Cross-country differences in economic performances have been discussed both theoretically and empirically with a broad perspective in the literature for years. A vast literature focuses on East Asian countries because of their successful – miracle – development and growth experiences and on Sub-Saharan Africa due to its very poor growth performance. However, the economies of the Central and Eastern Europe (CEE) and the Middle East and North Africa (MENA) draw more attention nowadays in the world's economic development process. The former group of economies, which were ruled by communism in the past, are now charming as they are either the new members of or the candidates for the European Union enlargement process. On the other hand, the MENA countries, which are characterized by unindustrial-

ized state-oriented economies and by the Islamic structure (except for Israel), have high potential for growth and development owing to the abundance of natural resources, unless their economic and social reforms are disrupted by the unstable political environment of the region. Although these two groups of countries have almost similar scopes of economic development and growth, the degree of vulnerability to internal and external shocks is considerably different due to their distinct sociocultural environments and geographical locations, which, in fact, shape their institutional structure. Hence, one expects both cross-country and cross-regional income disparities to exist between the CEE and MENA regions, driven by various qualitative factors beside their physical- and human-capital endowments, and thus, reflected in their total factor productivity levels.

Along with the development of the endogenous growth theory by the mid-1980s, a wide variety of factors are considered to be the competing determinants of economic performance, beside the conventional factors of production, i.e., capital and labor. Particularly, the institutional aspects of the economic performance have become one of the recent concerns of the researches in the literature with the emphasis that institutions are the essential determinant of the growth potential of the economies, which set the rules of the economic exchange and the market mechanism. In this respect, in many studies, sources of growth that cannot be explained by the capital- and labor-accumulation are attributed to changes in the structural factors involving the institutions, geographies and the cultures. Thus, the total factor productivity growth, which is known to be the residual component of economic growth in the Cobb-Douglas type output models, stands as the most relevant growth element through which the structural factors can influence the growth performance of the economies. In the relevant literature, the structural factors that reflect the quality of institutions in a society are basically (i) the level of democracy, reflected by the extent of the civil liberties and political rights, (ii) the goodness of government services, resulting from fine bureaucracy, low corruption and sound legal system, (iii) the risks for entrepreneurs, due to government instability, poor socioeconomic conditions, and low investment profile. Weakness in any one of these factors is expected to slow down total factor productivity growth in an economy, possibly due to the increased transaction costs, which propagate inefficiency in resource allocation and curb economic growth accordingly. Institutional deficiencies constitute obstacles against entrepreneurship and innovative incentives, by discouraging the flow and the mobility of resources in the economy. Therefore, in the recent analyses of the institutional influences on growth performance in the literature, changes in the total factor productivity component of economic growth are argued to be a more relevant aggregate than the factor accumulation component.

The objective of this chapter is to provide a comparative analysis of the growth dynamics in the CEE and MENA countries in the last two decades, particularly, based on their total factor productivity differentials, with the following research questions in the mind: (i) In what respects do the sources of growth in these two regions diverge from those in other regions of the world? (ii) What is the share of the contribution of the total factor productivity growth to economic growth rate in these two regions? (iii) What are the demographic, economic and political particularities that are expected to shape the institutional quality of the two regions? (iv) Can prevailing institutional quality differences in these regions explain their total factor productivity differentials? (v) Which of the institutional factors appear as the major driving forces of the total factor productivity changes in these regions? The sample period of the study is limited to the 1990-2011 period due to the unavailability of a long-span comparable data. The period in question coincides with structural reforms in most of the MENA countries, and with reforms of transition to a post-communist era in CEE. Hence, economic performances and growth related issues have gained great importance for both of the regions from the 1990s onwards.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Within this context, the chapter, first, briefly reviews the relevant literature so as to illustrate the association between institutions and economic growth in theory and then concentrates on the researches that link the institutional factors with total factor productivity, after demonstrating the theoretical underpinnings of the economic growth and total factor productivity nexus. In the next step, the chapter aims at giving an overview about the sources of growth in various regions of the world as well as in the CEE and MENA countries by making use of a comparative growth accounting analysis. The purpose of such an analysis is to figure out the relative contributions of total factor productivity growth and factor accumulation to the economic growth in the economies of interest. Following the growth accounting analysis, a descriptive part takes place in the chapter to provide some snapshots from demographic peculiarities and from the characteristics of the economic and political institutions in the CEE and MENA regions. The objective is to explore the embedded economic and social differences that are expected to shape the history of the institutional development in the CEE and MENA countries, which, in fact, is argued to affect the incentives of higher total factor productivity growth. Finally, the chapter consists of an empirical analysis part, which allows for a comparative inquiry about the influences of institutional quality on total factor productivity in the CEE and MENA countries through panel data regressions. Unlike the majority of the empirical studies in the literature, analyses in this chapter rest on regression estimates that employ total factor productivity as the dependent variable, instead of using the income level or the income growth rate as dependent, with the rationale that "[W]hile a determinant of productivity will also be a determinant of income, the converse is not necessarily true." (Islam, 2008: p. 203) Thus, the empirical analysis here is carried out through several estimates of fixed effects panel data regressions, which appears to be rewarding as the cross-country and cross-regional variations are taken into account over time in the determination of the productivity levels in the panel data estimates.

## AN OVERVIEW OF THE LITERATURE

### Institutions and Economic Growth

The concern about the role of institutions on growth dates back to the "new institutional economics", a term originated by Williamson (1975) and a discussion with roots in the Coase theorem. The most recent theoretician of this school is the Nobel Prize laureate Douglas North. In his Nobel lecture, North (1994) states that economic performance is shaped by economic rules defined and enforced by the governmental system. Hence, a stable long-run growth entails a legitimate set of rules and adaptive efficiency, rather than allocative efficiency, to generate "… flexible institutional structures that can survive the shocks and changes that are a part of successful evolution" (North, 1994, p. 367). The recent followers of the new institutional economics, Acemoglu et al. (2005), similarly, emphasize that economic institutions are the fundamental cause of different patterns of economic growth, and hence, the income differences across countries. According to them, institutions reflect the decisions of humans who organize their society to achieve prosperity through enforcing property rights that encourage investment, innovation and entrepreneurship in an environment of equal opportunities. However, Olson (1982) argues that it is the encompassing organizational structure, which can induce prosperity in a society, not the one with special interests, as the latter type of organizational structure involves more divisive political life and cannot have the incentive to cease redistributing income to their members when the excess burden exceeds the social cost of the redistribution. However, the neo-classical presumptions of the new in-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

stitutionalism, which take the individuals as given and rational, are criticized by the proponents of the Veblenian institutionalism. Accordingly, Chang (2002) proposes the "institutionalist political economy" approach, by which he rejects the temporal priority of individuals over institutions and emphasizes the role of institutions in affecting human actions. In the same vein, Hodgson (2006) describes institutions as common settled habits of thought, which form the rule-following behavior of the individuals, rather than as the rules of the game or the constraints, which shape the human interaction in the society. However, regardless of their being the consequence or the cause, institutions are argued to play the fundamental role in determining the growth potential of the economies.

There are various channels for institutional structure to influence growth. One widely accepted view is that policies and institutions characterized with economic freedom and democracy promote growth more across countries over time. Institutional structures that succeed in removing infrastructural inadequacies and resistance to the adoption of new technologies can increase output performance. Good institutions can reduce transaction costs and increase the efficiency of the market mechanism by providing the security of rights through sound legal systems and by reducing corruption and bureaucratic obstacles. As Rodrik (2000, p. 5) states, "… the market economy is necessarily "embedded" in a set of non-market institutions", some of which may not serve the needs of the market economy, whereas property rights, regulatory institutions, institutions for macroeconomic stabilization, institutions for social insurance, and institutions of conflict management are market-supporting institutions. The transmission channels of institutional influences are sophisticated and widespread. Even the financial sector's ability of mobilizing and channeling resources to production is an issue of institutional quality. Jones (2001) argues that if there were no institutions allocating resources toward innovation in the 20th century, the Industrial Revolution would have been delayed by more than 300 years.

Cross-country empirical works in this strand of the literature proliferate from the mid-1990s onwards, however, employing a broad range of measures in describing the institutional characteristics: the democracy index as the indicator of political rights (Barro, 1996; Rodrik, 2000; Rivera-Batiz, 2002; Esfahani & Ramirez, 2003; Butkievicz & Yanikkaya, 2006), government anti-diversion policies, type of organizations, language, and climate as the indicators of the social infra-structure (Hall & Jones, 1996; Hall & Jones, 1999; Chanda & Daalgaard, 2008), trust and civic norms as the indicator of social capital (Knack & Keefer, 1997), ethnic diversity as the determinant of the structure and policies of the institutions (Easterly & Levine, 1997), economic freedom of the world index, reflecting the key elements of the new institutional economics (Gwartney et al., 2004), institutional quality indicated by composite indices including the measures of rule of law, bureaucracy quality, corruption, risk of expropriation, security of contractual and property rights, political freedom and civil liberties (Knack & Keefer, 1995; Keefer & Knack, 1997; Rodrik, 1997; Sachs & Warner, 1997a; Sachs & Warner, 1997b; Grigorian & Martinez, 2000; Rodrik et al., 2004; Islam, 2008), mortality rates of settlers in the colonies as the determinant of the characteristics of the early and current institutionalization process in countries colonized in the past (Acemoglu et al., 2001). The cross-country studies using these various institutional measures all affirm the positive effect of good institutional structure on the level of income or on economic growth.

## Economic Growth and Total Factor Productivity

Income differences and the dynamics of the catch-up process of developing economies have been analyzed traditionally within the settings of the Solow (1956) growth model in the literature. The failure in the neo-classical prediction that poor economies grow faster than the rich led to doubts on the Solow

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

(1956) growth model until Romer (1990) introduced the perspective of the endogenous technological change that provides the incentive for continued capital accumulation. As argued both by Barro (1991) and Mankiw et al. (1992), the Solow growth model augmented by human capital accumulation is capable of explaining the international differences in per capita income, in a sample of 98 countries over the 1960-1985 period. Mankiw et al. (1992) point out the relevance of explaining the cross-country variation by the differences in tax policies, education policies, tastes for children, and political stability, which are, actually, the ultimate determinants of human capital quality. However, the empirical findings of Hall and Jones (1996, 1999) imply that the income differentials between the poor and rich countries are mostly attributed to differences in total factor productivity rather than differences in factor accumulation. This implication is agreed by Prescott (1998), who states that a theory of total factor productivity is required to explain international income differences, because broadening the concept of capital with human capital and other forms of intangible capital still is not capable of explaining the income disparity due to differences in the saving rates unless implausibly large intangible capital is invested. Accordingly, Prescott (1998) concludes that the neo-classical growth model works only if total factor productivity differs across countries.[1] Easterly and Levine (2001), through demonstrating some stylized facts about "something else" as a source of growth, emphasize that more effort should be dedicated to modelling and quantifying total factor productivity growth than focusing on physical and human capital accumulation in investigating the divergence between the poor and rich countries. Solow (2001) agrees with all these arguments noting that growth-oriented cross-country studies including countries at different stages of development should explain the potential output or total factor productivity, as Solow (2001, p. 286) thinks "… of growth theory as precisely the theory of the evolution of potential output." Consistent with the purpose of this chapter, Solow (2001) argues that in the multivariable cross-country growth regressions, the left-hand side variable should be an estimate of the potential output or the total factor productivity, while the right-hand side variables should precisely be accounting for differences in total factor productivity or in factor-augmented technological change. Following Solow (2001) literally, Islam (2008) develops and discusses an empirical model of productivity in broad perspective with the hope of contributing to the further development of a theory of total factor productivity.

In Solow's (1956, p. 85) framework, neutral technological change represents perfectly arbitrary changes over time in the production function and is modelled by an increasing scale factor, i.e., *A(t)* that multiplies the production function such that:

$$Y_t = A\left(t\right).F\left(K_t, L_t\right) \tag{1}$$

where *Y* is output, and *K* and *L* are capital and labor inputs. Expression (1) can be re-written in a functional form relevant for a cross-country analysis as:

$$Y_{it} = A_{it}.F\left(K_{it}, H_{it}\right) = A_{it}.\left[K_{it}^{\alpha_{it}}\left(L_{it}.hc_{it}\right)^{1-\alpha_{it}}\right] \tag{2}$$

where $H=L.hc$ denotes human-capital ($hc$) augmented labor ($L$); $\alpha$ is the output elasticity of capital (measured by the share of capital income in the national output) in the Cobb-Douglas aggregate production function. Subscripts $i$ and $t$ stand for the cross-section and time dimensions. The growth literature calls $A$ the total factor productivity (TFP, henceforth), which is assumed to be an indicator of both the tech-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

nological and non-technological sources of random changes in output that cannot be explained through changes in capital and labor inputs. That is, TFP is a residual representing deviations from constant returns to scale. The concern related to this residual term increases along with developments in growth accounting, as estimations imply significant and non-constant contributions to output that cannot be quantified with the traditional factor accumulation approach. Accordingly, the cross-country analysis of Hall and Jones (1996), based on output decomposition accomplished through the levels accounting method (Solow, 1957; Jorgenson & Griliches, 1967), implies that most of the difference between the output of the US and that of the rest of the world (132 countries) is attributed to TFP differences, and the differences are more pronounced for less developed countries. Moreover, the estimations by Hall and Jones (1996) indicate that differences in infrastructure (or institutions and government policies) are fundamental to physical- and human-capital accumulation and to productivity, causing different levels of economic success across countries (Hall & Jones, 1997, p. 173, 175). All these findings are confirmed by strong empirical evidence once again in another cross-country study by Hall and Jones (1999).

## Quality of Institutions and Total Factor Productivity

In the relevant literature, the influence of institutional quality on economic performance has been investigated often through regressions on growth or level of income, as in Knack and Keefer (1995), Barro (1996), Easterly and Levine (1997), Sachs and Warner (1997a, 1997b), which are the pioneering studies of the issue. However, in their recent studies, both Prescott (1998) and Solow (2001) draw attention to the importance of TFP and its non-technological driving forces in growth analysis. Thus, the institutional characteristics of the economies undoubtedly appear as one of the potential determinants of the non-technological sources of TFP growth in the economies. Nonetheless, there is a scant literature concerning the cross-country TFP implications of the institutional aspects.

Among the few studies of this type, Hall and Jones (1996, 1999) decompose the differences in output into differences in physical- and human-capital inputs and differences in TFP, and show that the contribution of TFP differences to output differences between the poorest and richest economies is significant, whereas contributions from physical- and human-capital are modest. The social infrastructure, referred as the counterpart of the institutional quality in Hall and Jones (1999), is found to affect each of the three components of contributions to output strongly. In another study, Chanda and Daalgaard (2008), by decomposing TFP into components, i.e., relative (or inter-sectoral) and absolute efficiencies, conclude that TFP levels are affected substantially by the institutional environment and geographic conditions. However, it is the relative efficiency across agricultural and non-agricultural sectors that is found to be affected, not the (absolute) efficiency in the economy. Most recently, Islam (2008) developed four TFP models discriminating them with respect to the classification of the types of productivity determinants, i.e., economic factors, institutions, social base, and physical phase. In his estimations with institutional indicators, only the 'democratic rights' indicator - a combination of the 'political rights' and 'civil liberties' indices - can explain the variation in TFP significantly, among the other institutional indicators such as 'political stability', 'risk of appropriation' and 'rule of law'.

In the MENA region, TFP is not found to be a significant source of growth according to the growth accounting figures given by Yousef (2004), Sekkat (2004), Makdisi et al. (2006), and Abu-Qarn and Abu-Bader (2007). However, it appears as the primary reason for the slowdown of the economic growth in the region in the 1980s and 1990s. Accordingly, the estimates of Makdisi et al. (2006) imply that poor institutional quality and human capital are responsible for the poor TFP performance of the MENA

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

region. TFP appears to be a more important source of growth in the CEE region than it is in the MENA region, especially in the recovery phase of the transition process, as put forth by Dobrinsky (2003), Ark and Piatkowski (2004), Bah and Barada (2009), and Rapacki and Prochniak (2009). However, there is no empirical evidence as to the influence of the institutional structure on TFP changes in the CEE economies. Havrylyshyn and Rooden (2003) show the important role of market-enhancing institutions only on the economic growth rate in transition economies.

