sectors. These markets and industries can be hardly treated by standard microeconomics and industrial economics, because they cannot function as competitive markets, characterized by a high number of price-taking agents. In this sense, this branch of network economics is consistent with the other two, because it also does not allow fitting general (or even partial) competitive equilibrium. Indeed, a specific, dedicated and systematic development of a form of network economics[31] can be dated back to the eighties and the full acknowledgment of network effects (Katz & Shapiro, 1985; Liebowitz & Margolis, 1994), and the network neutrality issue (Economides & Hermalin, 2012; Schuett, 2010).

However, in a certain sense, notwithstanding its self-definition as network economics, this collocation is misplaced, because it implies a confusion of interdependence with correlation. In fact, that effect means that a single node's benefit is correlated with that of one or more other nodes, and it is measured by correlations. However, two events can be correlated even without any kind of direct or indirect interdependence (or even simple dependence). At best, correlation indicates that there are some common factors that push two events to move into the same (or the opposite) direction with significant intensity. A high correlation coefficient holding between A and B absolutely does not mean that one can directly or indirectly influence the other. On the other hand, two (inter)connected nodes (or events) are correlated because the influence of a node (or any other entity) on another one is logically and mathematically expressed through a function, and its form determines the way in which (the rule with which) the two variables are (cor)related. Therefore, excepted for very complex phenomena[32], interconnectedness implies correlation, while correlation does not necessary implies interconnectedness. In fact, a collection elements is not necessary a network, even though such elements could be correlated.

This mistake occurs not only when network economics deals with network industries, but often also when it deals with the problem of coalitions, which are depicted as networks even when members are nor directly neither indirectly connected, that is when they do not constitute a network but just a group. Likely, this confusion is fed by game theory, which applies more or less the same logic and concepts to networks and groups. Shy (2011) warns that in most parts of his survey of network economics, "the term "network" will refer to a group of users (consumers or firms) who use products and services that are based on similar technologies". Quite strangely, this definition of network violates that that can be found in any textbook of graph theory or network analysis, because it lacks the fundament of networks: the (albeit potential) connections among nodes. Connections should not necessarily be incumbent, but at least its potential occurrence should be justified according to some theory or empirics. Hence, it seems that a significant part of network economics is based on a misinterpretation of what networks are.

Besides directly claiming input-output matrixes at macroeconomic level, in his recent emphasis on the relevance of networks also on industrial production, Carvalho (2014) shapes industry structures in terms of some prototypical network forms, and he shows very clearly that there are "network effects" else than externalities and the others listed by Shy. These effects refer to the typical nonlinear impact that

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

could be called also "nested interconnection", which occurs when a sector enters into the production of others and these in turn into others, and so on. In these cases, a shock occurring in the upstream sector amplifies its (positive or negative) effects as a cascade. Further, the characteristics of such amplifications strongly depend on the topology on the interconnected industries. We could add that this is, indeed, the well-known research area of network propagation processes, investigated in reference to many kinds of what is propagated – viruses, innovations, information, financial shock, etc. – with its own specificity. The fact that these issues – production processes, like filière or value chains, seen as networks, and the instability generated by possible shocks, as well as the dependence of instability on network structure – are considered as novelties to be published into a leading journal marks the delay with which economics is dealing with network analysis, even after 15 years of explosive research developments[33].

Still belonging to this (mostly descriptive) approach to network economics is the research stream applying network analysis to international trade networks, which from episodic contributions published in marginal journals or in non-economics journals – mostly SOC and MAPH – and often done by sociologists or physicists, is now landing to top economic journals (Chaney, 2014; Furusawa & Konishi, 2007). This way, the very long research tradition on international trade patterns has been enriched by a streamline which, starting about 25 years ago, applied network analysis to this field (Kali & Reyes, 2007; Kali *et al.*, 2007; Kick & Byron, 2001; Kim & Shin, 2002; Snyder & Kick, 1979, Maoz, 2011, among the many). Further, during the second half of the past decade, a number of paper investigated the world trade web from the MAPH network analysis and econophysics perspective[34] (Barigozzi *et al.*, 2010a, 2010b; Bhattacharia *et al.*, 2008a, 2008b; Chakrabarti *et al.*, 2006; Fagiolo *et al.*, 2009; Garlaschelli and Loffredo, 2004; Ruzzenenti *et al.*, 2010; Serrano & Boguñà, 2003; Serrano *et al.*, 2007; among the many).

*The third branch of network economics is an area of operating research applied to economic networks*, not differently as some parts of neoclassical economics did and (still do), and at which prestigious economists like Arrow, Koopmans, and many others actively participated. Here the purpose of network economics is to optimize economic networks: traditionally, transportation and communication networks (Bobzin, 2006; Nagurney, 1999, 2000), supplier-buyer networks (Nagurney, 2006), and more recently financial networks (Kalyagin *et al.*, 2014; Nagurney, 2003; Nagurney & Siokos, 1997). This branch of network economics is only a little bit connected with the previous one – descriptive economic networks of network industries – and much less connected with SNFM. Moreover, it is totally extraneous to the other areas of SNA.

Economists' scientific interest for network analysis grew fast opening different research streams, enlarging the scope and weakening the rigidity – mostly due to the "neoclassical chains" – of network economics. A well picture of this process of transformation that network analysis is inducing on economics can be seen by confronting the recent presentations of network economics made by Jackson (2014b) and Carvalho (2014) with Zuckerman's (2003) review of a readings edited by Rauch & Casella (2001). This latter discusses if and how the traditional view of markets as constituted by independent firms and customers could be challenged by a view of markets as networks. Besides important methodological warnings on network identification and analysis – and other specific points that here it is not possible to discuss - what apparently emerges is the reviewer's caution and reluctance to accept the rather self-evident fact that many (most?) industries – and also many exchange markets, according to White (2002) - are networks. A fact that 10 years later Jackson (2014) and Carvalho (2014) do not hesitate to argue. Though in both these papers SNA and MOS references are rather residual, it seems that the usage and familiarization with network analysis is producing a sort of "side effect" on mainstream economics weakening its rigidity on traditional traits: a focus on equilibrium and stability at the price of adopt-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing unrealistic hypotheses, which condemn it to irrelevance in representing and interpreting real-world (Helbing & Kirman, 2013; Screpanti & Zamagni, 2005). Perhaps, *it was just this "mutation danger" that pushed Arrow to devalue network analysis for economics*.

There are other examples of economists' investigations – via network economics - into typical SOC or MOS topics: Ballester *et al.* (2006), Currarini *et al.* (2009), Goyal (2003, 2007), Goyal & Vega-Redondo (2005, 2007), among others. It is not possible to discuss all of them, but just a couple more, which are particularly significant because they are placed into two leading economic journals, traditionally representing neoclassical orthodoxy, and more particularly into its mainstream expression of general competitive equilibrium[35]. Ballester and colleagues explicitly establish a bridge with SNA by studying if Bonacich network centrality index (Bonacich, 1987; Hannemann & Riddle, 2005; Wasserman & Faust, 1994) can be an interesting indicator for players of a large set of network games. They demonstrate that, in conditions of Nash equilibrium, that index is proportional to each single player's advantage. Further, they introduce an "intercentrality" measure, which is able to individuate "the key-players, whose removal results in the maximal decrease in overall activity"[36]. Goyal & Vega-Redondo (2007) deals with the issue of structural holes in exchange networks, one of the main topics in SOC and MOS literature. Again, the main scientific added value respect to that literature is to explicitly and formally considering values coming to an actor by forming links "to create surplus, to gain intermediation rents, and to circumvent others who are trying to become intermediary". On the other side, the main scientific added value respect to network economics literature is introducing into a network formation model the advantages of filling in structural holes. Goyal & Vega-Redondo find some prototypical topologies emerging in equilibrium depending on some key parameters - links capacity to carry values, and players' heterogeneity in terms of payoffs.

The excellent and promising reformulation of microeconomics as an interaction-based microeconomics recently made by Elsner (2012), and the abovementioned contributions indicate that the "contagion" with network analysis – and especially with SNA – is producing remarkable mutations of the dominant economic paradigm. Even if a direct confrontation and hybridization between SNA and ECON does not always happen[37], it seems that in more recent works such a confrontation and mutual acknowledgment is growing, and so it could be that future developments will be more open to external contaminations. This speculation seems to be confirmed by looking at the more open and less rigid contributions coming from last years, like that of Gallo (2012) above discussed, and that of van der Leij & Goyal (2011), who examine the "celebrated "strength of weak ties" theory of Granovetter". In doing so they fruitfully and deeply entered into a typical SOC issue approaching it from a perspective and a style reasoning of network economics. Hopefully, along the road of network analysis the distances between SOC, MOS and ECON theoretical frameworks can reduce, and hence favour a cross-fertilization among them.

## NETWORK ANALYSIS IN MANAGEMENT AND ORGANIZATION SCIENCES

Knoke (2012) is currently the only book that reviews economic networks taking both SOC and MOS perspectives, at the same time giving some (few) hints to network economics. Therefore, that book is now a good reference point to visit MOS network analysis, and its connections with SOC, ranging over all levels of aggregation: from interpersonal to group and organizational level, and then proceeding from the inter-organizational – business groups and industrial clusters – to the international level – global value chains, international trade, and international corporate or political organizations. Knoke's book is among the few to discuss Burt's (1980, 1988) and White's (1981, 1993, 2002) studies on economic

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

networks placing them into an organic theoretical framework. Indeed, excepted perhaps the field of interlocking directorates, there is no comparative and *integrative* analysis that combine SOC – which in this case could be ascribed also to MOS – with specialized network economics literature. The tradition of industry studies seems quite untouched by that related to SOC network analysis.

Some other works review the articulation and evolution of network analysis applications in MOS: Borgatti & Foster (2003), Brass *et al.* (2004), Carpenter *et al.* (2012), Kilduff & Brass (2010). In this section two of them are synthesized, then shifting the focus on one of the typical field reviewed in these general frameworks: the inter-organizational level of analysis, which has been also outlined by two recent works (Provan *et al.*, 2007; Zaheer *et al.*, 2010). Then, inter-organizational knowledge networks (Phelps *et al.*, 2012) will be zoomed, because this topic – and more in general that of *knowledge networks* in SNA - is becoming particularly relevant in MOS, and covering a large space within that of inter-organizational networks. This choice is led also by the idea that offering a set of topics overlapping with industrial economics enhances a comparison between the ways in which network analysis has been developed into economics and MOS[38]. In fact, the same concept of inter-organizational (and especially, inter-firm) network clearly implies the view that – at least many of industrial – markets are networks. Hence, the delay, caution and suspicion with which economics is (or at least, was) looking at this view will seem here rather unjustified and anachronistic, given the many and solid arguments and empirical analysis provided by MOS.

Borgatti & Foster (2003) underline the exponential grow during 1970-2000 of publications containing "social network" in the abstract and title, and they review the field of the network paradigm in organizational research by evidencing six fields, and four research dimensions. The first field is that of social capital (Lin, 2001), which drew its initial inspiration from Putnam's studies on the civics tradition in Italian provinces (1993). This issue refers to the density and pattern of connections around a focal node, if related to ego-networks, or in a whole network, depending on the level of analysis. The advantages of density have been emphasized by Coleman (1988, 1990) who, much in line with Putnam, underlines that density enhances mutual understanding and coordination. Conversely, Burt (1992) argues that social capital lies into the number of structural holes covered by a given position, that is, into an actor's potential (topological) power to broker other actors, which are eventually connected with him (ego) but not among them (alters). The dispute went on 25 years, and it is recently coming to a final (and combined) view (Burt, 2001, 2005), according to which both meanings matter, but its relative salience depends on the time in network evolution (Soda *et al.*, 2004), and on other variables like the type of network, the type of relationships, and the level of analysis – ego, dyad, sub-network, and whole network. The use of social capital as an explanatory variable to understand various types of advantages and performances is still a very interesting issue in many research fields, like innovation capacity, reputation, etc. The other issue reviewed by Borgatti & Foster (2003) is that of embeddedness, which seems now rather "dated", given that Granovetter (1985) raised the point addressing standard economists, who were quite reluctant to admit that economic relations are embedded into a dense texture of various types of social relationships, and that they influence one another. As seen already in the previous section, excepted undefeated supporters of the autonomy of economic sphere, even neoclassical economists acknowledge the embeddedness of economic relations within a net of social relations, and its mutual influence.

The third issue reviewed was that of "network organizations and organizational networks". The concept of network organizations is also rather dated, because it made sense when in organization theory and business strategy – and especially in organizational economics - it was traced a line of separation between hierarchies and (just) network organizations. The (wrong) idea was that hierarchies are not net-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

works, and thus, it was the case to separate the two. However, since long it is clear that hierarchies are networks, namely out-trees[39], and thus, the interesting question is not to argue a false dichotomy between hierarchies and network organizations, but rather it concerns how to express in formal network structures the main types of organizational forms (simple/artisan, functional, matrix, multi-divisional, etc.). In this view the idea of network organization refers more precisely and interestingly to those organizations whose boundaries are unstable, either because they are frequently (re)designed due to changing environmental features, or because some functions are managed in strict collaboration with other organizations, like in the cases of co-design, co-marketing, etc.

As "organizational networks" Borgatti & Foster addressed to what are properly defined inter-organizational networks, which indeed comprises various other topics: interlocking directorates, joint ventures, strategic alliances, and various other forms of collaboration and (voluntary or involuntary, formal or informal) exchanges, and among which knowledge exchanges and innovation diffusion are particularly interesting. It's impossible here to review a literature that has grown rapidly from the beginning of nineties up to now. Here, just the basic idea is outlined, with a brief comment on some paper[40]. In extreme synthesis, the basic idea is that the famous dilemma "make-or-buy" is indeed a trilemma "make-or-buy-or-ally" (Geyskens *et al.*, 2006**;** Mudambi & Tallman, 2010). In fact, there are many circumstances under which either producing on its own or purchasing from the "market" is rather inconvenient or too risky. According to transaction cost economics (Theurl, 2005; Williamson, 1975, 1981, 1985, 1994, 1996), these are the cases that were initially defined as relational or contractual governance mechanisms, characterized by high frequency and middle specificity of exchanges. Now, a transactional situation like this can occur not only for a pair of organizations, but also for triples or for many pairs, and if some of these small structures are connected, then they form an inter-organizational network[41]. Further, if an entire industry is characterized by these traits, then relational governance becomes the predominant mechanism, and thus, most (or many) organizations will issue some of the many possible forms of agreement. It becomes a network industry, in a much broader sense than the restrictive sense given by network economics to that label, which limits it only to industries or markets where some form of network effect or externality holds. What happened is that, after an initial metaphorical or analogic use of the network concept, after the end of the last century, theoretical and empirical researchers started to use the network concept in a formal and operating way, and therefore to apply SNA to the field of inter-organizational networks.

Another topic mentioned by Borgatti & Foster is knowledge management, which they refer to those of social cognition (Carley, 1989, 1999; Carley & Krackhardt, 1996) and transactive memory systems theory (Hollingshead, 1998, 2000), which both involves social influence theories (Friedkin, 1998, 2003), and interaction patterns[42]. Finally, their list closes with the topic of group structures (Friedkin & Johnsen, 2011), which of course crosses also the three previous ones, because groups are also cognitive networks that create, manage and transfer knowledge, whose efficiency and effectiveness depends on "who knows what" and "who knows who knows what": the basic questions of transactive memory systems theory.

As concerning the research dimensions, besides the already mentioned question of the levels of analysis, Borgatti & Foster focus on the question of the direction of causality, "whether the studies are about the causes of network structures or the consequences". They evidence that the majority of research is about the latter, but that – especially into the field of proximity and homophily (McPherson *et al.*, 2001) – the studies on network antecedents and network formation were at the beginning. Indeed, as we have seen in the previous section (and will treat deeper into the next one) SNFM came only during last 15 years in both ECON and MOS.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Almost 12 years after, another review (Carpenter *et al.*, 2012) synthesizes the state of network analysis in MOS. Two of the research dimensions discussed by Borgatti & Foster – direction of causality and level of analysis - are used even in this paper to cross-classify all studies into a 2x2 table. Further, since social capital has been most frequently considered as an antecedent of network structure, they call this (half) dimension "social capital research", juxtaposed to "network development research", which would concern network consequences. On the other dimension, network levels have been compressed to two: interpersonal and inter-organizational ones. Forced by an expositive choice, here only the latter will be briefly discussed, and as well shortly addressed to one of its main research fields: inter-organizational knowledge networks.

Carpenter and colleagues enumerate many findings obtained by network research in the field of inter-organizational networks, concerning either network determinants and network structures or its effects and endogenous forces. Some years before, Provan *et al.* (2007) dedicated their paper on reviewing only inter-organizational networks literature, focusing on whole network analysis. By applying rather restrictive criteria of selection, they identified 26 publications, an outcome that motivated their evaluation of this as a relatively underdeveloped research area, respect to other fields of MOS network analysis. Later on, Zaheer and colleagues (2010) provided a further review suggesting a categorization of key findings and research issues articulated in two dimensions, one of which is again that of levels of analysis, while the other is articulated into the following four aspects: resource access, trust, power/control, and signalling. They call these aspects "theoretical mechanisms", because each of them refers to one or more theories, mostly created and developed within SOC and MOS. Strangely enough, among the list of the main aspects there is not economic convenience, and (consistently) among theories there is not transaction cost economics. Of special interest are some contributions that, though not applying algorithms and methods specifically designed for network dynamics analysis, adopt a clear dynamic perspective, either in empirical testing through longitudinal data or in theoretical modelling: Cowan & Jonard (2009), Gulati *et al.* (2012), Rivera *et al.* (2010), Schilling & Phelps (2007), Soda *et al.* (2004), Uzzi & Spiro (2005), and Zaheer & Soda (2009)[43].

This absence of an explicit and direct economic dimension – meaning that links have an economic value and purpose – characterizes, with few exceptions, most MOS literature at any of the three classical levels of analysis. This is a good reason for enhancing a substantial knowledge exchange between ECON and MOS, a cross-fertilization that does not imply sharing all of the "other side", but that could produce a great benefit on both sides. Moreover, as concerning inter-organizational networks it should be noted that most part of the specific and abundant literature – and basically all that was produced until the end of last century – use the network concept in a metaphorical or intuitive sense, but does not apply network analysis tools. With few exceptions (Nohria & Eccles, 1992), this holds also for studies explicitly dealing with inter-organizational network formation (Ebers, 1997) or structure (Grandori, 1999). Still recently, good reviews of this research field, like that of Parmigiani & Rivera-Santos (2011), consider network analysis applications in a non-crucial position.

Industrial cluster theory and research (Karlsson, 2008; Karlsson *et al.*, 2005) is starting to give a valid contribution to that type of inter-organizational networks that are geographically defined and (usually) also industrially specialized in one or few sectors. However, here too happened that until few years ago most literature was treating an industrial cluster network structure more as a metaphor or an intuitive concept, sometimes approximately visualized, than a formal methodology with its specific measures. Only recently[44], this formal approach has been taken systematically: Giuliani (2006), Arikan (2009), Staber (2001). Most industrial clusters[45] are *multi-level multiplex large socio-economic networks*, which

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

means that they are micro-societies, because between heterogeneous organizations – artisans, small, medium and often also large firms, higher education institutions, local governmental institutions – there are various kinds of social, trade, informative, and personal relationships. Nodes are individuals, groups, firms, trade unions, trade associations, etc., and hence, there are multiple levels. Likely, it is due to this extremely high complexity that many research issues, like the supposed correlations, at the meso-level of firms, between single nodes positions and performance, or at the whole level researched correlations between some network properties – say, its small-worldliness - and some kind of industrial cluster performance, remain unanswered even after decades of inconclusive studies.

Notwithstanding this evident nature of industrial clusters as multilevel multiplex, Giuliani (2007) is one of the few studies that, with formal network analysis[46] and not just in a descriptive and intuitive way, approached them trying to grasp at least part of this complexity. She analyses the structural properties of knowledge networks in three wine clusters in Italy and Chile, and she compares knowledge topologies with trade topologies in each of them.

Strictly related to that of inter-organizational networks and industrial clusters is the topic of innovation networks (Ahrweiler, 2010; Pyka & Küppers, 2002), because large part of studies have focused those that, in both cases, have high innovating capacity. As for previous issues, most literature uses the network reference more as a metaphor or descriptive/intuitive phenomenon, rather than as a precise ontology whose investigation requires specific formal methods. However, as for the other topics, things are moving towards this *double acknowledgment*: ontological/epistemological on one side, and methodological on the other side. A clear example of this process is represented by the journal *Industry & Innovation,* which dedicated to the analysis of innovation networks with network analysis methods a special issue in 2011, followed by another one in the same journal during the same year, but focused on organizing inter- and intra-firm networks to improve innovation performance.

This (inevitably selective and partial) excursus on MOS network analysis ends up with a look at the literature on inter-organizational knowledge networks. Phelps *et al.* (2012) recently survey the field by building an articulated conceptual structure: their "typology organizes knowledge network research based on three important dimensions: knowledge outcomes (knowledge creation, knowledge transfer and learning, and knowledge adoption), knowledge network properties (properties of network structure, relations, nodes, and knowledge flows), and level of analysis (interpersonal, intraorganizational, and interorganizational)" (2012: 1119). Phelps and colleagues review literature that connects knowledge outcomes, like indicators of innovation performance, to firms network position, or its ego network structure or the whole network structure. As concerning correlations between network position and innovativeness, results are inconclusive, either for direct or indirect centrality. There are, in fact, a lot of contingent and moderating variables, like the type of knowledge[47], geographical proximity and the kind of performance parameter, not to say the industrial sector and the methods of data collection.

Things do not go better as concerning the role of social capital, meant à la Burt or à la Coleman, that is the effects determined by, respectively, open (as structural holes) or closed (complete) ego network structures on knowledge creation and transfer: studies are as well inconclusive. Some more agreement there is as concerning the relationship between network properties at network level and knowledge outcome, but as Phelps and colleagues underline this agreement depends to some extent on the scarcity of specific studies. They review Schilling & Phelps (2007) and Uzzi & Spiro (2005) who find that the small-world structure is particularly effective to enhance innovativeness, but with the need of a non-excessive intra-cluster density, because otherwise the side effect of strong closure reduces firms creativity (Gargiulo &

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Benassi, 2000). This idea has been elaborated by Nooteboom *et al.* (2007) in terms of optimal cognitive distance for knowledge absorptive capacity. Broekel & Boshma (2012) argue a similar idea with their proximity paradox, showing that while cognitive, social, organizational and geographical proximity were crucial for explaining the knowledge network of the Dutch aviation industry, too much proximity in one of these dimensions harms firms innovative performance. Considering another well-known network property, Lin & Li (2010) show that, respect to random, small-world, and regular topologies, the scale-free provides an optimal pattern for knowledge transfer.

Phelps and colleagues remark that even as concerning the role of tie strength there are conflicting results between those who find support for a positive relationships between strong ties and knowledge performance, and those who find the opposite. Finally, as concerning nodal similarity/proximity, it seems that the best conditions occur when the organizations constituting a network have an intermediate degree of similarity, because if they are too similar, then there is no interesting exchange[48], and if they are too diverse, then it becomes too difficult to understand the usefulness of one others' knowledge. A result consistent with Nooteboom and colleagues (2007) and Broekel & Boshma (2012).

Interestingly, the issue of inter-organizational knowledge networks crosses that of industrial clusters, because inter-organizational networks constitute the "structural backbone" of industrial clusters, and much of the competitiveness capacity of high-tech industrial clusters is supposed to come from the effectiveness and efficiency of knowledge creation and diffusion within industrial clusters and between an industrial cluster and its external inter-organizational network. Here much of literature on innovation networks, industrial clusters and inter-organizational knowledge networks can be placed. Examples are the abovementioned work of Giuliani (2007) on the wine clusters and those of Alberti & Pizzurno (2015), Biggiero & Sammarra (2010), Broekel & Boshma (2012), and Sammarra & Biggiero (2008) on the aerospace cluster. Remarkably, this topic of inter-organizational knowledge network, especially if combined with geographical aspects, has been matter of recent applications of ERGM (Broekel *et al.*, 2014; Hazir & Autant-Bernard, 2014; Zhang *et al.*, 2014), which are the theme of the next section.

## THE MODELING REVOLUTION

Despite methodological and epistemological differences, SOC, MOS and ECON – and to a less extent, MAPH too – are progressively overlapping on some common areas of research interests, namely small-world (Baum *et al.*, 2003; Schilling & Phelps, 2007; Soda *et al.,* 2004; Uzzi & Spiro, 2005) and scale-free structures (Biggiero & Angelini, 2015; Breschi & Cusmano, 2004; Di Guilmi *et al.*, 2003; Ebel *et al.*, 2002; Gaffeo *et al.*, 2008; Jackson & Rogers, 2007; Konno, 2009; Roediger-Schluga & Barber, 2006; Tseng *et al.*, 2009), social capital (Coleman, 1988, 1990; Lin, 2001), structural holes (Burt, 1992, 2005; Gallo, 2012), positional advantages (Doreian *et al.*, 2005; McBride, 2008; Wasserman & Faust, 1994) and equivalence (Wasserman & Faust, 1994), core-periphery structures (Borgatti & Everett, 1999; Hojman & Szeidl, 2008; Wasserman & Faust, 1994), community structures (Girvan & Newman, 2002). A growing attention is being paid to understand not just the properties and the consequences of these phenomena, but also how they have been generated, in relation to endogenous dynamics. A never ending descriptive and analytic research work is being accompanied by "retrodictive" (network formation) and predictive modelling. If in SFNM and MAPH network formation and statistical modelling has been standard scientific work, things evolved differently in SOC and MOS.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Until the nineties, SOC and MOS network analysis have been done, with few exceptions (Breiger *et al.*, 2003; Doreian & Stockman, 1997), mostly with descriptive approaches and sometimes with analytic or descriptive statistical approaches: antecedents or (more frequently) consequences of a given network (or a set of similar networks) are analyzed in relation with that network structure. By the end of nineties, mostly due to Snijders and his colleagues, dynamic statistical modeling to SNA and MOS start developing[49], initially limitedly to longitudinal methods (Snijders, 1996, 2001, 2005; Snijders & van Duijn, 1997). With early studies during the nineties (Wasserman & Pattison, 1996), who built on seminal works by Holland & Leinhardt (1981) and Frank & Strauss (1986), and a substantial milestone represented by p* modeling (Wasserman & Robins, 2005)[50], during last years a statistical modeling is being developed and consolidating mostly into ERGM (Lusher *et al.*, 2013; Harris, 2014).

ERGM represent a methodological revolution because, in reference to a given (observed) network, they allow to make a sort of "reverse engineering" to understand its most probable combinatory "parent". Though the statistical methods can be quite sophisticated, the basic idea is very simple and can be summarized in the following steps:

1. Analyze your observed network to formulate what you consider its distinctive and fundamental elementary properties, which can be either first-order, like density, average degree centrality, etc. or second-order parameters, like reciprocity, transitivity, assortativity, clusterization, small-worldliness, etc.: these are your descriptors, some of which will be your explanans and some others your explanandum;
2. Take a random graph of the same size and density of your observed network, and within the sample space of all possible combinations, create a number of random graphs. Then, check if your observed network falls in the mean value respect to each of your selected statistics or if, conversely, they have a low probability. In the former case, the statistics you have selected do not identify a distinctive trait of the observed network, because it would (as well probably) occur randomly. Conversely, those statistics are a good candidate for building – alone or jointly with some others – an ERGM for your observed network;
3. Build the ERGM by "imposing" to a random graph the statistics you have selected. In other words, within the sample space of all possible combinations, create a number of random graphs with the constraint of having the selected statistics. This produces a distribution of statistics generated by the model;
4. Proceed to find the "right" weight (estimate) of each statistic, that is its parameter value, in order to fit the model respect to the observed network. It means that you should choose the best combination of all parameters "so that observed statistics are not extreme, but are central, in the distribution of graph statistics from the resulting ERGM" (Robins & Lusher, 2013: 35).

Though ERGM was originally focused on link formation constrained by other links distribution – for example, reciprocity degree or micro-patterns like in-2-stars – current developments are working to widening modeling potentialities[51]. *From a methodological point of view*, they are radically different from standard statistical approaches, which assume independence of observations, because link formation is based on some mechanism of dependence between (types of) links and local patterns. Thus, standard statistical approaches – with its typical methods such as t-tests, ANOVA, regressions - cannot be employed[52]. *From an epistemological point of view*, ERGM acknowledge many aspects of complex social systems, like mutual dependence, structural heterogeneity and specificity.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

A criticism raised by Newman (2010) and Jackson (2010) to ERGM application potentialities concerns the serious limitations imposed by the computationally intractable combinatorial space implied by non-small networks. In fact, the number of configurations to be computed to find and test the fittest one scales as $2^{n(n-1)}$ for directed and $2^{n(n-1)/2}$ for undirected graphs. Obviously, for network size major than a very small one, it would become impossible to compute all configurations. More recently, Chandrasekhar & Jackson (2014) argue that ERGM and SNFM belong to the general class of Statistical Exponential Random Graph Models, as defined by them. Further, they show that "by reformulating network formation as a distribution over the space of sufficient statistics instead of the space of networks, the size of the space of estimation can be greatly reduced, making estimation practical and easy". This way they offer a solution to the criticism abovementioned.

A generalization of that solution implies to escape from an abstract implementation, and cope with real-world networks, because it is unlikely to face with networks about which we have no other factual or theoretical information on its main characteristics else than one or two simple rules concerning link attachment. One could have diachronic information regarding more or less probable states that the network has assumed in the past, and a number of information concerning nodes attributes and link distribution, which could substantially reduce the degree of freedom of single nodes position and network topology. For example, suppose to deal with an inter-firm network corresponding to an industry. This means that there is a technology and a certain degree of heterogeneity among nodes: some of them will be direct rivals, while others only weak competitors, and others strong complementary within a same segment (parts of the production cycle) or across segments (phases of the filière). The joint action of technology and heterogeneity determines a number of forbidden combinations: for instance, firms of the type A cannot connect with those of type B because this would result in a technological nonsense. Vice versa, others would be preferred (or even forced) connections: A firms could be forcedly linked only to a C or D firm.

The key-point is that the more type and number of forbidden or forced combinations, the more dramatic is the reduction of combinatorial space. In fact, as the combinatorial space scales exponentially in the growing direction, so it does also in the opposite direction. Let's recall Simon's example in discussing the architecture of complexity (1962). Of course, the more constraints and forbidden combinations, the more tractable is calculation, but also the less generalizable is the resulting model.

Toivonen *et al.* (2009) propose the following categorization of socio-economic network modeling, slightly different from that of Chandrasekhar & Jackson (2014): network evolution models, nodal attribute models, and ERGM. The former class substantially coincides with that of SNFM, and thus, with network economics modeling, where links and node are added iteratively according to certain rules. This class can be further divided into growing and dynamic models. Growing models fix a predetermined network size (or density) at which "evolution" must stop, while dynamic models stop when "selected statistics no longer vary". This is proper of most SNFM, which end up when some sort of Nash equilibrium is reached. According to the classification advanced by Toivonen and colleagues, nodal attribute models are based on distributing links depending of nodes attributes similarities, that is on its homophily under some respect. Spatial models (Boguna *et al.*, 2004; Wong *et al.*, 2006) would belong to this class, because in this case similarity would be defined in terms of a node's "location" in a social or geographical space. Finally, ERGM "are used to test to what extent nodal attributes (exogenous factors) and local structural dependencies (endogenous factors) explain the observed global structure" (2009: 241)[53].

During the last 10 years – and especially in the last 2-3 years – a plenty of ERGM applications have been done, mostly within SOC[54] (Ellwardt *et al.*, 2012; Yap & Harrigan, 2015; Zappa, 2011), but also in MOS (Lusher *et al.*, 2012; Pahor *et al.*, 2008; Wong *et al.*, 2015; Zhang *et al.*, 2014) and other fields

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Broekel *et al.*, 2014; Hazir & Autant-Bernard, 2014; Henry *et al.*, 2010). Among the many, and in line with the focus of this chapter and the previous section, a couple of them dealing with inter-organizational networks will be reviewed. Lee *et al.* (2012) study an inter-organizational collaboration network related to a regional economic policy development within the Orlando Metropolitan Area in Florida in 2006-2007. The network is made of 40 government and non-governmental organizations, which could coordinate or act independently for local policy development. The main aim of the study is to understand the logic of building connections so that the observed network results as a probable outcome. The theoretical problem is that each organization has good reasons to reciprocally exchange information and coordinate, because this would improve its policy effectiveness, but at the same time this behavior would subject to a high defection risk, because information obtained through interactions could give policy intervention advantages. In other words, in a game theorizing perspective, the setting involves either zero-sum or additive games. Lee and colleagues build an ERGM building on the following five statistics: reciprocity, clustering (transitive triads), popularity (in-k-stars)[55], brokerage (2-node paths), homophily. Notice that this latter is an attributive instead of a topological statistic, as the previous ones, which are the most used in the ERGM standard approach. Results show that organizations prefer connecting with dense clusters, but not necessarily with very popular (central) nodes. Further, it is strongly preferred to bond with non-brokers than with brokers. Coordination and information advantages drive to connect and reciprocate, but the high defection risk discourages to connect with popular and bridging alters.

Sharing the SOC and MOS view of industries as networks, Lomi & Fonti (2012) analyze the collaboration network of 72 Italian tiles producers, accounting for more than 90% of total industry sale. They hypothesize three endogenous factors explaining the observed network structure: 1) reciprocity, which makes connection more likely to be established among reciprocating firms; 2) transitivity, which makes connection more likely to occur between companies sharing the same partner; 3) bridging, which makes connection more unlikely to occur with companies playing a brokering role, that is filling in many structural holes. By building an ERGM they found confirm of all the three hypotheses, with a particular weight of the reciprocity mechanism.

Research on ERGM – and more generally on any kind of statistical network models - is under tumultuous development. Among some important advancements there has been the extension of ERGM methods to bipartite networks (Agneessens & Roose, 2008; Skvoretz & Faust, 1999; Wang *et al.*, 2009, 2013). Further developments concern that particular sub-set of the class of bipartite networks in which nodes (or the members/individuals) of one group can be affiliated only to one node of the other group. This is a way to look at multi-level networks, which have been developed by Snijders & Bosker (2012) with hierarchical linear models. Recently, Wang *et al.* (2013) advanced ERGM methods to deal with multi-level networks, and to remove the constraining requisite of hierarchical linear models according to which links between and within groups do not exist. Zappa & Lomi (2015) build a multilevel ERGM to study the effects of hierarchical relations between organizational subunits on the presence or absence of informal network relations among organizational members.

Besides ERGM, another network analysis simulation model has been developed and it is diffusing in SOC and MOS: stochastic actor-oriented modeling (SAOM), which has been introduced by Snijders and some colleague (Snijders, 1996, 2001, 2005, 2008; Snijders & van Duijn, 1997; Snijders *et al.*, 2010)[56]. As SNFM, these models are actor-based instead of link-based, and use objective functions - called evaluation functions - that drive actors' choice to (dis)connect with others, but differently from SFNM, actors do not necessarily seek to maximize some utility function[57], that is, connections could have no economic values. Further, though SAOM resemble SNFM because they aim at understanding network

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

inner dynamics, they differ because – as ERGM – they do not start from a single or a kernel of actors and then let them grow until a fixed predetermined size or until some kind of algorithmic or ontological equilibrium is reached. On the contrary, they assume an initial (and expected) size, and let the network evolve without a predetermined final state. Jackson () reviews various types of statistical models for network analysis presenting SNFM as a different category respect to ERGM, underlining that, contrary to ERGM, SNFM are based on agent's choice about utility-driven (dis)connecting behavior and agents' dependence.

Model building is driven by actor-based probabilistic specifications that are proportional to the exponential transformation of the objective function, and parameters estimation occurs in a similar way to ERGM (Snijders *et al.*, 2010)[58]. To a larger extent than SNFM, which until now – due to its neoclassical chains - have been quite limited as respect to agent's behavior[59], SAOM allow to take into account either social influence or social selection mechanisms, and hence they allow to distinguish to what extent and how actor's attributes influence network structure and the reverse[60]. Only in recent developments ERGM are employing also actor's attributes, and thus, broadening its explanatory power and reducing its methodological distance from SAOM. And both can be used as simulation modeling and not only for identifying elementary patterns or predictive purposes: it is enough to impose instead of estimate parameters.

All the three types of modeling - ERGM, SNFM and SAOM – are progressively leaving the oversimplifying assumption of agents' behavioral homogeneity, that is their uniform way to (dis)connect and react to others' behaviors, but they are still far from incorporating actors' realistic behaviors, as depicted by cognitive and evolutionary economics (Gigerenzer, 2008; Gigerenzer & Selten, 2001; Kahneman *et al.*, 1982). The main difference between ERGM and MAPH models on one side, and SNFM on the other side is that these latter explicitly and formally interpret link formation or deletion as driven by its economic costs and payoffs, expressed through an utility function. The rationale justifying why (and also how) an agent – represented by a node – establishes or severs a connection to some other agent is because it provides an economic advantage, which should be evaluated respect to its cost. Conversely, in SNA and MAPH network formation modelling the rationale pushing a node to connect to another one does not have an explicit economic nature. It is usually related to the intuitive advantages to be directly or indirectly central or – more rarely – to be placed in specific areas of the network. In general, there are topological reasons to connect, which of course in certain contexts can be reinterpreted in an economic sense, but *per se* they are not conceived as economic reasons[61].

On the other hand, ERGM, SFNM and SAOM are particularly advanced for neoclassical economics – especially standard economics - because they allow taking account of endogenous processes. While in SOC and MOS they are all but new or "strange phenomena", in economics endogenous processes have curiously been eluded, especially from formal theorization[62]. In fact, general and partial equilibrium cannot deal with them, because equilibrium existence is not more guaranteed, nor it is guaranteed its uniqueness or stability (Ingrao & Israel, 1990; Kirman, 1976; Loasby, 1991; Screpanti & Zamagni, 2005). Game theorizing (Gintis, 2000) and network economics are starting to tackle with this issue, and in fact they are opening a sort of "Pandora box" of effects, which often, in order to obtain some sort of equilibrium, force adding further constraints to usual modeling.

ERGM are static, because they assume the observed network as a stable state and try to search for its fittest estimated model "rolling the dice" at each trial. Though the Markovian Chain Monte Carlo algorithm adjusts estimation parameters in order to increase fitness, that is, in order to guarantee convergence to the fittest models[63], trials are independent each other: there is not direct consequence from one to the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

nother. It is as if we had a given Lego construction – the observed network - and we hypothesize that, justified by some theory, that construction could (or perhaps, should) be obtained by assembling certain building blocks and joining rules. Further, the observation and disassembling of the real construction gives us information about the relative weight (relevance) of each block and rule. Once we know all this, we design a method to build models of the real construction, models that are built according to the specifications – blocks and rules – and its weights. In this methodology there is no dynamics, no path dependence, nor interactions among actors and links. All these aspects (and thus, dynamics and self-organization) can be – but not necessarily should be – into the theory that is behind the formulation of the hypotheses/specifications, but this does not imply that dynamics and self-organization are also (transferred) into the model.

Conversely, SAOM and (many) SNFM are dynamic models, because they are based on path dependence[64]: a network topology at time t+1 follows *entirely* from what happened at time t, and the transformation does not need exogenous events[65]. But this form of dynamics is rather poor and simplified respect to recursive processes, especially when such processes: i) influence agent's behavior; ii) links reciprocal influence[66]; iii) produce emergent effects, which eventually feedback to influence agent's behavior and links influence. This is the true complexity (Biggiero, 2001; Casti, 1994; Mainzner, 1994; Standish *et al.*, 1998), which of course is also path dependent, but besides being this, it is much more. To grasp "true dynamics" or complexity, path dependence is not enough. To the extent that analytical sociology has defined itself as mechanism-based or generative-based explanations (Manzo, 2014b), it does not seem that there has been a full understanding of what complexity means, at least in a deep epistemological sense, and not just as a synonym of "complication" (Biggiero, 2001). Provided that mechanisms and interactions are the same thing, in order to qualify *complex* systems/networks, a focus on mechanisms is not enough. It should occur another couple of features: such mechanisms should be connected in a recursive and nonlinear way. Nonlinearity, which is the main "ingredient" of (almost all) sources of complexity, requires recursiveness (of interactions) to produce complex behaviors.

ERGM are sophisticated methods to check whether a certain set of network descriptors can be "combined" to produce a given, specific observed network. It is an exercise in reverse engineering and not the generation of "true dynamics". ERGM represent an extremely powerful method for understanding the determinants of network structure, but they cannot incorporate recursive processes nor actors' reactions and changes in consequence of others actions/decisions. The potentiality of ERGM has a limit in the degree of complexity of the observed network and in the degree of the required accuracy of estimates. If both are high, they should leave the scene to agent-based simulation models (ABSM), which in principle have no limits in neither of the two aspects, and can truly be "generative explanations" (Epstein, 1999, 2007). Therefore, ERGM cannot deal with the true essence of complexity, which lies in recursive interactions among short-sighting complex agents. Conversely, ABSM (Carley, 2009, Davis *et al.*, 2007; Gilbert, 2008; Gilbert & Terna, 2000; Gilbert & Troitzsch, 2005; Harrison *et al.*, 2007; Tesfatsion & Judd, 2006) can take into account, at least in principle, as much "true" complexity as required, and thanks to this capacity they are qualitatively different from ERGM, SAOM, and the other kinds of SNFM[67]. This demarcation is controversial in current debate. For instance, Snijders & Steglich (2015) argue there are no substantial differences, so that an advanced SAOM model like the one they discuss "may be regarded as an agent-based model". Conversely, Hedstrom & Manzo (2015), in the editorial of the same special issue where Snijders & Steglich (2015) publish their paper, suggest "a preliminary distinction between ''statistical'' and ''theoretical'' models …, the former referring to models that are used for estimation purposes while the latter type of models seek to formally represent a process believed to have generated a

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

specific type of outcome". This distinction between estimation and representation purposes is not sound, and it is full of ambiguities due to the vagueness and overlaps between the two concepts. Conversely, the distinction between models capacity to deal with nonlinear recursiveness is clear and strong, and thus, it is the best candidate to be a demarcation line between the two modelling families of ABSM on one side and many (perhaps most) other modeling methods on the other side.

It should be stressed that, if a relatively simple network-based methodology and epistemology like those implied and brought forth by static and descriptive network analysis is already rather incompatible with the methodology and epistemology standard (mainstream) economics (especially if meant as the traditional approaches to general competitive equilibrium theory), dynamic modeling as the various kinds of SNFM, SAOM, and ERGM remarkably enlarges the scope of incompatibility. This does not mean that it becomes impossible to build competitive equilibrium models, but that they cannot be general any more, and that they –even limited to partial equilibrium analysis - can hardly be grounded on stable and unique equilibria. As we have seen, most SNFM remain within neoclassical economics, and many of them are partial equilibrium models. according to the ways in which they have been built until now, SAOM assume actors' behaviors as optimization of utility (objective) functions, and in so doing they share a basic assumption of neoclassical economics. As well occurs generally (but not necessarily) with NK modeling (see next chapter of the book) and artificial neural network simulation (see chapter 3). ABSM are potentially much more disruptive for neoclassical economics, even for non-equilibrium approaches, because they allow any degree of freedom in complexity. Of course, it does not mean that it is impossible to design neoclassical models – and even equilibrium models - with agent-based methods, but only that with ABSM can be done what with neoclassical economics cannot be done. In other words, neoclassical models – and even more equilibrium models – become special restrictive cases of reality oversimplifications[68].

## FROM JUXTAPOSING TO COMBINING

In previous sections, neoclassical economics methodological individualism has been juxtaposed to SNA structuralism, and further it has been posed as the main reason why economics delayed to engage in network analysis. Now it is necessary to go deeper into this issue, in order to better specify its characteristics and implications. In fact, recent network modeling of ERGM and SAOM are realizing a fruitful and necessary combination and reconciliation of the old juxtaposition between methodological individualism and structuralism. In its radical formulations, the former perspective focuses exclusively on individuals choices, and structures dissolve into environmental constraints and resources. Neoclassical economics is a paradigmatic example, not only in its general competitive equilibrium approaches, but also in Austrian approaches: independent agents pursue their utility maximization, given their information, resources and technologies. Of course, Marxian approaches took the opposite view, because individuals are seen as strongly embedded – as we would say today – into their social, economic and technological production (and re-production) structures. Marx (and Marxism) was intrinsically structuralist. Granovetter's (1985) argument of under- and over-socialized agents is just another way to present the same problem. Sociology has been not immune from methodological individualism, which oriented a large part of sociological thought, even if usually in a less extreme version than that assumed by neoclassical economics. On the other side, radical structuralism – as that that dominated early sixty years of social network

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

analysis from Moreno's time up to the nineties, and that was prevalent in large part of sociology during the same years – was denying (or heavily reducing) agent's attributes and discretionary power, besides the expected behavior defined by the "topological opportunities" determined by her position. Agents cannot do much more or different than what is determined by their positions.

A corresponding juxtaposition characterized methodological individualism on one side and systems science on the other side, and it is clearly reflected into the history of organizational thought (Biggiero, 1990; Pfeffer, 1997; Tsoukas & Chia, 2011). Usually, scholars dealing with organization design and structural aspects – including technological aspects – were emphasizing the relevance of structure respect to single individuals, while scholars dealing with organizational behavior and personnel management were underlining the opposite. The issue of organizational decision making is highlighting in this sense: on one side the hyper-rational view of who prescribes that agents should individuate, analyze, and compare alternatives, and then choose the optimizing one; on the other side who remarks that real agents could not be farther respect to the "ideal" view. Individual's choices within organizations are heavily influenced by the organizational context in terms of socio-cognitive ad social-psychological variables[69].

As some other methodological and epistemological juxtapositions[70], even this one revealed wrong, because agents' behavior is structurally constrained and co-determined by their (at least direct and close) interconnections, but often it can happen also that such constraints and co-determinations could be modified – to some extent – by the agent, and this capacity depends on the agent's attributes. Network modeling – and to a larger extent, ABSM – helps stopping the "ideological war" between individualism and structuralism by giving the possibility to combine the two. Boudon (1998) and (much more) Giddens (1984) have built theoretical frameworks in the perspective of overcoming the juxtaposition between individualism and structuralism. Especially Giddens' structuration is consistent with a dualist view, where individualism and structuralism are reconciled in a unified social theory. However, until the questions are put in very general (and correspondingly vague) terms, it becomes very difficult to confront and persuade one another. A bad use of scientific rhetoric (McCloskey, 1985, 1994; Simons, 1989, 1990) can "digest" almost everything.

More recently, Hedström (2005) and Udehn (2002) support the "reconciling perspective", and in the same view is moving current analytical sociology (Manzo, 2014a; Squazzoni, 2012). Manzo (2014b) refers to *structural methodological individualism* to synthesize the combination of individualism with structuralism, and he underlines the (obvious) fact that micro-behaviors (and mechanisms) precede the (emergent) macro-effects. Biggiero (2011) argues that social (and natural) evolution results from co-evolutionary processes in either horizontal sense, because elements (nodes) interact and influence each other, or in vertical sense, because emergent (macro) entities – be them concrete or symbolic or other kind of structures – are generated by the bottom interactions, but in turn they can influence them in various ways - by constraining, speeding, or qualifying bottom interactions. In this multi-level view of double (bottom-up and top-down) co-evolutionary processes, what is emergent and macro respect to the underlying level of description (aggregation) becomes the bottom (lower) level respect to its emergent outcomes, which are at a corresponding higher (meta-level) of description (aggregation). Each level is emergent respect to its lower one: groups are emergent respect to its members interactions, organizations are emergent respect to its groups, etc. Further, Biggiero (1990) proposes to interpret this ontological view in terms of Bateson's logical types (1972), and (in 2009 and 2012) he applies this interpretation to the distinction between information and knowledge: this latter would be an emergent property from information network dynamics.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Indeed, much more effective than very general and broad frameworks and arguments is the capacity of a new approach to *produce concrete applications*, and it becomes even more convincing if it has the capacity to produce falsifiable predictions (Biggiero, 1997; Lakatos, 1978; Lakatos & Musgrave, 1970; Popper, 1972) through clear and controllable-replicable methods, like real and virtual experiments. And this is exactly what network (and agent-based) modeling enables.

By operationalizing agent's behavior respect to other agents and by imposing the presence of a certain share of motifs (configurations) or other kinds of structural specifications, SAOM and ERGM can dissolve the juxtaposition into concrete hypotheses about how, respectively, the network will evolve or how it was generated. The magic of operationalizing in concrete models is also demonstrating the sterility of ideological juxtapositions. Once we wonder what a specific type of agent - in a specific context respect to a specific problem – can or cannot do and how his ego-network or whole topology can constraint or enhance his behavior, ideological juxtapositions appear sterile and the debate is shifted to the plausibility of specific modeling choices and to the corresponding implications.

Clearly, being its modeling potentialities limited respect to what can be done with ABSM, network modeling cannot fully develop the scope of free combinations of individualism and structuralism. In fact ABSM, especially when are enough rich to consider the feedback from emergent effects on single agents, can fully take into account agent's potentialities and structural specificities (Squazzoni, 2012). On the other hand, network models offer the advantage to be less complex to be designed and interpreted. However, being (relatively) simpler, network models are more contendible, and in this sense they are more fruitful for scientific knowledge growth[71].

We can get explicit references and traces of this reconciling approach in Snijders', who initially argued that his "approach to network evolution is in line with the theoretical sociological principle of methodological individualism" (1996, 2001), but later moves towards the positions of Udehn (2002) and Hedström (2005): "The actors control their outgoing ties. This means not that actors can change their outgoing ties at will, but that changes in ties are made by the actors who send the tie, on the basis of their and others' attributes, their position in the network, and their perceptions about the rest of the network. This assumption is the reason for using the term 'actor-based model'. This approach to modeling is in line with the methodological approach of structural individualism (Udehn, 2002; Hedström, 2005), where actors are assumed to be purposeful and to behave subject to structural constraints. The assumption of purposeful actors is not required, however, but a question of model interpretation" (2010:).

## CONCLUSION

It seems that Arrows's (2009) judgment that network analysis is superfluous has been not shared even by economists. Schweitzer and colleagues' (2009) exhortation to deal with economic networks was confirmed by the prolific development of studies on economic networks. In fact, as we have seen there is currently a dramatic growth of network-based research in almost all fields of social sciences. The idea that life and nature are made of networks seems fully acknowledged, not only from an epistemological side, but also recognizing that a methodological revolution was needed to cope with this fundamental way in which social and natural phenomena occur. Standard statistics is not enough: better said, it is not appropriate, because it deals with attributes and not relationships. It presumes - and it matches well when there is - ontological independence, while it mismatches when elements (events, cases, agents)

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

are structurally connected. As rightly and repeatedly emphasized by social network scholars during the seventies and eighties, what unifies the various network approaches is structuralism. Conversely, what perhaps they did not stress enough is that a structuralist view requires an appropriate methodology, which cannot be standard statistics. They underlined it "only" by stressing that the core idea of network analysis lies into the properties that a single node acquires regardless of its attributes, just because of the specific position it covers into the network. Putting relations and (relative) positions at the core of analysis means presuming and acknowledging elements dependence. This view is completely different than putting at the core of analysis attributes of independent elements.

This contrast is all but trivial, because it requires an epistemological and methodological revolution in the way of approaching real or virtual phenomena and the corresponding scientific analysis. And in fact this revolution is so less trivial that standard economics employed at least fifty years more than sociology and management and organization sciences to make it. Standard economics was – and it still is in the mainstream – firmly grounded into radical methodological individualism, and thus, exactly into the view of socio-economic phenomena as constituted by independent individuals, on whom what counts is their attributes: preferences, income, capital, etc. This methodological and epistemological view is juxtaposed to the (radical) structuralism of traditional social network analysis, and incompatible with structural methodological individualism of current analytical sociology, which is adopted by network modeling. In fact, this methodological and epistemological perspective combines the two sides, and thus, it does not coincide with only one of them, especially in the standard economics radical approach. Further, since socio-economic networks are (almost all) redundant in connections – that is, they are not efficient and characterized by cycles – then three more pillars of standard economics crumble: i) the hypothesis of homogeneous agents, and hence of the representative agent; 2) the hypothesis of constant returns and proportionality between causes and effects, due to eventual shocks; 3) the hypothesis of lack of endogenous processes and changes.

The extent and depth of such theoretical changes give an idea of the relevance of the methodological and epistemological revolution that network economics is bringing into standard economics. Put in this light, it becomes not surprising and not coincidental that economics embraced network analysis so late, and the arguments that the delay depends on the scarcity of (relational) data and computational power sound more as ex-post rationalizations, functional for reducing cognitive dissonance (Festinger, 1964) rather than the main explanation. They fail to grasp the essential and crucial rationale, which lies into the substantial incompatibility of network economics with many methodological and epistemological traits of standard economics, and in a particular way with competitive equilibrium approaches, and especially general competitive equilibrium, which during last century has been mainstream economics.

If the *methodological chains of neoclassical economics* have already been significantly broken, the same cannot be said for the *theoretical chains*. In fact, network economics is still bounded into the usual theoretical framework of utility and production functions optimization (Simon, 1997), of perfect (or quasi-perfect) and substantive rationality (Gigerenzer, 2008; Gigerenzer & Selten, 2001; Kahneman *et al.*, 1982; Simon, 1962, 1997), and - among the many other aspects - the obsessive focus on equilibrium conditions (Arthur, 2006, 2010; Loasby, 1991). This theoretical framework becomes particularly strict when considering the two main streams of research in which network economics is currently engaged: that on network formation, and (even more) network optimization, which indeed is a branch of operating research. However, most recent developments (Jackson, 2014, 2015) leave hoping that, likely with the substantial help of cognitive and evolutionary economics, the "silent methodological and epistemologi-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

cal revolution" brought forth by network economics could further make free from neoclassical chains[72]. This is exactly the matter on which, from different perspectives, recent scientific advancements in social sciences are putting most efforts, largely based on relational methodologies[73].

Besides the analysis of network industries, the main contribution of network economics has been in its emphasis on network formation studies, which indeed was less (and almost only recently) developed by SOC and almost no developed at all by MOS applications. Into this field network economics joined MAPH. In particular, concerning some issues, like the small-world or the power-law or the structural hole or the segregation patterns, network economics produced remarkable and promising contributions, different and richer than those originally proposed by MAPH.

SOC has had the great merit to stress the crucial relevance of structuralism, with its methodological and epistemological (revolutionary) implications. Network analysis constituted this way the formal and quantitative ground and backbone of structuralism, which however was often limited to a metaphorical or just qualitative approach. The problem is that a methodology is not, *per se*, a theory. It can be a way to look at it, that is, it can be also an epistemology, and a way to gather and elaborate data on a certain problem, but this is not yet a theory about it. In this sense, economists are right to side among the ones who argue that network analysis – including SNA – is a set of tools, a methodology, and not a set of theories.

Differences between ECON and SOC or MOS network modeling remain as concerning models degree of abstraction. As claimed by Manzo (2014b), analytical sociology requires: "(1) a realistic description of the relevant micro-level entities at work…; (2) a realistic description of their properties and activities…; and (3) a realistic description of the structural interdependencies that are likely to relate these entities" (p. 18). Conversely, network economics modeling usually employs abstract hypotheses as concerning agents' behaviors and interactions. Interestingly, this high abstraction degree has been adopted also by early developments of sociological ABSM, as exemplified by the so-called KISS approach (Gilbert, 2008), which has been recently challenged by the KIDS approach (Edmonds & Moss, 2004), sided on the realistic description methodology.

In order to build network-based theories of social and economic phenomena it is necessary to work on and combine two sides: empirical research through descriptive and explicative analysis, and theory-driven and empirically-grounded models of network formation. A third approach, which is growingly employed by economists and far less by sociologists and management scholars, is that of laboratory experiments (Kagel & Roth, 1995; Plott & Smith, 2008), which have been fruitfully employed in network economics to support network formation modeling with plausible parameters. Modeling network formation and evolution appears as the natural and promising field of research in all the three SNA areas, a field that has all the requisites to facilitate cross-fertilization. Scientific knowledge growth, especially when dealing with complex phenomena, can be realized only through methodological pluralism (Mingers & Gill, 1997; Salanti & Screpanti, 1997; Samuels, 1998), which does not mean "simply"[74] that more methodologies should be admitted and promoted, but also that the corresponding results should be carefully considered and employed in a fruitful recursive interaction.

## ENDNOTES

[1] Economics has developed from its very beginning a theory of industrial and consumer markets, which has been consolidated in industrial economics (and industrial organization) and in a theory of the firm after the Second World War. From the sixties, economics started also developing an organization theory, later extended to a theory of bureaucracy and public administration. On the other "side", MOS was born just as a theory of the firm and organization theory, benefiting of substantial theoretical and empirical supports from sociology and psychology. Hence, ECON and MOS are overlapped since long in the fields of the theory of the firm and organization theory. Moreover, since the beginning of eighties, MOS developed its own theories of industrial organization. Therefore, since at least 35 years, ECON and MOS are fully overlapped also into this field.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

For some theoretical suggestions and epistemological implications of this progressive overlapping and competition, see Biggiero (1990) and Biggiero & Laise (1998a, 1998b), and Chapter 7 and 13 in this book.

[2] With this label it is meant either pure theoretical developments in mathematics and physics or its applications in natural sciences.

[3] Barabasi (2002) and Newman (2010) hint on these precursors, but for an historical deepening and the subtle distinctions between scale-free and lognormal (and other kinds of nonlinear) distributions see Caldarelli (2007), Gabaix (1999), Mitzenmacher (2011), and Newman (2005).

[4] Both Barabasi and Watts acknowledge such primacies of economists and sociologists, and their great merit is to have theoretically systematized and empirically confirmed (in an extensive and intensive ways) the two issues. Further, they offered a possible generative rule for scale-free and small-world topologies, respectively, with the preferential attachment mechanism and the link rewiring. Milgram's experiments has been replicated, extended and confirmed by Watts and his collaborators about 12 years ago (Dodds *et al.*, 2003). Historical hints and conceptual deepening on the small-world issue "from the two perspectives" of MAPH (first two) and SOC (second two) can be found in Barabasi (2002), Watts (1999, 2003), Freeman (2004), and Prell (2011).

[5] This is definitely not true if one think that during the fifties and sixties cybernetics, general systems theory, and graph theory were nurturing the development of automata studies, followed by cellular automata, and from there to artificial life and artificial societies. There are at least two key-scientists that, at that time, embodied with their own life and work the crossroads of all these research streams: one is Rapoport (1957; Solomonoff & Rapoport, 1951) and the other is von Foerster (1982, 2003). Though a deep and rich history of these two scientists and the thirty years between 1945 and 1975 should still be written, a good introduction can be found in Heims' two books (1982, 1991).

[6] See below the section on the "modelling revolution" and the Conclusions chapter of the book.

[7] Of course, other economic theories, above all neo-Marxian approaches, are completely structuralist.

[8] Further, he deals with economic networks almost exclusively from the sociology and MOS perspectives.

[9] See Nagurney (2003, 2009) for a short history.

[10] Depending on the various authors (Leinhardt, 1977; Freeman, 2004; Prell, 2011), sociology, psychology, and anthropology contend each other the early three positions, but only Prell does not neglect network economics.

[11] Biggiero (1988) applied the Lakatosian theoretical framework of "protective belt and hard kernel" (Lakatos, 1978; Lakatos & Musgrave, 1970) to neoclassical economics, and specifically to general competitive equilibrium models in the neo-walrasian version.

[12] Obviously, it is not possible to go deeply into the history of economic thought, which is so rich, long and complex. For recent contributions in this field, see previous references, and in particular Colander (2000), who reviews the history of economic thought in the light of complexity economics.

[13] Moreover, more or less explicitly, it is supposed that, being resources fixed and scarce, interests are conflicting, and thus, economy is (almost always) a zero-sum game. However, there is a florid literature also on cooperative games and non-zero-sum games.

[14] Indeed, information asymmetry is acknowledged in theorizing since long, but then, in order to prevent that is becomes too disruptive for maintaining the possibility to get – even only a partial or local – competitive equilibrium, a number of other ad hoc unrealistic hypotheses are introduced.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The theoretical perspective facing with this attempt to introduce this issue within the neoclassical framework is developed into the fields of organizational economics (Milgrom & Roberts, 1992) and industrial organization (Schmalensee & Willig, 1989; Tirole, 1988). With many implications for the issue of (network or non-network) externalities, see Shapiro & Varian (1998).

15 They are: i) perfect competition of markets and industries, that is a high number of exchangers, all of them price-taking; ii) a *given and known* distribution of preferences and resources available now and predictable for all the future states of the world; iii) a *given and known* set of technologies that are now (and will be) available for all the future states of the world; iv) constant returns to scale; v) no technological discontinuities.

16 Here I refer to the fact that, albeit claiming a strong link with the standard model, its applications to sectoral aspects, like industrial economics, international economic, etc., do not maintain all requisites of the standard model. This is due to the fact that, if they did it, they would result even more unrealistic and inapplicable of what they already are.

17 On this point see notes lvii and lix.

18 Conversely, modern views reconcile and combine the two methodological perspectives. See below Section "From juxtaposing to combining".

19 See Milrom & Roberts (1992), Schmalensee & Willig (1989) and the more recent Dietrich & Kraft (2012) for surveys on these issues.

20 This fact is still more meaningful because that journal is also very prestigious, and so ideal "to convince the reader that managing is an activity worthy of economic analysis". In the same incipit, Radner points that "this phenomenon has not escaped the attention of our colleagues in schools of business and management, where many courses are devoted to the subject". And right after he complains that "the pure science of economics, however, has been slower to focus on this phenomenon, and pure theory even slower. The picture of the firm in most economic textbooks, and in much current economic research, is still that of a unitary "entrepreneur", bent on maximizing profits". The core issue of that contribution is an investigation around the question of optimal hierarchy, whose relevance is framed by Biggiero & Mastrogiorgio in the Chapter 7 of this book.

21 Some of these arguments can be found also in Hodgson (2000) and Loasby (1999).

22 Being free from "neoclassical chains", MOS had no problem to acknowledge the network nature of firms and organizations. All organization theories, and in particular its part dealing with organization design, have been developed in the (more or less explicit) structuralist perspective. This convincement has been especially evident in the scientific literature on the structural aspects of hierarchical power. See Biggiero & Mastrogiorgio in this volume for a definition and some references to the long and rich debate.

23 For an extensive discussion see Lewis (2009), Newman (2010), and Vega-Redondo (2007).

24 An excellent way to introduce the combinations between graph theory and game theory is in Easley & Kleinberg (2010). This book drives the reader also ahead to complexity economics (Antonelli, 2011; Arrow *et al.*, 1988; Arthur *et al.*, 1997; Blume & Durlauf, 2006) and agent-based modeling (Hommes, 2013; Leitner & Wall, 2014; Teglio *et al.*, 2012; Tesfatsion & Judd, 2006). For an overview of evolving game theory, see Gintis (2000).

25 They introduced the modeling of heterogeneous players respect to values as well as the costs of forming links.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

[26] Here, segregation patterns mean the presence of communities, and brokers are the bridge between them. In this sense, brokers do not simply fill in structural holes within triples but rather between entire sub-networks represented by the communities.

[27] Narahari *et al.* (2009) offer a good merge of the two perspectives.

[28] Not by chance, the *Review of Economic Design* hosts a lot of papers in network economics.

[29] Network neutrality is a typical topic of this research field (Economides, 1996; Economides & Hermalin, 2012; Schuett, 2010).

[30] Shy (2011) reclaims 10 years later that this definition encompasses the whole area of network economics.

[31] Overlooking some episodic contribution and the Santa Fè Institute, which has been supported by Arrow and other prestigious economists.

[32] Some nonlinear recursive function produces chaotic behaviors (Casti, 1989, 1994; Cohen & Stewart, 1995; Eve *et al.*, 1997; Kiel & Elliot, 1997; Prigogine & Stengers, 1984; Waldrop, 1992), and in this regime the relationship between variables becomes unpredictable, and thus, correlation vanishes. See also Chapter 2 of this book.

[33] For instance, into the MOS perspective of network analysis the representation of single industries or entire industrial clusters as networks dates at least 15 years before (see next section). As well, questions concerning innovation diffusion and other types of propagation processes have been addressed since long in MAPH and MOS perspectives of network analysis (Lewis, 2009; Newman, 2010; Valente, 1995, 2005; Vega-Redondo, 2007).

[34] Interestingly, a contribution on a typical theme of international economics has been recently published by two non-economists in a physics journal (Koskinen & Lomi, 2013).

[35] A crucial part of contributions to the debate on existence, uniqueness, and stability of a general competitive equilibrium – including Arrow's fundamental works (Arrow, & Hurwicz, 1958; Arrow *et al.*, 1959) – have been published in these two journals (Ingrao & Israel, 1990; Screpanti & Zamagni, 2005).

[36] This index improves Borgatti's (2003) algorithm to find key players by considering also links values and agents utilities.

[37] For instance, an author like Jackson, who is among the most open and available to draw concepts and tools from SOC, in a paper on communication networks Dutta & Jackson (2000) did not confront at all with SOC in a field like this, where it produced an intensive and extensive research.

[38] This research area is very much overlapped with that of economic geography, which in a timing parallel to MOS is progressively applying network analysis to regional (or local) innovation networks, industrial clusters, etc. And recently it is also deepening the issue of geographical (and inter-organizational) knowledge networks. However, for reason of space and (already oversize) length of this chapter, the review of this interesting literature is skipped.

[39] See Biggiero & Mastrogiorgio (Chapter 7 of this volume), who provide also a reference literature.

[40] The ponderous size of a recent handbook (Cropper *et al.*, 2008) witnesses the broad range of questions dealing with this research area.

[41] This extremely short synthesis would be enlighten by seeing Nooteboom (1999, 2004), who deepens the issue and enlarges the spectrum to the role played by many other variables and theories (else than transaction cost economics).

[42] For a smart connection of transactive memory systems theory with SNA see Monge & Contractor (2003).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

[43] Interestingly, inter-organizational network dynamics has started to be investigated also with statistical network methods, namely the stochastic actor-oriented models discussed in next nection. See van de Bunt & Groenewegen (2007) and Angelini (Chapter 8 of this book).

[44] It should be said that this delay was due also to the lack of empirical data that, respect to what happens in other fields, like international trade, is not provided by public institutions. Further, into this field there are a lot of methodological problems in data collection, which are discussed in many SNA handbooks (Marsden, 2005; Frank, 2005).

[45] In particular, that sub-class of industrial clusters which is represented by industrial districts (Biggiero, 1999), because they are characterized by denser networks, more interconnected with the local social networks. On the origins of industrial districts, and the distinction between industrial clusters and industrial districts see also Belussi & Caldari (2009).

[46] With agent-based modeling there are in fact various models, among which two in this volume: see Chapter 12 (Biggiero & Basevi) and 14 (Carbonara). In both there are references to this specialized literature.

[47] As for the other variables, there are many ways to distinguish knowledge types: created, absorbed, accessed, or transferred knowledge; managerial, technological or market knowledge; knowledge depth and breadth; tacit or explicit; etc.

[48] Moreover, if they are also rivals in terms of products, then the risk to be exploited during collaboration prevent it.

[49] As noticed above, in MAPH statistical modeling this is the constant and main approach to network analysis. Besides random graph networks, later on also scale-free and small-world became fields of systematic statistical modeling (for an outline see Jackson, 2008; Lewis, 2009; Newman, 2010).

[50] For some indications about the path followed by SNA scholars to reach ERGM, see Harris, 2014; Lusher *et al.*, 2013; Prell, 2011; Wasserman & Robins, 2005. Very briefly, the main steps have been the following: i) in 1981 Holland & Leinhardt developed a model for binary directed networks, called $p_1$ model, to estimate the amount of reciprocation and unequal in-degree distribution; ii) in 1986 Frank & Strauss developed the first dyadic dependence model (the former were always assuming links independence), and introduced exponential distributions and Markov chains into network modeling. They added *k-star* structures as elementary configurations to the initial ones (reciprocation and unequal in-degree distribution); iii) in 1996 Wasserman & Pattison extended previous models introducing conditional probability in ties distribution, so that the probability that two or more ties do exist is usually different than that of each single existence, and they called them $p^*$ models. In this generation of modeling, the original purposes of reciprocation, in-degree irregular distributions and *k-star* had been further extended to homophily; iv) the last generation started 10 years later (Robins *et al.*, 2007; Snijders *et al.*, 2006), extending possible model specifications and methods to avoid model degeneracy and non-convergence. From that time on, because the basic statistical distribution was maintained within the exponential random graph family, this modeling was preferably called ERGM.

[51] Indeed, after an early debate on whether it is possible to employ *any* kind of statistic, be it topological or node-attributive, now it seems that, in principle, there are no restrictions. Topological are statistics related to dyadic or local pattern or network characteristics. Dyadic statistics are those that, for instance, establish a certain probabilities of having a link if two nodes have certain features, while examples of local patterns are in- or out-k-star structures. Local patterns are called configurations, which are also called "motifs" (Ohnishi *et al.*, 2010), especially in network biology

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Milo *et al.*, 2002). Network-level characteristics are reciprocity, density, degree distribution, (dis) assortativity, etc. Node-attributes can be any statistical or topological attribute. The former depend on the ontology of the specific network: for instance, in an inter-organizational network, nodes' attributes can be its juridical form, size, etc.

[52] In fact, though there are some conceptual similarities, ERGM estimating methods cannot be standard logistic regression procedures, because they assume independent observations.

[53] Notice that in a truly realistic (and complex) model nodal attribute could change according to nodal position within network topology.

[54] These appeared often in the journal *Social Networks*, especially those with a methodological content.

[55] When $k$ can be even more than 2.

[56] To know more on SAOM theoretical and methodological aspects, and to follow and application, see Angelini's Chapter 8 in this volume.

[57] Even though the model is designed to optimize actor's behavior, the model allows implementing also different algorithms. Seeking multiple objectives determined by more than one specification, it could happen that, if some objective-criteria are genuinely – that is, (onto)logically – independent, then standard optimization cannot be applied (Biggiero & Laise, 2003). See also Note lix.

[58] Indeed, it seems that Snijders brought into ERGM what he developed for SAOM. Likely, between the two modeling approaches it could be shared much more than what was thought in the pioneering stage of twenty years ago.

[59] As underlined by Angelini (chap. 8, this volume): "Actors are "memoryless" for Markov's chains assume that the next state only depends on the actual state and not on the sequence of events that preceded it. Moreover they are strategically myopic for they are not able to imagine conjectures about the countermoves of the other nodes and they cannot ally or coordinate their behaviors. On the other side they are omniscient on the relational dimension because they perfectly know the state of the networks; that is all the nodes and their connections. Obviously, such an assumption is hard to be sustained for large networks, in those cases the interpretation of the model results should be aware of it". Hence, SAOM current version is rather unrealistic as concerning actor's behavior – in this respect it is a rather neoclassical approach, because actors, albeit heterogeneous in terms of attributes, have the same objective function that consists in maximizing their utility. Moreover, agents have no computational limits and resolve possible conflicts inside their objective function through the standard multicriteria utility function. That is, they implicitly assume that among all specifications there are trade-offs, and thus, substitutability coefficients, which allow to express a given specification in terms of another one. In other words, the weight of a certain parameter is reduced in favor of another one. Specifications are like criteria into a multi-criteria objective function. (The same mechanism is employed also by ERGM.) However, if some specifications were truly independent, then a multi-criteria (or multi-specifications) objective function could not be built, and hence specifications parameters could not be varied as in a trade-off relationship. Consequently, and consistently with cognitive and evolutionary economics, agents had to be satisfiers and not maximizers, and instead of optimizing utility functions actors had to employ other heuristic algorithms, among which outranking methods (Bouyussou, 2001; Bouyussou *et al.*, 2000) are the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

most appropriate even though not the most practiced. To go deeper into these issues, see Biggiero & Laise (2003a, 2003b, 2007).

60 SAOM have been initially designed to study networks of individuals, but then van de Bunt & Groenewegen (2007) and Angelini (see Chapter 8 of this book) applied them to interorganizational networks. However, the fundamental SAOM methodological requirement of assuming nodes' behavior as driven by utility functions do remain.

61 Though not into the field of economic networks, Jackson & Rogers (2007) have created a very interesting model of network formation, which is rather simple and at the same time so powerful to generate all typical features of many social networks: small-wordliness, power-lawness, assortativity, and a negative relationship between a node's degree centrality and clusterization. Remarkably, network economics became so interesting for economics journals that such a *social* network model has been published in a leading journal of economics.

62 Austrian economics has been among the branches of economic theory that has given more emphasis on endogeneity, either in the form of self-organizing mechanisms to optimize resource allocation in competitive markets or in the form of innovation processes. Von Hayek and Schumpeter are the prominent scientists that stressed and developed these two issues, respectively. However, until the reformulations of their ideas into evolutionary economics (Dopfer, 2005; England, 1994; Foster, 1997; Hodgson, 2000; Kirman, 2011; Loasby, 1991; Witt, 1993), both issues were neither formalized nor modelled.

63 And it is just on this aspect that points some of the criticisms raised by Newman (2010) and Jackson (2010).

64 Many SNFM do not take into account path dependency, because they follows the "auction logic", which means that there is a sort of "virtual adaptation" while looking for equilibrium. In other models there is still such a powerful rationality that agents can evaluate the rational choices of all others and make the right (optimal) decision. In other SFNM there is path dependency in the form of Markov chains, as in SAOM.