## THE CEE AND MENA IN FIGURES

### Growth Accounting

The economic performance of a country can be analyzed in terms of sources of growth through breaking down the GDP growth rate of an economy into components within the framework of the growth accounting approach. This decomposition process is based on the estimation of the expression given in (2) by its observable variables *Y*, *K*, *L* and *hc* so that *A* is recovered as a residual term. Hence, GDP ($Y_{it}$) growth is decomposed into contributions from physical- and human-capital ($K_{it}$ and $E_{it}hc_{it}$) growths and from TFP ($A_{it}$) growth, respectively. Growth components can be obtained from the log-linearized and differenced version of (2) as follows:

$$\Delta ln\ y_{it} = \alpha_{it}\Delta ln\ k_{it} + \left(1-\alpha_{it}\right)\Delta ln\ hc_{it} + \Delta ln\ A_{it} \tag{3}$$

where $y_{it}=Y_{it}/L_{it}$ and $k_{it}=K_{it}/L_{it}$. The output elasticity of capital $\alpha$ is usually assumed fixed around $\alpha=1/3$ across countries, or estimated values can be utilized alternatively. Moreover, one minus the share of labor compensation in GDP can be used as the counterpart of $\alpha$, which allows capital- and labor-elasticity varying both across countries and over time, as in the Penn World Table 8.

In order to provide a rough comparative overview of the sources of economic growth in various regions of the world and, particularly, in the CEE and MENA economies, the growth accounting estimates of the Conference Board are summarized in Table 1 and 2, respectively. The figures in Table 1 allow for a regional comparison of the components of the average GDP growth rates in the world economy. As can be seen in the GDP column under the full period case (1990-2012 or 1997-2012), relatively poor or less developed regions have grown more than the early industrialized rich regions over the past two-decade. However, the groups of CEE and MENA economies do not seem to outperform the Asian and the Sub-Saharan African economies.

With respect to the TFP and K&L columns of Table 1, in all regions except for Central Asia, factor accumulation contributes more to GDP growth than does TFP growth. Particularly, more than 80% of GDP growth is accounted for by the accumulation of capital and labor inputs in the MENA region, while the contribution of the TFP to GDP growth is about 40% in the CEE region, which is the highest TFP contribution rate after that of Central Asia. Relatively high productivity growth in Central and Eastern Europe and in Central Asia may be explained by the efficiency gains owing to transitional dynamics of the post-communist era, which involve market-oriented structural reforms and institutional changes. However, according to the figures computed for the two sub-periods, while TFP contribution to growth

†Because of the missing observations of the transition economies, the full sample period is constructed starting also from 1997 to provide full comparability.

Western European countries classified as EU-1 are Belgium, Denmark, France, Germany, Ireland, Italy, Luxembourg, Netherlands and United Kingdom; the ones classified as EU-2 are Austria, Finland, Greece, Portugal, Spain, Sweden; and the others are Iceland, Norway, Switzerland, Cyprus, Malta and Turkey.

increases from 30% to 57% in Central Asia in the 2000s, it falls from 66% to 39% in the CEE region. Note that, in the 2000s, Western Europe and North America and Oceania record negative TFP contributions that curb their economic growths.

The sources of GDP growth in the CEE and MENA regions can be analyzed by country in detail in Table 2. It is seen that the relatively higher average TFP contribution in CEE is owed only to six of the seventeen economies in the region, that is, Belarus, Estonia, Lithuania, Moldova, Romania, and the Russian Federation. On the other hand, among the MENA countries only Iraq and Kuwait contribute to growth through TFP. Overall, although the relative contributions are not similar in the two regions, it is evident that factor accumulation plays the major role in growth both in CEE and MENA. However, the contribution of TFP in the CEE (40%) is above the world average (22%), while the contribution of K&L in the MENA (82%) is also slightly above the world average (78%). Unless the driving forces behind the disparity in the TFP contributions are explored, it is not easy to reveal the residual growth dynamics. Hence, further analysis is needed to explain the TFP variation both across and within these regions. As a preliminary step to this, an overview of some demographic, economic, and institutional factors pertaining to these regions is presented below.

## Some Regional Descriptive Indicators

### Demography

The demographic characteristics of societies play a crucial role in economic performance through many different channels, the outcome of which, however, may be ambiguous. For example, while rapid population growth is argued to lower living standards and the steady-state output due to the need for higher capital investment to keep the growing labor force productive, some counterarguments point out the merits of population growth that helps to increase the aggregate saving rate in the economy by increasing the working-age population relative to population of the old- and young-dependents. Less developed country experiences show that there is a trade-off between the poverty trap and the comparative advantage of low labor costs in growing populations, where in the former case the speed of infrastructural and institutional changes cannot keep up with the speed of the population growth, while in the latter, per capita output tends to grow fast, however, with deteriorating income inequalities. In this sense, especially the institutions for health and education should have infrastructural capacities that can adequately satisfy the needs of growing populations, for a better quality of human capital and for improvements in total factor productivity. Otherwise, unbalanced population growth is detrimental to moral values and social peace, leading to political and economic instabilities and efficiencies in a society.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the context of the life-cycle theory of the consumption, the age-structure of the populations in CEE and MENA may have some implications for the private savings differentials and hence for total factor productivity growth potentials in the two regions. According to the age–dependency ratios, the share of dependents (population younger than 15 or older than 64) in the working-age population in MENA has been high throughout the 1960s, but falling from about 80% to 50% in about fifty years' time (1960-2013). Figures show that most of the dependency in the region is young-age dependency and about 30% of the population is at ages below 15, whereas only the 5% of the population is above the age 65, with respect to the 2013 figures. However, the dependency ratios vary substantially across the countries in the sample.[2] For example, the average ratio of the 2000-2013 period is 28% for Qatar and 82% for Iraq, while the regional average of the age-dependency ratio is 53%. On the other hand, the age dependency ratios in the CEE region have been sluggish and lower than those in the MENA region over fifty years, decreasing from about 55% in the 1960s to 45% in the 2000s.[3] Unlike the MENA countries, the ratios do not vary much across the CEE countries, which lie within the 40-50% range. Moreover, in CEE, dependency ratios exhibit a decreasing trend for the young-age whereas an increasing trend for the old-age. The recent figures show that the age dependency ratios are now mostly below 50% by the year 2013 both in the CEE and MENA countries. The declining age dependencies in these two regions are expected to generate positive effects on private savings, which constitute the sources of funds to be channelized to the total-factor-productivity increasing activities, unless the declines in the age-dependency ratios are associated with greater unemployment rates in these regions. The high annual average of the population growth rate (3.3%) in MENA in the last ten years' time indicate that unemployment is a growing concern in this region, in contrast to the case in CEE, where the population growth rates are mostly close to zero or negative.

The share of the population living in the urban areas is about 60% in CEE and 80% in MENA with respect to the 2013 figures. The agglomeration economies of urbanization are expected to improve total factor productivity more in MENA than in CEE through reducing the production costs and through the economies of scale effects. However, the urbanization in the MENA region does not seem to generate efficiency despite the young population, because 65% of the youth and 70% of the women stay out of the labor force, with respect to the annual averages of the 2000-2012 period. The share of females in the total labor force in the MENA region is far below that in the CEE region, 22% in the former and 47% in the latter, with labor force participation rates of 30% and 60%, respectively. This gender gap in the labor market is due to the Islamic traditions prevailing in most of the MENA countries, which discourage the entry of women into labor markets, and due to the high unemployment ratios, which prevent women from competing with men in labor participation. Moreover, although the youth-unemployment rates seem to be close to each other in the CEE and MENA regions (about 20-25%), in MENA, these figures do not reflect the young population that is unemployed but not accounted in the labor force as they are discouraged to work due to the lack of job opportunities and due to the social barriers against females.

Overall, despite the continuously declining age dependency ratios and young population in MENA, the demographic profile seems to be less convenient than that of the ageing CEE region in mobilizing the potential sources of total factor productivity growth. The demographic factors play an essential role on the build-up of institutions and on their decisions in resource allocation. Unless the resources are allocated efficiently to health and education and to the projects of research and development, the high rates of population growth in the MENA region seem to discourage productive foreign direct investments (FDI) in the region.

## Economic Institutions

The role of economic policies and institutions in growth and productivity is another crucial issue, again nesting some controversies in terms of their outcome. The most controversial cases seem to be the repercussions of international-trade openness and the size of the government. Openness is argued to provide the transfer and diffusion of new technologies and ideas through the flow of goods and services. Moreover, the degree of openness may indicate the economic institutions' attitude towards the free-trade mechanism and the competition, which indirectly determine the size of international funds flowing to an economy. However, if not accommodated by the proper economic policies, openness increases the vulnerability to external shocks destabilizing the economies through exchange rate fluctuations in the short-run, which in fact cause fluctuations in the cost of acquiring imported capital goods, equipment, and machinery. A similar controversy exists for the role of the government, which is usually measured in terms of the size of government spending. In some cases, government size may be the indicator of the degree of policy interventions in the economy, acting negatively on economic performance due to government failures. The high share of the public sector activity may be detrimental to total factor productivity when it evolves to be a threat for macroeconomic stability due to fiscal sustainability problems. On the other hand, there is a noteworthy literature discussing the crowd-in effects of productive government spending, such as research and development expenditures. Thus, in economies with insufficient private resources or immature financial markets, government can assume a leading role in investment in high-cost areas and advanced technologies.

The openness ratios in the CEE and MENA regions, measured by the volume of trade as a percentage of GDP, are respectively 110% and 88% with the annual averages of the 2000-2011 period, where the ratio is 127% in East Asia. Estonia, the Slovak Republic, and Hungary in CEE, and Bahrain and Jordan in MENA are economies that appear with high trade shares at around 150% and 130%, respectively. However, despite the free trade agreements, the international trade in MENA is characterized still by high tariff and non-tariff barriers. A particularity of the trade in MENA is that most of the economies in the region are net exporters of energy products importing manufactural goods in return, mostly from the European Union. On the other hand, in the CEE region, only the Russian Federation is a net exporter of energy products. The merchandise trade of the other CEE countries are based mostly on manufacturing goods that are exported and imported within the European Union. The natural-resource-oriented exports of the MENA region discourage the production of the agricultural and manufacturing export goods, which, in fact, downgrade the diffusion of new technologies through knowledge spillovers and the diversification of the international trade. The openness in this region is associated with less technology inflows than in CEE, which is implied by the three times lower share of the information and communication technology (ICT) goods imported in the MENA region. Moreover, the average ratio of the research and development (R&D) expenditures to GDP in MENA is far below that of in CEE, with the exception of Israel, whose average ratio is about 4% in the last decade, which is four times the CEE's average ratio. When international capital movements are taken into account, the GDP share of the net FDI inflows in the CEE region appears to be higher than that in the MENA region, i.e., around 6% in the former and around 3% in the latter according to the annual averages of the 2000-2011 period, implying that the CEE economies are more open in terms of fixed capital flows than the MENA economies. The low FDI figures of the MENA countries may be explained not only by the political and economic risks of the region but also by the low quality of the labor and the production technologies. In MENA, there seems to be the "curse of natural resources" on trade and investment as well as on the build-up of modernized

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

institutions, which preclude innovative activities and the enlargement of job opportunities for the young and educated population, and thereby hinder total factor productivity growth.[4] Therefore, the political and economic institutions in MENA should be reformed so that the investment environment, production and trade integrate to the world economy through more democratic and stable society.

The MENA region, with its tradition of interventionist redistributive governments, and the CEE region, with its history of the state-owned economy, recently, have governments with moderate size. The size of the public sector, measured by the GDP share of the cash payments for operating activities of the government in providing goods and services, is 27% in MENA and 34% in CEE, with respect to the 2000-2011 annual averages. The latter figure is close to the one in the Western Europe (37%). The high GDP shares of public expenditures in the CEE and the Western Europe can be attributed to subsidies, which are exceeding 60% of the total expenses in the government budget in the last years. Although the subsidies and the compensation of public employees constitute the largest parts of the total government consumption expenses in both regions, the latter, which is an unproductive type of government expenditure, is in larger shares in most of the MENA economies than in the Europe. Thus, the composition of government expenses in MENA seems to be more detrimental to total factor productivity growth than that in CEE. Alternatively, the size of the public sector can be indicated also by the size of government's burden and drain on private sector. In this respect, when the figures on the GDP share of the compulsory transfers to the central government for public purposes are taken into account, both the CEE and MENA regions appear with approximately equal shares (16%), which is slightly above the world average (15%) and below the Western Europe average (22%). Although the shares of the government burden in CEE and MENA do not seem to be extremely high, they are above those in the developing economies of the Asia (10%) and the Latin America (12%). However, as long as the burdens are efficiently allocated to finance productive expenses in the economy, compulsory transfers to the government may not be detrimental to economic growth.

To conclude, it seems that benefits of openness can be utilized better in the CEE region than in MENA because of the safe investment environment and the geographic proximity to the advanced Europe. Although the size of the public sector expenses in the MENA region is smaller than that in CEE, payments to the public employee in the former seems to drain the resources that can be used for infrastructure investments and human capital improvements, which have the potential to increase the total factor productivity.

## Political Institutions

The most critical part of all discussions about the factors influencing growth and productivity is the institutions that would organize, audit, regulate and rule the mechanism in favor of the interests of the society. However, the definition of a 'good institution' is rather broad and hard to quantify for comparison purposes. Therefore, measures of the institutional quality are often produced based on the perceptions of the parties of interest or derived as a weighted index of quantifiable factors. The institutional indicators employed in this study are going to be the Freedom House's "Freedom in the World Country Ratings by Region" and the ratings published by the International Country Risk Guide (ICRG).

The political history of the CEE and MENA regions are characterized with autocratic institutional structures. Basically, the reason for the existence of authoritarian regimes in MENA is argued to be the abundance of natural resources. Institutions are shaped with the objective of keeping control over natural resources and their rents through an autocratic power. Unlike in MENA, autocracy in the CEE region

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

originates from the socialist elites of the centrally planned economies of the pre-1990s. However, the rent from natural resources has been the crucial part of the total rents, also, in most of the transition economies both before and after the collapse of the Soviet Union. Thus, the quality improvement in institutional structure is highly dependent on a build-up process that removes or reduces the ruins of the rent-seeking objectives in the CEE and MENA regions. The transparency and the trust established through economic and political freedoms provide the efficient allocation of capital and human resources to activities that enhance total factor productivity growth.

An overview of the institutional characteristics of the CEE and MENA regions can be given by making use of the Civil Liberty and Political Rights indices of the Freedom House and various indicators from the International Country Risk Guide (ICRG) database.[5] According to the figures given in Table 3, the CEE countries outperform the MENA countries in terms of civil liberties (*CL*) and political rights (*PR*), with respect to the average values of *CL* and *PR*, which are 2 in the CEE and 5 in the MENA.[6] This shows the success of transitional reforms on political liberalization in the CEE region. However, Russia stands as an exception in the region with low freedoms. Poor civil liberties and political rights in Russia and in most of the MENA countries can be explained by the abundance of natural resources, which provides high rents and benefits to the political power. Thus, the autocratic structures in these type of economies involve rent-seeking rulers, who are reluctant to liberalize rights and to build-up market oriented institutions. Especially, in MENA, the presence of undemocratic administrations may be related with the internal and external conflicts based on ethnicity and religion as well as on natural resources. Lack of freedoms not only prevent institutional reforms to adopt new ideas and technologies inside but also discourage capital investments from abroad.

Some important aspects of the political structure in the CEE and MENA regions can be investigated by using the sub-indices of the ICRG.[7] The average figures of the 2000-2012 period given in Table 3 indicate only slight differences between the two regions. The most significant differences between the regions are observed for the 'religion in politics' (*RELP*) and the 'democratic accountability' (*DEMA*) variables. Both of these indicators have higher ratings in the CEE region, implying the presence of a more secular and democratic institutional structure in the CEE. As in the cases of civil liberties and political rights, again Russia appears as an exception in the region with the poorest stance in democratic accountability, because of its autocratic administrations inherited from the past socialist-bloc leadership. In the MENA region, Israel is the exception, however, with the highest democratic accountability (*DEMA*) rating, implying the existence of an alternating democracy in Israel, unlike the other countries in the region. The low values of *RELP* for MENA countries, given in Table 3, indicate the significant religious influences on politics in MENA. This can be explained by the Arab-Israeli conflict and the inter-Islamic sectarian tensions, which have been dominating the political decisions and the structure of the institutions in the region for years. Accordingly, the degree of military participation in politics in MENA is also higher than that in CEE, shown by the lower *MILP* values in Table 3. The military interference to politics in MENA can be explained not only by the prevailing regional tensions but as well by the struggle for sovereignty over natural resources in the region. Under such religious and military influences on politics, governance in MENA appear with a worse stance of democratic accountability compared to governance in CEE. The lower *DEMA* ratings observed for most of the MENA countries in Table 3 indicate the prevalence of dominated democracies or one-party states as opposed to almost alternating democracies in the CEE countries. Correspondingly, the government stability (*GOVST*) ratings in Table 3, which indicate the legislative strength and the unity of the governments, appear to be higher in MENA than those in the CEE region. It implies that governments in MENA have better

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

capabilities in carrying out declared programs and staying in office. Although government stability can ensure economic policy stability by lowering the unexpected effects of political risks in most of the developing market economies, this may not be the fact in the case of stability achieved through governments without democratic accountability.

In developing economies, the decision of investments that are favorable for the diffusion and the spillover of the productivity-enhancing know-how is determined substantially by institutional risks. Beside the government instability, there are risks associated also with business conditions and social dissatisfactions. In this respect, ratings for *INVP* in Table 3 indicate the investment profile of the CEE

*Table 3. Institutional Indicators (annual averages, 2000-2011)*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

and MENA regions. The regional averages of the *INVP* ratings imply that investment risks associated with factors such as contract viability, profits repatriation and payment delays are almost similar in the two regions. Both regions seem to succeed in facilitating trade, as implied by the average *INVP* country ratings that are close to the maximum, which is 12. Another risk indicator given in Table 3 is the one associated with socioeconomic conditions (*SOCEC*). Low values indicate greater dissatisfaction resulting from unemployment, poverty and lack of consumer confidence. The average levels of dissatisfaction in CEE and MENA appear to be almost the same but unpromising. Massive layoffs due to privatization of the state-owned companies in the CEE economies and the high population growth rates along with internal political tensions in the MENA countries seem to be the basic reasons for the persistently poor socioeconomic conditions in the regions. Hence, risks associated with bad socioeconomic conditions appear to be the more important source of uncertainty in the CEE and MENA economies than risks associated with government instabilities and poor investment profiles.

Government service quality is one of the essential indicators of institutions' capacity to accommodate production without unexpected costs. The habit of rent seeking inherent both in the CEE and MENA economies due to authoritarian regimes and overstaffed state-companies constitute the primary problem of trust in governmental institutions in these regions. Correspondingly, the CEE and MENA countries appear with high levels of corruption in their political systems, shown by the average *CORR* rating of 2 out of 6 for both regions in Table 3. Such low figures imply serious treat for international merchants and investors, who will be exposed to unexpected doing-business costs in these regions. Similarly, the strength and the quality of the bureaucracy exhibit equal averages, which are 2 out of 4 for the two regions, as shown by the ratings of *BUREA* in Table 3. It means that bureaucracies in these regions cannot isolate themselves completely from drastic changes in policy or interruptions in government services, except for Israel in the CEE region. This is due to the persistence of state-oriented traditions in governance in CEE and MENA. The strength and the impartiality of the legal systems that associated with the popular observance of the law is another indicator of the good governance. Ratings given in Table 3 show that CEE and MENA regions have superior stances in terms of rule of law and order (*LAW*) compared to their stances in corruption and bureaucratic quality. However, the impartiality and the popular observance of the legal systems in question may not mean good governance for the foreign investors, unless these systems are market-friendly and democratic. As a matter of fact, this situation can be observed for many MENA countries when the ratings of *LAW* and *DEMA* in Table 3 are compared. Many MENA countries have better law and order scores than their democratic accountability scores, which shows the rule of law under authoritarian administrations. Russia is the only case among the CEE countries exhibiting the similar situation.

The cross-country analysis of the influence of institutional disparities can be more informative when the above indicators are exploited in the regression framework by allowing variation in both the time and cross-country dimensions of the data. Therefore, the next section of the study is devoted to a panel data regression analysis to enable the investigation of the relationship between the institutional quality and the TFP in the CEE and MENA countries.

## PANEL REGRESSION ANALYSIS

### Data and the Model

For a consistent cross-country comparative analysis of TFP and its determinants in the economies of the CEE and MENA regions, a panel data regression analysis is preferred so that we can exploit the time-varying information in the data, beside the cross-sectional variations. As the dependent variable of our regressions will be TFP, which, in fact, is the residual part of a relevant production function estimated properly, there is a need for time-varying TFP estimates in our analysis. For this purpose, we exploit the latest TFP estimates provided by the next generation of the Penn World Table (PWT) (Feenstra et al., 2013; Inklaar & Timmer, 2013). These estimates are computed so that they are comparable across-countries, as in the following:

$$CTFP_{ij} = \left( CGDP_i^0 \Big/ CGDP_j^0 \right) / Q_{ij}^T \tag{4}$$

where $CGDP_i^0$ and $CGDP_j^0$ are the real gross domestic products of the countries *i* and *j*, which account for differences in the terms of trade, and $Q_{ij}^T$ is the Tornqvist quantity index of factor inputs, which allows for comparing productivity between the countries *i* and *j* at a given time and computed from

$$lnQ_{ij}^T = 0.5\left(\alpha_i + \alpha_j\right)\left[ln\left(K_i / K_j\right)\right] + \left[1 - 0.5\left(\alpha_i + \alpha_j\right)\right]\left[ln\left(L_i / L_j\right)\right] \tag{5}$$

where $\alpha$ is the output elasticity of capital, of which the value is estimated indirectly by the share of GDP that is not earned by labor. *K* and *L* are capital and labor inputs. Note that the TFP figures, as denoted by *CTFP* in PWT version 8, are computed annually with current reference prices for each country *j* relative to the United States. For an overview, Table 4 gives the 1990-2011 averages of the per capita real GDPs and the TFP levels of the economies in CEE and MENA. According to the figures, there appears to be a correlation such that countries with higher per capita GDP levels are those with higher TFP levels. Thus, the simple correlation coefficient computed with the average figures for CEE countries is 0.8, while that for MENA countries is 0.9, indicating strong positive linear relationships. Per capita income figures in the table clearly show the large income disparity within each region; i.e., Slovenia and the Czech Republic are about 13 times richer than Moldova in the CEE region, and Qatar's per capita income is 18 times that of Iraq in the MENA region. When disparity is considered across the two regions, top-income countries of the MENA are much richer than those in the CEE, whereas, the poor of the CEE are not as poor as those of the MENA. Correspondingly, it is possible to relate income disparity to the presence of significant differences in the TFP levels in these economies. Except for the outliers of the MENA, i.e., Qatar and Kuwait, the developing CEE and MENA economies have TFP levels below the productivity level of the US economy. However, the MENA countries, apart from Jordan and Morocco, have TFP levels very close to maximum levels observed for the CEE economies. As shown before in Table 2, this may not necessarily correspond to higher GDP contributions from TFP in the MENA than in the CEE region.

Source: Penn World Table version 8.0.
CGDPE/POP: Expenditure-side real GDP at current PPPs (in mil. 2005 US$) divided by the population
CTFP: TFP level at current PPPs (USA=1)

Using the log of TFP level as the dependent variable, a fixed effect panel regression is constructed to estimate the influence of the institutional quality on TFP as follows:

$$ln\left(CTFP\right)_{it} = \mu_i + b_t + \sum_{k=1}^{K_1} \beta_k X_{k,it} + \sum_{k=K_1+1}^{K} \beta_k \left(IQ\right)_{k,it} + v_{it} \tag{6}$$

where $\mu_i$ denotes the unobserved country-specific fixed effects; $b_t$ represents dummies for capturing common time effects and $v_{it}$ is the random disturbance term. Here, $X_{it}$ includes the first set of $K_1$ demographic and economic control variables, such as the age dependency ratio (*AGEDEP*), population density (*POPDEN*), degree of openness to international trade (*OPEN*), rate of price inflation (*INF*), government expenditure to GDP ratio (*GOVX*), energy import ratio (*ENERM*), and number of telephone lines (*TLINES*). The other left-hand side variables of the TFP regression are denoted by $IQ_{it}$, which are various institutional quality indicators frequently used in the literature, i.e., the Gastil index (*GASTIL*), a country risk indicator (*RISK*), and a composite index for the quality of the governmental services (*GSQ*). The sub-indices of the *RISK* index, that is, the government stability index (*GOVST*), the investment profile index (*INVPR*), and the socioeconomic conditions index (*SOCEC*) on the one hand, and the sub-indices of the *GSQ* index, that is, the corruption index (*CORR*), the law and order index (*LAW*) and the bureaucracy quality index (*BUREA*) on the other hand, are also used as regressors for detailed

analysis of the institutional quality.[8] In our regression estimations, we exploit a generalized least squares (GLS) method that takes into account the possibility of different residual variances for each of the cross-sectional units. Hence, standard errors of the regression are cross-section correlation-consistent error estimates (Beck & Katz, 1995).

## Estimation Results

### Basic Model Estimates

The first set of regressions given in Table 5 are estimated separately for the whole sample of countries, for the Central and Eastern Europe (CEE) countries and for the Middle East and North Africa (MENA) countries, respectively, in the first three columns of the table. When the sizes and the statistical significances of the *K* regression coefficients in the first column are compared with those in the second and third columns, it is seen that the whole sample estimates do not reflect the information provided by the estimates for the separate regions, which means that a cross-regional distinction should be taken into account in the analysis. As the difference in the influences of the age dependency ratio *AGEDEP* on the TFP levels between the CEE and MENA regions shows, there may even be adverse effects in the two regions. However, because high levels of age dependency may influence TFP from different channels with different outcomes, there cannot be a clear-cut a priori expectation about the sign of the *AGEDEP* in regressions. The significant and negative sign found for the CEE case (in column 2) is consistent with the arguments that higher age dependency in a population crowds out funds financing investments that can help to increase TFP. On the other hand, the significant and positive sign of *AGEDEP* found for the MENA case (in column 3) may be interpreted in accordance with the arguments interpreting the increase in age dependency as an indicator of the increase in longevity or human health quality. In this respect, when trends in the Human Development Index (HDI) of these two regions are analyzed between 1980 and 2013, it is seen that the MENA region has an upward HDI trend much steeper than that in the CEE region, however, starting from a relatively low average index value. Not until 2000 does the MENA region reach the 1980-average of the CEE region. At present, the 2013-average of the HDI is 0.76 in the MENA and 0.80 in the CEE. Thus, we think that due to the differences in the initial endowments of the demographic structure in these two regions, the percentage influence of the changes in the age dependency ratio on TFP levels in the 1990-2011 period appears with different outcomes. However, the increases in the population density (*POPDEN*) appear to affect TFP levels negatively in both regions, implying that population growth prevents institutions from restoring efficiency in the economy. It is an evident fact that the increased quality of human capital both in terms of education and health improves efficiency in the use of technology and in resources allocated for technological development.

The indicators named as *OPEN*, *INF* and *GOVX* are included as regressors to capture the influence of economic institutions on TFP level. Although openness to international trade is usually assumed to affect TFP positively, with the rationale that free flows of goods and services across countries lead to the adoption of more efficient techniques of production, our findings implied by the negative coefficients on *OPEN* in regressions point to an inverse relationship between openness and TFP in both CEE and MENA regions. One explanation for this controversy may be the fact that when the degree of openness is measured by the volume of trade (exports plus imports), it may be much more an indicator of the degree of vulnerability to external shocks in less developed economies rather than an indicator of the quality of technology adoption. Since international trade in less developed economies is sensitive to

fluctuations in partner's demand and in exchange rate markets, negative influences of these fluctuations on economic growth may explain the deterioration in TFP, which is, in fact, nothing but the residual growth that cannot be explained by the changes in factor growth. Hence, we conclude that higher volume of trade does not imply a better performance in adopting technological change in the CEE and MENA economies, but rather implies shocks to current account balance deteriorating the TFP. The rate of price inflation (*INF*), which is employed as a proxy indicator of the discipline in monetary policy making, has significantly negative regression coefficients in the estimations. This means that the poor performances of the monetary policy makers and the governments in preserving the price stability reduce TFP in both the CEE and MENA economies. From another perspective, it can be argued that the negative sign on

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*INF* in the regressions may be an indicator of the adverse supply-side effects of inflation on productivity in the CEE and MENA economies. On the other hand, a higher government size or a lower fiscal discipline, denoted by the GDP share of government expenditures (*GOVX*), seems to be reducing TFP only in the MENA economies. Although the average GDP share of government expenditures in the CEE region is higher than that in the MENA region, TFP changes seem to be more responsive to government spending in the latter, maybe because the allocation of government spending in the MENA countries is not as efficient as that in the CEE region, due to institutional deficiencies.

The inclusion of the variables *ENERM* and *TLINES* aims at accounting for the influence of the comparative advantage owing to the abundance of natural resources that allow for cheap energy use and the influence of the infrastructure on productivity. As seen in the coefficients of *TLINES* in the regressions, this variable captures the positive effect of infrastructure on TFP well in both regions. As expected, *ENERM* appears with significantly negative coefficients in the regressions for MENA because the MENA countries have very disparate ratios of exported and imported energy use. For example, according to the 2000-2011 averages, while Qatar, Kuwait and Iraq export about 300-400% of their energy use, Israel, Jordon and Morocco import about 90-95% of their energy use, and there are countries in between. On the other hand, the countries in the CEE region are all net importers, except for the Russian Federation. We argue that the disparity in the natural resources in the MENA region is an important source of variation in TFP levels in the MENA economies.

Finally, the effect of institutional quality on TFP is investigated through the estimated regression coefficients on the three different institutional indicators, i.e., *GATSIL*, *RISK*, and *GSQ* in Table 5. The first is a composite index combining the indices of 'civil liberties' and 'political rights', which is published by the Freedom House and known as the Gastil index in the literature. Higher values of these indices imply lower levels of freedom. The second is an index based on the average of the 'government stability', 'investment profile' and 'socioeconomic conditions' ratings, while the third one is an index based on the average of the 'corruption', 'bureaucracy quality' and 'law and order' ratings of the International Country Risk Guide (ICRG). Higher values for each of these indices imply better quality for the issue in question. Hence, the negative and statistically significant coefficients on *GASTIL* in the regressions mean that TFP improves along with the freedom environment in both regions. Similarly, if, due to government instabilities together with poor investment profile and socioeconomic conditions, the total *RISK* can be reduced by the relevant institutions, the TFP increases significantly both in CEE and MENA. In accordance with the positive TFP effects of higher freedom and lower risk, the higher quality in governmental services, denoted by *GSQ* in regressions, also exhibits significantly positive effects on TFP in both regions. Overall, it can be concluded that there is significant statistical evidence that institutional quality plays a crucial role in TFP in the economies in question.

In order to test if the effects of institutional quality on TFP in the two regions differ from each other significantly, we run regressions with two regional dummies by assuming that all of the slope coefficients are different in the two regions, i.e., $\hat{\beta}_{\mathrm{k,MENA}} \neq \hat{\beta}_{\mathrm{k,CEE}}$. The coefficient differences and their statistical significances are given in the fourth column of Table 5 together with their standard errors. Leaving the interpretation of the estimates on other variables to the reader for brevity, we focus only on the estimates associated with the institutional quality indicators. According to the statistical significances reported in Table 5, total factor productivity in MENA is found to be more sensitive to freedoms (*GATSIL*) than those in the CEE region. The positive effects of lower *RISK* and higher quality in governmental services (*GSQ*) on TFP are found equally important in both regions. This implies that the MENA countries

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

should primarily focus on reforming their institutions so as to improve civil liberties and political rights for a better economic environment. Bad impressions about civil liberties and political rights in a country discourage international flow of funds and knowledge, which are the major impetuses of innovations and technological changes. The MENA countries are already less advantageous in terms of these impetuses compared to the CEE countries, since the latter are very close to developed Europe both culturally and geographically.

## Implications

Our estimation results imply that institutional structures that increase freedoms, reduce risks and improve governance quality can significantly contribute to TFP growth in the CEE and MENA regions. Because of the authoritarian institutions inherent from the past, the two regions need to increase their institutional quality to encourage the inflow of innovative knowledge through trade and investment. Moreover, our estimations point out that TFP changes in MENA countries are more sensitive to changes in civil liberties and political rights than those in CEE countries. This can be explained by the prevailing conflicts and tensions in the region, which delay the democratization of the institutions in MENA.