65 On many aspects of path dependence see Garud & Karnøe (2001).

66 Here I mean that most social or economic networks are multiplex, that is its nodes are interconnected through more than one – usually many – type of relationship. And generally, the different types of relationship interact between themselves and with actors. For instance, in an inter-firm network representing an industrial cluster, firms are connected through trade relationships, friendship relationships, knowledge-exchange relationships, union relationships, labor mobility relationships, etc. And friendship relationships can likely influence trade relationships: link-link interactions. Moreover, an eventual change of position into the trade network could – and likely will - induce a different behavior into future link formations in that or in other topologies corresponding to the other dimensions (friendship, knowledge, etc.). see more in the Conclusions chapter of the book.

67 In the Conclusions chapter of this book, a comparison between the four relational methodologies under nine evaluation criteria is provided.

68 ABSM criticisms to neoclassical economics have been addressed by Gallegati & Richiardi (2009) and Moss (2009). The impact of relational methodologies on neoclassical economics is revisited also in the Conclusions chapter of this book.

69 Among the set of hyper-rationalist we can enroll most economists and also a large group of management scholars, while on the other side many sociologists and psychologists, and a significant group of organization scholars.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

[70] Another case of strile juxtaposition is that between epistemological realism and relativism, which have been combined and reconciled by pragmatism (Hack & Lane, 2006; Putnam, 1995; Rorty, 1979, 1982). For an approach to MOS inspired to epistemological pragmatism, see Biggiero (2001, 2009, 2012), Tsoukas (2005).

[71] For more on this issue, see also the Conclusions chapter at the end of the book.

[72] An excellent view of what a "new microeconomics" could become once acknowledging the various forms of social complexity – evolution, interaction, cognition, and institutions – is presented by Elsner (2012).

[73] Besides the works already recalled, the following are still noteworthy to mention: Edmonds & Meyer (2013), Jörg (2011).

[74] Indeed, this acknowledgment is all but simple, because entire theoretical frameworks – and even paradigms – are mono-methodological, that is encapsulated into a single methodological approach.

# Chapter 13
# Financial Infrastructure and Economic Growth

**Saptarshi Chakraborty**
*Panchakot Mahavidyalaya, India*

## ABSTRACT

*This chapter attempts to explore both a theoretical and empirical relationship between financial infrastructure and real sector of the Indian economy. It first presents an endogenous growth model where economic growth, proxied by the incremental output-capital ratio, depend on the financial infrastructure through three routes, namely, by changing the quantity of investible resources or by affecting the efficiency of utilization of a given quantity of resources or both, of which the former can either be through change in the amount of savings channeled to investment or change in the rate of savings. A time-series econometric analysis shows that the financial sector variables can explain near about 96% of the changes in real economic growth in India, which is an excellent goodness of fit. It concludes that the development of the financial infrastructure helps the Indian real sector grow both in the short-run and in the long-run. Unlike contemporary literature that prescribes diminished role, our study suggests a greater role of the govt. to ensure long-run economic growth.*

## INTRODUCTION

Until the end of 1970s governments of the developing countries have failed to recognize the need to develop the financial infrastructure and set up conditions favorable to financial development. In the past, financial sector was merely an instrument to finance the key industrial sectors referred to as the 'engines of growth' in form of directed cheap credit allocation. High reserve requirement, interest rate controls, inefficient instruments of taxation and other easy short-run revenue earning policies of the governments resulted in persistent budget deficits and severe external debt crisis.

Unlike yesterday, financial markets are now the key movers, with primary roles of (a) increase in the saving growth rate (b) efficient allocation of investment resources and (c) better utilization of existing resources. Exaggerating these roles, contemporary theories put forward the idea that financial development has a causal influence on growth, unlike the traditional theories that vehemently insists on the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

passive role of financial system which merely adapts to the financing needs of the economy's real sector and fits in with the autonomous development of the sector. Therefore, during the last three decades, many developing countries undertook programmes of financial liberalization, aimed at removing various policy induced distortions that limited the development of the financial sector.

The interdependence between real sector and the financial sector of an economy has become a prominent research agenda in development economics since the publication of the seminal works of McKinnon (1973) and Shaw (1973). This gained more importance, as far as policy prescriptions are concerned, during the 1980s with the emergence of debt crisis in the Latin American countries as financial inflows made them more vulnerable to external shocks.

World Bank (1989) report stated that "*It became widely acknowledged that economic growth without well-developed domestic financial markets would be detrimental to the longer run growth prospects of developing countries*." As a reaction, several developing countries designed and carried out economic reform programmes during the 1980s, in which financial market reforms received a prominent role.

## A BRIEF REVIEW OF LITERATURE

Prof. H T Patrick (1966) worked out a useful reference framework for the study of causal influence on growth, by distinguishing between "supply leading approach" & "demand following approach" to financial development. Demand following financial infrastructure development appears as a consequence of development of real sector. This implies a continuous widening of markers and a product differentiation, which makes necessary more efficient risk diversification, as well as better control of transaction cost. This type of financial infrastructure development therefore plays more permissive role in the growth process. On the other hand, supply leading financial development precedes demand for financial services and can have an autonomous positive incidence on growth. Its role is essentially to mobilize the resources blocked in the traditional sector, transfer them to modern sector which is capable of promoting growth, and ensure they are used of finance the most dynamic projects. The hypothesis put forward by Prof. Patrick is that supply leading financial development dominates the early stages of economic development, especially as it makes it possible to finance investments that embody technological innovations more effectively. Once the economic development process has reached maturity, demand following financial infrastructure development takes over. In addition, the wider the gap with developed countries, the more likely it is that developing country will follow the supply leading financial development model.

Professor Patrick's hypothesis is of tremendous interest as it highlights the two-way causality which may exists between financial development and growth. It is however incomplete as it does not account for the complementarily of the two phenomena in consideration. While "supply leading" financial development can in fact speed up economic growth, "demand following" financial development is not just a passive adaptation of the financial system to the development requirements of the real sector, instead real growth enables the financial system to accomplish its own autonomous evolution, since the sustained increase in real income provides the means to set up a costly and increasingly sophisticated financial intermediation.

Gerschencron (1962) stated, on studying a case for Japan, that wider the gap with developed countries, supply-leading approach will be followed. Gupta (1984) tested this hypothesis and had favorable results subjecting it to Granger Causality tests. Jung (1986) tested this hypothesis and had favorable results subjecting it to Sequential Causality tests. However, Patrick did not take into consideration the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

complementarities between the two approaches and could not account for the huge cost of setting up of financial infrastructure, which can only come from high real sector development.

Townsend (1983), Greenwood & Jovanovic (1990) and Levine (1992b) suggested that there may exist circular relationship between real growth and development of financial sector. As the establishment of financial sector is very costly, level of development of real sector determines the type of financial network. The reciprocity between financial development and growth can give rise to some exogenous threshold effects, which when passed in terms of per capita income; the economy can reap the benefits of financial system's positive influence on growth. The presence of these threshold effects raises the possibility of the following circular relationships. When the income level is high, the financial system is able to monitor investment projects and identify the most cost effective innovations and hence as the financial development is adequate, income level increases further. But when the income level is low due to underdevelopment trap, the financial system can only mobilize savings and manage productivity and liquidity risks and hence as the financial development is inadequate, income level cannot increases further.

Theoretical studies have considered various financial policy variables as determinants of economic growth. As has been termed by Gupta (1987), the theorists can be classified into two categories, viz. the *financial structuralist* and *financial repressionist* schools. The former comprises those who contend that the quantity of financial variables and its composition affect economic development. Thus, factors like financial deepening and the composition of aggregate financial variables gain relevance as financial factors determining economic growth. Such works have been done by Gurley & Shaw (1960); Goldsmith (1966,1969); Patrick (1966); and Porter (1966). The financial repressionist school, on the other hand, comprise of those who emphasize that price variables are more relevant financial factors influencing growth. They believe that financial liberalization in the form of a "realistic" real interest rate and real exchange rate promote economic growth, while financial repression, especially in the form of below-equilibrium real interest rate and domestic currency over-valuation, retard growth. This idea is of relatively recent origin and was first put forward by McKinnon (1973) and Shaw (1973). This idea was later refined by Galbis (1977), Malthieson (1980), Fry (1987), Greenwood & Jovanovic (1990), Benchivenga & Smith (1991), Levine (1991, 1992), Paul (1992), Roubini & Salai-Martin (1991, 1992), King & Levine (1993), etc.

The common aspect of the structuralist, repressionist and related aforementioned studies is the idea that the major channel through which financial variables affects economic growth is by enhancing the productive and efficient utilization of investible resources. This is possible through the role of higher level of financial development and also through financial liberalization.

At the empirical level, various tests have been carried out relating to *financial structuralist* hypothesis. Some of those used a case study approach of relating the cross-country growth rate with the level of financial development, e.g. McKinnon (1973) and Layni & Saracoglu (1983). Others simply examined the direction of causation between economic growth and level of financial intermediation. Some of the notable works are of Fritz (1984); Jung (1986); and Odedokun (1992). Some others like Wallich (1969); Jao (1976); Wan (1980); Gelb (1989); Lanyi & Saracoglu (1983); and Ghani (1992) have tested for financial intermediation variables in the economic growth equations. Other recent empirical studies based on similar approach are that of De Gregorio & Guidotti (1992); Gertler& Rose (1991); King & Levine (1993); Roubini & Sala-i-Martin (1991). Odedokun (1992) has stated some of the major limitations inherent in this approach of including financial intermediation variables in economic growth equations. These limitations have now prompted direct evaluation of their effects on economic efficiency, rather

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

than on economic growth, by including them as regressors in the equations for incremental capital-output ratio. In virtually all the studies, the financial intermediation variables have been found to have positive association with economic growth and/or economic efficiency.

The financial *repressionist* proposition too has received a number of empirical tests. Lanyi & Saracoglu's (1983) case study is an example where interest rate regimes in various developing countries are classified into real interest rate with positive, slightly negative, and significantly negative values and this classification is related to economic growth across countries. A similar study has been made by Khatekhate (1988) but was unable to detect any relationship between real interest rate and economic growth. Others like Fry (1980); Gelb (1989); Agarwala (1983); Ghani (1992); King & Levine (1992); and Seck & El Nil (1993) included the real interest rate in economic growth equations and reported a positive relationship. However, the likely reverse causation from economic growth to real interest rate could not be identified due to various reasons stated by Gelb (1989). This and similar other econometric problems have encouraged the practice of directly testing for the effect of real interest rate on economic efficiency by relating it to incremental capital-output ratio instead of or in addition to economic growth. Such studies have been done by Fry (1979, 1981, 1984); Gelb (1989); Agarwala (1983); Odedokun (1992); and King &Levine (1992). Most of them have obtained a positive relation between incremental output-capitalratio and real interest rate. Very few studies, however, have tested for the other aspect of the financial repressionist proposition, viz. concerning the effect of exchange rate valuation either on economic growth or efficiency. Amongst them, Agarwala (1983) related exchange rate distortion to economic growth and incremental output-capital ratio. Gallagher (1991) adopted a similar approach by including a parallel market exchange rate premium as a proxy for exchange rate distortion in the composite "rent-seeking" variable included in the estimated equation for incremental output-capital ratio. Similarly, Ghani (1992) included the black market exchange rate premium in the estimated economic growth equations.

## OBJECTIVE

As it is well known that financial policies in all ramifications constitute a means for promoting economic growth in developing economies, to prescribe policies, we require some knowledge of whether and how the variables affect growth. Generally, in broad terms, they can be described to influence growth either by changing the quantity of investible resources of by affecting the efficiency of utilization of a given quantity of resources or both. Some of the studies have examined the effects of financial variables on the quantity of investible resources as an indirect way of identifying their effects on economic growth. Some other studies have directly related the financial indicators to growth. However, very few studies have investigated their effects on the efficiency of resource utilization. This is one of the reasons, which attracts me to this relatively neglected aspect. In addition, this analysis considers broader range macroeconomic variables that are financial in nature. To be exhaustive, this chapter studies the effects of such variables on economic efficiency, proportion of savings channeled to investment, savings rate and hence growth, thus considering all the routes how financial sector might influence the real sector.

Theoretical and empirical works on this issue of relationship between financial infrastructural development and economic growth raises some basic questions which warrant more academic importance in form of theoretical and empirical studies. The following are to mention a few.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- How the performance of the financial sector contribute to growth.
- How the level of economic development influences, and is influenced by, the development and structure of the financial system.
- How natural imperfections in the financial sector affect growth.
- How the structure of the financial sector affects growth.
- How to design and organize financial institutions and markets for a proper and effective financial reform.
- Should there be an optimum level of competition to ensure long-run growth? If so, what should be the degree?
- What are the comparative effects of different types of financial intermediation on growth and vice-versa?
- What should be the proper growth strategies taken in a Developing Economy that can be supplemented by the financial sector developments and simultaneously make the financial sector robust to all macroeconomic and financial shocks?
- Should financial development be 'demand-following' 'supply-leading' or an optimum blend of the two in order to ensure a long run stable growth in the developing Economics?
- What are the preconditions that a Developing Economy should have in order to ensure a safe journey to Financial Globalization?
- Do the fruits of Financial Globalization need the Globalization of some other sectors in a Developing Economy?

Various theoretical and empirical works done in this area are quite broad in their respective right. To assay all such aspects simultaneously is undoubtedly a magnum opus. Though difficult to choose between the savory areas of further research, this chapter would like to concentrate on the basic inter linkage between the real growth and financial infrastructure of a developing economy trapped in a low level equilibrium, striving for the big push to break free. Policy prescriptions, in such cases, are supposed to depend on the structural parameters of an economy, as has been stated in the literature. Hence, it becomes very difficult to estimate and understand the various aspects and linkages between the real and financial sectors of an economy when multiple economies are concerned as economies widely differ in their structural parameters. Hence this study therefore considered a particular case – that of the Indian economy, as it is perhaps the major point of concern in the perspective of a LDC and also that being a resident of this developing country, I would like to confine such study to India.

## THEORETICAL FRAMEWORK OF THE STUDY

This chapter attempts plausible frameworks for studying jointly some basic elements of endogenous growth that relate to the main aspect of the behavior of the financial sector. Particularly, this chapter extends a model of a Lucas (1988), Romer (1989) and Pagano (1993) type endogenous growth economy with an essence of Odedokun (1995) in order to incorporate the effects of the financial sector.

Following Odedokun, we derive the relationship between economic growth and economic efficiency,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$\frac{dY}{Y} = \frac{dY}{dK} \cdot \frac{dK}{Y} \tag{1}$$

where, dY/Y, i.e., rate of change of output is referred to as economic growth(g); dY/dK is the incremental output-capital ratio (IOCR); and dK/Y is the share of investment spending (dK) in the total output (Y). Thus,

$$g = IOCR \cdot \frac{dK}{Y} \tag{2}$$

In other words, economic growth is the product of economic efficiency (IOCR) and the ratio of investment to GDP. Thus, the channels of the effect of financial variables on economic growth is either through changes in investible resources (dK/Y) or through changes in productiveness or efficiency of resource utilization (IOCR) or both. Odedokun has however analyzed only the efficiency route, i.e. through IOCR.

To be exhaustive, we emphasize both the channels by incorporating Pagono(1993) type endogenous growth model into equation [2]. Change in capital stock 'dK' is referred to as investment spending 'I'. The growth equation is adjusted with the rate of depreciation of capital 'δ'. Thus, equation [2] can be renovated as:

$$g = IOCR.\ I/Y - d \tag{3}$$

At equilibrium, gross investment (I) equals gross savings (S). However, it is reasonable to assume some leakage, of proportion (1-θ), out of the flow of savings during the intermediation process. Hence,

$$I = qS \tag{4}$$

Equation [4] captures the interaction between the savings function (for the supply of funds) and the investment function (for the demand for funds). The firms and the government sector are the net demanders of funds and equivalently net suppliers of bonds and/or stocks. The household and overseas sectors are the net suppliers of loanable funds and equivalently net demanders of bonds and/or stocks.

In the light of identity [4], equation [3] can be rewritten as:

$$g = ICOR\ .s\ .q - d \tag{5}$$

where s = S/Y. This equation suggests that, at steady state, the growth rate is some composite of economic efficiency of capital, the propensity of total savings that gets transformed into investment, and the savings ratio. In identity form, a re-representation equation [5] can be written as:

$$g = \ln IOCR + \ln q + \ln s \tag{6}$$

We argue that the financial markets can raise θ, the proportion of savings channeled to investment; they may increase IOCR, the incremental output-capital ratio or social marginal productivity of capital; they may influence **s**, the private savings rate. Through these mechanisms, the growth rate of real per

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

capita income rises and the conclusions of endogenous growth are upheld. The first mechanism is perhaps most important for the process of economic growth. When savings are transformed into investment, it so happens that a rupee saved(S) by households, generates less than a rupee of investment (I=θS). Thus, the fraction (1-θ) goes into the financial markets in forms of spread between lending and borrowing rates, commissions and fees to securities and brokers, etc. This leakage (1-θ) of the financial resources might reflect the in-efficiency of the financial markets. Thus, with the decrease in (1-θ), θ increases and leads to the increase in the real per capita growth rate. The second mechanism claims that the financial markets increase the productivity of investment in various ways. As stated by Benchivenga & Smith (1991), financial markets play an informational role so that economic agents can evaluate alternative investment projects. King & Levine (1993) and Saint-Paul (1992) opine that financial markets help in sharing liquidity risks through portfolio diversification. As producers specialize and raise their productivity, economic growth is enhanced. By the third mechanism, financial markets affect economic growth by altering the savings rate **s**. The development of the financial markets leads to change in the rate of savings which leads to change in the rate of economic growth.

Due to multicolinearity arising from time-series nature of data and due to lack of sufficient observations for a time-series econometric analysis, we frame the following course of study for the rest of this chapter.

1. Regress ln(IOCR) on financial variables that are supposed to explain it.
2. Regress ln(θ) on financial variables that are supposed to explain it.
3. Regress ln(s) on financial variables that are supposed to explain it.
4. Regress g on financial variables considered in (i), (ii) and (iii) above.

## HYPOTHESIS AND RELEVANT VARIABLES

To estimate equation [6], we are to identify plausible variables that might explain incremental capital output-ratio (IOCR), propensity of savings channeled to investment (θ) and the private savings rate (s). We have to consider the behavioral nature of such variables which underpin the mechanisms in equation [6].

- **Variables Influencing IOCR:** The incremental output – capital ratio is supposed to depend on the following variables:
  - **Financial Intermediation Variables*:*** Financial intermediation variables are supposed to influence the IOCR to a great extent. According to King & Levine (1993), the liquid liabilities of financial intermediaries, expressed as percentage of GDP, indicate the relative size of the financial system and is supposed to correlate positively with the volume of financial services provided by the system. In practice, we consider the ratio of wide money stock $M_3$ to GDP or the **$M_3$/GDP** ratio. We further analyze this into the ratio of narrow money stock $M_1$ to GDP or the **$M_1$/GDP** ratio and the ratio of quasi money stock ($M_3$– $M_1$) to GDP or the **($M_3$-$M_1$)/GDP** ratio. In this manner, we wish to see whether there is any difference in the effects of the two components on efficiency. This is informed by the fact that while $M_1$ is basically for facilitating transactions and exchange, quasi-money is primarily supposed to fulfill the role of store of value or the wealth motive, suggesting that the efficiency effect of the former should be greater than that of the latter on *a priori* grounds. To further test for any difference in their effects, one may employ the ratio of the former to the latter, i.e. **$M_1$/($M_2$-$M_1$).** However, due

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

to multicolinearity problems, all the four variables could not be taken together. Moreover, as has been stated by Kuznets (1971) that broad money aggregates, unlike the narrow money, better explain real growth, as they covert more sophisticated financial assets. We therefore consider only **$M_3$/GDP** ratio in our estimation equation.

- **Government Borrowing:** Government Borrowing from private financial institutions, mainly in form of compulsory holding of govt. debt instruments and reserve requirements, does not only reduce financial development but also hampers the efficiency of the financial system. This has been stated by Fry(1988). Thus, we test for the effects of the ratio **GB/TB** of government borrowing from domestic deposit money banks – denoted by GB – to the outstanding claims of the deposit money banking system's total stock of lending (to both private and public sectors) – denoted by TB. We would expect this to have a negative effect on economic efficiency.
- **Information:** Information plays an important role to enhance economic efficiency and hence economic growth. Resources should be allocated to efficient entrepreneurs who choose proper projects. But this requires proper information, gathering of which is a costly affair. Setting up of specialized institutions and credit rating firms do the required. Thus one may test the effect of number of credit rating firms (**CRF**) on IOCR which is expected to have a positive relationship. As banks also do this job for the customers, a similar test with no. of commercial banks (**NCB**) can also be done. Presuming that Indian investors are somewhat between risk-lovers and risk-averters, we test the transactions of mutual funds (MF) to total investment (I), i.e. the ratio **MF/I**. The mutual funds companies, by virtue of their technical expertise, are expected to share the risk with investors. This indicator not only captures the risk behavior of the investors but also throws light on the aspect relating to the effect of information on investments. Investors not much aware of alternative investment opportunities might go for mutual funds. Hence we would expect MF/I to have a positive relationship with IOCR. Again, due to problems relating to multicolinearity and degrees of freedom, we had to restrict ourselves only to **MF/I.**
- **Directed Credit:** Directed Credit Policiescan affect the efficiency of credit utilization as has been stated by the World Bank. Not much of tests have been done with this factor due to difficulty in identifying a proxy for it. However, as pointed out by the World Bank that "development finance institutions have been perhaps the most common means of directing credit", we test for the outstanding stock of lendings to the private sector by the development banking system DEV in relation to GDP, i.e. **DEV/GDP** ratio. This has also been done by Odedokun(1992).

## Variables Influencing θ

Second, we hypothesize that the following variables might explain the behavior of the proportion of savings channeled to investment, i.e. θ:

- **Banks Assets:** The Asset Side of the banking system provides the ratio of outstanding claim on the private sector (CR) from the banking system to GDP, (or **CR/GDP** ratio) as an indicator of how savings are channeled to investment. The ratio of growth rate of real credit ΔCR with respect to GDP, i.e. ΔCR/GDP ratio, or with real domestic investment expenditure, i.e. **ΔCR/I** ratio, can

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

also be used. It will roughly indicate the fraction of investment expenditure financed through credit flows from formal financial institutions.

- **Banks Loans:** Relative amount of loan granted to the private CRG and the public CRC sectors is taken as an indicator to learn about how the structure of the financial sector influences growth. Thus, we take the ratio **CRG/CRC** as an explanatory variable.
- **Term of Deposits:** As some productive investments very illiquid and any premature sales of these assets lead to a heavy cutback in their yield, such investment technologies require considerable amount of time to be operational. Hence,'long-term-high-yield-illiquid-investments' might expose the investor to liquidity risks, but is expected to enhance economic growth. To capture how the nature and behavior of savings determine investment, we take the ratio of amount involved in Demand Deposits to that of Time Deposits, i.e. **DD/TD** as an explanatory variable for θ. As this variable increases, savings cannot be used in long-term investments. Hence, rise in DD/TD would generally mean fall in θ.
- **Business Environment:** More savings are channeled to investment during favorable business environment. Sensex, denoted by **'SENSEX'** can be considered as indicator relating to nature of business performance. We would expect this to have a positive relationship with the dependent variable.

### Variables Influencing 's'

Third, we hypothesize that the following variables may explain the behavior of rate of savings '**s**':

- **Money Market:** Money Market returns are expected to explain the behavior of savings rate because savers aim to invest funds if they get good returns. It is however assumed that savers, in Indian context, are not ultra risk-averse. Hence, we consider various money market deposit rates as indicators of money market returns. 1 to 3 years deposit rate**MR1**, 3 to 5 years deposit rate **MR2** and above 5 years deposit rate **MR3** are considered as explanatory variables for **s**. We also consider call/notice money market return **RM** to analyze its impact, if any.
- **Bond Market:** Bond Marketreturn is also expected to explain the behavior of savings rate because savers aim to invest in bonds if they get good returns. It is however assumed that savers, in Indian context, have invested mostly in govt. bonds for most of the period we have considered. Hence, we consider weighted interest on govt. bonds, denoted by **BR** as an indicator of bond market return. We presume this to have a positive impact with the dependent variable **s**.

## ECONOMETRIC INVESTIGATION

### Nature of Data and Estimation Technique

All the data has been collected from 'Hand Book of Statistics' and various bulletins of The Reserve Bank of India, which can be now obtained from the website www.rbi.org.The required data, ratios and indicators calculated from the data have not been shown due to space considerations.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Having known that the variables might contain unit roots, a simple Ordinary Least Square technique might not be a meaningful solution. Hence, we first test for unit roots in each of the variables making use of the Augmented Dickey Fuller (ADF) test and the Phillips-Perron (PP) test statistics. We then test for co-integration in the data, and if any, incorporate such co-integrating equations into a Vector Error Correction (VEC) model. Presuming that the analysis might have problems relating to multicolinearity and degrees of freedom, we first regress ln(IOCR), ln (θ) and ln(S/Y) on the variables that are supposed to explain them. Having identified significant indicators from such regressions, we use them to explain growth rate '**g**' by adding them in the regression equation in relevant groups.

## Testing for Unit Roots

Two widely used tests – the Augmented Dickey-Fuller (ADF) test and the Phillips-Perron (PP) test are adopted to test for unit roots. Results of the ADF and PP tests are tabulated in Table 1 and Table 2 respectively.

Both the tables show the various dependent and independent variables in column 1. The second column shows the state (whether at levels or in differenced form) a particular variable is taken for testing. The third and forth column show whether there is drift and trend in the data. Column 5 reveals the value of the estimated test statistic - ADF in case of Table 3 and PP in case of Table 2 along with the respective critical values at 5% level of significance in column 6. The seventh column of Table 1 shows the number of lags required to test the required equation suggested by Dickey & Fuller, whereas in case of Table 2, it is the truncation lag for PP statistic. On judging the null-hypothesis of unit roots, the next column states whether there is unit roots in levels, 1$^{st}$ differences and 2$^{nd}$ differences. The inference of the tests is portrayed in the last column by stating the order of integration required to make the series stationary.

As obtained from the tests, the variables ln(IOCR), M1/GDP, (M3-M1)/GDP, GB/TB, MF/I, DEV/GDP, ln(θ), CR/GDP, ΔCR/I, CRG/CRC, ln(S/Y), MR1, MR2, MR3, and BR are I(1) implying that they are stationary at 1$^{st}$ difference. SENSEX is I(2) implying that they need to be differenced twice in order to make it stationary. However, DD/TD and RM are stationary in levels. These results are confirmed by both the ADF and the PP tests for unit roots.

As most of the series contain unit roots by a formal testing procedure, we can conclude that our presumption that 'a simple OLS regression relating these variables is supposed to yield vague results' was correct. Having obtained unit roots in most of the variables we now propose to test for cointegration so as to obtain long-term relationships, if any, amongst the variables.

## FINANCIAL VARIABLES AND ECONOMIC EFFICIENCY

As stated earlier in equation [6] that economic efficiency can be captured by the variable IOCR. It has also been discussed that ln (IOCR) is supposed to depend on M3/GDP, GB/TB, MF/I and DEV/GDP. In the previous section we have seen that all of these variables contain unit roots and are integrated of order one. We now attempt a cointegration analysis amongst these variables.

## Cointegration Analysis

Given a group of non-stationary series, we are interested in determining whether the series are cointegrated, and if they are, in identifying the cointegrating (long-run equilibrium) relationships. We implement Vector Autoregression (VAR) - based cointegration tests using the methodology developed by Johansen (1991)to test the restrictions imposed by cointegration on the unrestricted VAR involving the series.

We have applied the Johansen test on the variables ln(IOCR), M3/GDP, GB/TB, MF/I and DEV/GDP all of which are I(1). Considering sufficient lags, the Johansen's approach for rank determination comprising of the summary of all 'deterministic trend assumptions' is run in EViews (option 6 – summarize all 5 sets of assumptions). It was obtained that the Rank was lowest when the test assumes for no deterministic trend in data, no intercept or trend in cointegrating equation (CE) or test vector autoregression (VAR). Hence, we run the Johansen test again with option 1 in EViews regarding assumption of deterministic trend. This results in 2cointegrating equations as indicated by the LR test at 5% level of significance. The results of the test with normalized cointegrating coefficients have been shown below. The numbers in parenthesis are the asymptotic standard errors (rounded off to three decimal places).

Cointegrating Equations (1 to 2)

$$CE(1): \quad \ln(IOCR)_t - \underset{(12.339)}{0.2503966}\frac{GB_t}{TB_t} + \underset{(147.1)}{38.26274}\frac{MF_t}{I_t} - \underset{(335.4)}{78.67115}\frac{DEV_t}{GDP_t}$$

$$CE(2): \quad \frac{M3_t}{GDP_t} + \underset{(8.872)}{1.671394}\frac{GB_t}{TB_t} - \underset{(105.8)}{27.92802}\frac{MF_t}{I_t} + \underset{(241.2)}{56.25306}\frac{DEV_t}{GDP_t}$$

## Vector Error Correction

When it is obtained that the variables are cointegrated, and three such cointegrating equations are reported by the Johansen's test, a simple 1st difference or 2nd difference of the series that are I(0) are not sufficient for obtaining a long run relationship. Instead, we have to modify the difference equation with the error correction terms. One of the common and simple ways to test cointegration is by making use of the Engle-Granger two step estimating procedure. We thus make use of a vector error correction (VEC) model which is a restricted VAR having cointegration restrictions (obtained from Johansen's test) built into its specification, so that it is designed for use with non-stationary series that are known to be cointegrated. In this model, we can write the VEC as follows:

$$\begin{aligned}\Delta \ln(IOCR)_t = {} & \alpha_1 \Delta \ln(IOCR)_{t-1} + \alpha_2 \Delta \ln(IOCR)_{t-2} + \alpha_3 \Delta \ln(IOCR)_{t-3} + \alpha_4 \Delta\left(\frac{M3}{GDP}\right)_{t-1} + \alpha_5 \Delta\left(\frac{M3}{GDP}\right)_{t-2} \\ & + \alpha_6 \Delta\left(\frac{M3}{GDP}\right)_{t-3} + \alpha_7 \Delta\left(\frac{GB}{TB}\right)_{t-1} + \alpha_8 \Delta\left(\frac{GB}{TB}\right)_{t-2} + \alpha_9 \Delta\left(\frac{GB}{TB}\right)_{t-3} + \alpha_{10} \Delta\left(\frac{MF}{I}\right)_{t-1} + \alpha_{11} \Delta\left(\frac{MF}{I}\right)_{t-2} \\ & + \alpha_{12} \Delta\left(\frac{MF}{I}\right)_{t-3} + \alpha_{13} \Delta\left(\frac{DEV}{GDP}\right)_{t-1} + \alpha_{14} \Delta\left(\frac{DEV}{GDP}\right)_{t-2} + \alpha_{15} \Delta\left(\frac{DEV}{GDP}\right)_{t-3} + \sum_{i=1}^{2} \lambda_i CE_{t-1}(i)\end{aligned}$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The results of the estimation of this VEC model have been tabulated in Table 3 shown below. It portrays the estimated coefficients of the respective variables along with their standard errors and t-statistics. The probability of the rejection of the null hypothesis for t-test is also shown in the last column. For a two-tail t-test, a probability value less than or equal to 0.05 is taken as evidence to reject the null hypothesis of a zero coefficient at 5% level of significance. To conduct a one-sided test, the appropriate probability is one-half of the critical value of the two-tail test. However, we consider only two-tail tests in our analysis.

The terms CE(1) and CE(2) at the beginning indicate the two cointegrating equations obtained from the Johansen's test shown above.

*Table 3. Estimation Results of VEC Model (FINANCIAL VARIABLES AND ECONOMIC EFFICIENCY)*

## Interpretation of Results

The Durbin-Watson statistic measuring the serial correlation in the residuals has been obtained to be **2.14** which is not at all far from 2. This suggests that there is no serial correlation. However, we also test for unit roots in the residuals and obtain that the ADF Test Statistic **-6.088** is less than its critical value **-1.952** at 5% level of significance. This confirms that there is no unit root or serial correlation in the residuals and the model can be used for predictive purposes. This also confirms the success of Vector Error Correction.

The probability of t-test, shown in the last column, indicates that only the variables Δ(GB/TB)and Δ(MF/I) along with their lags are significant. The probability values for all other variables are greater than 0.05 and hence it can be inferred that all other variables are insignificant because their null hypothesis of zero coefficients cannot be rejected.

Out of the significant variables mentioned, $\Delta(GB/TB)_{t-1}$, and $\Delta(GB/TB)_{t-2}$ and $\Delta(GB/TB)_{t-3}$have positive estimated coefficients. Unlike what has been stated by Fry(1988), an increase in the lagged ratios of Government Borrowing to Total Borrowing in Indiaenhances economic efficiency (proxied by IOCR). There might be various reasons for this type of behavior. Important among those are: (a) sometimes a deliberate financially repressed regime might enhance efficiency as has been found by Roubini&Sala-i-Martin (1992b), Benchivenga and Smith (1992), Stiglitz (1994) and Hellman (1994), and (b) the socialistic view of the govt. leads to heavy investment in infrastructure and core sectors which by virtue of linkage effects, enhances economic efficiency.

However, the variable $\Delta(MF/I)_{t-1}$and $\Delta(MF/I)_{t-1}$has significantly negative estimated coefficient. This means that rise in share of Mutual Fund investmentin total Investment retards economic efficiency. This is an interesting result because mutual fund houses are efficient enough in fund management but the present results might be due to the following reasons: (a) mutual fund investments are subject to market risks, (b) being an investor in the mutual fund market requires proper knowledge about investment options and adequate ability to decide between them, which in the Indian context is still not up to the mark, (c)

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the nature of investments – whether equity or debt – matters a lot as far as efficiency is concerned, and (d) most mutual fund companies are joint venture of foreign investment firms.

We also arrive at the result that the intermediation variablesM3/GDP and DEV/GDPcannot account for economic efficiency. This indicates inefficiency of the banking sector and the development financial institutions.

It should however be kept in mind that the significance of the variables we have discussed so far are basically about the short-run dynamics. The long-run relationships are given by the cointegrating equations stated earlier, both of which are statistically significant.

The R-squared ($R^2$) statistic, reported at the bottom of Table 3, was obtained to be **0.91**(approx). As $R^2$ is the fraction of the variance of the dependent variable explained by the independent variables and measures the success of the regression in predicting the values of the dependent variable within the sample, it can be stated that the explanatory variables considered in our analysis explains near about **91%** of the movement of the dependent variable. Though found that few variables significantly explain the dependent variable, all variables taken together jointly explain a major portion. The adjusted $R^2$, commonly denoted as $\bar{R}^2$, was estimated to be **0.81**(approx) indicating penalization(as $< R^2$) of the $R^2$ for the addition of regressors which do not contribute to the explanatory power of the model. Taking into consideration all the regressors, a handsome proportion of about **81%** is the goodness of fit.

The F-statistic and its probability are estimated to be **9.374** and **0.000041** respectively. As F-statistic tests the hypothesis that all of the slope coefficients (excluding the constant, or intercept) in a regression are zero, its probability value is the marginal significance level of the F-test. As in our analysis, the p-value is less than 0.05 (significance level 5%), and less than 0.01 (significance level 1%), we reject the null hypothesis that all slope coefficients are equal to zero implying that not all of our regressors are insignificant.

## FINANCIAL VARIABLES AND SAVING PROPENSITY CHANNELED TO INVESTMENT

Amount of Savings channeled to Investment can be captured by the variable ln(θ) as has been shown earlier in equation [6]. It has also been discussed that ln(θ) is supposed to depend on CR/GDP, (ΔCR/I), CRG/CRC and SENSEX. We have also obtained that SENSEX is integrated of order two and all other variables are integrated of order one. We now attempt a cointegration analysis amongst these variables. However, we exclude the variable SENSEX as differently integrated variables cannot be a part of cointegration analysis and differencing this variable to I(1) would fade its economic meaning.

### Cointegration Analysis

We have applied the Johansen test, exactly in the same fashion as done above on the variables ln(θ), CR/GDP, (ΔCR/I), and CRG/CRCall of which are I(1). Considering sufficient lags, the Johansen's approach for rank determination comprising of the summary of all 'deterministic trend assumptions' is run in EViews (option 6 – summarize all 5 sets of assumptions). It was obtained that the Rank was lowest when the test assumes for no deterministic trend in data, no intercept or trend in cointegrating equation (CE) or test vector autoregression (VAR). Hence, we run the Johansen test again with option 1 in EViews

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

regarding assumption of deterministic trend. This results in **1**cointegrating equation as indicated by the LR test at 5% level of significance. The results of the test with normalized cointegrating coefficients have been shown below. The numbers in parenthesis are the asymptotic standard errors (rounded off to three decimal places).

$$\text{Cointegrating Equation}$$

$$CE(1): \quad \ln(\theta)_t \underset{(6.578)}{-23.00775}\left(\frac{CR}{GDP}\right)_t \underset{(4.356)}{-6.463007}\left(\frac{\Delta CR}{I}\right)_t \underset{(1.463)}{+9.320606}\left(\frac{CRG}{CRC}\right)_t$$

## Vector Error Correction

When it is obtained that the variables are cointegrated, and two such cointegrating equations are reported by the Johansen's test, a simple 1st difference or 2nd difference of the series that are I(0) are not sufficient. Instead, we have to modify the difference equation with the error collection terms, i.e. we have to consider a VEC. One of the common and simple ways to test cointegration is by making use of the Engle-Granger two step estimating procedure. We thus make use of a vector error correction (VEC) model in the same procedure as done in earlier section which is a restricted VAR having cointegration restrictions (obtained from Johansen's test) built into its specification, so that it is designed for use with non-stationary series that are known to be cointegrated. The VEC specification used in this case is as under:

$$\begin{aligned}\Delta\ln(\theta)_t = {} & \alpha_1\Delta\ln(\theta)_{t-1} + \alpha_2\Delta\ln(\theta)_{t-2} + \alpha_3\Delta\ln(\theta)_{t-3} + \alpha_4\Delta\left(\frac{CR}{GDP}\right)_{t\text{-}1} + \alpha_5\Delta\left(\frac{CR}{GDP}\right)_{t\text{-}2} \\ & + \alpha_6\Delta\left(\frac{CR}{GDP}\right)_{t\text{-}2} + \alpha_7\Delta\left(\frac{\Delta CR}{I}\right)_{t\text{-}1} + \alpha_8\Delta\left(\frac{\Delta CR}{I}\right)_{t\text{-}2} + \alpha_9\Delta\left(\frac{\Delta CR}{I}\right)_{t\text{-}3} + \alpha_{10}\Delta\left(\frac{CRG}{CRC}\right)_{t\text{-}1} \\ & + \alpha_{11}\Delta\left(\frac{CRG}{CRC}\right)_{t\text{-}2} + \alpha_{12}\Delta\left(\frac{CRG}{CRC}\right)_{t\text{-}2} \lambda_1 CE_{t-1}\end{aligned}$$

The results of the estimation of this VEC model have been tabulated in Table 4 shown below. It portrays the estimated coefficients of the respective variables along with their standard errors and t-statistics. The probability of the rejection of the null hypothesis for t-test is obtained and the result of the test, i.e. whether the corresponding variable is significant or not is stated in the last column. For a two-tail t-test, a probability value less than or equal to 0.05 is taken as evidence to reject the null hypothesis of a zero coefficient at 5% level of significance. To conduct a one-sided test, the appropriate probability is one-half of the critical value of the two-tail test. However, we consider only two-tail tests in our analysis.

## Interpretation of Results

This Vector Error Correction model can be used for predictive purposes as PP Test Statistic **-5.523**of the residuals is less than its critical value **-1.952** at 5% level of significance. The significance of t-test, shown in the last column, indicates that only the variable $\Delta(\text{CR/GDP})_{t\text{-}2}$is significant. All other variables, except for the error correction terms, are insignificant because their null hypothesis of zero coefficients cannot be rejected.

| $\Delta\left(\Delta CR/I\right)_{t-1}$ | 1.702432 | -3.52612 | -0.48281 | |
| $\Delta\left(\Delta CR/I\right)_{t-2}$ | -5.019508 | -3.68857 | -1.32083 | |
| $\Delta\left(\Delta CR/I\right)_{t-3}$ | -2.529012 | -2.65716 | -0.95177 | |
| $\Delta\left(CRG/CRC\right)_{t-1}$ | 1.342104 | -1.91497 | -0.70085 | |
| $\Delta\left(CRG/CRC\right)_{t-2}$ | -0.339486 | -1.65389 | -0.20527 | |
| $\Delta\left(CRG/CRC\right)_{t-3}$ | 0.638226 | -1.55379 | -0.41076 | |
| R-squared | 0.413650 | Mean dependent var | | 0.011354 |
| Adjusted R-squared | 0.061841 | S.D. dependent var | | 0.268309 |
| S.E. of regression | 0.259880 | Akaike info criterion | | 0.429911 |
| Sum squared resid | 1.350753 | Schwarz criterion | | 1.019444 |
| Log likelihood | 5.906476 | F-statistic | | 1.175779 |
| Durbin-Watson stat | 2.069439 | Prob(F-statistic) | | 0.361698 |

However, the variable $\Delta(CR/GDP)_{t-2}$ has significantly positive estimated coefficient. This means that rise in ratio of real credittoGDPraises the amount of savings channeled to investment. However, it should be noted that though real credit when considered with respect to GDP raises saving-investment ratio, it actually has adverse effect when taken with respect to total investments. It implies that increase in credit

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

from formal institutions is good but increase in dominance of such institutions is bad. It follows that a change in financial structure, regime or nature of financial liberalization might have a positive effect.

Apart from the short-run dynamics, the long-run relationship stated by the significant cointegrating equation states that the proportion of GDP given as credit to the private sector CR/GDP and the proportion of investment financed through credit flows from formal financial institutions$\Delta$CR/I enhance the proportion of savings channeled to investment. However, unlike the short-run where it is insignificant;the ratio of credit given to the govt. and to the commercial sector CRG/CRC has a long run negative impact.

The R-squared ($R^2$) statistic, reported at the bottom of Table 4, was obtained to be **0.41**(approx) and the adjusted $R^2$was estimated to be **0.06**(approx) indicating penalization (as $< R^2$) of the $R^2$ for the addition of regressors which do not contribute to the explanatory power of the model.

## FINANCIAL VARIABLES AND SAVINGS RATE

The rate of savings or average savings propensity is captured by the variable'**s**' as has been shown earlier in equation [6]. It has also been discussed that '**s'** is supposed to depend on money market variables MR1, MR2, MR3 & RM and bond market return BR. We have also obtained by the Augmented Dickey-Fuller test and the Philips-Peron test that RM is integrated of order zero and all other variables are integrated of order one. We now attempt a cointegration analysis amongst the I(1) variables. RM is excluded because it is a I(0) process and cointegration analysis cannot be performed when variables are integrated of different order. Moreover, differencing of certain variables done to match the order of integration, sometimes erode their economic meaning.

### Cointegration Analysis

We have applied the Johansen test on the aforementioned variables exactly in the same fashion as discussed earlier. Considering sufficient lags, the Johansen's approach for rank determination comprising of the summary of all 'deterministic trend assumptions' is run in EViews (option 6 – summarize all 5 sets of assumptions). It was obtained that the Rank was lowest when the test assumes for no deterministic trend in data, no intercept or trend in cointegrating equation (CE) or test vector autoregression (VAR). Hence, we run the Johansen test again with option 1 in EViews regarding assumption of deterministic trend. This results in **2**cointegrating equation as indicated by the LR test at 5% level of significance. The results of the test with normalized cointegrating coefficients have been shown below. The numbers in parenthesis are the asymptotic standard errors (rounded off to three decimal places).

Cointegrating Equations (1 and 2)

$$CE(1): \quad \underset{}{\ln(s)_t} + \underset{(0.261)}{1.041523}\left(MR2\right)_t - \underset{(0.115)}{1.100612}\left(MR3\right)_t - \underset{(0.091)}{0.130488}\left(BR\right)_t$$

$$CE(2): \quad \underset{}{(MR1)_t} - \underset{(0.001)}{0.009590}\left(MR2\right)_t - \underset{(6.921)}{9.240015}\left(MR3\right)_t - \underset{(4.105)}{0.000279}\left(BR\right)_t$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Vector Error Correction

We employ the Engle-Granger two step estimating procedure in a vector error correction (VEC) model which is a restricted VAR having cointegration restrictions (obtained from Johansen's test) built into its specification, so that it is designed for use with non-stationary series that are known to be cointegrated. The VEC specification used in this case is as under:

$$\begin{aligned}\Delta \ln(s)_t = {} & \alpha_1 \Delta \ln(s)_{t-1} + \alpha_2 \Delta \ln(s)_{t-2} + \alpha_3 \Delta \ln(s)_{t-3} + \alpha_4 \Delta \left(MR1\right)_{t\text{-}1} + \alpha_5 \Delta \left(MR1\right)_{t\text{-}2} + \alpha_6 \Delta \left(MR1\right)_{t\text{-}3} \\ & + \alpha_7 \Delta \left(MR2\right)_{t\text{-}1} + \alpha_8 \Delta \left(MR2\right)_{t\text{-}2} + \alpha_9 \Delta \left(MR2\right)_{t\text{-}3} + \alpha_{10} \Delta \left(MR3\right)_{t\text{-}1} + \alpha_{11} \Delta \left(MR3\right)_{t\text{-}2} + \alpha_{12} \Delta \left(MR3\right)_{t\text{-}3} \\ & + \alpha_{13} \Delta \left(BR\right)_{t\text{-}1} + \alpha_{14} \Delta \left(BR\right)_{t\text{-}2} + \alpha_{15} \Delta \left(BR\right)_{t\text{-}3} + \sum_{i=1}^{2} \lambda_i CE_{t-1}(i)\end{aligned}$$

The results of the estimation of this VEC model have been tabulated in Table 5 shown below. It portrays the estimated coefficients of the respective variables along with their standard errors and t-statistics. The probability of the rejection of the null hypothesis for t-test is obtained and the result of the test, i.e. whether the corresponding variable is significant or not is stated in the last column. We have considered a two-tail test in our analysis. However, to conduct a one-sided test, the appropriate probability one-half of the critical value of the two-tail test can be taken.

## Interpretation of Results

When tested for unit roots in the residuals, PP Test Statistic **-6.131** is less than its critical value **-1.952** at 5% level of significance. This confirms that there is no unit root or serial correlation in the residuals and the model can be used for predictive purposes. Moreover, the Durbin Watson statistic is very close to 2 which also confirm the success of Vector Error Correction.

The significance of t-test, shown in the last column, indicates that only the variables $\Delta(\text{MR2})_{\text{t-1}}$and $\Delta(\text{MR3})_{\text{t-1}}$ are significant. All other variables, except for the error correction terms, are insignificant because their null hypothesis of zero coefficients cannot be rejected.

The significantly negative estimated coefficient of $\Delta(\text{MR2})_{\text{t-1}}$implies that a rise in the money market short period deposit rate leads to a decrease in the savings rate. Whereas, the long term deposit rate $\Delta(\text{MR3})_{\text{t-1}}$does increases the savings rate of Indian investors. This behavior of the Indian savers' might be due to the fact that long-term investments provide various kinds of tax rebates.

The bond market returns do not have any significant impact on the savings rate. This shows that changes in the returns on govt. bond do not affect the savings rate. This might be due to various causes. Two among those are: (a) the Indian savers prefer govt. bonds not because of its return but because of the trustworthiness of the govt., (b) there are very few alternative than to invest in govt. bonds despite low returns for most of the period considered in this analysis.

The long-run relationships shown by the cointegrating equations state that mid-term and long-term interest rates behave similar to that of their short-run behavior. However, we can observe that the bond market return raises the savings rate in the long-run.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The R-squared ($R^2$) statistic, reported at the bottom of Table 5, was obtained to be **0.61**(approx)and the adjusted $R^2$was estimated to be **0.23**(approx) indicating that about 61% of the variation in the dependent variable could be explained by the independent variables.

## FINANCIAL SECTOR AND ECONOMIC GROWTH

Economic Growth [**g**] has been argued to depend on economic efficiency [**ln(IOCR)**], savings channeled to investment [**ln(θ)**] and savings rate [**ln(s)**] as has been shown earlier in equation [6]. It has been obtained that ln(IOCR) significantly depends on **GB/TB**and**MF/I**, ln(θ) significantly dependsonly on **CR/GDP** and ln(s) significantly depends on **MR1** and**MR2**. We now attempt a cointegration analysis amalgamating the all the types of significant variables into the growth equation.

### Cointegration Analysis

We have applied a similar Johansen's test discussed earlier and EViewsreported that there is no deterministic linear trend in data, and no intercept or trend in cointegrating equation (CE) or test vector autoregression (VAR). Hence, we run the Johansen test again with option 1 in EViews regarding assumption of deterministic trend which results in **4**cointegrating equations shown below. The numbers in parenthesis are the asymptotic standard errors (rounded off to three decimal places).

Cointegrating Equations (1 and 4)

$$CE(1): \quad g_t + \underset{(0.056)}{0.221826}\left(MR3\right)_t - \underset{(3.872)}{45.69109}\left(\frac{CR}{GDP}\right)_t$$

$$CE(2): \quad \left(\frac{GB}{TB}\right)_t - \underset{(0.008)}{0.055072}\left(MR3\right)_t + \underset{(0.537)}{0.884274}\left(\frac{CR}{GDP}\right)_t$$

$$CE(3): \quad \left(\frac{MF}{I}\right)_t + \underset{(0.002)}{0.006539}\left(MR3\right)_t - \underset{(0.134)}{0.521436}\left(\frac{CR}{GDP}\right)_t$$

$$CE(4): \quad \left(MR2\right)_t - \underset{(0.041)}{0.701538}\left(MR3\right)_t - \underset{(2.747)}{12.51573}\left(\frac{CR}{GDP}\right)_t$$

These cointegrating equations portray long-run relationship amongst the variables which we tabulate as under to depict the type and significance of the relation of explanatory variables with the dependent variable '**g**'. The order of the explanatory variables in the Johansen's cointegrating test has been changed each time so that we obtain cointegrating equations of the dependent variable **g** with each of the independent variables. The following Table 6 portrays the results of such estimation. It portrays the estimated coefficients of the respective variables along with their standard errors. The t-statistics has been calculated and a null hypothesis of zero coefficients has been compared with the critical values and stated in the last column. We have considered a two-tail test in our analysis. However, to conduct a one-sided test, the appropriate probability one-half of the critical value of the two-tail test can be taken.

*Table 6. Results of Cointegration Analysis*

| Variable | Coefficients | Standard Errors | t - Statistic | Significant? |
|---|---|---|---|---|
| $(^{GB}/_{TB})_t$ | 7.98466 | -1.13077 | 7.0612591 | Yes |
| $(^{MF}/_{I})_t$ | 101.1663 | -33.9758 | 2.9775988 | Yes |
| $(MRi2)_t$ | -2.782925 | -0.73406 | -3.7911411 | Yes |
| $(MR3)_t$ | 3.650692 | -0.83371 | 4.3788512 | Yes |
| $(^{CR}/_{GDP})_t$ | 45.69109 | 3.872 | -11.800385 | Yes |

## Vector Error Correction

The specification obtained on incorporating the cointegrating equations reported by the Johansen's test into a vector error correction (VEC) model in the same procedure as done earlier is as follows:

$$\Delta g_t = \sum_{i=1}^{4} \lambda_i CE_{t-1}(i) + \alpha_1 \Delta g_{t-1} + \alpha_2 \Delta g_{t-2} + \alpha_3 \Delta g_{t-3} + \alpha_3 \Delta \left(\frac{GB}{TB}\right)_{t-1} + \alpha_3 \Delta \left(\frac{GB}{TB}\right)_{t-2} + \alpha_3 \Delta \left(\frac{GB}{TB}\right)_{t-3}$$
$$+\Delta\alpha_4 \left(\frac{MF}{I}\right)_{t-1} + \Delta\alpha_4 \left(\frac{MF}{I}\right)_{t-2} + \Delta\alpha_4 \left(\frac{MF}{I}\right)_{t-3} + \Delta\alpha_4 \left(MR2\right)_{t-1} + \Delta\alpha_4 \left(MR2\right)_{t-2} + \Delta\alpha_4 \left(MR2\right)_{t-3}$$
$$+\Delta\alpha_4 \left(MR3\right)_{t-1} + \Delta\alpha_4 \left(MR3\right)_{t-2} + \Delta\alpha_4 \left(MR3\right)_{t-3} + \Delta\alpha_4 \left(\frac{CR}{GDP}\right)_{t-1} + \Delta\alpha_4 \left(\frac{CR}{GDP}\right)_{t-2} + \Delta\alpha_4 \left(\frac{CR}{GDP}\right)_{t-3}$$
$$+\alpha_9 \left(DUMMY\right)_t$$

The results of the estimation of this VEC model have been tabulated in Table 7 shown below. It portrays the estimated coefficients of the respective variables along with their standard errors and t-statistics. The probability of the rejection of the null hypothesis for t-test is obtained and the result of the test, i.e. whether the corresponding variable is significant or not is stated in the last column.

## Interpretation of Results

When tested for unit roots in the residuals, PP Test Statistic **-5.821** was found to be less than its critical value **-1.952** at 5% level of significance confirming that there is no unit root or serial correlation in the residuals and the model can be used for predictive purposes. The Durbin-Watson statistic which is very close to **2.0** also confirms the success of Vector Error Correction. The significance of t-test, shown in the last column, indicates that all the variables in some of its lag are significant.

Though we had obtained that the ratio of government borrowing to total borrowing enhances economic efficiency, it fails to have a positive short-run impact on the growth rate as a financially repressed regime might enhance efficiency and provide immediate relief to the government, but actually hampers growth as has been stated by Roubini & Sala-i-Martin (1992a). However, govt. borrowing in the long-run has a positive (see table 3.6) impact on the rate of economic growth as govt. projects are believed to have long gestation lags and due to the fact that govt. borrows mainly for infrastructure and heavy industries which takes long time to fruit. This also validates the propositions of Fry (1988) and McKinnon (1973) but adds that such propositions are true only in the short-run as far as India is concerned.

It was obtained that the proportion of mutual fund investments to total investment has a positive significant impact on the growth rate both in the short-run and in the long-run because mutual fund companies have greater technical expertise and better handle asymmetric information which is very much persistent in India.

The significantly negative estimated coefficients of $\Delta(MR2)_{t-1}$ and $\Delta(MR2)_{t-1}$ imply that a rise in the money market short period deposit rate leads to a decrease in the growth rate and a rise in the long term deposit rate $\Delta(MR3)_{t-1}$ increases the growth rate. This behavior of the Indian savers' might be due to the fact that short-term investments are highly liquid and any premature sale of these assets imply heavy cutback in their yield. The consumers' choice is between 'low-yield-liquid-investment' and 'high-yield-illiquid-investment'. When short-period deposit rate rises, people prefer short-term investments for which the yields are low and hence growth hampers. However, when the long-period interest rate rises, people prefer long-term investment which raises the rate of growth being of high-yield variety. This result is in accordance with what was stated by Levine (1991).

The variable CR/GDP has significantly negative estimated coefficient. This means that rise in the proportion of real credit to the private sector as a proportion of GDP reduces the rate of growth though it was found earlier that it significantly enhanced the amount of savings channeled to investment. This shows that the private sector can effectively channel savings to investment but such investments cannot effectively raise the short-run economic growth rate. However, it is also found that CR/GDP has a significantly positive relationship with the economic growth rate in the long-run.

We also arrive at the result that the DUMMY variable, formulated to test for a structural break in 1991-92, has a significant coefficient. It proves the success of the financial reforms taken during 1991-92.

The R-squared ($R^2$) statistic, reported at the bottom of Table 7, was obtained to be **0.96** (approx) implying that the explanatory variables considered in our analysis explains near about **96%** of the movement of the dependent variable. The adjusted $R^2$ was estimated to be **0.88** (approx) indicating penalization (as $< R^2$) of the $R^2$ for the addition of regressors which do not contribute to the explanatory power of the model but still explains a huge proportion.

## CONCLUSION

In this chapter we have explored whether the real sector is affected by the financial sector in India.We posit that financial variables may influence growth either by changing the quantity of investible resources of by affecting the efficiency of utilization of a given quantity of resources or both, of which the former can either be through change in the amount of savings channeled to investment or change in the rate of savings. Hence, we have considered 3 sets of financial variables according to the nature of influence stated above. We have then attempted a time-series econometric analysis amongst the various sets of explanatory variables and each of the aforementioned indicators (components) of growth. We have then regressed growth on the significant of the explanatory variables.

The ratio of government borrowing to total borrowing enhances economic efficiency and long-run growth rate but fails to have a positive short-run impact. This result totally walks away from the propositions of Fry (1988) and McKinnon (1973) and shows that such relationships are not true at least in the context of India.

It was obtained that the proportion of mutual fund investments to total investment has a positive significant impact on the growth rate both in the short-run and in the long-run.

The short period deposit rate has a negative impact on the growth rate and the long term deposit rate has a positive impact. This result is in accordance with what was stated by Levine (1991). It follows that promoting long-term investment and its interest rate certainly can boost real growth.

The proportion of real credit to the private sector as a proportion of GDP needs some time to enhance real growth as it was found to enhance growth only in the long-run. That is, the private sector might look for own profits in the short-run but certainly helps the nation grow by its linkage effects.

The DUMMY variable, formulated to test for a structural break in 1991-92, has a significant coefficient and proves the success of the financial reforms taken during 1991-92.

However, financial intermediation variables, generally supposed to enhance economic efficiency and growth, were found to impart no impact on both efficiency and growth.

Finally, we have obtained that the financial sector variables, which account for financial infrastructure, can explain near about 96% of the changes in real economic growth in India, which is an excellent goodness of fit. To conclude we can say that the development of the financial sector helps the Indian real sector grow both in the short-run and in the long-run but unlike contemporary literature that prescribes diminished role, our study suggests a greater role of the govt. to ensure long-run economic growth.

## KEY TERMS AND DEFINITIONS

**Causality:** *Causality* (also referred to as causation, or cause and effect) is the agency or efficacy that connects one process (the cause) with another process or state (the effect), where the first is understood to be partly responsible for the second, and the second is dependent on the first.

**Cointegration:** Cointegration is a statistical property possessed by some time series data that is defined by the concepts of stationarity and the order of integration of the series. A stationary series is one with a mean value which will not vary with the sampling period.

**Econometric Investigation:** Investigating causal relations by econometric models.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Economic Efficiency:** A broad term that implies an *economic* state in which every resource is optimally allocated to serve each person in the best way while minimizing waste and inefficiency. When an *economy* is economically *efficient*, any changes made to assist one person would harm another.

**Economic Growth:** Increase in the inflation-adjusted market value of the goods and services produced by an *economy* over time. It is conventionally measured as the percent rate of increase in real gross domestic product, or real GDP, usually in per capita terms.

**Financial Infrastructure:** The underlying foundation for the *financial* system including the institutions, information, technologies and rules and standards which enable *financial* activities including financial intermediation.

**Incremental Output-Capital Ratio:** The *incremental capital output ratio* (ICOR) is a metric that assesses the marginal amount of investment *capital* necessary for an entity to generate the next unit of *production*. Overall, a higher ICOR value is not preferred because it *indicates* that the entity's *production* is inefficient.

**Unit Roots:** A *unit root* test is a statistical test for the proposition that in a autoregressive statistical model of a time series, the autoregressive parameter is one.

**Vector Error Correction:** A vector error correction (VEC) model is a restricted VAR that has cointegration restrictions built into the specification, so that it is designed for use with nonstationary series that are known to be cointegrated.

# Chapter 14
# Tourism-Led Growth Hypothesis and Foreign Direct Investment in ASEAN

**Praopan Pratoomchat**
*Bates College, USA*

## ABSTRACT

*This study tests the relationships of visitor spending, foreign direct investment in the tourism sector, and the gross domestic product (GDP) per capita among members of the Association of Southeast Asian Nations (ASEAN) during the period of 1988 to 2011 to prove the tourism-led growth hypothesis. The results of panel regression show that tourism-led growth hypothesis is valid for the ASEAN countries. Factors determining the GDP per capita in these countries are visitor spending, foreign investment and government consumption in tourism sector, human capital and trade openness. The results from this study suggest that the governments of the ASEAN countries are able to have effective growth policies by encouraging foreign direct investment in the tourism sector and improving their human capital. Therefore, ASEAN Economic Community (AEC) which will strengthen and facilitate investment cooperation and human capital developments in the tourism sector among ASEAN countries will have a significant benefit to economic growth in the region.*

## INTRODUCTION

Tourism is one of the world's fastest growing industries. It is an agglomeration of many activities: transportation, accommodation, the restaurant industry, the entertainment industry, sports and recreation, and other activities that support the demand derived from tourists. Tourism requires strong support from financial facilities, telecommunication services, and other environmental factors to determine visitor demand. Players in the industry range from small-scale businesses to transnational corporations (TNCs).

In developing countries, the tourism industry has become a major source of foreign exchange revenues. It generates jobs and promotes economic diversification. It can generate spillover effects: further investments, jobs, and growth in other sectors of the economy. However, since the tourism sector

depends largely on the demand of foreign visitors, it is sensitive to external shocks, whether economic, environmental, or political. Wages in the tourism sector are considered relatively low, and jobs in this sector are considered labor intensive. The tourism sector is sometimes called a pro-poor industry. It can be associated with criminal activities such as sex tourism. With all the positive and negative effects, a country has to carefully consider the net benefits before making a decision to support the expansion of tourism. A fine balance needs to be maintained in order for developing countries to capture the benefits of this growing economic activity at minimum or sustainable costs (UNCTAD, 2007).

By 2015, Association of Southeast Asian Nations (ASEAN) aim to establish the ASEAN Economic Community (AEC), a security, economic and socio-cultural community of over 600 million people which will account for nearly 5% of world GDP (World Economic Forum, 2012). The Southeast Asian region endowment for tourism includes a wealth of cultural heritage and nature. It possesses a long tradition of tourism and locates in the heart of Asia. They have been joining forces to address travel and tourism–related issues, which greatly benefit from regional cooperation, such as promotion and marketing, connectivity, environment protection, visa policies and mobility, and sector liberalization. The ASEAN member have reached agreements on several aspects. If the AEC makes ASEAN members a stronger connection through market liberalization and factor of production flows, there are a significant opportunity for travel and tourism sector to grow from both inside and outside the region.

Because most countries in Southeast Asia are in the developing country group, there are some gap of investment and saving represented by problems of infrastructure and financial resources. Domestic capital is not sufficient to facilitate a growing sector such as tourism. Also there is little recent literature on FDI and tourism in developing countries, particularly from the empirical perspective (UNCTAD, 2007) and little evidence of either mapping of FDI in the tourism industry or the economic impact of FDI in the tourism industry. The impact of FDI varies according to the specific country and the historical context. UNCTAD (2007) finds that the impact depends upon the host country's level of economic and human development, including the extent to which it can leverage the presence of TNCs to foster domestic enterprise. This ability is related to host countries' absorptive and productive capacities. Another factor influencing the impact of FDI is the motivation and corporate strategy. The main questions in this study are whether FDI in the tourism sector strongly contributes to economic growth in the country, what are directions of causality among FDI in tourism sector, tourist spending, human capital index, exchange rate, trade openness, government consumption in tourism sector and economic growth in the country and is the tourism-led growth hypothesis valid in Southeast Asia.

This paper evaluates the causality and long-run relationship of international tourist spending, FDI in tourism industry, and economic growth in ASEAN countries using the panel co-integration approach and causality test then proves the tourism-led growth hypothesis using FDI as one of the main variables. The study estimates the relationship among expansion in the tourism sector (visitor spending), FDI in tourism industry, and the GDP per capita in the case of members of the Association of Southeast Asian Nations (ASEAN) during 1988-2011. The method used in the study is ordinary least square analysis. The results show that the FDI in the tourism industry has a significant role in the GDP per capita in the Southeast Asian region. Other factors determining the GDP per capita in these countries are human capital, trade openness, and government consumption per output. The results from this study confirm the tourism-led growth hypothesis and indicate that the governments of ASEAN countries are able to have an effective growth policy through the tourism sector using the promotion of tourism FDI.

## DEFINITION OF TOURISM AND ITS ECONOMIC IMPACTS

The World Tourism Organization defines travel and tourism as follows:

*Traveling to and staying in places outside their usual environment for not more than one consecutive year for leisure, business and other purposes. (World Tourism Organization, 1995, p.10).*

The first tier of the tourism industry definition includes enterprises that are directly involved in the production and consumption of tourism services. The second tier is called "tourism economy." It involves people and firms that indirectly participate. Tourism industry does not appear as a formal industry in the national account systems. Therefore, it has been a difficult task to collect the data and quantify the size of the industry since some tourism-related activities fall into categories of other formal industries. For example, hotels and restaurants are counted in the construction industry. WTO-OECD-Eurostat Inter-secretariat Working Group has developed tourism satellite account (TSA). TSA was endorsed by the Statistical Commission of the United Nations in 2000 (UNCTAD, 2007). TSA adopts the basic system of concepts, classifications, definitions, tables, and aggregate systems of national accounts 2008 (NSA, 2008), the international standard for a systematic summary of national economic activity, from a functional perspective. There are 12 national account industries, all of which are in the service sector, with half related to transportation.

According to the World Travel & Tourism Council, this study categorizes the impact of the tourism sector on the economy as direct or indirect impacts. Direct impacts are from the industries that deal directly with tourists, including hotels, travel agents, airlines and other passenger transportation services, as well as the activities of restaurant and leisure industries that deal directly with tourists. Direct impact is equivalent to total internal travel and tourism spending within a country less the purchases made by those industries (including imports). Indirect and induced impacts include three factors: capital investment by all industries directly involved in travel and tourism, government collective spending in support of tourism activity, and supply-chain effects, which include purchases of domestic goods and services directly by different industries within travel and tourism as input to their final tourism output. The induced contribution to GDP is the boarder contribution to GDP and employment of spending by those who are directly or indirectly employed by the travel and tourism industry.

The World Travel & Tourism Council and World Tourism Organization emphasized three roles of tourism. Firstly, tourism benefits through the creation of sustainable enterprises and decent jobs, provides the necessary security for millions of people worldwide. Secondly, it is a major source of foreign exchange which is needed for developing countries' development. Finally, tourism is increasingly interconnected with environmental sustainability (Chheang, 2013). Environmentally responsible tourism is one of the new growth poles of the 'green economy', providing sustainable infrastructure, business opportunities and jobs and income (World Tourism Organization, 2012).

## FACTS AND FIGURES OF TOURISM AND FDI IN SOUTHEAST ASIA

Tourism is a part of the service sector, which has an increasing share in the GDP component of the ASEAN countries. In 2012, the service sector accounted for the highest share of GDP in eight ASEAN member states, whereas in 2008, it was the main source of national income in only six ASEAN coun-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

tries (ASEAN Secretariat, 2013). Therefore, the service sector has become the main driver of growth. Strong support of the tourism-led growth hypothesis can lead to effective growth policy implications. The ASEAN tourism industry has played a significant role in the economic growth of the region. Tourists are attracted to ASEAN countries because of the culture and history, the good weather, and the natural beauty of the region. It is interesting to speculate how much the tourism industry affects overall economic growth in this region. The Asia Pacific is one of the most dynamic regions which attract both domestic and international tourists from all over the world (Chheang, 2013). It is estimated by the World Tourism Organization that the Asia Pacific region will be the world's second-most important tourist destination after Europe in 2020.

Up until early 1980s, ASEAN relied largely on agriculture and the export of primary products as a foreign exchange receipts. The global economic recession after the oil crisis in 1970s forced the government in ASEAN to find a new source of foreign exchange. Tourism had become a key industry in the exports to earn foreign exchanges.

The World Economic Forum (2012) had measured the travel and tourism competitiveness index (TTCI) in collaboration with expert from the sector. Their framework aims to measure the factors and policies that make it attractive to develop the travel and tourism sector in different countries (World Economic Forum, 2012, pp.vii). They used three subindexes to measure including regulatory framework, business environment and infrastructure, and the human cultural and natural resources. Singapore has the highest rank, followed by Malaysia, Thailand, Brunei, Indonesia, Vietnam, the Philippines, and Cambodia. The government prioritization of travel and tourism is a significant strength shared by the most ASEAN countries. Also, the region's affordability is also considered a major reason why a lot of visitors decide to travel to ASEAN countries. On the other hand, the World Economic Forum's study revealed that major challenges for ASEAN countries for travel and tourism are inadequate infrastructure, poor public health situation and environmental stewardship. The governments experience the challenge of balancing the socio-economic interest of different stakeholders.

## Economic Contribution of Tourism in Southeast Asia

With respect to tourism statistics in ASEAN, tourist per capita or tourist spending in ASEAN is presented in Table 1, calculated using total tourism receipts (Current $US) per number of tourist arrivals. In 2012, three countries with the highest tourist spending per capita among ASEAN countries were Singapore, Thailand, and Brunei. The countries with lowest tourist spending per capita were Laos, Cambodia, and Myanmar. The overall trend of tourist spending per capita fluctuated from 1995 to 2012. In Lao, Malaysia, Myanmar, Thailand, and Singapore, tourist spending per capita dropped in 2005 compared to 1995 figures and picked up again in 2012. In Brunei, the Philippines, and Vietnam, tourist spending per capita increased in the 17-year period. In Cambodia, the trend increased in 2005 and then slightly dropped in 2012.

For the number of international arrivals, ASEAN is expected to receive approximately 107 million international tourists in 2015. ASEAN tourism is strongly linked with Northeast Asian countries like China, Japan and South Korea which are very important market for Southeast Asia. Malaysia, Thailand, and Singapore had the highest number of visitors in 2012. The highest growth in number of international arrivals was in Lao in 2012 at 21.8.45% compared to the number in 2005. Cambodia's visitors in 2005 compared to 1995 increased by 546.36%. In 2012, the number of international arrivals in Cambodia increased 152.04% compared to the number in 1995. Vietnam is another country with high growth in the number of visitors. In 2005, there was a 157.36% increase compared with 1995 and a 96.95% in-

*Table 2. Number of international tourist arrivals (Person)*

| | 1995 | 2005 | 2012 |
|---|---|---|---|
| Brunei | N/A | 126,000 | 209,000 |
| Cambodia | 220,000 | 1,422,000 | 3,584,000 |
| Indonesia | 4,324,000 | 5,002,000 | 8,044,000 |
| Laos | 60,000 | 672,000 | 2,140,000 |
| Malaysia | 7,469,000 | 16,431,000 | 25,033,000 |
| Myanmar | 117,000 | 232,000 | 593,000 |
| The Philippines | 1,760,000 | 2,623,000 | 4,273,000 |
| Thailand | 6,952,000 | 11,567,000 | 22,354,000 |
| Singapore | 6,070,000 | 7,079,000 | 11,098,000 |
| Vietnam | 1,351,000 | 3,477,000 | 6,848,000 |

Source: World Travel and Tourism Council (2015)

crease in 2012 compared with 2005. Myanmar in 2012, compared with 2005, had a significant increase of 155.60%. Among other countries in ASEAN, the number of international visitors also has increased substantially during the 17 years.

From the outstanding performance of the tourism industry in ASEAN, we can see that it has been expanding for almost two decades. Since the tourism sector is becoming a great player in the GDP of ASEAN countries, research on the relationship between the performance of the tourism sector and GDP can provide crucial information for policy formulation and strategic planning by ASEAN governments, as well as tourism businesses. This study estimates the relationship between GDP per capita in nine countries that were members of ASEAN from 1995 to 2011 using dynamic panel data analysis. The results confirm that the better performance of the tourism industry led to higher GDP per capita in these countries. Other significant factors determining GDP per capita in this model are human capital, government consumption share, and trade openness.

Visitors generate important service exports revenues for Southeast Asian countries. In 2014, visitor exports generated $112.0 billion or 7.1% of total exports. This is forecast to grow by 4.2% in 2015 and by 5.7% from 2015 to 2025.

The total GDP contribution of travel and tourism to GDP in Southeast Asian countries was $291 billion or 12% of GDP in 2014, which includes both direct and indirect contributions. The direct contribution of travel and tourism to GDP in Southeast Asian countries was 4.8% of GDP in 2014, and is forecast to rise by 5.0% in 2015 and by 5.4% from 2015 to 2025, to $209.4 billion in 2025 (WTTC, 2015). Of 12 regions in the world, Southeast Asia has the second fastest growth rate. The total contribution of travel and tourism to employment, including jobs indirectly supported by the industry, was 9.7% of total employment (29,358,000 jobs). This contribution is expected to rise by 2.9% in 2015 to 30,196,000 jobs and by 2.7% to 39,227,000 jobs in 2025 (11% of total).

## Tourism FDI in Southeast Asia

Strong macroeconomic fundamentals, improved policy environment and greater regional market prospects in ASEAN have increased foreign investors' confidence. In 2013, ASEAN attracted $122 billion, accounting for 8% of the global FDI (ASEAN and UNCTAD, 2014). ASEAN member states also increase their investment inside the region (17% of total FDI inflows).

According to Table 4 total net inflows of ASEAN in 2014 was $136,181.4 million. Singapore had the highest total net inflow share of 53% of all ASEAN countries, followed by Indonesia, Thailand and Malaysia. Most of net inflow to Singapore was from outside of ASEAN while Indonesia had the highest share of Intra-ASEAN inflows. Since Southeast Asian countries have diverse levels of development, the effects from FDI are different by country. Singapore is the only developed country in the region. Malaysia is in the upper-middle income group. Thailand, the Philippines, and Indonesia share middle-income status, but other countries in this region are in the lower-income group.

According to UNCTAD's World Investment Report (UNCTAD, 2012), FDI in service sector and primary sector rebounded in 2011 after falling sharply in 2009 and 2010, at the expense of manufacturing sector. Developing Asia remains the world's largest recipient region of FDI inflows (UNCTAD, 2014). Service has the largest share of announced green field project and mergers and acquisition (M&A) deals. However, FDI growth in ASEAN has been slowing down due to some economic situations. Indonesia got affected from financial turmoil in mid-2013. Malaysia's inflows has increased in 2014 by 22% as a result in rising FDI in services (UNCTAD, 2014). Thailand's political instability has discouraged a lot of FDI inflows especially from Japanese investors. ASEAN's low income economies inflows varied. Myanmar's inflows increased in 2014 by 17% (UNCTAD, 2014) while Cambodia, Vietnam and Lao's inflows are fairly constant.

The perception of the expanding tourism industry leads to misconceptions about the trend in tourism FDI. UNCTAD (2007) finds that FDI in tourism is still rather low in both developed and developing countries compared to FDI in other sectors. UNCTAD (2007) noted that this is partly because tourism-related FDI is concentrated in just a few of many related activities covered by the definition of tourism, mostly hotels and restaurants and car rentals. On the basis of the UNCTAD research, FDI and TNC presence is concentrated in a handful of 12 classified activities, including hotels, restaurants, second homes, travel agencies, cultural services, sports and recreational services, and all modes of passenger transportation services. Although the absolute value of FDI is low, it can be very important to the host economies.

Asia is a growing destination for tourism industry investors. Greenfield investments are the most common form of investment. Global data on green field investments in foreign hotels show that South, East, and Southeast Asia were the top regions in which the hotel TNCs planned to expand their investment during the period of 2006-2011 (UNCTAD, 2007). Travel and tourism investment in Southeast Asian countries in 2014 was $49.0 billion or 7.4% of total investment. It should rise by 5.8% in 2015 and by 6.4% over the next 10 years to $96.4 billion in 2025 or 8.1% of total investment.

FDI in Tourism of Southeast Asia is relatively low compared to other sectors. Numbers of foreign affiliates in hotels and restaurants compared to total number of foreign affiliates in 2012 of Southeast Asia are relatively low compare to electrical and electronic equipment sector as shown in Table 5.

The significant recipient industries in ASEAN were electronics and automotive and automotive parts (ASEAN and UNCTAD, 2014). According to ASEAN Secretariat and UNCTAD (2014), service and the manufacturing sector continued to dominate FDI flows in the region. Two sectors accounted for about 90% of FDI flows in ASEAN in 2012 and 2103. According to Table 6, there was an increasing trend of foreign value added in ASEAN exports. Service sector had 21.9% share of total foreign value added in exports in 2011. However, when the author consider the categories of the service sector, hotels and restaurants shared only 17.9% of total service sector.

Shares of number of foreign affiliates in hotels and restaurant which are the main subsector in tourism industry are around 1% to 4% in 2012 in ASEAN countries except Lao which had higher share of foreign hotels and restaurants than electric and electronic equipment sector. According to UNCTAD (2007), hotels and restaurants are the subsector inside tourism sector which has the highest FDI flow. We can see that even it is the subsector with the highest FDI in tourism, it is still very low compared with other important sector in the Southeast Asian economies. According to the statistics of UNCTAD based on Bloomberg and companies' website (2014), among 50 largest ASEAN companies with regional presence only two companies on the list are in the tourism sector (Genting of Malaysia is in hotel and

leisure and Singapore Airline is in airlines). Therefore, ASEAN countries have a lot of room for the investment from both developed countries and intra-ASEAN in tourism sector. The potential benefit that ASEAN countries can get from FDI are technological transfers in terms of physical capital and human capital, management skills for sustainable tourism, and sufficient tourism infrastructure that can support the expanding tourism sector. FDI in the tourism sector of the Southeast Asia hence becomes an important issue to study.

Source: WTCC (2015)

Despite of the increasing FDI in tourism, its share is relatively low compared to manufacturing sectors. Total contribution of travel and tourism in Southeast Asia is 12% of GDP in 2014 (WTCC, 2015). However, the investment was only 7.4% of total investment. UNCTAD's report on FDI in tourism (2007) noted that even though tourism is the largest industry in many countries, it appeared to be one of the least globalized. Moreover, tourism FDI is concentrated primary in developed countries. It appears that

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

85-90% of TNC hotels are located in developed countries with only small proportion in developing countries. For the investment trend, travel and tourism investment growth in Southeast Asia is 5.7%, slower than South Asia, Middle East and Northeast Asia (WTCC, 2015).

## STUDIES OF TOURISM-LED GROWTH HYPOTHESIS

The field of research on the relationship between tourism and economic growth is still in development. Many studies have been conducted examining the impact of expansion of tourism sector. There are both positive and negative economic impacts from tourism expansion. It leads to economic development in terms of job creation and poverty reduction. However, many side effects from tourism expansion without cautions can lead to environmental or cultural degradations such as sex tourism.

There are two generally accepted methodologies that can be applied to estimate the impact of tourism on GDP: the Tourism Satellite Account (TSA) and the Computable General Equilibrium (CGE) models (Cortes-Jimemez, Pulina, Prunera, & Artis, 2009). The Tourism Satellite Account (TSA) approach uses the contribution of tourism and traveling to different sectors of the economy. This method is commonly employed by international organizations and governments. There are two mainstream schools of thought stemming from the export-led growth hypothesis since tourism is one component of the service sector that can be exported. Nowak et al. (2007) argue that the growth is derived from the volume of production inputs, so-called Tourism Capital Imports to Growth (TKIG). Economic development in this proposition is achieved through imports of capital goods, which are mainly financed by tourism receipts (Sinclair & Bote Gomez, 1996). Another school of thought is the tourism-led growth hypothesis, which states that output growth can be generated by expanding international tourism as a non-traditional export. In contrast to the extensive literature on exports and growth, empirical studies that focus on the tourism-led growth hypothesis are still scarce.

The tourism-led growth hypothesis was first proposed by Ghali (1976) for the case of Hawaii. Ghali (1976) followed the method of Caves and Holton (1959), who studied the impact of exports on the Canadian economy. Ghali (1976) used the construction of an econometric model that captures as best as possible the essential features of the economy. Ghali's model became the starting point for the tourism-led growth hypothesis. In this study, the author uses the same basic model as Ghali (1976). Oh (2002) studied the contribution of tourism development to economic growth in the Korean economy using Engle and Granger's two-stage approach and a bivariate vector autoregression (VAR) model. He found that there is no long-run equilibrium relation between tourism growth and economic growth. Oh's test implies the one-way causal relationship of economy-driven tourism growth. He concluded that the tourism-led growth hypothesis does not hold for the Korean economy. However, Chen and Chiou-Wei's (2009) study of the causal relationship between tourism and economic growth in Korea and Taiwan found that the tourism-led growth hypothesis is supported for both countries. Chen and Chiou-Wei (2009) used a method different from that proposed by Oh. They used the EGARCH-M model with an uncertainty factor to capture the uncertainty in the economies. Balaguer and Cantavella-Jorda (2004) found indirect causality for tourism and economic growth. Later, Eugenio-Martin et al. (2004) studied the relationship between tourism and economic growth for Latin American countries from 1985 to 1998 using the panel data approach and the Arellana-Bond estimator for dynamic panels. They found that the tourism sector is adequate for the economic growth of medium- or low-income countries, though not necessarily for developed countries. They also estimated inverted causality to explain the tourism arrivals conditional

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

on GDP and other covariates. Eugenio-Martin et al. (2004) used the generalized least square AR(1) panel data model to conduct the estimates and found that low-income countries seem to need adequate levels of infrastructures, education, and development to attract tourists. Medium-income countries need a high level of social development, such as health services, and high GDP per capita levels to attract tourists. They also found that the price of the destination is irrelevant for tourism growth.

Sequeira and Compos (2005) studied international tourism and economic growth using the panel data approach. They reported that tourism-specialized countries grow more than others, which is inconsistent with the endogenous growth theory since tourism is not high intensity in R&D or the large-scale sector. Sequeira and Compos (2005) added variables linked to the proportion of tourism in exports and GDP rather than using only arrivals of tourists per capita as a proxy for tourism intensity. They used the panel data method and concluded that tourism on its own cannot explain the higher growth rates. Lee and Chang (2007) applied the new heterogeneous panel cointegration technique to reinvestigate the long-run comovements and casual relationship between tourism development and economic growth for OECD and non-OECD countries for the 1990-2002 period. On a global scale, Lee and Chang (2007) found a substantial relationship between GDP and tourism development. Tourism development has a greater impact on GDP in non-OECD than in OECD countries. The greatest impact is in Africa. In the long run, Lee and Chang (2007) found that there is a unidirectional causality relationship for tourism development and economic growth in OECD and bidirectional relationships in non-OECD countries, but only weak relationships in Asia.

Cortes-Jinenez et al. (2009) studied tourism and exports as a means of growth by considering both exports and tourism as potential influencing factors for economic growth. They used data from Italy from 1954 to 2000 and Spain from 1964 to 2000. They used standard cointegration and Granger causality techniques to prove the hypothesis and found that both exports and tourism have a significant effect on long-term growth in both countries. Kartircioglu (2009) used the bound test for cointegration and Granger causality tests to investigate level relationships and the direction of causality between international tourism and economic growth in the case of Malta. His results revealed that a long-run equilibrium relationship exists between international tourism and economic growth in Malta. On the other hand, Granger causality test results suggest that both the tourism-led growth hypothesis and the output-driven tourism hypothesis can be confirmed. In Pakistan's case, Khalil et al. (2007) attempted to determine whether there is a unidirectional or bidirectional causal relationship between tourism and economic growth using the cointegration test. They found that tourism growth influences increases in the economy in the short run, that the combination of results points to two-way causality for economic growth and tourism growth, and that economic expansion is necessary for the development of tourism in Pakistan. They found a significant impact of tourism on Pakistan's economy, which justifies the necessity of public intervention aimed at promoting the demand for tourism and providing the development of the supply side of tourism industry. Lean and Tang (2010) extended the Gunduz and Hatemi-JA (2005) study on the tourism-led growth hypothesis with Malaysian data and found that the causality is valid and stable over the sample period, January 1989 to February 2009.

Brida et al (2014) conducted a literature review on the tourism-led growth hypothesis. They provided an in-depth analysis of the tourism-led growth hypothesis based on a revision of approximately 100 published empirical papers together with the theoretical papers. Brida et al (2014) found that the tourism-led growth hypothesis is confirmed for the studied countries with few exceptions. The validity of tourism-led growth hypothesis is consistent with the fact that the government can promote economic

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

growth through tourism industry. However, they found that the results should not be generalized to all countries since the number of studied countries is still limited and unbalanced.

Tourism needs support from global market access, capital, and infrastructure. The availability of financial resources is critical for achieving further tourism development and economic growth (Samimi, A.J., Sadeghi, S. and Sadeghi, S., 2013). Capital inflow can facilitate the financial resource factor for the tourism industry. Hence, foreign direct investment (FDI) is important for steady and sustainable growth in the tourism sector. Transnational corporations (TNCs) are key players in the flow of international capital. Green field investment generates technological transfer and a spillover effect. FDI is seen as an important element in the solution to the problem of scarce local capital and overall low productivity in many developing economies (De Mello, 1999; Eller et al., 2005).

The literature reviews on the tourism-led growth hypothesis demonstrates the different methods were used to conduct the study. The most frequently used method is Granger causality tests to consider the direction of the relationship between tourism growth and output growth. Another important method is dynamic panel analysis to estimate the relationship between growth and tourism development. However, panel data analysis using ordinary least square is chosen to conduct the estimation in this study because of the limit of time-series data to conduct dynamic model. The use of panel data not only allows an increase in degree of freedom and better estimation of large sample properties but also reduces the endogeneity problem from a specific country effect that can be correlated with the repressor (fixed effects) or random effects (Sequeira & Compos, 2005). In this study, the author also adds FDI in the tourism sector as an important factor to stimulate the economic growth and benefits other variables in the model specification.

## DATA AND METHODOLOGY

This study tests tourism-led growth hypothesis using econometric technique. Before running the regression, the author conducts nonstationary test using the Im, Pesaran, and Shin (2003) method which allow the heterogeneity of autoregressive root under the alternative hypothesis. Being unable to reject the null hypothesis of this test implies that the variables have a unit root.

After nonstationary test, the paper presents tests for the long-run relationship among variables using the method based on Engle and Granger (1987) co-integration test. To test the co-integration, if the variables are co-integrated or have a long-run relationship, the residuals of the regression will be the integration of order zero, I(0), or stationary. Co-integration implies that there are relationships between the variables but does not tell the direction of the causal relationship. To adapt the co-integration test using panel data, Pedroni (1999, 2004) extended the Engle and Granger's test (1987) to allow heterogeneous intercepts and trend coefficients across cross-sections.. Kao's (1999) Augmented Dickey-Fuller (ADF) test and Pedroni's (1999) test are employed in this study to test the long-run equilibrium relation between the dependent variables and all independent variables as a group. Kao's (1999) test is based on the ADF test with a null hypothesis of no co-integration with a *t*-distribution. Kao's test provides an alternative hypothesis of four statistics: *v*-statistics, *rho*-statistics, PP-statistics, and ADF-statistics. For Pedroni's (1999) test, the null hypothesis is also no co-integration in panel against two alternatives. Pedroni's test allows for an individual-specific fixed effect and time trend. The second alternative hypothesis is tested using group *rho*-statistics, group PP-statistics, and group ADF-statistics. Pedroni (1999, 2004) showed that the panel ADF-statistics and group ADF-statistics have better sample properties than other co-integration tests.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

After the long-run relationship test, the study uses the pairwise Granger causality test to test the causality between variables. Each of the null hypotheses states that one variable does not cause another variable using F-statistics. To test for Granger causality in the time domain, the minimum mean square prediction error is used as the criterion to evaluate incremental predictive power. In the bivariate case, the presence of Granger causality is tested by evaluating the predictive power of one time series for another. The linear-reduced form vector autoregression (VAR) follows:

$$X_t = A\left(L\right)X_t + B\left(L\right)Y_t + U_{x,t} \tag{1}$$

$$Y_t = C\left(L\right)X_t + D\left(L\right)Y_t + U_{Y,t} \tag{2}$$

where A(L), B(L), C(L), and D(L) are one-sided lag polynomials of orders a, b, c, and d in the lag operator L with roots outside the unit circle and no roots in common. The regression errors, $\{U_{X,t}\}$ and $\{U_{Y,t}\}$, are assumed to be mutually independent and individually i.i.d. with zero mean and constant variance. To test for strict Granger causality from Y to X in this linear framework, a standard joint test (F or chi-square test) of exclusion restrictions is used to determine whether the lagged Y has significant linear predictive power for current X. Bidirectional causality exists if Granger causality runs in both directions, in which case, the coefficients on the elements in both B(L) and C(L) are jointly different from zero.

The last step in the methodology in this study is to conduct the ordinary least square estimation of the relationship between real GDP and variables determining the income. The hypothesis of this study is that real GDP is determined by foreign direct investment in tourism industry, visitor spending, human capital, degree of trade openness, government spending, and exchange rates (local currency to $US). The study adopts the ordinary least square technique to eliminate the biased estimator from the presence of outlying observation.

## Theoretical Framework

In the Neoclassical growth model developed by Solow-Cass-Koopman, GDP growth depends on the initial level of income. Barrow and Sala-i-Martin (1992) and Mankiw, Romer, and Weil (1992) proposed the concept of conditional convergence, allowing the differences among countries in the model. Letting $y_{it}$ denote log per capita of income or output, the growth rate can be written as:

$$y_{it} - y_{it-1} = a + \beta y_{it-1} + u_{it} \tag{3}$$

where $a$ is the steady state, $-1<\beta<0$, if there is convergence between countries, and $u_{it}$ is the error term.

If the steady state among countries is different, the structural model can be extended to:

$$y_{it} - y_{it-1} = a + \beta y_{it-1} + \varphi X_{it-1} + u_{it} \tag{4}$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

where $X_i$ is the vector of determinants of the steady state per capita income. The determinants can be in terms of population growth, government policies, political stability, physical and human capital, openness, and other growth-related variables.

## Model and Variables

The augmented Solow-Swan model from (4) can be taken as the baseline empirical growth model. There are four important determinations of growth: initial income, rate of physical accumulation, human capital accumulation, and population growth. This study constructs the augmented Solow-Swan model as the core and then adds more specific variables including visitor spending and foreign direct investment in the tourism sector, as well as trade openness, human capital, government consumption, and exchange rate into the model specification. The model specification used in this study's estimation is:

$$\log\left(PERCAPITA_{it}\right) = c + \varphi_1 \log\left(\frac{VS}{POP}\right)_{it} + \varphi_2 \log(HC)_{it} + \varphi_3 \log(EXR_{it}) + \varphi_4 \log\left(OP_{it}\right) + \varphi_5 log\left(\frac{FDIT}{POP}\right)_{it} + \varphi_6 \log(GOVC / POP)_{it} + \alpha_i + n_t + u_{it} \quad (5)$$

with $t$=1,…,24(1988 – 2011); $i$=1,…,9 and $u_{it} \sim N\left(0, \sigma_i^2\right)$

To test the relationship between tourism and economic growth, this study uses the flows variables, which are standard in the endogenous growth literature (Barro, 1991; Barro & Sala-i-Martin, 1995). The variables in the equation (5) are defined:

- Visitor spending per capita (*VS/POP*) is used to represent tourism activity in the country. Visitor spending data is obtained from WTCC (2015) measured by money spent from foreign visitors to a country. This variable is a key component of direct contribution of tourism and travels to the economy. Positive sign is expected;
- Index of Human Capital (*HC*) is used as a proxy for human capital. The data is obtained through the Penn World Table 8 (Feenstra et al., 2-15) and a positive sign is expected;
- EXR is the exchange rate in local currency to $US;
- Openness is measured by exports plus imports to output ratio (*OP*). It represents the impact of trade openness on economic growth. Data is obtained from World Economic Indicator (World Bank, 2015). A positive sign is expected;
- Government spending per capita (*GOVC/POP*) is amount of government spending on tourism industry per number of population. It is used to measure long-run crowding-out and the overall negative effect of government spending in long-run growth or the effect of government purchase in tourism sector to GDP per capita. There is no expectation on the sign since it depends on which side's magnitude is bigger;
- Foreign direct investment in tourism industry per capita (*FDIT/POP*) represents the capital investment spending by all industries directly involved in the travel and tourism industry. *FDI/POP* also constitutes investment spending by other industries on specific tourism assets such as new visitor

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

accommodations and passenger transport equipment, as well as restaurants and leisure facilities for specific tourism use, which is consistent with total tourism gross fixed capital formation in Table 8 of the TSA: RMF 2008. Positive sign is expected.

The study uses E-views 8.0 software to obtain the result of all test and estimations. The dataset used in this study are obtained from the Penn World Table 8 (Feenstra et al., 2-15), the World Development Indicators (World Bank, 2015) and United Nations Conference on Trade and Development (UNCTAD, 2007), and the World Travel & Tourism Council (WTTC, 2015). The panel data consist of a 24-year period from 1988 to 2011 in nine countries in ASEAN: Brunei, Cambodia, Indonesia, Lao, Malaysia, the Philippines, Singapore, Thailand, and Vietnam.

## RESULTS

### Unit Root Test

Table 8 gives the Im, Pesaran and Shin W-test on a unit root for the variables under consideration. The null hypothesis is that there is a unit root (assumes individual unit root process). The results show that every variable except population (pop) is integrated order 1 or I(1).

After testing the unit root, although the variables are not stationary at their levels, they are stationary at their first-differenced series. Therefore, the panel data of these variables can be used in the study at least for long-run relationship.

### Panel Co-integration Test

The next step is testing the long-run relationships between these variables. This study uses Kao's and Pedroni's panel co-integration test.

From the Kao test, the ADF-statistics show that the null hypothesis of no co-integration can be rejected at the 10% level of significance. This is supported by the Pedroni test in which v-statistics, PP-statistics, and ADF-statistics show the rejection of the null hypothesis. For the group test, PP-statistics and ADF-statistics also demonstrate co-integration among the variables.

*Table 8. Im, Pesaran and Shin W-tests for a Unit Root*

| Variables | Level (with intercept) | 1st differenced | P-value |

**Indicates statistical significance at 5% level. *Indicates statistical significance at 10%. Individual fixed effect and individual trend are allowed in the Pedroni test.

## Causality Test

The co-integration test is able to show long-run relationships between variables. However, it does not show the direction of the relationships or the causality. The technique to show the directions of relationships is the pairwise Dumitrescu Hurlin panel causality test, which allows an individual coefficient for each country. The results are shown in Table 10.

From the results of Pairwise Dumitrescu Hurlin panel causality test, this study found the following:

- GDP Per capita in Southeast Asia is determined by government consumption in tourism per capita (GOVCPOP) and human capital (HC)
- Foreign Direct investment inflows in the tourism industry per capita (FDITPOP) are caused by trade openness (OP) and visitor spending per capita (VSPOP).
- The human capital index (HC) is caused by GDP Per capita (PERCAPITA), trade openness (OP) and visitor spending per capita (VSPOP)
- Government consumption in tourism per capita (GOVCPOP) is caused by human capital (HC).
- Trade openness (OP) is caused by GDP Per capita (PERCAPITA), government consumption in tourism industry per capita (GOVCPOP), and human capital (HC),
- Visitor spending per capita (VSPOP) is caused by GDP per capita (PERCAPITA) and human capital (HC).
- The exchange rate (EXR), in term of local currency to US dollar, is caused by GDP per capita (PERCAPITA), foreign direct investment in tourism industry per capita (FDITPOP), human capital (HC), trade openness (OP), and government spending in tourism sector per capita (GOVCPOP)

The focus of this study is the relationships among FDI in the tourism industry, GDP Per capita, and visitor spending. From the causality test, the author found that FDI in the tourism industry and visitor spending does not have direct effects to GDP per capita. However, the effects from the visitor spending and FDI in tourism sector can possibly have indirect effect through other variables. The effect of each variables will be estimated using ordinary least square estimation.

## Tourism-Led Growth Hypothesis Estimation Results

The focus of this study is to test tourism-led growth hypothesis using visitor spending and FDI in tourism sector as representatives of tourism sector. The contribution of hypothesized variables to real GDP per capita in Southeast Asia is presented in Table 11.

**Indicates statistical significance at 5% level. *Indicates statistical significance at 10%.

Table 11 gives the estimation result for the panel least square estimation. The results show that visitor spending per capita (VS/POP), FDI in the tourism industry per capita (FDIT/POP), human capital (HC), trade openness (OP) and government consumption in tourism sector per capita (GOVC/POP) have statistically significant effects to determine real GDP per capita. Trade openness has negative coefficients. Exchange rate does not have statistically significant in GDP per capita change.

From the result, we can confirm that the tourism-led growth hypothesis is valid for ASEAN countries from the positive significant coefficient of visitor spending per capita (VS/POP). When the visitor spending per capita increases by 1%, the GDP per capita will increase by 0.08%. In addition of foreign investment in the tourism sector per capita into the model, the result shows that it significantly has a positive effect to the GDP per capita. When the foreign investment in the tourism sector increases by 1%, GDP per capita will increase by 0.01%.

In terms of relationship between human capital and GDP per capita, if human capital index increases by 1%, GDP per capita will increase by 2.77%. If the trade openness increase by 1%, GDP per capita tend to decrease by 0.14%. The trade openness coefficient has unexpected sign which will be needed to study further. The government consumption in the tourism industry also has a statistically significant effect to the GDP per capita. If the government consumption in the tourism sector increases by 1%, GDP per capita increases by 0.09%.

From the causality analysis, the result showed that FDI and visitor spending do not homogeneously cause GDP per capita to change while the panel least square estimation result shows that there are some significant effects. The author's hypothesis is that there are some indirect effect of FDI of tourism industry and visitor spending through other variables that can pass the contribution to economic growth or the relationship is not in the linear form.

Panel least square estimation also allow the cross-sectional effects to identify the differences among ASEAN countries. The magnitude of cross-sectional effects is shown in table 12. Singapore and Brunei have highest intercepts since they are in high-income country group. Malaysia, Thailand, Indonesia are in the middle income country group therefore the intercept is positive. The lowest intercept is in Lao, Cambodia, Vietnam

## CONCLUSION AND DISCUSSION

With the best tourism assets in terms of culture, heritage, natural sites and wildlife, Southeast Asian countries attract a steady flows of international visitors. The tourism industry has a growing share in the GDP of this region. This study tests the relationships between real GDP per capita and tourism sector in terms of visitor spending and FDI in this sector and other related variables. The study empirically estimates the contribution of the tourism FDI and visitor spending to GDP per capita in nine ASEAN countries-- Brunei, Cambodia, Lao, Malaysia, the Philippines, Singapore, Thailand, and Vietnam--from 1988 to 2011. The result of panel least square from this study is consistent with the tourism-led growth hypothesis, which states that the tourism industry can bring sustainable economic growth in the long run.

*Table 12. Cross-sectional effects*

| Country | Cross-Sectional Effects |
|---|---|
| Brunei | 1.283616 |
| Cambodia | -0.901738 |
| Indonesia | 0.006223 |
| Lao | -1.114873 |
| Malaysia | 0.185871 |
| Philippines | -0.791436 |
| Singapore | 1.649491 |
| Thailand | 0.144499 |
| Vietnam | -0.767364 |

The methods used in this study are panel co-integration using Kao's and Pedroni's tests, causality test and panel data analysis using Ordinary Least Square (OLS).The variables hypothesized to influence the GDP per capita are visitor spending per capita, FDI in tourism industry per capita, government consumption in tourism per capita, trade openness, human capital, and exchange rate. The study tests the presence of a unit root and panel co-integration before conducting the causality test and regression. The results of panel cointegration test show that there are long-run relationships among variables. For the direction of causality, the study uses pairwise Dumitrescu Hurlin panel causality test which allows an individual coefficient for each country and found that human capital and the government consumption in the tourism industry per capita can cause the real GDP to change. For other causalities, it can be summarized by figure 4.

The empirical findings have implications in providing policy makers directions for achieving a path of growth through tourism industry. The evaluation of tourism-led growth hypothesis in ASEAN countries benefit the governments that are willing to stimulate the economy using travel and tourism sector. The increasing number of international arrivals stimulates the demand for other goods and services. The extended linkages of the tourism sector to other downstream sectors are key to success if governments use tourism as a focused sector of their growth policy. The tourism sector is closely related to the food and restaurant industries, hotel and accommodation services, healthcare industries, the transportation industry, and other related goods industries. In addition, tourism provides greater foreign exchange, which leads to appreciation of the local currency and alleviates a gap in foreign exchange and finance imports of capital goods.

However, governments should also aware of the disadvantages of tourism development, the potentially negative influences on communities and their residents. Moreover, when the domestic demand is stimulated, the possible result can be rising domestic prices or inflation. The expenditures by foreign tourists may also alter domestic consumption patterns via the so-called demonstration effect, and this can, in fact, be inflationary (Lee & Chang, 2008). According to Sinclair (1998), another possible cost of the expansion of tourism industry is the expenditure for the provision and maintenance of infrastructure in the form of water, roads, airports, sanitation, and energy. Gursoy and Rutherford (2004) studied the

*Figure 4. Causality of Real GDP, FDI in Tourism sectors, Visitor Spending and Other Relating Variables*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

host attitudes toward tourism and concluded that tourism imposes other costs on the host country such as increased pollution, congestion, or despoliation of fragile environments. In short, countries should be aware of the adverse economic, socio-cultural, and environmental impacts that result from the expansion of tourism.

The estimation results also reveal that trade openness and human capital are effective channels to promote growth in ASEAN. Trade openness can spur expansion in exports, which will lead to higher productivity and more efficient resource allocation in ASEAN countries. Human capital contributes to economic growth through the supply side. Human capital allows the production function of the aggregate economy to shift upward without experiencing the diminishing return on capital. This finding is satisfactory and also consistent with Keynesian economic theory and the literature on trade and human capital.

## POLICY RECOMMENDATIONS

Tourism-related policies should be consistent with the wider economic policy framework. In order to obtain the maximum benefits and minimize the cost of expanding travel and tourism sector, the host country has to be prepared to absorb the negative impacts. Since tourism industry involves in many economic sectors and activities, the number and range of policies that need attention are large and diverse. They include town planning, environmental regulations, labor standards, tourism educational policies, transportation safety standards, a wide range of financial regulations and telecommunication laws and regulations.

1. From the result of the study, human capital can be increased by FDI in the tourism sector and has a large role in promoting GDP per capita. Spillover effects can be a major source of human capital increase. The government can encourage more FDI in term of green field investment which there are on-the-job trainings. In other direction, the government can allocate the budget to promote the tourism educations to provide some skills in the tourism industry in order to prepare local communities for the foreign investment in their areas.
2. Degree of openness is another important factor to attract the FDI in the tourism industry in ASEAN. Government can provide some incentives to attract FDI such as grants or loans at discount interest rates, tax holidays, or facilitate the TNC by providing some infrastructure.
3. ASEAN has an advantage of regional integration which has been accelerated in recent years. At the ASEAN Economic Ministers Meeting in August 2011, member states agreed to accelerate the implementation of programs towards the ASEAN Economic Community (AEC) in 2015, focusing on initiatives that would enhance investment promotion. This can be an opportunity to enhance competitiveness in attracting FDI in tourism sector and TNC activities.
4. The development of infrastructure alongside the tourism can assist the process of industrialization and modernization (Hitchcock et al., 1993). When the infrastructure is ready, FDI in tourism will increase and that will stimulate the GDP per capita according to the result of this study.

# Chapter 15
# Foreign Aid to Africa: Conceptualising Socio-Economic and Political Development Applying Complexity Theory

**Sultan Juma Kakuba**
*Islamic University in Uganda, Uganda*

## ABSTRACT

*The main objective of this chapter is to provide evidence that foreign Aid to African countries is a barricade to their sustainable development. Both modernisation and Dependency theorists' suggestions have failed to spawn socio-economic and political development in African countries. Complexity theory may provide a better understanding of the linkage between foreign aid and the socio-economic and political underdevelopment. The current foreign aid given to African sovereign states by donor or developed countries seems to perpetuate underdevelopment. In fact, Foreign Aid to most of African countries has not adequately addressed its problems; rather it has succeeded in keeping most of African countries dependent on foreign aid and in the state of underdevelopment. Using both quantitative and qualitative document analysis of records on foreign Aid to Africa reveals that foreign Aid in and out of itself is not a bad thing, it is among those many important resource inputs, which operate in many African countries which if paved with good intention could bring about sustainable socio-economic and political development in Africa.*

## INTRODUCTION

Unlike in Europe, where many countries reaped profitably from the Official Development Aid (ODA) through the Marshal Plan, which contained assistance programmes for the economic reconstruction of countries that had suffered the consequences of World War II. For instance, Foreign Aid provided to countries like Japan principally helped to improve up on its socio-economic and political development. Since then developed countries have adopted it as a tool to promote economic and political development

to underdeveloped world such as Africa. In other words, Foreign Aid is considered as an important tool that can help to overcome underdevelopment in Africa, which is viewed by developed world as a dark continent. Extending foreign aid to Africa is therefore expected to transform it to a modern world.

However, massive Foreign Aid disbursed to Africa has been of questionable benefit. Africa is seriously grappling with socio-economic and political problems. Perhaps it is correct to say that foreign Aid has exposed Africa to both intended and unintended consequences which curtail its socio-economic and political development. To say the least, there has been little impact of Foreign Aid on economic and political development in Africa despite its huge transfer to the continent. In fact, there are questionable political practices as well as significant economic instabilities in many African countries which are fueled by foreign assistance. The nature of political injustices and poverty in Africa is unacceptable, though developed or donor community continue to transfer massive Aid to the continent.

The objective of this paper is to explore the relationship between Foreign Aid on one hand and economic and political development on the other. In other words, the interest is to establish how foreign Aid shapes or affects economic and political development in Africa. In-depth understanding of this, is very important to guide political leaders, policy makers on whether to continue relying on foreign Aid or give it a break. This is because it is surprising that the mission of Foreign Aid is to help close the gap of socio-economic and political up-hills faced by developing nations is hardly reflected on the African continent. The continent remains with exception of a few countries like South Africa and Botswana, majority countries in Africa experience economic and political underdevelopment. It should be mentioned that even those countries like South Africa pockets of destruction are seen in the foreign Aid extended to it.

Political development is seen in the perspective of having a self-reliant, rule of law, free and fair periodic elections and respect for human rights among other tenets. In that regard, citizens are given full opportunities to participate in the political affairs of the country. Economic development on the other hand is often looked in the lens of a sustaining economy, where there is economic growth in terms of Gross Domestic Product (GDP) as well as increase in international trade. In this paper Foreign Aid should be understood as international transfer of any resources or assistance intended to contribute towards economic and political development. It is pertinent to note that to achieve this status is a hard rock to crack, which requires adequate resources and credible policies.

The western developed world emphasise that to get to this level of development, democracy has to take centre stage. In this regard, both viable economic and democratic institutions have to be established to promote economic and political development. This was born out of decolonisation, which was a striking feature, which brought high hopes to Africa. Along those lines, they have been quick to suggest policies to many third world countries like those in Africa for their socio-economic and political development. Calhoum (2011) points out that "after independence, a variety of the world's richer countries mounted substantial efforts to help postcolonial countries grow" economically and politically.

In the light of this, Foreign Aid has remained a major source that supplements domestic economic and political development initiatives in many African countries. Therefore, it is pertinent to understand its contribution in this perspective. The paper limits itself to a period 1986-2011. This period will provide a better understanding the impact of foreign aid over a long period of time. This paper attempts to address this important question: to what extent has Foreign Aid had impact on economic and political development in Africa? In view of this impact, what is the importance of Foreign Aid to Africa? Does it constitute any important episode in the economic and political development in Africa? The answer to this question will clear clouds about theory and reality through critical assessment of Foreign Aid potential as regards economic and political development. It will also add to the existing literature about

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the effects of Foreign Aid on economic and political development of developing countries in Africa. To answer the stated question, literature is reviewed hereunder and from there a framework for analysis is developed to link Foreign Aid to economic and political development.

## FOREIGN AID

The concept Foreign Aid has a long history in the socio-economic and political transformation philosophy. Its identification is rooted in the gigantic dynamic marshal Plan, which was designed to help in the reconstruction of Europe after it had suffered substantial impact of World War II. According to Encyclopaedia Britannica Foreign Aid "involve a transfer of capital, goods, or services or commodities such as food aid or military equipment or technical assistance and training (www.britannica.com/EBchecked/topic/213344/foreign-aid)." The concept of foreign Aid therefore, is characteristically a multidimensional. It manifests in many forms such as financial aid, suggestive policies, goods and services, training etc. Thus, it lacks a single acceptable definition and focus. But "the most common type of Foreign Aid is the Official Development Assistance (ODA)," which is usually given in form of assistance to promote development and arrest poverty (Ibid).

## LITERATURE REVIEW

Probably nothing is as controversial subject as the impact of Foreign Aid on Africa. Promoters and supporters of Foreign Aid argue that it has a multi-dimensional potential to socio-economic and political development (www.google.com.my/search?hl=en&output=search&sclient=psy-ab&q). Burnside & Dollar (2000) carried out an empirical study on the relevance of Foreign Aid and found that it can only be effective if it is dressed with good policies. This suggests that recipients of Foreign Aid need to have sound policies that can put the assistance received to good use. In the same vein, McGillivray et al. (2006) in their study discovered that Foreign Aid can be useful based on certain conditions such as political conditions and quality of institutions among others.

Harford & Klein (2005) examined how resourceful Foreign Aid can be a source to economic and political development and in this study they found that foreign aid a major source of income that facilitates leaders to build "bad institutions." For instance, in elections these leaders use it to bribe citizens; an act which reduces democratic accountability.

It is very clear from the literature reviewed that there are many studies that have established that there a positive relationship between Foreign Aid and economic growth and political development, while others were not able to reach such conclusion. For them they have concluded that the beneficial effect of Foreign Aid in Africa is virtually like a person urinating in the sea with the hope of increasing its water sea level. However, it is important to know that Foreign Aid in a away is an engine to economic and political development because it can strengthen major players in politics such as financing political parties, civil society organisations and supporting electoral commissions bodies. This paper explores the link or role of Foreign Aid in influencing economic and political change on African continent. In other words it assesses and analyses its impact on the economic and political development.

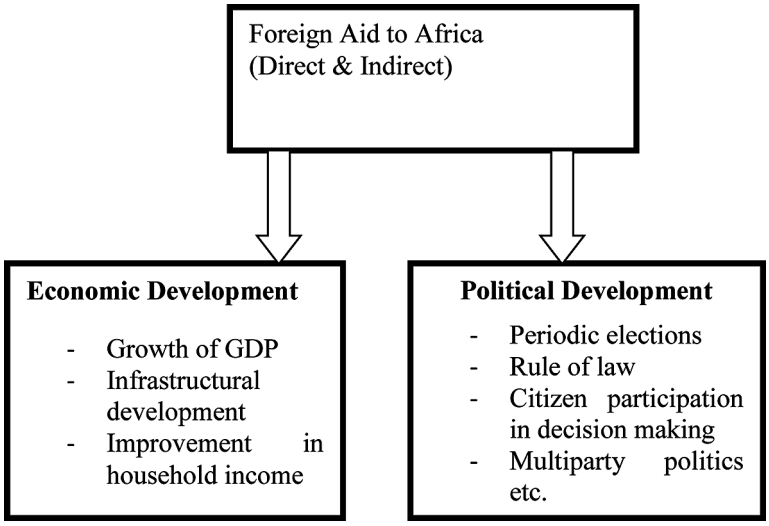
## THEORETICAL FRAMEWORK FOR ANALYSIS

This part provides a theoretical framework as a foundation for answering the question set. Theory is important in providing guidance to define the central concept for discussion. It exposes the hypothesis or assumptions that help and provide a good understanding and explanations of the variables. The framework of analysis relies on two opposing discourses i.e. the modernization and dependency approaches. The tenet of the latter duels much on the positive effects of Foreign Aid, while that of the former looks at its negative effect to explain the nature of economic and political development of Africa. The concept of modernisation is perceived differently by different writers. According to Berger (1996) "modernization is the internal achievement of a society; the particular processes of modernization support each other in combination; the leading nations do not impede the followers; the processes of modernization are converging in a common goal." Thus, modernization theory in the 1950s and 1960s, one must remember that this theory was designed as a program explicitly directed to the non-Western world, that is, it was devoted to the "export" of Western institutions and values. This was to help them to transit from traditional states to modern from states on that account the modernization theorists and writers refute the assumption that equates Foreign Aid with exploitation and underdevelopment like that exist in Africa. To modernisation theorists, this means that development cannot be explained by exploitation but strongly believe that economic and political development of Africa could be accomplished by simply copying western institutions. This perpetuated a permanent process of interdependence between the metropolitan centre and the periphery, the trends and forces of globalization are decisive.

But such concepts have been bitterly disputed as credible tools in the modernization discourse in Africa today. According to Jeffrey (1994) modernization theories were suitable for the reconstruction of western development and, in its liberal belief of grant progress and the universalization of values, projected them worldwide, especially in the developing countries. Berger (1996) puts it that this is one popular model which combines western scholars and development theorists who agitate for actualisation of economic and political development or international transformation.



Against this doctrine, Afro-centric theorists, particularly the development and underdevelopment theorists heaped criticisms on capitalism, particularly the advances made by modernisation theorists. In that regard, they advocated for the alternative world-systems theory that should de-link African from its former colonial masters. They condemn that relationship, which explains under-development and exploitation of the periphery by the capitalist centre. The dependency school believes that dependency is an external condition, that the centre nations get all the benefits from unequal exchange, and that the peripheral countries should serve their ties with the core countries. As argued by Alvin (1990) The World System School adds the concept of semi-peripheries with an economic emphasis on import-substitution; this school shifts its focus from the nation-state to the whole world; long-term historical trends are its units of analysis. They concluded that there is little if not nothing beneficial from Foreign Aid to African. Both theories predicted the transition, already underway, of late capitalism into socialism. However, when this transition failed to occur and when some developing countries, particularly in Africa, progress was geared towards constructing liberal modernization.

The hypothesis derived from Figure 1 is that Foreign Aid affects economic and political development. It is important to note that theoretically, the chosen indicators as shown in the figure above are the elements of a Gross Domestic Product, infrastructural development, improvement in household income, while political development indicators are existence of periodic elections, rule of law, citizen participation in politics and existence of multiparty politics. These are elementary building blocks of any economic

*Figure 1. Foreign aid*
*Source: Developed by the author*

and political development, respectively. Thus, these theories are important to this study because they provide an understanding of development dynamics in Africa. They also give better message on the role foreign Aid play in the development process in Africa.

## METHODOLOGY

This chapter uses secondary research method of data collection and analysis. It relies on collection and extensive review of relevant documents on foreign aid in Africa. The data explored includes: Published foreign aid reports on Africa, books, journals and other related published and unpublished materials on the topic. Thus, the analysis of the effect of Foreign Aid on the economic and political development uses the state of political and civil rights gathered by freedom house index for analysis.

### Foreign Aid and Economic Development in Africa

When most of the African states attained their independence from their colonial masters, political leaders and citizens had high hopes to transform the continent of Africa into a modern one with self-sustaining economies. Although the ambition was high, most leaders failed to significantly contribute and perpetuate economic development in the continent. In this regard, the continent found itself permanently dependent to its former colonial master and other developed countries in pursuing its economic development. And for one reason or the other, developed nations for a long time have been committed on extending economic and political development assistance. But interesting to know is that when such assistance is given, particularly financial aid to facilitate development initiatives such as infrastructural development, health, education and agriculture, it is embezzled by government officials. At this point, it is the ordinary citizens who are most affected. It is also interesting to know that investing in education is one of the sure ways to reduce poverty in Africa but the kind of support to education sector, is still

inadequate many institutions in Africa produce more of theory based skilled labour force which cannot urgently provide answers the development problems facing Africa.

Most areas in Africa are rural with many striving to become urban. People living in these rural areas depend on agriculture not industry for a living; majority of the population have limited skills because the spread of education is limited to theory based and diffusion of modern technology is still scanty and; agrarian norms habits and practices dominates social consciousness of Africa. Interesting to know also is that most people in urban areas live deplorable life in slums with no safe water and other basic public facilities. To buttress this point, poverty bites so deep in Africa. The suggested policies by International Monetary Fund (IMF) accompanying its Aid to Africa to facilitate its economic growth, has failed to improve the condition of socio-economic life of the people in Africa. For instance, there has been continued support to education sector to improve social life through education and employment. But the reality is that the hope of many is much more far from imagination.

Though many African countries are considered rich in natural resources and one could expect the huge Foreign Aid extended to Africa to supplement on its development initiatives.

Ajulu (2005) argues that globalization has become a key tool through which has conditioned national economies of African countries to be integrated into a world economic system through international "free market trade regimes. African countries have designed neoliberal economic policies, to bind their national economies together in a capitalist market system. Economies of different countries are integrated into this system through the creation of common finance mechanisms, regimes and transactions. This is packaged by different international organizations such as the World Trade Organization (WTO), International Monetary Fund (IMF) and the World Bank (WB). In that regard, international political economy does not only lack bureaucratic, technological and judicial processes, to ensure stable transactions within the international economic systems, but it is also constrained by a political ideology such

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

as "neo-liberalism" to provide the raison d'être, which can legitimize the existing world order. Instead, Neo-liberalism promotes the values of capitalism, liberal democratic systems and the forces of free market economy (Ibid).

The principle effect of these practices is that economic systems of different countries have become increasingly interconnected to the extent that they are no longer under strict control of the states' interest. In a similar way, International Organizations, Multi-National Corporations and flows of Foreign Development Investment have gained more prominence. In that regard, Economic globalization poses both opportunities and threats to Africa, since the national economies of African states are dependent on the international economic system to achieve economic growth and wealth, and at the same time suffers losses of economic and political sovereignty to bargain equitably in the international trade because they are not in control of the Multinational Corporations, International Organizations and investors who facilitate the global flows of capital, Foreign Development Investment and trade. The increased flow of transactions between various actors world-wide is engineered by technological advancement in communication and transport, which enables transcontinental travelling and more importantly instant communication among people and organizations globally.

Despite these merits, economic Foreign Aid, which has been paved to Africa with good intention through a number of ways, but it has not been an undivided blessing for Africa. It is arguably that some African states in the world rankings have made some impressive improvements in their economic and political fields. But this does not reflect the life of ordinary African. This can pre-empt one to argue that Foreign Aid remain within the road to development that has proved inadequate in combating underdevelopment African economies face. There is need to change the road to development of economies of African states.

This is because, the vast parts of Africa suffer the negative consequences of Foreign Aid in terms of strings attached to it. The political response to high global competition, as a result of encouragement from Foreign Aid, has made Africa to experience economic instability and political insecurity generated by shelters of foreign influence. Hence, Foreign Aid has brought about widespread pain and suffering in terms of socio-economic dislocations to most African states. Therefore, Africa needs development initiatives that put its available resources at the center of development plan.

Besides that, a lot of Foreign Aid has been sunk into the education sector in Africa, but this education mainly favors small portion of elites particularly those in top government positions in Africa. This has promoted corruption and rent-seeking by elites and more importantly this foreign aid has made African leaders to pay little attention to the rich available resources in African as they are made to believe that Africa is poor. But the reality is that most African countries are not poor but they face poor management of the available resources. Worth noting is that Africa losses substantial amount of money (US $ 148) annually through corruption. This has suffocated African skill of creativity and established a permanent dependency culture. In addition, with the exception of South Africa, sub-Saharan Africa spent a total of US $11 billion on arms alone in 1998 and annually, Africa spends about US $ 14.5 billion on repaying debts it acquired as loan.

## Foreign Aid and Political Development in Africa

The political development on the African continent can be traced back to pre-colonial times when it was still out of the colonial control. But the interest here is to focus mainly on the period after independence. Presently, Leaders of African states are influential actors in the management of Foreign Aid extended

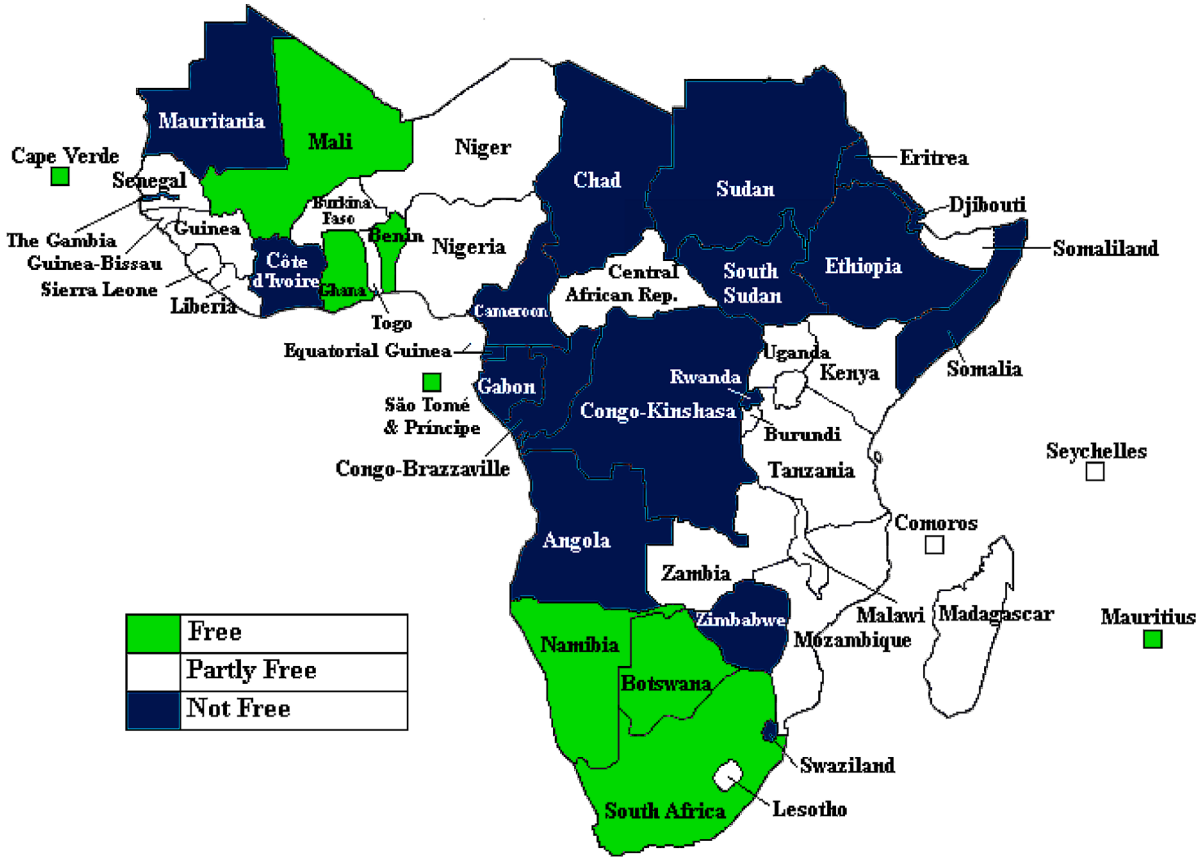
EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

to their countries. Therefore, it is pertinent to gain insight into a theoretical understanding of the nature of African states. These states are not natural geographical entities, but they are an outcome of colonial processes, which swept across the African continent and other colonized areas. Jackson (1997) clearly states that: "Far from being natural entities, modern sovereign states are entirely historical artifacts the oldest of which have been in existence in their present shape and alignment only for the past three or four centuries."

Pre-colonial societies in Africa varied significantly. There were kingdoms, which were ruled via patronage networks. Writers such as Médard & Doyle (2007) observe that African societies were characterized by osmotic ethnic communities with a core area of organized governance with a king or supreme chief and peripheries that were scantly controlled and frequently changed alliances between different ethnic groups. The reach and capacity of pre-colonial African communities was an outcome of wars, alliances and negotiations between the different ethnic communities and were thus in a state of constant flux, lacking territorial demarcations. Berman (1998) argues that "Pre-colonial socio-cultural and political boundaries were marked by fuzziness and flexibility, and Africans existed within a reality of multiple, overlapping and alternative identities." At the time, the British colonialists developed political system based on their policies, which were intended to serve its interest.

It is interesting to note that political leaders have used foreign aid extended to the country to cure their ironical appetite to promote, the polarisation based on personal interests. The situation has been built to favour those in government positions and their kinsmen. It should be acknowledged that most political parties in Africa are backed by foreign assistance, but those especially in powers, their performance has been miserable. It is arguably these political organisations created hatred among the populace. The map (Figure 2) shows the state of political freedom in sub-Saharan Africa.

Freedoms such as freedom of expression, freedom of association, freedom of movement, freedom from discrimination etc. are clearly written in the Constitutions of African countries receiving foreign Aid. But it is evident from the above map that a total of only nine countries in Africa are considered to be politically free. The remaining are either partly free or not free as shown in the map. Pudding (2012) observed that in the period 2007-2011 many African countries declined in freedom which is a fundamental right.



## CONCLUSION

From the foregoing there are multiple types of foreign aid which are given to different countries in Africa by donor communities for multiple reasons. These could be paved with good intentions by the donor to help the recipient improve on its socio-economic and political needs. But as discussed above it can be concluded that the idea of extending foreign aid to third world countries such as those in Africa with the hope that it will lead to its economic and political development stands on a shaky ground. It is noticeable that Foreign Aid does not adequately deliver appropriate results as a catalyst for economic and political development in Africa. Huge foreign Aid in form of finance has been turned into political football in government circles in most of the African states. Whoever plays his/her cards well gets personal benefit. In that regard, it remains a puzzle to profitably aggregate the impact of Foreign Aid. This is because despite huge constant transfer of Foreign Aid to facilitate the "take off," it has always resulted into double economic and political burden. It is perhaps also not to distort and denounce how important is Foreign Aid is, it is true that instead of foreign aid creating an economic environment with

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 2. Freedom in the world 2012*
*Source: africanelections.tripod.com/fh2012.html*

high-income people, many remain poor living a miserable life, while a few particularly those in government positions enjoy the dividends of Foreign Aid. In that lens it can be said with an increasing amount of confidence that Foreign Aid has a mixed effect on economic and political development.

Therefore, it is perhaps important for Africa to change strategies of mobilising resources for its development purpose from foreign sources which have salient strings that curtail development. This will prevent foreign investment and continuous capital transfers used as a tool to pursue the objectives of donor country. Hence, the focus should be on domestic resources and market built on African economic and political needs and structure. This should be out of the rich natural resources endowed to Africa because Foreign Aid is a curse to economic and political development. The intent of developed countries to make developing nations like Africa dependent on them adequately explains the underdeveloped nature of Africa. It is arguably therefore that Africa can equitably economically and politically develop through maximum exploitation of its rich resources. This should be accompanied by strengthening institutional structures and ensuring that strong and competent committed political leadership and efficient technical capacity to enforce development strategies in Africa are properly managed. In addition, Donor agencies and states to Africa should set more Africa-based approach rather than providing foreign aid to facilitate African economies take-off into self-sustained growth and development. This is because donor countries

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

and Aid agencies have transferred a lot of funds to aid to socio-economic and political development but little success is observed in Africa.

## FUTURE TRENDS

Based on the arguments raised in this paper, it is necessary to conduct a more extensive study that will be aimed at revealing the effect of Foreign Aid to democratic and Authoritarian Regimes in Africa. Other possible investigation should be on the interest of Developed World to continue providing Aid to African countries despite the fact that little impact is realised.

## KEY TERMS AND DEFINITIONS

**Complexity Theory:** Attempts to reconcile the unpredictability of dynamic systems with a sense of underlying order and structure.

**Foreign Aid:** The international transfer of capital, goods, or services from a country or international organisation for the benefit of the recipient country or its population. Aid can be economic, military, or emergency humanitarian.

**Political Development:** Means "the increased differentiation and specialization of political structures and the increased secularization of political culture."

**Socio-Economic Development:** The process of social and economic development in a society which is measured by indicators, such as GDP, life expectancy, literacy and levels of employment, personal dignity, personal safety and freedom from fear of physical harm, and the extent of participation in civil society.

# Chapter 16
# Operational Structure of Multinational Enterprises in Africa

**Edet E. Okon**
*University of Uyo, Nigeria*

## ABSTRACT

*The operational structures of Multinational Enterprises (MNEs) in Africa, a developing and emerging economy do not necessarily differ from those of the developed or even Less Developed Economies (LDEs) except in few areas such as size and capital outlay. Meanwhile, both MNEs of African origin and those which originate from outside Africa do have salient attributes: they have many foreign affiliates or subsidiaries in foreign countries; they operate in a wide variety of countries around the globe; the proportion of assets, revenues, or profits is high; their employees, stockholders, owners, and managers are from many different countries; and they are involved in much more than merely establishing sales office, but incorporate a full range of manufacturing, research and development activities. This chapter examined operational structures of MNEs with focus on meaning, attributes, financing, exchange rate risk and international financial investment, strategies for improved financing and outlay of MNEs in selected African countries.*

## INTRODUCTION

African countries continue to experience growth in multinational enterprises which has equally been observed to play a major role in the development of Africa's economy. Multinational Enterprises in Africa dates back to the nineteenth century during the European domination of African territories, where the author is of the opinion that the colonial powers were out for their business exploit mainly to secure materials for their manufacturing industries. This prompted the establishment of foreign branches of MNEs, the headquarters, which already exist in their home countries in Europe or elsewhere in the world. Other factors played as 'raison d'etre' for establishing MNEs in Africa. These include market

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

expansion and technological advancement. Currently, many MNEs indigenous to Africa have sprang-up as a result of globalization with its competitiveness in businesses that are internationally-oriented. The existence of MNEs in Africa, be it of African origin or foreign-based and the spate at which MNEs is expanding in this region largely contribute to the development of Africa's economy; which, at best in global ranking is described as developing.

In order to give more attention to the growth and development of African economy, African countries have come together to form African Multinational Enterprises (AMNEs) at the level of public, private or mixed sectors. AMNEs refer basically to enterprises owned and controlled by more than one African country. The motive behind the formation of AMNEs is for analysis of economic development in Africa with an assessment of regional cooperation and industrial organization. Thus, the pattern of growth – macro and structural – of the African economy; present sub-regional arrangements; potential sources of financing are deciphered in addition to an overview of MNEs and Africa's economy; operational meaning and importance of MNEs and expansion of African economy are the major focus of this chapter.

## BACKGROUND

The world of business is changing and we are now witnessing the beginning of the end of old economic order which has for decades been dominated by the triad economies (US, Europe and Japan). The new economic order is a multi-polar world characterized by multiple centres of economic power and activity (Accenture, 2007). What is most important change about this new order is the remarkable rise of emerging market multinationals (EMMs) while the share and influence of multinational companies from developed countries is declining. Fan (2008) asserts that the market intelligence has become more globalized than ever and this is a major challenge to most multinational organizations around the world. It is also important to note that market development can be viewed from the perspective of multinationals from developed countries and those from emerging markets. Fan (2008) argues that emerging markets multinational firms are more aggressive and ambitious in their operations and are likely to take western multinationals by storm just as Japanese companies did in the late 1970s. These emerging market multinationals are largely from Latin America, Asia Pacific and South Africa.

Mthombeni (2006) described a Multinational enterprises (MNEs), also known as Multinational corporation/company (MNC), Transnational corporation, and by many other names as a "firm that owns or controls income-generating assets in more than one country." The author further posited that a transnational corporation would probably be achieved by linking the firm or company to the form of trade it engages in. Hence, MNE is a company that has established an international presence by engaging in foreign direct investment (FDI). This differs from general trade because FDI represents the physical extension of operations and the investment of equity funds and stock in several countries.

The degree of multi-nationality of firms, Spero and Hart (2003) highlighted as:

1. They have many foreign affiliates or subsidiaries in foreign countries;
2. They operate in a wide variety of countries around the globe;
3. The proportion of assets, revenues, or profits is high;
4. Their employees, stockholders, owners, and managers are from many different countries; and
5. They are involved in much more than merely establishing sales office, but incorporate a full range of manufacturing, research and development activities.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Grunberg (2001) described MNEs as economic firm that have their head offices in their country of origin (their home country) and produce or distribute products or services in foreign countries (the host country) where they establish a branch or affiliate. According to Nickels, McHUGH and McHUGH (2002), a multinational corporation (either multinational enterprise) is an organization that manufactures and markets products in many different countries and has multinational stock ownership and multinational management. Akpan (2003) defined a multinational company (MNC), also known as multinational enterprise (MNE) as a company that does business and has assets in two or more countries. In the words of Rugman and Hodgetts (2003), a multinational enterprise (MNE) is a company that is headquartered in one country but has operations in one or more other countries. The author noted that multinationals often downplay the fact that they are foreign-held as their names may not necessarily indicate where they originate. This also portrays that many large MNEs have world holdings far beyond that which is known to the casual observer, yet these companies have dramatic impact on the quality of the goods and services being produced around the world.

The motivation to invest capital in a foreign country is to provide a return in excess of that obtained domestically. Expansion into foreign markets is the reason for most investment abroad. Other reasons include securing the necessary raw materials, generating foreign exchange, lowering operating costs. Pugel (2007) viewed MNE as a firm that owns and controls operations in more than one country. The parent firm in the MNE is the headquarters or base firm, located in the home country of MNE. The parent firm has one or more affiliates (subsidiaries or branches) located in one or more host countries. Pinelo (1973) described a multinational corporation as one that does most of its business across national boundaries.

Multinational Enterprises have economic power, especially when comparing the annual sales of multinational companies with the Gross Domestic Products (GDP) of some nations. In most cases, the annual sales of MNEs can be larger than the GDP of some nations. This is clear evidence that MNEs offer careers for global businesses. In other words, MNEs are typically extremely large corporations; but not all large firms involved in global businesses are multinationals. For instance, a business could literally be exporting everything it produces, thus delivering 100 per cent of its sales and profits globally, and still not be a multinational corporation. Only firms that have manufacturing capacity or some other physical presence in different nations can truly be called multinational. Needham and Drainsfield (2000) noted that MNEs are mainly Public Limited Companies (PLCs). A multinational is a company with its headquarters in one country but with operations in other countries. Needham and Drainsfield reported that there are over 12,000 MNEs, the largest 500 which account for over 80 per cent of the world's foreign direct investment. Again, some 434 of the world's top 500 MNEs are from what is referred to as the triad blocs of the European Union, Japan and the USA as illustrated in Figure 1.

Similarly, Rugman and Hodgetts (2003) reported that over 60,000 MNEs with largest 500 account for 80 per cent of all worlds' foreign direct investment. Unfortunately, of this number Africa has only one, represented by South Africa. Although the number may change between the year 2000 and 2015, it is observed that there is still an imbalance in the spread of MNEs across the world, with Africa still at the bottom line. A breakdown of these 500 largest multinationals is given on Table 1.

A multinational enterprise has two major areas of concern, namely the home country of its headquarters and host countries which it operates. A multinational enterprise is able to draw on a common pool of resources, including assets, patents, trademarks, information and people. Salient features of MNEs include the fact that the affiliates must be responsive to important environmental factors. These include competitors, customers, suppliers, financial institutions and government. Environmental factors can affect both the home and host country environments. MNEs can use the same suppliers overseas

that they employ domestically and it is common to find home country-based suppliers following their MNE customers to other geographic locals in order to provide the same types of services worldwide.

MNEs can draw on a common pool of resources, including assets, patents, trademarks, information, and human resources. The affiliates are parts of the same company, hence, will have access to assets that are often not available to outsiders. In this case, different companies can compete vigorously in the same environment. For instance, both Ford and General Motors compete vigorously in Europe and many of the design and styling changes developed for their European cars have now been introduced in US models.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

MNEs can link together the affiliates and business partners with a common strategic vision. In this case, the firms with whom the MNE works fit into the company's overall plan of what it wants to do and how it intends to go about implementing the strategy. Companies, therefore, strife to become MNEs for a number of reasons: one of the reasons being to diversify themselves against the risks and uncertainties of the domestic business cycle. By setting up operations in another country, MNEs can often diminish the negative effects of economic swings in the home country. This is a form of diversification. Companies also strive to become MNEs in order to tap the growing world market for goods and services. This is part of the process of growth in an integrated world market, sometimes called "globalization" (the rapid growth of similar goods and services produced and distributed by MNEs on a worldwide scale).

Further, firms can strive to become MNEs in response to increased foreign competition and a desire to protect their home market share. Most MNEs establish operations in the home countries of their major competitors. This strategy serves a dual purpose – it takes away business from their competitors by offering customers other choices, and it lets the competitors know that if they attack the MNEs' home market, they will face a similar response.

Companies also become MNEs in order to reduce costs. Such costs include transportation; overheads that would have warranted through the middlemen, among others. The operation of businesses as MNEs help to tap local resources, make rapid and adequate response to customers' needs and take advantage of local resources through a process known as "internationalization" of control within the MNE, thus, there is cost reduction.

Multinational enterprises also have the ability to overcome tariff and non-tariff barriers by serving a foreign market from within. This is most likely to be when MNE operate within the same region. Within Africa for instance, MNEs of the continent's origin and operating within the region can promote free movement of factors of production without paying tariff.

## MNE IN SELECTED COUNTRIES IN AFRICA

### South African MNCs

According to Taal (2014), South African companies continue to be expanding into the African continent and are experiencing better growth prospects. South Africa's economy is seen as slow to stagnant in comparison to some countries to the north and much like MNCs from abroad, South African MNCs have noticed a growing urbanized population looking for convenience and accessibility. Those companies that are succeeding are those that recognize not just the new wealth of Africa, but the workers, lower income earners who also consider themselves urban consumers. A report in respect of the retail industry showed that in 2010, 25.7 percent of South Africa's overall merchandise export basket was destined for other African markets. By the first half of 2014, this ratio had increased to 30 percent. Therefore, for many South African retailers the future looks to be firmly to the north. In some cases the companies are only hosted in one country outside of South Africa on the African continent. In most cases the bulk of those companies foreign affiliates are offshore – such as is the case with Sappi with a strong presence in North America and Europe, and Network Healthcare Holdings, that has many operations in the United Kingdom. These off-continent operations are not yet tracked. Perhaps, in coming years it would be prudent to do so. Standard Bank Group is present in its various forms in the most countries, nineteen with Shoprite, the pioneer in African expansion, still in sixteen countries. Evidently Mauritius is no longer a favored

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

destination for investment having dropped from three to one company operation. Kenya has also disappeared from the list of South African Multinational destinations, the local companies, it seems proving dominant in their own markets are Swaziland, Zambia Botswana, Lesotho, Ghana, Mozambique, Namibia, Tanzania, Malawi, Nigeria, Uganda, Zimbabwe, Mauritius, Angola, DRC, Guinea, Mali. Host to two companies include: Congo, Kenya, Madagascar, and South Sudan. Host to one company include: Benin, Cameroon, Côte d'Ivoire, Guinea-Bissau, Ivory Coast, Liberia, Mauritania, Rwanda, Sénégal, Sierra Leone, and Sudan. Although the assets will remain, they will be wholly foreign-owned and controlled.

## Transnational Corporations in Egypt

Transnational corporations (TNC), which originate in Egypt, are listed below (see Table 2).

## Nigeria

Nigeria has been a focus for international business investment because of its potential for market expansion as the most populated nation on the African continent. As a result, many advanced nations and other African countries aim to establish their investment in Nigeria. On the other hand, the nation's staggering progress for development, at least, to be at par with her contemporaries decades ago; but which have assumed development status far beyond the line of Nigeria is course for concern. Consequently, government policies in recent times are formulated to attract foreign investment. This has opened the avenue for new comers into the Nigerian Markets to compete with the old entrants. Among the new entrants are China, Japan, South Korea, South Africa, Egypt, among others. Until recently, Nigeria's major investors basically, have been America and Europe. According to Companies and Allied Matters Act (CAMA) 2004 and Investment and Securities Act 2004 (2011 ed.), foreign companies intending to carry on business in Nigeria would have to satisfy the following legal requirements (Table 3):

*Table 2. Egyptian TNCs*

| Company | Sector |
|---|---|
| Abu Qir Fertilizers and Chemical Industries | Chemical and chemical products |
| Al Chark Insurance C0. | Insurance |
| Alexandria Minerals Oils Co. | Food products, beverages, and tobacco |
| Alexandria National Iron and Steel co. | Iron and steel |
| Aluminum Co. Of Egypt | Iron and steel |
| American Group for Food | Diversified group |
| ASEC Cement Co. | Building materials |
| Delta Industrial Company | Engineering |
| Eastern Co. | Diversified group |
| Egypt Air | Air transport |
| Egyptian Aluminum Products Co. | Aluminum |
| Egyptian cement Co. | Building materials |

(Afribiz, 2010)

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Subject to sections 56 to 59 of the Companies and Allied Matters Act (CAMA), every foreign company which before or after the commencement of this Act was incorporated outside Nigeria, and having the intention of carrying on business in Nigeria shall take all steps necessary to obtain incorporation as a separate entity in Nigeria for that purpose, but until so incorporated, the foreign company shall not carry on business in Nigeria or exercise any of the powers of a registered company and shall not have a place of business or an address for service of documents or processes in Nigeria for any purpose other than the receipt of notices and other documents, as matters preliminary to incorporation under the CAMA.
2. Any act of the company in contravention of subsection (1) of this section shall be void.
3. Nothing in this section shall affect the status of:
    a. Any foreign company which before the commencement of this Act was granted exemption from compliance with part x of the companies Act 1968.
    b. Any foreign companies exempted under any treaty to which Nigeria is a party.

## FINANCING OF MULTINATIONAL ENTERPRISES

Grunberg (2001) explained that MNEs finance some portion of their overseas operations by transferring funds from the parent firm in the home country to the branch or affiliate in the home country. This transfer of funds is what is called foreign direct investment (FDI) because it involves engagement in directly

*Table 3. MNEs in Nigeria*

productive activities overseas with the purpose of owning or controlling overseas assets. In essence, FDI is a vital ingredient and key feature of MNEs. It involves the establishment of foreign production facilities or the purchase of an existing foreign business and of acquiring ownership control of such a domestic firm. The control over operations immediately suggests that more than mere flows of financial capital is often accompanied by, inter alia, technological knowledge and increased leverage and management of foreign markets. This further implies that FDI serves as the "backbone of the MNE." The transferring of capital, technology and know-how, mobilizing untapped and under-utilized resources, MNEs can increase productivity, foster growth through its financing power.

Multinational enterprises use flow of foreign direct investment to establish or finance its foreign affiliates. Pugel (2007) pointed out that in two different ways; a multinational enterprise is more than just the flow of foreign direct investment. First, foreign affiliates usually receive only part, and often a rather small part, of their total financing from the direct investment flows. Second, the multinational enterprise transfers many other things to its foreign affiliates in addition to the direct investment financing. The MNE typically provides its affiliates with a variety of intangible assets for the affiliates to use. These intangible assets can include proprietary technology, brand names, marketing capabilities, trade secrets, and managerial practices.

Pugel maintained that a foreign affiliate can obtain financing either from its parent (or other parts of the MNE) or from outside lenders and investors (for instance banks or the buyers of bonds that the affiliate issues). The former is foreign direct investment, whereas, the latter is not. For instance, Pugel reported that in year 2000, for all MNEs in the world, foreign affiliates had $21 trillion of financing in place, in $6 trillion of that financing was provided by foreign direct investment by the multinational enterprises. According to evidence from US – based multinationals borrowing in the host countries provides more than half of the outside financing. The reason for foreign direct investment (FDI) providing so little of the affiliates' total funding as highlighted by Pugel include the need by parent firm to reduce the risks to which its foreign activities are exposed. One of these risks is unexpected changes in exchange rates, which can alter the value of its direct investments. Risk – reducing strategy can be applied whereby a parent company that has foreign – currency assets in its affiliates can take on foreign – currency liabilities as well, by borrowing in foreign currencies that are used to finance the affiliate. This process involves exchange rate risk which includes hedging.

Akpan (2003) opined that for most companies wishing to establish a foreign subsidiary, there are three methods of financing. These are highlighted as follows:

1. Exporting funds (capital). When looking at MNEs of African origin, then export of capital from Africa uses foreign currency, which needs to be bought with African currencies in operation.
2. Raising the funds in the country in which the subsidiary is to be located.
3. Raising funds in one of the international finance markets where interest rates are lowest.

In comparing the alternative sources, Akpan (2003: 98) said, "It should be remembered that the objectives are twofold. Firstly, the company will want to pay the lowest interest possible but secondly, it will wish to minimize exchange rate risk. When assets and liabilities used to finance them are dominated in different currencies, a change in the relative values of the currencies will result in the company incurring exchange rate losses or making exchange rate profits. However, in making international financing decisions, it is desirable to minimize the possibility of such gains or losses. Exporting funds directly from Africa will have the advantage of being relatively simple. There is the further advantage that the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

company is presumably known to investors in its domestic economy. A company of African origin with a good track record can easily raise loan within the continent than as would be obtained outside the continent. The loan being raised in home currency can be used to buy the relevant foreign currency for investment abroad. The problem with this approach to financing is that the company is completely exposed to exchange rate risk. Furthermore, as many countries have fairly stringent exchange control regulations, there may be problems in repatriating funds.

Raising the required finance in the country in which the subsidiary is to be located, is obviously attractive. Having the assets and liabilities denominated in the same currency eliminates exchange rate risk. However, it will rarely be possible to raise all the required finance in a country where the company is not known. Firstly, the parent company will inevitably be required to put up some equity in the new venture. Secondly, capital markets in some countries are not highly developed and it is unlikely that sufficient funds could be raised.

In some cases, direct foreign investment in a subsidiary is initially financed by foreign currency, borrowing from Eurobank or the issue of Eurobond. Eurobank is a bank that participates in Eurocurrency market by accepting deposits and providing loans in foreign currencies. Eurocurrency market is the international money market in currencies of nations outside the locality. Eurocurrency (Eurofunds, Euromoney) is a currency that is circulating outside the nation where it was issued, example, Eurodollars. Eurodollar is a U.S dollar deposited in a foreign bank and used in European money market. Eurobond is an international bond issued in a country other than the one in whose currency the bond is denominated. Eurobond can be issued in any currency but the requirements for ease of conversion and stability have made the U.S. dollar, the Deutschemark, etc the most popular. Euro is the official currency of 11 countries in the European Union. On January 1, 1999, the euro became the single currency of the 11 participating countries – Austria, Belgium, Finland, France, Germany, Ireland, Italy, Luxembourg, Netherlands, Portugal, and Spain. The major disadvantage of overseas borrowing is that the loan has to be repaid in the currency of issue. The borrower thus runs the risk of an exchange loss (or the possibility of gain) should either of the currencies be revalued between the time of borrowing and the time of repayment.