## Detailed Model Estimates

The estimations in Table 6 are carried out to allow analysis of the influences of *RISK* and *GSQ* on TFP in detail through exploiting them in components. Estimations in the first three columns of Table 6 imply that government stability (*GOVST*), which is an assessment of the government's ability to carry out its declared programs and its ability to stay in office, has no statistically significant effect on TFP in either of the regions. However, the investment profile (*INVPR*), which is a measure of the risks to investment that are not covered by other political, economic, and financial risk components, appears to have a statistically significant influence on TFP only in the MENA region. On the other hand, the socioeconomic conditions (*SOCEC*) indicator, which reflects the pressures at work in society that could constrain government action or fuel social dissatisfaction, is found to have a significant effect on TFP in the CEE region. However, among these three sub-indices of *RISK*, the regional difference is significant only in terms of the effects of socioeconomic conditions on TFP. Though at a weak significance level, this finding implies that the positive influence of good socioeconomic conditions on productivity is more important in the CEE than in the MENA region.

The last three columns of Table 6 contain the estimations detailed for the sub-indices of *GSQ*. According to the regression coefficient estimates, while the lower corruption within the political system (*CORR*) and the higher bureaucracy quality (*BUREA*) are estimated to influence TFP in MENA, the strength of the legal system (*LAW*) effects TFP in the CEE. However, when these individually significant effects are tested in comparison to each other, regional differences are statistically significant, however, at 10% level only in terms of the effects of *CORR* and *LAW* on TFP. That is, while productivity is affected more by corruption in MENA, it is affected more by the strength of the legal system in CEE.

## Implications

Our estimation results, which are based on the disaggregation of the risk indicator used, imply that TFP growth in CEE is significantly affected by changes in socioeconomic conditions. This finding can

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

be explained by the fact that the CEE countries, most of which are EU members, have improved their investment profile and government stability but still have bad socioeconomic conditions (high unemployment, severe poverty, and poor consumer confidence). In the EU standards, bad socioeconomic conditions signify a serious institutional deficiency in the economy, which discourage the inflow of the good quality human capital that can increase TFP. Therefore, TFP growth in CEE is sensitive to changes in socioeconomic conditions. On the other hand, TFP growth in MENA is significantly affected only by changes in the investment profile, because government stability in the MENA region is generally an authoritarian one, which has no potential to encourage TFP-increasing investments, and because the socioeconomic conditions in MENA are chronically bad, which decrease the relative significance of the problem for TFP growth.

The disaggregation of the government service quality indicator in the estimations points out that reducing the level of corruption in the political system improves TFP significantly in MENA. Although its statistical significance is not so high, bureaucratic quality has also a similar effect on TFP in MENA. This shows that incentives of TFP in the MENA region are influenced positively by the institutional structure that deports rent-seeking behavior. Finally, the rule of law is found to be weakly significant in CEE, but not in MENA. This implies that the legal system makes sense for TFP incentives, only if the system is democratic and market-friendly.

## CONCLUDING REMARKS

This chapter is an attempt to analyze the determinants of total factor productivity in the Central and Eastern Europe and the Middle East and North Africa regions, with a special emphasis on institutional quality. The analysis in this study focuses on the total factor productivity issue, which is challenging because it is the most controversial source of economic growth in the literature. Although average figures do not lend support for any substantial contribution from total factor productivity to GDP growth in the CEE and MENA regions, their average contribution rates are above the world average in the 2000-2013 period. Although the average rate of contribution from total factor productivity in the MENA region is slightly above the world average, the CEE region has the second highest average rate (1.45%) after the Central Asia region (4.18%) along with GDP growth rates at 3.76% and 7.30%, respectively. Hence, analyzing the driving forces behind total factor productivity changes in these regions is crucial to develop policies for growth based on sources other than factor accumulation.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In this chapter, when various institutional quality indicators are analyzed prior to constructing their relationships with TFP, it is seen that civil liberties and political rights in the MENA countries are substantially worse than those in the CEE countries. Many studies in the literature show that the lack of a freedom environment is the major obstacle against a stable economic growth. Transfer of new ideas and knowledge, which can be succeeded through trade and investment inflows, increases total factor productivity through innovative technologies and through the increase in the quality of human capital. Moreover, indicators show that both the CEE and MENA regions are characterized with high levels of corruption in politics and low bureaucracy quality, which implies the existence of poor quality institutions that are far from establishing a safe investment environment in these regions. The differences in the demographic and cultural endowments of the two regions are inevitably reflected in their governance structure. Despite the fact that CEE has an autocratic governance history due to the communist regime, indicators point to higher levels of democratic accountability in this region compared to MENA, most probably owing to the inherited democracy culture of the old Europe. In similar vein, military and religious participations in politics appear to be more common in the MENA countries according to the ratings of the relevant indicators. Such political structure ironically seems to increase the government stability ratings of the MENA countries, if these ratings, which are higher than those in CEE, cannot be explained by some other reasons.

Our regression estimates, which aim at investigating the influence of institutional factors on TFP, imply that the freedom environment, investment risk and the quality of the governmental services are the significant determinants of productivity in the CEE and MENA regions. However, a statistically significant regional difference exists only in the influence of the freedom environment, proxied by the Gastil index. When the estimations are carried out alternatively by the components of the investment risk and the quality of the governmental services, the investment profile and corruption are found the sole statistically significant determinants of total factor productivity in the MENA region, while socioeconomic conditions are found to effect productivity significantly in the CEE region. Bureaucracy quality and the strength of the legal system also appear to affect productivity in MENA and CEE, respectively, however, at a weak significance level.

To summarize, the strongest statistical evidence of regional differences in institutional influences on productivity are observed for the institutional quality indicator measured by the Gastil index, which is the combination of the civil liberties and political rights ratings. This evidence is consistent with the arguments in the literature that a freedom environment is one of the crucial determinants of cross-country total factor productivity disparities in the world economy. Within each region, investment risk and the quality in governmental services, and some of their components are also found to influence total factor productivity. Overall, the results demonstrate the sensitivity of total factor productivity to cross-country and cross-regional variations in the institutional quality in CEE and MENA.

Further research may focus on the determinants of the total factor productivity contribution to GDP in the CEE and MENA regions, rather than focusing on the determinants of the level of total factor productivity, as done in this study.

## ENDNOTES

1. See Islam (1999) for an extensive review of the methodologies and results of the cross-country studies concerning total factor productivity and see also Felipe (1999) surveying the literature on total factor productivity growth in East Asia.
2. Henceforth, the MENA region includes only the countries Bahrain, Egypt, Iran, Iraq, Israel, Jordan, Kuwait, Morocco, Qatar, Saudi Arabia, and Tunisia, which form the sample used in our regression estimates in the following section.
3. Henceforth, the CEE region includes only the countries, Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Moldova, Poland, Romania, Russian Federation, Serbia, Slovak Republic, Slovenia, and Ukraine, which form the sample used in our regression estimates in the following section.
4. See Sachs and Warner (2001) and Gylafson (2001) for the discussions of the curse of natural resources.
5. See the Appendix for the definitions and sources of the data.
6. High values of CL and PR imply low freedoms.
7. High values of the ICRG indices imply the favorable stance.
8. The sample period of the study is limited to the 1990-2011 period due to the lack of comparable data before 1990 for the CEE economies. Detailed definitions and the sources of all variables are given in the Appendix.

## ABSTRACT

*Economic emission dispatch (EED) problems are one of the most crucial problems in power systems. Growing energy demand, limited reserves of fossil fuel and global warming make this topic into the center of discussion and research. In this chapter, we will discuss the use and scope of different quantum inspired computational intelligence (QCI) methods for solving EED problems. We will evaluate each previously used QCI methods for EED problem and discuss their superiority and credibility against other methods. We will also discuss the potentiality of using other quantum inspired CI methods like quantum bat algorithm (QBA), quantum cuckoo search (QCS), and quantum teaching and learning based optimization (QTLBO) technique for further development in this area.*

## INTRODUCTION

Electrical power system of almost all countries in the world mainly consists of thermal plants which use fossil fuel such as coal, oil and gas to produce electricity. The use of fossil fuels increases tremendously due to the rapid economic growth in the developing countries especially in China and India. At the same time, the capacity to deliver fossil fuels as per their growing demand are limited due to limited production capacity and lack of infrastructure such as pipelines, refineries and terminal capacities. In order to build such infrastructure to support such increasing demand of fossil fuels could cost trillions of dollars (Birol, 2004). Moreover fossil fuels are always not easily accessible to all as fossil fuel reserves are concentrated in a small number of countries. Almost 85% of the world's total coal reserves are located in just eight countries (Dudely, 2015). Again, more than 65% world's total gas stock has been found in only four countries (Agency, 2015) and eight countries (six of them are OPEC members) have almost 80% of the world's total proved oil reserves (Dudely, 2015). Some of these countries may exercise their power to restrict supply or influence the supply of fossil fuels. On the other hand, with the increase of economic growth fossil fuels reserves are declining. According to a research conducted by S. Shafiee and E. Topal, coal will be the only fossil fuel remains after 2042 (Shafiee & Topal, 2009). Several other studies indicate that projected crude oil reserves will run out between 2050 and 2075 (Ivanhoe, 1995; Walsh, 2000). From these studies, it is very clear that fossil fuels will become distinct and too expensive in the near future, which will lead the electricity production to be much more expensive.

In addition, thermal plant is one of the main sources that releases polluted particulates and gases into the air such as sulfur dioxide ($SO_2$), carbon dioxide ($CO_2$), nitrogen dioxide ($NO_2$), ozone ($O_3$) etc. Burning coal can even cause to emit radioactive materials (McBride, Moore, Witherspoon, & Blanco, 1978) and toxic heavy materials like arsenic, mercury etc. Sulfur and nitrogen dioxide contribute to smog and acid rain, whereas large emission of carbon dioxide is contributing to the greenhouse effect which ultimately leads us to global warming. Global warming has far-reaching, long-lasting and, in many cases, devastating consequences on environment. As the temperature is rising due to global warming, lower areas of the world will soon be flooded by sea water.

Therefore, it is important to employ a model that optimizes both the generation/fuel cost as well as the cost associated with the control of emissions from thermal unit operation and other constraints. Both the objectives cannot be optimized simultaneously and hence there exist a conflict between them. This conflicting behavior gives rise to a type of optimization called multi-objective optimization. The economic emission dispatching (EED) option is an attractive option (Kumar, Bavisetti, & Kiran, 2012), where the objective is to minimize fuel cost and polluted emission while satisfying all constraints including transmission loss, load balance, upper and lower generation of thermal unit, ramp rate limit, prohibited zone of thermal unit etc. Multiobjective optimization with two or more objective functions that are usually noncommensurable and conflicting in nature often gives rise to a set of optimal solutions rather than a single optimal solution. It is because that none of the solution can be considered to be better than any other solutions with respect to the objective functions. All these optimal solutions are known as Pareto-optimal solutions. Fuzzy set theory (Vasant, 2006) often utilized to get the best compromised solution from obtained Pareto-optimal set of nondominated solutions (Abido, 2003).

## Computational Intelligence (CI)

Being a relatively new field for the researchers, Computational Intelligence (CI) has no such fixed accepted definition (Xing & Gao, 2014). However, researchers have tried to define CI through their own understanding about it. Roughly, CI can be said to be a heterogeneous field of computer science that can be defined as any biologically, naturally, linguistically or any other sciences like Physics, chemistry, mathematics etc. motivated computational paradigms that include, but not limited to, artificial neural network (NN), connectionist machine, fuzzy system (FS), evolutionary computation (EC), autonomous mental development, and hybrid Intelligent System (IS) in which these paradigms are contained (Duch, 2007; Manju & Nigam, 2014; Xing & Gao, 2014). Genetic algorithm, particle swarm optimization, ant colony, harmony search, gravitational search, cuckoo search, artificial bee colony etc. and their hybridization versions are some of the examples of CI methods.

## Advantages and Applications of CI

CI methods are gradually replacing classical Artificial Intelligence (AI) approaches for their broad applicability, robustness to dynamic environments and self-optimization capability which established its role as an optimization and design tool in various fields such as in emerging energy technologies (Senvar, Turanoglu, & Kahraman, 2013), prognostic and health management (Bonissone, Hu, & Subbu, 2009), automated insurance underwriting (Bonisone, Subbu, & Aggour, 2002), interpretation of medical images (Tadeusiewicz, 2008), medical diagnosis (Steimann & Adlassnig, 1998), plug-in hybrid electrical vehicle (PHEV) charging stations (Rahman, Vasant, Singh, & Abdullah-Al-Wadud, 2015), supply chain management (Che, 2010) etc. On the other hand, AI based approaches face severe challenges when dealing with multi-object nature of design problems as these are purely rule based approach and when taking an action which involves a number of parameters to decide upon in combination (Manju & Nigam, 2014). Use of synergistic combinations of CI methods are proved efficient in multi-object multi parameter nature of design problems as it allows combining the strength of several CI methods by letting each method to take care of a certain issue constituting the complexity of the problem (Bittermann, 2010).

## Quantum Computational Intelligence (QCI)

QCI is the extension of CI into the domain of quantum computing (QC). Quantum computation is a computation based upon the time evolution of a physical system, characterized by certain principles of Quantum Mechanics (QM) and very much probabilistic in nature. Two important and powerful ideas of quantum computation are quantum parallelism and entanglement (Ventura & Martinez, 1998). Quantum parallelism is referred to the fact that a quantum system exists as a superposition of many states at once, and therefore computation involving the system is simultaneously applied to all states represented in the quantum system. Entanglement is the non-classical correlations that can exist between different quantum systems through which the systems may be said to communicate (Ventura, 1999). Quantum genetic algorithm, quantum particle swarm optimization, quantum evolutionary algorithm etc. are some of the known QCI methods.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Advantages of QCI Over Other Methods

Quantum computation is very counterintuitive and even unsettling from a physical standpoint but from a computational standpoint it can predict results with high level of accuracy and has provided us with perhaps the most accurate physical theory ever. The advantage of quantum inspired algorithm is that it can exploit massive quantum parallelism which can be expressed as the principle of superposition. This phenomenon is combined with existing methods of CI, thus instead of a single state, a superposition of states will be used, resulting all these states compute in parallel. As a result it will increase the speed of computation by many orders of magnitude (K.-H. Han & Kim, 2002; Hogg & Portnov, 2000). For this reason Quantum Inspired CI has been shown used in solving a wide range of problems and many efficient strategies have been proposed as improvement (Manju & Nigam, 2014).

## Some QCI Methods and Their Applications

Kak first proposed the concept of quantum neural computing (QNC) in 1995 (Kak, 1995). Later T. Menneer and A. Narayanan developed quantum inspired neural network (QNN) where they introduced some basic concepts inspired by quantum theory for use in neural network training (Narayanan & Menneer, 2000). Finally, Gupta et al. presented QNN as a potential way to build scalable parallel computers with the help of quantum computing under very tight constraints (Gupta & Zia, 2001). QNN successfully used in medical application (Gandhi, Prasad, Coyle, Behera, & McGinnity, 2014; Karayiannis et al., 2006), image compression (Kouda, Matsui, & Nishimura, 2002), fault diagnosis in integrated circuits (Zhu, Chen, & Yang, 2005) etc. Researchers begin to introduce quantum computing phenomenon of performing efficient parallel computations into the classical evolutionary methods to overcome their shortcomings thus introducing quantum inspired evolutionary methods (K.-H. Han & Kim, 2002). This technique has proved very resource consuming even a classical computer. Quantum inspired evolutionary algorithms have been used in solving unit commitment problem (Lau, Chung, Wong, Chung, & Ho, 2009), knapsack problem (Zhang, Gheorghe, & Wu, 2008), economic dispatch (Neto, Bernert, & Coelho, 2011), for determining the optimal operating strategy, cost optimization and reducing emissions of a micro-grid etc.(Hosseini, 2014).Other QCI methods like quantum inspired genetic algorithm and quantum inspired particle swarm optimization will be discussed later into this chapter.

# BACKGROUND

In electrical power generation system, the goal of economic dispatch (Wood & Wollenberg, 2012) is to find an optimal combination of power generation in order to minimize the total production cost satisfying all other constraints like transmission loss, load demand, generation limit in each generating unit, generator ramp rate limit etc. On the other hand, emission dispatch deals with the minimization of total emission of hazardous gas and particulates in the generation plant. Thus economic emission dispatch (EED) problems of an electrical power generation system can be formulated as an optimization problem in which two conflicting parameters i.e. fuel cost and emission of hazardous gases and particulates are minimized simultaneously to ensure optimal output of generated power whilst satisfying all other equal and unequal constraint.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Problem Formulation

The general simplified fuel cost function or the object function can be mathematically formulated as (Kothari, 2012),

$$F(P) = \sum_{i=1}^{n} a_i P_i^2 + b_i P_i + c_i \tag{1}$$

where,

$F(P_{gi})$= Total fuel cost, (in \$/hr)
$P_{gi}$= Real Power Output of the $i^{th}$ generating unit
$a_i, b_i, c_i$= Cost coefficients of the $i^{th}$ generating unit

The emission function which can also be defined by a quadratic function (Kothari, 2012) can be formulated as,

$$E(P) = \sum_{i=1}^{n} d_i P_i^2 + e_i P_i + f_i \tag{2}$$

where,

$E(P_{gi})$= Emission Function (in Kg/hr)
$d_i, e_i, f_i$= Emission coefficients of $i^{th}$ generating unit

Researchers have also used cubic function to define and formulate economic and emission dispatch problem (Krishnamurthy & Tzoneva, 2012). Polynomial function effectively reduces the nonlinearity and thus gives actual response of power generating unit. However, to limit the scope of this book chapter the authors only focus on quadratic function which is the most used fitness function to solve EED problems.

Fuel cost and emission of hazardous gases and particulates are two conflicting objectives to be achieved. When fuel cost decreases, emission increases and decrease of emission will increase the fuel cost. Thus sometimes both objectives are converted into a single objective function (Krishnamurthy & Tzoneva, 2012) with the help of a penalty factor. The combined economic emission dispatch problem can then be formulated as,

$$OF = F_T = \sum_{i=1}^{n} F(P_{gi}) + \sum_{i=1}^{n} h_{i,\max/\max} E(P_{gi}) \tag{3}$$

where,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Penalty factor, $h_i = \sum_{i=1}^{n} \frac{F(P_{i,\max})}{E(P_{i,\max})}$

$$\sum_{i=1}^{n} F(P_{i,\max}) = \sum_{i=1}^{n} a_i P_{i,\max}^2 + b_i P_{i,\max} + c_i \tag{4}$$

$$\sum_{i=1}^{n} E(P_{gi,\max}) = \sum_{i=1}^{n} d_i P_{gi,\max}^2 + e_i P_{gi,\max} + f_i \tag{5}$$

Economic emission dispatch problems are often subjected to constraints. Some of the most common constraints in electrical power generation systems are given as follows,

1. **Equality/Power Balance Constraint:** Total generated power must be able to meet total system demand considering total system loss. It can be formulated as,

$$\sum_{i=0}^{N} P_{gi} = P_{SD} + P_L \tag{6}$$

where,

$N$ = Total number of generation unit.
$P_{SD}$ = Total system load demand.
$P_L$ = Total transmission loss.

2. **Inequality/Generation Limit Constraint:** There will be some upper as well as lower limit for each generation unit. Thus, the power generation of each generation unit must be within these limits. It can be formulated as,

$$(P_{gi})_{\min} < P_{gi} < (\mathrm{P}_{gi})_{\max} \tag{7}$$

where,

$(P_{gi})_{\max}$ = Maximum power output by $i^{\text{th}}$ generating unit.
$(P_{gi})_{\min}$ = Minimum power output by $i^{\text{th}}$ generating unit.

3. **Generator Ramp Rate Limit:** Generating units are restricted to operate in certain operating zone due to their ramp rate limits and thus operate in two adjacent specific operation zones. To formulate EED accurately, generator ramp rate limit must be taken into account. The power output of each generating unit then can be formulated as,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$Max(P_i^{\min}, P_i^{t-1} - DR_i) \le P_i^t \le Min(P_i^{\max}, P_i^{t-1} + UR_i) \quad (8)$$

where $P_{gi}^{t-1}$ is active power generation of the $i^{th}$ unit at the $(t-1)^{th}$ hour, $P_{gi}^{t}$ is real power output of the $i^{th}$ generating unit at the $t^{th}$ hour, $DR_i$ and $UR_i$ are down rate and up rate limits of the $i^{th}$ unit respectively.

## Related Works on Economic Dispatch

Classical mathematical programming based methods like lambda iterative method (Zhan, Wu, Guo, & Zhou, 2014), Lagrange multiplier (Thang & Asme, 2012), Lagrangian relaxation (Hindi & Ab Ghani, 1991), interior point methods (Balbo, Souza, Baptista, & Nepomuceno, 2012), Bender's decomposition algorithm (Abdolmohammadi & Kazemi, 2013), gradient method (C.-L. Chen & Wang, 1993), linear programming (Farag, Al-Baiyat, & Cheng, 1995; Somuah & Khunaizi, 1990), nonlinear programming (X. Han, Gooi, & Kirschen, 2001), dynamic programming (Liang & Glover, 1992) etc. had been used to solve economic dispatch problem for their certain advantages like availability to large-scale problems, mathematically proven optimality, fast computational speed (in some algorithms), no problem specific parameters to define etc. (Bansal, 2005). However, some of these conventional methods require the unit input-output curves of generators. But, these curves do not increase monotonically due to operating zones of the approaches. Thus, the conventional dispatch algorithms cannot be directly used to optimize such nonlinear cost function. To overcome these limitations, conventional algorithms often hybridized with other (especially intelligent) algorithms like Hopfield neural network (Dieu & Ongsakul, 2011), differential evolution (Duvvuru & Swarup, 2011) etc. and let these handle the part that cannot be handled efficiently by them (conventional algorithms). In the conventional economic dispatch problem, the cost function for each generator approximately represented by a single quadratic function (Ling, Lam, Leung, & Lee, 2003). But, the characteristics of generating units are highly nonlinear inherently, because of different constraints in the power system. Again, polynomial function can handle nonlinearities in the system (as discussed earlier) for that reason some researchers also used cubic function to solve economic dispatch problem (Adhinarayanan & Sydulu, 2006; Truong, Vasant, Balbir Singh, & Vo, 2015). However, most of the researchers ignored higher order polynomial to avoid excessive complexities and higher computational time. Intelligent and stochastic algorithms like artificial neural networks (ANN) (Yalcinoz & Short, 1998), evolutionary programming (EP) (Sinha, Chakrabarti, & Chattopadhyay, 2003), biogeography based optimization (BBO) (P. Roy, Ghoshal, & Thakur, 2009), nature-inspired meta-heuristic algorithms like genetic algorithm (GA) (Ling et al., 2003), tabu search (TS) (Naama, Bouzeboudja, & Allali, 2013), ant colony optimization (ACO) (Pothiya, Ngamroo, & Kongprawechnon, 2010), particle swarm optimization (PSO) and it's variants (Chaturvedi, Pandit, & Srivastava, 2008; J.-B. Park, Jeong, Shin, & Lee, 2010; J. B. Park, Lee, Shin, & Lee, 2005; Selvakumar & Thanushkodi, 2007), cuckoo search (M. Basu & Chowdhury, 2013), bat algorithm (BA) (Gherbi, Bouzeboudja, & Lakdja, 2014), etc. successfully used for solving economic dispatch problems. ANNs have self-adapting capabilities that make them suitable against nonlinearities, uncertainties and parameter varieties which are common in economic emission dispatch problems. One of the advantages of stochastic optimization methods is that it can solve economic dispatch problem without any or fewer restrictions on the shape of the cost function curves for their ability to seek the global optimal solution. In the meantime, intelligent techniques suffer from the drawbacks of long computation time (in some algorithms) and large number of arbitrary or problem-specific parameters (Xia & Elaiw, 2010).

## Related Works on Economic Emission Dispatch Problem

Like economic dispatch problem, scholars previously focused on classical conventional methods like Lagrangian relaxation (Shalini & Lakshmi, 2014), Newton Raphson method (S.-D. Chen & Chen, 2003), Quadratic programming (Ji-Yuan & Lan, 1998), linear programming (El-Keib & Ding, 1994) etc. to solve economic emission dispatch problem. Conventional techniques have certain advantages over other methods like they don't have any problem specific parameters, their optimality are mathematically proven and some of them are computationally fast etc. (Papageorgiou & Fraga, 2007). These methods as usual suffer from non-satisfactory results and take large computational time for nonlinear and nonconvex complex problems. Furthermore, in conventional techniques, the economic emission dispatch problem was tackled considering only one loading condition for a given system (Krishnan & Krishnan, 2011). The impact of different loading conditions on the shape of Pareto optimal set was not addressed in the most of the traditional methods.

In second stage, researchers focused on stand-alone intelligent methods to solve the EED problems and finally most of the researchers are now focusing on hybrid intelligent techniques to tackle economic emission dispatch problems. In the early stages of using intelligent techniques to tackle EED problems, fuzzy logic controlled genetic algorithm has been exploited by Song et al. to solve EED problem and compared with conventional GA and Newton-Raphson method to validate its performance (Song, Wang, Wang, & Johns, 1997). Basu came up with particle swarm optimization based goal-attainment method to solve EED problem considering the ramp rate limit of the generating units (M Basu, 2006) where he used goal-attainment method to convert this multiobjective problem into a single objective problem then solved the problem with the help of PSO. But, PSO technique sometimes prematurely converges to local optima. To counter this problem, different improved and modified versions of PSO later used in solving EED problems (Bahmani-Firouzi, Farjah, & Azizipanah-Abarghooee, 2013; Jadoun, Gupta, Niazi, & Swamkar, 2015; Mandal, Mandal, Bhattacharya, & Chakraborty, 2015). New nature inspired metaheuristic Cuckoo Search (CS) algorithm had been used recently to solve EED in 3-unit and 6-unit thermal system (Thao & Thang, 2014). Obtained result showed that CS gives better result than TS and non-dominated sorting genetic algorithm (NSGA-II) and similar performance as BBO in the first system, whereas it's emission cost is higher than TS and same as in BBO and NSGA-II. However, in both systems CS takes less time to reach the convergence point. Almost in the same time, fuzzy set theory integrated CS algorithm was exploited to solve EED problems (Chandrasekaran, Simon, & Padhy, 2014). This method had been tested in 6-unit test system, IEEE standard 24 and 118 bus system which validated its effectiveness on this complex problem. Apart from these methods, some new intelligent methods like bacterial foraging (Hota, Barisal, & Chakrabarti, 2010), differential evolution (Abou El Ela, Abido, & Spea, 2010), firefly algorithm (Apostolopoulos & Vlachos, 2011), teaching and learning based optimization (Niknam, Golestaneh, & Sadeghi, 2012), bat algorithm (BA) (Ramesh, Chandra Jagan Mohan, & Veera Reddy, 2013) etc. have been exploited to reduce fuel and emission cost in electrical power generation systems.

From the recent literature on solving EED problems, the authors can assume that researchers are now more interested to use hybrid algorithms instead of stand-alone algorithms. An improved version of PSO that can represent the control variables in natural way was introduced with GA to improve the overall performance against EED problems (Roselyn, Devaraj, & Dash, 2011). Combinational approach of biogeography based optimization and powerful differential evolution algorithm presented in (Bhattacharya & Chattopadhyay, 2011). This hybrid algorithm searches for global optimum in two different

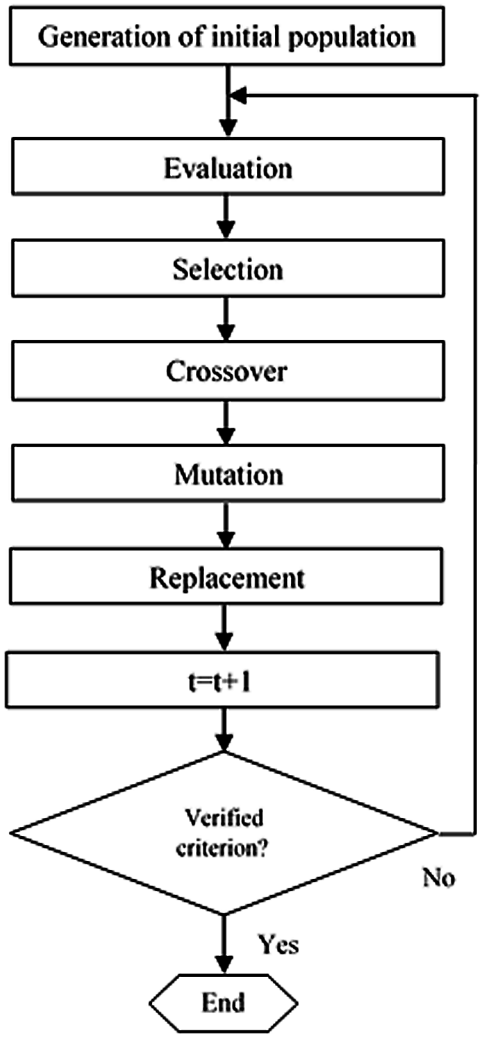
EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

steps, migration and mutation. Several tests with different number of units confirmed that this proposed method performed better than other methods like NSGA-II, fuzzy logic controlled GA (FCGA), PSO, BBO and Newton-Raphson. regarding solution quality and computational efficiency A novel hybrid PSO with gravitational search algorithm was proposed to solve EED problem considering various practical constraints by Jiang et al. where the authors incorporated the social element of PSO with the motion element of GSA (Jiang, Ji, & Shen, 2014). The result of proposed hybrid method was compared with PSO and GSA separately which showed its superior performance over these methods when used separately. Dieu and Ongsakul proposed a combination of Lagrangian function and continuous Hopfield neural network which gave better global solution and less convergence time (Dieu & Ongsakul, 2010). This method can be considered as a good example of a conventional and intelligent technique hybridization. Hybrid optimization techniques provide better solution for EED problems especially in the cases where the processes are too complex to be analyzed by conventional or stand-alone techniques (Krishnan & Krishnan, 2011).

## LITERATURE REVIEW

### Quantum Genetic Algorithm (QGA)

Genetic algorithm (GA) is a classical nature inspired algorithm that has been used to solve the combinational or nonlinear optimization problem with non-differential or complicated constraint condition. Figure 1 shows the complete process of GA. Although, GA has been used to solve EED problem for its parallel computing character and the ability of adaptive search (Koridak & Rahli, 2010), its more iterative approach with slow convergence speed easily makes it fall into local optimum. A. Narayanan and M. Moore proposed QGA which introduced the quantum theory into GA (Narayanan & Moore, 1996). Due to its stronger search capability and more efficient and simple characteristics, QGA has been proven to be a favorable technique to tackle economic emission dispatch problems of power generation systems (G.-C. Liao, 2012).



*Gwo-Ching Liao,* in his developed algorithm (G. C. Liao, 2010), exploited the global optimization ability of genetic algorithms with local searching capability based quantum probability model, the sensitive dependence of chaotic algorithms to initial value and the traverse of the search space to establish a new improved quantum evolution algorithm known as Chaotic QGA (CQGA). More about chaotic systems and their recent implication can be found in (Köse & Arslan, 2013). In CQGA method, quantum bit was adopted for problem coding. One of the features of this algorithm was the quantum choromosome was generated using quantum encoding and it carries information about multiple states which ultimately helped to produce a richer population than the simplistic genetic method. The population possessed inherent diversity with this method, thus it wasn't prone to fall into the local optimal trap during the optimization process. Simulated results showed that CQGA outperformed other well-known methods like QGA, evolutionary programming (EP), GA and dynamic programming (DP) in terms of average convergence of power generation cost.