## Exchange Rate Risk and International Financial Investment

Activities of multinational enterprises involve exchange of money. Again, payments or receipt of money are done at future dates with antecedent of uncertainty in knowing the exchange rate that will be practicable as at the future date to translate a country's currency into another. This means that exchange rate changes over time. Pugel (2007) explained that in a floating rate system, spot exchange rates change from minute to minute because supply and demand is constantly at influx. Floating rate sometimes change quickly by large amounts as a result of large shifts in supply and demand. In a fixed – rate system, spot exchange rates can equally change from minute to minute, but the range of the rate is typically limited to a small band around the par value as long as the fixed rate is defended successfully by the government authorities. This does not mean that in a fixed rate system large change cannot occur; but this is often so when the currency is devalued or revalued by the authorities. Of course, some portion of the change in spot exchange rates in either system can be predicted by participants in the foreign exchange market, another part – often a large part – of exchange rate change cannot be predicted.

Therefore, a person or an enterprise such as MNE is exposed to exchange rate risk if the value of income or net worth changes when exchange rates change unpredictably in the future. The fact that exchange rates can change over time calls for two types of responses. Enterprises may try to avoid

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

gambling on what exchange rates would be in the future, can acquire exposures to exchange rate risk in the course of their regular activities but seek to reduce (or eliminate) their risk exposure by 'hedging'. Hedging, a position exposed to rate risk, is the act of reducing or eliminating a net asset or net liability position in the foreign market. On the other hand, enterprises having a fair knowledge of exchange rate may anticipate a rise or fall in exchange rate with expectation to gamble when this occurs in future. In this case, such enterprise is willing to take on hold positions that are exposed to exchange rate risk, and likes to bet that exchange rate will move in their favor so that they make a profit. This process is known as speculation. Put shortly therefore, speculating is the act of taking a net asset position ("long") or a net liability position ("short") in some asset class in a foreign currency.

## SPECIFIC WAYS FOR IMPROVING FINANCIAL BASE FOR THE DEVELOPMENT OF MNEs IN AFRICA

Africa can develop and expand her MNEs through a number of regimes including strengthening her economic institutions such as export – import bank, known as African Export – Import Bank (AFREXIM); African Development Bank (ADB), among others. These institutions can issue bonds, partner with foreign global partners and give loans. African Export-Import Bank, also referred to as Afreximbank, is an International financial institution, headquartered in Cairo, Egypt, whose primary objective is to promote and finance trade within the African continent and trade between Africa and other continents. The headquarters of Afreximbank are located at 72 (B) El Maahad El Eshteraky Street, in the Heliopolis neighbourhood in the city of Cairo, the capital and largest city in Egypt. The bank maintains a second branch at 2 Gnassingbe Eyadema Street, Asokoro, Abuja, the capital city of Nigeria. The bank's third branch is located at Eastgate Building, Third Floor, North Wing, Gold Bridge, in Harare, the capital and largest city in Zimbabwe.

African Export-Import Bank ("Afreximbank or the "Bank") is an international partnership of African States, international organizations, public and private institutions and investors which was set up in 1993 to facilitate additional flow of resources in support of African Foreign Trade. We exist to finance, promote, and expand intra-Africa and extra-African trade. To serve our members we employ three principal delivery channels; extend direct credit to eligible African exporters providing pre- and post-shipment finance; extend direct and indirect credit to the African business community through local African intermediaries comprised by Banks and other African Institutions; promote and finance intra- African trade and support the development of trade finance in all African member states (www.afreximbank.com, accessed 2015).

### Structures of the Bank

The Bank has full juridical personality under the laws of the State Parties to the Bank Establishment Agreement and is endowed with immunities, privileges and concessions pursuant to it. The constitution of the Board and Management reflects its broad constituency, ownership and mandate. The Bank's Board of Directors is comprised by four Directors elected by Class 'A' Shareholders, including one member appointed by the African Development Bank; four Directors elected by Class `B' Shareholders; and two elected by Class C' Shareholders. Members of the Board of Directors are elected for a term of three years and may be re-elected. The Board meets once every three months or as often as the business of

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the Bank may require. The President is an ex-officio member and Chairman of the Board of Directors. News Letter We facilitates the flow of resources in support of African Foreign Trade.

Increased confidence is being shown in the Bank through increased investments by existing shareholders. Issues of Joining the Bank and Accessing Afrexim Bank Facilities: The Bank welcomes partnerships and, applications for membership and applications for credit facilities from eligible entities and individuals who are engaged in the promotion, development and business of trade Finance in Africa as well as those individuals and institutions that either trade with Africa or are interesting in developing trade Finance in Africa. The overarching goal is to harness synergies to finance and develop intra-Africa trade and enhance the region's access to critical imports and exports for sustainable economic development for our region that have a genuine interest in developing trade finance in Africa or ascribe to similar objectives. Therefore, all Independent African States and Institutions; all African Public and private sector Institutions; International Financial Institutions and Economic Organizations that can be able to subscribe for a minimum for each class.

## Strategic Partnerships

Export-Import Bank of China Grants US$100 million Line of Credit to Afreximbank as part of its drive to promote access to essential capital equipment and export, generating imports, the Bank, has intensified efforts to diversify its sources of funding by aggressively mobilizing funds under its ECA Loans Facilitation Program. Under this program, the Bank selectively works with other ECAs to promote the acquisition of essential goods, especially capital goods and/or services by African counterparties. On May 13, 2009 the Bank signed a US$ 100 million Trade and Project Financing Facility with Exim Bank of China. Under the Facility, US$20 million will be used by Afreximbank to fund short-term trade finance activities and US$80 million will be channeled into medium term project finance on-lending to its clients in support of acquisition of a variety of Chinese goods and services from a broad range of sectors including, industry and agro-industry, telecommunications, energy and environmental protection, transportation, water supply and sanitation.

The African Export – Import Bank (AFREXIM) continues to partner with trading giants globally to expand its horizon in investments. Bloomberg (2015) reported that AFREXIM is to generate over $1 Billion in bonds and loans in Renminbi, the Chinese currency, as trade with China rises. Bloomberg, who quoted Jean-Louisa Ekra, President of the Cairo-based lender, as saying a Eurobond of between $400 Million and $600 Million might in turn be sold in the Month (June 2015), spoke in Abidjan, Ivory Coast where the bank opened its third regional office after Harere in Zimbabwe and Abuja. According to Bloomberg, the firm will seek the loan from 35 banks later in the year.

Meanwhile, the reason to raise fund in Chinese currency may not be unconnected with the increasing volume of trade between Africa and China in recent years. This assertion is confirmed by Bloomberg who posited thus: "AFREXIM is considering borrowing in Chinese renminbi to take advantage of rising trade in Africa with China, which is the top trading partner of Africa's five-largest economies, including South Africa, Nigeria and Angola", P.26.

## AFREXIM Bank Responds to the Economic Crisis

The negative consequences of the global economic crisis on African trade and trade finance are currently being seriously felt on the African continent. Afreximbank understands the ramifications of the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

current global financial crisis on African trade and trade finance, given its history and raison d'etre. The Bank was established in 1993 to deal with a similar credit crunch that Africa was facing. To assist its member countries satisfy essential import needs given the drastic cut in credit lines, the Bank is actively: deepening existing business relationships with core OECD partner banks to ensure that credit lines from those banks are maintained; and intensifying its program of expanding partnership arrangements with Pan-African entities, including African Development Bank (AfDB), Africa Finance Corporation (AFC), ECOWAS Bank for investment and Development (EBID), African Trade Insurance Agency (ATI), Shelter Afrique and the Eastern and Southern African Trade and Development Bank (PTA Bank), for the purpose of pooling technical and financial resources as well as sharing risks in the funding of viable trade and project ventures. Discussions are also ongoing with major multilateral institutions to ensure that the Bank can support the increased demand for its services. Afreximbank understands the current global financial crisis. Hence, the Bank is also championing the creation of an Alliance of African International Financial Institutions (AAIFI), made up of African multilateral financial institutions and multinational banks. The move will assist Bank members to share business risks, financial resources, and expertise in such a way as to allow member institutions achieve their mandate efficiently in the collective interest of the Continent.

## African Development Bank

African Development Bank Group (AfDB) is a multilateral development finance institution established to contribute to the economic development and social progress of African countries. The AfDB was founded in 1964 and comprises three entities: The African Development Bank, the African Development Fund and the Nigeria Trust Fund. The AfDB's mission is to fight poverty and improve living conditions on the continent through promoting the investment of public and private capital in projects and programs that are likely to contribute to the economic and social development of the region. The AfDB is a financial provider to African governments and private companies investing in the regional member countries (RMC). While it was originally headquartered in Abidjan, Côte d'Ivoire, the bank's headquarters moved to Tunis, Tunisia in 2003, due to the Ivorian civil war; before returning in September 2014.

The historical birth of the bank could be traced to the end of the colonial period in Africa, where there was a growing desire for more unity within the continent which led to the establishment of two draft charters, one for the establishment of the Organization of African Unity (established in 1963, later replaced by the African Union), and for a regional development bank. A draft accord was therefore submitted to top African officials, then to African Ministers, before being cosigned by twenty-three African governments on August 4, 1963, in the form of an agreement establishing the African Development Bank. The agreement came into force on 10 September 1964. Although established officially under the auspices of the Economic Commission for Africa, the AfDB began operation in 1966. Originally, only African countries were able to join the bank. However, since 1982 it has allowed the entry of non-African countries as well. During its forty years of operations, AfDB has financed 2,885 operations, for a total of $47.5 billion. In 2003, it received an AAA rating from the major financial rating agencies and had a capital of $32.043 billion. The African Development Bank Group has two other entities: the African Development Fund (ADF) and the Nigeria Trust Fund (NTF).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## African Development Fund

This was established in 1972. The African Development Fund started operations in 1974. It provides development finance on concessional terms to low-income RMCs which are unable to borrow on the non-concessional terms of the AfDB.

In harmony with its lending strategy, poverty reduction is the main aim of ADF activities. Twenty-four non-African countries along with the AfDB constitute its current membership. The largest ADF shareholder is the United Kingdom, with approximately 14% of the total working shares followed by United States with approximately 6.5 percent of the total voting shares, followed by Japan with approximately 5.4 percent. The Federal Reserve Bank of New York was designated as the depositor bank for the fund according to telegraphs sent from the U.S. Embassy in Abidjan in 1976. The ADF's general operations are decided by a Board of Directors, six of which are appointed by the non-African member states and six designated by the AfDB from among the bank's regional Executive Directors. The ADF's sources are mainly contributions and periodic replacements by non-African member states. The fund is usually replenished every three years, unless member states decide otherwise. The total donations, at the end of 1996, amounted to $12.58 billion. The ADF lends at no interest rate, with an annual service charge of 0.75%, a commitment fee of 0.5%, and a 50-year repayment period including a 10-year grace period. The tenth United Kingdom replenishment of the ADF was in 2006.

## Nigeria Trust Fund

The Nigeria Trust Fund (NTF) was established in 1976 by the Nigerian government with an initial capital of $80 million. The NTF is aimed at assisting in the development efforts of the poorest AfDB members. The NTF uses its resources to provide financing for projects of national or regional importance which further the economic and social development of the low-income RMCs whose economic and social conditions require financing on non-conventional terms. In 1996, the NTF had a total resource base of $432 million. It lends at a 4% interest rate with a 25-year repayment period, including a five-year grace period.

## Management and Control

In terms of management and control, the AfDB is controlled by a Board of Executive Directors, made up of representatives of its member countries. The voting power on the Board is split according to the size of each member's share, currently 60%-40% between African (and "regional") countries and "non-regional" member countries ("donors"). The largest African Development Bank shareholder is Nigeria with nearly 9 percent of the vote. All member countries of the AfDB are represented on the AfDB Board of Executive Directors. Mr. Donald Kaberuka is the 7th elected President of the African Development Bank Group, having taken the oath of office on September 1, 2005. However, the baton will be changed in August 2015, following the election on May 2015 which saw the emergence of Nigeria's outgoing Minister of Agriculture and Rural Development, Akinwumi Adesina. Adesina on assumption of office on August 2015 will be 8th President of the African Development Bank (AfDB). Mr. Adesina, 55, will succeed incumbent president, Donald Kaberuka, at the end of his second term as President of the Bank in August 2015. He chairs the Boards of both the African Development Bank and the African Development Fund. Mr. Kaberuka is a former finance minister of Rwanda.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Member governments are officially represented at the AfDB by their Minister of Finance, Planning or Cooperation who sits on the AfDB Board of Governors. The AfDB Governors meet once a year (at the Annual Meetings of the AfDB each May) to take major decisions about the institution's leadership, strategic directions and governing bodies. The Governors typically appoint a representative from their country to serve in the offices of the AfDB's Board of Executive Directors. Day-to-day decisions about which loans and grants should be approved and what policies should guide the AfDB's work are taken by the Board of Executive Directors. Each member country is represented on the Board, but their voting power and influence differs depending on the amount of money they contribute to the AfDB. The African Development Bank is using a Unit of Account which is registered as XUA as ISO 4217 standard currency code. It is not exchanged directly by individuals; it is used for accounting between state members.

The primary function of AfDB is making loans and equity investments for the socio-economic advancement of the RMC. Second, the bank provides technical assistance for development projects and programs. Third, it promotes investment of public and private capital for development. Fourth, the bank assists in organizing the development policies of RMCs. The AfDB is also required to give special attention to national and multinational projects which are needed to promote regional integration.

The AfDB promotes economic development and social progress of its RMCs in Africa and the bank commits approximately 3 billion dollars annually to African countries. It's relatively small lending and tendency to follow in the footsteps of more prominent public institutions like the World Bank, implies that the African Development Bank has been receiving little interest from civil society organizations as well as academia. AfDB emphasizes the role of women along with education reforms, and lent its support to key initiatives such as debt alleviation for Heavily Indebted Poor Countries and the New Partnership for Africa's Development (NEPAD). The Bank is currently based in Tunis, Tunisia after relocating from its headquarters in Abidjan, Côte d'Ivoire because of instability there. It employs approximately 1,020 employees as of 2007, and has 78 members: 53 countries in Africa and 25 American, European, and Asian countries.

One of emerging views, repeatedly cited by the AfDB's Board of Directors and management, is that the AfDB should be more "selective" and "country-focused" in its operations. Though this policy has still to be clearly defined, it appears to be driving certain lending priorities. The infrastructure sector, including power supply, water and sanitation, transport and communications, has traditionally received the largest share of AfDB lending. This focus was re-affirmed in the AFDB's 2003-2007 Strategic Plan, which identified infrastructure as a priority area for AfDB lending. In 2005, the AfDB approved 23 infrastructure projects for approximately $982 million, which totaled 40 percent of AfDB approvals that year. Given the increased attention to infrastructure development in Africa from donors and borrowers, it is likely that AfDB's infrastructure lending will increase significantly in the coming years. In 2007, infrastructure operations accounted for approximately 60 percent of the bank's portfolio. Regional integration infrastructure projects will be a key part of the AfDB's future business. According to the AfDB's *2005 Annual Report*, regional economic blocs will make Africa "more competitive in the global market", while transport and power interconnections between smaller African economies will help create larger markets in the continent. The AfDB's member countries claim that AFDB, as a multilateral institution, is particularly suited to support regional integration projects.

The AfDB has been designated the lead agency to facilitate "NEPAD infrastructure initiatives", which are regional integration projects led by African Regional Economic Communities (RECs). Additionally, the AfDB hosts the Infrastructure Consortium for Africa (ICA). The ICA was established by G8 countries to coordinate and encourage infrastructure development in Africa, focusing on regional infrastructure

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

development in particular. The AfDB helps to prepare projects so they may obtain financing from others sources through an initiative called the Infrastructure Project Preparation Facility (IPPF). So even if the AfDB is not directly involved in financing a particular infrastructure project, it may have helped to make it possible.

Energy projects are likely to become a more important area of the AFDB's infrastructure work, given the lack of access to energy services across Africa and continued high oil prices affecting oil-importing countries. It is not clear if the AFDB's role in the energy sector will prioritize energy projects for domestic consumption or for export, although the AfDB has supported both in the past. The AFDB is currently drafting an energy policy and developing its contribution to the G8-mandated Clean Energy Investment Framework. Although there is no official statement or consensus to this effect, AFDB lending for agriculture, (non-infrastructure) rural development and social sectors, such as health and education, is reportedly likely to decrease over the coming years.

The AfDB's financial standing has been restored from the near collapse of 1995, but its operational credibility remains a work-in-progress. A working group convened by the Center for Global Development, an independent Washington think tank, released a report in September 2006 that offered six recommendations for Bank's president and board of directors on broad principles to guide the Bank's renewal. The report contains six recommendations for management and shareholders as they address the urgent task of reforming Africa's development bank. Prominent among the recommendations is a strong focus on infrastructure. AfDB is still a relatively small source of development finance for Africa. According to the most recent figures, the AfDB provides only 6 percent of total development assistance to the continent. Through its International Development Association (IDA), the World Bank annually approves about four times more in low-interest loans and grants to Africa than the AfDB does. The AfDB lacks the financial resources, the staff capacity and the range of staff skills and experience of the World Bank. For example, at the World Bank there is more than four times the number of staff working on any given project than at the AfDB. A number of the AfDB's projects, especially its policy loans, are financed jointly with the World Bank and other donors. The AfDB also relies extensively on World Bank research and analysis. As a larger institution and often the lead financier on joint projects, the World Bank attracts more attention than the AFDB.

While the AfDB's lending had not expanded significantly in recent years, 2006 figures indicate that things may be changing. Between 2005 and 2006, the AfDB's lending activities increased by more than 30 percent to $3.4 billion. Over the same period, private sector operations doubled in value. The AfDB has specific mandates from the New Partnership for Africa's Development (NEPAD) and other international organizations to take the lead amongst financial and development institutions in areas such as infrastructure, regional integration, and banking and financial standards in Africa. These mandates have also increased the AfDB's profile in the media. The increased international emphasis on Africa's development needs in recent years (for example, surrounding the 2005 Gleneagles G8 Summit), and on the importance of infrastructure investment in Africa, has highlighted the role of the AfDB.

Some research have indicated that a high percentage of respondents in African countries have marked preference for additional aid from the African Development Bank, despite its relatively low rating against most of the aid effectiveness criteria found to be important by donor recipients. This suggests that donor recipients in Africa views on the 'multilateral donor of choice' are informed by additional aid effectiveness criteria that are not commonly identified or reported against, though exactly what those criteria have not been discussed.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In general, whereas there have been progress at all levels with regard to democracy, growth and restoring the macro-economic balances in Africa over the past fifteen years, half of sub-Saharan Africa lives on under one dollar a day, and AIDS is threatening the social fabric of the continent. The studies conducted by various organizations (including the African Development Bank and the World Bank) show that, with the exception of northern and southern Africa, the United Nations Millennium Development Goals (reducing by half the number of persons living in poverty and without access to potable water by 2015) will in most cases not be attained. Nevertheless, these same studies indicate that the majority of the African countries can make notable progress to these ends.

## CHALLENGES FACING MNEs IN AFRICA

According to Khan (2014), globalization may be a fact of life, but it remains highly fragile. Embedding global market forces in shared values and institutionalized practices, and bridging the gaps in global governance structures are among the most important challenges faced by policymakers and corporate leaders alike. According to Khan, MNEs face other equally important challenges such as ability to adapt to the cultural differences, standards and practices. Again, the author stated that the challenge of political instability is traditionally associated with developing or emerging countries for MNEs coming from developed nations where MNEs from developing countries consider economic risk such as exchange rate risk as a greater challenge. Also, appropriate market segmentation, relating to the low spending power of the major part of the market and developing effective marketing strategies to apply in different sections of the transforming society are other major issues facing MNEs in emerging markets, the author further stressed. Other challenges highlighted by Khan include: balancing the price and quality; understanding the influence of institutions such as judicial system, political system, education system and mixes of traditional local culture and modern global culture; industrial infrastructure is inefficient, lack of intellectual property right protection, high tariffs, expensive bureaucracy, ambiguous rules and regulations, monopolistic practices, control of distribution systems, unreliable and low quality suppliers; high price sensitivity, local needs and limited purchasing power are the characteristics of emerging markets; absence of specialized intermediaries, regulatory system and contract-enforcing mechanisms are other critical issues in the emerging markets. Other risks for MNES are: transactional risks, income risks from operation, income risks from financing, and accounting risks due to fluctuations in the rate of exchange of the local currency; political risks, inflation risks, bank instability, and legal risks (Khan, 2014). Further, the author noted that corporate social responsibility is growing challenge for the MNEs operating in emerging countries. MNEs are expected to balance their role in economic development with social responsibilities toward the country in which they operate.

It is a fact that MNE has global outlook, hence, is prone to competitive abilities. It is therefore important for multinationals from developing countries such as those in Africa, among others to carefully assess the impact of MNEs in the advanced nations if they have to succeed in their market development strategies. Failure to do this will immensely harm their market development initiatives (Fan, 2008). Another market development challenge for multinationals in Africa is how to create new competitive advantages in the market. The establishment of MNE in Africa should therefore characterize with pre and post establishment learning about organizational behavior. This is crucial for them to fulfill a successful catch up strategy, and this learning process is likely to be long and expensive, especially where the technology continues to advance rapidly and competition from the incumbent firms remains fierce. African Multi-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

nationals must be serious in acquiring and accumulating business skills, new knowledge and expertise to be able to operate with cost-based competencies and location-based advantages and have ownership or firm specific advantages. Multinational Companies in Africa is equally challenged by cultural distance in their efforts to develop new markets. Each African country has her cultural milieu and Multinational firms have a country of origin that has got a culture different from other countries. Since cultures differ across national boundaries, it may be difficult to agree in business terms where such agreement is in conflict due to cultural barriers of the countries involved. In view of the forgoing, the management team of a multinational who intend to develop a new market need to understand the culture of the host country of their new market if sound and acceptable decisions must be taken for market development. In other cases, the challenge of skill gap in managerial ability among African countries and between Africa and the outside world is posing threat to market development and expansion. The managerial competences and practices found in African countries tend to differ from those of the advanced economies, making African MNEs to continue in hiring the services of foreign experts. African multinational firms entering new markets are facing stiff competition globally. This can result in MNEs in African quitting the market. This may be compounded when considering the cost implication. When the costs involved is so high, it may affect returns, especially where there is external financing resulting in very high liability ratio. Other challenges affecting African MNEs include low level of business technology, poor market information and limited research output; product and packaging modifications; logistics; ineffective distribution networks due to inadequate transportation infrastructure and trade restrictions.

## THE ORGANIZATIONAL STRUCTURE OF A MULTINATIONAL COMPANY

According to Bert Markgraf, Demand Media, Multinational companies, especially smaller ones, face more organizational challenges than companies operating in only one national market. They have to maintain functional organizational units, but they have to fulfill these functions in different ways, depending on where the business in operating. The essential challenge is to create differentiated organizational units responsible for the foreign markets while coordinating operations across the whole company.

### Functional

A functionally organized multinational company uses corporate functions as the basis for its organizational structure. Production, human resources, design and customer service are typical functional units. If a functionally organized company has a centralized structure, all operations are based in the home country and individual employees have responsibilities for different national markets. This type of organization is efficient and effective for companies that are too small to have overseas subsidiaries. Larger companies can have this type of organization, but in a decentralized form, where foreign employees carry out some of the work in their own countries. In this case, companies have to pay special attention to coordinating activities.

### Geographic

A common form of organizational structure for larger companies and businesses that require a presence in the foreign markets is one that is based in geography. In addition to the home office or headquarters,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

semi-independent operations are established in the countries where the company is active. For larger corporations, these can take the form of subsidiaries, while smaller companies can have something as simple as an agent or a small office. This structure affords flexibility; the head office can transfer responsibilities abroad if required by local conditions and if the foreign operation is competent, but it can also take over local operations if needed.

### International Division

One way multinational companies can accommodate foreign operations without disrupting the organization in their home market is to create an international division. This structure is suited to larger corporations, but it is also effective for smaller companies that have an established home market and a rapidly growing international business. It leaves the company free to maintain the focus on its home market in its main organization while leaving the international division free to adapt to the foreign markets in which it is active.

### Matrix

A matrix organizational structure combines the efficiency of the functionally organized company with the flexibility of extensive local operations. Foreign workers report to local managers for questions about their work, while they report to the head office for all other functions. The home organization retains control of disciplinary matters, pay and promotions, while the employees carry out the work according to local requirements. This is a suitable organizational form for smaller companies active in only one or two foreign markets, but it is mainly used by larger corporations who have extensive foreign operations.

Nigerian National Petroleum Corporation (NNPC) is the state oil corporation through which the federal government of Nigeria regulates and participates in the country's petroleum industry. NNPC was established on April 1, 1977 as a merger of the Nigerian National Oil Corporation and the Federal Ministry of Mines and Steel. NNPC by law manages the joint venture between the Nigerian federal government and a number of foreign multinational corporations, which include Royal Dutch Shell, Agip, ExxonMobil, Chevron, and Texaco (now merged with Chevron). Through collaboration with these companies, the Nigerian government conducts petroleum exploration and production. In 2007, the head of the Nigerian wing of Transparency International said salaries for NNPC workers were too low to prevent graft. The NNPC Towers in Abuja is the headquarters of NNPC. Consisting of four identical towers, the complex is located on Herbert Macaulay Way, Central Business District Abuja. NNPC also has zonal offices in Lagos, Kaduna, Port Harcourt and Warri. It has an international office located in London, United Kingdom.

## FINAL THOUGHTS

African countries are increasing committed to the development of Multinational Enterprises (MNEs) in this 21st Century. In view of this, these countries are strengthening their integration ability to overcome the consequences of financial risks, limited market and low competitiveness ability. Among African countries, therefore, indigenous Multinational Enterprises are springing up with potentials for global competitiveness. For instance MTN group, a MNE with origin in South Africa is cutting across conti-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

nents with very large market. On the other hand, Multinational Enterprises originating from advanced countries of Europe and America with affiliates in Africa are providing strong competition to Africa's MNEs. Institutions such as African Development Bank (AfDB), New Partnership for African Development (NEPAD) are strategic enough to provide the financial and specialized know-how for the sustenance of existing African-based MNEs and provide platforms for establishing more.

## Promoting MNEs through Africa's (Regional) Economic Integration

One of the most recent and vibrant economic grouping that has dynamics to create an atmosphere for expanding business horizon that can in turn promotes the development of MNEs with origin in Africa is the New Partnership on African Development (NEPAD). According to Akanbi (2006), the NEPAD was established as a child of necessity in 2003. It was conceived by African leaders, midwifed through consultations with global partners, and delivered within the continent in order to address the myriads of contemporary socio-economic and political challenges facing Africa at the dawn of the 21st Century. These challenges, the author highlighted to include extreme poverty. Akanbi noted that NEPAD is set against clearly identified objectives to:

1. Make Africa attractive to both domestic and foreign investors;
2. Tap the vast economic potentials of the continent;
3. Achieve and sustain an average GDP growth rate of over 7 per cent per annum by 2015;
4. Ensure that the continent achieves the agreed International Development Goals (MDGs);
5. Increase investment in human resources development
6. Promote sub-regional and continental economic growth, among others.

In a view to implementing the objectives of NEPAD, certain strategies have been put in place by NEPAD. These strategies include:

1. Capital Flows Initiative (CFI), including debt relief, private capital flows and Foreign Direct Investment (FDI);
2. Market Access Initiative (MAI), including export diversification, barrier removal and value addition, Manufacturing, Mining, Services and Tourism;
3. Bridging the Infrastructure Gap, in energy, transport, education, health, water and sanitation;
4. Bridging the Digital divide through investment in Information and communications Technology (ICT);
5. Human Resource Development Initiative, including reversing the Brain Drain Syndrome; among others.

The objectives of NEPAD and strategies mapped out for implementing these objectives highlighted above point to the endearing nature of Africa's environment for MNEs to thrive.

## CONCLUSION

Based on the facts enunciated in this chapter, it is concluded; among others that Multinational Enterprises in Africa have functional, geographical, international division and matrix organizational structures. Africa's multinational enterprises use corporate functions as the basis for its organizational structure. These include production, human resources, and design and customer service units. Consequently, all operations are not based in the home country. Also, Africa's MNEs in addition to the home office or headquarters have semi-independent operations established in the countries where the company is active with few countries outside Africa. Multinational companies in Africa also create international division by leaving the company free to maintain the focus on its home market in its main organization while leaving the international division free to adapt to the foreign markets in which it is active. It is also concluded that MNEs in Africa combines the efficiency of the functionally organized company with the flexibility of extensive local operations. Foreign workers report to local managers for questions about their work, while they report to the head office for all other functions. The home organization retains control of disciplinary matters, pay and promotions, while the employees carry out the work according to local requirements.

Given the spate at which MNEs are flourishing in Africa as an alternative market in the emerging economy's context, the operational structures of these MNEs are becoming more fascinating and dynamic. This holds more productive ability in the near future.

### Recommendations

In view of the conclusions drawn the following recommendations are made:

1. The relatively bigger countries in Africa should invest in the relatively smaller countries through the establishment of MNEs in those countries.
2. Multinational Enterprises in Africa should pay attention to products which Africa has absolute advantage.
3. MNEs operation in Africa should focus on production of finished goods to add value to products.
4. Africa should encourage the development of indigenous MNEs through tax rebate and low tariff.
5. There should be a concerted effort by African countries to encourage the use of e-business to eliminate geographical divide in business operations within and outside Africa.

## KEY TERMS AND DEFINITIONS

**Economy:** Describes the productive and consumption ability of a country, region, continent and even the entire globe and the monetary inflow and outflow resulting in these economic activities.

**Exchange Rate:** Ratio in which a country's currency translate with the currency of other countries in the international (exchange) market.

**Exchange Rate Risk:** Loss associated with currency exchange due to disparity in value.

**Multinational Enterprises in Africa:** These are those MNEs which have either parent or subsidiaries for business operation within African continent.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Operational Structures:** Are issues and components, which facilitate the performance of an organization. In this context, they are issues and components which facilitate the performance of MNEs in Africa.

**Parent Company:** The operational headquarter of a Multinational Enterprise.

**Strategic Partnership:** Union of corporate bodies or countries for the integration of ideologies and economic prospects where they have diverse advantage for improvement in the economy.

**Subsidiary:** An affiliate or branch office of a Multinational Enterprise usually located across countries globally.

## ABSTRACT

*Business incubation programme has been adopted by numerous countries globally. Its adoption has been related to its performance and actual contribution to entrepreneurship development. Studies have acknowledged the role of incubation programme to different spheres of national economy. In spite of the positive side of incubator model, there is still a contradiction concerning incubation performance in the developing countries, especially, Nigeria. This study aims to examine the contribution of government policy on the relationship between the critical success factors (CSFs) and incubator performance in Nigeria. Questionnaires were distributed to a sample size of 153 respondents from a population of 253 incubatees. The Partial Least Squares (PLS) software was used to analyze the data. Government policy as a moderator did not show a significant moderation relationship between the CSFs and incubator performance. The study recommends that future studies should integrate this quantitative approach of data collection with the qualitative method. Also, as the value of the coefficient of determination is 46%, future research should look at other factors which may likely increase the variation in performance explained by (or accounted for by) the variation in the CSFs.*

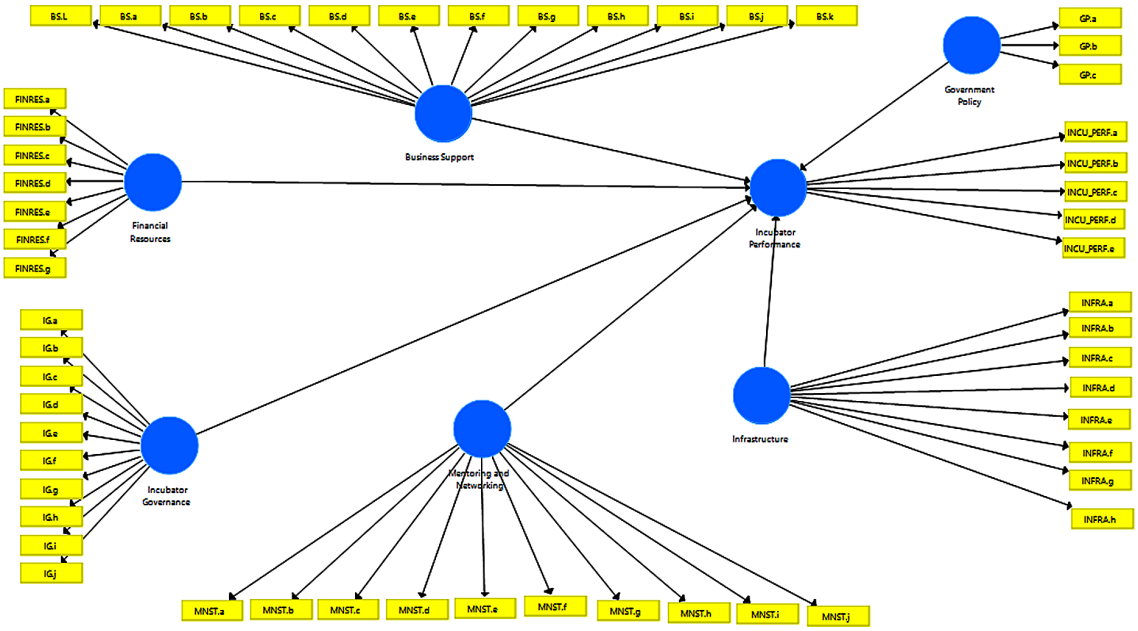
## INTRODUCTION

Business incubation has variously been described as a support programme that assist the early-stage entrepreneurs to develop and stay on their own. Chandra and Fealey (2009), defined incubator as an environment that encourages the creation and development of new businesses, especially those with innovative and intensive intellectual content. Furthermore, business incubation programme has been acknowledged as an economic development tool most countries globally adopted (Al-Mubaraki, Muhammad, Busler, Ahmed, & Ahmed, 2015; Salem, 2014). The fundamental idea behind the business incubator is to offer fledgling businesses with series of resources and services associated with establishing the businesses (Al-Mubaraki & Busler, 2013). In determining the performance of incubation programme, especially in the developing countries, governments' attitudes towards incubation contribute a very significant function for the reason that incubators in developing countries are typically financed by government. Studies have shown that business incubation programme has grown progressively significant within both developed and emerging nations. Furthermore, in the industrialized nations, incubators are primarily driven in the direction of high technological innovation businesses. Another highlight is the existence of a robust linkage among invention, academes as well as business incubators.

Despite the positive affirmation of business incubation, there is lack of studies related to its performance such that it is argued whether the programme is effective or not. As a result, there is a questionable evidence on incubation performance in the developing countries, especially, Nigeria. Furthermore, ever since the business incubation initiative was established in 1993, the programme seemed to have failed to live up to anticipations. For this reasons, this study looks into the salient role of government policy towards incubation performance in Nigeria. This will be done by employing a quantitative research approach whereby surveying stakeholders (incubatees) who are directly involved in the day-to-day incubation activities will be surveyed. This study provides a conceptualisation of business support, infrastructure, financial resources, networking, incubator governance as well as government policy, and joins those constructs using the resource based view (RBV) and institutional theory as supporting theories as depicted in Figure 1. Despite many studies that have investigated various factors that influence Incubator performance, most of them were conducted mainly in Asia, United States of America (USA), Australia and Europe while paying less attention to the African continent, particularly in Nigeria. Hence, Incubator Performance deserves further investigation in Nigeria because the findings of the previous studies may not be generalisable to the Nigerian context due to cultural and contextual differences.

## LITERATURE REVIEW



### Resource Based View

With respect to the RBV theory, is the development of competitive advantage that bridges government support programmes to superior financial performance. This assumption is grounded in the RBV of the firm (Amit & Schoemaker, 1993; Barney, 1991). Before the advent of the resource-based theory (Barney, 1991), the main strategic management thinking concentrated on external factors such as (industry position) that determined company profitability (Allen & Wright, 2006). However, with the advent of the resource-based view (Barney, 1991; Wernerfelt, 1984), strategic management research has moved to a more internal focus in accounting for firm performance (Allen & Wright, 2006; Barney, 1991). The

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 1. Conceptual Framework*

resource-based view (RBV) of the firm has become one of the most widely used theoretical frameworks in the management literature. The emphases of RBV are competitive advantages generated by the firm, from its unique set of resources (Barney, 1991; Barney, 1986; Peteraf, 1993; Wernerfelt, 1984).

In accordance with the RBV, although resources (such as financial resources) are important, companies need to develop unique, inimitable assets and capabilities that will set the foundation for sustainable competitive advantage. In a competitive environs, businesses deploy their physical, human, and organizational assets to gain an advantage in the marketplace (Day & Wensley, 1988)). If these resources and capabilities are valuable to businesses, rare, and difficult to imitate, then these assets give rise to sustainable competitive advantage(s), enhancing the performance of firms (Barney, 1991; Barney, Wright, & Ketchen, 2001; Wiklund & Shepherd, 2003). Among various intangible assets that a firm possesses, business support, government policy is considered some of the most important because these skills sets are deep-rooted into the daily practices of an organization and, as such, are problematic for competitors to copy (Zhou, Li, Zhou, & Su, 2008).

The RBV suggests that firms ought to consider internally to their resources, both physical and intellectual, for sources of competitive advantage. The key assumptions of RBV as recommended by scholars (Newbert, 2008; Takeuchi, Lepak, Wang, & Takeuchi, 2007; Wright, Dunford, & Snell, 2001) are that resources that are valuable, rare, inimitable, and non-substitutable will produce competitive advantage. Value in this perspective is defined as resources either utilizing opportunities or neutralizing threats to the organization and rarity is defined as a resource that is not currently available to a large number of the organization's current or future competitors (Barney, 1991). Inimitability refers to the difficulty other firms have in copying or reproducing the resources for their own use. Finally, non-substitutability means that other resources cannot be used by competitors to reproduce the benefit (Barney, 1991). When all of these are met, it is said that the firm or organization possesses resources which can potentially result in sustained competitive advantage over time (Allen & Wright, 2006; Barney, 1991).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The theory has been critiqued for its lack of managerial implications (Priem & Butler, 2001). Researchers (Connor, 2002; Miller, 2003) have critiqued the theory based on the fact that it only tells managers to obtain VRIN resources instead of how to do it. The theory has not paid attention to where firms obtain their resources (Barney & Clark, 2007).

The RBV is applied in the study for the reason that the theory focuses on an enterprise level of analysis as suggested by Peteraf and Barney (2003). Furthermore, the theory focuses on the resources and capabilities controlled by an organisation that underlie performance differences across organisations. Barney (1991); Peteraf (1993) viewed performance differences as earnings differentials attributable to resources having different levels of efficiency.

## Institutional Theory

Institutions have been defined as regulative, normative and cognitive structures and activities that provide stability and meaning for social behaviour (Scott, 1995 p.33). Laws, regulations, customs, social and professional norms, culture, and ethics are some of the examples associated with institutions.

Furthermore, from institutional theory (North, 2006), we take the arguments of how government financial support can influence the initial resource flows for new businesses either through direct financial resources (e.g. seed capital) or through legitimacy-enhancing mechanisms (e.g. policy mandating banks to set aside certain amount from their profit to support start-ups on low interest repayment basis) that ease access to recourses such as bank financing. Thus, we offer a theoretically model depicting the importance of competitive advantage as a measure of the outcome of incubator performance using government support policies. In addition, institutional theory which is consistent with incubator development is largely affected by legal policies and local authority, government as well as university support (Eisenhardt, 1988; Scott, 2005). As numerous incubators are not-for-profit; in line with this incubator programme is a social service which depends wholly on government funding. Therefore, government policy related to funding for social service such as Technology Business Incubator (TBI) will operationally affect the programme. Furthermore, incubators and other business support programme facilitator such as science parks, technology parks in many cases arise from public-private partnerships.

## Hypotheses Development

### Business Support

Typically, business incubators offer incubatees the much needed business support services as one of the resources needed by the tenants to be sustained and eventually become fully matured, therefore business support is seen as a very important aspect of incubation process.

To better understand the relationship between business support and incubator performance, the current study borrows from resource based view (Barney, 1992; Penrose, 1959; Somsuk & Laosirihongthong, 2014) which view firms as an assemblage of unique resources and capabilities that are valuable, rare, inimitable and non-substitutable (VRIN) and which offer the firms with sustainable competitive advantage.

In relation to the resource based view of the firm, Amit and Schoemaker (1993) reported that although firm's tangible resources are important, the key focus is placed on the intangible skills and resources of the firm as they are viewed to be non-tradable, more difficult to imitate and take time to build internally.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Other authors both prior and contemporary who found business support to be an important element for incubator attainment include (Allen, 1985; Barrow, 2001; Campbell, Kendrick, & Samuelson, 1985; Knopp, 2007; McAdam & McAdam, 2008; Smilor & Gill, 1986; Xu, 2010). The lack of business assistance usually affects the programme performance because those business assistance are more often than not the basis for attracting entrepreneurs to the incubator. Therefore, lack of business assistance or support affect the programme for the fact that the essence of coming to the incubator is to get business support such as coaching, training, business development and book-keeping. Once there are absence of all these, incubator performance will be affected negatively.

It is hypothesised that:

**H1:** Business support will be positively related to incubator performance.

## Financial Resources

In any business setting, funding is usually a critical factor for attaining the objective of the entity. Business incubator is not an exception to this fact. For the attainment of business incubation initiative financial support from the sponsor should be defined and regular especially in the developing countries. Accessibility of monetary services is one of the significant factors for the continued existence of majority of the newly formed firms as well as an essential element in business incubation, and a theorized precursor to the continued existence of incubator success (Alan, 2012).

Resource based view theory (J. Barney, 1991; Wernerfelt, 1984) postulates that incubator performance is significantly influenced by financial resources. In line with the principle of RBV, Pergelova and Angulo-Ruiz (2014) found that financial resources was an important factor in incubator performance. In another study, Somsuk and Laosirihongthong (2014) found a significant and positive relationship between financial resources and incubator performance. These contributions, lead to the following hypothesis:

**H2:** Financial resources will be positively related to incubator performance.

## Government Policy

Government policy is defined as any course of action which aims at regulating a specific condition. Based on this definition, government policy as it relates to business incubation practice is targetted at encouraging entrepreneurship by making a favourable environment for the entrepreneurs. This, it does through enactment of guidelines that will regulate entrepreneurial activity generally for the reason that entrepreneurship is the bedrock of a nation's path to industrialisaton. Several studies have been conducted with regards to the role of government policies in the development of entrepreneurship generally (Friedman, 2011; Ihugba, Odii, & Njoku, 2014; Mason & Brown, 2011; Minniti, 2008). Their various contributions have been contradictory as well as supporting. For example, while Mason and Brown (2011) and Minniti (2008) are in support of government policies in encouraging entrepreneurship; Ihugba et al. (2014) and Friedman (2011) are on the contrary. A case in point is Friedman's study finding which shows that perceived government effectiveness was significantly negatively related to entrepreneurship on a national level. On the other hand, Minniti (2008) observed that government policy adds vigorously to the development of an institutional setting that encourages productive entrepreneurship. He however added that the relationship between policy and entrepreneurial activity varies across countries.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Government related policies are the fulcrum with which other resources revolve. This can be further expounded by viewing the government as the provider of other resources. Therefore, government pronouncement may affect the provision of the other resources (such as funding, infrastructure and other government commitment) negatively or positively. A well implemented positive policy by government will typically boost the performance of the incubators towards the incubatees. Government policy is a well-established factor that exerts a significant influence on a variety of activities including foreign direct investment (FDI) Asiedu (2006), technological change Ashford (1993), financial crisis Ha and Kang (2015), university technology transfer Guan, Xie, and Zhou (2015), regional innovation system Yang (2014) as well as incubator performance among others. It is hypothesised that: Government Policy will be positively related to incubator performance (H3)

Also, H7, H8, H9, H10, and H11: Government policy moderates the relationship between CSFs and incubator performance.

## Incubator Governance

Several researchers have included incubator governance as incubator attainment factors, for instance Smilor (1987) – An experienced incubator manager; (Allen, 1985; Barrow, 2001; Bøllingtoft, 2012; InfoDev, 2010; Mbewana, 2007; Roper, 1999; Smilor, 1987; Suresh, 2012) - a key board of directors; (Allen, 1985; Smilor, 1987) – a willing advisory board; (Smilor, 1987) – clear incubation policies and programmes. Kumar and Ravindran (2012) indicate that for successful incubation, the programme should have a clear policies and programmes as well as an effective business incubation manager and a dynamic governing board of the incubator. Furthermore, this linkage between incubator governance and performance is in line with RBV, with concise programme milestones as well as clear policies and procedures (Somsuk & Laosirihongthong, 2014). In a study, Suresh (2012), revealed that for effective incubation outcome, incubator should have a sound governance system in place that includes a governing board with members representing the entrepreneurial ecosystem, clear incubation policy and programmes and should also maintain a tie with the university. Therefore, the following hypothesis is formulated:

**H4:** Incubator governance will be positively related to incubator performance

## Infrastructure

Researchers have noted that for incubation programme to be successful there must be adequate facilities and infrastructural development (Campbell & Allen, 1987; Verma, 2004). Infrastructure is one of the elements that need to be in place for the success of a business incubator. According to Wang, Lin, Yin, Lu, and Cheng (2008) empirical evidence carried out in St. John's innovation centre of Cambridge district of UK reveal that of all services provided to the incubatees, three elements were obviously established as vital. This was also the submission of Chan and Lau (2005) who indicated that infrastructure is virtually the advantageous aspect to incubatees.

Kumar and Ravindran (2012) study awarded high importance to infrastructure as a factor for successful incubation. Likewise, Chan and Lau (2005) specified that infrastructure is essentially a very important element to incubatees. Furthermore, many other researchers (Bergek & Norrman, 2008; Lee & Osteryoung, 2004; McAdam & McAdam, 2008) established that offering of space by incubator is very essential to business incubation performance.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**H5:** Infrastructure will be positively related to incubator performance

## Mentoring and Networking

The incubation process involves not only the activities of the incubator in question but also several stakeholders and practitioners alike. Therefore, for incubation programme to be successful there is need for close interaction among these practitioners such as (financial institution, universities, R&D institutes, venture capitalists, angel investors, industrial contacts, lawyers, marketing experts) and for the networking to be effective, the business incubator should be in the lead for the interaction and coming together. Incubators offer incubator tenants an opportunity to a group of colleagues in the incubator business. This helps them to get information and other source of help that ordinarily would have been hard to approach (Hallam & DeVora, 2009). Many researchers, both earlier and contemporary have acknowledged the importance of networking in the incubation programme of most countries. Therefore, several of them (Hallam & DeVora, 2009; InfoDev, 2010; Kumar & Ravindran, 2012; Mbewana, 2007; Roper, 1999; Smilor, 1987; Verma, 2004) included mentoring as a success factor. Bøllingtoft's (2012) study highlights networking as a significant factor for the existence and development of business enterprise is also consistent with those of earlier studies. From a resource-based perspective, the impact of incubator facilities on the small-firm result in access to new knowledge, expertise, networks and cost effective access to leading edge research (Barrow, 2001). In line with this, the incubators networking capability plays a key role in attracting resources from the eco-system (Suresh, 2012).

Prior research supports a positive relationship between mentoring and networking and incubator performance (McAdam & McAdam, 2008). For example, Roper (1999) reported a significant and positive relationship between networking and incubator performance.

Suresh (2012) concluded that mentoring and networking play an important role in predicting incubator performance among the members of the Infodev network. Therefore, the following hypothesis is advanced:

**H6:** Mentoring and Networking will be positively related to incubator performance.

## Incubator Performance

The performance concept has been described as an ability to assess the level of success of a business organisation irrespective of its size (Olusola, 2011). In view of this description, performance examines how well a business entity fared using some industry criteria or benchmark. Evidence abound regarding empirical studies that showed how performance measurement can be typically productive as well as assist in improving organisational performance (Davis & Albright, 2004; Ittner, Larcker, & Randall, 2003; Poister, 2008). Incubator performance is usually measured based on the goal of the promoters. Majority of incubators in the developing countries are mostly public sponsored and therefore the main objective is usually for economic development such as job creation, SME development and commercialization of new products. Several indicators have been used to measure incubator performance such as occupancy rate of incubator (Kumar & Ravindran, 2012), tenant firm's survival and growth (Mian, 1997), job created by tenants/ graduate firms, financial performance of incubator itself, turnover of tenants/graduate firms, and number of companies graduating from incubator.

## METHODOLOGY

The study involves a data collection process of surveying stakeholders in Nigeria with direct involvement in the national programme. A sample size of 153 is drawn from a population of 253 entrepreneurs within the Nigeria business incubation programme using Dillman (2007) formula. 113 usable questionnaires were returned. In order to ensure an equal distribution of entrepreneurs in the 29 incubation centres located in the 6 geopolitical zone of Nigeria, a quota sampling technique was used to select 153 determined sample size.

According to Cooper and Schindler (2014) "Quota sampling can be described as a purposive sampling in which relevant characteristics are used to stratify the sample. Sekaran and Bougie (2010) considered it as a form of balanced stratified sampling, in which a predetermined proportion of people are sampled from different groups, but on a convenience basis". The justification for using Quota sampling technique in this study was three-fold. To start with, for the reason that sampling frame could not be accessed, quota sampling (i.e., a non-probability sampling technique) is considered appropriate for the present study despite the fact that findings cannot be generalized (Cooper & Schindler, 2014; Saunders, Saunders, Lewis, & Thornhill, 2011). However, this study is more concerned about theory rather than on population. The structural equation model (SEM-PLS) will be highly employed in the study.

## RESULTS

In furtherance to examining the goodness of measure, reliability and validity criteria were applied. Reliability tests the consistency of a measuring instrument whereby in different conditions will yield the same results (Everitt, 2006). Validity looks at how well an instrument that is developed measures the exact concept it is intended to measure.

### Construct Validity

Construct validity shows how well the results arrived at from the use of the measure fit the theories around which the test is designed (Sekaran & Bougie, 2010). This can be estimated through convergent and discriminant validity. In the first place, the respective loadings and cross loadings are assessed if there are problems with any individual items. A cut-off value for loadings at 0.5 are deemed as significant Hair, Black, Babin, and Anderson (2010). Therefore, if any items which has a loading higher than 0.5 on two or more factors then they will be considered as having significant cross loadings. Table 2 shows that all the items measuring a particular construct loaded highly on that construct and loaded lower on the other constructs thus confirming construct validity.

### Convergent Validity

The next in line is the convergent validity which is the degree to which multiple items to measure the same concept are in agreement. With regards to Hair et al. (2010) suggestion, we used the factor loadings, composite reliability and average variance extracted (AVE) to assess convergent validity. The loadings for all items exceeded the recommended value of 0.5 (Hair et al., 2010). Composite reliability values (see Table 4), which show the degree to which the construct indicators specify the latent, con-

*Table 3. Variance Explained in the Endogenous Latent Variables*

| Latent Variable | Variance Explained ($R^2$) |
|---|---|
| Incubator Performance | 46% |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

struct ranged from 0.81 to 0.91 which exceeded the recommended value of 0.7 (Hair et al., 2010). The AVE measures the variance captured by the indicators relative to measurement error, and it ought to be greater than 0.50 to justify using a construct (Barclay, Higgins, & Thompson, 1995). The AVEs, were in the range of 0.51 and 0.69.

Table 4 summarizes the results of the measurement model. The results show that all the five constructs business support, financial resources, infrastructure, government policy and incubator performance are all valid measures of their respective constructs based on their parameter estimates and statistical significance (Chow & Chan, 2008).

## Discriminant Validity

Next we proceeded to test the discriminant validity. The discriminant validity of the measures which testifies the degree with which each construct is genuinely and clearly defined from other constructs in the model. Discriminant validity was assessed by assessing the correlations between the measures of potentially overlapping constructs. The criterion for assessing discriminant validity is that the AVE of each latent construct ought to be greater than the construct's highest squared correlation with any other latent construct in the model (Chin, 2010; Hair, Ringle, & Sarstedt, 2011). As shown in Table 1, the AVE is higher for all constructs than the squared correlations for each construct, thus the model's latent constructs show adequate discriminant validity. In sum, the measurement model demonstrated adequate convergent validity and discriminant validity.

## DISCUSSION OF RESULTS

The key goal of this research is to examine the moderating effect of government policy on the relationship between the critical success factors and incubator performance. To this end, the following question was asked: Does government policy moderate the relationship between the (various individual) critical success factors and incubator performance in Nigeria? The results of this study showed that a positive and supportive relationships exist between business support and incubator performance; incubator governance and incubator performance as hypothesised. However, the results also confirmed that government policy did not act as a moderator in the relationship between the critical success factors and incubator performance as shown in Table 2. TBI programme in Nigeria is a social service and depends wholly on Government funding. So government policy regarding funding for social service such as TBI will nevertheless affect the programme operationally. Furthermore, government policy towards entrepreneurship development and youth employment will positively affect the TBI programme.so the performance of TBI programme revolves around Government Policies.

## CONCLUSION

Ideally good sustainable government policies are the required panacea needed to move the Technology Business Incubation programme in Nigeria from the level the programme has been at inception to where it is at the moment and to meet the global best practices in the nearest future. However, Government policy did not support any of the relationship related to moderator. One of the key reasons may perhaps

*Table 5. Level of education*

| | | Frequency | Percent | Valid Percent | Cumulative Percent |
|---|---|---|---|---|---|
| Valid | Diploma<br>B.Sc<br>M.Sc | 72<br>31<br>6 | 63.7<br>27.4<br>5.3 | 63.7<br>27.4<br>5.3 | 63.7<br>91.2<br>96.5 |
| | Other | 4 | 3.5 | 3.5 | 100.0 |
| | Total | 113 | 100.0 | 100.0 | |

rests on the characteristics of the respondents; for example, majority of the respondents are not well educated as can be seen from the descriptive analysis related to level of education as shown in Table 5; wherein most of them are diploma graduate and other vocational trainings. As such they may not be able to decipher how important the policies of government influence entrepreneurship generally and business incubation programme to be specific. Furthermore, the non-supportiveness of government policy may also be caused by the subjective nature of answering the questionnaire by the respondents whereby objectivity was not followed in answering the questions. Another likely reason may perhaps be as a result of low sample size. Therefore, future studies should increase the sample size as well as making sure that other direct incubation stakeholders including incubator managers are surveyed. Finally, other qualitative approach of data collection should be integrated to the quantitative method, which entail a mixed method approach.

Finally, the result in Table 3, the coefficient of determination which is also known as the $R^2$ showed a value of 46%. This represents the proportion of variation in the dependent variable that can be explained by one or more predictor variable. This means that, at least one of the six predictor variables can be used to model incubator performance.

## ABSTRACT

*IFRS refers to International Financial Reporting Standards, which are the guidelines that provide the framework for accounting works. The principles are also known as the International Accounting Standards (IAS). This global financial concept was first introduced in 2001 to equip investors with analyzed accounting statements. In this Chapter we review the relation between IFRS and Foreign Direct Investments (FDIs). We review the relevant literature that analyses the effects on IFRS on FDIs and cross-border acquisitions. The economic literature states that the introduction of IFRS has presented an important increase in FDIs. The evidence shows that IFRS adopting countries attract investments from countries that implemented IFRS and non-IFRS implementing countries.*

## INTRODUCTION

IFRS refers to International Financial Reporting Standards, which are the guidelines that provide the framework for accounting works. The principles are also known as the International Accounting Standards (IAS). This global financial concept was first introduced in 2001 to equip investors with analyzed accounting statements. In this Chapter we review the relation between IFRS and Foreign Direct Investments (FDIs). We review the relevant literature that analyses the effects on IFRS on FDIs and cross-border acquisitions. The economic literature states that the introduction of IFRS has presented an important increase in FDIs. The evidence shows that IFRS adopting countries attract investments from countries that implemented IFRS and non-IFRS implementing countries.

## BACKGROUND AND LITERATURE REVIEW

The notion of unifying accounting principles dates back to the early 19th century. It is at this time that the concept of international financial standards originated, specifically during the first Global Congress of Accountants held at St. Louis in 1904 (Fritz & Lammle, 2003, p. 3). At the conference, the need for harmonization and cooperation in the accounting field was emphasized. Despite the initiative, differences in the accounting principles still abound, mainly because the dissimilarities in legal systems, the manner in which providers of capital operate, taxation systems, national cultures, and general accounting practices. The differences hindered investors from obtaining clear financial information, which is vital for strategic planning. Thus, international trade was constrained; countries experienced unequal opportunities as a result of the dissimilarities. In this regard, the inequalities and unclear financial statements were the main reasons behind the call for financial standardization.

### 1. The Accounting Harmonization Process

In harmonizing the accounting standards, different approaches were and still are being employed (Fritz & Lammle, 2003, p. 3). To enable accurate depiction of the process, harmonization can be viewed from different angles. First the process can be shown as a timeline and then depicted as a series of trait junctions. The timeline follows the steps and achievements made by the International Accounting Standards Committee (IASC) since the early 1960s.

#### 1.1 Pre-Stage of the Harmonization Process

Jacob Kraanyehorf was the pioneer of financial unification. He released his first concept paper on the subject in 1959; through the document, Kraanyehorf campaigned for the international acceptance of economic unification (Fritz and Lammle, 2003, p. 21). To strengthen his proposal, he noted the advantages of a unified financial front such as elevated global loaning and easy trading that come with identification and appreciation of differences among countries. As a result of Kraanyehorf efforts, the International Accounts Study Group (IASG) was formulated in 1966 to help analyze and eliminate the differences in financial documentation between Canada and the United Kingdom. The Americans were not as enthusiastic about harmonization in the early 1960s, but changed their viewpoint in 1972 after one of their professional accounting bodies held discussions with six other nations, including Germany, Japan, China, the United Kingdom, and Canada (Fritz and Lammle, 2003, p. 21).

#### 1.2 Harmonization between 1973 and1987

The International Accounting Standards Committee (IASC) was slowly developed between 1973 and 1987. This body was responsible for a considerable number of the standards set during the 14-year period. Particularly, the institution dealt with the problem of inventory recording. In this case, the main objective of the IASC was to ascertain compatibility between the new set guidelines and those established by the IASG (Fritz & Lammle, 2003, p. 23). Besides that, during the period, the unpopular global measurement methods, such as the austerity metrics, were eliminated. All standards were incorporated through

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

a democratic process; if the set quorum was not achieved, the member states had the right to use any other desired algorithm to enact changes to the accounting principles. Unfortunately, the IASC actually ended up endorsing only mainstream financial procedures, instead of performing actual harmonization.

## 1.3 Harmonization between 1987 and 1993

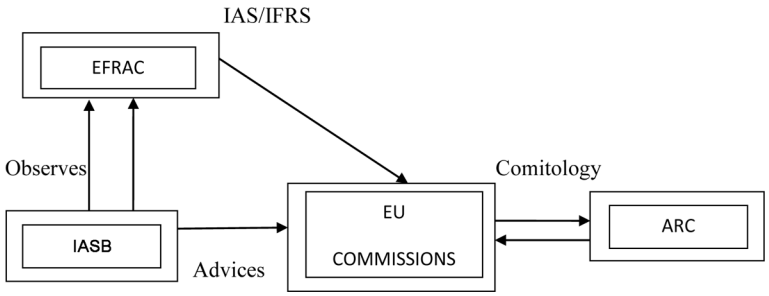
This period marked the second generation of the IASC's developments. In 1987, the harmonizing group initiated membership with the International Organization of Security Commissions (IOSCO). A year later, the Financial Accounting Standards Board (FASB) joined the membership committee. The more other regulatory organizations acceded to the principles promoted, the further procedural standardization advanced. The member bodies dealt with financial matters in the same manner and thus the second harmonization process was characterized by further reduction of the set IASC options. That said, the IASC financial recording principles of 1989 were employed on a trial basis, hence the union of guidelines was rarely implemented. In this respect, the existence of comparability and a right to choose constrained the unification process; member organizations basically operated independently (Fritz & Lammle 24).

## 1.4 Harmonization between 1993 and 1998

The third IASC harmonization process began in 1993 after the agency and IOSCO agreed on a specific catalog of core guidelines for integration of financial statements (Fritz & Lammle, 2003, p. 25). By the end of 1994, the IOSCO had initiated and completed an analysis on all standards set by the IASC. By doing that, the body identified several niches and standards that required modifications to increase the openness, truthfulness, and accuracy of reporting. In 1995, both agencies jointly went through the reviews to create a joint list of unified principles. It is also at this time that the European Union (EU) decided to support the unification process. In addition, the EU decided not to segregate itself and thus eliminated its independent accounting standards. Finally, the harmonization process came to an end in 1998.

## 1.5 Harmonization 1998 Onwards

The current harmonization process began mainly in the new millennium. In May 2000, the IOSCO instructed its member states to permit the IASC to prepare for them international listings and offerings. The body also created a 26-question questionnaire that examined the acceptability of the financial documentation process under harmonization. The creation of the Euro – the EU's currency – in 1999 also increased the push for global accounting standards and thus more reviews and changes were made. Examples of the changes include the formulation of an inclusive body of accounting, emphasis on high levels of transparency and comparability as well as rigorous interpretations of financial statements (Fritz and Lammle, 2003, p. 27). The changes facilitated complete statement analysis in different languages and through multiple algorithms. The standard enforcement is now structured as shown below (see Figure 1).



## 1.6 Harmonization through Socio-Economic Aspects

In relation to trait junctions, the harmonization process has to be analyzed through socio-economic aspects. In this respect, the harmonization process can be broken down into material and formal harmonization, mutual recognition, reconciliation, and standardization. Material harmonization refers to the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 1. Standard enforcement of accounting principles*

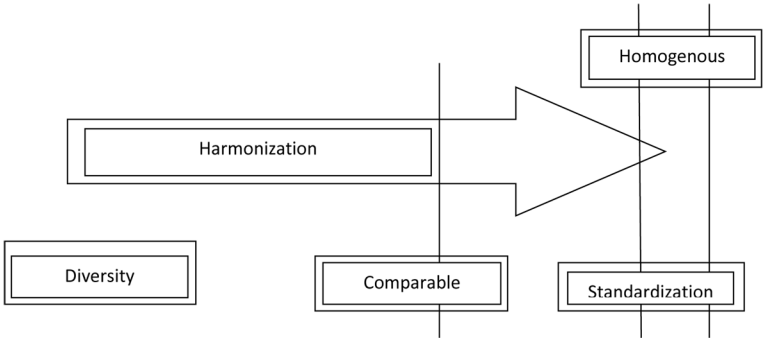
use of standard materials, such as tick marks and opinion letters, to ensure financial research follows a common theoretical and practical angle (Fritz & Lammle, 2003, p. 31). Formal harmonization refers to the broad acceptance and analysis of domestic or independent rules and regulations used by different states (Fritz & Lammle, 2003, p. 31). In the process of conducting formal harmonization, divergence and similarities were considered in the interpretation process, hence allowing statistical data to have similar conclusions irrespective of the rules and regulations applied.

Mutual recognition is the acceptability of statements across borders despite the fact that preparation of the documents may not have been done in accordance with accounting guidelines of the destination state. For instance, Canada and the United States employ different accounting principles domestically, but a document prepared by either country would be accepted by the stockbrokers of both nations. In this respect, mutual recognition curtails the harmonization process to some extent because it negates the need for similar core principles.

The reconciliation guidelines state that an expanding or foreign enterprise has the right to prepare documents in accordance with its local accounting standards so long as it additionally prepares records for use in the accounting of critical principles in the destination state (Fritz & Lammle, 2003, p. 33). As states reconcile critical principles, the harmonization process is able to identify the major dissimilarities in the accounting procedures. To elaborate further, an enterprise using IFRS guidelines can only venture into the United States if it prepares secondary Generally Accepted Accounting Principles (GAAP) documents.

Through standardization, all members participating in an accounting interaction set a number of principles that each party must comply with (Fritz & Lammle, 2003, p. 33). Thus, every act is binding, homogenous, and regular. In other words, standardization does not leave room for variation, misinterpretations, or unevenness. Given that the transactions in consideration affect international players, then one accounting principle of the participant states is applied universally. The summary of the concepts and processes involved in the harmonization through socio-economic aspects is shown below (see Figure 2).

## MAIN FOCUS OF THE CHAPTER: ISSUES, CONTROVERSIES, PROBLEMS



### 2. Economic Value of the IFRS

The push for common international financial reporting standards is based on the fact that successful implementation of the policy will result in economic benefits including creation of value relevance for fair value and minimization of reporting costs. The integration of the IFRS guidelines in financial report-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 2.*

ing has elevated the quality of fair worth with respect to financial assets and liabilities. Value relevance is an important analytical aspect used in the testing of book data, mainly within the balance sheet. The financial concept is vital because it has a direct implication on equity and market values. Assets and liabilities are the basic variables of interest, thus harmonization of the elements allows open share pricing (Okpala, 2012). In this respect, value relevance is examined using the valuation model through which market and equity worth in balance sheets are regressed (Okpala, 2012). The US banking industry is an example of a market in which value relevance is constantly applied to examine the robustness of the IFRS in contrast to the US GAAP. Through the IFRS' fair value principle macro hedging in the United States was raised, thus facilitating more funding on asset demand that in turn enhances revenue generation.

Adoption of the IFRS minimizes the reporting costs of financial documentation given that enterprises within a trade pact do not operate as the sole entities (Okpala, 2012). Compliance with the standardized regulations enables the streamlining and cohesion between foreign companies, hence enabling comparisons, benchmarking, and company status-derivation on a simplistic level that does not necessitate the hiring of external consultants or auditors, which comes with extra costs. The harmonization process also puts a company in an advantageous position over its competitors through open financial reporting. The standards also help to identify new innovative production and marketing procedures that give better results.

The adoption of the IFRS has other economic benefits. It facilitates the transcending of international boundaries, hence making mergers and acquisitions of enterprises easier. The standardized guidelines aid in identification of organized and suitable partners, thus increasing opportunities of accessing foreign capital. In other words, companies can trade, move, and secure their capital and shares in different stock exchanges (Okpala, 2012). In relation to that, a majority of stock exchanges requires statements to be prepared under the IFRS process. By late 2010, more than 127 non-European states had accepted to use the IFRS guidelines as the standard reporting principles.

The IFRS is applied to take advantage of the progressive nature of companies and in the process it has been shown that only big audit firms can provide the expertise required for international cohesion. The standards have curtailed the developments of small establishments because such entities are often inexperienced or lack familiarity with cross border rules and regulations (Okpala, 2012). Consequently, the harmonization encourages the establishment of second tier firms, particularly because of the complexities involved in reconciliation. Fortunately, the application of macro-hedging and fair value estimates on financial assets and liabilities give more structured and defined information on the status and capacities of institutions, thus removing the need for external audits. This reduces the burden for smaller enterprises.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

To some extent, the IFRS facilitates fraud deterrence. Fraudulent accounting is a menace that has eaten into the profits of international organizations. Several companies, for instance, AIG, have suffered considerable losses from fraudulent practices such as offshore trading. The harmonization of financial reporting, done through the IFRS' principles, has facilitated the reduction of fraud cases. Particularly, the push for high levels of document transparency and openness has made it easy to identify malpractices (Okpala, 2012). Therefore, companies cannot falsify their financial capacities to lure investors. Similarly, an organization cannot defraud its employees and vice versa, because of the specified relationship guidelines that state that functionality is mutually exclusive and firms have direct liability over protection of labor rights.

## 3. Political Value of the IFRS

In addition, the IFRS guidelines play a major role in politics. Politics or policy-making is a socio-economic function undertaken by state leaders to ensure that the best interests of citizens are protected. The incorporation of the IFRS accounting standards is a political strategy. The Gunadarma University conducted research on the subject in 70 countries and discovered that the IFRS guidelines ensure political stability through economic progression (Alexander, Fajri & Kurniawan, 2009, p. 168). This is because the standards determine the political approach that a country's administrators will employ. Though political stability was identified as a null factor in the integration of IFRS, the standards were noted as determinants of the level political constancy (Alexander, Fajri & Kurniawan, 2009, p. 168). This suggests that the better the economic capacity of a country, the more stable its governance is. Hence, the harmonization of reporting principles enhances the economic capacity of a state.

In relation to that, since the onset of the new millennium, countries have had different perspectives on the global standards and, therefore, comply to varying extents to the guidelines, particularly because of the dissimilarities in culture, technology, governance, and endowment with natural resources (Alexander, Fajri and Kurniawan, 2009, p. 168). Jurisdictional differences in the IFRS implementation result in immediate political response. For instance, if a certain domestic market performs better in terms of revenue generation than the international market, the political rhetoric would be against using the IFRS. Such a measure would be taken to discourage foreign penetration and at the same time safeguard local resources. Conversely, if the domestic economy performs poorly in comparison to the international market, the politicians would support the integration of the IFRS standards to lure investors.

## 4. The Global Acceptance of the IAS/IFRS Accounting Standards

Given the political and economic benefits of accounting harmonization, there is widespread or universal acceptance of the IAS reporting standards. The guidelines equip investors with the required flexibilities that enable expansion into foreign markets. For instance, through the IFRS, companies have enhanced their levels of capital security and have access to proficient audit consultancies. To highlight the degree of the global acceptance, the IAS guidelines have to be analyzed chronologically and in terms of the functions of the accounting standards.

The global acceptance of the IFRS guidelines can best be depicted in a chronological manner, from the introduction of the principles to present day enforcement. As earlier shown, the adoption of unified reporting standards was a gradual process that began in the late 50's and still continues to date. In 2002 all the member states of the EU voted unanimously to adopt the IFRS standards (Carmona & Trombetta,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

2008). Hence, all the companies trading in the European Security Market were required to abide by IAS guidelines, while foreign or non-European investors had to adhere to the US GAAP. In 2005, the Australian Accounting Standards Board (AASB) followed suit; the agency recommended that all standards and reporting interpretation methods in the country be tailored to comply with IFRS guidelines (Carmona & Trombetta, 2008).

Some regions continue to lag behind in terms of implementation of the IFRS guidelines. Particularly, countries in South West Asia and Middle East and North Africa (MENA) regions have been slow in adopting the standards. For instance, Tunisia, Korea, Mongolia, and Morocco are still in the process of integrating the IFRS principles. The main impediment in the MENA region is Sharia Law, which compels Muslims to apply different accounting principles. Other nations are just beginning the transformation process. At the present, all banking institutions and enterprises within Russia are required to prepare financial statements using the IFRS regulations. Since 2005, New Zealand has adopted 36 novel accounting rules as well as 12 interpretation algorithms, all of which were derived from the IFRS guidelines (Carmona & Trombetta, 2008). The other accounting standards in use in the country are all past guidelines that were equivalent to the IAS principles.

Other significant markets also adopted the policies recently. The eighth largest market in terms of capitalization, Hong Kong, has been aligning its standards with the IFRS guidelines since 1990. In 2008, the Canadian Accounting Standard Board adopted the IFRS principles on a trial basis for a five-year period (Carmona & Trombetta, 2008). As a result, the United States is the only G4 country that does not comply with the harmonized practices. By the time Canada acceded to the standards, Japan and China had already begun gradually adopting the principles a decade earlier.

The distinctive element of the IFRS/IAS guidelines is its principle-based approach; domestic standards employ a rule-based approach. A principle-based approach overrides secondary rules that increase data complexities (Carmona & Trombetta, 2008). In addition, its associated restrictions, precedents, and exceptions are clear and precise unlike the criteria thresholds of rule-based systems. Hence, the principle-based approach offers generic practices that address controversial issues, while simultaneously ascertaining ambiguity (Carmona & Trombetta, 2008). The approach also allows the diverse and broad nature of harmonization to be viewed from a narrow and simplistic perspective, thus enhancing report comprehension. For example, according to principle 19 of the IAS that addresses employee benefits, integration of the corridor approach eases documentation of losses and gains that in turn reflects on the net income for any portion that surpasses the corridor.

## 5. Effects of Mandatory IFRS Adoption in the EU Commerce

The European Union officially adopted the IFRS standards in 2005 and, as a result, all European companies listed on the unified stock exchange were forced to abandon their domestic national accounting standards in favor of the new reporting principles. The adoption of the new accounting practices had implications on loans and advances, particularly due to changes on fair value estimation. The fair worth of loans and advances became vital and relevant derivatives for the determination of a bank's performance (Dimos, 2011, p. 100). In addition, the fair values gave a clear picture of a firm's economic position by highlighting its financial capacities. In other words, the values on loans, advances, and debts showed that fair value was a functional indicator of an institution's financial health as well as its revenue generation variability. Hence, the nations with strong financial institutions found it easy to adopt the IFRS, while the reverse is true.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Besides that, (Dimos, 2011, p. 102) conducted an analysis of several European banks over a five-year period and discovered that the adoption of the IFRS resulted in lower equity-capital costs. Even the European states that fared poorly in IFRS enforcement recorded the reduction in equity-capital costs; possibly the benefits resulted from the complete implementation of the IFRS principles by neighboring nations. The capital costs may have also reduced because of the changes in measurement and presentation methods along with the asset holding to maturity function prior to the commencement of a financial transaction (Dimos, 2011, p. 102). The measurement and presentation of all assets and liabilities incorporated a mixture of fair value and remunerated expenses that in turn increased the accuracy of status depiction. Hence, the investors and entrepreneurs could effectively and efficiently carry out share pricing. This in turn elevated trading within the region. The act of holding stock to maturity ensures that trading is done in instances when the shares fetch the optimal market values, thus maximizing revenue generation (Dimos, 2011, p. 102). In addition, the practice encourages provision of bank advances and loans, hence also increasing revenue generation in the long term.