*Wenxia Liu, Yuying Zhang, Bo Zeng, Shuya Niu, Jianhua Zhang, and Yong Xiao* (Liu et al., 2014) proposed a hybrid heuristic algorithm for a large-scale nonlinear and non-convex electrical power system. This algorithm utilizes the complementary of multiple techniques including the variable step size opti-

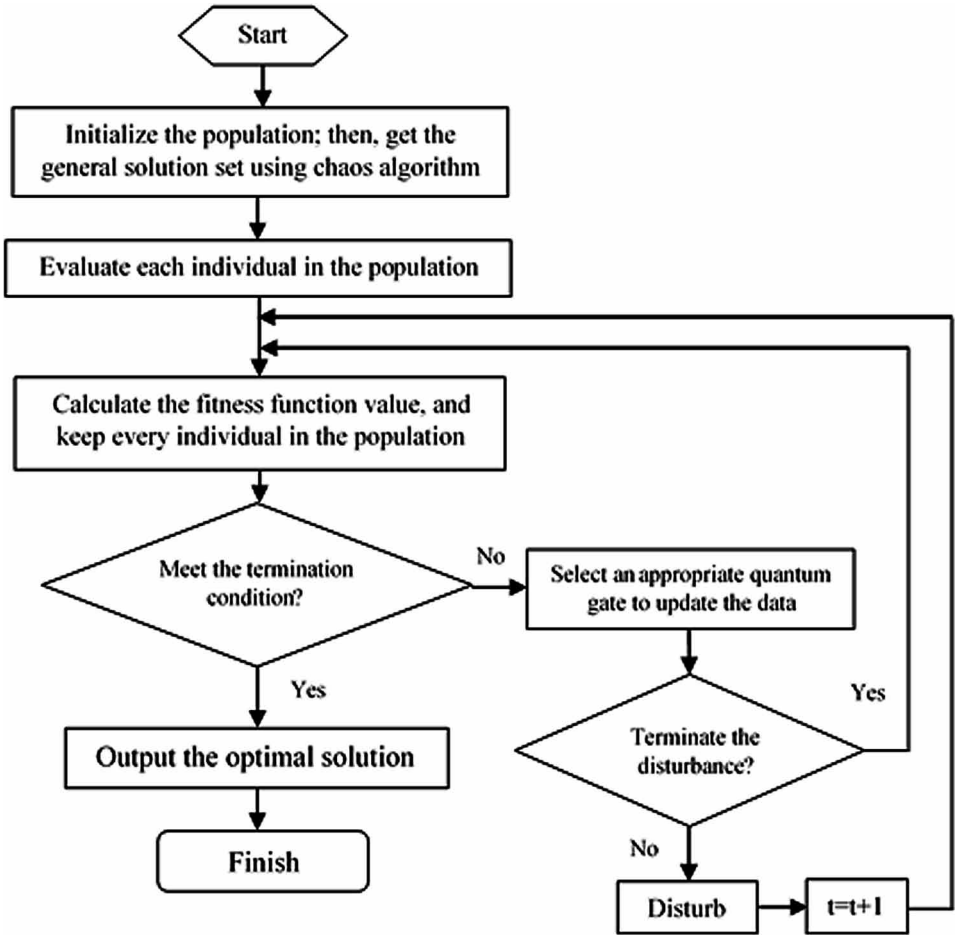
*Figure 1. Flow chart of a genetic algorithm (Laboudi & Chikhi, 2012)*

mization, the rotation mutational angle fuzzy control, and the quantum genetic algorithm. This algorithm follows five steps before it gives final optimal output. Steps of this proposed algorithm is given as follows:



**Step 1:** Population initialization with variable step size chaos algorithm.
**Step 2:** Encoding and individual measurements to the generator power output where chaotic QGA and EA are probability algorithms.
**Step 3:** Evaluation of individual targets separately in the obtained solution set.
**Step 4:** Update the solution set by using suitable quantum rotating gate.
**Step 5:** Perturbation in the population to escape it from local optima.

Figure 2 shows the steps of VSS_QGA in a flowchart. It shows better performance with superior accuracy and efficiency when comparing with GA, EP approach, QGA and chaotic quantum genetic algorithm (CQGA). One of the reasons of its faster convergence is unlike the searching strategies of GA,

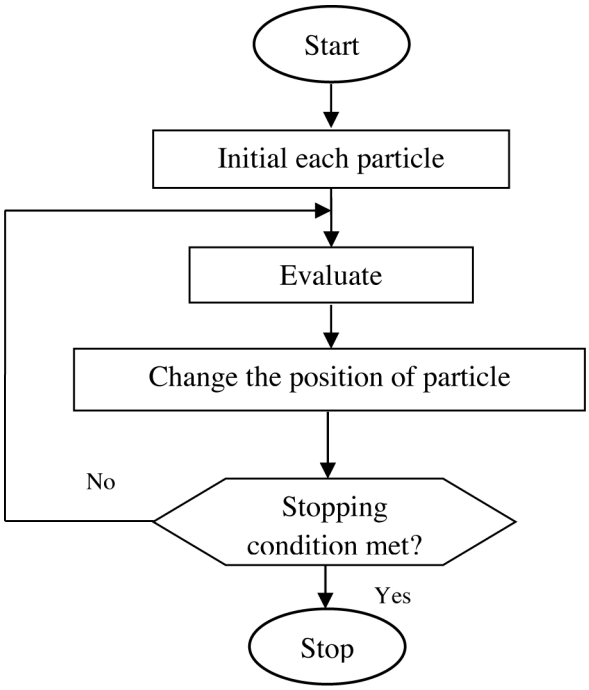
*Figure 2. Flow chart of the variable step-size chaotic fuzzy QGA (VSS_QGA) (Liu et al., 2014)*

EP, and QGA this algorithm obtain the optimal solutions by improving chaos motion ergodicity and local search strategy, which is more suitable and efficient for solving the scheduling optimization problem.

*A. A. Mousa and E. E. Elattar* (Mousa & Elattar, 2014) presented a hybrid multi-objective quantum genetic algorithm (HM QGA) for solving EED optimization problem where EED problems were formulated as a nonlinear constrained multi-objective optimization problem with both equality and inequality constraints. This technique has been applied successfully to solve EED problems considering two objectives simultaneously where there is no limitation in handling more than two objectives. Instead of a single solution it gives multiple Pareto-optimal solutions in a single simulation run which is useful in giving a reasonable freedom in choosing operating point from the available finite alternative. Overall it provides a sound optimal power flow by simultaneously considering conflicting multi-objective functions.

## Quantum Particle Swarm Optimization (QPSO)

Particle swarm optimization (PSO) was first introduced by Kennedy in 1995 (Kennedy & Eberhart, 1995) and later explained more deeply in 1999 (Shi & Eberhart, 1999) by Y. Shi and Eberhart. PSO



EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

is inspired by the social behavior of animals such as bird flocking and fish schooling. It gained a lot of attention in various optimal control system applications for its faster convergence, reduced memory requirement, lower computational complexity and easier implementation as compared to other evolutionary algorithms. Many improvements have been achieved in PSO since its introduction in 1995 (Li, Ngambusabongsopa, Mohammed, & Eustache, 2011; Shi & Eberhart, 1998). Inspired by quantum mechanics, Sun et al. proposed QPSO which is a novel variant of the PSO and outperforms the PSO in global search ability (Cai et al., 2008; Sun, Feng, & Xu, 2004). QPSO algorithm has been applied to the power system optimization such as economic load dispatch with valve-point effects (Nie, Xu, & Yue, 2010), engineering design problem (Coelho, 2010) etc.

*Songfeng Lu, Chengfu Sun, Zhengding Lu* (Lu, Sun, & Lu, 2010) developed an algorithm for hydrothermal power system, where hydrothermal scheduling was formulated as a bi-objective problem. This method combines QPSO algorithm with differential mutation operation to enhance the global search ability. Heuristic strategies were exploited to handle the equality constraints and at the same time a feasibility-based selection technique was also employed to meet the reservoir storage volumes constraints. The simulation results of the case studies revealed that this method had superior features, such as high quality solutions and good convergence properties than the other tested optimization methods like Differential Evolution (DE) or PSO.

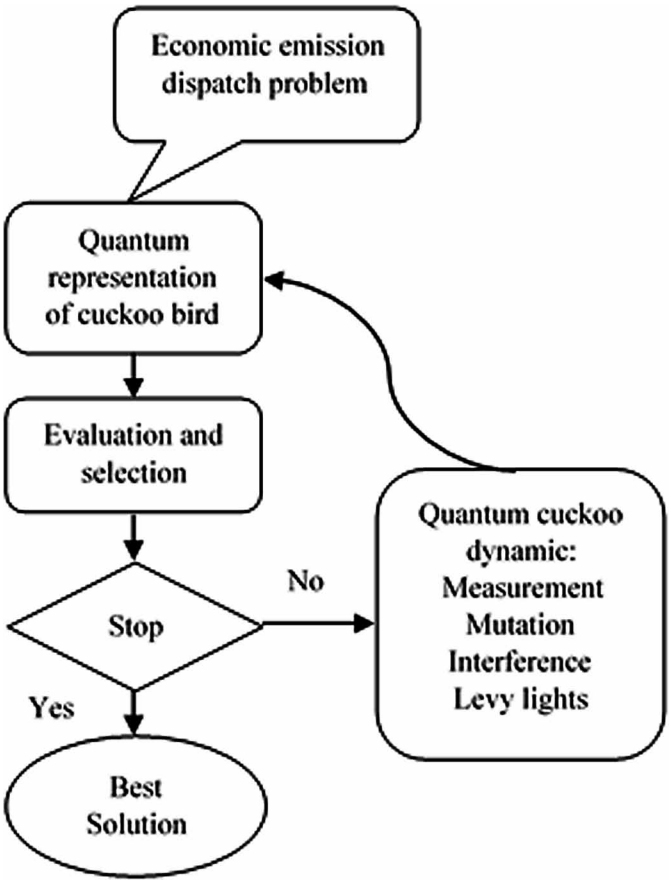
## PROPOSED METHODS

The use of quantum computational intelligence (QCI) for solving economic emission dispatch (EED) problems is still in its primary stage. The QCI methods so far used to handle EED problems proved successful compared to other methods. In future, different QCI methods like quantum cuckoo search (QCS), quantum bat algorithm (QBA) and quantum teaching and learning based optimization (QTLBO) algorithm etc. should be explored to solve EED problems in power system.

### Quantum Cuckoo Search Algorithm (QCSA)

The cuckoo search (CS) method is one of the most recent developed meta-heuristic algorithms (X.-S. Yang & Deb, 2014; X. S. Yang & Suash, 2009) that utilizes the breeding behavior of cuckoos, where each individual searches the most suitable nest to lay an egg (compromise solution) in order to maximize the egg's survival rate and achieve the best habitat society (Chandrasekaran et al., 2014). It gives better solution quality, computational efficiency and robustness than many other classical or nature inspired algorithm like genetic algorithm, PSO etc. (X.-S. Yang & Deb, 2014). QCS algorithm exploits the quantum computing principles like qubit representation, quantum mutation and measure operation in the core of the CS algorithm as explained in Figure 4 (Djelloul, Layeb, & Chikhi, 2015). QCS contains three essential modules to operate. Quantum representation of cuckoo bird is contained in the first module. Quantum representation of cuckoo bird allows QCS to represent the superposition of all potential solutions for a given problem. Fitness function and selection operator are contained in the next module. The function of selection operator is quite similar to the elitism strategy of GA where some portion of the fittest chromosome are kept unchanged into the next generation to ensure the algorithm does not waste time on rediscovering previously discarded past solutions. The last module contains the most important part of the algorithm and it is the main quantum cuckoo dynamics (QCD). Four main operations, inspired by cuckoo search and quantum computing, are done in quantum cuckoo dynamics. They are measurement, mutation, interference and Lévy flight operations. QCS algorithm exploits these operations to evolve the entire swarm through generations (Djelloul et al., 2015). The authors expect that this powerful mechanism of proposed QCS will be very efficient to solve EED problems.



### Quantum Bat Algorithm (QBA)

Bat algorithm (BA) was developed by Xin-She Yang that mimics some of the characteristics of micro bats (X.-S. Yang, 2010). It is proved to be easy to implement and has superior features like quality of solution, stable convergence characteristics and superior computational efficiency which is suitable for multiobjective problem (X.-S. Yang, 2011). Bat algorithm has already been successfully implemented to solve EED problems. Comparison with different versions of GAs and artificial bee colony (ABC) reflects its superiority over these methods (Ramesh et al., 2013). The authors believe that integration of the efficient mechanism of quantum computing will boost its search ability and convergence which will be very suitable for complex multiobjective problems like EED problem.

*Figure 4. Proposed flowchart of quantum cuckoo search algorithm for economic emission dispatch problems (Layeb, 2011)*

## Quantum Teaching and Learning Based Optimization (QTLBO)

Teaching and learning based optimization (TLBO) is an efficient algorithm proposed by Rao et al. (Rao, Savsani, & Vakharia, 2011) and based on teaching-learning phenomena. This algorithm has been proved effective in terms of the quality, speed, and stability of the final solutions when comparing with other state of the arts algorithms (Satapathy, Naik, & Parvathi, 2013). Recently, TLBO algorithm has been successfully applied in different areas of power system such as Hydro-thermal Scheduling (HTS) (P. K. Roy, 2013), optimal capacitor placement (Sultana & Roy, 2014), load frequency control (LFC) (A. Roy, Dutta, & Roy, 2015), transient stability constrained optimal power flow (TSC-OPF) (Mukherjee, Paul, & Roy, 2015), finding optimal location in thyristor controlled series compensator (TCSC) (Mukhopadhyay, Dutta, & Roy, 2015) and last but not least for solving dynamic economic emission dispatch problems (Niknam et al., 2012). In TLBO, learners develop their knowledge by mean of interaction between learners and from the teacher, which we can define as random learning strategy. Some researchers propose to exploit quantum behaved (Jun, Wenbo, & Bin, 2004) learning strategy using a certain probability in learner phase to improve the performance of TLBO (Zou, Wang, Hei, Chen, & Yang, 2014). The probabilistic learning phenomena by means of quantum-behaved learning strategy enhances

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the exploitative nature of TLBO and thus ultimately improve the overall convergence performance of the algorithm. Thus, TLBO has excellent prospects in solving EED problems. Integration of quantum computing phenomenon with this algorithm will make it more robust and efficient against different nonlinear multiobjective complex EED problems.

## DISCUSSION

Power generation of almost all countries depend on fossil fuels like coal, oil and gas. Unlike coal, fossil fuels like oil and gas has declining reserves. Besides, fossil fuels are not always easily accessible due to different infrastructural and geopolitical constraints. It is thus a matter of concern for every power generation system to minimize the fuel cost. On the other hand, due to many environmental issues like global warming, smog, acid rain etc. emission of hazardous gases and particulates are also a matter of concern. But these two objectives of reducing fuel cost and minimizing emission are conflicting to each other. Reduction of fuel cost may cause the emission problem and vice versa. Thus, there rises the need of multi-objective optimization. Many classical, intelligent and hybrid methods have been proposed to achieve both objectives simultaneously. Traditional methods have suffered against the growing nonlinearities of economic emission dispatch (EED) problems; where different intelligent methods suffer from long computational time degrade performance. Quantum based advanced computational intelligence methods show better optimization result than their predecessor. The parallel computing phenomenon of quantum computing reduces computational time to reach optimization point and makes it computationally efficient. In the later part of this chapter, we have proposed quantum inspired cuckoo search (CS), bat algorithm (BA) and teaching and learning based optimization (TLBO) methods for solving EED problems. Previously CS, BA and TLBO methods have successfully been implemented for solving EED problems and thus these methods are very prospectus with the integration of quantum computing phenomenon.

## CONCLUSION

In this chapter, authors have shown why it is necessary to be concerned about the fuel cost by describing fossil fuels complex accessibility and declining reserves problem. Authors have also discussed briefly about the necessity of controlling emission of polluted particulates and gases and thus undermining the need of combined economic and emission dispatching. Later, some short discussions are added on computational intelligence (CI), quantum computational intelligence and some of their advantages, and applications. After discussing and comparing a number of heuristic and meta-heuristic methods and optimization algorithms, it can be said that, in handling multiobjective nonlinear and non-convex complex problems like economic emission dispatch problems, where objectives are conflicting with many other equal and inequality constraints, quantum inspired computational intelligence methods are so far very successful. Its quantum computing phenomenon makes it computationally very efficient and robust than the other conventional algorithms. Improved metaheuristic algorithms like artificial bee colony, firefly, cuckoo search, biogeography based optimization etc. also showed good performance in solving economic and emission problem. For further development of electrical power generation system, advanced methods like quantum cuckoo search, quantum bat and quantum teaching and learning based optimization algorithms have been proposed and discussed in this chapter.