Adoption of the IFRS by the EU also improved the hedge accounting process. The purpose of hedge accounting is to pair up gains and losses to reduce risk. According to the IAS, hedging accounting can be classified into cash flow, fair value, and net venture on alien operation hedging (Dimos, 2011, p. 104). Fair value hedges mitigate an institution's exposure to fair value risks, cash flow hedges protect a firm from poor cash flows, and the net investment hedges on foreign soil ensures that a company's interest or total assets are free from exposure in the novel territory. The effectiveness of the risk management functions of the IFRS facilitated by the modified hedge accounting process improved the financial performance of European institutions. The banking sector benefited by receiving expansion guarantees, thus encouraging ventures into South West Asia and the MENA regions that lagged behind financially because of adopting religion-based accounting principles. In this respect, macro hedging has extensively been promoted by the EU's banks.

A report from ICAEW (2015) examines the findings of about 200 research papers on the effects of mandatory IFRS adoption in the EU. The report aims to add to the debate on the future of IFRS in the EU. The report shows that there is evidence of benefits following IFRS adoption in relation to financial reporting transparency and comparability, the cost of capital, market liquidity, corporate investment efficiency and cross-border capital flows. The report points out that the benefits found are uneven, varying with the institutions and incentives that apply for different companies in different countries.

## 6. Multinational Companies and Accounting Convergence

The movement towards a global economy has increased the need for global accounting standards. The growth of multinational companies has enhanced the need of such standards. The Securities and Exchange Commission (SEC) has influenced the topic of converging US GAAP and international accounting standards. The commission has allowed foreign companies to use IFRS in financial reporting without having to reconcile US GAAP and international standards. In addition, it has sought to unite world regulators on the convergence of global accounting standards. The convergence and harmonization of IFRS and American GAAP into a single set of accounting standards would benefit multinationals significantly.

According to the United Nations Conference on Trade and Development (2008), the decision to adopt IFRS is determined by a cost-benefit trade-off between some factors. Firstly, it recognizes the benefits of the investors. Secondly, it recognizes the recurring cost savings on the multinationals. The third trade-off involves the one time transition cost that multinationals and the national economy have to incur. The

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

cost involves the adjustments to the institutions of a specified country. Multinational companies have enhanced the spread of IFRS. They provide a significant channel for foreign direct investment into most economies. They were involved in the formulation of the standards. In addition, their support has been essential to the success of the standards. Due to the important role that they play in the national economy, it is impossible to imagine if the standards would have been so successful had they opposed them.

Furthermore, governments should let multinational companies to decide whether and when to adapt the IFRS. The companies incur the heaviest burden of the process. In addition, they hold the key to determining the success of implementing the standards.

Countries should embrace the model that Russia has adopted. Their financial reporting standards should be implemented in a dual manner. Firstly, the national GAAP should be upheld as alternatives to the IFRS. Secondly, countries should adopt the IFRS. Having the two options will enable the country to comply with the needs of the international financial community without undermining its local practices. In addition, it would save domestic organizations from incurring the expense of adopting international standards that would have no real impact on their operations.

The accounting scandals that have occurred in major multinationals such as Enron and World Com have highlighted the need for high quality international accounting standards. The need for the standards has been increased by the expansion of the internalization of the securities market.

The Securities and Exchange Commission (SEC) has joined forces with the European Commission and the Japan Commission to increase the globalization of international accounting standards. However, the threat of increased global power for the SEC is a contentious issue. The formation of the International Accounting Standards Committee Foundation (IASCF) is expected to solve the problem of a super powerful SEC.

The process of globalization has combined with the increased awareness of capital markets to increase the need for the convergence of accounting standards (Fortin, Barros, & Cutler, 2010). In addition, the size of investors has increased significantly. For example, foreign institutional investors are investing in significant global volumes. Furthermore, the television and online media have enabled the public to track the movements of share prices in the global market. The convergence of accounting standards would enable investors to make quick investment decisions.

Multinational organizations have adopted institutional entrepreneurship. The institutional entrepreneurs are organizations that use their resources to advocate for change. They have been change agents on the subject because they perceive the value in the implementation of international accounting standards.

## 7. IFRS Adoption, FDI and Institutions

An evaluation of the data on international trade and financial reporting standards demonstrates that the development of institutions in a country has a greater impact than the mere adoption of the standards. Although adopting the standards has a positive immediate impact, it does not have a long-term influence. According to the United Nations Conference on Trade and Development (2008), investors consider multiple factors when making an investment decision. As a result, the presence of one positive factor is not enough. The observation can be used to explain why the implementation of the standards in developing countries has a limited impact. Governments should instead match the adoption of the standards with a number of key factors. Firstly, they should work on strengthening the institutions in the country. Most developing countries have weak institutions controlled by the government. They should ensure

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

that there is a strict separation of powers between the arms of government. They should also promote the rule of law. Countries with low corruption rates will benefit from increased FDI. There should be a strong focus on the implementation of property law and the enforcement of contracts.

The World Bank has made more countries to adopt the standards. Most countries are forced to adopt the standards in order to receive funding from the institution. As a result, the standards have been driven by international forces as opposed to a deliberate desire among the countries to increase the integrity of their standards.

Another key thing to note is that the developing countries as opposed to their developed counterparts drive the overall increase in FDI. The observation is because foreign direct investment is skewed in favor of emerging markets. In addition, most developed countries already have similar financial reporting standards.

The success of the international financial reporting standards is dependent on government institutions. Governments adopt the standards and commit themselves to enforce them in their jurisdictions. However, the implementation of the standards requires the participation of all the stakeholders. In most instances, the government would have to give the organizations within its jurisdiction sufficient time to implement the new standards. The relevant government institutions will have to police the organizations.

Financial standards setters, regulators and policy-makers have a significant interest on the impact of financial reporting standards on the economy (Tsamenyi & Uddin, 2008). The interest can be attributed to the economic consequences associated with the financial information. The financial information influences the behavior of investors by determining their portfolio selection. Firms have a significant interest in the information because it determines the pricing of securities that in turn affect their ability to get additional funding. The regulation of financial reporting mechanisms is a significant mechanism that determines the operation of securities markets. The markets are a significant channel of foreign direct investment.

Adoption of IFRS has been influenced by the desire to among transitional economies to adopt corporate governance practices that would give them global intimacy (Tsamenyi & Uddin, 2008). The move acknowledges the modernization of developing economies. The practice is bound to result in greater financial transparency. Achieving a high level of transparency will encourage international trade and FDI. The adoption of the practices has been both mandatory and voluntary. However, a country's adoption of the standards was not affected.

The increased push for more countries to adopt International Financial Reporting Standards requires a determination of their impact on international trade. The practice results in increased foreign direct investment and international trade because it fosters transparency and comparability. International investors are keen on investing in countries whose financial practices are understandable. Furthermore, they desire to work in countries that have high levels of transparency. The countries with transparent institutions have the ability to attract investors from diverse countries (Fortin, Barros, and Cutler, 2010). For example, the United States has a code of standards that investors and companies working abroad should follow. If they engage in questionable financial practices, then there is the possibility that they could be sued for their actions. As a result, they are keen on entering into countries with clear financial practices.

In addition, the practice enhances the ease of doing business. The standards will enhance the process of doing business because agents will understand each other more. Furthermore, the adoption of such standards will reduce information cost. International trade and foreign direct investments are often hampered by the high cost of acquiring the right information. In cases where there are different accounting standards involved, the investors are forced to invest in consultants. The price of hiring consultants increases the investment cost significantly.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In 2010, 120 countries decided to adopt the International Financial Reporting Standards and made a commitment to enforce them in their jurisdictions (Lasmin, 2011). In the same year, foreign direct investment in foreign countries increased significantly. As a result, an increase in people who support the adoption of uniform accounting standards has been noted. However, there is no sufficient data to prove that developing countries benefit from adopting the standards. According to the United Nations Conference on Trade and Development (2008), developing countries are not likely to receive more FDI inflows and increased international trade by adopting the standards. This is because international trade is determined by many different factors. In contrast, the European countries benefited the most from the adoption of those standards.

The process is characterized by several challenges. For example, the United Nations Conference on Trade and Development (2008) notes the high cost involved in adopting the standards for the organizations involved due to the overhauling of systems and training costs involved. Furthermore, the organizations would be forced to implement many changes in their financial practices. However, the benefits of benchmarking with their peers from any part of the world are enough to offset the high cost. In addition, adopting the standards would allow a multinational company to have consistent reporting standards with its subsidiaries. The move would improve international communications. Moreover, it would result in a better quality of reporting. The decision-making process within the organization will also be improved in a significant manner.

However, it is clear that there should be further research on accounting standards harmonization process in Europe and other countries. Furthermore, a deliberate effort to address the unwanted effects of adopting IFRS standards is crucial. The process will lead to a better understanding of IFRS standards on national and international economies.

## 8. When do the Adoption and Use of IFRS increase Foreign Investment?

A significant challenge that firms face when attracting foreign investment is the asymmetry of information between foreign and direct investors. IFRS gives firms the opportunity to reduce the asymmetry. The move will increase their attractiveness among foreign firms. However, significant differences are noted in the manner that firms implement the IFRS standards. The observation is because firms have different reporting practices. Firms with strong reporting standards tend to attract many foreign investors. In contrast, those with weak reporting standards only attract little foreign investment (Bowe, Miletkov & Wintoki, 2013, p. 3). The countries that have weak investor protection systems would not benefit significantly from the adoption of the standards if the practice were not matched with a deliberate process to reform the institutions of the organization.

Foreign investors consider many factors before investing in a country. For example, the country must demonstrate its respect for the rule of law. Strong property laws and a commitment to enforce contract characterize countries that respect the rule of law. Since corruption increases the cost of doing business significantly, most investors are keen on investing in countries with low levels of corruption. Consequently, an enabling environment is necessary for the IFRS to increase foreign investment. As a result, countries looking to benefit from the adoption of the standards should ensure that a deliberate process to create an enabling environment that protects investors accompanies them.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In addition, IFRS are effective in countries with high quality auditing standards. Auditors play noteworthy role in ensuring that organizations comply with the financial practices of their countries. Foreign investors rely on auditor reports to enable them make appropriate investment decisions. In the event that a country with high quality auditors adopts IFRS, then it can attract many foreign investors.

A critical evaluation of IFRS standards shows that they were designed for developing and mature capital markets. Although it is clear that financial statements assist investors to make critical investment decisions, countries with no stock markets should not adopt IFRS. Financial statements help users to estimate the value of securities when they are buying or selling. Financial reporting should not exist in developing markets. The accounting systems in a particular country are determined by its socio-economic and political history. The fact that some economies differ significantly from others shows that the adoption of the standards is only effective in some countries.

In order for IFRS to be effective, it is important to modify some aspects in order to make it suitable to the accounting needs of the country. The European Union and other countries have adopted modifications that ensure that the standards address their needs. If the standards are suited to a given country, then they are likely to succeed in attracting foreign investment.

Many countries have adopted the European Union-based IFRS standards. Understanding the reasons that motivate their actions provides a strong indication of the future of the standards. An evaluation of the countries that have adopted the standards shows that more powerful countries are less likely to adopt them. The countries have a strong economy that has good corporate governance systems. As a result, they fail to perceive any value in adopting additional standards. The approach explains why the developing countries represent a significant portion of the states that have adopted the standards.

The indifference that powerful countries have towards the standards is due to their unwillingness to surrender standard setting authority to an outside entity. In most instances, countries try to avoid surrendering any authority to independent entities. For instance, the United States has been reluctant with the adoption of the IFRS (MAFK International, 2013). However, with hundreds of countries adopting the standard, the United States is likely to replace its US GAAP standards with the new accounting practices (MAFK International, 2013).

The network effect that is associated with the adoption of the standards provides a powerful motivation for other countries to join them. A country is more likely to adopt the IFRS standards if other countries within their geographic region did the same. In addition, if trade partners adopt the standards, then a country would be under intense pressure to act similarly. Consequently, the practice has been driven by strategic considerations as opposed to a willful desire to demonstrate financial prudence.

Furthermore, the increasing number of countries adopting the standards has led to higher network effects. The argument postulates that some countries are forced to adopt the studies so that they can benefit from the effects of a global economy that focuses on the creation of a unified financial code.

However, there is no evidence to show that changes in the trade and foreign direct investment have any direct impact on the decision of a country on the subject. In contrast, the adoption is due to the economic theory of networks. The theory postulates that the value of something such as a product or service increases when it is adopted by a wide group of people. The adoption of the standards has occurred in a gradual manner. Countries did not adopt the standards at once. Instead, the adoption process has been gradual. As more countries embrace the standards, their counterparts have to adopt them in order to avoid missing a new global reality.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The strength of the governance and corporate structures in a country determine whether they are likely to adopt the IFRS standards. Countries, whose governments have the ability to make timely-decision making, are more likely to adopt the standards. In addition, they are more likely to embrace the standards if the cost of switching to the new standards is expensive.

The implementation of the standards does not result in a significant reduction in information costs for advanced economies. The observation demonstrates that the developing economies would benefit the most from adopting the standards. As a result, it is evident that adopting the standards is driven by strategic considerations.

Countries understand that widespread adoption of the standards is integral towards creating a global accounting standard that benefits everyone. The standards will result in a significant reduction in the investment decision. In addition, it would lead to a reduction in the cost of accessing the information (MAFK International, 2013). Many countries realize the importance of being part of the global economy. They hope that by adopting the standards they are likely to create an environment that matches the emerging trends in the international arena.

## 9. IFRS, Foreign Direct Investment, and Corporate Social Responsibility

Although there is not a standard definition of corporate social responsibility, the term is widely known as contributing to a better society through company actions in the benefit of the workforce and local community. This means the adoption of voluntary codes of conduct and rules of behavior by companies which go beyond public legislations. There is a strong relationship between corporate social responsibility and foreign direct investment as the increase of foreign direct investment has fostered the growth of corporate social responsibility. Corporate social responsibility is an important determinant for multinational companies to start operations. FDI increases the working conditions due to established CSR initiatives (see Frost & Ho, 2005; Goyal, 2006; Kolk & van Tulder, 2010).

Some authors claim that FDI and CSR have played an important role for poverty reduction, as well as having an impact on salaries and working conditions in developing countries (see Brown *et al*, 2004). On the other hand, other authors explain that corporate social responsibility is the reaction to the social dissatisfaction from globalization (see Jenkins, 2005; Gonzalez-Perez & McDonough, 2007). CSR policies have increased as a result of globalization creating a sense of responsibility creating a sense of responsibility engaging companies in an improvement of the societies where they operate. There is also a relationship between CSR and economic performance of companies (see McWilliams & Siegel, 2000, 2001; Carter, 2005). Although it is not clear if companies are successful as a result of the CSR implementation or if companies implemented CSR policies due to their economic success.

It is often suggested that there is a mutual relationship between society and economic actors. In this sense, Edwards (2004) explains society needs to access the surplus of market economies in order to have sustainable social objectives, he points out that society needs markets and these markets need a strong civil society to develop. Goyal (2006) points out that corporate social responsibility can create a sense of responsibility for companies entering new countries to cooperate in poverty reduction and social welfare. Thus, an increase in FDI will promote growth of CSR practices, and a higher degree of responsible business initiatives will attract new FDI.

Emerging economies are still perceived as risky places to invest, although multinationals countries are actively investing in many developing countries. Countries which are rich in resources are a strong motivation for investment. Most developing countries depend on FDI inflow to transform their fast growing

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

economy. These countries hope that a higher inflow of FDI will improve their economy and increase the standard of living of their population with more employment opportunities. The implementation of the appropriate macroeconomic policies together with the liberalization of the economy, and privatization are the key factor to attract FDI to emerging economies (See Ajayi (2008)). Unemployment and poverty are the major challenges faced by developing economies, being the high unemployment the main determinant of low standard of living in these countries. Thus, developing countries have a strong incentive to attract foreign companies to invest and to use trade in favor of their country´s interest.

Most developing countries have implemented policy reforms with the intention to create great business atmosphere for foreign investors. The leaders of developing countries work to attract more FDI to alleviate poverty. Creating job opportunities in a country would contribute to alleviate poverty. The higher economic growth would increase employment, improving the standard of living and reducing poverty. Furthermore, FDI can contribute to the improvement of infrastructure by host countries. Another factor which contributes to poverty alleviation is the taxation of foreign subsidiaries. Taxes from foreign companies would increase the revenues of the host country. This tax revenue can be used to finance poverty reduction initiatives or creating a safety net for the poor. In this sense, Prahalad (2002, p. 42) stated that "By stimulating commerce and development at the bottom of the economic pyramid, MNCs could radically improve the lives of billions of people and help bring into being a more stable, less dangerous world".

## INVESTMENTS THROUGH EMPLOYMENT OPPORTUNITIES: SOLUTIONS AND RECOMMENDATIONS

### 10. The Effect of IFRS on Cross-Border Acquisitions

One of the biggest arguments advanced by proponents of the IFRS is its ability to create an efficient capital allocation process through greater cross-border investment. An evaluation of investment data shows a significant increase in the level of investment due to the adoption of the IFRS standards. The observation is consistent with the fact that investors benefit from a significant reduction in information symmetry due to the increase in the comparability of financial reports.

In addition, a strong implementation of the IFRS standards may result in a significant increase in mutual funds investment. The countries that have strong implementation credentials tend to attract many investments from both individual and institutional investors. In contrast, countries with weak implementation capacities realize no significant impact from the adoption of the standards. Achieving financial comparability is bound to have a net positive result of cross-border trade. Comparability refers to achieving uniformity in accounting practices between two different countries (DeFond, Hu, Hung & Li, 2010, p. 1). High comparability levels will reduce the cost of accessing information. As a result, increased investment in firms will be noted.

However, two factors should qualify any claim about the impact of achieving financial comparability. In jurisdictions where the enforcement of the standards is mandatory, the success of the new accounting standards is dependent on the management credibility of the new organizations (DeFond, Hu, Hung & Li, 2010, p. 1). Management credibility involves the ability of the management to implement the new accounting standards. Financial reporting practices vary significantly amidst countries. In addition, managers have a lot of flexibility in determining the implementation of accounting standards.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The second qualifying factor involves the magnitude of the increase in uniformity. A large increase in uniformity will result in increased financial comparability. The magnitude varies from one country to another (DeFond, Hu, Hung & Li, 2010, p. 2). As a result, the adoption of IFRS standards is bound to result in varying implications in different countries.

(Henock & Oktay, 2015) examine the effect of IFRS on foreign direct investments (FDIs) by analyzing whether the 2005 mandatory adoption of IFRS leads to an increase in cross-border acquisitions in the adopting countries. They find that the adoption of IFRS led to a significant increase in FDIs, which is consistent with the primary objective of IFRS.

## FUTURE RESEARCH DIRECTIONS

The European Union provides an effective case study for analyzing the impact of the implementation of the IFRS standards on a large scale. In the European Union, the implementation of the IFRS standards was mandatory. As a result, they were implemented in many firms at the same time. An analysis of the information is based on mutual fund investments. In most instances, mutual fund investors are sophisticated investors who make their investment decisions based on a comprehensive analysis of financial information.

## CONCLUSION

The impact of adopting the IFRS standards is limited to domestic investors. The investors have access to alternative channels of communication. For example, they can obtain information from industry analysts or mangers. Similarly, the increase in cross-border transactions is due to the activities of foreign- owned organizations. The organizations tend to have a presence in multiple foreign markets. Consequently, they have a significant interest in benchmarking with a large number of firms.

The effects of adopting IFRS on cross-border trade are dependent on the economic institutions in the countries involved. Furthermore, the management incentives in the country determine the process. The enforcement of the IFRS standards is bound to play a significant role in determining if the implementation of the organization is bound to have a significant effect. Some countries have strong financial regulatory bodies that ensure all the organizations in the country implement the standards. Others have weak institutions that lack the resources or ability to ensure that all firms in a country implement the new standards. In the former countries, a significant increase in cross-border trade is noted while in the latter countries, the impact will be limited.

Multinational companies contribute to economic development through investments, taxation, jobs, and the transfer of technology and skills. As the level of corporate social responsibility is strongly related to FDI inflow for developing countries, there should be a higher degree of cooperation between local governments and multinational companies to improve FDI inflow and reduce poverty. Local governments should implement programs to engage foreign companies to hire and train their local employees with the view of increasing long-term employability. Initiatives followed by developing countries should include liberalization of trade, increase export-led growth, and privatization of public companies.

## KEY TERMS AND DEFINITIONS

**Accounting Harmonization:** A process of increasing the comparability of accounting practices worldwide. Harmonized standards should improve the compatibility of financial information from different countries.

**Corporate Social Responsibility:** A company initiative to take actions to improve the environment and social wellbeing.

**Developing Country:** A country with an underdeveloped industrial environment, together with a low Human Development Index (HDI). It is also called less developed country or underdeveloped country.

**Foreign Direct Investment:** An investment made by a company located in one country, into a company based in another country.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**International Trade:** The exchange of goods and services between countries.

**Multinational Company:** A company that has operations and assets in at least one country outside its home country. It is also referred as "transnational corporation".

**Poverty Reduction:** Promotion of several measures, economic and humanitarian, that will eliminate poverty.

# Chapter 19
# Legal Aspects and Regulation in Crowdfunding:
## Comparisons across Countries

**Alessandro Maria Lerro**
*Associazione Italiana Equity Crowdfunding, Italy*

## ABSTRACT

*Crowdfunding started with the donation-based and reward-based models, but soon its disruptive capacity to innovate the traditional approach to finance made it evolve into an alternative finance instrument, suitable to fund new business. Peer to peer lending and equity crowdfunding are investment instrument that can truly sustain the growth of businesses and generate profits. As any investment instrument, lending and equity crowdfunding are heavy regulated in order to protect investors and maintain a proper trust in the system. This chapter will go through the American and European main regulatory principles, offering a picture of the overall approach to this innovative and disruptive financing tool.*

## REGULATION

The crowd economy comprises a number of different forces, trends, and dynamics originating from the crowd. Many of them are connected with money; this is why a large part of the crowd economy is identified as crowdfunding. Indeed, crowdfunding is a very broad concept that includes several very different operations, each having its own logic and metrics.

## "NON-INVESTMENT" CROWDFUNDING

### Donation

Thanks to the explosion of social networks and the wide use of the web, fundraising easily moved from offline events and efforts to online crowdfunding platforms.

Donation crowdfunding was the first crowdfunding model based on the web, and it is being used not only by charities and nonprofits to raise funds, but also by individuals to ask for help for their personal projects (business, entertainment, study, or any other purpose without limitation).

In donation crowdfunding, the crowd donates money to support a project with no expectation of financial return. In some cases, the crowd is offered some kind of rewards or incentives tied to their level of contribution, which have no significant intrinsic monetary value. In most jurisdictions, these perks do not influence the model, which remains a donation, and there is only a moral obligation to provide the promised reward.

However, in some civil law jurisdictions (originating with the "Napoleonic Code"), the eventual breach of promise might have consequences, like the obligation to give back the grant. In fact, a contractual obligation binds the donor and the project owner, simply because of the donation.

## Reward

Donation-based crowdfunding quickly evolved to a model in which the value of the reward is comparable or substantially equivalent to the value of the donation: the project owner offers to produce and deliver an object to the donor, provided that a minimum number of orders are placed and therefore break-even is reached.

This model perfectly answers the need of financial coverage for those who create innovative products outside a well-established company: they can test the market without committing the upfront marketing, production, and distribution costs required to fully commercialize a new product.

Moreover, the customer validation arising from a successful pre-sale campaign grants project owners a valuable tool when negotiating with investors. Several studies have shown that a successful reward-based crowdfunding campaign influences the proclivity of professional investors to sustain the project with an equity investment. A well-known example is Pebble, a smart watch that interacts with every kind of smartphone. Pebble's business model didn't attract investors, so its founders launched a reward-based campaign on Kickstarter. The campaign was a real success—it's still in the top 10 overall—and Pebble pre-sold enough smart watches to raise $10 million. This scenario totally changed the approach of venture capital firms, and after a few months, Charles River Venture invested $15 million in equity. One year later, a second crowdfunding round brought in $20 million more. The Pebble case demonstrates the strength of the interaction between crowd validation and venture capital analysis and strategy.

In most jurisdictions, when the perk offered has a value comparable or close to the value of the financial contribution, reward-based crowdfunding is nothing but a sale or, better, a kind of e-commerce. As a consequence, consumer protection rules are applicable to each subscription, as well as regulations concerning guarantees, delivery, and breach of contract. From a tax point of view, some governments have made it clear that this is not a donation and therefore VAT and similar local taxes are applicable to these kinds of sale, and the European Commission is considering the possibility of uniform regulation.

## Royalty

Using a different approach, a project owner might offer supporters a part of the profits that the project is going to generate. Without sharing in the ownership of the project, a funder could still share in part of the expected financial returns. This third and most complicated type of "non-investment" crowdfunding is the royalty-based model: funders are offered a return of a financial nature, calculated as a share of the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

revenues or profits generated, which will be payable under certain conditions and for a certain period of time. This profit-sharing formula can be used for a stand-alone project or for a specific business or product of a company (e.g., a software application) without involving any other business of the company. Risks are transferred to the funders, without designating an investment scheme, because the founder gets nothing as an immediate consideration—not even the promise to get the money back (otherwise, the "investment" would simply be a loan).

Funders fully take part in the losses, up to the value of their own contribution, which is non-refundable and can be completely lost.

Royalty-based crowdfunding is purely financial; campaign owners seek funds for their projects through the web. However, in some jurisdictions this practice is not totally new, and is already regulated as a specific kind of financing that might be either financial or in-kind (i.e., work for equity).

In order to offer uniform rules to all the funders, the project owner (or the crowdfunding platform) must propose a uniform agreement. Otherwise compulsory local rules might prevail and find discrimination among the funders as well as create unexpected situations for the project owner. For example, the project owner might open the business to new membership, accepting a large number of potential new supporters, without any kind of consent from the supporters already invested.

Funders do not fully take part in the earnings either: the project owner can propose a certain amount of shared revenues and the relative duration, fixed in a limited period of time (e.g., five years from the investment), regardless of the ratio of contributions to the value of the business.

Indeed, this is not an investment and funders don't buy shares in the business as if they were investors and shareholders. Moreover, the project owner can offer funders some rights: audit, access to documents, or even involvement in the conduct of the business.

In some cases, royalty-based crowdfunding has been used to circumvent prohibitions on solicitation of investment, rather than for strategic reasons. Otherwise, royalty-based crowdfunding is a viable solution for companies that do not meet the requirements to access equity crowdfunding or who do not wish to open their equity to third parties, and it allows companies to encourage their backers' participation in a useful and, possibly, an advisory role.

What is most complicated with royalty-based crowdfunding is the dissolution of the relationship (on both sides) upon the conclusion or sale of the project. In most jurisdictions, contract freedom allows the stipulation of an agreement which perfectly suits the purposes of all parties, but finding royalty-based crowdfunding that sets clear rules for these cases is not common.

Tax regulation may also be critical: some jurisdictions do not allow deducting royalties from the revenues to pay the funders, requiring the business to calculate profits, pay taxes and distribute royalties out of the net profits. This kind of tax regulation makes royalty-based crowdfunding rather expensive to the entrepreneur, because royalties paid would be lower than those resulting from a normal ratio of the share capital.

Royalty-based crowdfunding is useful for collecting money for a single project keeping the crowd out of the entire business of the proposer; e.g., the publication of a book, a movie or music. Sandawe allows the public to view a few draft pages of comic books to decide whether and what to finance. The Belgian company, which in July 2015 claims to have raised more than €1,607,000 for 56 projects, proposes an editorial plan and a budget (usually €35,000–55,000 per album), and the project starts only when the amount is collected. Funders do not become shareholders or get voting rights; they are remunerated with their share of 60% of net profits until full coverage of their initial investment, and with a share of 40% of net profits thereafter, in proportion to the funding.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Sandawe has a large community of active members (15,500 in August 2015, with a 100% annual increase rate): all comic fans. They are highly motivated to support projects for the sake of participating in their implementation, and at the same time are a relevant market for the distribution of the same products they have helped to publish.

A similar model of profit sharing is the German website SellaBand, one of the oldest European crowdfunding platforms, through which artists can post a series of music tracks: the public can listen and choose to invest in some of them, for a share price of €10. The money raised stays in a temporary escrow account until it reaches the artist's target amount, whereupon it is used for the production of a CD (or returned if the goal isn't reached). Some artists offer supporters, termed "believers," a share of as much as 10% of the CD's revenues.

The need to find alternative solutions to the subscription of risk capital has inspired some entrepreneurs to find solutions more closely compared to the model of profit sharing, by moving different levers. In this regard, Kappel (Kappel, 2009, p. 375) classifies "ex-ante" crowdfunding, which finances a goal yet to be achieved, in two variations: the investment model, which is classic equity crowdfunding, even when it results in a partnership or profit sharing; and the betting model.

To explain the betting model, Kappel presents the example of the British company Slicethepie, which is considered a licensed bookmaker according to English gambling laws. In addition to a classic model of donation focused on music production, the company offers a trading platform of "contracts": for each music album funded through the platform, the company issues up to 15,000 contracts: that can be purchased for £1 each. The contracts can be traded for two years; afterwards they are called up and cleared at a price calculated on the basis of sales of the album at a rate of £1 for every 10,000 digital copies sold. For example, if a purchase was made at £1.8, the break-even for the supporter is 18,000 album sold. Artists are free to sell their rights to a record company, provided that it awards the holder of any contract a 50% premium on the specific purchase price of each. The model is completed with a royalty of £2.50 to Slicethepie for each album sold, over two years.

One important side effect of this model is that the owners of "contracts" are encouraged to advertise the album and increase sales, if they want to get a higher terminal value.

This is an interesting solution, especially for its strategic approach: Slicethepie wanted to involve a segment of the public attracted to trading and betting, offering a chance to play, with modest amounts of money, in a particularly stimulating business. What probably draws the crowdfunder to Slicethepie is the thrill of playing the particular game that the company invented, more than the desire to invest in a company or the prospect of a margin business.

Risks arising from contract-holders' relying solely on their hearts might be huge, and governments can't help but consider them. Indeed, while some commentators in the past have referred to the U.K. Gambling Act 2005 as a possible legislative solution for certain types of crowdfunding, the betting model in the U.S. has been prohibited since 2006, under the Unlawful Internet Gambling Enforcement Act (UIGEA), which prohibits the transfer of funds to online betting.

## A Community Business

In any kind of reward-based crowdfunding (donation, reward, or royalty), the community is absolutely crucial to the success of the initiative and helps determine the form taken by the request for funding, which otherwise would become entirely similar to what one might expect at a bank.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In an interesting essay, based on preorder or profit-sharing paradigms, Belleflamme, Lambert and Schwienbacher (Belleflamme, Lambert, & Schwienbacher, 2012) developed a mathematical proof that explains that entrepreneurs prefer preorders for projects that require little capital, but profit sharing for projects that require a major investment.

In fact, by virtue of preorders, the ability of the entrepreneur to manage price discrimination between lenders and customers is influenced by the amount of capital needed to cover fixed costs. Beyond a certain threshold, the distortion of the price becomes excessive and profitability is reduced. Instead, if the capital requirement is high, following the profit-sharing mechanism, the entrepreneur is able to expand participation without compromising too much on profitability.

The same authors, however, point out that the mathematical analysis of profitability cannot take into account the objective side of crowdfunding that nevertheless is critical to the success of the project: namely the creation of a community, a chance to test the market, and opportunities for strategic marketing.

## INVESTMENT CROWDFUNDING

When crowd-funders are offered securities (shares, bonds, or debt instruments) as a consideration for their financial contribution, the crowdfunding model becomes substantially different, mostly in terms of legal consequences. This model involves the sale of a securities instrument (stock) in a company through a regulated, online platform.

Rather than simply providing financial support for the project, funders will expect some kind of financial gain from the transaction, so their solicitation must be balanced by a number of assurances required by the law, as for any kind of investment.

In principle, possible sources of funding for a company are two: capital (equity) and debt.

While equity grants some rights to control the business (first of all, the right to vote), it is the riskiest form of financing from the investor's perspective. On the other hand, loans don't bear the same risks, are liquid (i.e., repayable after a term) and are usually negotiated against guarantees.

### Equity

The categories of potential investors in equity are as follows:

1. **The Entrepreneur:** Who generally invests his assets or gets personal loans to fund his company;
2. **Family and Friends:** People close to the entrepreneur who invest in the business, generally in small amounts;
3. **Business "Angels":** Individuals (or funds, or companies) who want to invest money in small projects, often to diversify their portfolios;
4. **Venture Capitalists:** Professional investors who collect money from sophisticated but non-specialized investors, and invest in innovative projects and for a set time, with the aim of realizing a significant capital gain on liquidation of the investment;
5. **Strategic Investors:** Other companies that may have a tied interest in industrial, commercial or strategic initiative to be undertaken (e.g., suppliers);
6. **Crowd or Retail Investors:** Undifferentiated public that invests in companies and buys securities.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the mainstream of business funding, it is the entrepreneur who initially funds the business, eventually with the help of family and friends. Very early-stage businesses usually have their "bootstrapping" period: the term is hyperbole derived from the fanciful "pulling yourself up by your bootstraps," adopted in the 19th-century U.S.; it refers to tactics of self-financing—using the cash flow or other stratagems—rather than capital or loans.

The second stage has typically been that of angel investors and venture capitalists. But most recently the investment time for such professional investors has shifted forward, and is being replaced by crowdfunding; reward-based first, and equity crowdfunding as soon as a certain maturity is reached.

Venture capital is provided by investment funds managed by advisors, specialized in specific areas (information technology, health, biotechnology, etc.). They have a very professional approach to risk and usually follow specific preset guidelines for the time of entry in the investment; the available amounts are generally enough to advance the target company, after several rounds, to maturity, or until a stock exchange or trade sale exit, and their structure is tailored to follow the investment.

Projects of even greater size are often backed by private equity funds, which generally prefer to concentrate on a few deals involving larger amounts, invest in advanced stages of a business, or facilitate acquisitions or mergers, adding a significant value to the target company. They only invest in validated businesses that have demonstrated the ability to generate significant revenues through a concrete history.

Anyway, the access to finance in the last ten years has become increasingly difficult. Startups prefer the use of venture capital, angels or strategic investors since subjects specializing in this form of investment are generally able to contribute more than just financial support, in terms of management, network, media production and distribution. Indeed, professional investment is usually referred to as clever money, compared to the "stupid money" coming from the bank system, which typically has no nonfinancial support. The effectiveness of this strategic choice is demonstrated by Keushnigg (Keushnigg, 2004, p. 239), who explains how innovative companies supported by venture capital funds have the highest growth rates.

The European Commission communication of 7 December 2011 entitled "An action plan to improve access to finance for SMEs" states that "the difficulties of access to finance is one of the major obstacles to growth for SMEs," as also evidenced by the ratio of the ECB, "Survey on the Access to Finance of SMEs," in February 2010. In fact, the EU funding with venture capital has great potential, but so far has hardly been tapped for the development of SMEs (small and medium enterprises). Despite the huge size of the asset management industry in the EU, there is no existing legislation specifically designed to channel investment in equity capital to SMEs.

The EU Regulation no. 345/2013 of 17 April 2013, about European funds for venture capital, states that "... providing finance and advice to these undertakings, venture capital funds stimulate economic growth, contribute to the creation of jobs and the mobilization of capital, encourage the creation and development of innovative businesses, increase their investment in research and development and foster entrepreneurship, innovation and competitiveness."

As explained by Bhidé (Bhidé, 1992, p. 109) in 1992 in *Harvard Business Review,* the institutional investor thinks in terms of default amounts to invest. Since 2002, venture capital funds have gradually increased these levels, since many small investments are more expensive in terms of monitoring, compared to fewer larger investments. Being listed on a regulated market is only possible in connection with significant investment thresholds, also keeping in mind the complexity and cost of the IPO (Initial Public Offering).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

This distinction involves a practical consequence extremely important for startups: the equity market is effectively closed to projects that are too small, with a cash need insufficiently attractive to institutional investors.

Not least, it is necessary to consider the influence of macroeconomic conditions (market trends, trends in interest rates, etc.) on investment decisions, often more effective for small and medium-sized enterprises; in 1990 the credit crunch in the U.S. had reduced loan disbursements by 38%, from 144 billion to 88 billion dollars, as noted by Berger and Udell (Berger & Udell, 1998, p. 613).

## Debt

As an alternative, other organizations prefer to take out loans rather than dilute ownership by taking on investors. The players on the loan side of investment are:

1. **Banks:** Usually they don't lend money to startups without revenues, and in any case, they ask for guarantees;
2. **Leasing Companies:** They finance tangible assets (computers, technical equipment, etc.) and the business premises;
3. **Government Agencies:** In some countries they offer loans, usually at reduced rates, for particular classes of projects;
4. **Customers or Suppliers:** Entrepreneurs might succeed in getting financed through delayed payments accepted by suppliers or advance payments from customers.

Debt might seem more expensive than equity because of the interests to be paid, but indeed the problem is not the cost of finance, rather how to access it. The choice to get a loan seldom depends on the interest rate or the consideration required by the lender; it is more often determined by lack of alternatives or by a strategic choice of the entrepreneur. In some cases, indeed, he is not yet able to justify a significant business evaluation in order to get a fair value against equity shares of his business; therefore, he prefers to take on debt until a significant value may be demonstrated and capital is open to third parties.

Regardless credit crunch, borrowing money is increasingly difficult for start-ups, because while SMEs at least have a history and a turnover, a startup's history is usually not compatible with the requirements of financial institutions, being too short and limited to the building of a business yet to be demonstrated as successful; moreover, it is usually unable to offer assets as collateral.

This difficulty to access the loan market has led to the growth of a new kind of crowdfunding: in debt-based crowdfunding, individuals lend money to either other individuals (P2P) or to businesses (P2B). Debt platforms screen the applicants, underwrite the loans, assign interest rates (sometimes based on an auction of interest rates among willing lenders), and then create a market where investors are able to screen available loans, and supply parts of the total loan amount to the projects or businesses. P2P platforms might fund everything from debt consolidation to home improvement, to leases, to real estate, and even college tuition. Indeed, in some countries their business is limited to private borrowers; in some others, businesses are allowed to borrow; in others there are restrictions on the lending side. In still other countries, debt-based crowdfunding is heavily regulated through bank licenses, which substantially inhibits the expansion of the market.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Lending-based crowdfunding platforms are growing rapidly across the world and have amassed billions of dollars in transactions. For example, in 2013, Lending Club originated over $1 billion (USD) in unsecured loans from consumers, and now Prosper is following the same growth curve. Normally, unsecured loans come at a higher default rate, but experience has shown that the default rates on these loans are not greater than traditional loans, and they have a higher yield. The successful IPOs of LendingClub and OnDeck further demonstrate the acceptance of these financing platforms.

According to recent research, this could become a $1 trillion global market within 10 years—an enormous figure that would still represent only one percent of the $100 trillion global debt market.

The screening and underwriting process is faster than traditional loan underwriting, and the web-based technology is a great facilitator. This may be particularly beneficial to companies that otherwise would have to turn to expensive receivables discounting for the fastest approval when seeking capital. In many countries, where SMEs need to finance their working capital on credit in order to remain in business, and a late payment is too often a reason for bankruptcy, this could be the difference between life and death.

Lending platforms are leveraging all available information on potential borrowers in order to assess their creditworthiness, and are investing in new algorithms in order to gain the ability to select relevant information from big data. An Indian platform is focusing on credit scoring, analyzing candidate borrowers' behavior on the social networks, while African micro-credit platforms are starting to rely on a candidate borrower's online micro-payments history to assess credibility. Indeed, evaluation and risk assessment are of prime importance when providing unsecured loans.

Most recently, large corporations also started investing in lending platforms, by purchasing loan portfolios or by taking portions of a large number of loans, given that the growing success of the score system that these platforms are developing is often more successful than that of banks. This is why the availability of investors now exceeds the current demand for loans. Such an opportunity should lead even the most restrictive governments to be open to lending-based crowdfunding, and accepting investors from abroad.

A variety of lending-based crowdfunding is microcredit: started in Bangladesh by Grameen Bank, it is a way to kick-start microbusinesses in underdeveloped countries, through very small loans, that nevertheless make the difference between opening a business or starving—between life and death (United Nations Development Program, Evaluation Office, Essentials Microfinance, 1999). Thousands of women and men in Asia and Africa have successfully started businesses and changed their lives with as little as $700–800, and also contributed to the development of their own countries. It is a very risky business, given the lack of guarantees and the frequent absence of promising conditions; therefore, interest rates must be high enough to remunerate the risk. Nevertheless, the success of microcredit demonstrates that borrowers easily succeed in paying back loan and interest, and are quite eager to do that, provided that the overall amount is not huge.

One problem preventing the wide development of microcredit is that some governments ban its average interest rates (20–30%) as usurious, thereby prohibiting microcredit by definition. Such bans stand regardless of context, or terms and conditions of a deal, so that no discrimination is possible and no access to this precious instrument is allowed.

## The Regulatory Framework

Given the public solicitation operating through the web and its investment nature, equity crowdfunding is regulated within the framework of financial regulation and securities; on the other hand, lending-based crowdfunding is either subject to the same regulation as bank and credit institutions or non regulated at all.

The main topics for lending crowdfunding in those countries where it is regulated are:

- License to operate a platform;
- Who can lend;
- Who can borrow.

For equity crowdfunding, instead, there are more critical topics, including:

- License to operate a platform;
- Who can invest in equity;
- Who can receive an investment;
- Maximum limits per investor;
- Maximum limits per deal;
- Solicitation rules.

Hereinafter we will go through some different approaches to equity crowdfunding deals in order to have a broad view of different approaches and regulations.

## Equity Crowdfunding: The U.S. Legal Framework

Despite the title of the debate born from the pages of *The Wall Street Journal* ("Should Equity-Based Crowd Funding Be Legal?" by Lavinsky and Torrens) which offered opposing viewpoints of this form of investment, equity crowdfunding has never been illegal in the U.S., although it has been rather inaccessible in terms of cost and bureaucracy.

The dichotomy that has animated the American debate reflects opposing economic theories, interventionist and liberal, based on the "invisible hand" thesis of Adam Smith. One theory argues that it is a viable form of financing for companies that do not qualify for access to venture capital, mostly because of their limited size; the other states that if the target companies are not good investments for venture capitalists and angels, there are probably good reasons not to invest, and these reasons may be too subtle for retail investors to detect.

In the American system we must start from the concept of "securities" and their strict regulation. ("The term 'security' means any note, stock, treasury stock, security future, bond, debenture, evidence of indebtedness, certificate of interest or participation in any profit-sharing agreement, collateral-trust certificate, preorganization certificate or subscription, transferable share, investment contract, voting-trust certificate…" –Securities Act, 1933). Considering financial instruments stocks, bonds, investment contracts and other forms of participation, an investment contract means any collection of money that might explicitly or implicitly provide investors with a potential gain.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

An investment contract is subject to the securities regulation depending on the Howey test; i.e., the verification of the conditions set by the Supreme Court in the Howey case: considering as an investment contract for the purposes of the Securities Act an agreement by which a person invests money in a company with other people or is solicited to expect profits because of a promoter's or a third party's advice. This definition covers investments involving real estate. The declared purpose of the Securities Act was to promote transparency in order to gain strong consumer protection: Justice Louis D. Brandeis is often quoted as saying: "sunlight is the best disinfectant; electric light is the most efficient policeman."

The U.S. law is divided into two regulations: the 1933 Disclosure Requirements and Registration Act and the 1934 Periodic Reporting Requirements Act. The result is a complex system based on three fundamental requirements:

1. Registration of the securities whose sale is induced;
2. Full documentary disclosure for the investor through a prospectus that contains detailed information about the entrepreneurial activity and verified accounts;
3. The obligation to produce periodic update reports.

A third act in 1934, the Broker-Dealer Registration Requirements, extended the registration requirements to intermediaries.

One of the main rules in the American system (both state and federal) is the difference between accredited and non-accredited investors. Accredited investors are defined in reference to the size of their assets, which must be larger than $1 million (excluding the value of their house) and current revenues exceeding $200,000 ($300,000 where cumulated with a spouse). In total, accredited investors account for about 3% of the American population, and their investments in non-listed private companies is about $30 billion a year, distributed among approximately 600,000 accredited investors.

In the U.S., as in many jurisdictions, what is most problematic and expensive is the prospectus requirement; i.e., the information to be provided to the public when soliciting an investment. Nevertheless, a number of exemptions occur, provided by U.S. legislation and the SEC to exclude or limit the rules for very small companies, or financial instruments having a small value or dedicated exclusively to sophisticated investors. Such exemption schemes, mainly built around the Regulation A and Regulation D, never exclude information and reporting duties.

When a U.S. website (BuyABeerCompany.com) tried to propose $300 million online funding for the purchase of Pabst Brewing Company, without registering the operation nor complying with the Securities Act, the SEC stopped the offer. The promoters immediately answered that they would collect investment intentions before actually getting investments. Since the money had not yet been collected, the case ended with an agreement based on the spontaneous withdrawal of the promoters from the initiative (SEC, Adm. Proc. File No. 3-14415). The promoters, whose communication of the offer was amplified via Facebook and Twitter, have reported investment intentions for over $200 million, from more than five million individuals.

The primary legislation regarding equity crowdfunding is the Jumpstart Our Business Startups Act (JOBS Act, April 2012), but it is not sufficient by itself to regulate equity crowdfunding: the SEC had been delegated to issue a special implementing regulation which will govern the process in detail and will be complemented by an appropriate regulation of the FINRA. Unfortunately, the deadline set by the JOBS Act had long expired by the time the SEC finally released a 500-page draft regulation and later, on October 30th, 2015, the implementation of the bill.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the wide debate about the SEC delay, many questions were posed and no answers were provided. There was apparently some concern about an eventual mass diversion of investments from the regulated stock exchanges to the "real" economy of restaurants, shops and small businesses.

Meanwhile, while waiting for the SEC regulation, several states (15 at the moment) have issued their own regulation and exemptions for offering limited crowdfunding to their residents. This is certainly a great opportunity, given the large investment capacity of some states; nevertheless, the scalability offered by the web would better be exploited through a national unified framework, and even better at an international level.

While non-accredited investors individually may make only small investments, collectively they may create a huge boost to the capital markets.

Besides that, other instruments are provided by specific regulations and allow restricted forms of crowdfunding, limited to accredited investors. This might not be considered "true" crowdfunding, but the dimension of U.S. accredited investors' available funds is so huge that it is a very good first step (reportedly 40% of the $55 billion annually invested in venture capital worldwide).

## The JOBS Act

The legislative initiative at the federal level was taken by President Obama in April 2012 with the JOBS Act, with the stated aim of reviving the economy then in a worldwide downturn. Not surprisingly, Obama's policy and the support granted to the economy are generating important results in terms of growth and employment, in contrast to other industrialized countries (except Japan).

The JOBS Act contains three different pieces of legislation, tailored for accredited, non-accredited or both kinds of investors.

Title II of the JOBS Act, concerning accredited investors, has been implemented by the SEC, and dramatically contributed to the $1.1 billion equity raised worldwide in 2014 on-line. It allows accredited investors unfettered access to operate on online platforms.

Title III, in contrast, allows retail investors to participate in equity crowdfunding. Given that the U.S. has the broadest national economy, analysts are eager to check out how retail investors will react to this huge democratization of their access to finance.

Title IV, which became effective on 19 June 2015, permits investments by both accredited and non-accredited investors, albeit with some rather expensive strings attached for small businesses (hereinafter referred to also as Reg. A+).

The main principles of Title III of the JOBS Act are the following:

1. Crowdfunding platforms are subject to a registration requirement;
2. The amount retail investors can invest in a company is capped at $2,000 or a specified percentage of the company's annual net income or net wealth (5% for incomes up to $100,000, and 10% for higher incomes), whichever is greater;
3. Any company proposing an investment must provide information to potential investors and the SEC; such information includes:
    a. The objectives of the company;
    b. The capital that is being collected;
    c. The maximum term of validity of the offer;
    d. The price of the securities offered;

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

   e. News about the company and management (board of directors and managers);
   f. News related to major shareholders and the capital structure;
   g. Business plans and financial situation;
4. Special attention is to be paid to the risks, to be duly highlighted both to the potential investors and to the SEC;
5. The SEC may require written additional information;
6. If the offer of securities exceeds $500,000, audited financial statements are required; between $100,000 and $500,000, accounts might be verified by an independent expert in accordance with rules established by the SEC; up to $100,000 it is sufficient to publish tax returns and financial statements of the previous year certified by the CEO.

After a successful funding, information on the business and operations ought to be updated annually, together with the financial statements.

The JOBS Act has chosen to limit the collection of equity through crowdfunding, to a million-dollar maximum for each twelve-month period.

It's true that this amount is high when compared to the current values of crowdfunding, but the most common crowdfunding models in 2012 (donation and reward) are very different from equity. For example, the average successful project on Kickstarter is $8,390. In contrast, the world average for equity-based crowdfunding, according to data from Massolution report CF2013 in 2012/2013 was $190,000, which almost doubled in 2014.

The ability to raise equity online under federal guidelines is limited to companies that qualify as Emerging Growth Companies (EGC): this type of company is not identified in relation to its business activity, but the volume of its annual sales, which must not exceed the astronomical sum of $1 billion in the previous fiscal year.

ECG status is retained for five years after the public offering, unless the company issues non-convertible debt securities exceeding $1 billion in three years or does not become a "large accelerated filer" (Rule12b-2). These values are frankly very far from the best ambitions of a startup and appear to contradict a roof of $1 million a year, and were established solely to avoid limitations to a truly effective use of crowdfunding. The logic of the U.S. crowdfunding legislation, intended primarily for small businesses with deep local development, is intended to encourage a strong link between investors and communities. Indeed, the small and very small companies have a greater capacity to create jobs, and help achieve the main objective of the JOBS Act.

In this regard, it is interesting that Amy Cortese coined the word "Locavesting" just to explain the phenomenon of the investment located in a community and the benefit it brings to the development of the community's social components. According to this analysis, while a dollar invested in Apple will contribute to the development of a better iPad, the same dollar invested in an agricultural activity can stimulate the local economy, helping induced activities that remain in the territory.

From the perspective of small business, the million-dollar roof is sufficient (at least for a year), but most importantly, it enables the proponent to focus on concrete and effective financial needs, avoiding the distraction of projects that are too complex or ambitious. The repeatability of annual crowdfunding allows the business to postpone raising further capital in the immediate aftermath of the first year's successes. Also in the American logic, for companies with greater financial needs, given that the U.S. venture capital and angel investing are extremely popular and mature, other means of financing might be preferable. Not to be overlooked, finally, a generalist small business is less likely to fail than a high-tech startup.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

This means that from the point of view of the American legislator, in order to create more jobs, and to limit risks for retail investors, it is useful to allow investments in "old economy" pure commercial companies, like a restaurant or a shoe manufacturer. It may not be the new Google, but it will most likely distribute dividends to investors and develop the local economy, advancing the goals of the U.S. government.

Each investor has a right to withdraw during the first 21 days after the initial crowdfunding offering to the public, regardless of the moment when the investor first learned of the possible deal. The reason for this rule lies in the great trust the American legislator puts into the network and in the ability of the people to expose fraud attempts: the thinking is that in a period of three weeks, the people will be able to discover and disclose any attempts at fraud. So, until the 21st day everyone can withdraw (even those who accepted the offer on the first day), but once the twenty-first day after the start of the campaign is over, no withdrawal right is allowed.

While equity crowdfunding access limits are modest, in order to allow the maximum access to capitalization, the JOBS Act sets significant requirements for the life of the company after the capitalization, and the sale of subscribed shares is restricted for one year. While it is true that the effectiveness of an emerging company may only be measured over time, this restriction seems to have no other logic than preventing these securities from being fuel for speculation and immediately traded.

A significant barrier to entry is the nationality of the target company, which must be exclusively American. This is a protectionist measure clearly designed to grow only American companies, as well as increase the gross domestic product and employment in the United States, in the spirit of the JOBS Act. The American system, subject to federal laws, is not therefore a candidate as an international marketplace for small and medium-sized enterprises, but is only a facilitator for its domestic market.

## Intermediaries in the JOBS Act

The typical crowd investment designed by the JOBS Act, both for accredited and non accredited investors, is through an authorized intermediary (broker-dealer) or through a crowdfunding platform registered with the SEC and at FINRA (Financial Industry Regulatory Authority). This excludes what happened spontaneously in different parts of the world at the dawn of crowdfunding, i.e., self-made websites to raise equity. The broker-dealer is responsible for the screening of the proposals, the subscription process and the delivery of the equity to the proposer once the financing goal is reached, according to the "all or nothing" formula. (The "take it all" formula, widely adopted in reward-based crowdfunding, is not allowed by the JOBS Act.)

The main charge the intermediary is entrusted with is the step-by-step compliance verification and the proper and deep disclosure of the offer and its supporting documents.

The broker-dealer is subject to a series of requirements set by the SEC at the regulatory level, and then:

1. Must inform investors of the risks;
2. Provides investors with educational tools;
3. Checks that investors examine the information provided by the offering party;
4. Checks that investors answer some questions and confirm that they properly understand the risks.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The only type of advertising allowed for crowdfunding is that directing the potential investor to the web platform (or the registered intermediary), and SEC/FINRA specifically regulate the kinds of possible advertising.

In addition, the remuneration of the intermediary (and thus of the platform) must be transparent for the investor.

## Crowdfunding Platforms

Equity crowdfunding platforms operating pursuant to Title II of the JOBS Act are not reserved only for broker-dealers or their subsidiaries.

The U.S. legislation directed the SEC to amend its rules to allow general solicitation and advertising for securities offerings being sold to accredited investors, stating that a platform offering securities under Rule 506, and permitting general solicitation and advertising by the issuers of such securities on its platform, does not need to register as a broker-dealer.

Such exemption is subject to the following requirements:

1. That the platform does not receive compensation in connection with the purchase or sale of any security;
2. That it does not hold customer funds or securities in connection with the purchase or sale of such security;
3. That it is not subject to statutory disqualification.

Otherwise, the intermediary must be registered as a broker-dealer and the FINRA regulatory system applies, along with all consequences in terms of expensive and time-consuming reviews, analyses, due diligence, and compliance.

Funders Club and Angel List are well-known and very effective equity crowdfunding platforms operating under Title II, though not registered as broker-dealers: in 2013, they received "no action" letters from the SEC, where the SEC Division of Trading & Markets staff agreed not to recommend enforcement actions. Since exempt platforms did not need to register as broker-dealers, under specific circumstances, these no action letters established a precedent.

Of course, Funders Club and Angel List offered securities to accredited investors only, did not earn transaction-based compensation (but rather "carried interest," as they were operating as investment advisors), did not handle customer securities or funds, and were not subject to statutory disqualification. If instead, for example, they were receiving commissions on securities transactions, compensation calculated on the success or size of the offering, or holding customer funds or securities, then they would have needed to register as broker-dealers.

Nevertheless, these platforms remain subject to the anti-fraud provisions of the federal securities laws, identification and anti-money-laundering regulations. Identification is particularly important in order to properly check the accredited investor profile.

The current legislation implicitly defines a primary difference between funding portals and funding platforms.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Funding portals are heavily regulated by the JOBS Act as miniature broker-dealers, and the October 2013 FINRA Regulatory Notice 13-34 set forth the rules for their FINRA membership, supervision, AML and reporting rules. But until the SEC approves crowdfunding federally, there are no funding portals to be supervised by FINRA.

Instead, the American equity crowdfunding market is currently managed by funding platforms, websites where investments are advertised to accredited investors only. Such platforms are mentioned just once in the Title II exemption from broker-dealer registration and the SEC itself confirmed that they don't need to register as broker-dealers, by the aforesaid no action letters to Funders Club and Angel List.

Equity crowdfunding, therefore, is currently managed through three different business models:

1. Broker-dealers, who recommend investments and earn commissions;
2. Investment advisors;
3. Listing platforms, that simply list offerings without any recommendation, earn listing fees, and charge further fees for services or tools.

## JOBS Act, Title IV, and Regulation A+

Under the Securities Act of 1933, when a company offers or sells securities to potential investors, it must either register the offer and sale or rely on an exemption from registration. A longstanding exemption from registration is Regulation A: it allows unregistered public offerings of up to $5 million of securities in any 12-month period. In recent years, Regulation A offerings have been relatively rare (it is generally considered expensive and complicated) and the new regulation, that Title IV of the JOBS Act required the SEC to modify, adds a new set of rules commonly referred to as Regulation A+.

The SEC finally issued Regulation A+ on 26 March 2015, to take effect on 19 June 2015, providing for two tiers of offerings, plus some limits on secondary sales by affiliates:

**Tier 1:** Securities offerings of up to $20 million in a 12-month period, with not more than $6 million in offers by selling security-holders that are affiliates of the issuer.
**Tier 2:** Securities offerings of up to $50 million in a 12-month period, with not more than $15 million in offers by selling security-holders that are affiliates of the issuer.

For offerings of up to $20 million, the issuer could elect whether to proceed under Tier 1 or Tier 2. Both tiers would be subject to basic requirements as to issuer eligibility, disclosure, and other matters, drawn from the current provisions of Regulation A. Both tiers would also permit companies to submit draft offering statements for non-public review by Commission staff before filing, permit the continued use of solicitation materials after filing the offering statement, require the electronic filing of offering materials and otherwise align Regulation A with current practice for registered offerings.

In addition to these basic requirements, companies conducting Tier 2 offerings would be subject to other requirements, including:

- To provide audited financial statements.
- To file annual, semiannual and current event reports.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Moreover, a limitation has been set on the amount of securities non-accredited investors can purchase in a Tier 2 offering: no more than 10% of the greater of the investor's annual income or net worth.

The exemption is limited to companies organized in and with their principal place of business in the United States or Canada. The exemption would not be available to companies that:

- Are already SEC reporting companies and certain investment companies;
- Have no specific business plan or purpose or have indicated their business plan is to engage in a merger or acquisition with an unidentified company;
- Are seeking to offer and sell asset-backed securities or fractional undivided interests in oil, gas or other mineral rights;
- Have been subject to any order of the Commission under Exchange Act Section 12(j) entered within the past five years;
- Have not filed ongoing reports required by the rules during the preceding two years;
- Are disqualified under the "bad actor" disqualification rules.

Regulation A+ is essentially a good way to launch a mini-IPO to both accredited and non-accredited investors; it is considered expensive (commentators quote about $100,000), it takes a long time (about 6–10 months to get the paperwork ready), and it gives significant exposure to the target company, even if it fails (although a "testing the water" period is allowed). But the large amount that can be raised is a good prize for the attempt.

Years ago, fast-growing companies went public much earlier in their growth cycle (compare Apple's IPO in 1980, which raised about $100 million, to Alibaba's recent record-breaking IPO of $25 billion). In this new scenario, a first step before the stock exchange might be useful.

It might be also useful to compare the benefits of Regulation A+ to those of Regulation D (specifically Rule 506 of Regulation D), which is to date the most prevalent approach private companies use to raise capital: Rule 506 allows private companies to raise an unlimited amount of capital from accredited investors only (this is the main difference); it does not require federal and state review and approval of offering materials; moreover, it allows companies to generally advertise their offering and solicit investors.

The primary advantage of Regulation A+, then, is the ability to solicit the retail investor, rather than relying, as the argument goes, on the more limited universe of accredited investors. The consideration required for gaining access to the general public is mostly time and money.

Filing an offering circular to the SEC for a Regulation A+ offering is nearly as complex as filing a prospectus for an initial public offering. The SEC estimates about 10 months to approve the average Regulation A filing, with only a 23% acceptance rate for the filings it receives.

## Equity Crowdfunding: The European Framework

The European Commission is currently studying equity crowdfunding with great interest, given the continued strong commitment to the development of the internal market.

Back in 2008, the Commission issued a "Think Small First" communication (Communication no. 394/2008, 25.6.2008) which called for the establishment of a regulatory framework for small business, called the "Small Business Act," based on 10 guiding principles; the sixth principle highlighted the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

difficulties of SMEs in raising capital and in obtaining financing through normal banking channels, and supported the opportunity to evaluate possible private placement regimes to facilitate cross-border investment and reinforce the European market for risk capital.

More recently, with the "Entrepreneurship Action Plan 2020" communication (Communication no. 795/2012 of 01/09/2013), the European Commission signaled the importance of supporting SMEs, stating that each year they create more than four million new jobs in Europe. The Commission focused on the crucial nature of the initial stages of their life cycle, showing that about 50% of SMEs fail during the initial five years; a major cause of failure being the absence of an appropriate financial ecosystem that was favorable to growth. Consequently, the Commission highlighted its initiatives in the Programme for the Competitiveness of Enterprises and SMEs (COSME) and Horizon 2020 to provide financial support to startups and strengthen venture capital, angel investment and incubators.

This context also fits Regulation no. 345/2013/EU of 17.4.2013 relating to European funds for venture capital.

Finally, with the "State of the Innovation Union 2012 – accelerating change" communication (Communication no. 149/2013 of 03/21/2013), the European Commission noted that in Europe there is no shortage of innovative ideas to be converted in successful business models, but the main obstacle is access to finance, further aggravated by the current economic downturn: the collection of venture capital funds fell by 45% and the investment activities of business angels is currently about one-fifth that of the United States.

In this regard, the European Commission had some recommendations drawn up by the Expert Group on cross-border matching of innovative firms with suitable investors; among the recommendations is to "promote joint financing (crowdfunding)." The Commission also took some important steps, including one in 2014 when it created the European Crowdfunding Stakeholders Forum, a group of experts coming from both the private market and national financial authorities, meant to help the European Commission in understanding and regulating this instrument.

Before issuing uniform provisions for the internal market, however, one must first establish whether there are crowdfunding profiles already regulated at the EU level.

More recently the European Commission published the communication "Realizing the potential of the crowdfunding" (COM 2014/172, 27 March 2014), which was followed by the establishment of study groups among operators and experts in the field and the publication of a "Guide for SMEs. Crowdfunding. What is it?"

On 18 December 2014, ESMA (European Securities and Markets Authority) published an opinion to the competent National Authorities and Advice addressed to the European institutions in the field of investment-based crowdfunding, with the aim of achieving greater convergence in the EU regulatory and supervisory arena.

Finally, the Green Paper on the Capital Market Union focuses on crowdfunding as a tool that should make a decisive contribution to the financing of the European economy, even beyond national borders, asking whether there are obstacles to the development of adequately regulated platforms, even across borders. ESMA, in its response to the consultation, identified crowdfunding among the possible areas of regulation in the field of financial markets in the coming years.

In principle, there are no regulations prohibiting the models based on rewards or donation, and e-commerce rules apply to preorders. Lending-based crowdfunding is usually part of banking legislation, albeit with the necessary adjustments.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Instead, equity crowdfunding regulation is far more complex. At the community level, the Prospectus Directive (Directive 2003/71/EC as amended by Directive 2010/73/EC) regulates public offerings of risk capital larger than €5 million. Offers below €100,000 are exempted, but there is no agreement at the community level between these ranges, and each member state retains its own rules (and the right to change them).

An eventual directive on crowdfunding could harmonize operations up to €5 million, contain a specific exemption from the prospectus requirement, and delineate proper forms of consumers protection.

In terms of communication, ESMA issued a "Notice to Investors" which invites the public to:

- Be aware of the risks inherent in investing online;
- Check whether the proposing company is unauthorized (obviously depending upon the applicable laws);
- Be wary of the promises of high returns;
- Pay attention to software that generates automated orders.

However, the document is aimed at investments online via electronic platforms, regardless of the object of the investment, and not crowdfunding specifically. In fact, numerous operators recently started offering online trading platforms involving financial products freely available on the market. These operators often provide training with "wallets" or economic promotions to attract the public.

In addition, reference should be made to Directive 2002/65 / EC of 23.9.2002 concerning long-distance marketing of consumer financial services, which plays a significant role in the harmonization of national laws, and has taken a large part in the drafting of national consumer codes.

In principle, where specific regulation doesn't yet exist, member states apply their internal finance regulations. This includes the application of Article 3 of Market in Financial Instruments Directive (MiFID) (n. 2004/39/EC) and Articles 1.2 and 1.3 of the Prospectus Directive, as also recently represented by ESMA during a workshop on crowdfunding organized in Brussels by the European Commission on 3 June 2013.

The main feature of MiFID is that it creates a system based on authorized and vigilant broker-dealers, subject to very strict regulation, and that it requires an authorized broker-dealer to carefully assess the investor's proclivity to make risky investments and the adequacy and appropriateness of the investment with respect to the investor's profile.

Article 3 of the MiFID Directive contains an exemption where the offer is run jointly with a broker-dealer, and the platform doesn't hold the investors' money. In 2016, the MiFID II Directive will become effective, and the member states will have to adapt their own legislation to the new rules. Although worded differently, Article 3 of MiFID II will continue to be the basis of equity crowdfunding exemptions in the European Union. Some European countries have already issued their own regulation based on the exemption provided by the revised Article 3.

The problem with this regulation is that nationally regulated equity crowdfunding platforms may not be "passported" throughout the Union, as have other financial institutions and intermediaries, as their operation is allowed only in the Member State where they got a license. This limitation strongly affects the scalability of equity crowdfunding, which indeed is one of the main features of this disruptive financial instrument. This is why the industry is calling for a specific European uniform equity crowdfunding exemption, enabling equity offers throughout the European Union.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Since crowdfunding platforms are usually IT companies, they rarely meet the requirement to apply for a broker-dealer or banking license, in order to be compliant with the MiFID Directive. This is why some European Countries (such as Italy) have chosen to require a platform to operate jointly with a broker-dealer:

1. The platform selects and publishes offers;
2. The broker-dealer receives and executes the subscription order under the MiFID requirements, holding the money until the offer is completely subscribed.

The exemption might help in the sense that national governments may set a limit below which the investment may be done without the broker-dealer. Italy has set this limit at €500 per deal and €1,000 annually (per individual), but after 18 months it was discovered that this amount is very far from the average transaction, which is above €10,000. This might lead to an increase of the exempted investment, in order to facilitate greater access to equity crowdfunding.

The Italian exemption of 26 June 2013 was the first in the world to be issued, even before the SEC regulation for accredited investors under Title II of the JOBS Act, but it followed an upside-down approach that didn't properly meet the needs of the market, perhaps due to the legislators' misunderstanding of how the market might have worked. A revision is scheduled for fall 2015.

Almost a year after Italy, the English FCA (Financial Conduct Authority) became the second national authority to issue equity crowdfunding regulations (effective 1 April 2014), but the FCA used a bottom-up process which started by observing the market and approving some provisional licenses to the first players who approached.

The U.K. is a vast financial market, and in fact the volume raised in 2014 exceeded €111 million. This large equity crowdfunding was also possible thanks to a regulation that left the investment process entirely to the crowdfunding platform, without involving broker-dealers or other intermediaries. Any MiFID-related verification and information is the exclusive responsibility of the platform, as are the identification and anti-laundering verifications, and they are properly run online.

There is no size or industry limit, provided that the target company is U.K.-based. Moreover, the English system allows the collection of the expression of interest (guaranteed by credit card), that becomes a true investment only once the target investment is reached.

The French exemption came with a regulation on 1 October 2014, also through a bottom-up process: platforms operate as CIP (Conseiller en Investissements Participatifs), registered with and under the inspection of AMF (the French financial authority); they don't need the help of a broker-dealer because they are registered intermediaries themselves, subject to the online verification duties specified by the MiFID regulation. There is no exempted amount, but the MiFID procedure is easier than in Italy, as it is run completely online and with a single goal: focused and specialized solely on equity crowdfunding.

The French exemption is working very well, as the market is growing 146% per year, and in 2014, €25 million was invested, with an average deal of €376,733. Nevertheless, there are restrictions concerning the size of the deal (€1,000,000) and the nationality of the target companies.

The German market clearly appreciated their national regulatory approach, as the market gained 50% in just the first quarter of 2015, when €12.4 million was collected, versus €7.9 million for the entire 2014 year.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The German regulation issued in April 2015 raised the limit for the prospectus from €1 million to €2.5 million, and set a personal investment limit for retail investors at €10,000, provided that they were found to be eligible for risky investments under the MiFID profiling rules. A huge effort has been made to move the entire investment process online, and to reduce the advertising limitations formerly applicable to any financial offering.

Spain was the last to adopt its national exemption and used a bottom-up approach, clearly resulting from two years' observation of equity crowdfunding in the world markets. The Spanish regulation imposed minimum capital requirements (€60,000) and professional liability insurance (€400,000) on platforms, to be increased proportionally to the investments managed.

From the American system, Spain imported the accredited investors profile: they have no investment limits, provided that certain revenue or estate criteria are met (€50,000 annual revenue for individuals). Non-accredited investors, on the other hand, have limits of €3,000 per investment and €10,000 per year.

The maximum offering is €2 million, unless the deal is reserved for accredited investors only, in which case the limit rises to €5 million.

# Chapter 20
# Utilizing Complexity Theory and Complex Adaptive Systems in Global Business

**Kijpokin Kasemsap**
*Suan Sunandha Rajabhat University, Thailand*

## ABSTRACT

*This chapter aims to utilize complexity theory and complex adaptive systems in global business, thus describing the theoretical and practical overview of complexity theory, the application of complex adaptive systems, and the significance of complexity theory and complex adaptive systems in global business. The utilization of complexity theory and complex adaptive systems is vital for modern organizations that seek to serve suppliers and customers, increase business performance, strengthen competitiveness, and acquire routine success in global business. Thus, it is essential for modern organizations to utilize complexity theory and complex adaptive systems, create a strategic plan to investigate their dynamic promotions, and instantly respond to the needs of customers. The chapter argues that utilizing complexity theory and complex adaptive systems has the potential to improve organizational performance and gain sustainable competitive advantage in global business.*

## INTRODUCTION

The organizational literature has considered complexity as an important factor influencing organizations (Hanisch & Wald, 2014). In the global markets where most organizations operate, the perspectives for competitiveness, flexibility, and dexterity has increased, and this demands for more adaptive structures (Arévalo & Espinosa, 2015). In this context, contemporary complexity theories that inspire managers with ideas about self-organization and neural network-like organizations are in demand, both in academic journals and in consultancy (Mitleton-Kelly, 2011). This is the case with social sciences researchers, which are increasingly attracted to the notions of permanent innovation, coevolution, and decentralized decision making in global business (Allen, Maguire, & McKelvey, 2011).

Complexity theory paradigm is in the process of being taken up from the natural sciences into the social sciences and humanities (Murray, 2008). Complexity theory is an effective domain to consider organizational response (Trenholm & Ferlie, 2013). Complexity theory is applied in organizational studies (Caldwell, 2006; Richardson, 2005; Stacey, 2003), public health (Durie & Wyatt, 2007), education studies (Zellermayer & Margolin, 2005), and policy studies (Callaghan, 2008; Morçöl, 2010; Sanderson, 2009). Complexity theory offers the new ways of thinking about some of the classic dilemmas in the social sciences, in particular, engaging with the tension between the examination for general theory and the desire for contextual and specific understandings (Calhoun, 1998; Haydu, 1998; Kiser, 1996), which lies at the essence of tension between realist approaches (Bhaskar, 1997; Byrne, 1998; Somers, 1998), and postmodern approaches (Cilliers, 1998; De Landa, 2000).

Complexity theory gains popularity in the discipline of the social sciences, organization studies, and management studies (Gerrits, 2009). Advocates of complexity theory describe it as a new scientific paradigm (Mitchell, 2009). Complexity theory has applied to the study of neuroscience, ecology, epidemiology, memory coding, computer science, metabolic networks (Arenas, Diaz-Guilera, Kurths, Moreno, & Zhou, 2008), and social sciences (Teisman & Klijn, 2008). Complexity theory is used to understand international relations (Jervis, 1998), public policy, and policymaking institutions (Geyer & Rihani, 2010). Academicians and practitioners utilize complexity theory to recommend the new forms of policymaking (Sanderson, 2009).

Complex adaptive systems are recognized as a theoretical foundation for studying group development, organizational culture, inflection points, nested adaptive cycles, leadership development, and innovation advancement (Edson, 2012). Complex adaptive systems are the special kinds of self-organizing system with emergent properties and adaptive capacity in response to the changing conditions (Kim & Mackey, 2014). Complex adaptive systems are made up of a diverse range of components, including individuals, organizations, physical resources, and other complex systems (Byrne, 2011). Complex adaptive systems are the neural-like networks of interdependent agents who are bonded in a cooperative dynamic by common goal, outlook, and requirement (Uhl-Bien, Marion, & McKelvey, 2007).