# Chapter 28
# The Determinants of Foreign Direct Investment Outflows from Turkey

**Raif Cergibozan**
*Kırklareli University, Turkey*

**Caner Demir**
*Kırklareli University, Turkey*

## ABSTRACT

*The aim of this study is to specify the determinants of the outward Foreign Direct Investment (FDI) flows from Turkey. For this purpose, the ARDL Bounds Test is used in order to observe the possible relation between these flows and define potential factors that might have an effect on them. The evidences of the empirical analysis reveal that the destination countries' market size, the home country's development level, trade openness and wage rate are positively related to outward FDI while the home country's interest rate shows a negative relationship. Turkey's outward FDI is significantly determined by the opportunities of the foreign markets as well as the outstanding home country factors.*

## INTRODUCTION

Foreign direct investment (FDI) flows have made an important impact on the globalization process. Since 1980's, the volume of FDI inflows has shown a substantial increase especially in developing countries. Even though the impact of FDI inflows on developing economies is still discussed by various perspectives in the literature, main findings state that it is hard to ignore the long run benefits of these types of investments for many developing countries. Nowadays, many firms or investors from developing countries seek to invest in abroad. This type of investment, which is termed the outward foreign direct investment (OFDI), reveals that the investors from developing world intend to compete in foreign countries. However, economic development performance of countries is not the only motivation for firms and investors to

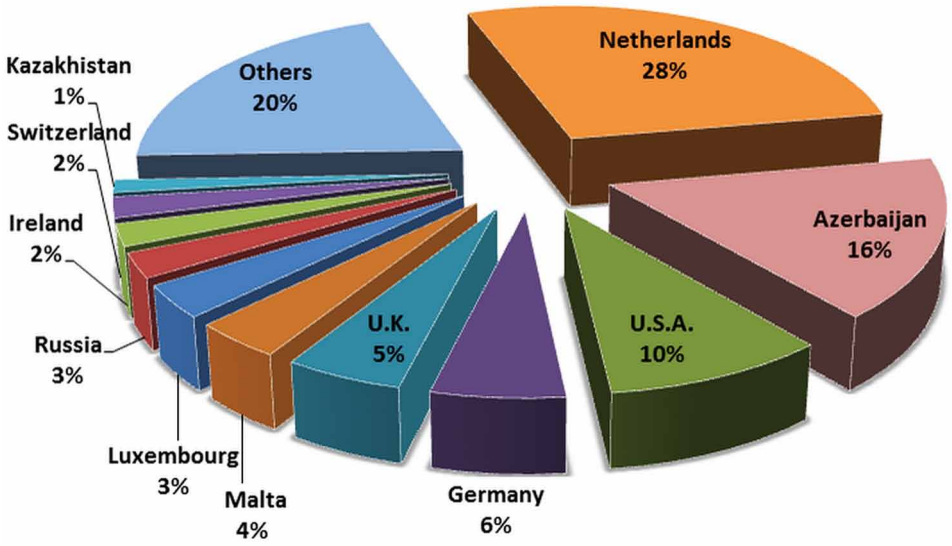
make a decision on investing abroad. There might be some other factors determining the outward foreign direct investment flows. From this point of view, the analysis of this chapter attempts to investigate the determinants of the FDI outflows from an important emerging market and developing country; Turkey.

Since the foundation of the Republic of Turkey in 1923, Turkish Economy has passed through several policy periods. During the first decade of the republic, the government had promoted the private sector and also established some public enterprises to provide the necessary inputs for the private sector. Despite these public interventions, until the great depression the main objective of the Turkish economic policies was forming an open economy model that advanced the country to an industrialized stage. As from the 1930's, the Turkish Economy had been considerably affected by the great depression. Moreover, the incentives given in the previous decade did not serve the purpose of the open economy. In order to change the course of economic developments, the government applied state-oriented economic policies and changed its exchange rate regime to the fixed system. In 1930s, the Central Bank of the Republic of Turkey was also established. In the late 1940's and 1950's Turkey shifted to liberal economic policies. In 1947, Turkey became a member of the International Monetary Fund (IMF) and World Bank. Also some foreign economic supports, such as under the Marshall Plan, were received to help rebuild the development process. Likewise in 1950's, foreign capitals were encouraged to come to Turkey for the purpose of contributing to the development process of the country. Besides, the means of credit were expanded and credit volume was increased particularly with the infrastructural investments. However, the inflation problem that showed itself later left behind the initial benefits. As a result, the paradigm of the Turkish economic policy was again changed to the planning mentality. Between 1960 and 1980, Turkey had been aiming to limit the volume of import and raise the exports. The oil shock in the mid 1970's influenced Turkish economy in a unfavorable way and the high prices in energy damaged the industrialization process. During the 1970's the country also faced with some internal and external political issues. Even if the economic administration had tried to overcome the emergent economic issues, their efforts could not succeed. In the beginning of 1980's, the economy was upgraded to a new stage which might be called as a transition stage to a free market economy. In 1980's the main economic policies were as followings; encouraging foreign investment inflows, limiting the public interventions and ensuring the economic stability (Boratav, 2009; Eğilmez and Kumcu, 2015).



The financial liberalization process of the Turkish Economy in the late 1980's was accompanied by the commercial deregulation process; and thus the free movement of both goods and capital became possible. Since then, the great deal of foreign direct investment has been flowing into Turkey and making the economy more integrated with the world. The obvious effects of this transformation have been being observed since the early 1990's. In the same time, the outward FDI flows have shown significant increase. To be able to investigate these investment developments, econometric time series analysis methods on the outward FDI flows from the Turkish Economy are used over the period 1992-2015.

In 2015, the volume of the outward foreign direct investment flows from Turkey was worth about USD 5.3 billion. Figure 1 provides information about the destinations of these investments for the period of 2005-2015. 54% of these flows go only towards three countries; Netherlands, Azerbaijan and USA. Of the total outward FDI from Turkey, Germany, U.K., Malta, Luxemburg and Russia receive 6%, 5%, 4%, 3% and 3%, respectively. Thanks to its largely liberal economic structure and conveniences for foreign investors, Netherlands is one of the most attractive countries for the global FDI flows. Like many other investors around the world, Turkish investors also mostly invest in Netherlands. Due to the fact that both countries have a long historical and cultural relationship, Azerbaijan is the second biggest destination for the Turkish outward foreign direct investments. As for the USA, being the land of opportunity and

*Source: The Central Bank of the Republic of Turkey.*

providing remarkable conveniences for investors, it comes after Azerbaijan by getting 10% of the total outward foreign direct investments from Turkey.

Table 1 shows the share of the outward Turkish foreign direct investments by sectors and presents the tendency of the Turkish investors over the period 2005-2015. The outward Turkish FDI mainly consists of industrial and service sector, 57% and 42%, respectively. The data states that mining, food production, textile production and non-metallic mineral production are the outstanding industrial sector for the outward FDI flows while financial and insurance activities, information and communication services, construction, transportation and real estate activities are the major activities in service sector. It is also observed that the total amount of the industrial outward FDI flows is about 1.5 fold greater than that of services. This is an expected symptom for a developing country that is still pursuing its industrialization process. For sure, it is hard to claim that there is an absolute positive relationship between economic development and the share of the services sector in the total outward FDI. Today, many highly industrialized countries' industrial sectors progressively invest in abroad while their services sectors mainly chose to stay in domestic market.

The developments of the outward foreign direct investment flows from Turkey are shown on Figure 2. As the data clearly exhibits, since 2001 the outward FDI flows from Turkey have shown a dramatic increase. At the first part of 1990's, the yearly volume of the flows was about less than USD 500 million while it reached USD 5 billion in 2015. Although the Turkish Economy has integrated with foreign countries since a long time ago, the yearly total flows did not surpass the level of USD 1 billion until 2000. It may imply that even if the Turkish Economy has opened its gates to foreign countries since 1980, its impacts on the outward FDI could be seen only after 2000's.

The outward foreign direct investment of a country may follow different paths and might be affected by various factors. Firms or investors may decide to invest in abroad due to the following main reasons;

- If the potential market size of their home country is insufficient (i.e. FDI by rich firms or investors of developing world).
- If the return on investment in the home country is relatively lower than investing in abroad (i.e. FDI from developed world).

With this study, it is tried to determine these factors and compare their impacts on investment decision in abroad. Undoubtedly, two main reasons which are mentioned above could be composed of many sub factors. For instance, the first reason implies factors such as low population and low household income level while the second reason implies factors such as high labor and production costs and low market share caused by extreme competition. For sure, the home country's conditions are as important as the conditions of the host country are important for the determinants of the outward FDI. In the literature, there are several studies which investigate the outward FDI flows between two or limited number of countries. In such analyses, it is possible to analyze both home and host country. However, in this study,

*Figure 2. Outward FDI flows from Turkey (million, USD)*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the total outward FDI flows from Turkey is examined and this makes it impossible to measure the conditions of each host country. Thus, only the home country determinants of the outward foreign direct investment flows from Turkey have been focused.

## BACKGROUND

To present a brief literature survey, several studies from the existing theoretical and empirical literature have been composed. Unlike many topics in the economics literature, the number of studies focused on the outward foreign direct investment is relatively low. However, in this section some significant studies in the relevant literature either in a general view or in a country-specific view on the outward FDI will be presented.

For sure, it would not be rational to think the outward FDI by dissociating it from the global FDI flows. The logic is simple; the outward FDI of a country is the inward FDI of another one. Therefore, also the conditions of the destinations countries might be important determinants of home country's outward FDI. So, by keeping this fact in mind let us start with some early studies in the outward foreign direct investment literature that have focused on the investment flows between the U.S. and European Economic Community (EEC). Scaperlanda and Mauer (1969) have investigated the determinants of U.S. direct investments in the E.E.C for the 1952-1966 period. The evidences obtained from their least squares regressions reveal that the *market size* of the destination country (or countries) is the prominent and the most significant determinant of US direct investment. Although their analysis contains some other indicators such as openness, the volume of the export between the two regions and within the EEC, growth rates of countries, the estimation results do not yield significant coefficient for these variables. Also Lunn (1980) has examined the determinants of US outward FDI in the EEC for the 1957-1970 period. Beside the basic determinants, his model specification allowed to observe the impact of growth of the market for the US affiliates and their net plant and equipment expenditures in the destination country which are estimated significantly via the regression analysis. Scaperlanda and Balough (1983) have revisited some previous studies including Scaperlanda and Mauer (1969) and Lunn (1980) papers by making some changes in the model structure and extending the time series which covers 1953-1977 period. The results of the newer study support the market size finding of the former studies and reveal that the market size of the destination country positively affects the US outward FDI. Moreover, the findings also show that the growth of the market for the US affiliates attract the potential US foreign direct investments. However, in the same issue of the same journal, Lunn (1983) has responded again to Scaperlanda and Balough (1983) and defended his (1980) paper in some aspects. Lunn (1983) has estimated the base theoretical model of Lunn (1980) by using the variable used by Scaperlanda and Balough (1983) for the 1957-1970 period. The findings are similar to the results of the Lunn (1980) paper and Lunn (1983) has annotated also some critics for the former study; such as the estimated model specifications and the period of the analysis covered. Lunn (1983) has stated that 1970's contain many national and global structural breaks that might have influence on the results and the period that has been extended to 1977 by Scaperlanda and Balough (1983) could lead to biased results.

Some other studies have focused on the home country determinants of outward direct investment. Kyrkilis and Pantelidis (2003) have investigated the country-specific determinants of the outward FDI for the 1977-1997 period of five European-Union and four non-European Union countries. The results vary across countries. However, as it is understood from the evidences, the reel GNP level of the home

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

country is an important determinant of OFDI almost for all countries in the analysis. Secondly, the effective exchange rate and interest rate are estimated significantly for some countries even though some unexpected signs are observed for the exchange rate coefficients. These kinds of defects are possibly caused by the simple estimation method of the analysis which is ordinary least squares regression. Similarly, Kueh et al. (2010) have made a country-specific analysis and dealt with the macroeconomic determinants of Singapore's outward FDI. The empirical findings of their cointegration analysis that covers the 1975-2007 period reveal that the income of the home country, trade openness and interest rate are positively correlated with the FDI outflows of Singapore.

Kalotay and Sulstarova (2010) have investigated the determinants of Russian outward FDI for the 1993-2007 period. Despite the authors have used both home and host countries' factors such as home country's GDP, host country's GDP, policy change, natural resources of the host country, ratio of services to GDP, geographical distance, exchange rates and patents, only the GDP levels of countries and natural resource variables are significantly estimated. Besides the justification of the previous literature's evidence on GDP levels (both for the *home* and the *host*), this study's finding on the natural resources of the host country is a remarkable evidence. Yet another study focused on the impact of natural resources is Kolstad and Wiig (2012) which has estimated the impacts of the host country factors on Chinese outward FDI. Unsurprisingly, also this study's first evidence show that host country's market size is the most significant determinant of the outward FDI. The second and interesting evidence of the study has been observed via the interactive structure of its model. In the main model of the study, the impacts of institutions and natural resources has been estimated interactively (with an explanatory variable created by multiplying natural resources and institutions) that implies the interpretations of these factors are not independent of each other. The sign of the interactive variable has been estimated significantly and negative which has been interpreted by the authors as follows; "The worse the institutions are in the host country, the greater Chinese investment is attracted by natural resources." (Kolstad and Wiig, 2012: 32).

Goh and Wong (2011) have analyzed the impacts of market size and government policy on outward FDI flows of Malaysia over the 1999-2008 period. The evidences of the study reveal that Malaysian outward foreign direct investment is positively associated with the market size of the destination country, trade openness, reel effective exchange rate and international reserves held by the Malaysian Central Bank.

Mihci et al. (2011) have examined the home country determinants of FDI outflows of 12 European Union countries for the 1997-2003 period via a panel data analysis. Their findings reveal firstly that cost related factors such as interest rates, environmental sensitivity index and real labor cost (even if the last one was estimated as insignificant) have positive impacts on FDI outflows. As distinct from studies that measure the impacts of the market size of the destination country, Mihci et al. (2011) have employed the growth of the domestic market size and observed that the growth of the domestic market size is negatively associated with the FDI outflows.

As it has been clearly inferred from the existing literature some factors such as home and destination countries' market size, interest rate, production costs and openness come to the fore. Therefore, to examine whether there is any significant relationship, in the empirical analysis of the study these variables or appropriate proxies of them are used.

## DATA AND METHODOLOGICAL FRAMEWORK

The aim of this study is to investigate the determinants of outward FDI in the Turkish economy both in the short and the long-run, over the 1992Q1 - 2015Q2 period by using the ARDL bound testing approach. Due to the important trade and financial liberalization process undertaken during the 1980s that radically transformed the Turkish economy and the data constraints for outward direct investments, the sample period stars from 1992Q1. All the data are obtained from IMF International Financial Statistics (*IFS*), Republic of Turkey Ministry of Development-Economic and Social Indicators and The Central Bank of the Republic of Turkey (*CBRT*). All the variables in the data set are transformed into natural logarithms for econometric estimation. Based on the theoretical discussions and previous studies, the following model is suggested;

$$OFDI = f(RGDP, INT, OPEN, WAGE, MARKET) \quad (1)$$

where *OFDI* is Turkey's outward *FDI*, *RGDP* is real *GDP* which stands for the development level of the home country, *INT* is nominal interest rate in the home country, *OPEN* is openness indicator (foreign trade amount of the home country, % of *GDP*), *WAGE* is wage rate which stands for the labor costs of the home country investors, *MARKET* is market size of the destination countries. Expected impacts (signs) of the variables on the outward *FDI* are as follows:

$$\frac{\partial OFDI}{\partial WAGE} > 0, \frac{\partial OFDI}{\partial INT} < 0, or > 0, \frac{\partial OFDI}{\partial OPEN} > 0, \frac{\partial OFDI}{\partial GDP} < 0 \; or > 0, \frac{\partial OFDI}{\partial MARKET} > 0 \quad (2)$$

Theoretically, increases in wage rate, trade openness and market size are expected to raise outward FDI. The expected signs of real GDP, nominal interest rate could be negative or positive. The definition and sources of all variables used in this study are shown in Table 2.