Complex adaptive systems include the adaptive agents (Liang & Huang, 2013). Complex adaptive systems approach is required for evaluating infrastructure projects (Verweij & Gerrits, 2013). Complex adaptive systems thinking is a subset of complexity theory (Casti, 1979). Complex adaptive systems thinking is used to investigate leadership styles, organizational change, team dynamics, and sustainability (Brown, 2008; Glatter, 2006; Harkema, 2003). The greater the level of adaptability, the more productive the organization is likely to be (Silverthorne & Wang, 2001). Rather than learn the new methods for evaluation, individual can apply complex adaptive systems thinking to the existing methods (Cabrera, Colosi, & Lobdell, 2008). Complex adaptive systems theory helps explain the challenges that organizations face (McDaniel, Jordan, & Fleeman, 2003). Complexity theory suggests that complex adaptive systems change to adapt to their environments (Hogue & Lord, 2007). There are the important limits to a reductionistic approach to understanding organizational processes (Cilliers, 1998) because complexity arises from the nonlinear interactions of many parts of a system, with interactions being highly sensitive to the history of the components and to their current context.

The strength of this chapter is on the thorough literature consolidation of complexity theory and complex adaptive systems in global business. The extant literatures of complexity theory and complex adaptive systems provide a contribution to practitioners and researchers by describing a comprehensive

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

view of the functional applications of complexity theory and complex adaptive systems to appeal to the different segments of complexity theory and complex adaptive systems in order to maximize the business impact of complexity theory and complex adaptive systems in global business.

## ORGANIZATIONAL BACKGROUND

Complexity is an established construct in organization theory (Anderson, 1999) and results from the system size and diversity, and the interdependent interactions of the system's entities (Sommer & Loch, 2004). Complexity theory has developed across a range of disciplines, both natural sciences and social sciences, from ecology to mathematics (Capra, 1997; Waldrop, 1992). Several authors have drawn parallels between educational research and some theories of natural sciences, in particular complexity theory and chaos theory (Norman, 2011). A major feature of complexity theory is its anti-reductionist analytic strategy, which is connected to a fundamental rethinking of the nature of systems, so as to better conceptualize the simultaneously systematic interrelationships between sociological phenomena (Walby, 2003). Complexity theory is associated with the development of realism in sociological thought (Archer, 1995; Bhaskar, 1997; Sayer, 1992).

Complexity theory concerns itself with the properties of systems with a large number of interdependent or interconnected parts (Carroll & Burton, 2000). Complexity theory is a transdisciplinary development (Capra, 1997), so it is important to be careful as to the translation of theories from between different disciplines, especially between those based on mathematical abstractions and those that include the complication of empirical observations. While there are attempts to develop a unified theory of complexity (Holland, 1995), the relationship of a system with its environment means that this is fraught with difficulties (Chu, Strand, & Fjelland, 2003). Many sociological investigations using modern statistics have utilized rather simple equations, assuming a direct proportionality, a linear relationship, between the changes in the scope of sociological phenomena (Abbot, 2001).

Complex adaptive systems typically emerge in social systems (Roy, 1954). Complex adaptive systems internally generate new structures in reaction to the changing conditions in the environment (Dekker, Cilliers, & Hofmeyr, 2011). Complex adaptive systems are capable of solving problems and are able to learn (Carley & Lee, 1998). Complex adaptive systems are unique in their ability to creatively adapt to environmental changes (Uhl-Bien et al., 2007). Complex adaptive systems enhance their capacity for adaptive response to environmental problems and internal demand by diversifying their strategies (Holland, 1995). Complex adaptive systems enhance their ability to prepare data (Lewin, 1999), solve problems (Levy, 1992), learn the business (Carley & Hill, 2001), and improve the business (Marion, 1999).

Complex adaptive systems are adaptive and innovative (Cilliers, 1998). Complex adaptive systems obtain the flexibility to adapt, thus attributing to the capacity to coordinate from an interdependent structure (Kauffman, 1993). In complex adaptive systems, coordination in modern business comes from two sources: from informal emergent constraints imposed by interdependent relationships themselves and from constraints imposed by actions external to the informal, dynamic, and environmental restrictions (Marion, 1999) and administrative controls (McKelvey, Marion, & Uhl-Bien, 2003). Internal controls are imposed by a perspective of common purpose that defines complex adaptive systems and from an accountability that is inherent in the interdependent systems (Schneider & Somers, 2006).

# UTILIZING COMPLEXITY THEORY AND COMPLEX ADAPTIVE SYSTEMS IN GLOBAL BUSINESS

This section describes the theoretical and practical overview of complexity theory, the application of complex adaptive systems, and the significance of complexity theory and complex adaptive systems in global business.

## Overview of Complexity Theory

The literature on complexity theory is expansive and heads in several directions (Woodside, 2014). Over the last decade, an increasing literature has considered the implications of complexity theory perspectives in development, health and social service policy, implementation, and evaluation (Patton, 2011). Anderson (1999) provided the advances in research on complexity theory related to organizational sciences. Several useful studies expand on the perspectives of Anderson's (1999) and prior work (March & Simon, 1958) especially in the complexity theory of organizational behavior through simulation methods (Davis, Eisenhardt, & Bingham, 2007). Urry (2005) provided a far-ranging literature review of complexity theory in the natural sciences and social sciences and offers the various meaningful insights. Complexity theory gives to connectedness and hybridity (Gatrell, 2005).

Complexity theory builds on chaos theory (Gleick, 1988). Complexity theory is a merger of various sciences such as political sciences (Kingdon, 1995), management and organization sciences (McKelvey, 2001), public administration sciences (Byrne, 1998), biology (Kauffman, 1993), and physics (Prigogine & Stengers, 1984). Underlying complexity theory is cybernetics (i.e., the mathematical study of communication and control) (Ashby, 1956) and the applications of systems thinking (Luhmann, 1995). Complexity theories stem from attempts by meteorologists, biologists, chemists, physicists, and other natural scientists to build the mathematical models of systems in nature (Gleick, 1988; Lorenz, 1993; Styhre, 2002).

A number of related theories have emerged such as the chaos theory (Bechtold, 1997; Haigh, 2002; Lorenz, 1993), dissipative structures theory (Prigogine, 1997), and the theory of complex adaptive systems (Goodwin, 1994; Stacey, Griffin, & Shaw, 2002). Stacey (2003) stated that the chaos theory and the dissipative structures theories seek to construct the mathematical models of systems at the macro level (e.g., whole systems and populations), while complex adaptive systems theory effectively models the same phenomena by using an agent-based approach.

Complexity theory includes a number of concepts that describe how complex adaptive systems develop and behave over time (Walton, 2014). Two concepts of central concern are emergence states and attractor states (Byrne & Callaghan, 2014). Emergence states are generated through the operation of the system as a whole and cannot be identified through examining individual system parts. Attractor states depict a pattern of system behavior and represents stability, with a change in attractor state representing a qualitative shift in the system (Room, 2011). Kania et al. (2013) explained that opening an evaluation to emergence and adaptation challenges the role of evaluating predetermined goals. Concepts of attractor states and emergence states provide a framework to understand both stability and change within complex adaptive systems (Morell, Hilscher, Magura, & Ford, 2010). With inspiration from complexity theory, failures are viewed as an emergent property of complexity (Dekker et al., 2011).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The concept of complexity is defined in opposition to both complicatedness and simplicity (Cilliers, 1998; Lewin, 1999; von Baeyer, 2003). The use of complexity refers to understanding the social systems within which interventions are implemented as complex (Shiell, Hawe, & Gold, 2008). Complexity theory provides the three implications in the social sciences. Firstly, complexity theory places an increasing stress on self-organization and a realistic awareness that sociological phenomena cannot be forecast. Secondly, complexity theory recognizes that all living organisms are self-steering within certain limits and their behavior can be steered from the outside to a moderate extent. Thirdly, complexity theory highlights the continuous emergence of the new levels of organized complexity within modern society. A system that is composed of many intricate parts is complicated unless the interaction of those parts is rich, dynamic, and non-linear leading to a change in their organization (Cilliers, 1998; Manson, 2001).

Complexity theory is broadly recognized in the social sciences (Davis, Phelps, & Wells, 2004). The growing interest in complexity research in social theory is described as the complexity turn (Urry, 2005). Complexity theory is predicated on a sociological phenomenon possessing five attributes: it contains independent complicated entities; multiple entities are contained within; the entities within sociological phenomenon perform interrelated functions; the sociological phenomenon seeks a common goal through a process of adaptation; and uncertainty is generated because of unpredictable interactions within itself and between itself and the environment. Complexity theory is a formal attempt to question how coherent and purposive wholes emerge from the interactions of simple and sometimes non-purposive components (Lissack, 1999). Action research can be considered as a form of social practice which acknowledges social interactions (e.g., teaching, learning, and knowledge generation) take place among people (Grundy, 1995).

Complexity theory serves as an umbrella term for a number of theories, ideas, and research programs derived from scientific disciplines such as meteorology, biology, physics, chemistry, and mathematics (Burnes, 2005; Stacey, 2003; Styhre, 2002). Complexity theory grows beyond the boundaries of the academy and into practice, particularly in the fields such as health care (Sweeney & Griffiths, 2002), social policy (Geyer, Mackintosh, & Lehmann, 2005), and organizational management (McMillan, 2004). Complexity theory identifies instability and disorder in politics and policy making, and links them to the behavior of complex systems (Cairney, 2012). Byrne (2013) provided a summary of Byrne's critical realist complexity theory and outlines implications for understanding complex causality through case-comparison methods. Callaghan (2008) argued for a theory driven approach to evaluation utilizing complexity theory and idea of negotiated order. Recognizing the role of agency in creating change in complex adaptive systems, the negotiated order is used to understand how policies are implemented at local level and their interaction with organizational structures, policies, power relations, and professional agendas (Callaghan, 2008).

Complexity theorists consider the most beneficial types of change as being those achieved through the self-organizing activities of teams and group in organizations (Brown & Eisenhardt, 1997). Complexity theory views the change as adaptation stemming from the interaction, alignment, and organization of agents into the higher levels of complexity (Lee, 1997). The inspection for general theory in more scientific thought in many disciplines has involved a process of reducing from complex phenomena to the simpler phenomena (Walby, 2003). This perspective includes either a reduction downward to the smaller units of analysis as in the movement from organisms to cells in modern biology (Rose, 1997) and in the methodological individualism of rational choice theory (Coleman, 1990; Goldthorpe, 2000; Kiser & Hechter 1991). This perspective involves a reduction upward, as in much structuralist thought in the social sciences (Althusser, 1971; Parsons, 1951).

## Application of Complex Adaptive Systems

Complexity theory, as a theoretical perspective within social science, considers utilizing complex adaptive systems in global business (Begun, Zimmerman, & Dooley, 2003). Complex adaptive systems are the dynamic networks of agents acting in parallel, constantly reacting to what the other agents are doing, toward influencing behavior and network as a whole (Holland, 1992). Sawyer (2005) indicated that there are the four perspectives of complex adaptive systems: many components interact in the densely connected networks; global systems functioning cannot be localized to a subset of components, but rather are distributed throughout the entire system; the overall system cannot be decomposed into subsystems; and the components interact using a sophisticated language.

Self-organizing systems are considered as systems that operate autonomously, and co-evolve between themselves through transitions between disorder and order (Arévalo & Espinosa, 2015). Order emerges at the boundary between the organization's legitimate and shadow systems (Houchin & MacLean, 2005). Various authors have considered self-organizing systems as the major parts of complex adaptive systems (Nitschke, 2005). Self-organizing systems are the mechanisms for complex adaptive systems evolution (Johnson & Lam, 2010). Self-organization is a self-referential process characterized by the logical deductive reasoning, concentration, discussion, and improvement (Chiva, Grandío, & Alegre, 2010).

Self-organization leads to the coevolution of ideas between different components of the social system (Nooteboom, 2007). Evolution is the process of change or transformation (Darwin, 2010), characterized in terms of macroscopic behaviors that emerge from the interactions that occur at the microscopic level (Bedau & Packard, 1992). Self-organizing systems can be recognized as a set of dynamic mechanisms in which global structures appear from a system of interactions between components at different levels (Bonabeau, Dorigo, & Theraulaz, 1999). The rules of interaction between the constituent units of the system are developed based on local information without reference to global patterns which are an emergent property of the system rather than a property imposed on the system (Holland & Melhuish, 1999). Self-organizing systems occur only in open systems that import information from the environment and achieve the limited instability states (Kauffman, 1995).

Complex adaptive systems involve many components that adapt as they interact (Holland, 2006). Complex adaptive systems develop the order through the self-organizing behavior of agents (Coleman, 1999). Through the co-creation of all agents involved, the order will come to pass without efforts to control and direct it (Keane, 2000) through two different forms of information processing (Marion & Uhl-Bien, 2001). Micro-dynamic processing occurs when individuals interact to form the aggregates, working together in an interdependent way to fulfill their own needs and cooperating to reach a satisfactory accommodation of the needs of the rest of the group (Hogue & Lord, 2007). This leads to the retention of uniqueness among agents as well as the development of sameness within the group. Uniqueness leads to the unpredictability of emergent order, while sameness allows more dependable prediction (Marion & Uhl-Bien, 2001).

Complex adaptive systems perspective suggests that to develop resilience demands a policy approach which is sensitive to the various principles of complexity, nonlinearity, unpredictability, and the importance of feedback (Bristow & Healy, 2014). Complex adaptive systems are oriented to the study of systems in which global behaviors depend more on the interactions between the parts than the actions of each one (Gell-Mann, 1994). Consistency of complex adaptive systems depends on the multiple

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

interactions among the parts, the aggregation of the various elements, and learning (Holland, 1995). A sustained intervention is required at every possible level until the phenomenon of learning excellence emerges itself (Mason, 2008).

If organizations are treated as complex adaptive systems, the issues of managerial activity changes, sense-making, learning, and improvisation become more effective strategies for performance improvement (McDaniel, 2007). Complexity theory and its component concepts (e.g., coevolution and self-organization) can offer the meaningful insights into knowledge phenomena associated with networks and clusters (Lindsay, 2005). Organizational learning, knowledge management, and knowledge-sharing behavior are positively related to organizational performance (Kasemsap, 2013a). Organizational learning, organizational innovation, and organizational performance help organizations obtain sustainable competitive advantage in modern organizations (Kasemsap, 2013b). Organizational learning, human resource management, and knowledge management capability practically lead to the improved organizational performance in the digital age (Kasemsap, 2015a). Utilizing data mining methods for business intelligence makes it easier for the users to promote its overall contribution to the knowledge management process (Kasemsap, 2015b).

Thinking about complex adaptive systems initiates a variety of new options (Holden, 2005). Many researchers have considered the value of leadership styles which use the principles of complex adaptive systems thinking in order to make positive changes by influencing context and relationships (Bujak, 1999). Understanding the principles and actions that enable change in complex adaptive systems is essential for the long-term business success (Nesse, Kutcher, Wood, & Rummans, 2010). Building on the principles of complex adaptive systems thinking can help executives and management team focus less on prediction and more on promoting relationships and creating conditions so that complex adaptive systems can produce the firms' outcomes in global business (Burns, 2001).

Action learning seems concerned with development within organizations, and within a complex frame, thus developing the skills to consider the complex adaptive systems (Burgoyne, 2010). Adam et al. (2012) indicated that there is a need for more comprehensive evaluations of a wider range of effects, with no evaluation exploring system effects that reflect complex adaptive systems. In complexity theory, the interdependent linkages among agents and aggregates are described in terms of coupling strength and coupling direction (Marion & Uhl-Bien, 2003). Coupling provides the structure for transmitting knowledge among agents, and knowledge is transmitted more reliably and more quickly in the moderately coupled interactions. Coupling direction is recursive so that information can be passed in either direction among the agents or aggregates (Hogue & Lord, 2007).

## Significance of Complexity Theory and Complex Adaptive Systems in Global Business

There is a growing body of literature applying complexity to management (Lissack, 1999; Stacey, 2001) and education (Bloom, 2001; Davis & Sumara, 1997; Iannone, 1995). Complexity theory acknowledges that the uncertainty of prediction is necessary (Eve, Horsfall, & Lee, 1997) and the processes are critically dependent on their initial conditions. Lee (1997) stated that complexity theory can offer a more consistent explanation of research-related data gathered through mixed methods and presented in methodological languages. Combining complex adaptive systems with local knowledge is required for implementation and evaluation of multilevel dynamic systems interventions (Schensul, 2009). Economic evaluation

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

should draw upon complexity theory to deal with the related issues of complexity and reflexivity (Lessard, 2007). Marchal et al. (2013) stated that an evaluation of complex intervention regarding complexity theory should evaluate the program effectiveness and reveal the causal mechanisms.

Global economy is transitioning from product-oriented perspective to service-oriented perspective (Sheehan, 2006). Most developed countries have service economies in which the majority of national productivity comes from service products and activities (Chae, 2012). Within those developed countries, manufacturing firms are increasing their revenues through offering the integrated solutions or integrative services, which combine both products and services (Araujo & Spring, 2006). Firms in the business-to-business (B2B) market view the services, rather than traditional products, as the main source of their revenue and competitive advantage (Zhang, Wei, & Chau, 2012). Information technology (IT) has profoundly changed the ways that customers interact with service providers (Fitzsimmons & Fitzsimmons, 2008). IT is an integral part of services (Chae, 2014).

Since IT-enabled services include specific IT artifacts are operated on specific digital platforms, the divergent perspective on service as the intangible units of economic exchange can be less useful to explain the evolution of IT-enabled services and their interactive natures (Chen & Vargo, 2010). In modern business, IT-enabled services as complex adaptive systems can offer greater insights about IT-enabled services and innovation, since complexity theory represents advancement in the principle of complex adaptive systems (Chae, 2014). Complexity theory is considered as the modern perspective of systems theory (Nan, 2011). Key characteristics of IT-enabled services are the emergent nature of service requirements (Essen, 2009), diversity in service (Maglio, Vargo, Caswell, & Spohrer, 2009), and service elements (Voss & Hsuan, 2009). Emergence, diversity, and self-organization are the important characteristics of complex adaptive systems (Beinhocker, 2006).

Complexity theory is likely to be applicable to organizational behavior and to behavior in health services organizations (Paley & Eva, 2011). Complexity thinking and complex adaptive systems are broadly recognized in the business of health care (McDaniel & Driebe, 2001), achieving change in health service organizations (Suchman, 2001), interprofessional education (Sargeant, 2009), medical education (Rees & Richards, 2004), consultations in general practice (Innes, Campion, & Griffiths, 2005), problem-based learning in dentistry (Farmer, 2004), clinical governance (Sweeney & Mannion, 2002), evidence-based practice (Petros, 2003), shared care for patients with long-term mental illness (Byng & Jones, 2004), clinical leadership in mental health (Minas, 2005), environmental illness (Coyle, 2009), services in elderly care (Henriksen & Rosenqvist, 2003), diabetes management (Cooper & Geyer, 2009), research on maternity care (McCourt, 2005), public health nursing (MacDonald, 2004), decision making in nursing management (Clancy & Delaney, 2005), and occupational therapy (Creek, Ilott, Cook, & Munday, 2005).

Megaproject requires a closer examination as a result of the expansion of global business networks, thus increasing the collaborations among business partners and the complexity of managing projects (Kardes, Ozturk, Cavusgil, & Cavusgil, 2013). Megaprojects are characterized by complexity, uncertainty, ambiguity, dynamic interfaces, political influences, and time periods reaching a decade or more (Floricel & Miller, 2001). Megaprojects involve the international participants with a variety of cultural differences, backgrounds, political systems, and languages (Shore & Cross, 2005). Megaprojects include the coordinated applications of capital, sophisticated technology, intense planning, and political influence (Gellert & Lynch, 2003).

Complexity emerges as a major challenge for managers of megaprojects (Kardes et al., 2013). Regarding complexity theory, difficulty resulting from the lack of cooperation between stakeholders with conflicting interests and the changes occurring during the duration of the projects (e.g., the changes in

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

laws and regulations) increase the complexity (Capka, 2004). The complexity of megaprojects is brought about by a number of contributing factors such as tasks, components, personnel, and funding, as well as the numerous sources of uncertainty and their interactions (Mihm, Loch, & Huchzermeier, 2003). Research evidence suggests that the principal factors leading to complexity include the large-scale and long time span, the multiplicity of technological disciplines, the number of participants, multinationality, the interests of stakeholders, sponsor interest, escalating costs over time, country risk, uncertainty, and the high levels of public attention (van Marrewijk, Clegg, Pitsis, & Veenswijk, 2008).

Complexity dynamics are the emergent processes through which complex adaptive systems effectively form and operate (Uhl-Bien & Marion, 2009). In complexity theory, top-down dynamics occur when information processing is guided by a central authority, and bottom-up dynamics are the emergent events that occur through the uncoordinated interactions of those involved (Marion & Uhl-Bien, 2001). Top-down information processing is influenced by an existing memory structure such as implicit leadership theories (Medvedeff & Lord, 2007). Although the top-down and bottom-up processes can be separately conceptualized, perception involves the interaction of these two sources of activation (Grossberg, 1999). Complex adaptive systems relate to the interaction of the components (Dekker et al., 2011). Jet airliners become complex adaptive systems when they are deployed in the nominally regulated world with the cultural diversity, the receiver-oriented versus transmitter-oriented communication expectations, the effects of procedural drift (Snook, 2000), and the cross-cultural differences in risk perceptions, attitudes, and behavior (Lund & Rundmo, 2009).

Many organizations are the complex systems which need to operate at the edge of chaos and have to continuously respond to the changes in their environments through a process of self-organizing change (Macbeth, 2002; Stacey, 2003). At the edge of chaos, specific behaviors are not easily predicted, yet the unpredictable specific behavior occurs within a predictable structure of behavior (Burnes, 2004). Complexity theory is applied to a wide range of social system, including the economy, society, and culture (Lewin, 1999; Waldrop, 1992). Complexity theory perspective has the potential to help policymakers understand the dynamic and complex nature of reforms (Toh & So, 2011). Complexity theory offers a set of conceptual tools to help explain the diversity of changes in contemporary globalization (Walby, 2003). Management concepts (e.g., industrialization, class conflict, inequality, the development of welfare state, capitalism, and the consequences of increasing bureaucratization) are connected to the development of the modern society and the consequences of the growing complexity (Sztompka, 1994).

Complexity theory captures the change occurring in social institutions (Cohen, 1999; Hunt & Ropo, 2003; Mathews, White, & Long, 1999). Instability and change are the inherent characteristics of complex adaptive systems (Speakman & Sharpley, 2012). Complexity theory is concerned with the emergence of order in nonlinear systems such as weather systems (Beeson & Davis, 2000; Haigh, 2002; Wheatley, 1992). Order in such systems manifests itself in a largely unpredictable perspective, in which the patterns of behavior emerge through a process of self-organization governed by the order-generating rules (Black, 2000; Macintosh & MacLean, 2001; Tetenbaum, 1998). In an application of complexity theory to examine public service changes, Wallace (2007) outlined the key characteristics of complex public service change. Complex change is systematic, differentially impacting, and contextually dependent (Wallace, 2007). Wallace et al. (2007) stated that health and education sectors, as the largest and most complex public services, offer the most influential insights of the complexity of change and strategies for dealing with complexity.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Boal and Schlultz (2007) stated that the concept of complex adaptive systems is attractive to the organizational scholars because it describes that the innovative behaviors can emerge from the interaction of the agents' groups without the requirement of centralized control. Concerning complexity theory, leadership is crucial to the process of self-organization (Knowles, 2001) and leaders serve as the context setters of the learning experiences (Brown & Eisenhardt, 1997; Pascale, 1999). Leaders influence other persons and processes (Marion & Uhl-Bien, 2001). Leadership in complex adaptive systems indirectly affects the organization through the mediating variables of organizational identity and social movements (Schneider & Somers, 2006).

Developing leadership skill and reputation requires self-development that occurs over a substantial time period (Lord & Hall, 2005) and it reflects both top-down and bottom-up processes used by potential leaders to construct leadership self-schema. Complexity theory has promoted a reexamination of leadership, as much of the leadership dictionary developed under the general systems theory (Schneider & Somers, 2006). Transformational leadership, innovation support, and empowerment help organizations increase innovation in the global economy (Kasemsap, 2014). The leader-member exchange, organizational justice, and job satisfaction have mediated positive effect on organizational citizenship behavior (Kasemsap, 2013c).

## FUTURE TRENDS

The strength of this article is on the thorough literature consolidation of complexity theory and complex adaptive systems in global business. The extant literatures of complexity theory and complex adaptive systems provide a contribution to practitioners and researchers by describing a comprehensive view of the functional applications of complexity theory and complex adaptive systems to appeal to the different segments of complexity theory and complex adaptive systems in order to maximize the business impact of complexity theory and complex adaptive systems in global business. The classification of the extant literature in the domains of complexity theory and complex adaptive systems will provide the potential opportunities for future research. Future research direction should broaden the perspectives in implementation of complexity theory and complex adaptive systems to be utilized in the knowledge-based organizations.

Practitioners and researchers should acknowledge the applicability of a more multidisciplinary approach toward research activities in implementing complexity theory and complex adaptive systems in terms of knowledge management-related variables (e.g., knowledge-sharing behavior, knowledge creation, organizational learning, learning orientation, and motivation to learn). It will be useful to bring additional disciplines together (e.g., strategic management, marketing, finance, and human resources) to support a more holistic examination of complexity theory and complex adaptive systems in order to combine the existing theories and approaches to inquiry in this area.

## CONCLUSION

This chapter aimed to utilize complexity theory and complex adaptive systems in global business, thus describing the theoretical and practical overview of complexity theory, the application of complex adaptive systems, and the significance of complexity theory and complex adaptive systems in global business.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Complexity theory enables understanding the realities of the evolutionary, dynamic, and complex nature of organizations, businesses, and economics. The understanding of complexity theory is necessary to develop an evolving organization capable of producing and sustaining a competitive advantage in global business. Complexity theory is used in business as a way to encourage innovative thinking and real-time responses to change by allowing business units to self-organize.

Complex adaptive systems are a particular category of complex system that displays the ability to adapt and evolve in response to changes in the environment. Complexity theory and complex adaptive systems have developed the powerful ways of thinking about systematic relations, including the nature of systems. Complexity theory and complex adaptive systems facilitate the development of the general social theory as well as the explanation of specific contextual occurrences. Utilizing complexity theory and complex adaptive systems promotes the revision of the concept of system to grasp the unstable and dynamic processes of change. The modern ways of thinking about complexity theory and complex adaptive systems are useful in conceptualizing the nature of the connections and linkages involved in global business.

The utilization of complexity theory and complex adaptive systems in the social sciences is vital for modern organizations that seek to serve suppliers and customers, increase business performance, strengthen competitiveness, and acquire routine success in global business. Thus, it is essential for modern organizations to utilize complexity theory and complex adaptive systems, create a strategic plan to investigate their dynamic promotions, and instantly respond to the needs of customers. Utilizing complexity theory and complex adaptive systems has the potential to improve organizational performance and gain sustainable competitive advantage in global business.

## KEY TERMS AND DEFINITIONS

**Change:** The act of becoming different, or the result of something becoming different.

**Chaos Theory:** The mathematical framework for understanding irregular and erratic fluctuations in economic cycles, financial markets, weather, other complex phenomenon, or non-linear systems with many variables.

**Complex Adaptive System:** The entity consisting of many diverse and autonomous components which are interrelated, interdependent, linked through many dense interconnections, and behave as a unified whole in learning from experience and in adjusting to changes in the environment.

**Complexity:** The condition of having many diverse and autonomous but interrelated and interdependent components linked through many dense interconnections.

**Complexity Theory:** A set of concepts that attempts to explain complex phenomenon not explainable by traditional theories.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Information Technology:** A set of tools, processes, and associated equipment employed to collect, process, and present information.

**Leadership:** The activity of leading a group of people or an organization or the ability to do this.

**Self-Organization:** The ability of a system to spontaneously arrange its components in a purposeful (non-random) manner, under appropriate conditions but without the help of an external agency.

**Social Science:** The study of society and the way that people live.

# Chapter 21
# Examining the Roles of Virtual Team and Information Technology in Global Business

**Kijpokin Kasemsap**
*Suan Sunandha Rajabhat University, Thailand*

## ABSTRACT

*This chapter aims to examine the roles of virtual team and information technology (IT) in global business, thus describing the theoretical and practical overviews of virtual team and IT; the importance of virtual team in global business; and the importance of IT in global business. The applications of virtual team and IT are necessary for modern organizations that seek to serve suppliers and customers, increase business performance, strengthen competitiveness, and achieve continuous success in global business. Therefore, it is essential for modern organizations to examine their virtual team and IT applications, develop a strategic plan to regularly check their practical advancements, and immediately respond to virtual team and IT needs of customers in modern organizations. The chapter argues that applying virtual team and IT has the potential to increase organizational performance and reach strategic goals in global business.*

## INTRODUCTION

Virtual teams are becoming more and more important and continuing to grow in popularity (Olariu & Aldea, 2014). Understanding the influence of leaders in virtual team settings can help organizations in allocating resources and sorting teams' priorities (Saafein & Shaykhian, 2014). Multinational companies are beginning to adopt a virtual team strategy, due to the benefits of cost reduction and performance improvement (Ferreira, de Lima, & da Costa, 2012). Virtual teams are an organizational form in which an overlay of information and communication technologies (ICT) enables departures from traditional, face-to-face, organizational forms (Haines, 2014). Virtual team members have developed a new technique which reduces the ambiguity of virtual communications in order to influence their team members (Wadsworth & Blanchard, 2015).

Economic growth of most of the industries depends largely on the development of operating technologies within the industries (Prabhakaran, Lathabai, & Changat, 2015). The increasing business competitiveness leads industries to differentiate themselves in terms of technology (Reis & Freitas, 2014). ICT has been a major technological innovation for developed countries and is increasingly spreading to developing countries (Kossaï & Piget, 2014). Allameh et al. (2011) stated that ICT is one of the strategic factors toward the improvement of business and human resource productivity. Organizations are relying on Internet services as well as information systems to enhance business operations, facilitate management decision-making, and deploy business strategies (Kankanhalli, Teo, Tan, & Wei, 2003).

The strength of this chapter is on the thorough literature consolidation of virtual team and IT. The extant literature of virtual team and IT provides a contribution to practitioners and researchers by describing a comprehensive view of the functional applications of virtual team and IT to appeal to different segments of virtual team and IT in order to maximize the business impact of virtual team and IT in global business.

## BACKGROUND

Virtual work settings cause organizational challenges such as maintaining remote leadership, managing cultural differences, and developing trust relationships among the teams (Saafein & Shaykhian, 2014). Virtual teams need to deal with such as communication difficulties, decreased cohesion, and high level of conflicts among teams (Staples & Zhao, 2006). Virtual team members are physically separated from one another and they rely on technological devices for communication and information exchange (Ghaffari, Sheikhahmadi, & Safakish, 2014). Virtual teams are thought to be differently experienced and to have poor outcomes because there is little or no face-to-face interaction and a tendency for virtual team members to use different communication techniques for forming relationships (Haines, 2014).

The diffusion of new technologies can have a significant impact on economic growth and development (Kossaï & Piget, 2014). Allameh et al. (2011) indicated that the application of IT has a great stance among basic industries since it plays an important role in different industries such as productivity, social services and job opportunity improvement. The continued diffusion of new ICT is an example of the dynamics of technological change and economic development (Freeman & Soete, 1997). ICT is used as a production technology to improve labor productivity and coordination within the firm (Raymond & St-Pierre, 2005). ICT is considered to be the main engine of growth in the knowledge economy (Kossaï & Piget, 2014). Firms invest in ICT in order to become more successful in highly competitive markets (Koivunen, Hätonen, & Välimäki, 2008).

## VIRTUAL TEAM AND INFORMATION TECHNOLOGY IN GLOBAL BUSINESS

This section describes the theoretical and practical overviews of virtual team and IT; the importance of virtual team in global business; and the importance of IT in global business.

### Overview of Virtual Team

Organizational teams mainly bring numerous benefits for both management and employees, including a method of pooling ideas, facilitating communication, and improving workflow (Lin, 2011). Transfor-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

mational usage of computer-mediated interactions and online collaboration technology platforms among team members collaborating in virtual teams practically contextualizes multiple settings for the terminology of virtual teams in organizations (Mansor, Mirahsani, & Saidi, 2012). Virtual teams are teams whose members are mediated by time, distance, or technology and whose members are interdependent, working together on a common task (Driskell, Radtke, & Salas, 2003). Luse et al. (2014) stated that virtual teams are characterized as a group of people with unique skills who interdependently work but are geographically separated and they need technological mediums to communicate.

The technologies of virtual teams vary as to how much they incorporate the media dimensions of co-presence, visibility, audibility, contemporality, simultaneity, sequentiality, reviewability, and revisability (Clark & Brennan, 1991). Members of virtual teams communicate through various ICT including telephone, video and audio conferencing, chat rooms and instant messaging, file and application sharing, and other virtual reality options (Hertel, Geister, & Konradt, 2005; Olson & Olson, 2000). Virtual teams are a group of geographically, organizationally and time dispersed workers brought together by IT to accomplish one or more organization tasks (Powell, Piccoli, & Ives, 2004).

Members of virtual teams often collaborate within and across institutional boundaries (Schiller, Mennecke, Nah, & Luse, 2014). Virtual teams are comprised of members who are located in more than one physical location (El-Kassrawy, 2014). Virtual teams represent interdependent groups of individuals who work across space, time, and geographical boundaries with communication links that are heavily dependent upon advanced IT (Hambley, O'Neill, & Kline, 2007). Geographically distributed team members can easily withhold information from one another (Rosen, Furst, & Blackburn, 2007).Virtual teams have become basic units in business organizations, and their activities are ubiquitous and have received considerable attention from social and organizational psychologists (Bosch-Sijtsema, 2007).

Advances in ICT have allowed organizations to facilitate virtual team member coordination in a cost effective manner (Pendharkar, 2013). Team performance and knowledge sharing remain important issues for interpersonal relationships within virtual teams (Levy, Loebbecke, & Powell, 2003). ICT, the dispersion of members around the world, and the relationships between team members of different status may affect the use and effectiveness of influence tactics in virtual teams (Wadsworth & Blanchard, 2015). Influence tactics are how people enact power over others (Lines, 2007; Yukl & Tracey, 1992).

Martins et al. (2004) defined virtual team as team whose members use technology to varying degrees in working across locational, temporal, and relational boundaries to accomplish an interdependent task. Nemiro (2001) indicated the five traits of virtual teams: geographical separation (members being separated from one another), alternative methods of communication (members using new information technologies in order to collaborate), reduced information richness (the majority of methods used to communicate having low levels of information richness), loose boundaries, and dynamic membership (membership in virtual teams being adaptable and temporary).

The interpersonal relationships within virtual teams are comprised of two elements: cooperation and competition relationship (Baruch & Lin, 2012). Regarding coopetition relationships, all teaming activities should aim for the establishment of a beneficial partnership with one another in the team, including the coworkers who may be considered as a competitor (Zineldin, 2004). Coopetition is important among intra-organizational partners and inter-team parties (or inter-organizational parties), and these interactions are key for a firm's long-term viability (Luo, Slotegraaf, & Pan, 2006). If both the elements co-exist, then the relationship between the members is considered coopetition (Bengtsson & Kock, 2000).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Concerning advances in IT facilitating information sharing, more companies are moving toward using virtual teams (Baruch & Lin, 2012). The use of technology can allow a virtual team to recruit additional members (Lipnack & Stamps, 1997), which leads to increased communication requirements. Virtual teams work collaboratively in geographically dispersed locations but still share the same interests, goals, needs and practices that define face-to-face teams (Chiu, Hsu, & Wang, 2006). The handling of technological issues such as adaptation and regular use of communication tools as another challenge that faces virtual teams (Indiramma & Anandakumar, 2009).

Because members of virtual teams have fewer tools available for developing relationships than face-to-face teams, they must rely on categorization processes (McKnight, Cummings, & Chervany, 1998) and their experience from other settings (Jarvenpaa & Leidner, 1999). Virtual teams need to deal with such as communication difficulties, decreased cohesion, and high level of conflicts among virtual teams (Staples & Zhao, 2006). Individuals working in anonymous groups believe that their group's decision are less effective, and are often less satisfied as compared to members of teams' face-to-face meetings (Reinig & Mejias, 2004; Valacich, Dennis, & Nunamaker, 1992). In order to prevent problems arising regarding anonymous communication, individuals supervising virtual teams would prefer team members to be identifiable (Midha & Nandedkar, 2012). Knowledge of the identity of a specific source enhances the source credibility and accountability for virtual teams (Rains, 2007).

Virtual team leaders stimulate followers to be high performers through effective use of motivational and communication skills on individual and group levels (Bolman & Deal, 2003). Virtual team leaders may need different leadership characteristics from leaders of traditional teams when setting goals, offering support and guidance, and inspiring team members (Saafein & Shaykhian, 2014). Challenges to good communication between virtual team members are obtaining timely communication feedback (Jarvenpaa & Leidner, 1999), building trust between team members (Fan, Suo, Feng, & Liu, 2011), building a common sense of purpose between team members (Blackburn, Furst, & Rosen, 2003) and team members' access to rich communication media (Kayworth & Leidner, 2000).

## Overview of Information Technology

Information Technology (IT) is an integral part to support, sustain, and grow a business (Mohamed & Singh, 2012). With the rapid development of IT, the innovative IT strategy has become an important topic of research in the era of electronic business (Yeh, Lee, & Pai, 2012). IT as a new human technology is rapidly affecting business and productivity (Zafiropoulos, Vrana, & Paschaloudis, 2006). Most companies heavily invest on IT for getting better business feedbacks (Williams & Williams, 2007). ICT encompasses computer and communication technologies, shareable technical platforms and databases, networking technologies, broadcast media, and audio and video processing and transmission (Chung & Hossain, 2010; Schaper & Pervan, 2007).

The mixed empirical results concerning financial performance achieve from IT integration (Chapman & Kihn, 2009; Hunton, Lippincott, & Reck, 2003; Poston & Grabski, 2001). Successful IT integration can deliver IT resources in support of the new roles and functions of workers as a result of redesigned and tightened business processes (Rockart, Ear, & Ross, 1996). Integrated IT not only enables process automation, but also can provide the ability to disseminate timely and accurate information, resulting in improved managerial and employee decision-making (Hitt, Wu, & Zhou, 2002). Manufacturing plants will reap the greatest financial performance benefits from investments in activity-based cost control systems when combined with IT integration (Maiga, Nilsson, & Jacobs, 2014).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Technology can improve business productivity (Yang, Lee, & Lee, 2007). IT has a considerable effect on globalization and is a revolution in information, knowledge, and organizational changes (Pavic, Koh, Simpson, & Padmore, 2007). IT applications can be used in formalizing knowledge and distributing it in modern business (Okumus, 2013). IT should be managed to assist core business in achieving organizational mission and vision (Sharma & Baoku, 2013). IT alignment has an indirect effect on operational performance through information sharing (Ye & Wang, 2013).

Brady et al. (2008) stated that obtaining high efficiency and effectiveness in organizations requires investment in IT components such as the Internet (Deeter-Schmelz & Kennedy, 2004), office automation (Geiger & Turley, 2005), and management information system (Li, 1995). The Internet is a global network of computers which independently work and offers a variety of useful tools such as e-mail and website (Obra, Camara, & Melendez, 2002). Most companies effectively use the Internet to boost national economy (Martin & Matlay, 2001) with a much more profitability than telephone and fax (Grandon & Pearson, 2004).

The use of ICT has been found to increase the productivity of research and development (R&D) in innovative industries (Hollenstein, 2004). Productivity improvement, service quality improvement, cost reduction, individuals' satisfaction, and long-term profitability are among the expectations of practitioners and researchers dealing with ICT (Law & Jogaratnam, 2005). IT helps companies to find new ways of improving their market by providing their customers with their immediate needs (Phuong, 2008).

## Importance of Virtual Team in Global Business

Virtual teams have to be viewed from dimension of human resource strategic management and approached from the perspective of human resource practitioners in order to develop theories and frameworks to measure team performance of human resources or intellectual assets of an organization who are not co-located during their team collaboration, considering performance measurement tools and theories available in face-to-face teams context such as economic value added (EVA) determinants and measures (Mansor et al., 2012).

Virtual teams create challenges to leaders such as leading remotely, building trust relationship among team members without personal face-to-face interaction, and using technologies that facilitate virtual collaboration (Neufeld, Wan, & Fang 2008). Aldea et al. (2012) stated that the tendencies of business globalization have force organizations to develop ICT facilities for the development of virtual teams. Leaders of virtual support teams face various challenges which differ from those facing leaders in traditional face-to- face environment. Leaders' inability to meet their teams face-to-face may limit their influence on team members (Piccoli, Powell, & Ives, 2004).

Due to the challenges that arise when learning and working in electronic settings, the satisfaction of team members tends to be lower compared to face-to-face teams (Furumo & Pearson, 2007). Thus, the evidences of team members' low satisfaction are acknowledged in virtual teams (Martins et al., 2004). When virtually collaborating, members' satisfaction may be moderated by the team's level of virtuality (Gurtner, Kolbe, & Boos, 2007). The effects of employed communication media is often influenced by the nature of task and the composition of team (Cicei, 2012).

A team leader is the person who defines the project objectives, selects participants to assure a broad-based team composition, conduct training regarding communications technologies, evaluate the team outputs, coordinate the team processes, clarifies confusions, solves operational problems, and eliminates conflicts (Chang, 2011). Challenges in virtual environment require leadership styles that have different

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

personal skill sets, leadership strategies, and communication techniques (Neufeld et al., 2008). Leaders in virtual teams tend to be informal, convincing, and possess effective communication skills (Beranek, Broder, Reinig, Romano, & Sump, 2005). Leaders may face challenges to setup, design, manage, and operate virtual teams, which may result in less productivity and low performance (Gibson & Gibbs, 2006).

Global virtual team leaders have to lead from a distance (Zander, Zettinig, & Makela, 2013). Management, control, coordination, jobs, and operation s are distributed among different human agent teams that work virtual combination of virtual and face-to-face (Aart, Wielinga, & Schreiber, 2004; Bélanger & Watson-Manheim, 2006). The macro economic developments have led organizations to increase inter-firm cooperation (Gluckler & Schrott, 2007). The inter-firm cooperation often requires teamwork from employees in different firms, and physically collocating team members, while effective, is often expensive and impractical (Poltrock & Engelbeck, 1999).

Virtual teams offer several advantages over their traditional face-to-face counterparts (Midha & Nandedkar, 2012). In order to enhance the depth of information access and task performance effectiveness, virtual teams overcome space and time constraints which limit their collocated face-to-face counterparts (McGrath & Hollingshead, 1994). Virtual teams make managerial communication more efficient; reduce the expense and difficulty concerning distributed work (Galegher & Kraut, 1994). Virtual teams enable organizational flexibility, improve resource utilization, reduce cost, and expand organizational knowledge generation by bringing together diverse range of knowledge, skills, and competencies (McLean, 2007). Virtual teams pose challenges due to lack of trust between team members, language barriers, temporal constraints, individual goals, institutional constraints (legal and political), and choice of technology (Aart et al., 2004; Bélanger & Watson-Manheim, 2006; Fan et al., 2011).

Many organizations use teaming arrangements to push team members to both compete and cooperate with each other, leading to a major challenge for organizations that seek to manage their team workflows and performance (Tsai, 2002). An effective virtual team coordination strategy will involve supervision, standardization of work, standardization of output, standardization of skills and mutual adjustment (Aart et al., 2004). Good communication between team members lead to successful operation of a team (Anderson, McEwan, Bal, & Carletta, 2007) and poor communication leads to poor performance (Thompson & Couvert, 2003). The improved communication tends to bind virtual teams, which leads to low dissolution rates; and long-term teams are generally more productive than short-term teams (Ortiz de Guinea, Webster, & Staples, 2012).

Virtual worlds have been shown to be a powerful environment for collaboration and communication (Schultze & Orlikowski, 2010). Virtual teams can effectively function both within and across organizational boundaries (Levina & Vaast, 2008; Romano, Pick, & Roztocki, 2010). Within-boundary virtual teams are preferred over cross-boundary virtual teams if satisfaction with the collaboration process is of the highest priority (Schiller et al., 2014). The increased communication requirements need special handling to ensure improved productivity and performance of virtual team (Anderson et al., 2007). Zibetti et al. (2012) stated that IT-based virtual team meeting scheduling may increase team member motivation and coordination.

Virtual teams-related boundaries such as corporate culture (Krishna, Sahay, & Walsham, 2004), formal organizational boundaries (Espinosa, Cummings, Wilson, & Pearce, 2003), spatial and temporal boundaries (O'Leary & Cummings, 2007; Van den Bulte & Moenaert, 1998), and functional boundaries (Birnholtz & Finholt, 2007; Espinosa et al., 2003) account for a team's success as well as pose challenges to effective team outcomes. Working in virtual teams can assure a series of advantages consisting in the enhancement in creativity and innovation of products, the facilitation of learning, and the development

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

of positive attitudes facing the tasks that need to be achieved (Levenson & Cohen, 2003). Virtual teams can support knowledge sharing between members and sustain the application of obtained information and skills (Johnson et al., 2002).

## Importance of Information Technology in Global Business

Yılmaz et al. (2015) stated that since the advent of computer and Internet technologies, the continuous and rapid developments occurred in technology-based applications have become an important part of the reality of the life for many people in the world. ICT has substantial impact on economic growth and productivity (Choi & Hoon Yi, 2009; Litan & Rivlin, 2001; Roller & Waverman, 2001). Access to ICT through cell phones, the Internet, and electronic media has exponentially increased around the world (Graham & Nikolova, 2013).

There has been considerable research about the impact of ICT on organizational performance and importance of ICT as an essential enabler of business growth and economic development has been widely confirmed using both a growth accounting and at the firm-level approach (Jorgenson & Vu, 2007; Oliner & Sichel, 2003). IT is fundamental to a firm's growth and represents a primary tool for enhancing business-to-business (B2B) sales force performance (Limbu, Jayachandran, & Babin, 2014). ICT enhances the sales force activities, thus employing market intelligence, managing their customer contacts, submitting sales call reports, and developing sales forecasts (Gohmann, Guan, Barker, & Faulds, 2005). IT plays an important role in modern business regarding the accounting function (Efendi, Mulig, & Smith, 2006). IT has transformed the nature of business and accounting practice (Hunton, 2002).

The link between IT and organizational performance is important for the information systems researchers and practitioners (Stoel & Muhanna, 2009). IT is universal because modern IT crosses organizational activities, and has become aligned with business activities (Ko & Fink, 2010). Xue et al. (2012) identified the positive effect of IT on organizational innovation. The use of technology has caused critical dependency on IT, thus involving a complex mix of organizational and technical perspectives (Sethibe, Campbell, & McDonald, 2007).

IT has a mixed record regarding organizational performance and user satisfaction, thus playing an important role in modern organizations (Peslak, 2012). Kudyba and Vitaliano (2003) stated that the enhanced flow of information brought about by IT integration and cost control systems throughout the company practically empowers decision makers to consolidate operations by reducing unnecessary waste and increasing profitability. There is a positive impact of ICT, human resource practices, and organizational reorganization on productivity (Black & Lynch, 2001). Business strategy and IT strategy remain as critical determinants of an organizational success in the foreseeable future (Brown, 2006).

Investing in ICT has an impact on productivity and contributes to reducing prices and improving services (Brynjolfsson & Hitt, 2004). Kleis et al. (2012) found the positive relationship between IT and intangible output, and stated that the use of IT in both organizational innovation and knowledge creation processes is the most critical factor in an organization's long-term success. IT can provide organizational members with quick and effective access to the right amounts of information (Hope & Hope, 1997). If connectivity is enhanced through IT, organizational members can more easily share individual interpretations of the cost information, thus making consensus development more efficient (Maiga et al., 2014).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## FUTURE RESEARCH DIRECTIONS

The strength of this chapter is on the thorough literature consolidation of virtual team and IT. The extant literature of virtual team and IT provides a contribution to practitioners and researchers by describing a comprehensive view of the functional applications of virtual team and IT to appeal to different segments of virtual team and IT in order to maximize the business impact of virtual team and IT in global business. The classification of the extant literature in the domains of virtual team and IT will provide the potential opportunities for future research. Future research direction should broaden the perspectives in the implementation of virtual team and IT to be utilized in the knowledge-based organizations.

Practitioners and researchers should accept the usefulness of a more multidisciplinary approach toward research activities in implementing virtual team and IT in terms of knowledge management-related variables (i.e., knowledge-sharing behavior, knowledge creation, organizational learning, learning orientation, and motivation to learn). It will be useful to bring additional disciplines together (i.e., strategic management, marketing, finance, and human resources) to support a more holistic examination of virtual team and IT in order to combine or transfer existing theories and approaches to inquiry in this area.

## CONCLUSION

This chapter aimed to examine the roles of virtual team and IT in global business, thus describing the theoretical and practical overviews of virtual team and IT; the importance of virtual team in global business; and the importance of IT in global business. The applications of virtual team and IT are necessary for modern organizations that seek to serve suppliers and customers, increase business performance, strengthen competitiveness, and achieve continuous success in global business. Leadership has an influence on the performance of virtual teams.

One of the main concerns of virtual team is the reliability of communication, perceived as the most important factor concerning performance of virtual support teams. Leaders of virtual teams carry the responsibilities to satisfy their bosses, subordinates, and external customers in a complex distributed environment that is highly dependent on IT perspectives. Leaders of virtual support teams may need to assume a coordinating role to ensure effective collaboration and communication among virtual team members. It is essential for modern organizations to examine their virtual team and IT applications, develop a strategic plan to regularly check their practical advancements, and immediately respond to virtual team and IT needs of customers in modern organizations. The chapter argues that applying virtual team and IT has the potential to improve organizational performance and gain sustainable competitive advantage in global business.

## KEY TERMS AND DEFINITIONS

**Business:** An organization or economic system where goods and services are exchanged for one another or for money.

**Communication:** The imparting or interchange of thoughts, opinions, or information by speech, writing, or signs.

**Competitive Advantage:** A superiority gained by an organization when it can provide the same value as its competitors but at a lower price, or can charge higher prices by providing greater value through differentiation.

**Information and Communication Technology:** The study of the technology used to handle information and aid communication.

**Information Technology:** The development, implementation, and maintenance of computer hardware and software systems to organize and communicate information electronically.

**Innovation:** The newly introduced something such as a new method and device.

**Internet:** The single worldwide computer network that interconnects other computer networks.

**Technology:** The branch of knowledge that deals with the creation and use of technical means and their interrelation with life, society, and the environment.

**Virtual Team:** A group of individuals spread across different time zones, cultures, languages or, ethnicities which are united by a common goal.

## ABSTRACT

*There are significant inequalities in development both within and over the borders of countries, in addition, urban and rural areas show significant differences in the level of development. The reason for the occurrence of spatial discrepancies is that the economic and social processes are always restructured in space and time and such processes are even accelerated by the globalization. In order to get precise and realistic picture about territorial processes, it is worth to learn the spatial processes that have already happened as well as their impacts on the spatial structure, since these may enable the regions to break out from the disadvantaged situation. In such a multivariable system, the development strategies need to be built on the endogenous potentials and own strengths of the regions. The aim of this chapter is to highlight the importance of local values and local conditions in the sustainable rural development, thus emphasizing the importance of localization in long-term progress. The chapter puts emphasis on the characteristics and features of transition countries.*

## INTRODUCTION

Spatial processes are interpreted in the European Union as series of long-lasting social, economic, cultural and demographic phenomena, which have area-specific imprint (Enyedi, 2004). According to the duration of their emergence, they can be long and short ones. They are created by the series of decisions made by the determining players of the phenomena: individuals, businesses, institutions, local governments, national governments, international organizations, etc. (Faragó, 2007). Due to the continuous spatial changes, the spatial inequalities are inevitable and long-lasting. It is important to note that there have been various social responses to the appearance of territories with unfavorable conditions, including the prevention of migration and the improvement of unfavorable conditions (e.g. isolated location, infrastructural handicaps). General features of disadvantaged areas include poor infrastructure, low quality of services, and lack of jobs. Consequently, the unemployment rate is high and the salaries are low. The migration of young generations from disadvantaged rural areas is also a common phenomenon, leading to the unfavorable age-structure in long-terms. Due to the shortage of high quality roads and highways, it is difficult to get access to rural areas, resulting in their isolation from the national economic and social circulation, which can be the obstacle in the new economic development approach. The objectives of this chapter are to summarize the major reasons for spatial inequalities and the features of rural areas lagging behind to provide some ideas for their sustainable development.

## BACKGROUND

The economic restructuring of the 1990s, e.g. in Hungary, also contributed a lot to the creation of spatial discrepancies, since it was the time when the gap between the dynamically developing centers and the underdeveloped peripheries speeded up (Dusek, 2001), not to mention the impact of revision of borders at the beginning of the 20th century on the spatial discrepancies. While examining the spatial inequalities, it has to be highlighted that the two basic components of the spatiality are inequalities and order (Nemes Nagy, 2005). The duality of inequality and configuration are usually equal to the duality in the expressions “region” and “spatial structure” (Szabó, 2006). Nowadays, in the researches on inequalities two basic questions are raised: how much are the spatial discrepancies and how do they change? Due to the developed information technology society of the 21st century, there are no places in the world about which there would be no information available regarding the environment or the society. This allows the spatial researches to show real results (Jakobi, 2002; Dusek, 2003; Nagy & Káposzta, 2003). The harmonization of spatial elements providing the social basic functions and the social needs was carried out in different ways during the history.

Both spontaneous and organized economic/social processes happen in the space used by the population. In one-centered countries, like France, Austria, Hungary, as well as in most of the Central and Eastern European countries and partly in the United Kingdom there are dominant capitals existing, while peripheries perform poorly, the railway system was developed in a radial structure (serving the needs of the national center, the capital) and the cultural and political functions are also located in the capital (Berend & Ránki, 1987; Horváth, 2004). The rapid development of sectors with high demand of raw materials started in remote areas from former growth centers (Antwerpen, Venice, Florence, Amsterdam, Bordeaux), thus the population of such developing areas (North-and East-Anglia, Lorraine, Ruhr, North-Italy) has jumped.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

However, due to the migration, other parts have become uninhabited. Industrial agglomerations in large cities were created at the turn of the 19th and 20th century and the monocentric spatial structure of several countries was also established at that time (Anderson, 1999; Nagy, 2003). Partial regulation of spatial development was included in the program of more and more governments between the two world wars. After the First World War, the new Central and Eastern European countries elaborated concepts to strengthen the cohesion of their areas that used to belong to other countries. Later, the economic depression of the early 1930s provoked state measures and developments in the areas hit by the crisis in Western Europe and in the United States. The euphoria during the reconstructions after the Second World War helped to forget temporarily about the regional discrepancies, but at the end of the 1940s overall regional development strategies were elaborated in the market economies. Eastern European socialist countries also elaborated their own spatial development programs, though much later. The large economic upswing after the reconstructions related to the Second World War generated various processes in different parts of Europe. Traditional industrial centers and their regions were modernized, while peripheries lagged further behind. Population migrating from such areas settled down in the large urban agglomerations, increasing the social problems of the conurbation rings (Granberg & Kovách, 1998; Horváth, 1998; Nagy, 2002). The gradual economic development of the 1950s-1960s, the major political current and economic thinking as well as the economic policy of welfare state opened a new era in spatial development, too. The formerly hidden and "sleeping" spatial development has been replaced by an active state intervention policy. Based on the comprehensive assessment of both theoretical and practical experience of that development period, the tasks and aims of industrial and post-industrial societies have become clear and regional policy has become an important element of social- and economic policy (Yuill, Allen, & Hull, 1980; Wadley, 1986). The developed countries have stepped into the phase of so-called structural adaptation. Spatial policies of Central and Eastern Europe were clearly in favor of cities and against villages because of the ideologically disparagement of the role of infrastructure. Despite the declarations, they supported strong concentration of settlement system (Enyedi, 1998).

Special characteristics of spatial economies, concentrated cooperation of locations, relationships in the settlements, as well as characteristics of the settlement system expanded the scope of the economy (Illés, 1997; Rechnitzer, 1998). The processes were further accelerated by the fact that the political and economic changes in the Eastern European countries in the early 1990s created a new situation in the European spatial structure. New markets had to be accessed, transportation networks had to be connected, elements of the settlement network had to be linked, and several other so-far unknown regional problems had to be faced.

## MAIN FOCUS OF THE CHAPTER

### The Characteristics of Transition Countries Regarding Local Economic Development

The dominance of the central government in the local economic development, especially in the allocation of funds and the definition of development priorities, is a general characteristic in the centralized, single-centered countries in transition (Mezei, 2006). Regional public administration units have various functions in the European countries. While increasing importance has been given to regions in the economic development strategies of Western Europe over the 1990s, Central and Eastern Europe is late

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

in this regard (long reform procedures, laggard decentralization). Participation of medium-level public administration is mainly based on the type of state, its public administration system as well as the legislation (to which players duties and responsibilities are delegated by the legislators) (Mezei, 2006).

Central legislation and various roles of regional players in the local economic developments are different in the transition countries, but the essential role of local municipalities in the local developments is really emphasized. In the former socialist countries, where the market players had to face liberalization, privatization, globalization, and foreign capital inflow at the same time, local governments gained significant position in amending the legal background as well as modifying the institutional system (Young & Kaczmarek, 2000). In addition to the local municipalities, there are several other contributors in the local developments. The potential players may involve various entities, since among others, their contribution depends on the settlement-system, public administration system and its financial conditions, role of civil organizations in the society, institutional systems serving enterprise development, system of banks and financial institutions, educational system as well as the power of organizations representing interests. Since the players in local economic development vary, the organizations participating in the local developments are various too. The emphasis, however, is not on the individual players, but on their cooperation as well as on the horizontal and vertical links among the participants (Cameron, Danson, & Halkier, 2000). It should be stated that regarding cooperation, transition countries are at the beginning of the process with little experience in this regards, since they are learning the essence of partnership (Puljiz, 2004; ESPON, 2006). In addition, there is a low rate of participation in such developments due to the disappointment and unwillingness of the population towards public and common issues (Plostajner & Mendes, 2004).

General feature of the transition countries is the unfavorable financial condition of local municipalities which is due to the increasing burdens imposed on the local governments by the central government and the structure of financing that does not match the increasing duties. In most cases, local municipalities do not have real chance to increase their own income primarily because of the low standard of living of local population and the high tax liabilities. Therefore, raising money for local investments and generating local initiatives meet several challenges, and in most cases the end is failure. However, the main forming impact of external funds on the local developments is really strong in the transition countries. In such cases, mainly the idea of the external fund-raiser is realized and the demand of the local population and local businesses are not reflected in the developments. As it is mentioned above, most of the local governments do not have sufficient amount of own capital that would enable them to apply asset-based economic measures. Bank loans for local municipalities are available in most transition countries, but while in the Czech Republic the loans for development purposes are distinguished from other types of loans, in Hungary loans for development purposes and liquidity loans are subject to the same legislation (Mezei, 2006).

While analyzing the instruments for local economic development, it can be found out that the local municipalities of the countries in transition apply more or less the same measures, i.e. infrastructural development, financing, asset-related measures, marketing and promotion, as well as information services and advisory instruments. The most commonly used instruments reflect the dominance of supply-oriented strategies, i.e. the major aim is to attract investors, while the development of local human resource or the domestic SMEs is only the secondary priority (Capková, 2005). Due to the increasing importance of local developments, this trend is expected to shift to the demand-oriented policies in the future, as it is now happening in the developed countries of the world.

## The Importance of Localization and Endogenous Resources in Rural Development

Nowadays, the public attention on the spatial inequalities has increased and is increasing in the European Union. The reason is that the discrepancies gradually rise, new forms are created, and thus the significance of spatial policy is increasing (Enyedi, 1997; Horváth, 2003). This general tendency is true in 2015 as well. The multi-stage enlargements of the European Union have brought the issue of territorial inequalities to the frontline. It can be stated that the economic and social space of Europe is very proportioned. The reasons for the differences in settlement networks, economic structures, education of the population, infrastructural supply are hidden in the history of the continent over centuries (Csite & Granberg, 2003).

Recent changes forecast two determining factors in regional policy in the early 21st century in addition to the self-governing rules of the economy: on one hand, the reforms regarding the organization, operation and finances of the European Union as well as its Eastern enlargement; on the other hand, partly due to the mentioned factor, the creation of new division of labour in the countries and the decentralization (Michalski & Saraceno, 2000). However, the basic aim is not expected to be modified, since spatial imbalances are the obstacles of economic growth, prevent the improvement of competitiveness, lead to social tensions and restrict the concept of a single Europe. Thus, cohesion is the prerequisite of integration, requiring more harmony between the national and community regional policies, therefore encouraging the mutual interdependence. Its creation is mainly prevented by spatial inequalities and the centers and peripheries (due to the discrepancies). So the key issue of regional policy is related to the elimination of peripheral situation.

Spatial development measures – from the regional resources point of view – can be planned in two different ways. Either the missing resources are provided from external sources, i.e. investors are attracted to the region, or local investments are supported by huge amount of money. In the latter case, the intention must be to discover own resources and utilize them as efficiently as possible or enable the local people to do that. It is obvious that local businesses can be the perfect ones to meet the needs of the local population. The two abovementioned approaches may be combined in the spatial development. Moreover, the most efficient solution in practice is the optimal combination of the two.

In the spatial development strategy of Hungary, for example, the dependence on external resources is the most common, which might not be the most suitable solution for the regional imbalances. Such strategies are called supply-oriented development strategies.

By now, it is proven that lasting and sustainable results cannot be achieved with solely external resources because decisions on external resources and economic factors are mostly made without involving the local community, thus the interest of the local community might not be considered and such decisions may destroy the commitments of local population to the local aims. In many cases, the involvement of external financial sources results in fast and short-term boom and almost immediate decline, afterwards. Furthermore, the external resources usually target the more-developed regions, since the economically and socially backward regions do not have the sufficient infrastructure (physical, human etc.) to receive the operational capital. Therefore, external resources themselves are not the expected solutions to prevent the break-off of such regions.

Considering the abovementioned, internal (local) resources are becoming more and more important, however, their exploitation is sometimes overshadowed. According to the demand-oriented strategy, the local strengths have to be in the focus and they need to be improved further. However, in the bottom-up approach it is sometimes difficult for the local population to list up the local strengths and potentials on

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

which the developments can be built on. In many cases, the local population cannot even see the hidden values and potentials, so the expertise of external professionals is necessary to achieve success. It is usually forgotten that if the goods are kept within the region and are given to local players, eventually they serve the best for the whole community. Internal resources may include human resources (labor force, knowledge, ambition and cohesion), as well as natural and economic resources. Such goods are gaining more and more importance nowadays (in the period of gradual urbanization) like clean environment, no stress, healthy food, environment-friendly energy sources, unused local minerals as well as forgotten traditions. Similar resources are cooperation, close link between local society and the economic players, as well as exchange of goods. All these can be observed in both urban and rural areas – even if to different extent. Local economic development may be an applicable tool in dynamizing economic resources even for such places where general, common economic development tools have not been successful (Czene & Ricz, 2010). However, it is not only the disadvantaged regions where such methods can be applied. In order to achieve real success, a balance should be reached in using internal and external resources. It is aimed in the basic document of the spatial policy of Hungary, so called National Spatial Development Concept (NSDC) as well, which introduced the concept and aim of spatial sustainability to discover, protect and develop the local resources. Therefore, local development strategy, which focuses on internal resources, is favorable not only for the given region but outside of it as well, since it provides stability and development potentials. It also reduces travel-, transportation- and emission needs that originate from the region, moderating the environment- and social load.

According to some experts, spatial sustainability and spatial competitiveness are contrast, since the first is about strengthening the autonomy of the region and encouraging the circulation of information, energy, money, products and raw materials within the region as long as possible, while the latter one is usually emphasized rather in Western Europe. However, the abovementioned contrast seems to be virtual, since the right-interpreted spatial competitiveness means that every region should find their own competitiveness factors. Autonomous local economy – based on internal resources – may play key role in such processes and may be an important competitiveness factor. Local economy in general is located in a settlement or a micro-region, which uses its own resources in a sustainable way, coordinates its activities according to its resources. However, local products and services may be sold on external markets, but the primary aim is to meet the local (internal) demand. In such cases, external market represents the location of the sales of internal surplus (Czene & Ricz, 2010).

The local economic development is a complex process and has various tools, so it is not surprising that there is no generally acknowledged concept or definition either in Europe or in the world. Local economic development is a conscious interference by the local community into the economic processes to achieve sustainable local development (Lengyel, 2010). Thus, local economic development is more than just the local allocation and distribution of central/state economic development funds.

It requires new methods and should define new focuses. One of the basic principles of local economic development is to know the various endowments, conditions and resources as well as economic and social structures of regions. In addition, the integration of economic, social, cultural and nature conservation activities plays much more important and more direct role. The expression “local” reflects the territorial unit of the measures taken. A primary objective for local economic development is to expand employment of local people on a permanent, long-term basis by helping them to create their own small businesses and by creating local markets for locally produced goods and services.

As a supplement or even a contrast of globalization, localization, i.e. the evaluation of local conditions and values, gets more importance. Due to the intensive involvement of the national economy in the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

world economy, the effects of globalization directly reach certain regions and settlements, which may result in defenselessness in some cases. While focusing on local conditions, it must not be forgotten that each settlement and community should survive and act competitively not only on isolated local markets but on the global market as well. It can be observed in rural areas at an increasing extent, while their economic power is being lost resulting in increasing spatial- and rural policy actions.

Defining and implementing the economic development directions adjusted to local endowments and resources may gain important role in the creation of the economic basis in such areas. As restructuring the local conditions, encouraging entrepreneurship, cooperation between businesses, strengthening the consciousness of the population, supporting the direct links between farmers and consumers, as well as strengthening community actions can all be realized. Concrete aim is to allow the results of economic activities be used locally either in the form of products, services or jobs or income. It means that local economic development is not simply local, but economic development with local interest. It aims to support the local market through encouraging the local businesses and economic activities to meet the interest of the local community. Therefore, its aim is not exclusively of economic feature, but definitely of community and social one, meaning that it aims to improve the quality of life of local population and to increase profits by all means. Thus, it can be called as local community economic development referring both to the methodological and theoretical point of views. In an ideal situation, it is carried out based on local initiative, but external expertise cannot be avoided especially at the beginning.

It depends on the fact whether the area has ambitious and committed experts who as "engines" can generate the organization and launching of the process and whether the trust capital is available which is crucial for activating the local community. Due to the rapid changes in the international economy, rural regions need to face some obvious threats but they can have significant opportunities as well. These changes include globalization, improved communications, reduced transportation costs, changing trade patterns for commodities and the emergence of important non-farm activities in rural regions. Globalization, increased accessibility (development of transportation infrastructure and ICT) and new migration patterns offer new opportunities for rural areas to develop. In many rural areas the diffusion of clusters, as seen in food processing or in other industries, has played an important role in improving the economic performance of the area.

Moreover, thanks to the improvement in transport links, a large number of rural regions have been able to take advantage of some emerging elements that increase their economic and social performance; it is the case for some rural areas that have been able to respond to the new demand for services, such as clean environment, attractive landscapesб and cultural heritage (European Commission, 2006; Organisation for Economic Co-operation and Development, 2006). The assets of rural regions, development of transportation and infrastructure can retain or attract people and businesses. The infrastructure helps to reduce per unit costs for businesses. Therefore, in the past twenty years, many rural areas have shown an increasing capacity to attract permanent investments. Consequently, many rural regions have experienced positive employment growth rates in industrial and service sectors (and parallel the loss of agricultural jobs). Between 1996 and 2001, in many OECD countries (10 out of 27) the region with the highest rate of employment growth had rural character. In fact, the level of industrial employment in predominantly rural regions increased by 0.5% annually over the 1990s, while there was a decline in urban and intermediate regions (Organisation for Economic Co-operation and Development, 2006).

In addition to globalization, localization (Porter, 1990; Dicken, 2003) is an important factor as well, advancing local values and endogenous resources of the countryside (Moseley, 2003; Terluin & Post, 2001). Therefore, a large number of successful rural regions have been able to valorize public or quasi-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

public goods such as clean environment, attractive landscape and cultural heritage (including food). It has raised the demand for residential houses and commuting which have played an important role in changing the economic and social aspects of many rural areas. Easier commuting across longer distances has expanded the sphere of influence of major urban areas enabling people to live in rural regions while working in cities. Rural assets such as quality of life and environment, natural heritage and other amenities are also more in demand and constitute real attributes that attract investment and workers as well. All these factors have contributed to a partial reversal of the trend of rural out-migration in many rural areas in countries such as France, the UK and Italy and also in some of the EU's New Member States, such as Poland and Hungary (European Commission, 2006; Organisation for Economic Co-operation and Development, 2006). The positive perspective on globalization highlights the increasing post-productivist countryside with economic and social changes (Ilbery & Bowler, 1998), growing social demand on the new functions of the space (for example tourism, recreation, environment functions, etc. (Marsden, 1995)), expansion of services, industry and technology, and integration of new rural economy into the regional, national and international economies (Clout, 1993). That kind of expansion of modern industry and service sector is perfectly realizable by the development and researches on the agriculture, rural economy, rural clusters of the United States (Economic Development Administration, 2007; Isserman, 2000; Porter, Ketels, Miller, & Bryden, 2004; Rosenfeld, 2004) and the Organisation for Economic Co-operation and Development (2006) as well. However, as these changes are strongly related to improved transport links that make investments, recreation and residential location in rural areas increasingly feasible, growth tends to be concentrated on the more accessible rural regions.

While positive effects could be realized in accessible rural areas, countryside in general terms shows considerable heterogeneity and differentiation (Bryden & Hart, 2004). Globalization has escalated competition, as it has brought competitors at international level close to or into local markets sweeping away former geographical, identity-based community borders that had defended the local products, industry and cultural traditions of rural areas earlier. Meanwhile, new technologies and intensive production have been crowding out manpower from labour-market, especially in case of agriculture. According to Kulcsár and Brown (2005), modernization accompanied by globalization changes the rural social structure as well. It coincides with other opinions in literature where negative perspective on globalization highlights mainly the social aspects, especially from the rural point of view: e.g. cultural homogenization (Fiss & Hirsch, 2005), vulnerability of local societies (Kirby, 2006; Luloff & Bridger, 2003; Putnam, 2000), risk of poverty and social exclusion, and increasing inequality (Wade, 2003).

Whether the positive or negative side of the globalization is stronger depends on how a region or settlement is connected to the changing international economy, how much it is able to attract capital and how the residents as a critical mass make demand for goods and services (Cloke & Goodwin, 1992). These are in strong correlation with accessibility, but not just in physical or geographical meaning, but in terms of easiness to access to all those services and activities which represent public goods for people living in urban centers (such as schools, hospitals, sports, social and cultural facilities, basic services, etc.).

What is apparent is that rural areas tend to show a weaker economic performance and face significant challenges in comparison with other regions in the OECD countries and in the EU as well. The problems stem, in general, from a declining and ageing population and from the distance from markets and services. These characteristics have an impact on enterprise dynamism and job creation, on the accessibility and quality of educational and other public service resources, on the quality and density of infrastructure, and so on. These factors can interact to generate what is called the circle of decline for rural areas (European Commission, 2008; Organisation for Economic Co-operation and Development, 2006).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Actually, the problems of rural areas in the field of demography, remoteness, education and labor market may generate their own circles, and may interact, reproduce and amplify the phenomenon of poverty of rural areas. The demography circle starts with the unfavorable demographic situation of many rural areas: large share of elderly people, few young people and low density negatively affect the economic performance of the area; as a consequence, low birth rates and migration of young people worsen the demographic situation further. The remoteness circle is generated by poor infrastructure, which negatively affects the economic performance of the area, thus fostering out-migration; this has a negative consequence on the demographic situation, representing a further obstacle to the development of infrastructure. The education circle is generated by the low educational levels of most of the rural population; this causes a low employment rate and, consequently, may increase the poverty rate, which, in turn, negatively affects the chance of receiving high quality education.

Finally, the labor market circle starts with poor labor market opportunities of many rural areas, which force many qualified people to migrate and thus worsen the quality of the local labor force; a low-skilled labor force is a disincentive for investments of domestic or foreign firms in the area; the consequence is a further deterioration of the labor market situation (Organisation for Economic Co-operation and Development, 2006; Patrick, 1997; Study on Employment in Rural Areas, 2006; European Commission, 2008). This is kind of a vicious circle, in which unemployment and lack of services lead to rural exodus (movements of population and economic activity out of rural regions over the past few decades) that has been a common pattern in rural regions ever since the agricultural sector began to shed employment (European Commission, 2008; Organisation for Economic Co-operation and Development, 2006).

However, cooperation also has a significant role in local economic development. One of its features is that in the framework of local economic development, local (economic and social) players cooperate to achieve more active local business activities matching the local conditions and meeting new demands. Joint thinking and actions of the business sphere, municipalities and local population may enable the community to preserve their own values and potentials based on special local conditions under ever-changing external and internal circumstances. It is also about their improved adjustability. It is always a proactive adjustability, which protects and maintains the local values, traditions and resources as well as meets the demand of local population and complies with the requirements of environmental, social and economic sustainability (Czene & Ricz, 2010).

Local economic development has numerous benefits that have spatial development and rural development significance as well:

- Generates local business activity;
- Has job-preservation and -creation role;
- Activate the local community, expands the local cooperation network;
- Leads to sustainable use of local resources;
- Strengthens local identity and local patriotism;
- Improves the population-keeping ability of the settlement as well as its livability;
- Renews the urban-rural relations (Czene & Ricz, 2010).

## SOLUTIONS AND RECOMMENDATIONS

Local economic development can be carried out in several ways and forms. However, most of the actions are related to local products and local businesses, but in most cases the initiatives have to be started at changing the way of thinking of the population and encouraging change in their behavior and attitude towards the competitiveness potentials. Usually it is not money issue whether a successful strategy can be realized or not, but the approach of local population to changes, improvements and new actions. Therefore, communication plays a very important role in local developments.

In underdeveloped rural areas – facing social and economic difficulties – complex rural development activities need to be carried out which exceeds agricultural production and farming. The aim of the developments is to establish sustainable systems which uses the special local resources efficiently and maintains local value; therefore it promotes the complex catching-up of areas lagging behind. Therefore, gradual expansion of the functions of such areas and involving new resources (e.g. tourism, alternative income-generating activities) are inevitable. Moreover, in many cases total shift in functions is necessary (e.g. establishing housing and touristic functions). In addition to the new functions, the renewal of traditional agricultural and food industry functions may provide perspectives in such regions (e.g. processing industry on local products). One of the fundamental principles of economic and social catching-up is that the rural areas should be able to keep their population, especially the qualified people. Appropriate life- and working conditions are key factors as well as the infrastructural conditions and advanced access to public services.

It is important, however, that developments should be based on local identity, traditions, local values and last but not least on extended cooperation and partnership. Despite the fact that there are several rural areas in Hungary that are lagging behind with similar economic and social indicators, the way how they got to the same underdeveloped situation is not the same. Therefore, researchers and experts need to focus on finding out the reasons for recession of such rural areas. It is the only solution to find the appropriate development measures and actions. Despite the common goals and principles, rural areas are not homogenous at all. Conditions are area-specific, so solutions have to be adjusted to the specifications.

For instance, in tiny settlements, the most serious threat is becoming uninhabited, which might cause the disappearance of institutions, businesses and public services; the natural and built landscape is demolished, the traditional land use (animal husbandry, horticulture, and vineyards and orchards) loses scope. Problems addressed in such areas are ageing population, unemployment, and social and ethnic isolation. Thus, the most important tasks of rural development are to improve accessibility, to promote remote-working and distance-education, to provide appropriate healthcare and education services. In addition, to promote traditional small-scale industry and handcrafting, small-scale ecological farming and processing as well as to develop the tourism-related infrastructure and services so that complex touristic packages could be offered.

Farmhouses on the Great Plain of Hungary have lost their functions related to traditional agricultural farming. The buildings are ruined, the infrastructure is underdeveloped and most of them face severe economic and social difficulties (subsistence difficulties, low standard of living, segregation and crime, etc.). Their renewal can only be realized through establishing new functions for them (modern farming, holiday and housing functions, catering, tourism), while preserving the values which are represented by them (heritage, conventional farming, close to nature feature, etc.).

Regions habited by mainly minorities should be built on the common culture and strong community, allowing spatial- and settlement-development which is based on traditions and special endowments. In

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

order to keep the population, national and cultural identity and spatial coherence have to be strengthened. In addition, development of social life and culture related to their mother tongue is inevitable. Renewal of such areas should be based on minority traditions, individual cultural values in developing the demand for alternative heritage tourism.

Over the last decades, significant changes and increasing territorial differentiation could be observed in the rural areas of developed countries, mainly in Western Europe, but – parallel with the political and economic transformations in Eastern European countries – all over the European Union. These changes have been accelerated by the unequal expansion of economic and social effects of the globalization that affect rural areas and settlements, their development and local economy differently (Bryden & Hart, 2004).

One of the most important elements of the changes is strengthening and modification of the expression rural, since it has meant a totally different and new dimension for the society and the economy in the developed countries for a while. It has been shown by the suburbanization, by the re-evaluating of natural resources, by the economic development of a certain part of the countryside (the new rural economy), etc. In addition, as the major location of the agricultural raw material production and food industry, rural areas play important role in the EU's Common Agricultural Policy (CAP) as well. Rurality has been defined by the predominance of agriculture in the economic activity, in social and environmental context as well as concerning the ethnic values of an area for a long time. By now, the transformation of the European economy and the wide-spread distribution of industry and services in the territory have profoundly modified the rural dimension, resulting in growing integration between cities and the countryside.

In spite of the abovementioned, general problems of the rural areas that are mainly caused by the fact that the importance of agriculture has been gradually decreasing in the employment, (e.g. depopulation, fewer jobs, increasing social burdens, low accessibility to the basic services, etc.) cannot be ignored. As a result of that, the unemployment causes further rural problems not only within the EU (Study on Employment in Rural Areas, 2006; European Commission, 2008), but for example in the United States as well (e.g. Lichter & Johnson, 2007; Macke, 2003).

Although declining agricultural employment is a usual tendency in the developed countries, it does not have the same effects everywhere because of the special characteristics of the territorial structure. Negative tendencies hit rather such rural areas where there are traditional agricultural activities carried out, qualification of the population is low, share of elderly population is high, there are no large cities nearby, and they have unfavorable accessibility, especially in the post-communist Eastern European countries, where the territorial aspects of economic and social processes following the political transition have even deepened those negative impacts (European Bank for Reconstruction and Development, 1999, 2002; Study on Employment in Rural Areas, 2006).

In areas with high share of Roma population, segregation, low level of qualification, high unemployment rate, health conditions of the population are the most serious problems. In the abovementioned settlements, complex development strategies are needed that deal with the challenges of employment. Self-organization of community, preservation of culture, Roma inclusion and integration of Roma and non-Roma population should be addressed.

Areas with rich natural landscape and cultural values represent increasingly important role due to the increasing demand for healthy living environment, recreation, keeping the traditions as well as demand for handcrafts, artworks with special local characters. In such settlements, the most important task seems to be protecting the values and avoiding further damage (caused by industry, agriculture, urbanization, transport as well as intensive tourism sector).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Based on the abovementioned, it can be seen that there are no samples and universal schemes that are suitable for addressing the various challenges experienced in the regions. Every time a local development strategy is prepared, special local conditions need to be discovered and mapped that can serve as a good basis for strategy-making.

## FUTURE RESEARCH DIRECTIONS

As it is written above, there are no samples that could be applied in an unchanged form for the development of various rural areas. However, availability of such complex indicators and multi-dimensional methods that could reflect real conditions of the areas and serve as inputs of statistical analyses could help local decision-makers as well as those who are responsible for preparing local economic development strategies. At the moment, there is no such in the Central and Eastern European region, though it would be a great help in selecting the hot-points and cold-points of the rural areas. It is known that statistical methods need to be supplemented by quantitative methods while discovering the endogenous resources, but the creation of a complex resource-index could provide a good basis even for the non-professionals or experts in the local decision-making, e.g. mayors, members in the local government, etc.

## CONCLUSION

Based on all the above mentioned, the major aim of the development of rural areas is the use and activation of endogenous resources and use of spatial potentials. The basic question of development is how spatial factors can be integrated (with efficient allocation) to the local economy and society to achieve optimal operation under certain economic and social circumstances. According to the authors, the theoretical roots of such developments are hidden in the generative growth concept, saying that local development results, local development capacities lead to the growth of larger territories. Therefore, the local comparative advantage-based economic developments can provide the basis for regional developments. Local potentials, as endogenous resources, vary on a wide range. A starting assumption can be that "a unit system of geographical, environmental, historical, social and economic factors and conditions of settlements and regions as well as the factors that influence the abovementioned conditions" (Rechnitzer, 1990) may play determining role in the modernization of the given area.

Considering the system of factors that influence the development, endogenous resources as economic potentials can be related to the factors as listed below:

- Capital-potential (available production-base and assets);
- Absorption ability necessary for receiving funds;
- Presence and composition of operation capital;
- Extra income that can be spent without restrictions;
- Qualifications, age-structure and other features of labour;
- Quality of infrastructure;
- Geographical condition, distance from centrums;
- State and quality of the environment, natural endowments;
- Market relations (demand factors), logistics possibilities, tertiary sectors;

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Socio-cultural conditions, ethnic and minority issues;
- Artificial heritage;
- Decision-making and institutional system, as well as power.

One endogenous factor can be found in another factor as well (directly or indirectly) or it may be created due to the interference of potential-components. In geographical potential the market potentials or relations of a region are already defined. This factor is able to characterize the potentials and barriers of transportation and communication infrastructure. The labour potential originates from the composition of the population; however, it defines the socio-cultural conditions and affects the capital as well. Settlement characters influence capital potentials and infrastructure, but have impact on labour force and human dimensions as well. It can be seen that these endogenous factors can also be interpreted individually, but due to their inter-dependence, they have impacts on each other. Moreover, under certain social and economic circumstances, they may start active processes and thus the renewal of the regions (Porter, 1980). Spatial potentials may be related and may be built on each other. Such relationships may open new activation scopes and may create additional endogenous resources.

Finally, it can be stated that spatial potentials include all the endogenous resources of regions. Their relationships, coherences, overlappings, and networks can offer new dimensions in economic developments in case dynamic interferences are supported by exogenous factors, i.e. due to synergies, spatial renewal may have new development path. Based on the abovementioned, endogenous resources hidden in local characters have significant impact on the economic development of regions, as well as rural economies. Therefore, without strengthening and developing such factors, the economic and social periphery is expected to expand in the future, and the spatial discrepancies are expected to increase. Overall, one – however, probably the most important – factor in the catching-up of disadvantaged regions is the local economic development based on endogenous resources. In order to achieve this, transition countries need to consider bottom-up approaches more, involve local players in the strategy-making and decision-making more since only active and efficient cooperation of the local population, local businesses, local municipalities as well as local civil organizations may lead to the sustainable development of rural, disadvantaged areas.

## KEY TERMS AND DEFINITIONS

**Endogenous Resources:** Such resources which are related to that specific area and can provide a basis for developments.

**Local Economic Development:** The complex (economic, social, environmental) development of local territorial units, focusing on their specific needs and resources.

**Localization:** Valorizing the local, the area-specific resources and potentials rather than globalized ones in the local strategy-making.

**Rural Areas Lagging Behind:** The general features of such areas like depopulation, fewer jobs, agricultural-dominance in the economy, lack of qualified human resource, increasing social burdens, low accessibility to the basic services etc.

**Spatial Inequalities:** Such differences that should be the basis of sustainable development strategies, originating either from the unique local conditions of regions or the ineffective use of resources.

**Sustainable Rural Development:** A complex and integrated approach that pays special attention to the specific features of rural areas and defines development strategy based on their specific local resources, enabling the areas to achieve gradual and lasting development.

**Territorial Cohesion:** When the development of regions is harmonized and the differences of regions, which are due to insufficient use of resources, gradually disappear and they step on a long-term development path.

# Chapter 23
# Channel for Vertical Spillovers: The Effect of MNCs Training Activities in Stimulating Local Suppliers Innovative Capacity

**Abd Rahim Jaguli**
*Universiti Utara Malaysia, Malaysia*

## ABSTRACT

*The objective of this study was to fill a research gap, where the channels through which technology and knowledge were transferred remained unexplored in the existing Foreign Direct Investment (FDI) knowledge transfer literature. A case study method was adopted as it is appropriate for exploring the complex process of knowledge transfer. The findings obtained from the case studies were able to demonstrate a positive relationship between MNCs and local innovation where knowledge and technology can be diffused through training programmes offered by MNCs to local suppliers. It provides an understanding as to the extent to which MNCs, through linkages with local firms, may facilitate the innovation activities of said local firms. Policy implications are subsequently discussed and future research suggestions are then put forth.*

## INTRODUCTION

Researchers have long been focused on the study of Foreign Direct Investment (FDI) as the main vehicle for technology and knowledge spillovers (Branstetter, 2000; Keller & Yeaple, 2003; Giroud, 2003; Ivarsson & Alvstam, 2005; Liu & Buck, 2007; Blalock & Simon, 2009; Liu, Wang & Wei, 2009; Du, Harrison, & Jefferson, 2011; Hale & Long, 2011). Knowledge spillover from Mutinational Fims (MNC) to local firms were created through inter-firm relationship with indigenous firms (buyer-seller) relationship (Javorcik, 2004; Ivarsson & Alvstam, 2005; Giroud, 2007; Ivarsson & Alvstam, 2009 and 2011). The transfer of knowledge takes place through the demonstration effect (Kokko, 1992; Wang & Blomström, 1992), labor movement between firms (Fosfuri, Motta, & Ronde, 2001; Glass & Saggi, 2002;

DOI: 10.4018/978-1-7998-2448-0.ch023

Meyer, 2004; Spencer, 2008) and the transfer of knowledge from MNCs to their suppliers (Ivarsson & Alvstam, 2009 & 2011). Moreover, business transaction between MNCs' subsidiaries and local firms may also vital in increasing the likelihood of knowledge and technology spillovers (Blalock & Gertler, 2008; Keller & Yeaple, 2009; Blalock & Simon, 2009).Through this vertical relationship MNCs may encourage technology and knowledge sharing between their subsidiaries and suppliers workers through labor training, innovations, quality management, production process, managerial skills and manufacturing management systems (Agosin & Mayer, 2000; Ivarsson & Alvstam, 2005; Giroud, 2007).

Despite the growing body of research on the topic and the belief that FDI may act as catalyst for technology and knowledge transfers, knowledge spillovers are still treated as a 'black box'. There is little evidence on how and in what ways through labor training, technology and knowledge were diffused. Local employees may increase their knowledge not just through formal training, but through on-the-job training, learning by doing, or learning by observing. Knowledge transfer may also take place through simple interactions between MNCs and local firms' workers who perform similar tasks. Hence, this study goes beyond the existing research in the area of FDI spillovers by investigating on what types of training offered by MNCs' subsidiaries to local firms' employees and how and in what ways these trainings could enhance technology and knowledge diffusion. This study focuses on MNCs as the generators of spillovers and local suppliers as receivers through vertical linkages and business relationships. Although a number of surveys exist on the role of technology transfer between foreign MNCs and their local suppliers in developing countries, many of these are either theoretical contributions, e.g. identifying various types of technology linkages (for reviews, see Dunning 1993; UNCTAD 2001, 2002), or empirical analyses focusing on FDI spillover effects on host-economies using aggregate industry-level data (see Blomström *et al.* 2001). Thus, the aim of this paper is to add to this small number of empirical analyses and contribute to an increased understanding of the extent to which MNCs' training activities could facilitate innovation activities among local suppliers in a developing country. Moreover, it analyses to what extent, and in what ways, MNCs through their formal and informal training programs could provide their local suppliers with different types of assistance, and discusses to what extent the linkage has a beneficial impact upon the innovation activities of their local suppliers.

## FOREIGN DIRECT INVESTMENT AND KNOWLEDGE TRANSFER

It is clearly recognised that multinational firms are widely acknowledged as having firm-specific advantages that allow them to overcome a potentially disadvantageous position with respect to domestic counterparts in foreign markets (Blomström & Sjöholm, 1999). Such advantages typically take the form of knowledge-based assets such as proprietorial information relating to product or process technology, managerial know-how, the quality of the workforce, the company culture, use marketing and branding and so on. A firm's decision to invest instead of pursuing other forms of internationalisation such as exporting or licensing results from internalisation and is due to investment being the most efficient strategy for exploiting their firm-specific assets. It has been widely acknowledged that such inward-investment offers potential indirect benefits to domestic firms, via enhanced productivity levels and/or productivity growth (Blomström, 1986; Haddad & Harrison, 1993; Görg & Greenaway, 2004). However, MNCs can also take on local firms with superior knowledge of local markets, consumer preferences and business practices because they possess superior intangible productive assets, such as managerial skills, reputation, or technological know-how (Blomström & Sjöholm, 1999; Liu, Wang & Wei, 2009; Du, Harrison, &

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Jefferson, 2011; Hale & Long, 2011). Foreign investors affect local firms in their industry in numerous ways. It is beneficial to consider the various channels through which international technology transfers occur and many studies have recognised the important routes through which inward FDI can benefit productivity and the innovation activity of domestic firms in a host-country (Blomström & Kokko, 1998; Görg & Greenaway, 2004). According to Blomström and Kokko (1998), spillovers can occur through three main channels: firstly, through a labour mobility channel; the diffusion of technology occurs when the movement of labour from foreign subsidiaries to locally-owned firms takes place (Kaufmann, 1997; Haaker, 1999; Fosfuri, Motta, & Ronde, 2001; Glass and Saggi, 2002; Meyer, 2004; Spencer, 2008). This occurs through labour turnovers, whereby local firms obtain the technological know-how of foreign firms by ''stealing'' their skilled workers. In this case, the movement of highly-skilled staff from MNCs to domestic firms results in an influx of knowledge which may be usefully applied in domestic firms. Additionally, labour mobility facilitates human capital development in a host country when a trained local work force starts their own businesses. On the other hand, there is the possibility of MNCs attracting local firms' best employees as MNCs are able to offer higher wages (Sinani & Meyer, 2004).

In fact, evidence from previous theoretical and empirical studies shows that technology transfer from export activities does occur and has a significant positive effect on product innovation. This is consistent with the effects of learning by exporting on firm innovation. It has also been recognised that the endogenous growth model is important as it considers international trade as an important channel of diffusion of technological knowledge (Grossman & Helpman, 1991; Coe & Helpman, 1995). The endogenous growth theory emphasises the role of international trade in enhancing innovation which is generated from an international flow of ideas, where the international trade process between trading countries enables the transfer of technology and knowledge. There is a vast amount of knowledge and technological information diffusion that occurs from exporting activities. Selling products to international buyers requires local firms to be more competitive as high quality products and price become crucial factors. The high standard requirements imposed by international buyers enable local firms to learn how improve product quality and production process. The "collaboration" with their foreign buyers may create the opportunity of "learning-by-exporting" where exporting firms learn from their buyers how to upgrade the product quality. MNCs can also directly affect the trade performance of host country through their own exporting activities (Blake & Pain, 1994; Barry & Bradley, 1997; Cabral, 1995). MNCs have an impact upon domestic firms through export information externalities and the demonstration effect (Aitken & Harrison, 1997; Greenaway, Sousa, & Wakelin, 2004). Export activities normally involve high costs where there is a need for a distribution network, transportation facilities as well as the "know-how" on local customer taste and preferences (Greenaway *et al*., 2004). Thus, exporting activities may act as a facilitator, whereby local firms may reduce the entry cost by collaborating or imitating MNCs' export process. The endogenous growth theory also emphasises the role of internationalisation in enhancing innovation which is generated from an international flow of ideas (Grossman and Helpman, 1991). This source of international spillovers which flow from buyers to sellers through their interactions enables local sellers to access the ideas and technology developed by their foreign counterparts. Grossman and Helpman (1991) stress that interaction between a domestic producer and its international agent contributes to the enhancement of the knowledge of domestic producers. Additionally, the importation of products from developed to developing countries also allows developing country producers to familiarise themselves with technologically better quality products from importing countries. The information from the "bilateral trade" gives them ideas on how to improve their products. Trade can facilitate knowledge

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

spillovers by facilitating the interaction of 'reverse engineering' between developed country producers and developing country buyers (Grossman & Helpman, 1991; Coe & Helpman, 1995).

Finally, through linkages, spillovers may take place vertically from foreign firms to their local suppliers by means of technological know-how transfers, staff training, standard quality requirements, cost leadership and so on. A theoretical study on the impact of FDI externalities on host-country economic growth suggests that it most probably arises at inter-industry rather than intra-industry level (Rodriguez-Clare, 1996; Markusen & Venables, 1999; Javorcik, 2004; Blalock & Gertler, 2008, 2009; Arnold & Javorcik, 2009; Javorcik & Spatareanu, 2011). Multinationals are beneficial to the host-country in creating demand for local inputs, increasing the specialisation and efficiency of upstream and downstream activities and generating positive externalities for local industries (Rodriguez-Clare, 1996; Markusen & Venables, 1999). Rodriguez-Clare (1996) has developed a theoretical model that studies MNC effects on host-country firms through the generation of backward and forward linkages, particularly the externalities created from FDI via vertical linkages. The model shows that MNCs create backward linkages and thereby lead to the production of a greater variety of intermediate goods, which allows the economy to gain a comparative advantage in the production of more sophisticated final goods. This results in higher productivity and wage rates. This could also, however, generate a negative effect if MNCs import all their inputs from parent companies, thus reducing the demand for local supplies. The relative strength of the competition and spillover effects remains unclear. However, the competition effect may condition the way FDI affects the local industry, as suggested by Aitken and Harrison (1999). They cautioned that multinationals have lower marginal costs owing to some firm-specific advantages which allow them to attract demand away from domestic firms, forcing them to reduce production and move up their (given) average cost curve.

Similarly, Markusen and Venables (1999) studied the effects of multinational companies on the development of domestic firms in the host-economy. They suggest that it is possible for FDI to act as a catalyst that can lead to the development of local industry through linkage effects. Their study shows theoretically that multinationals, through the creation of linkages with indigenous suppliers, can exert a positive influence on the development of indigenous firms. They also link vertical spillovers to market structure. They argue that multinationals can change the structure of imperfectly competitive industries in the host-country by fostering the development of domestic intermediate goods- producing firms, which, in turn may have positive effects on the development of domestic final goods-producing firms. In relation to the theoretical models on vertical spillover and linkages (Rodriguez-Clare, 1996; Markusen & Venables, 1999; Javorcik, 2004; Arnold & Javorcik, 2009), the concept of linkages was first established by Hirschman (1958). Linkages can be broadly defined as direct relationships established by firms in complementary activities, which are external to pure market transactions and essential to the functioning of any normal industrial market (Lim & Fong, 1982). As inter-industry spillover may take place primarily through customer-supplier relationships which develop between foreign and indigenous firms, many domestic firms have increased their productivity through the impact of spillovers from the presence of FDI (Dunning, 1993). In these instances, spillovers may take place through knowledge transfers from MNCs who act as customers to local firms while the local firms act as suppliers. Local firms have incentives to upgrade their performance because there are higher requirements for product quality and they are under pressure to 'prove themselves' to their customer, i.e. the MNCs.

## RESEARCH APPROACHES

This study uses firm-level case evidence, where it is able to provide new case evidence and contribute to an increased understanding as to the extent to which MNCs (through business relationships with local firms) facilitate technological upgrading among domestic firms in a developing country. Therefore, in order to have an in-depth understanding of the matter, interviews and first person accounts need to be heard from the people involved in order to get valuable information. Moreover, as suggested by Feagin, Orum and Sjoberg (1991) case studies are an ideal methodology when a holistic, in-depth investigation is needed. Moreover, many scholars suggest exploratory research and qualitative methodologies to capture multi-dimensional phenomena (Yin 2014) and this can provide a clear and holistic view of the context (Ghauri & Firth, 2009; Ruyter & Scholl, 1998). This study aims to provide a better understanding of vertical knowledge transfers as Corbin and Strauss (2014) claim that qualitative methods can be used to better understand any phenomenon about which little is known. They can also be used to gain new perspectives on matters about which much is already known, or to gain more in-depth information that may be difficult to convey quantitatively. In addition, only a few empirical studies in this area had previously used a case study approach. Therefore, by using detailed firm-level case evidence, this study is able to provide new case evidence and contribute to an increased understanding as to the extent to which MNCs (through business relationships with local firms) facilitate technological upgrading among local firms in a developing country.

A total of 9 interviews were conducted: two interviews with an American firm, five interviews with three different Japanese firms and two interviews with a European firm. In order to achieve information-richness of the case selected, this study uses three important criteria in selecting the cases. Firstly, the firm must have already operated in Malaysia for a relatively long period in which their presence has already had a significant contribution to the economic growth of the country. In addition, firms which have already had a long period of operation are more likely to have linkages/business links with domestic firms. Secondly, the selected firms must be among the largest in terms of output in the selected industries. Thirdly, the firms will be from the main industries in Malaysia which have attracted a substantial amount of FDI: that is, in this case, the electrical and electronics industry. Initially, and most importantly, in order to guarantee reliability, the details of the procedures followed in the interview process were constructed. Firstly, in order to secure the interviews, the author wrote to the CEO of respecting firms and asked them for permission to conduct an interview with a suitable person. All interviews took place at the respondent's offices, and each interview lasted between forty five minutes to one hour and was conducted in English. A semi-structured in-depth interview format was used where a list of pre-prepared open-ended questions were asked. These open-ended pre-prepared questions were designed to extract detailed and crucial information on how technology transfer occurs. Moreover, this approach enabled the researcher to focus on the main topic rather than a more general one and address more specific questions. Obviously, in the interview process, the interviewer did not attempt to influence the responses of interviewees. Each respondent explained the topics asked according to their own conscience and understanding.

In order to keep the research results confidential and use them solely for academic purposes, no specific individuals or names of companies will be identified. Hence, the study uses pseudonyms in place of the names of companies and only refers to the position or job title of the respondents. The study identifies the company as Japan co. 1, Japan co. 2, Japan co. 3, the US co. 1 and Europe co.1. The interviewees of the case companies are the Assistant Head of AU Production (BU2), Production 2 Department of Japanese Co. 1, the Procurement & Logistics Manager of the US co. 1, the Production Manager of the US co. 1,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the Purchasing Department Manager and the Department Head of Home Shower Production of Japan co. 2, the Assistant Manager of Procurement & Administration and the Production Manager of Japan co. 3, the Purchasing Section Manager and the Director of Procurement of Europe co. 1. The interviews were conducted one-to-one, digitally recorded and subsequently transcribed. Detailed accounts of the interviews which included the transcription and coding process are presented in next section. Below were the lists of all cases:

## Case 1: Japan co. 1

Japan co. 1 is one of the world's best-recognised brand names, with extensive operation networks that span the four corners of the globe. The history of Japan co. 1 started more than 20 years ago when, it first manufacturing plant was established on the shores of Malaysia in Prai, Penang, one of the states in Malaysia. Since then, with the vision of its founder and a dedicated workforce, it has become one of the biggest companies in Malaysia, boasting a headcount of 13,000 employees. With the total production quantity per year reaching 50 Million units, it is the biggest manufacturing plant in Asia that incorporates state of the art of cutting-edge technology in the design and production of quality consumer video products. Japan co. 1 is also one of the top 5 companies in Malaysia in terms of sales volume. Presently, Japan co. 1 has two manufacturing entities: one in Prai, Penang (PG Tec) and one in Bangi, Selangor (KL Tec). The company started manufacturing audio/visual products in Malaysia in the 1980s. They manufacture high technology products such as DVDs, CD-RW, flat screens, TVs, audio products and hi-fi sets. Cumulatively, the company has invested more than RM2 billion in this country. Their products have positively enriched the lives of consumers with products that push the technology envelope and make life more enjoyable and exciting. Japan co. 1 consists of two manufacturing plants, strategically located in Prai (PG Tec) and Bangi (KL Tec).

## Case 2: Japan co. 2

The first Japan co. 2 was established in 1965 in Malaysia and since then, the Japan co. 2 Group of Companies in Malaysia has grown manifold times into 23 companies, 15 of which are Manufacturing, 3 Sales & Service, 3 Research & Development Centres, 1 Finance Centre and 1 Insurance Company. The Group is one of the largest employers in the manufacturing sector, with a current workforce of approximately 30,000 employees and its consolidated annual turnover is around RM9 billion. Its products range from simple to sophisticated components and electrical goods, where 75% of the Group's total production output is exported to overseas markets, which makes the Group's contribution to the Malaysian economy highly visible, accounting for as much as 2% of total Malaysian exports. The acceptance of Japan co. 2 'Made-In-Malaysia' products in the world market provides recognition for the Group's effort to maintain a high standard of quality equivalent to the Japan co. 2 Electric Industrial Co., Ltd. (MEI), Japan. Adhering to its motto, 'We make people before products', the Group is committed to the development of human resources and the transfer of technology and management skills. This is largely achieved through On-The-Job and Off-The-Job training conducted in Malaysia, Japan and other countries. All employees have the opportunity to develop themselves and grow with the company. Today, the Japan co. 2 brand name has emerged as one of the most welcome and trusted brand names for electrical home appliances chosen by most Malaysian households. The company manufactures, operates, delivers, and maintains a

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

series of product ranges with globally competitive models under the Japan co. 2 brand name, incorporating new features, enhanced capability and improved quality.

## Case 3: Japan co. 3

Japan co. 3 has been operating in Malaysia for about 15 years and currently has more than 200 employees who represent various nationalities but are mostly locals. The company produces several parts/products ranging from lead wires, aluminium coil for electrolysis condensers, capacitor cases, electronic components, electronic engineering as well as metal products. The company has 100 percent foreign equity, that is Japanese and has a paid up capital of RM25 million. Nearly 80 percent of the products are manufactured for export markets which include the Japanese market, China, Taiwan, Hong Kong, the Philippines, Thailand and Indonesia. The remaining percentage is for the domestic market. The company also supplies certain parts or components (such as aluminium wires and aluminium coils) to large global manufacturers. The company has always ensured that productions are systematic and has been able to maintain the standard of products by abiding by the guidelines of Standards and Industrial Research Institute of Malaysia (SIRIM). The company had managed to achieve ISO-certification of ISO 9001 in the years 2000 and 2002.

## Case 4: US co. 1

Incorporated in 1974 and with more than US$1.1 billion in investment, the US co. 1 in Malaysia has established itself as a leading manufacturer of high-technology communications, information technology and electronics components, and products, equipment and accessories for the global market. With over 30 years of corporate presence, the company has established itself as a leading manufacturer of high technology wireless communications solutions and accessories for the global market. The company is now the largest manufacturing site for two-way radio products in Asia and the only design centre for two-way radios in the region. The company is a global leader in providing integrated communications solutions and embedded electronic solutions. US co. 1's Malaysia operations consist of two manufacturing sites, a world class Research & Development centre, an Asia Pacific distribution centre, a Multimedia Super Corridor (MSC)-status Software centre, and seven core sales businesses.

Until now the company presence has contributed positively to the Malaysian economy, especially in the areas of technology transfer, local vendor development and export business. In addition, the company has contributed significantly to the community by imparting its knowledge through training and development programmes, especially in the field of engineering. Some of these education initiatives include joint-development of curriculums with education institutes, research grants, scholarship programmes and cross-training for technology advancement, as well as the donation of communication equipment.

The company is one of two in Asia and the largest facility that manufactures two-way radio products. The Penang Design Centre is the first two-way radio design centre in Malaysia and the only one in Asia with over 30 years of R&D expertise. The centre is recognised as a SEI-CMM® Level 5 organisation with the highest level of software maturity as assessed by the Software Engineering Institute (SEI) from the Carnegie Mellon University in the USA. Both manufacturing operations and product development operations are ISO14001/ ISO9001/TL9000 accredited. In 2007, the Penang operations was awarded the prestigious 'Penang Chief Minister's K-ICT Award 2007' for its best practices in developing knowledge workers within its operations. The company's excellent track record is a testament to the tenacity

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

and commitment of the team which has enabled it to remain as one of the key growth centres in the company's global operations.

Employing more than 1,000 R&D engineers, the company plays a strategic role as the 'Centre of Excellence' responsible for the entire product lifecycle activities including R&D, manufacturing, sales and distribution and customer support for regional and global markets for its digital two-way radios and advanced wireless broadband communications solutions. It is also a 24-hour Asia technical support centre. With its customer solution centre co-located with R&D, the company serves as a world class technology showcase for Made-in-Malaysia products and solutions, demonstrating the high level of engineering competencies in Malaysia. In addition, the company has an Advanced Communications Laboratory that houses four key laboratories - an Electromagnetic Emissions (EME) Laboratory, a Type Approval (TA) Laboratory, an Engineering Laboratory, and an Electromagnetic Compatibility (EMC) Laboratory. The company has what they have called the US co. 1 University which is globally recognised as a leader in corporate education and provides industry-related learning solutions both internally and externally to private and public enterprises and institutions.

## Case 5: Europe co. 1

Europe co. 1 was founded in 1974 and provides a full range of integrated designs, prototyping, new products and mass production services to some of the most demanding European and American OEMs, and delivers to them or directly to their customers worldwide. The company serves customers primarily in industries like industrial electronics, electrical & lighting, electronics, residential & building controls, high-end consumer electronics, power tools, communications & networking, audio & video and defence electronics. A Swiss-owned company located in Penang, Malaysia, Europe Co. 1 has more than 30 years of contract manufacturing experience in Europe and Asia and a marquee list of leading OEM customers. Among other fully-integrated providers of electronic and mechatronic design and manufacturing services, the company stands out as a world-class concern. With a full range of design and manufacturing services, the company offers a truly vertically-integrated, one-stop shop for its customers. With a first-class development team in the heart of Europe and several production locations in Asia, now for more than 30 years the company has become the preferred electronic manufacturing services (EMS) company providing integrated design and production solutions for customers in Switzerland, Europe and North America.

The company is committed to total quality management, providing product and product-related services that conform to all established requirements of customers and its quality management system. Through continual review and improvement, the company is committed to exceeding the expectations of its customers, achieving total customer satisfaction, and providing defect-free, competitive products/solutions on time. The company has a strong, 30-plus year commitment to maintaining the highest quality standards. The company has combined the principles of Kaizen with the procedural discipline of the ISO, QS and TS standards. With this combination, the company has created an innovative quality system that works throughout the entire organisation to continually maintain and reinforce its quality standards. The company is certified to the quality standards such as QS 9000, ISO 9001:2000, ISO 14001, ISO 13485:2003, ISO 13485:2003.

In a business where as much as 80% of the value of the products the company builds can be in the components and materials, supply chain management is critical to the company success. At the front end, the company design teams consult closely with its supply chain teams in order to ensure a bill of

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

material optimised for eventual mass production. At the individual factory level, planning and execution of buying activity optimises lean inventory management and lead-time flexibility customer by customer. In a world driven by breakthroughs, the company is a thriving leader in the electronics manufacturing industry. With a blue-chip list of OEM customers, the company continually has exciting new design and manufacturing challenges to solve. At the company design centres in Switzerland and Malaysia, and its manufacturing facilities in Switzerland, Malaysia, Singapore and China, the company team members are challenged to learn and innovate and create value every day. The company growth in 2007 was RM612 million and until the third quarter of 2008 the company has recorded RM650 million growth.

## FINDINGS AND ANALYSIS ON TRAINING PROGRAMS AS A CHANNEL FOR KNOWLEDGE SPILLOVERS

The transfer of knowledge and technology from MNCs to local suppliers is not only embodied in machinery, equipment, production processes, product design and technical processes but is also realised through the training of local employees. This is another important area of knowledge diffusion where different types of training programmes are offered by MNCs in order to upgrade the human resource base of their suppliers. The American MNC in this study gives training to supplier's people at the MNC site as well as supplier's site. In this situation, MNC engineers will be sent to the supplier's site to train them as well as in-plant training for supplier's employees at MNC's site. Training of supplier's employees normally includes an assembly works which takes place in MNC's factory or, on some occasions, experts from the MNC will go to supplier's factory to conduct the training. This emerged clearly from an interview with the Production Manager of US co. 1:

*We will ask their people to come or our people can go there and train them. (US co. 1)*

*Normally those are typically involve a lot of assembly sometimes they need to assemble this assemble that so we will send our people there and train them. (US co. 1)*

He added:

*We send our engineers to train them. Typically assemble work we go there and train them. (US co. 1)*

The statement was echoed by the Procurement and Logistics Manager of US co. 1 as he pointed out:

*We will have our local team here to go and train supplier's workers in term of technical consultations. (US co. 1)*

He added:

*Sometimes if it is required they will come here and do some in-plant training as well before we go over there, they normally come in and do in-plant training first then later on once we will get our engineer also to go over as well to train them. (US co. 1)*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

One of the important objectives of the training programmes offered by the MNCs is to develop local talent. According to the company, human capital development is one of the three tenets of their extensive Corporate Social Responsibility programme. The company is taking a holistic approach to investing in talent development, citing the need for nurturing local talent as a key ingredient to Malaysia moving forward. The company transfers technology and knowledge to its local employees through various training programmes. The company believes these various training programmes will affect every level of employee. It involves simple manufacturing operatives to high level operations and from lower level production workers, supervisors to technically advanced professionals and top-level managers. The types of training range from on-the-job training to workshops, from in-house training to specific training at the parent company, depending on the skills needed. Most of the time, training will take place in the factory or its training facilities. At any time, as and when necessary, an expert from Headquarters will come over to conduct training. The Production Manager of US co. 1 reiterated:

*In terms of like all those tech that we are trying to ever transfer from states or other countries to Malaysia, equally all this will be transferred to them, all this tech will be passed on to them, indirectly it will help build our local talent not only inside the company but outside the company. (US co. 1)*

He added:

*Normally the latest technology will come directly to the factory it won't go directly outside, so either we will have our people going to the HQ directly for training or personnel from the HQ come over here to train us. (US co. 1)*

The company currently works alongside local universities in joint collaboration efforts and has partnerships with local universities such as the 'Inter-School Engineering Challenge' (ISEC) with International Islamic University Malaysia and the 'Creative Engineering Design Competition' with Universiti Sains Malaysia (USM) to cultivate students' interest in engineering. For outstanding engineering students who excel in their studies, the company has introduced the Gold Award, rewarding them with cash prizes and internship programme opportunities. The company believes in investing strategically in R&D and human capital as a step to continuously increase its value chain in the industry. This commitment reflects the company's position as a strong and long-term investor, as well as a committed employer in the country.

Previous studies based on developing countries have shown that training programmes are crucial for MNCs in order for them not only able to produce higher quality products but also for acquiring good quality material from local suppliers in the host country. Gerschenberg (1987) for instance, examines MNCs and their training programmes as a means of managerial skills diffusion in Kenya. From detailed career data of 72 top and middle level managers in 41 manufacturing firms, the study concludes that MNCs offer more training of various sorts to their managers than private local firms do. Managers also move from MNCs to other firms and contribute to the diffusion of know-how. Chen (1983), in a study of technology transfer to Hong Kong, chooses to emphasise the training of operatives. MNCs' training expenditures were significantly higher than those for local firms. Strikingly, the study concludes that the major contribution of foreign firms in Hong Kong manufacturing is not so much the production of new techniques and products, but the training of workers at various levels.

A constant effort is needed to enhance customer satisfaction. In this case, employees as well as suppliers' education and motivation is the key to avoiding mistakes. In their search to give customers more

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

value for their money, Japanese MNCs placed extensive training programmes for both employees and their local suppliers. They believe good training and continuous retraining is essential. Generally, the focus of Japanese training is on how to perform a task efficiently while achieving better quality. Japanese management views quality training as an investment where results can be seen in the long-run. This attitude towards quality training leads to an extensive, expanded, and continuous programme. Normally, engineers from HQ will come to train subsidiary employees or an advisor from MNC's HQ will communicate technology with a subsidiary's engineers. Sometimes, subsidiaries send their people to HQ to study the introduction of new products. Japanese MNCs' commitment in relations to the importance of various training programs was evidenced as the Section Head of Production of Japan co. 2 pointed out:

*What we did was that we will ask people from HQ to come here and train us which we believe that it is the best way where many of our employees will be able to get train from people from HQ rather than only certain people. (Japan co. 2)*

He added:

*Here, we have our engineering department which acts as our R&D team. We do not have a specialised centre for R&D here. If we have any problem faced by the team they will consult with the team in Japan. Our R&D and technology are actually control by our engineering department. Suppliers do not have to come here to get along with our R&D department. Most of our engineers are local people but normally, we have one advisor from Japan who will communicate the technology between HQ and us. (Japan co. 2)*

As production technologies have a dynamic impact in relation to technology development, it is important to have continuous training programmes in order to ensure company competitiveness. Formal classroom training, informal training and on-the-job training are some of different methods of training used by Japanese MNCs. The important point is that different employees from different levels of the organisation are involved in training programmes in one way or another. For Japanese MNCs, in-house training programmes by HQ technical teams to subsidiary people normally take place on the subsidiary's site. Various training programmes were also offered at the MNC's HQ. The Production Manager of Japan co. 3 stressed:

*We do provide all sorts of trainings especially to our technical team. Some of the trainings that we conduct are in terms of product safety; sometimes our technical people have the opportunity to utilise cutting-edge machineries or work process. (Japan co. 3)*

He added:

*We do send our technical team to attend trainings at our Headquarters in Japan, or sometimes, they are in-house trained by our Japanese technical advisor. We normally send our people to our Headquarters in Japan; to have a feel of the product. Of course all new employees will have to attend basic orientation training in the initials weeks of starting work; i.e. fire safety, safety in the workplace, the correct posture when lifting heavy products. (Japan co. 3)*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Engineers in HQ and engineers from subsidiaries will study together about the new product in MNC's HQ and, after studying the new product, a subsidiary's engineers will transfer the knowledge to the people in the subsidiary. The company believes training programmes offered by MNC are crucial in the development of local talent. The company is responsible not only in the investment of talent development, but as key to the progress of Malaysian human resources. In this case, Japanese MNCs transfers technology and knowledge to its local employees through various training programmes. The company believes these various training programmes affect every level of employees. The Section Head of Production of Japan co. 2 stressed:

*When we want to introduce certain new product, first thing we need is to have a discussion among ourselves then we will send our engineering people to Japan. Basically in Japan, they have many engineers that design and develop a new model, so we will study together between Malaysian engineers and Japanese engineers. When our engineers have learned everything there, they will transfer their knowledge to our workers here as well as our suppliers. (Japan co. 2)*

Similarly the Head of the Production Department Production manager of Japan co. 1 pointed out:

*These people will make sure the introduction of the new model will going smoothly, no defects. They will discuss with the production people on the necessary things regarding the introduction of new model. (Japan co. 1)*

Japanese MNCs send their engineers and quality control staff to the suppliers' factories to educate suppliers' employees. Workers with adequate skill, knowledge and training are an important element in the quality-related efforts of a company. This is an important point where knowledge is diffused through different types of training programmes offered by MNCs in order to raise the human resource capabilities of their suppliers. In fact, education and training of vendors is considered a top priority. Suppliers must be trained to perform rigorous quality-control on their products. The Section Head of Production of Japan co. 2 pointed out:

*We do send our people to suppliers' place to train them. We decided to go to their place and do training there so that we will be able to train most of the supplier's workers. (Japan co. 2)*

The Manager of the Purchasing Department added:

*Basically in Japan, they have many engineers that design and develop a new model, so we will study together between Malaysian engineers and Japanese engineers. When our engineers have learned everything there, they will transfer their knowledge to our workers here as well as our suppliers. (Japan co. 2)*

As production procedures will change according to any related technology developments, it is vital to have ongoing training sessions as a way of familiarizing employees with new ways of doing things and to ensure that these technological changes ensure that product quality is on a par with the product leaders. Training facilities, be they local or abroad, are also offered to local suppliers' personnel as part of a healthy technology and knowledge transfer/ sharing environment and as a testament to the principal

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

companies' commitment to improving product quality. The importance of various training programmes emerged clearly from the interviews with the Director of Procurement of Europe co. 1 where he stressed:

*The company provides training for managers and technicians abroad at our HQ as and when applicable. We also have in-plant training program developed by the company for managers and technicians for example ESD, ISO QMS, etc (Europe co. 1)*

Similarly the Purchasing Section Manager said:

*Every plant has its own training plan. Sometimes when suppliers faced problem we will send our engineers and procurement to go just to go through with suppliers. (Europe co. 1)*

The company believes knowledge and know-how are important; unfortunately due to the prohibitive high cost, extensive training programmes are only offered to their own employees but not to their local suppliers. However, the company always has knowledge sharing and on-going discussions. The company provides guidance in order for the suppliers to provide high standard products. This emerged clearly from an interview with the Director of Procurement of Europe co. 1:

*The company does not assist our local suppliers in setting up their training programs as well as providing training for their workers abroad at your HQ. We also do not have in-plant training program for our for suppliers workers. (Europe co. 1)*

The Purchasing Section Manager added:

*We will have detail discussion and consultation from the start of the production process and of course we provide them with assistance especially for new suppliers. (Europe co. 1)*

## TRAINING PROGRAMMES AS CHANNEL OF KNOWLEDGE SPILLOVERS

This section aims to explore the links between training and innovative capacity of local suppliers. The pertinent question here is as follows: does training provided by MNCs to local suppliers improve their skills, enabling them to undertake more complex tasks or complete tasks better or faster? Does training strengthen local suppliers' innovation? As production technologies have dynamic changes in relation to technology developments, it is important to have continuous training programmes in order to ensure company-competitiveness. In their search to give customers more value for their money, Japanese MNCs devise extensive training programmes both for employees and their local suppliers. Generally, the focus of Japanese MNCs' training is on how to perform a task efficiently while achieving better quality. Japanese management views quality training as an investment where results can be seen in the long run. This attitude towards quality training leads to extensive, expansive, and continuous programmes. They believe good training and continuous retraining is essential because training of workers could improve their skills, enabling them to undertake more complex tasks or complete tasks efficiently. A constant effort, according to Japanese MNCs is needed in order to enhance customer satisfaction. In this case, employees as well as suppliers' education and motivation are the keys to avoiding mistakes. Though

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

training is costly, the benefits that could be gained out of providing quality training to employees will translate into a more efficient human capital and with these improvements in the way workers do their jobs, the end product itself, be it in components manufactured or a harmonious supplier relationship, is ultimately improved.

In Japanese MNCs, engineers from HQ come to train subsidiary employees or an advisor from MNC's HQ will communicate technology to a subsidiary's engineers. Sometimes, subsidiaries send their people to HQ to study the introduction of new products. They also send their engineers and quality control staff to the suppliers' factories to educate suppliers' employees. The communication and transference of technology from the HQ to the subsidiaries need not be one way. Where relevant, subsidiaries do play their part in initialising technology transfer and proactively seek technology enhancement or enrichment opportunities from the HQ. This willingness and readiness help to instil the responsibility of ensuring that technology is sought out by local companies a factor which is especially important in an industry that is ever changing and demands that firms are on top of their game at all times. In this regard, local suppliers' innovation capacity could be increased as the latest technology normally comes from the HQ. It is common knowledge that Japanese MNCs have many engineers who design and develop new models and these abundant sources of expertise would be a beneficial aspect for subsidiaries' employees and local suppliers who are able to learn new techniques and technologies from Japanese engineers there and transfer the newly acquired technology information to their counterparts back home. This is an effective way of showing how knowledge could be transferred from the HQ to the subsidiary.

Japanese MNCs' commitment in relation to the importance of various training programmes is evidenced where formal classroom training, informal training and on-the-job training are used by Japanese MNCs to train local suppliers. The important point is that different employees from different levels of the organisation are involved in training programmes in one way or another. For Japanese MNCs, in-house training programmes, delivered by HQ technical teams to subsidiary people normally take place in the subsidiary's site. Various training programmes were also offered in MNCs' HQ in order to produce the desired innovation. These training programmes were able to equip their employees and suppliers' employees with greater skills and knowledge. In fact, education and training of vendors is considered a top priority. Suppliers were trained to perform rigorous quality control on their products. This is because the Japanese believe workers with adequate skill, knowledge and training are an important element in the quality-related efforts of a company. The commitment of MNCs for life-long learning is evidenced in the meticulous structuring of training for staff. For any company, it goes without saying that human capital is the most valuable asset and utmost care should be exercised for these valuable assets to flourish and serve their purposes. Providing training formal or informal is therefore beneficial in terms of generating skilled workers for the MNCs. Much has been said about Japanese MNCs' lifelong employment and the provision of training would be a way for MNCs to safeguard the companies' future and to ensure employees are well trained and highly skilled.

In American MNCs, technology was transferred to MNCs' employees through training. American MNCs in this study provide training to suppliers at the MNC site as well as at the supplier's site. In these instances, MNC engineers will be sent to supplier's site to train them as well as providing in-house training for supplier's employees at MNC's site. Training for supplier's employees normally includes assembly work, which takes place in MNCs' factories or at previously agreed time. For the previously agreed time, experts from the MNC will go to a supplier's factory to conduct training. To this end, local suppliers can consistently improve because they are willing to learn in order to secure future contracts with MNCs. The American MNCs believe that having technical discussions and consultations with

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

suppliers when introducing new technology gives suppliers the opportunity to grasp the new technology. These 'learning processes' therefore not only increase the ability of their human capital, but also increase local firms' stock of innovation. Local suppliers are satisfied because once they have the new technology they can enhance their business performance and increase their innovative capacity. In addition to discussion, consultation and demonstration, intensive training helps local suppliers to master the technology. In return MNCs rarely experience major quality problems with local suppliers such as having to call the products back. This is an example of a win-win situation and how harmonious business relationships between MNCs and local suppliers could minimise product call backs and pave the way for future contracts.

As for the European MNC, the company has always been a proponent of knowledge-sharing and on-going discussions. The company provides guidance in order for the suppliers to provide high standard products. Giving some leeway in training management, the MNC does not assist local suppliers in setting up their training programmes but, as production procedures change according to any related technology developments, ongoing training sessions with local suppliers take place in order to ensure that technological changes help the local producer increase their product quality. Training facilities, be they local or abroad are also offered to local suppliers' personnel as part of a healthy technology and knowledge transfer/sharing environment and as a testament of the principal companies' commitment to improving product quality.

It is important to note that the diffusion of such knowledge can take place through different types of channels. Among the many channels through which foreign knowledge spills over to local companies in the host country, FDI is one of the most effective forms of international technology transfer because it can convey not only technology embodied in goods and services but also intangible assets such as knowledge skills (Branstetter, 2000). The case evidence in this study clearly demonstrates that FDI from foreign MNCs through their training programmes can be viewed as an essential element in enhancing organisational learning and creating new knowledge, hence leading to innovation. Extensive training programmes, discussions and consultation with MNCs provide local suppliers with knowledge about how to design a product and also increase their innovative capacity because design activities can have a positive effect on innovation outputs (Marsili & Salter, 2006). Moreover, communication between the companies also provides local suppliers with the skills of processing, and knowledge regarding specifications on technical areas. All these elements enable local suppliers to increase their innovation and produce a product that can meet MNCs' standard requirements. Having technical discussions and consultations with MNCs in the case of the introduction of new technology gives suppliers the opportunity to fully embrace the new technology. In addition to discussion and consultation, demonstration and intensive training help local suppliers to master the new technology introduced and increase the innovative capacity of local suppliers. As revealed by (Johnson et al., 1996), commitment to the development of human capital, signalled by formal and informal training programmes, is likely to be central to successful innovation in both products and processes. This view is echoed by Warner (1996 p. 348) who contends that innovation 'requires a greater human resource management investment in technician training as well as linking this with the work of engineers in design and product development'

It is evident from the discussion above that training is found to be closely related to innovation and training is a crucial factor in upgrading the skills of employees. When employees from these local suppliers learn advanced technology from MNCs, this may lead to more innovative activity in suppliers' local firms. Training programmes offered by the MNCs in this study have enabled local firms to learn about the products and technologies brought in by foreign investors by means of reverse engineering or

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

demonstration effects, where domestic firms learn superior production technologies from MNCs. Previous studies by Dunning (1993) and Jenkins (1990) suggest that MNCs may impact local economies by stimulating imitation, reverse engineering and involuntary diffusion of information on advanced technologies and managerial techniques. Furthermore, training programmes offered by MNCs help to raise the human resource capabilities of their suppliers and can be considered as a major channel of knowledge transfer. In this sense, training offered by MNCs is inextricably linked to the innovation performance of local suppliers (Warner, 1996). Thus, training and education could lead to an increase in the quality of labour, by equipping employees with greater skills and knowledge. As a result, local suppliers are able to improve the efficiency of their production process and are able to undertake more difficult tasks with higher quality results. If domestic firms learn more advanced technology from MNCs then this may also lead to more innovation. This is because innovation is conceived of as a process of 'learning by interacting' (Lundvall, 1995), 'learning by doing' (Arrow, 1962) and 'learning by using' (Rosenberg, 1982). Thus, in order to take full advantage of the opportunities that FDI offers, and especially the potential for technology-enhancement to local companies, it is imperative that the governments of developing countries should prioritise the provision of a hassle and bureaucratic-free platform where technology transfer can take place between foreign MNCs and local companies.

The linkages between MNCs and local suppliers are vital because assistance provided by MNCs acts as a catalyst to stimulate innovation activity of local firms in developing countries like Malaysia. The findings in this study corroborate those of the previous work in this field. Previous studies based on developing countries have shown that training programmes are crucial for MNCs in order for them not only able to produce higher quality products but also to acquire good quality material from local suppliers in the host country. One example of this is cited by Gerschenberg (1987) for instance, who examines MNCs and their training programmes as a means of managerial skills diffusion in Kenya. Chen (1983), in a study of technology transfer to Hong Kong, emphasises the training of operatives. MNCs training expenditures were significantly higher than those for local firms. Strikingly, the study concludes that the major contribution of foreign firms in Hong Kong manufacturing is not so much the production of new techniques and products, but the training of workers at various levels. Lall (1978) finds that MNCs improve the productivity of indigenous firms by providing technical assistance and training, by assisting them in purchasing of raw materials and by pressuring suppliers to meet standards of reliability and speed of delivery. These vertical spillovers can then enhance the innovation capability of local suppliers. All of the above views on how training could catapult local companies to greater heights in producing more technologically advanced products and secure more future contracts with MNCs could well be justifications for developing countries to offer more FDI-friendly policies to MNCs.

It is imperative to comprehend the transfer of knowledge and technology from MNCs to local suppliers is not only embodied in machinery, equipment, production processes, product design and technical processes, but is also realised through the training of local employees. In the MNCs' context, this is another important area of knowledge diffusion where different types of training programmes are offered by MNCs in order to upgrade the human resource base of their suppliers. Training possibly leads to increasing in the quality of labour, equipping employees with greater skills and knowledge, improving the standard and quality of products, thus resulting in continual innovation and increased productivity and profitability (Mathews, 2002; Taylor & Davies, 2004). The training given by MNCs to their local suppliers in the area of production as well as management area enables local suppliers to know all the processes involved. Extensive discussion and consultation with MNCs during training programmes provides local suppliers with knowledge and technology know-how. These resources allow local sup-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

pliers to produce a product that can meet MNCs' standard requirements. Moreover, some of the training provides local suppliers with the opportunity to utilise cutting-edge machineries or work processes. These training activities ensure that local suppliers use machineries appropriately in order to achieve optimum production and simultaneously ensure that employees are trained for the purpose of putting health and safety in place. Therefore, it can be proposed that:

*Training programs offered by MNCs to local suppliers could stimulate local innovations.*

Table 1 indicates the findings gathered from the case study interviews, which points to the significance of training programs in enhancing local suppliers' innovative capacity.

## FUTURE RESEARCH DIRECTIONS

The limitation that should be considered in this study concerns the issue of generalisation in the use of the case study method. The research attempt is based on five cases and therefore does not permit any claim of generalisability. Furthermore, the author only interviewed MNCs, but not local suppliers thus, the evidences and findings could not be confirmed from local suppliers perspectives. Having said this, this case study have opened the black box of the MNCs and its channels to reach the local suppliers and further study might be useful to give insights how the other side of the coin will work which would too much for the scope of this study. One of the main objectives of this study was to add to limited evidence related to how and in what ways technology and knowledge are diffused. Specifically, it attempts to contribute to the FDI spillover literature by exploring the channels through which technology and knowledge could be transferred to the host country. In doing so, the author had identified that an in-depth case study method was most suitable in order to generate a deeper understanding of the significance of the assistance provided by MNCs and that this method would prove an effective strategy in generating a large volume

*Table 1. Training programmes as a channel of spillovers*

| | **Training Programms** |
|---|---|
| **Japanese MNC** | • HQ's engineers give training and communicate technology with subsidiary's engineers.<br>• Subsidiary's staff to attend training at HQ.<br>• Latest technology comes from the HQ.<br>• Formal classroom training as well as informal training to local suppliers.<br>• On-the-job training was used to train local suppliers.<br>• Education and training of vendors are considered a top priority.<br>• Suppliers were trained to perform rigorous quality control on their products. |
| **American MNC** | • Conduct training programs to local suppliers at MNC site.<br>• Conduct training programs at the supplier's site.<br>• MNC engineers were sent to supplier's site to conduct training.<br>• Training includes assembly work.<br>• Technical discussion and consultations to locals suppliers when introducing new technology.<br>• Gives suppliers the opportunity to grasp on the new technology. |
| **European MNC** | • More flexible training programmes.<br>• Ongoing training sessions according to any related technology developments.<br>• Provide training facilities local or abroad being offered to local suppliers' personnel. |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

of very meaningful data. However, future studies may consider using the survey method to empirically test the significance of channels of knowledge and technology spillover on local innovative capacity.

The findings obtained from the case studies were able to produce a new theoretical framework with propositions. For example, this research has explored how knowledge and technology can be diffused through different channels of FDI spillover. The results seem to demonstrate a positive relationship between MNCs and local innovative capacity, where knowledge and technology can be diffused through the high-quality and standard requirements imposed by MNCs. Knowledge could also be disseminated through their training programmes offered by MNCs to local suppliers, as well as the high-quality and standard requirements imposed by MNCs.

However, this study overlooked the importance of cultural differences and the impact of cultural diversity; both of these are factors which might affect knowledge and technology transfer. Although the effects of culture on business practice and organisational behaviour have been extensively studied, less effort has been made to study the effects of cultural diversity on FDI spillovers. Further studies are needed to find out whether national cultural differences have an impact on the relationship between the level of technology transfer from MNCs to local firms and whether innovation activities between MNCs and local suppliers may be impeded by cultural barriers. Further studies are needed to explore how cultural barriers may slow down or accelerate the transfer of knowledge and technology from different MNCs to local firms. Though the cases were positioned to show differences in the MNCs of the Triad countries, a deeper analysis of the differences between the use of channels across these MNCs would need to be reserved for further research. On one hand, the long term orientation may motivate Japanese MNCs to build trust and long term partnerships with local suppliers, and to transfer advanced technology or provide best training to local suppliers, whereas US MNCs may seek short-term solutions with local suppliers. The Japanese MNCs may be in a better position to understand local suppliers due to the relatively small cultural distance when compared with US and European MNCs. The cultural dimensions as distinguished by Hofstede (1982, 2001) could be used as a measure of national culture for this future study.

## CONCLUSION

As discussed in earlier section, previous studies were unable to specifically identify how knowledge and technology were transferred through vertical linkages. Little attention has been paid to discovering knowledge transfer through the various means that could be channels of spillovers and how these linkage effects may improve the innovation activities of local suppliers. This study was designed to examine how and in what ways knowledge is transferred through business linkages. This study has been able to demonstrate that significant linkages were established between MNC and local suppliers. Moreover, the evidence from this study suggests that knowledge can be transferred through training programmes offered by MNCs to local suppliers. This is evident in this study where local firms gained knowledge and understanding about products and technologies brought in by foreign investors by means of reverse engineering and demonstration effects, training, feedback and technical consultations. The present study was designed to determine how and in what ways technology is transferred through these linkages. The findings presented in this study not only provide benefit to the academic circle but also to local businesses, especially small and medium industries, as well as policy makers. As for local businesses (and especially small and medium industries), FDI and innovation activities from MNCs may represent a source of knowledge and technology know-how. Hence, local suppliers may gain a number of advantages

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

from establishing linkages with MNCs. In particular, the findings show the importance of the effect of knowledge brought in by MNCs. The findings show the importance of various advantages that local businesses could gain from business relationships with MNCs. For instance, activities like vendor management programmes to improve the product-quality of local suppliers may improve local suppliers' performance. Moreover, constant interactions between MNCs' engineers and local suppliers enable them to share new ideas. Consultations and discussions about product design, processes and technical specifications provide local suppliers with skills that could enhanced their innovative capability. For policy-makers, the evidence obtained in this study related to foreign innovation activities as a significant factor for the improvement of local suppliers innovative capacity justifies government policies that aim to encourage more capital intensive foreign investments. The strategies introduced to attract foreign investments that give priority to R&D will strengthen Malaysia's capability to innovate and create indigenous technology and market new products. Hence, these strategies are critical in order for Malaysia to establish local abundant resources which are highly skilled and knowledgeable. Significant investment in innovation activities is needed for Malaysia to establish a knowledge-based economy and speed up economic development, thus stimulating innovation activities and increasing local innovative capacity.

# Chapter 24
# IFRS, Foreign Investment, and Prevailing Institutional Structure in Africa

**Efobi Uchenna**
*Covenant University, Nigeria*

**Francis Iyoha**
*Covenant University, Nigeria*

## ABSTRACT

*We revisit the effectiveness of IFRS adoption for FDI attractiveness by considering the adopting country's institutional structure. Attention was on the extent of corruption control (as a measure of institutional structure). Data was tested on 42 African countries for the period 2001-2012. Using the Panel Corrected Standard Error (PSCE) estimation technique, our result suggest that the effect of IFRS adoption on foreign investment differs based on the level of corruption control instituted in the sample countries. When the variable – IFRS adoption, was tested for the sample with corruption control below the median value, the coefficient was either negative or insignificant. However, the opposite was seen for the category of countries with corruption control above the median value. This result was robust to the inclusion of alternative measures of corruption, foreign investment, and control of global financial crisis and legal origin of the country.*

## 1. INTRODUCTION[1]

Since the promulgation of the International Financial Reporting Standard (IFRS) following the creation of the International Accounting Standard Board from the International Accounting Standard Committee in 2001, there has been an improvement in the global capital flow as one of the bi-product from the usage of IFRS for global financial reporting practice. IFRS was adjudged as a better form of financial reporting practice that applies more realistic measure of accounting numbers and promotes better disclosure of

accounting transactions; thus reducing information asymmetry between preparers and users of financial information (Portes & Rey, 2005; Ramos, 2010; Wysocki, 2011; Gordon, Loeb & Zhu, 2012). Recent studies (e.g. Gordon, Loeb & Zhu, 2012; Chen, Ding & Xu, 2014) have emphasized the role of IFRS adoption as a catalyst to spur foreign investment. The main argument is that – since IFRS promotes better disclosure – then it reduces the cost of monitoring of subsidiaries and information barriers to cross border investments. Foreign investors – therefore – will be able to have access to high-quality information that enables them to make decisions as regards the prospects of their investments at a lower cost.

Institutions, on the other hand, includes those structures and frameworks by which authorities are exercised to provide incentives for productive economic activities. It includes those rules, decrees, policies, guidelines and frameworks, which shapes relationships among economic agents, ensures security of property rights and reduces any form of losses as a result of opportunistic behaviours of economic agents (see North, 1991; Williamson, 2000; Osabuohien & Efobi, 2013; Osabuohien, 2014; Efobi, 2015a). There are recounting empirical evidences suggesting a strong correlation between institutions and foreign investment (Asiedu, 2006; Busse & Hefeker, 2007; Asiedu & Lien, 2011; Anyanwu, 2012; Bandyopadhyay, Sandler & Younas, 2014). Investors seek to protect their investment and maximise their returns, and therefore will prefer to flow into countries that have a strong institutional structure to set up their investment.

Pointing directly at the main concern raised by Wysocki (2011)[2], this chapter looks at the extent to which the resulting FDI benefit from the adoption of IFRS is affected by the prevailing institutional structure in Africa. The main issue addressed is whether the prevailing institutional structures interferes with the extent to which IFRS adoption can inform foreign capital flow to Africa. This issue is of utmost importance in the African setting because of the increasing wave of the number of IFRS adopting countries in this region and the underlining reason being to improve financial reporting infrastructure in order to be able to attract more foreign investors. More frantic, some experts in the International Accounting Standards Board (IASB)[3] encourages African countries to see the adoption of IFRS as an opportunity for deepen their capital market participation, enhance inward investment to foster the growth of the private sector and provide a suitable investment climate for multinationals who would like to set-up their operations in Africa. This therefore makes the improvement of the volume of investment in Africa the central reason for the drive towards IFRS adoption. However, the quality of institutions in this region questions the realisation of the FDI benefit from IFRS adoption.

Focusing on corruption: this represents one of the main institutional palaver in most African countries and has been charged for the slow developmental process of these countries (Fosu, 2011; Asongu, 2012; Ackah, Turkson & Opoku, 2013; Asongu, 2013, 2014; Efobi, 2015a). There are incidences in some African countries where political leaders divert developmental resources for private interest (Easterly, 2008). The spill-over effect of the reoccurrence of such incidences is that the complimentary structures like infrastructure, human capital development, among others, will be unattended to thereby creating an unfavourable environment for investment and creating a disincentive for foreign investment inflow. More so, corruption erodes the capacity of the state to deliver efficient services to economic agents that would have hitherto desired to invest in such country. For instance, corruption increases the transaction cost of setting up an investment since those who control regulatory authorities can possibly circumvent instituted guidelines in order to derive specific rents. In contrast, countries with lower corruption will experience reduced transaction cost for investors as the requisite guidelines to be followed in setting up investment is rid of unnecessary delays and procedures to attract rent from the investors. Being this the case, we

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

suspect that African countries may not be able to realise the FDI benefit from the adoption of IFRS as a result of the prevailing institutional structure and bearing in mind its effect on investment decisions.

There are three plausible ways through which the prevailing institutional structure in African countries affects the FDI outcome from IFRS adoption. First, IFRS is more of principle based regulations that allows professionals to apply their value judgement in interpreting/applying the standard (Collins, Pasewark & Riley, 2012). The danger in this is that in countries with poor institutional frameworks, professionals can still perpetrate in opportunistic behaviours and thus, progress the occurrence of information asymmetry which defeats the objective of IFRS adoption. Second, for African countries to attract FDI from their adoption of IFRS, they will require the development of their institutional structure in order to reduce resultant associative transaction cost. The increased transaction cost from poor institutions signals the incidence of poor investment climate to other investors who would have wanted to invest in the affected country: thus investment is diverted to other locations with lower transaction cost and improved institutions (Bandyopadhyay, Sandler & Younas, 2014). Considering the adoption of IFRS in isolation cannot reduce such transaction cost as it is embedded in the requisite framework that is charged with investment set-up processes like licensing, documentation, legal procedures, among others. Third, in a country with poor institutions - like the prevalence of corruption – there is a higher incentive to divert public fund from development projects (such as infrastructural provisions and human capital development) to personal benefit of public officers. Consequently, such developmental projects, which would have induced foreign investment flow, will be lacking and the adoption of IFRS will matter insignificantly in informing FDI flow.

This chapter therefore presents an empirical investigation into this tripartite issues by including the three variables in an empirical model and from the analysis, learn more about the relative importance of institutional structure in the IFRS adopting country. There are a number of conceptual and empirical challenges that such an investigation has to overcome. The first is in the measurement of the concepts - IFRS adoption. There are potential overlap to the identification of the exact indicator for this concept. Nevertheless, the literature provides adequate guidance to some of the indicators that suffices in measuring IFRS. For IFRS adoption, Gordon, Loeb and Zhu (2012) proposes the use of a dummy variable where 1 connotes the period for adoption of IFRS and 0 otherwise. This is unlike Chen, Ding and Xu (2014) that applied Ding *et al* (2005) national accounting standards conformity with IFRS index, which reports the number of points on which the national accounting conforms with IFRS. While the later presents a more recent and robust measure to identify IFRS adoption, it only captures the extent of convergence of national accounting standard with IFRS and does not show the extent of adoption like most African countries are currently doing. So we recourse to the former, but faces another challenge of identifying the year to use as a base for IFRS adoption. Two options are available: the first is to capture IFRS adoption year as the year the country's Security and Exchange Commission (SEC) publicly declares its legal adoption of IFRS, while the second is to use the year the country's SEC mandates all publicly quoted entities to report their financial statements using IFRS. In this chapter, we categorise the two periods as the year of IFRS adoption and the year of implementation. We prefer to use the former for two reasons: first, it represents the year the country legally and statutorily adopts IFRS. Second, the dataset that presents the IFRS legal adoption status of countries did not explicitly state the year the country is expected to implement IFRS, which most times are within two year of the legal declaration of adoption of IFRS. Therefore, when a country declares its legal adoption of IFRS, it signals some extent of favourability of some institutional infrastructure that attracts foreign investment and improves the localisation advantage for the FDI presence (Chen, Ding & Xu, 2014; Efobi, 2015b).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The second challenge is to examine the effect of corruption either as a conditioning factor or at varying thresholds. The first considers the relationship between IFRS adoption and FDI conditioned on corruption. This includes the indirect or intervening effect of corruption on the IFRS-FDI nexus. The second is to consider different thresholds of corruption and examine the behaviour of IFRS adoption and FDI. In this case, only the direct effect of IFRS adoption on FDI is considered but at varying thresholds of corruption. Of course, with this kind of analysis, we are able to see how the effect of IFRS adoption on FDI diminishes (or improves) across the different corruption thresholds. This fits more to the emphasis of this chapter.

Using a sample of 49 African countries for which data was available, and controlling for other FDI determinants identified by literature, we obtain result generally consistent with our expectations. Specifically, our cross-section analysis generally shows that IFRS adoption is visibly important in attracting FDI flow to countries with stronger institutional structures. Furthermore, this relationship is found to be consistent irrespective of the combination of the covariates. Also, the result does not change even when we controlled for the global economic crisis shocks.

This chapter contributes to policy and literature in some important ways. First, the effect of the institutional structure in the IFRS adopting country and how it affects the FDI outcome have not received empirical attention. Most influential studies concludes by advocating for better institutions to enhance the effect of IFRS on FDI[4]. This is without empirical estimations of the behaviour of the nexus when considering different thresholds of institutional development. We take this further by being the first (to the best of our knowledge) to provide such empirical clarifications. Second, since the focus of this chapter is on African countries; considering the institutional structure and its attendant consequence will receive influential policy attention. This is because the region have since seen ineffective institutions as a major challenge impeding development processes. Third, the chapter also advanced the theoretical explanations on the factors that determine the location of FDI by considering IFRS and institutional infrastructure as an important framework.

The contributions of this chapter is important because foreign investment presents one of the foremost developmental finance relevant for African economy. The United Nations Millennium Declaration clearly points out that an increase in the volume of foreign capital flow to Africa will aid in the speedy achievement of the Millennium Development Goals (MDG), which includes poverty reduction by at-least half in 2015[5]. Asiedu (2006) also points out that the resource gap needed to attain broad economic goals of African countries will be substantially improved if foreign capital inflow is stimulated. No wonder some of the African countries are seeing the improvement of their financial reporting infrastructure as a veritable tool for attracting foreign capital flow. This is even reverberated by the recounting push by international organisations like the World Bank, World Trade Organisation and United Nations Conference on Trade and Development (UNCTAD) for the need to improve the business environment – by adopting IFRS – in order to be capable of attracting FDI. The remainder of the chapter is organised as follows: the next section presents the development of the hypothesis. The research method, which includes the econometric model and variables, the data and the estimation technique are in the third section. The main empirical results is presented and discussed in the fourth section. The fifth section concludes with policy recommendations.

## 2. REVIEW OF RELATED LITERATURE AND HYPOTHESIS DEVELOPMENT

There is an increased range of literature that has related institutions to the growth of foreign capital inflow to countries especially African countries. Prominent among them include Morisset (2000), Li and Resnick (2003), Asiedu (2004), Busse and Hofeker (2005), Daude and Stein (2007), Asiedu and Lien (2011), Bandyopadhyay, Sandler and Younas (2014). These authors observe that the improvement of the institutional framework of a country tend to provide a conducive environment that reduces the transaction cost on investment and improves the overall returns from investment. Based on this, it is usual to expect that a country with better institutions will attract FDI. This is so since governance structures that are reform oriented and pro-active with policies, will gain the trust of foreign investors. More so, such countries will create location-specific benefits and internationalization advantages to encourage the inflow of investment.

IFRS, on the other hand, is a global financial reporting standard that is intended to ensure better transparency and information disclosure, aimed at improving the flow of foreign investment and ensuring improved global capital mobility. The prominent contributors to this nascent body of knowledge include Barth et al (2008), Beneish *et al* (2010), Ramos (2010), Prochazka and Ilinitchi (2011), Gordon, Loeb and Zhu (2012), Chen, Ding and Xu (2014), Efobi (2015b), who all concluded that the convergence of national accounting standards with IFRS/or the adoption of IFRS promotes foreign investment by reducing information processing costs that would hitherto have been heightened if local standards were maintained. As it is well known, multinationals require transparent and comparable accounting standards in order to minimize the cost of translating financial information.

Despite the budding empirical evidence supporting the claim that improved FDI flow stems from IFRS adoption, it is essential to note that other structural factors affect the extent to which this relationship can be substantiated. An important structural factor (being considered in this chapter) is the prevalence of corruption. We argue that apart from the accounting reporting standards that is expected to affect the extent of transparency and disclosure of accounting information, foreign investment will still dwindle (or not be improved) in the face of heightened corruption.

Some studies have attempted to carry on this enquiry but without substantial empirical justification. For instance, the influential study by Chen, Ding and Xu (2014), concluded that accounting standards have no major impact on accounting quality per se, but there is the need to control for the institutional factors as a possible reporting incentives that can have an impact on foreign investors. Wysocki (2011) earlier concluded that observed outcomes from the adoption of IFRS will be more effective when benchmarked against institutions. Some other studies like Louis and Urcan (2013), Gordon, Loeb and Zhu (2012), and Hail, Leuz and Wysocki (2010) have reached similar conclusions. A common peculiarity across these studies is that there are no empirical justification to validate this relationship.

The closest attempt was Chen, Ding and Xu (2014) and Gordon, Loeb and Zhu (2012), who used rule of law variable and other measures of institutions. Since this chapter is interested in corruption control for obvious reasons, we are not able to rely on their conclusions for the African sample. More so, these authors included the measure of institution in a linear model framework, where their measures of institutions were included as part of the explanatory variable. The concern with this approach is that we are not able to empirically isolate the effect of IFRS adoption on FDI when considering the conditioning effect of institutions (or corruption control). Therefore, it will be difficult to see how the effect of IFRS adoption on FDI changes when considering different regimes of institution. Based on this, we present the main hypothesis of this chapter as:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Hypothesis One:** African countries will attract more FDI if they adopt IFRS and improve on the institutional structures that controls for corruption.

## 3. RESEARCH METHOD

To begin with, an econometric model was formulated to conceptualise the main aim of this chapter. The main objective is to examine the linkage between IFRS adoption and foreign investment, taking into consideration the quality of institutions in the selected sampled countries. The econometric model is a standard foreign capital explained model that is augmented by including the institutional structure. Asiedu (2006) presents a background for the formulation of an FDI explained model for African countries. This is because the model includes the prominent factors that inform the attractiveness of foreign investor into African countries. Asiedu's model is such that foreign investment into African countries is explained by structural, policy and institutional variables. Thus:

$$FDI_{it} = \alpha_1 + \beta \text{EconomicStructurei}_t + \gamma \text{EconomicPolicyi}_t + \delta \text{InstitutionalVariablei}_t + \varepsilon_i \quad (1)$$

This model was extended by including the IFRS adoption variable in Equation (1). Therefore Equation (1) is transformed as:

$$FDI_{it} = \alpha_1 + \partial IFRS\text{Adoption}_{it} + \beta \text{EconomicStructurei}_t + \gamma \text{EconomicPolicyi}_t + \delta \text{GovernanceVariablei}_t + \varepsilon_i \quad (2)$$

This model, at this point, cannot effectively explain the effect of IFRS adoption on FDI when considering corruption. To effectively accentuate this, we first of all estimate the baseline model in Equation 2 at varying thresholds of corruption, to understand how IFRS adoption variable reacts at different levels of corruption. In essence, we expect that at higher thresholds of corruption, the effect of IFRS adoption on FDI becomes insignificant due to the deteriorating effect corruption has on FDI attractiveness. On the other hand, we expect a significant and positive effect of the IFRS adoption variable on FDI when considering lower corruption thresholds.

The variables are defined as follows: *FDI* is used as an indicator of foreign investment. The reason for this is because the OECD definition of foreign investment considers FDI as a major indicator due to its long lasting relationship with the host country's enterprise and the magnitude of influence that usually comes with such relationship[6]. In measuring FDI flow, we follow the approach of Asiedu (2006) and Bandyopadhyay, Sandler and Younas (2014), where FDI is measured as the net inflow of FDI as percentage of GDP. This approach captures the volume of FDI inflow that remains in the country as a percentage of the total income of the country. A second measure was also used for sensitivity checks: net FDI inflow, computed as the net FDI flow without it being considered as a percentage of GDP.

IFRS Adoption variable was measured as earlier defined. A dummy variable structure is applied to capture this variable, where the value 1 was assigned to the year the country's Security and Exchange Commission (SEC) legally adopts the standard and 0 to other years when the standard was not adopted. This approach has received credence in Gordon, Loeb and Zhu (2012).

The variables economic structure and economic policy were included as control variables. The variable economic structure include those variables that reflects the structure of the economy in terms

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the extent of *natural resource dependence* and *market size*. *Natural resource* was measured as the percentage of fuel and minerals in total export, while the *market size* was computed as the value of per capita GDP in constant 2005 USD. The economic policy variables include variables that are influenced by government policies and which can affect the extent of FDI flow to the country. Popular measure of this variable is the *FDI policy* (i.e. total trade to GDP). These control variables are popular covariates included in FDI models in previous studies that have focused on the determinants of FDI flow to African countries (e.g. Asiedu, 2006; Asiedu and Lien, 2011; Anyanwu, 2012).

The variable 'governance structure' is the second main explanatory variable. The variable 'rule of law' was used to capture the governance structure of the country. The reason being that it effectively captures the extent to which economic agents have confidence in and abide by the rules of society, and in particular the quality of contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence. This effectively explains the quality of governance in the respective countries.

Two approaches are applied in understanding corruption control in the respective countries. They are the control of corruption indicator from the World Bank World Governance Indicator (WGI) – by Kaufmann, Kraay and Mastruzzi (2010) and the corruption perception index as reported by the Transparency International. This approach has its advantage over other sources like the Transparency International and International Country Risk Guide (ICRG), especially because of the substantive nature of the methodology that was applied in generating the scores (Rohwer, 2009). More so, Glaeser et al (2004) lend support to the use of WGI measure of corruption other than the ICRG. The measure of corruption, as reported by WGI, is captured as -2.5 (increased corruption) to + 2.5 (reduced corruption). While that of the Transparency International is as defined: where higher values signify reduced corruption and vice versa.

To test the models in this chapter, data was gathered for 49 African countries for which data was available. Small countries – with population that is less than 500, 000 – were excluded from the sample, since idiosyncratic factors are likely to be a major influencer of their economic policies and decisions. For instance, countries like Cape Verde, Mayotte, Sao Tome and Principe, and Seychelles, fall into this category. The full list of the sampled countries are presented in Table 1. The period selected is between 2001 and 2012. The choice of this period was because IFRS came to existence after the formation of IASB in 2001, and 2012 was the latest year for which data was available for the variables of interest. Furthermore, to allow for longer span of variation, the selected period fits this objective.

The data was collected from several sources. The data for the explained variable, economic structure and policy variables, was gathered from the World Bank 'World Development Indicators,' 2012 version. The data for IFRS adoption was gathered from various sources including the IFRS website (www.ifrs.org), Deloitte IASPlus (www.iasplus.com) and World Bank Group Report on Standards and Codes (www.worldbank.org/ifa/rosc). Finally, the data for governance structure and institutions was gathered from the World Bank 'World Governance Indicators'.

A brief descriptive statistics of some of the key variables are also presented in Table 1. The mean net FDI inflow as a percentage of GDP for the entire sample is 4.69 percent. The net FDI flow of the individual countries, scaled by their GDP, is presented in the same Table. On the average, the entire sampled countries have since adopted IFRS for about 2 years. Some countries like Malawi and Lesotho have longer IFRS adoption period. Moving on to the measure of corruption as reported by WGI, the level of corruption in the sampled countries is still high.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The form of the model for this chapter is such that considers IFRS adoption as a global accounting standard that is expected to bring about linkages in the accounting framework across countries. As a result of this, it is expected that the error term in the estimable model (Equation 2) may be contemporaneously correlated across countries as a result of the increasing inter-country similarity in their financial reporting framework. We therefore estimate this relationship using the Panel Corrected Standard Errors (PCSE) procedure, which allows for disturbances across the sample, and that are heteroscedastic and contemporaneously correlated. The PCSE corrects for first-order autocorrelation (AR1) that are specific to each country.

Since we intend observing the behaviour of IFRS adoption on FDI at varying thresholds of corruption, it will be important to consider how the thresholds are determined. In this chapter, we consider the thresholds above and below the median values of the corruption indicators. The reason for this is the size of our sample, which is relatively small and somewhat homogenous – in terms of corruption incidences (see Table 1). This will not allow for the considerations of thresholds at the 25%, 75% and 90%, because the sample countries that fall into these thresholds are minimal and may be affected by the degree of freedom for accurate predictions. As a result of this, we considered only thresholds lower and above the median values of the measures of corruption. In essence, countries lower than the median value for the WGI and CPI measure of corruption are termed high corrupt countries and those higher than the median are termed low corrupt countries.

## 4. EMPIRICAL RESULTS

The empirical results are discussed beginning with the correlation analysis, then followed by the main regression analysis. The robustness checks are then reported afterwards.

### 4.1 Correlation Analysis

The correlation matrix is presented in Table 7 in the appendix. The first panel of the Table for the entire sample and the thresholds of corruption are presented in Panels A-C. The essence being to have a foresight as to the bivariate behaviour of the main variables and to check for the existence of multicollinearity among the explanatory variables. From the Table, the bivariate association between the variables IFRS adoption and FDI as a percentage of GDP was positive in all the Panels except for Panel B, which presents the estimates for countries that are below the median value for corruption. Countries within this category can best be defined as those experiencing high rate of corruption (or poor rate of corruption control). In essence, the result suggest that – in these countries, IFRS adoption was not able to exert a positive influence on FDI inflow. This is unlike countries in Panel C, where the IFRS adoption variable was positively associated with FDI inflow.

Considering the issue of multicollinearity, the behaviour of the variables in all the Panels of Table 7, shows that the explanatory variables were all individually identified. Their behaviours in the model did not show possibilities of being *multicollineared*. This implies that the variables can all be included in a single model and their behaviours will be independent of themselves. Since it is only the bivariate relationships that are presented in Table 7, we may not be able to draw accurate inference as to the behaviour of IFRS adoption and FDI when considering the varying corruption thresholds. Therefore, we go further to present the PCSE estimations in Table 2.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 1. Mean statistics of sampled countries' variables*

| | FDI | Years of IFRS Adoption | Natural Resource | Market Size | FDI Policy | Corruption |
|---|---|---|---|---|---|---|
| **All Sampled Countries** *(Mean)* | 4.69 | 1.58 | 17.52 | 1597.60 | 78.26 | 3.12 |

| Swaziland | 2.24 | 0.83 | 0.80 | 2351.23 | 161.20 | 2.83 |
| Tanzania | 4.63 | 3.75 | 0.95 | 397.65 | 56.98 | 3.04 |
| Togo | 3.39 | 0.00 | 1.27 | 390.42 | 93.08 | 3.43 |
| Tunisia | 3.46 | 0.00 | 12.73 | 3377.84 | 96.56 | 2.45 |
| Uganda | 4.85 | 3.75 | 3.11 | 343.50 | 47.09 | 3.32 |
| Zambia | 6.90 | 3.00 | 0.86 | 667.05 | 75.35 | 3.17 |
| Zimbabwe | 1.50 | 0.83 | 4.49 | 462.78 | 93.24 | 3.84 |

*Note:* FDI was measured as the percentage of net FDI flow to GDP; IFRS Adoption was measured as the number of years post the year the country legally adopts IFRS; Natural resource was measured as the percentage of fuel and minerals in total export; Market size (per capita GDP in constant 2005 USD); infrastructure was measured as number of telephone usage per 100 population; macroeconomic stability was measured as inflation rate and FDI policy was measured as percentage of total trade to GDP. Other variables are as earlier defined.

## 4.2 Main Regression Result

The PCSE estimates are presented in Table 2. For robustness and sensitivity checks, two (2) indicators are included as a measure of FDI inflow, representing the two *Panels* in the Table. *Panel A* of Table 2 represents the FDI as a percentage of GDP, while the *B Panel* represents the aggregate net FDI inflow, which is logged because of the nature of this data[7]. The *Wald* statistics and its significant values are presented in the lower segment of the two panels. The significant values shows the overall fitness of the estimated model; implying the reliability of the estimates. The coefficient and significant values of the covariates are considered to ensure their consistency with theoretical expectations.

In most of the columns, the variables *Natural Resources*, *GDP Growth*, *FDI Policy* and *Governance* follow theoretical predictions (i.e. Morrisset, 2000; Asiedu, 2004; Asiedu, 2006; Asiedu & Lien, 2011; Bandyopadhyay, Sandler & Younas 2014), since they displayed a significant association with the variable 'FDI inflow' to African countries and their signs were consistent as well. This suggest that in the African context, natural resource, the GDP growth rate (measure of economic buoyancy), FDI policy and governance are important determinant of the inflow of foreign investment. The infrastructural development 'infrastructure' displayed an inconsistent behaviour in most part of the columns in both *Panels* of Table 2. Perhaps, we infer that the extent of the development of complementary factor input like infrastructure dissuades the extent of FDI inflow into African countries. This is contrary to the findings by Asiedu (2006) and Asiedu and Lien (2011), who found a positive association between the two variables. However, to ensure that our result is not affected by the inclusion of this variable, we go further to present the estimations (in Table 2) when this variable is excluded from the model.

Note: the columns 'All' imply the estimation of the baseline model without considerations of the different thresholds; '*<=3.18* and *<=27*' include the estimations below the median value for corruption when considering the definitions by World Governance Indicator – WGI, and by Transparency International Corruption Perception Index – CPI. On the other hand, '*>3.18* and *>27*' imply the estimates above the median value for both WGI and CPI. In essence, the median for WGI and CPI are 3.18 and 27 respectively.
The superscripts *, **, and *** imply the significant values at 1, 5 and 10 percent respectively. The values in parenthesis are the probability values.

Moving on to the variable of interest – *IFRS Adoption* – Table 2 reports that when considering the effect of IFRS adoption on FDI (see the columns identified as 'all' in *Panel A* and *B*) irrespective of the prevalence of corruption, the result reveal that there is a positive effect on FDI inflow. This result supports the findings of Gordon, Loeb and Zhu (2012) and Efobi (2015b), who observed that IFRS adoption has a positive influence on the volume of FDI inflow. In essence, the adoption of IFRS improves the information environment in the adopting country and makes it easier for parent firms to monitor their subsidiaries, which raises their incentives to increase their investment capitals. The findings we will like to highlight, however, are the behaviours of IFRS adoption on FDI when considering the extent of corruption in the sampled African countries.

As earlier argued, we expect that the extent to which IFRS adopting country is able to attract FDI is highly dependent on the extent of institutional framework within the country. In this case, we are particular about the prevalence of corruption and substantial argument have earlier been presented on the reasons why this form of institutional framework is most important in Africa. Our result in both *Panels* of Table 2 reveals that in countries with higher prevalence of corruption (i.e. countries that are below the median value of corruption for WGI and CPI), IFRS adoption has either an insignificant effect on FDI flow or at best the relative effect is negative. However, when considering the countries with lower prevalence of corruption (i.e. countries that are above the median score of corruption for WGI and CPI),

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the IFRS adoption variable were consistently having a positive effect on FDI inflow. This suggest that in these countries, the adoption of IFRS will most likely attract more FDI than in countries with higher prevalence of corruption. It is important to highlight that in this sample, the effect of some of the covariates were absorbed and their levels of significance were no longer visible.

Table 3 presents the regression analysis to check the behaviour of the IFRS adoption variable by re-estimating the model when the *infrastructure* variable was excluded from the model. As earlier pointed out, the infrastructure variable did not follow theoretical expectation and it is likely that its presence in the model may disturb the behaviour of the other explanatory variables, including the IFRS adoption variable. From the Table, it is evident that IFRS adoption had a significant and positive impact on FDI flow in the columns that represents better corruption control, compared to those with lower corruption control. In essence, the IFRS adoption variable was not positive and significant in the columns that includes countries with lower than median values for the *WGI* and *CPI* measures of corruption. Contrary result that are consistent with the outlook in Table 2 was observed for countries with corruption values that are higher than the mean value for the *WGI* and *CPI* measures of corruption. Therefore, irrespective of the inclusion (or exclusion) of infrastructure variable, IFRS adoption will have a better impact on FDI in countries with better control of corruption (or lower incidence of corruption).

An important feature of countries with higher incidence of corruption is that the transaction cost of doing businesses is higher compared to countries with lower prevalence of corruption. Some of these transaction cost can be seen in the risks associative with expropriation, cost of investment, such as licensing, securing property and land, cost of accessing public services and utilities (christened cost of doing business), among others. In such a situation, a foreign investment that hitherto was attracted to invest in an IFRS adopting country, will incur a higher opportunity cost when the institutional framework in such a country is low. These investors would rather prefer to invest in countries with better institution (reduction of corruption) and that have adopted IFRS.

## Further Robustness Checks

This sub-section further checks the robustness of our results. Three main items are likely to play central roles in the determination of our results. The first is the effect of the disturbances that are likely to occur in the FDI trend as a result of the inclusion of the period of financial crisis in the sampled time period. Second is the consideration of other measures of governance, since the measure of governance included is an important variable that determines the behaviour of FDI flow in empirical analysis. Third is the control of the legal origin of the sampled countries, which may likely inform the outlook of our result. We devote some space to each of these variables by discussing how they may likely affect our result and then consequently, observe consistency of the results when considering each of these variables.

### Financial Crisis Dummy

The global financial crisis was triggered by the United States housing bubble in 2007 and soon after, in September 2008, the financial turmoil erupts and contagion over the European Union's member countries escalated into the named global financial crisis. The effect of the crisis include the collapse of asset markets, decline of industrial productivity and employment and increase in government debt as a result of decline in fiscal inflows (see Reinhart & Rogoff, 2009). Consequently, to mitigate this crises, some of the prosperous countries who participated in development assistance to developing countries

Note: the columns 'All' imply the estimation of the baseline model without considerations of the different thresholds; '*<=3.18* and *<=27*' include the estimations below the median value for corruption when considering the definitions by World Governance Indicator – WGI, and the Transparency International Corruption Perception Index – CPI. On the other hand, '*>3.18* and *>27*' imply the estimates above the median value for both WGI and CPI. In essence, the median for WGI and CPI are 3.18 and 27 respectively.
The superscripts *, **, and *** imply the significant values at 1, 5 and 10 percent respectively. The values in parenthesis are the probability values.

and whose nationals/ investors were engaged in foreign investments, took fiscal austerity measures and some extent of investment repatriations. Atleast, it was reported that FDI flows decreased by 10 percent in 2008 and the foreign financial flow that sustained developing countries development capital were drastically affected as a result of the economic recession in 2008 and 2009 (UNCTAD, 2009; Das & Dutta, 2012; Osabuohien & Efobi, 2014).

The effect of this crisis on our result is that there may be disturbances that are contained in the dataset as a result of the inclusion of the period of the financial crisis (2007-2009) in our dataset. Therefore, to check whether our results are sensitive to the inclusion of this period, we created a dummy called the *financial crisis* dummy. A similar approach has been used by Osabuohien and Efobi (2014). This dummy was then included in the estimations that are reported in Table 2. The main function of this variable in the model is to control for the effect of the financial crisis that are typical with the years 2007-2009, which may not be captured by the other control variables.

Table 4 reports the robustness check result that examines foreign investment as a percentage of GDP (see *Panel A* in Table 4) and the logarithm value of FDI (see *Panel B* in Table 4): we find that the behaviour of IFRS adoption (our main explanatory variable) are essentially the same as those presented in Tables 2 and 3. In particular, IFRS adoption is found to exert a positive and significant effect on FDI inflow in countries with lower corruption (or higher control of corruption), and the result becomes insignificant and to some extent, negative, when considering the impact of IFRS adoption on FDI in countries with higher corruption. In essence, we surmise that the result is not affected by the disturbances caused in the trend of FDI as a result of the financial crisis.

Note: the columns 'All' imply the estimation of the baseline model without considerations of the different thresholds; '*<=3.18* and *<=27'* include the estimations below the median value for corruption when considering the definitions by World Governance Indicator – WGI, and the Transparency International Corruption Perception Index – CPI. On the other hand, '*>3.18* and *>27*' imply the estimates above the median value for both WGI and CPI. In essence, the median for WGI and CPI are 3.18 and 27 respectively.
The Pairwise correlation was first carried out to ensure that the financial crisis dummy was not multicollineared with any of the other explanatory variables. This was not reported for space.
The superscripts *, **, and *** imply the significant values at 1, 5 and 10 percent respectively. The values in parenthesis are the probability values.

## Other Measures of Governance

In as much as we controlled for governance in model (2), by including the indicator - rule of law, it is important that we draw attention to some of the shortcomings of using one indicator to represent this complex concept that has faced many criticism. The concept "governance" is a framework that shows the extent of institutional development in a country, which aims at protecting the rights of economic agents and reducing economic losses from human interactions. Noting the importance of this concept in studying economic phenomenon (as earlier discussed in previous section), studies have warned that the concept cannot be adequately measured by relying on some secondary databases for which the methodology in explaining its computation cannot be readily verified. For instance, the construct validity of some of these measures, regarding their ability to measure what they purport to measure, have received heavy criticism by authors such as Knack (2006), Rohwer (2009), Thomas (2010), among others. As a result of this, empirical models that include these measures may likely be confronted with the possibility of bias estimates. However, the prevailing conclusions in some of these studies is that each measure of

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

governance by different sources have their relative strengths and weaknesses, and it will be important to take account of this fact when applying the measures for policy research.

One possible way of reducing the likelihood of presenting a biased estimate is to use alternative measures of governance, and check if the results still remains consistent. This approach have been favoured by Asiedu (2006), Asiedu and Lien (2011) and Efobi (2015a). In this chapter, an alternative measure of governance is applied: it is the use of the measure of democracy, which is the average of the Freedom House's political rights and civil liberties[8]. Table 5 reports the result when this measure of governance is included in the empirical model (i.e. Equation 2).

From Table 5, the result shows that when including another measure of governance, the effect of IFRS adoption on FDI still remained consistent across the different thresholds of the prevalence of corruption. For countries with lower prevalence of corruption (i.e. higher control of corruption and CPI score), the effect of IFRS adoption on FDI remained consistently positive – just as it is for Tables 2-4. Likewise, for countries with higher prevalence of corruption (i.e. lower corruption control and CPI score), the effect of IFRS adoption on FDI remained insignificant. Therefore the result is robust and not driven by the type of governance measure included in our empirical model.

Note: the columns 'All' imply the estimation of the baseline model without considerations of the different thresholds; '*<=3.18* and *<=27'* include the estimations below the median value for corruption when considering the definitions by World Governance Indicator – WGI, and the Transparency International Corruption Perception Index – CPI. On the other hand, '*>3.18* and *>27*' imply the estimates above the median value for both WGI and CPI. In essence, the median for WGI and CPI are 3.18 and 27 respectively.
The Pairwise correlation was first carried out to ensure that the financial crisis dummy was not multicollineared with any of the other explanatory variables. This was not reported for space.
The superscripts *, **, and *** imply the significant values at 1, 5 and 10 percent respectively. The values in parenthesis are the probability values.

### Controlling for the Legal Origin of Sampled Countries

The legal origin of the IFRS adopting country connotes the existent jurisdictional differences that explains some fundamental structures that affects investment within the country. These differences are seen in the structure of the legal system, which explains how economic and social life should be organised (Asongu, 2011). The legal origin also explains the legal protection of outside investors and limits the risk of expropriation. Empirical documentations (e.g. La Porta et al, 1997, 1998; La Porta et al, 2008) suggest that some legal origin that are tied to the English Common Law are more protective of outside investors than the civil law- particularly the French civil laws. More so, some legal jurisdiction – like the civil law, have more government involvement in the market, thereby resulting to higher incidences of corruption and larger unofficial economy (La Porta et al, 2008). From yet another stand point, countries with common law legal structure, have lower formalism of judicial procedures and higher judicial independence, than the countries with civil law legal structure (Djankov et al, 2003; La Porta et al, 2004; Osabuohien, 2011).

Noting these issues, a regression analysis that does not control for the legal origin of countries will likely be omitting an important variable that is supposed to account for the behaviour of foreign investment as a result of their sensitivity to the extent of contract enforcement and security of property rights. Foreign investors consider these issues as an important determinant of the direction of FDI flow (Busse and Hefeker, 2007; Asiedu and Lien, 2011). Following Asongu (2014) approach, we classified the legal origin of our sample into English Common Law "*English_Law*" as 1, while 0 otherwise.

From Table 6, the legal origin variable was positive in most of the column, suggesting that legal origin that are tied to the English common law had a positive influence on the volume of FDI. However, the significant values are not verified except for some of the columns (see columns 2 and 3 in Panel B). We focus on the main variable of interest (i.e. IFRS adoption), From the Table, the signs and significant values of the IFRS adoption variable remained consistent like it has been in the previous Tables. This suggest that the effect of IFRS adoption on FDI does not change even when the legal origin of the sampled country are controlled for. Hence, we conclude that the results conform to our hypothesis irrespective of the checks conducted and the approach of measuring foreign investment.

## CONCLUSION

This chapter investigates the impact of IFRS adoption on FDI when considering the prevailing institutional structure (or corruption control) of African countries. We apply IFRS adoption data for forty two (42) African countries for the period 2001-2012. More so, alternative measures of FDI was included and further robustness checks to ensure the consistency of our estimates. This chapter distinguishes the effect of IFRS adoption on FDI across sampled countries depending on the level of corruption control in the country. Put differently, this effect was tested on countries with low corruption control (i.e. high prevalence of corruption) and countries with high corruption control (i.e. low prevalence of corruption). The result suggest that in countries with high corruption control, the incidence of IFRS adoption will have a higher and positive effect on FDI flow. This was contrary when considering countries with lower corruption control. This result validates the conceptual submission of Wysocki (2011) that there is a complimentary impact of institutional development on IFRS effect on FDI.

| Prob. Value | 0.000 | 0.000 | 0.000 | 0.000 | 0.001 | 0.000 | 0.000 | 0.000 | 0.000 | 0.000 |

Note: as usual, the columns 'All' imply the estimation of the baseline model without considerations of the different thresholds; '*<=3.18* and *<=27*' include the estimations below the median value for corruption when considering the definitions by World Governance Indicator – WGI, and the Transparency International Corruption Perception Index – CPI. On the other hand, '*>3.18* and *>27*' imply the estimates above the median value for both WGI and CPI. In essence, the median for WGI and CPI are 3.18 and 27 respectively.
The Pairwise correlation was first carried out to ensure that the financial crisis dummy was not multicollineared with any of the other explanatory variables. This was not reported for space.
The superscripts *, **, and *** imply the significant values at 1, 5 and 10 percent respectively. The values in parenthesis are the probability values.

This result has diverse implications for African countries. The desire to adopt IFRS in order to improve the financial statement reporting framework, and with the utmost intention of attracting foreign investors will not be effective by disregarding the underlining role of improved institutions (in the form of corruption control). There is the need for policies to address the issue of corruption control in African countries. This, of course, will require the government commitment to setting up structures that discourages rent-seeking behaviour of any form. In essence, just as most African government are desiring to address the state of financial reporting in their countries by adopting IFRS, it should not be assumed that the state of corruption in these countries does not matter.

This chapter has suggestions for future enquiries. The main area of critical focus is to examine a case study type of inquiry, with objectives that are streamlined on country specific cases. The aim of such enquiry should be to ensure, and validate, the findings from this study. In essence, the main enquiry will be to observe whether the result remains the same when focusing on case studies of African countries that have adopted IFRS.

## ENDNOTES

1. Foreign investment, and foreign capital are used interchangeably throughout the chapter.
2. Wysocki (2011) noted that more empirical emphasizes should be placed on some unanswered questions about the structure, types, causation, interdependency and efficiency of observed accounting framework like IFRS on economic outcomes (e.g. FDI) and how institutional structures in the IFRS adopting country interplays.
3. See http://www.ifrs.org/news/features/Pages/africa-embraces-ifrss.aspx
4. See Wysocki (2011); Gordon, Loeb and Zhu (2012).
5. Asiedu (2006) for more discussion of the role of FDI in improving development resources in Africa.
6. OECD (2014) Define foreign investments as cross-border investment by a resident entity in one economy with the objective of obtaining a lasting interest in an enterprise resident in another economy. The lasting interest implies the existence of a long-term relationship between the direct investor and the enterprise and a significant degree of influence by the direct investor on the management of the enterprise. Ownership of at least 10% of the voting power, representing the influence by the investor, is the basic criterion used.
7. The aggregate FDI inflow was presented in Billion USD.
8. Political right measures the extent to which a particular country allows for the freedom of the electoral process, political pluralism and participation, as well as the presence of a functioning government. On the other hand, the civil liberty variable captures the freedom of expression and belief, freedom to join an association and organization, the prevalence of the rule of law and other forms of personal autonomy and individual rights.

# Chapter 25
# Evaluating the Role of Three Basic Factors of Prospect Theory in Decision Making: An Empirical Study

**Evanthia K. Zervoudi**
*Athens University of Economics and Business, Athens, Greece*

## ABSTRACT

*The main aim of this paper is to empirically evaluate the role of three significant factors of the Prospect Theory: the S-shaped value function, the loss aversion, and the distortion of probability, in decision making. In order to do this, a general behavioral reward-risk model is firstly setup and an empirical evaluation about the role of each of these factor, separately and in interaction, on the optimal solutions of the problem follows. For the analysis, well known US equity portfolios consisting by stocks listed in NYSE, AMEX, and NASDAQ formed on investment style are employed. The findings indicate that agents differentiate their behavior according to their type of preferences and their loss aversion level but they seem to always prefer high positively skewed assets such as small and value stocks. The attractiveness of positively skewed assets is re-enforced when probability distortion is introduced in the model. The introduction of probability distortion also affects the optimal perspective values of the problem increasing significantly their magnitude. After that, results show that as loss aversion increases agents tend to follow more conservative strategies, with and without probability distortion, while the value functional form has also its role in the model; bounded value functions as the negative exponential function drives agents to more conservative behaviors while unbounded value functions as the piecewise power function give the incentive to agents to undertake great risks and follow more aggressive strategies. The examination of the interaction of these factors indicate that the combination of an unbounded value functional form with a large loss aversion index may reduce agents' aggressiveness and limit (but not alter) the value functional form effect on optimal solutions.*

## 1. INTRODUCTION

For several years, Markowitz's (1952a) mean-variance rule was widely used in portfolio decision making analysis. This rule suggests a tradeoff between two simple but powerful criteria, the reward (mean) and the risk (variance); agents choose maximum mean portfolios under the constraint that the variance will remain below a specific risk level, or alternatively minimum variance portfolios under the constraint that the mean will remain above a specific reward level. Note that this rule concerns only totally risk averse investors whose preferences are described by a totally concave utility function while it assumes normally distributed asset returns. In practice, risky asset returns are usually not normally but positively skewed distributed while investors are not totally risk averse.

Kahneman and Tversky (1979) proposed the Prospect Theory (PT), as an alternative decision making theory that revolutionized the classical financial theories. In PT, agents behave rationally (prefer more than less) but they are neither totally risk averse nor totally risk seeking; more specifically investors tend to be risk averse for returns considered as gains and risk seeking for returns considered as losses. Gains and losses are determined by a reference point depending on the formulation of the offered prospects and the expectations of the decision maker; in the original version of Prospect Theory (Kahneman and Tversky, 1979) the most representative preference function is an S-shaped value function which is concave above the reference point (for gains) and convex below the reference point (for losses). This type of preferences, the S-shaped function, is characterized by two important parameters: the reference point (rp) and the loss aversion coefficient $\beta$. Another important issue in Prospect Theory is the probability distortion, i.e. the observation that investors do not weight outcomes linearly, but they tend to overweight small probabilities and underweight large and moderate probabilities. Several papers (Karmarkar (1978), Bleichrodt, Pinto and Wakker (2001), Nawrocki and Viole (2014) among others) are referred on how the use of Prospect Theory could improve the descriptive use of Expected Utility by taking into account issues as the probability distortion and the change of investors' risk attitude from gains to losses that the Expected Utility cannot capture.

This paper empirically evaluates the role of the three basic factors of Prospect Theory (PT): the value functional form, the loss aversion, and the probability distortion, within a PT framework. For the empirical analysis, are employed well known US equity portfolios formed on investment style, consisting by stocks listed in NYSE, AMEX, and NASDAQ, for the period between 1927 and 2013. The paper contributes to the relevant literature in a number of ways. Firstly, in order to examine how the type of agents' preferences affects decision making, two value functional forms, the piecewise power function and the negative exponential value function, are empirically evaluated and compared; these two value functions represent different types of investors while they have different properties that affect the analysis in a separate way. Secondly, in order to examine the effect of loss aversion on optimal solutions, some of the most popular loss aversion indices in the literature are employed; the choice of each of the loss aversion indices has been done in an appropriate way so as to be consistent to the value functional form under consideration. In this way, the paper arrives at general conclusions about how risk and loss aversion interact and how this interaction may affect the optimal asset allocations; the robustness of results are examined in view of loss aversion variations.

Thirdly, in order to examine the impact of the probability distortion on optimal solutions, two methods of weighting outcomes are used: (1) the classical linear probability weighting where the objective probabilities are used, as in the classical Expected Utility Theory (no probability distortion), and (2) the objective probabilities are replaced by decision weights using three different probability weighting

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

functions. The reason of employing three different probability weighting functions is to ensure that the impact of the probability distortion on the optimal solutions (if any) is not due to the specific weighting functional form that is used for the probability distortion.

Fourthly, having built the behavioral model, the optimization process follows. The value functions of the model are non-smooth; they have a kinked point at the reference point because of the loss aversion index that makes the value function steeper for losses than for gains; for this purpose smoothing techniques are used so as to get around the reference point where the value functions are non-differentiable. Moreover, the value functions are non-quasi-concave which means that the first order conditions are necessary but not sufficient to describe a global maximum. Such a problem may only have local maxima that are found and given in the present paper through Matlab codes.

To anticipate the results, the authors find that positively skewed assets (such as small and value stocks) are very attractive to PT agents, for all value functional forms, and for any loss aversion index. This clear preference of PT investors to positively skewed assets is more pronounced when probability distortion is introduced to the model. Probability distortion also affects the optimal perspective values increasing significantly their magnitude; the impact of probability distortion on the optimal solutions is independent of the using probability weighting functional form. Moreover, as loss aversion increases agents tend to follow more conservative strategies for both value functions; although the bounded negative exponential value function results to a more conservative behavior than the unbounded piecewise power value function that gives to agents the incentive to undertake great risks and thus follow more aggressive strategies.

The rest of the paper is organized as follows: section 2 presents the models, section 3 the data and the methodology, while section 4 concludes the paper.

## 2. THE MODELS

### 2.1. The General Setup

Prospect Theory suggests that investors evaluate investments based on the changes of wealth rather than on the final total wealth as in Expected Utility Theory (Levy and Levy, 2002); this result is also in accordance to Markowitz (1952a, 1952b). Gains and losses are determined by a reference point (rp) where the value function is equal to zero. If returns are greater than the reference point ($r>rp$) then they are considered as gains and if they are smaller ($r<rp$) then they are considered as losses. This reference point is the first important parameter of the value function. In this paper, as reference point is used the risk-free rate, $rp = 3.5\%$ (see data and methodology section). The second important parameter of a value function is the loss aversion coefficient; the initial estimation of Tversky and Kahneman (1992) for this loss aversion parameter was 2.25.

The value function in terms of gains and losses incorporating the loss aversion index β is formulated as follows:

$$U(x) = \sum_{t=1}^{T} \left( v\left( \max\left(0, x_t - rp\right)\right) * p_t \right) - \beta \sum_{t=1}^{T} \left( v\left( \max\left(0, rp - x_t\right)\right) * p_t \right) \forall \boldsymbol{x} \in X \quad (1)$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In (1), *rp* is the reference point. The function $v: X \to \mathbb{R}$ is a continuous, strictly increasing function on $\mathbb{R}$ and twice differentiable on $\mathbb{R} / \{rp\}$, strictly concave for gains and strictly convex for losses with $v(rp)=0$. The evaluation of assets is done by investors according to gains and losses. The first part concerns the positive deviations of assets' returns from the reference point (gains) and it does not take into account the losses. This part of the value function is the reward measure $\mu$. The negative deviations of assets' returns from the reference point (losses) are given by the second part and it does not take into account the gains. This part of the value function is the risk measure $\rho$ and is multiplied by a loss aversion coefficient β which makes the value function steeper for losses than for gains (losses are more painful for investors than the pleasure they take from similar size gains).

PT also suggests the objective probabilities to be replaced by decision weights $w(p)$ that capture the investors' tendency to overweight small probabilities and underweight large and moderate probabilities i.e. probability distortion phenomenon. Generally, in PT framework, outcomes are transformed through an *S*-shaped value function *v*, probabilities are transformed through a probability weighting function *w*, while values and decision weights are combined through a rank-dependent weighting scheme.

Using these functions and incorporating the loss aversion index in the risk part, the Prospect Theory Preferences are formulated as following:

$$V(x) = \sum_{t=1}^{T} \left( v\left(\max\left(0, x_t - rp\right)\right) * \omega\left(p_t\right)\right) - \beta \sum_{t=1}^{T} \left( v\left(\max\left(0, rp - x_t\right)\right) * \omega\left(p_t\right)\right) \tag{2}$$

In (2) the decision weights $w(p_i)$ are derived by a non-linear monotonic transformation applied on the objective probabilities *p*. This transformation function *w* is a continuous non-decreasing function $w$: $(0,1) \to [0,1]$ with $w(p)>p$ for small probabilities *p* and $w(p)<p$ for large probabilities *p* while $w(p)=p$ for $p = 0$ and $p = 1$. Having defined the basic components of the PT, specifications of the *S*-shaped value function, the probability weighting function and the loss aversion coefficient are presented thereafter.

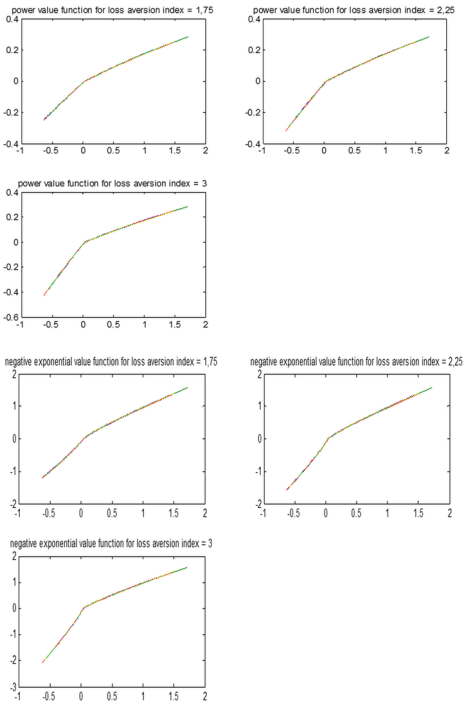
## 2.2. Value Function

As regards to the *S*-shaped value function, the change in the curvature of the function and specifically the concavity for gains and the convexity for losses, captures the asymmetric risk aversion of Prospect Theory investors; agents are not totally risk averse but their risk attitude changes from gains to losses i.e. they tend to be risk averse for gains and risk seeking for losses. The *S*-shaped functional form also reflects the psychological phenomenon of diminishing sensitivity, i.e. the impact of a change diminishes with the distance from the reference point. Another basic characteristic of the S-shaped value function is that is non-smooth; it has a kinked point at the reference point due to the multiplication of the loss part of the value function with a loss aversion parameter. The *S*-shaped property holds for every initial wealth level.

In this paper two different specifications are employed. The first one is the piecewise power value function of Kahneman and Tversky (1979) with equal curvature parameters for losses and gains, i.e. $\alpha^{+} = \alpha^{-} = 0.88$. More specifically:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$V(x)=\begin{cases}(x-rp)^{\alpha^+} & if\ \ x\geq rp\\ -\beta(rp-x)^{\alpha^-} & if\ \ x<rp\end{cases} \tag{3}$$



In (3), $\beta$ is the loss aversion index. The value function $V$ has a kinked point at the reference point ($rp$) because of $\beta > 1$ that makes the value function $V$ steeper for losses than for gains while it is smooth elsewhere.

Then the piecewise negative exponential value function is employed:

$$V(x)=\begin{cases}1-e^{-b(x-rp)} & if\ \ x\geq rp\\ \beta\left(e^{b(rp-x)}-1\right) & if\ \ x<rp\end{cases} \tag{4}$$

This function has been suggested as an appropriate functional form for financial problems; for instance De Giorgi and Hens (2006) indicate that the St. Petersburg paradox (see Blavatsky (2005) among others) and every paradox that arises from an infinite expected monetary value can be solved by using such a functional form. This may be so because the negative exponential value function is bounded in the sense that the marginal function decreases fast enough, and thus it ensures a finite expected monetary value; the optimal portfolios resulting by a problem with a negative exponential value function are definitely bounded (see Figure 1).

*Figure 1. Value functions for various loss aversion coefficients*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## 2.3. Probability Distortion

In classical Expected Utility Theory (EUT), each outcome of the problem is weighted linearly by a probability $p$ that is objective and common for all investors. However, experimental findings show that investors do not use to weight outcomes linearly but they tend to underestimate large and moderate probabilities and overestimate small probabilities. Such findings are the common ratio effect (Allais, 1953) referred to the observation that the more risky of two simple prospects becomes more attractive when the winning probability is reduced equally (by equal proportion) for both prospects, and the common consequence effect that defines a class of choice problems in which choices shift as probability is moved from one common consequence to another. The main point in Allais paradox is that the independence axiom of Expected Utility Theory is violated. The common ratio effect has been largely studied in the papers of Kahneman and Tversky (1979), Karmarkar (1979), Wu and Gonzalez (1996) and Prelec (1998) who suggested to replace objective probabilities by decision weights $w(p)$ which are subjective for each agent and proposed some basic properties that an appropriate weighting function must meet (regressive, asymmetric, S-shaped and reflective). In this paper three different weighting functional forms are employed in order to extract the decision weights $w(p)$: the one-parameter probability weighting function of Tversky and Kahneman (1992), the two-parameter weighting function of Wu and Gonzalez (1999) and the two-parameter weighting function of Lattimore, Baker and Witte (1992).

More specifically, the Wu and Gonzalez (1999) probability weighting function is:

$$w(p) = \frac{p^{\gamma}}{\left(p^{\gamma} + (1-p)^{\gamma}\right)^{\delta}} \tag{5}$$

In (5) $\gamma$ is the curvature parameter (an index of discriminability) and $\delta$ is the elevation parameter (an index of attractiveness). Discriminability has to do with the way that individuals discriminate probabilities in a probability interval (0,1) and it is strictly related to the notion of diminishing sensitivity i.e. people tend to be less sensitive to probability-changes as they move away from the bounds $p = 0$ and the $p = 1$. The principle of diminishing sensitivity supports a reverse S-shaped weighting functional form that will be firstly concave and then convex. On the other hand, the attractiveness is related to the underweighting and the overweighting of probabilities and determines the position of the weighting function relatively to the identity line. Using aggregate data, Wu and Gonzalez (1996) suggest the following estimations for the curvature and the elevation parameters: $\delta = 1.565$ and $\gamma = 0.721$.

For $\delta=1/\gamma$ the Wu and Gonzalez (1999) probability weighting function becomes the well-known weighting function of Tversky and Kahneman (1992):

$$w(p) = \frac{p^{\gamma}}{\left(p^{\gamma} + (1-p)^{\gamma}\right)^{1/\gamma}} \tag{6}$$

This probability weighting function is a nonlinear reverse *S*-shaped probability weighting function. Such a transformation deflates the large probabilities and inflates the small probabilities. The parameter that determines the overweighting of small probabilities and the underweighting of large probabilities is

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the parameter *γ;* this parameter must be greater than 0.27 in order to ensure the continuity of the weighting function (Ingersoll, 2008). Tversky and Kahneman (1992) estimate this parameter as $\gamma \approx 0.65$ that keeps the new "corrected" probabilities close to the objective ones; it is also greater than the γ critical = 0.279 which implies that the weighting function is monotone and the resulting decision weights are positive.

The Lattimore, Baker, Witte (1992) two-parameter probability weighting function is given by:

$$w(p) = \frac{\delta p^{\gamma}}{\delta p^{\gamma} + (1-p)^{\gamma}} \tag{7}$$

Wu and Gonzalez's estimations for the function parameters are: $\delta = 0.84$ and $\gamma = 0.68$.

## 2.4. Loss Aversion

Loss aversion describes the psychological phenomenon according to which investors are much more sensitive to losses than to gains and shows the unwillingness of investors to accept mixed prospects. The loss aversion is expressed by a loss aversion index $\beta$ that gives the tradeoff between gains and losses. One of the most used loss aversion indices is that of Kahneman and Tversky (1979) which is equal to 2.25 for small values of losses and gains, and implies that losses are almost twice painful for investors than the pleasure they take from same-size gains. He and Zhou (2011) in their paper also study the agents' loss aversion attitude but for large values of losses and gains and they introduced a new measure of loss aversion, the Large Loss Aversion Degree (LLAD). They conclude that risk exposure decreases monotonically as the LLAD value increases while the Kahneman and Tversky's (1979) estimation of 2.25 is a good approximation for such a loss aversion index.

In this paper, three of the most popular loss aversion indices and their estimations are employed (always in consistency to the value function under consideration). More specifically, the first loss aversion coefficient is based on the definition of Kahneman and Tversky (1979) and it can be expressed as the mean or the median of

$$\beta = \frac{-u(-x)}{u(x)}$$

for $x>0$. This definition may be applied without problem to any utility function among which the piecewise-power function with equal curvature parameters for gains and losses, and the piecewise negative exponential value function that are employed in this paper.

Another loss aversion coefficient used in this paper is the

$$\beta = \frac{\inf\left(-u(-x)/u(x)\right)}{\sup\left(u(y)/y\right)}$$

for $x,y>0$ that is based on the definition of Neilson (2002). Bleichrodt et al. (2001) provide two estimations for this loss aversion coefficient: 2.17 and 3.06, using two different datasets. The first estimation is

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

approximately the same to that of Kahneman and Tversky (2.25), so the second estimation that implies a high loss aversion coefficient (around 3) will be employed.

Finally, Köbberling and Wakker (2005) support in their study that the loss aversion is the main factor of risk aversion which means that differences in loss aversion may lead to differences in risk attitude. The loss aversion index

$$\beta = \frac{\lim_{x \to rp^{+}} u'(x)}{\lim_{x \to rp^{-}} u'(x)} \geq 1$$

(at the reference point (rp)) that they propose provides an exchange rate between gains and losses in utility units while it drives to a decomposition of risk attitude into three components: utility, probability weighting, and loss aversion making prospect theory easier to analyze. The derivatives of the index exist and they are positive and finite, since the value function is non-differentiable only at the reference point (*rp*) and differentiable elsewhere. However, this definition is a local definition in the sense that the derivatives of the utility function concern a specific point, the reference point. Such a definition cannot be applied on constant relative risk aversion (CRRA) utilities, such as the power utility functions, with reference point equal to zero because at this point the utility function has extreme derivatives (zero or infinity). Note that this is not the case of this paper; the employing reference point in this paper is the risk-free rate that is different to zero ($\neq 0$). The definition can be applied on constant absolute risk aversion (CARA) utilities as exponential utilities, without problem. The estimations of Booij and van de Kuilen (2009) for this loss aversion coefficient, using low and high monetary amounts, are 1.74 and 1.79 respectively.

The main purpose of using these three loss aversion coefficients is to examine the impact of a change in loss aversion attitude on the optimal solutions. Each of these loss aversion indices represents a specific investor's type: a great loss aversion coefficient (around 3) concerns a "too loss averse" investor, a median loss aversion coefficient (2.25) concerns to a "moderately loss averse" investor and a small loss aversion coefficient (of about 1.75) concerns a "less loss averse" investor. Note that these estimates are consistent with the estimates of Abdellaoui, Bleichrodt and Paraschiv (2007) and Abdellaoui, Bleichrodt and l'Haridon (2008) who found a mean loss aversion estimation of 1.72 using exponential utilities, and an estimation of 2.7 to 2.9 using power utilities.

## 3. DATA AND METHODOLOGY

For the empirical analysis, data on US style portfolios (stocks listed in on the NYSE, AMEX, and NASDAQ) are employed. More specifically, the sample consists of ten canonical decile portfolios formed on size (market equity, ME) and ten decile portfolios formed on value (Book to Market Equity ratio, B/M) expressed in annual real returns for the period 1927-2013 (87 years). All data are available to Kenneth French's online data library.

Table 1 presents descriptive statistics of the sample portfolios; note that there seems to be an inverse relation between firm size and stock returns; that is, the smaller the market capitalization of the firms included in a portfolio the larger the portfolios' return. Also, for portfolios formed on B/M ratio, the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

higher the B/M ratio the higher the average return, i.e. value stocks seems to outperform growth stocks. Small and value stocks seem to have higher variance /standard deviation than large and growth stocks, indicating that higher returns may be a compensation for the higher variance. Note, however, that small and value stocks also have positive skewness while large and growth stocks are negatively skewed. This is a quite desirable feature of assets especially for Prospect Theory investors. After that, the maximum return that small and value stocks may offer is in excess of 100% and too high relatively to the maximum return of large and growth stocks. This fact may enhance the belief of PT investors that the positively skewed and more profitable small and value stocks seems to be a better investment than the negatively skewed and less profitable large and growth stocks.

*Table 1. Descriptive statistics*

Note: The table presents descriptive statistics (average, variance, standard deviation, skewness, kurtosis, min, max and Sharpe ratio) for the annual real returns of US style portfolios, i.e. ten canonical decile portfolios formed on size (market equity, ME) and ten decile portfolios formed on value (Book to Market Equity ratio, B/M). All data are available from Kenneth French's online data library. The sample period is from 1927 to 2013 (87 years). The Sharpe ratio is the ratio of mean to standard deviation; quite important in the mean-variance analysis where the investment with the highest Sharpe ratio will be preferred.

These findings resulting by the descriptive statistics of the portfolios under consideration, are directly related to the analysis of the present paper; they illustrate investors' preferences to specific assets such as small and value stocks and B/M portfolios and contribute to the explanation of the results below, in combination with the behavioral factors of the PT models and the technical analysis. As results of the paper show, small and value stocks tend to be strictly preferred by PT agents over the large and growth stocks; a first explanation for this behavior has to do with the high returns that these assets offer and their positive skewness as the Table 1 shows. Moreover, B/M ratio portfolios seem to gain ground over the size portfolios as the loss aversion index increases; based on the descriptive statistics this may be justified by the fact that B/M portfolios offer satisfying rewards but they are less risky choices than size portfolios.

In order to formulate the asset allocation problem, as $\boldsymbol{\lambda}$ is considered the vector of the assets' weights in the investor's portfolio; *N* assets are assumed with $\lambda_i$ i = 1, …, N the weight of each asset in the agent's portfolio. The constraints imposed in the model are the budget constraint, i.e. an agent can purchase assets whose prices are less or equal to his wealth in order to maximize his welfare $\left(\sum_{i=1}^{N}\lambda_t = 1\right)$, and the short-selling constraint, i.e. the weights of portfolios assets must be non-negative ($\lambda_i \geq \forall i$). In this way, the case of infinite leverage and a great risk exposure are avoided.

Hence, the asset allocation model is formulated as follows:

$$\max_{\lambda} \sum_{t=1}^{T} w(p_t) * V\left(\left(\sum_{i=1}^{N} r_{it} * \lambda_i\right)\right)$$

$$\text{s.t. } \sum_{i=1}^{N}\lambda_t = 1 \tag{8}$$

$$\lambda_i \geq \forall i$$

In (8), $\sum_{i=1}^{N} r_{it} * \lambda_i = r_t^T * \lambda$ is the portfolio return at each t = 1…T, $r_t$ is the vector of the assets' returns at each t = 1…T, and λ the vector of the assets' weights while V is the value function under consideration (see (3) and (4)). There are various difficulties in maximization process of a behavioral reward-risk model. Firstly, since the value function is not quasi-concave (and of course not totally concave) the first order condition may only describe local maxima. Another difficulty is that the loss aversion index which is incorporated in the value function makes the objective function non-smooth and results a non-differentiability at the reference point. In the case of a piecewise linear value function this problem can easily be dealt with by using linear programming. In the general case of changing risk aversion, which is the case of the value functions under examination in this paper, several computational issues arise. For example, the value function is non-smooth but it has a kinked point at the reference point where the value function is non-differentiable; here smoothing techniques are used in order to get around the reference point. Also, the value function is non quasi-concave which implies that there are upper sets that are non-convex sets and consequently, the portfolio optimization problem may have several local maxima but not a global solution.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In this paper, a process similar to that of De Giorgi, Hens and Mayer (2007) is followed introducing probability distortion, different loss aversion indexes and different value functional forms. Firstly, the non-smoothness of the value function is treated using cubic spines. Specifically, in order to deal with the non-differentiability problem, the non-smooth value function V(x) is replaced by the smooth $\tilde{V}(x)$:

$$\tilde{V}(x)=\begin{cases} a_0x^3+a_1x^2+a_2x+a_3 & if\ x\in[rp-\delta,rp+\delta] \\ V(x) & elsewhere \end{cases} \tag{9}$$

In the above, $\delta = 10^{-6}$. The goal of this method is to replace the non-smooth part of the value function by a smooth and thus differentiable cubic polynomial. A too small random number $\delta$ is taken in order to be as close as possible to the reference point and the non-smooth part of e value function to be approached using cubic splines in order to make it smooth. So, around the reference point the value function is replaced by a cubic polynomial which is now differentiable. The rest of the value function remains the same, since away from the reference point the value function is smooth and differentiable and thus there is no problem in maximization process.

Note that the role of the smoothing technique is to make the maximization process feasible without distorting basic characteristics of the model i.e. the Loss Aversion and the value function's behavior. The "new" value function $\tilde{V}(x)$. is still convex for losses and concave for gains; applying the cubic interpolation the 3rd order polynomial replaces continuously only a too small part of the function around the reference point without changing the curves of the function (convexity-concavity). Moreover, the presence of loss aversion in the model is not affected; the coefficients used in this paper are based on global definitions of loss aversion applied to the entire value function, not only to the reference point around which the cubic interpolation is applied; the only local definition used in the analysis is that of Köbberling and Wakker (2005) that however separates the risk attitude into three components: utility, probability weighting, and loss aversion permitting the cubic interpolation to be applied to the utility function without influencing the loss aversion effect in the model.

Thus, the asset allocation model is now formulated as:

$$\max_{\lambda}\sum_{t=1}^{T}w(p_t)*\tilde{V}\left(\left(\sum_{i=1}^{N}r_{it}*\lambda_i\right)\right)$$

$$\text{s.t. } \sum_{i=1}^{N}\lambda_t=1 \tag{10}$$

$$\lambda_i \geq \forall i$$

The second problem is that the value function is non quasi-concave which implies that the portfolio optimization problem may have several local maxima but not a global solution. In order to overpass this problem $N$ starting points randomly generated on the unit simplex $\left\{\lambda \mid \sum_{i=1}^{N}\lambda_t=1,\lambda_t\geq 0\forall i\right\}$, are con-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

sidered. The algorithm of Rubinstein (1982) is employed in order to find the optimal allocation in the problem. Briefly, this algorithm starts with the generation of *n* pseudo-random numbers ($x_i \; \forall \; i = 1 \ldots n$) according to the uniform distribution on [0, 1], continues with their transformation to $y_i = -\log(x_i) \; \forall \; i = 1 \ldots n$, corresponding to the exponential distribution with parameter 1, and terminates with their normalization as following $\frac{y_i}{\sum_{i=1}^{n} y_i}$ corresponding to the uniform distribution over the unit simplex. This process is repeated *N* times. Thus, starting from *N* starting points the authors get *N* locally optimal allocations for each of the value functions that are used to find the corresponding optimal perspective values (at each of these optimal allocations). The allocation with the highest perspective value is considered as the solution of the problem.

Having set up the behavioral optimization problem, the analysis is continued to the practical part of the paper, by building Matlab codes and applying the above-described maximization process in practice. In this way, the optimal asset allocation for PT investors and their optimal perspective values (resulting by the optimal allocation) are firstly extracted; after that, the analysis goes on by empirically evaluating the role of each of the three main elements of Prospect Theory (value functional form, loss aversion, and probability distortion) on the optimal solutions of the problem, separately and in interaction, within a PT framework. The results are presented below.

## 3.1. Results

### 3.1.1. The Case of Non-Probability Distortion

Figure 2 presents the effect of loss aversion on optimal asset allocation when objective probabilities are used in the model. It depicts the optimal asset allocations for each of the three loss aversion indexes (small, average and large) using the piecewise-power and the piecewise negative exponential value function. A first result obtained by Figure 2 is that both the value functional form and the loss aversion index affect the optimal asset allocation i.e. there are differentiations in optimal allocations from one loss aversion index to the other and between the two value functional forms. Specifically, as the loss aversion index increases agents tend to shift their preferences from too risky to less risky choices for both value functions e.g. for the low (1.75) and the average (2.25) loss aversion indexes, agents give the greatest weight to the riskiest but also most profitable small stock portfolio while for the large loss aversion index the greatest weight is given to the less risky decile 8 portfolio formed on B/M. Thus, concerning the loss aversion effect, the smaller the loss aversion index the more aggressive the strategy that agents choose to follow; agents with low loss aversion index (1.75) adopt the most aggressive strategy by investing to the riskiest positively skewed assets in order to have great potential returns, for both value functions.

However, it is the value functional form that also affects the optimal allocation (in interaction with loss aversion) i.e. there are differences in allocations between the two value functions within each loss aversion coefficient. Namely, for the low loss aversion index, agents with a piecewise negative exponential value function prefer to allocate their wealth among the most risky positively skewed stock portfolios formed on size: the small stock portfolio (about 40% of wealth), the size decile 2 (about 18% of wealth), the size decile 3 (about 10%) while they allocate less than 10% to value stocks. On the other hand, agents with a piecewise power value function prefer to allocate about 35% to small stocks and about 30% of wealth to the highest B/M portfolio and a further 25% approximately to B/M decile

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

8 portfolio. Hence, despite the riskiness of strategies that agents with a low loss aversion index choose to follow, those whose preferences are described by a piecewise power value function tend to be more aggressive than agents with a piecewise negative exponential value function who choose to reduce the weights of the riskiest assets and increase the weights of less risky choices e.g. they prefer to allocate the greatest part of their wealth among B/M portfolios instead of the riskier (and more profitable) size portfolios clearly preferred by agents with a piecewise power value function. The main reason for this differentiation is that the piecewise negative exponential value function is a bounded function that permits only bounded returns and bounded perspective values, a characteristic that discourages an extreme risk exposure driving agents to follow more conservative strategies. Such a bounded value functional form may also limit the aggressiveness of agents with a small loss aversion index. This is not the case of the unbounded piecewise power value function that permits unlimited potential returns giving to the agents the incentive to undertake great risks.

In the case of the average loss aversion parameter (2.25), investors allocate the greatest part of their wealth among four positively skewed assets (decile 8 and decile 9 portfolios formed on B/M, the value and the small stocks' portfolio), for both value functions. These assets are quite risky (and profitable) but less risky than that agents with a small loss aversion index choose. This agents' turn to less risky choices shows that as loss aversion increases agents start to be more cautious about the undertaken risk.

For the large loss aversion index (3) PT investors follow the most conservative strategy, for both value functions. The greatest weight is given to the less risky positively skewed decile 8 portfolio formed on B/M. Moreover, agents increase their investment to less risky assets such as the decile 9 portfolio formed on B/M decreasing the weights of very risky assets such as the value stocks' portfolio. Finally, investors' choice to diversify their portfolios by investing non-insignificants percentages of their wealth to more than six assets, for both value functions, is another evidence that as investors become more loss averse they follow more conservative strategies – diversification is adopted in order to disperse the undertaken risk; note that for the low (1.75) and the average (2.25) loss aversion indexes agents chose to invest to only four or less assets.

Another strong result obtained by this part of the analysis is the clear preference of PT agents to positively skewed assets (although the exact allocations differ) irrespective of the value function and the loss aversion under consideration. It is remarkable that for all loss aversion indices and for any value function, the weights that agents give to the positively skewed small and value stocks' portfolios are much greater than the infinitesimal weights of the negatively skewed large and growth stocks' portfolios. In general, extreme positively skewed decile portfolios (low capitalization and high B/M portfolios) are the most preferred assets to PT investors.

### 3.1.2. The Case of Probability Distortion

Figure 3 presents the optimal asset allocation results in the case of probability distortion using the piecewise power value function, while Figure 4 presents the optimal allocation employing the negative exponential value function. Both results are obtained for various loss aversion coefficients. As figures show the optimal solutions are quite similar for all probability weighting functions, for both value functions and for all loss aversion indices. This indicates that the influence of probability distortion on the optimal solutions is independent of the specific weighting functional form that will be employed; because of the similarity of the solutions obtained by the Wu and Gonzalez (1996) and the Lattimore, Baker, Witte (1992) probability weighting functions, that of Wu and Gonzalez will be used to the rest of the analysis for probability distortion.

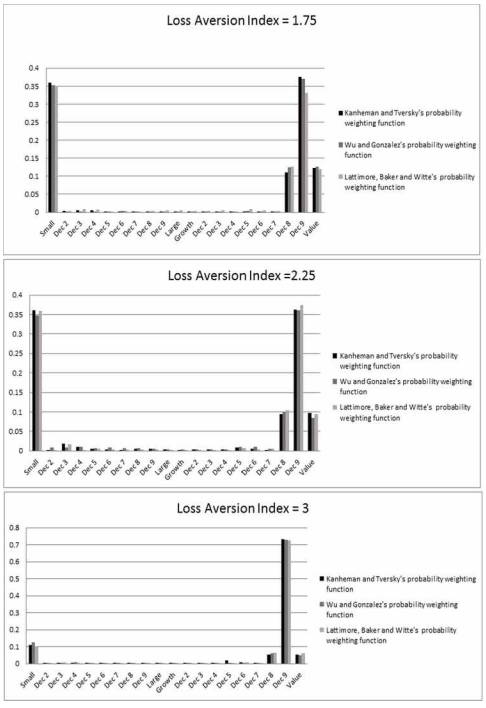

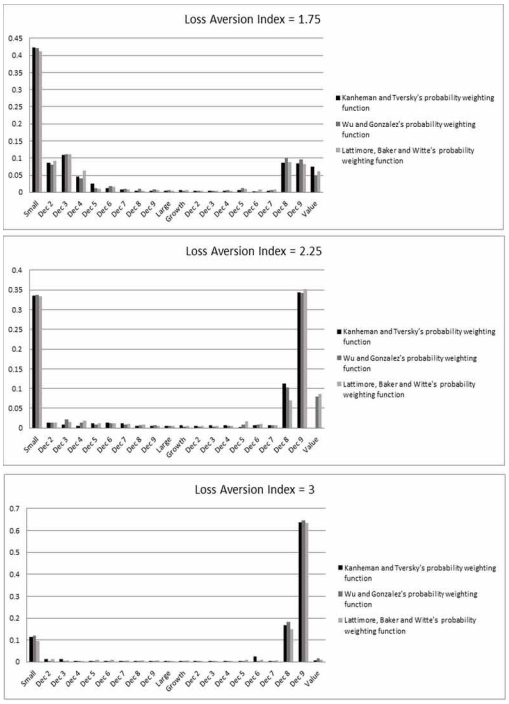

*Figure 4. Optimal allocations for the Piecewise Negative Exponential value function (probability distortion)*

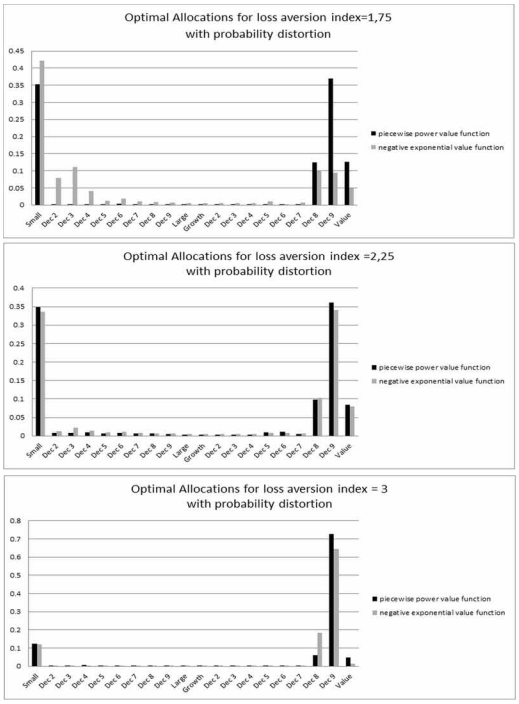


EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5 presents the effect of loss aversion on optimal asset allocation when subjective probabilities are used in the model. It depicts the optimal asset allocations for each of the three loss aversion indexes (small, average and large) using the piecewise-power and the piecewise negative exponential value function. An immediate result obtained by Figure 5 is that both the value functional form and the loss aversion index affect the optimal asset allocation.

For the low loss aversion index, agents still follow the most aggressive strategy, for both value functions, e.g. they choose to invest more than 35% of their wealth to the riskiest but also most profitable small stocks' portfolio. This is due to the low loss aversion coefficient that makes agents more inclined to undertake great risks (by investing to quite risky and quite profitable positively skewed assets such as decile 2, decile 3 and decile 4 size portfolios) in order to have high potential returns, for both value functions. In the case of the average loss aversion parameter (2.25), the small stocks' portfolio remains a quite attractive asset. However, agents with this loss aversion parameter choose to increase the weights of less risky assets such as the decile 8 and the decile 9 B/M portfolios and decrease the weights of too risky assets such as the size portfolios.

For the large loss aversion parameter (3), agents with both value functional forms follow the most conservative strategy. In this case, the highest weight is not given to the riskiest small stocks' portfolio but to the less risky decile 9 B/M portfolio. After that, the weights of the riskiest portfolios decrease remarkably while the weights of less risky choices as the decile 8 B/M portfolio increase significantly. The large loss aversion index makes agents to turn to clearly less risky choices in order to reduce the undertaken risk with a particular preference to high B/M stocks. Thus, as the loss aversion index increases agents shift their preferences from very risky to less risky choices for both value functions, as in the case of non-probability distortion.

*Figure 5. Optimal allocation with probability distortion*

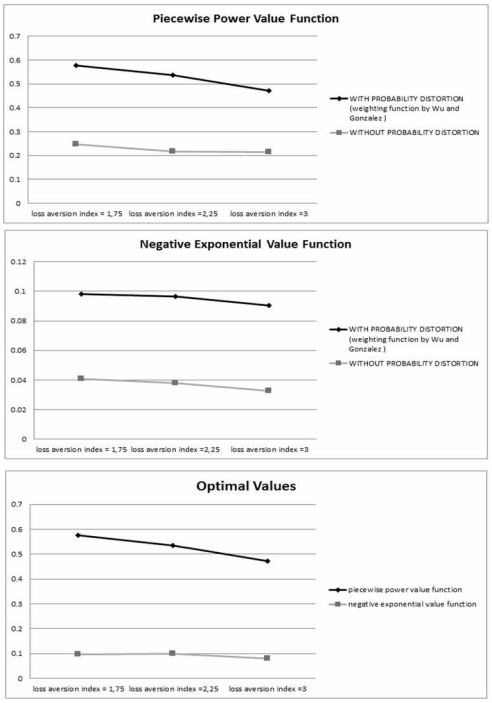
EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Another factor that influences the optimal allocations is the value functional form. Agents with a low loss aversion index and a bounded piecewise negative exponential value function choose to introduce a greater number of assets in their portfolios than agents with a piecewise power value function i.e. they choose to diversify their portfolios. This fact implies that a bounded piecewise negative exponential value function may limit the aggressiveness of agents with a low loss aversion index. In the cases of the average (2.25) and the large (3) loss aversion parameters, agents with a piecewise negative exponential value give much smaller weights to very risky assets such as the value stocks' portfolio and greater weights to less risky assets such as the decile 8 B/M portfolio comparing to the weights that agents with the unbounded piecewise power value function give to these assets. Thus, the strategies that agents with a bounded piecewise negative exponential value choose to follow are more conservative than that of agents with the unbounded piecewise power value function, for all loss aversion indexes.

So, the loss aversion effect and the value functional form effect remain unaffected to the introduction of probability distortion in the model (although the exact allocations differ). However, the probability distortion does influence the optimal allocations and especially the optimal perspective values. The basic probability distortion effect on the optimal allocations is that it reinforces the clear preference of PT investors to positively skewed assets, in all cases. This is due to the fact that positively skewed assets are related to very small gain-probabilities; when probability distortion is introduced in the model these too small objective gain-probabilities are overweighted making the positive skewed assets more attractive to PT investors driving them to increase further the percentages of their wealth that they invest to these assets.

### 3.1.3. Optimal Perspective Values

The optimal perspective values are the values resulting by the value function under consideration if the optimal asset allocations are used as weights of the assets in an investor's portfolio. Figure 6 presents the results for the two value functions, with and without probability distortion, for various levels of loss aversion.



Three important results emerge. Firstly, the piecewise function provides much higher values compared to the negative exponential, i.e. the functional form matters. For instance, for the piecewise function with probability distortion the perspective values are in the area of 45% to 60% depending on loss aversion, while for the negative exponential the respective values are between 9% and 10%. This result may be justified by the fact that the negative exponential value function is a bounded *S*-shaped function i.e. for large outcomes, the piecewise negative exponential function exhibits more curvature and discourages an extreme risk taking. A bounded value function as the piecewise negative exponential function permits only bounded returns and thus limited perspective values.

Secondly, when objective probabilities are used the resulting perspective values are much lower compared to the case where probability distortion is assumed, for both value functions e.g. for the piecewise power function and a loss aversion index of 1.75, the resulting perspective value is about 25% without probability distortion and nearly 60% with probability distortion; for the negative exponential function and a loss aversion index of 1.75, the resulting perspective value is about 4% without probability distortion and nearly 10% with probability distortion. This means that probability distortion has a significant effect on optimal perspective values. The objective probabilities which weight the outcomes of the problem are too small but when probability distortion is introduced in the model, the too small objective probabilities are overweighted; thus the resulting subjective probabilities which weight the outcomes of

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 6. Optimal perspective values*

the problem (the decision weights) become greater increasing in this way the perspective values. After that, the probability distortion makes the positive skewed assets more attractive by overweighting their small gain-probabilities; this drives agents to increase the percentages of their wealth that they invest to these quite profitable assets increasing in this way further the optimal perspective values. These are the probability distortion effects on optimal perspective values and hold for both value functions and for all loss aversion indexes.

Thirdly, there seems to be a negative relation between loss aversion and perspective values. Recall that as the loss aversion increases agents follow a more conservative strategy by investing to less risky and thus less profitable assets. Hence, the highest perspective value (e.g. 25% for the piecewise power function and almost 4% for the piecewise negative exponential function (without probability distortion)) is observed for the lowest loss aversion index (related to the riskiest strategy), a mean perspective value for the average loss aversion index (e.g. 22% for the piecewise power function and almost 3.8% for the piecewise negative exponential value function) and the lowest perspective value for the largest loss aversion index (e.g. 21% for the piecewise power function and almost 3% for the piecewise negative exponential function). So, there is loss aversion effect on optimal perspective values and hold for both value functions.

## 4. CONCLUSION

The basic purpose of this paper was to empirically evaluate the role of the three main factors of Prospect Theory: the *S*-shaped value function, the loss aversion, and the probability distortion, in decision mak-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing. In order to do this, a general behavioral reward-risk model is firstly setup; the analysis continues with the optimization process so as to find the optimal allocations and the optimal perspective values of the model; the paper ends with the empirical evaluation of the role of the probability distortion, the value functional form and the loss aversion on the optimal solutions of the problem. The findings of the paper indicate that all the factors under examination are crucial for a behavioral analysis and influence the optimal solutions of a PT model.

More specifically, PT agents differentiate their behavior according to their type of preferences and their loss aversion level but they seem to always prefer high positively skewed assets such as small and value stocks. The attractiveness of positively skewed assets is re-enforced when probability distortion is introduced in the model; the probability distortion tends to overweight the too small gain-probabilities of such assets driving PT agents to increase further their weights increasing consequently the magnitude of their optimal perspective values. The probability distortion impact on the optimal solutions is independent of the used probability weighting functional form.

The investment style of agents is another determinant factor for the optimal allocation of the problem; a conservative style assigns higher weights to less risky assets and smaller percentages of wealth to very risky assets. These investors have smaller optimal perspective values relatively to investors who follow more aggressive strategies. The value functional form also plays a significant role in this analysis; results showed that agents with an unbounded piecewise power value function have the incentive to undertake great risks in order to obtain higher potential returns. On the other hand, agents with a bounded negative exponential value function which permits only bounded potential returns choose more conservative strategies lowering in this way their optimal perspective values, for any loss aversion index. Finally, results show that as agents become more loss averse they tend to follow more conservative strategies, with and without probability distortion. This loss aversion effect is strong enough to limit (but not alter) the value functional form effect on optimal solutions e.g. the interaction of a large loss aversion index with the unbounded piecewise power value function may reduce agents' aggressiveness.

It would be useful here to mention that this paper is a behavioral analysis that gives emphasis to behavioral factors and their role in decision making using technical methods as tools. This analysis is developed into a Prospect Theory framework as the studies of Best and Grauer (2016) and Pirvu and Schulze (2012) that however do not give emphasis to the role of behavioral factors in decision making but they focus at most to the optimization process of a PT model under the appropriate constrains. One interesting issue for future research would be the development of such a behavioral analysis into a Cumulative Prospect Theory framework. In this direction are the paper of Shi, Cui, and Li (2015) and especially the working paper of Hens and Mayer (2014) where algorithms for optimization into a Cumulative Prospect Theory framework are presented, the probability distortion is applied on cumulative rather than on individual probabilities (see Tversky and Kahneman (1992), Wakker and Tversky (1993) among others) while it is taken into account the additional non-smoothness that is introduced in the model because of the sorting of scenarios.

# Chapter 26
# The Role of Institutional Quality on Total Factor Productivity:
## A Comparative Analysis on the CEE and MENA Economies

**Tarkan Cavusoglu**

## ABSTRACT

*Within the settings of the economic growth literature, this study aims at analyzing the determinants of total factor productivity in the Central and Eastern Europe (CEE) and the Middle East and North Africa (MENA) regions, with a special emphasis on institutional quality. Beside descriptive analyses, several fixed-effect panel data regressions are estimated, which enables both cross-country and cross-regional analyses. Estimation results provide strong statistical evidence of institutional influences on total factor productivity in the CEE and MENA economies.*

## INTRODUCTION