*Table 2. Variables: definitions and sources*

| Notation | Definition | Source |
|---|---|---|
| *OFDI* | Turkish Outward Foreign Direct Investment | CBRT |
| *RGDP* | Real Gross Domestic Product Index (2010=100) | IMF |
| *INT* | Nominal Interest Rate | IMF-IFS |
| *OPEN* | (Exports of goods and services + Imports of goods and services) / Gross Domestic Product | IMF-IFS |
| *WAGE* | Nominal Unit Wage Index (2010=100) | CBRT, ESI |
| *MARKET* | This variable is constructed as a weighted average of real foreign incomes of Turkey's major partners, each country receiving a weight equal to its share in Turkey's OFDI. $MARKET = \sum_i w_i GDP_i^*$ where $w_i$: share of country i in Turkey's OFDI, *Y**: Real GDP Index of *i* country (2010=100), *i*: Netherlands, Azerbaijan, United States, Germany, United Kingdom and Switzerland (these 6 countries constitute two-thirds of total market of the Turkish OFDI). | IMF-IFS, Datastream |

Note: ESI: Republic of Turkey Ministry of Development-Economic and Social Indicators.

The long run relationship among outward FDI, real GDP, nominal interest rate, openness indicator, wage rate and market is investigated by applying the ARDL Bounds testing approach. The ARDL bounds testing approach of cointegration is developed by Pesaran and Shin (1999) and Pesaran et al. (2001). The ARDL cointegration approach has numerous advantages compared to other cointegration methods such as Engle and Granger (1987), Johansen (1988), and Johansen and Juselius (1990). The existence of a long run relationship among the variables used in the econometric model are performed, regardless of their order of integration contrary to Engle and Granger (1987), Johansen (1988, 1991), and Johansen and Juselius (1990) cointegration methods. Furthermore, ARDL bounds testing approach providing that the variables have different optimal lags and the estimation results are consistent in small sample size allows to estimate the long and short run parameters of econometric model (Panopoulou and Pittis, 2004; Baek and Kim, 2013).

The F and t-statistics are essential for ARDL bounds testing approach. The asymptotic distributions of these statistics are non-standard under the null hypothesis that there exists no level relationship, irrespective of whether the variables are I(0) or I(1). However, if the order of integration of any of the variables is greater than one (i.e. I(2)) then the critical bounds provided by Pesaran et al. (2001) are not valid. Thus, before proceeding to the estimation stage the integrating properties of variables must be checked. Two sets of asymptotic critical values are provided; when all variables are I(1) and when they all are I(0). These two sets of critical values provide a band covering all possible classifications of the variables into I(0), I(1) or mutually cointegrated (Pesaran et al., 2001).[1] For econometric estimation, the following ARDL model is employed:

$$\begin{aligned}\Delta OFDI = {} & \alpha_0 + \sum_{i=1}^{p} \alpha_1 \Delta OFDI_{t-i} + \sum_{i=0}^{p} \alpha_2 \Delta RGDP_{t-i} + \sum_{i=0}^{p} \alpha_3 \Delta INT_{t-i} + \sum_{i=0}^{p} \alpha_4 \Delta OPEN_{t-i} \\ & + \sum_{i=0}^{p} \alpha_5 \Delta WAGE_{t-i} + \sum_{i=0}^{p} \alpha_6 \Delta MARKET_{t-i} + \lambda_1 OFDI_{t-1} + \lambda_2 RGDP_{t-1} + \lambda_3 INT_{t-1} \\ & + \lambda_4 OPEN_{t-1} + \lambda_5 WAGE_{t-1} + \lambda_6 MARKET_{t-1} + \varepsilon_t\end{aligned} \tag{4}$$

where the terms from $\lambda_1$ to $\lambda_6$ indicates the long-run relationship among the variables, while the expression from $\alpha_1$ to $\alpha_6$ with the summation signs corresponds to the short-run dynamics of variables. Moreover, $\alpha_0$ stands for the constant term, $\Delta$ is the first difference operator, and $\varepsilon_t$ is the Gaussian white noise.

The complete results for short and long-run dynamics through ARDL Bounds testing are obtained through two steps. In the first step, Eq. (4) is estimated by using OLS method employing an optimal lag selection criterion such as Akaike Information Criterion (AIC) and Schwarz Information Criterion (SIC). The existence of a long-run relationship among the variables is examined by applying the F-test which indicates the joint significance of the coefficients at their one period lagged level of the time series variables in Equation 4. The null hypothesis of no cointegration

$\boldsymbol{H_0}$**:** $\lambda_1 = \lambda_2 = \lambda_3 = \lambda_4 = \lambda_5 = \lambda_6 = 0$

is tested against the alternative of cointegration

$\boldsymbol{H_1}$**:** $\lambda_1 \neq \lambda_2 \neq \lambda_3 \neq \lambda_4 \neq \lambda_5 \neq \lambda_6 \neq 0$.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The calculated F-statistics value is then compared with upper and lower critical values which are given by Pesaran et al. (2001). The calculated F-statistics value is greater than upper critical value obtained from Pesaran et al. (2001), indicating that the null hypothesis of no-cointegration is rejected irrespective of whether the regressors are I(0) or I(1).

$$\Delta OFDI_i = \beta_0 + \sum_{i=1}^{p} \delta_i \Delta OFDI_{t-i} + \sum_{i=0}^{p} \phi_i \Delta RGDP_{t-i} + \sum_{i=0}^{p} \phi_i \Delta INT_{t-i} + \sum_{i=0}^{p} \phi_i \Delta OPEN_{t-i} + \sum_{i=0}^{p} \phi_i \Delta WAGE_{t-i} + \sum_{i=0}^{p} \phi_i \Delta MARKET_{t-i} + \alpha ECT_{t-1} + u_t \quad (5)$$

where $\Delta$ is the first difference operator and $u_t$ represents residual terms that are assumed to be identically, independently, and normally distributed. $\alpha$ is the speed of adjustment parameter and *ECT* is the error correction term. The statistical significance of lagged error correction term $ECT_{t-1}$ with negative sign validates the established long-run relationship between the variables and its coefficient indicates the proportion by which deviations from the long-run equilibrium in the dependent variable are eliminated or corrected in in each period (Yusoff, 2010).

Finally, the cumulative sum (CUSUM) and cumulative sum of squares (CUSUMSQ) tests are employed to investigate the stability of the short and long run parameters of the model. Ignoring structural breaks in econometric models might lead to model misspecification and inconsistent estimation results of model parameters. In these methods, staying within the critical bounds of CUSUM and CUSUMSQ statistics implies that long and short run parameters are stable over the time.

## EMPIRICAL FINDINGS

Before estimating the econometric model, the stationarity of the time series was checked by unit root tests in order to avoid *spurious regression problem* suggested by Granger and Newbold (1974). In the literature, there are different unit root tests such as Dickey-Fuller, Augmented Dickey-Fuller, Phillips-Perron and KPSS to investigate integrating properties of variables.[2] In this study, Augmented Dickey-Fuller (ADF) and Phillips-Perron (PP) unit root tests were used to evaluate the order of integration. Table 3 provides results from unit root tests for all variables used in the model. According to these results, all variables are non-stationary at level but stationary at their first difference. In other words, they are integrated of order one I(1). Hence, the ARDL Bound Testing Approach can properly be used in the model.

The selection of optimal lag length is essential for the ARDL bounds testing approach. To determine the optimal lag length for the econometric analysis Schwarz Information Criterion (SIC) is employed. Based on SIC results, it is found that lag 0 is appropriate for trade openness, while lag 1 is fitting for outward FDI, real GDP, interest rate, wage rate, and market size. The estimation results of the ARDL are shown in Table 4. F-statistics for

*F*(*OFDI* | *RGDP, INT, OPEN, WAGE, MARKET*)

greater than the upper critical value, thus there is a long-run relationship between outward FDI, trade openness, real GDP, interest rate, wage rate, and market size at 5% significance level.

| MARKET | -1.999 | -3.697*** | -2.427 | -5.686*** |

Note: The superscripts ***, ** and * denote the significance at 1%, 5% and 10% level, respectively.

*Table 4. The results of ARDL cointegration test*

| | Optimal Lag Length | F-Statistics | Critical Values %5 | | Critical Values %10 | |
|---|---|---|---|---|---|---|
| | | | I(0) | I(1) | I(0) | I(1) |
| F(OFDI \| RGDP, INT, OPEN, WAGE, MARKET) | (1, 1, 1, 0, 1, 1) | 9.13 | 2.62 | 3.79 | 2.26 | 3.35 |

Notes: The critical values for the lower I(0) and upper I(1) bounds are taken from Pesaran et al. (2001).

After investigating the existence of cointegration among the series, the long-run and short-run relationship between outward FDI, trade openness, real GDP, interest rate, wage rate, and market size are examined. The results of ARDL bounds test are given in Table 5 and all variables' expected sign are statistically significant at 1% level except for market size. The long run elasticity of market size is significant at 5% level. According to the estimation results, in the long run, real GDP is positively related to outward FDI, suggesting that 1% increase in real GDP raises outward FDI by 0.82%. The relationship between interest rate and outward FDI is negative and an increase of a 1% in interest rate decreases outward FDI by 0.83%. The effect of trade openness on outward FDI is positive and 1% increase in trade openness raises outward FDI by 0.68%. The long run elasticity of wage rate is positive, implying that a 1% increase in wage rate raises outward FDI by 0.24%, ceteris paribus. The impact of market size on outward FDI is also positive, indicating that an increase in market size raises outward FDI by 0.70%.

At this point, it might be useful to debate over the evidence on the relationship between the interest rate and outward FDI. Let it be known that there is not a single, commonly-held impact of interest rate on outward direct investment. The classical view on the interaction between foreign direct investment and interest rate is so obvious; lower interest rates induce foreign direct investment. If one thinks a country's outward FDI as the inward FDI of another country, it might be clearly suggested that higher home country interest rates cause the domestic investors to escape through foreign countries with lower interest rates. The logic here is simple; investors always pursue lower cost of capital. However, to specify the determinants of outward direct investment, one should primarily consider that getting into foreign markets requires a considerable amount of capital. As Kyrkilis and Pantelidis (2003) has stated, for a firm which has not got into foreign markets yet, capital accumulation is directly in association with the home country interest rate. In such a condition, lower home country interest rates raise the capital abundance of the domestic firms and pave the way for getting into foreign markets.

| $\chi^2$ (Functional form) | | 0.28 |

Note: The superscripts ***, ** and * denote the significance at 1%, 5% and 10% level, respectively. Parentheses are t-statistics.

As it can be seen from Table 5, the $ECT_{t-1}$ has a negative expected sign and this is statistically significant at %1, suggesting that there is a long-run relationship between the variables in Turkey over the 1992-2015 period. The short run deviations from the long run equilibrium are corrected by 17% towards long-run equilibrium path each year. The diagnostic test results are reported in Table 5 showing that there is no diagnostic problem in the econometric model.

Finally, the cumulative sum (CUSUM) and cumulative sum of squares (CUSUMSQ) tests are used to check stability of long run and short run parameters of the econometric model. The result presents that the estimated coefficients lie within the critical bounds of 5% significance. It means that the estimated parameters are stable over the sample period.

## SOLUTIONS AND RECOMMENDATIONS

As it has been clearly mentioned in the previous sections, the main goal of the study is to determine the main factors of the outward foreign direct investment flows from Turkey. In this context, some potential determinants have been presumed in a theoretical framework and estimated in via an econometric model. Before the empirical analysis, it has been stated that the openness rate of the home country, the wage rate of the home country and the market size of the destination countries are expected to have positive impacts on the outward foreign direct investment flows of Turkey. However, it was indicated that the development level and the interest rate of the home country could have either positive or negative impacts. Higher development levels may bring about higher domestic market size and this may keep the investor in domestic market. On the impact of the domestic country's interest rate, the issue is more complicated. Higher home country interest rates may cause domestic investors to escape through foreign countries

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

with lower interest rates. But there is another possibility; since moving into markets in abroad requires a considerable amount of capital, lower home country interest rates may raise the capital abundance of the investors and make it easier to branch out.

Since Turkey is still in the developing stage, firms and investors still need capital accumulation for great decisions; such as investing in abroad. The empirical finding that suggests the domestic interest rate negatively affects Turkey's outward FDI caused by this fact. We may also suggest that in the further development paths, this impact might become reversed.

## FUTURE RESEARCH DIRECTIONS

Even though the findings obtained in this study reveal significant and considerable results, there are still some deficiencies and improvable points. Firstly, the analysis includes five variables in addition the outward FDI variable. For sure, there might be many other factors and variables that have an impact on Turkish OFDI. In this study, due to the data limitations a model with only these five variables has been employed. Future analyses may extend the model used. Secondly, in the analysis of this study, a destination country market size variable has been calculated by considering the share of Turkey's OFDI to these countries and their GDP levels. Although defining the market size of the destination countries with such a methodology is a useful way, it also has some disadvantages. Each destination country has different economic, geographical, historical and cultural relationship with Turkey (*or with any home country*). For instance, the underlying reasons of Turkey's outward FDI flowing into Netherlands and Azerbaijan are probably different from each other. Thus, to overcome this issue, applying country-by-country analyses (*i.e. gravity models*) might give more explicit results.

## CONCLUSION

International capital movements and foreign investments have an important role on today's globalizing world. Since 1980's, with the speed-up of globalization around the world, capital holders and investors have been seeking for profitable areas out of national borders. In this study, the determinants of outward foreign direct investment flows are investigated for Turkey, which is an important emerging country in global economy.

The detailed data on the outward direct investment flows from Turkey shows that about 60% of the total investment flows from Turkey are shared by Netherlands, Azerbaijan, USA and Germany which implies that these four countries constitute an important part of the market for the Turkey's outward FDI. Correspondingly, to be able to create a proxy variable for market size, two more countries (U.K. and Switzerland which induce %5 and %2 of Turkish OFDI respectively) have been added to this group of countries and attained a ratio of %67 which makes two-thirds of the total flows. In addition to this variable, also the impacts of home country's real GDP level, interest rate, openness and wage rate have been estimated via the ARDL bounds test approach. The results of the analysis show that all the variables used are significantly associated with the outward foreign direct investment flows from Turkey. However, the signs of the estimated coefficients vary across variables. All the other variables are in a positive relationship with Turkish outward foreign direct investment while the home country interest rate has a negative impact on it.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The evidences reveal that, higher development level of the home country, higher rate of openness in the home country, higher labor cost in the home country and higher market size of the destination countries encourage outward foreign direct investment tendency for Turkish investors while higher interest rates in the home country discourages them. Within the observed evidences of the present study one may suggest that these five variables might be counted as significant determinants of Turkish outward foreign direct investment.

## KEY TERMS AND DEFINITIONS

**ARDL Bounds Testing Approach:** It is a cointegration test providing that the existence of a long run relationship among the variables used in the econometric model are performed, regardless of their order of integration contrary to the other cointegration methods.

**Cointegration:** It is known that if two or more time series are not stationary but some linear combinations of them are stationary, hence the time series are said to be cointegrated.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Foreign Direct Investment (FDI):** A kind of investment made in one country by an investor in another country.

**Home Country:** The country that is the origin of the investors that make OFDI.

**Host (Destination) Country:** The country that is the destination and the target of the investors that make OFDI.

**Market Size:** The intensity of demand in the destination country.

**Outward Foreign Direct Investment (OFDI):** The flowed FDI that has been counted for the home country.

## ENDNOTES

# Chapter 29
# The Nexus Between Institutional Quality and Foreign Direct Investments (FDI) in South Asia:
## Dynamic Heterogeneous Panel Approach

**Mohammad Ashraful Ferdous Chowdhury**
https://orcid.org/0000-0001-8540-1353
*Shahjalal University of Science and Technology, Bangladesh*

## ABSTRACT

*South Asia is one of the world's fastest growing regions, averaging 6.7 percent annual increases in real GDP over the past decade. However, South Asia's FDI inflows as a share of GDP are the lowest of all developing regions, averaging less than 2 percent in 2000-11(World Bank, 2013). Institutional quality is one of the factors that determine the volume of FDI inflow in any country. This study covers the data of three sampled countries of South Asia provided by the World Bank for the period 2003-2014. By using both static and dynamic models, this study reveals that regulatory quality and the political stability have significantly positive impact on the FDI inflow into each of the three countries. For Robustness, this study also employs dynamic heterogeneous panel approaches like Pool Mean Group (PMG) and found that institutional quality factors are significantly relevant to the FDI. As a policy implication, the regression results indicate that during the process of reform, the relation between FDI and institutional quality warrants a certain amount of attention.*

## INTRODUCTION

The role of foreign direct investment (FDI) as a key driver of economic development has been proved by many researchers (Borensztein et al., 1995). It contributes to economic development through raising capital accumulation, increasing production capacity, enhancing technology, transferring knowledge, creating employment opportunities, improving management practices, enhancing competitiveness and

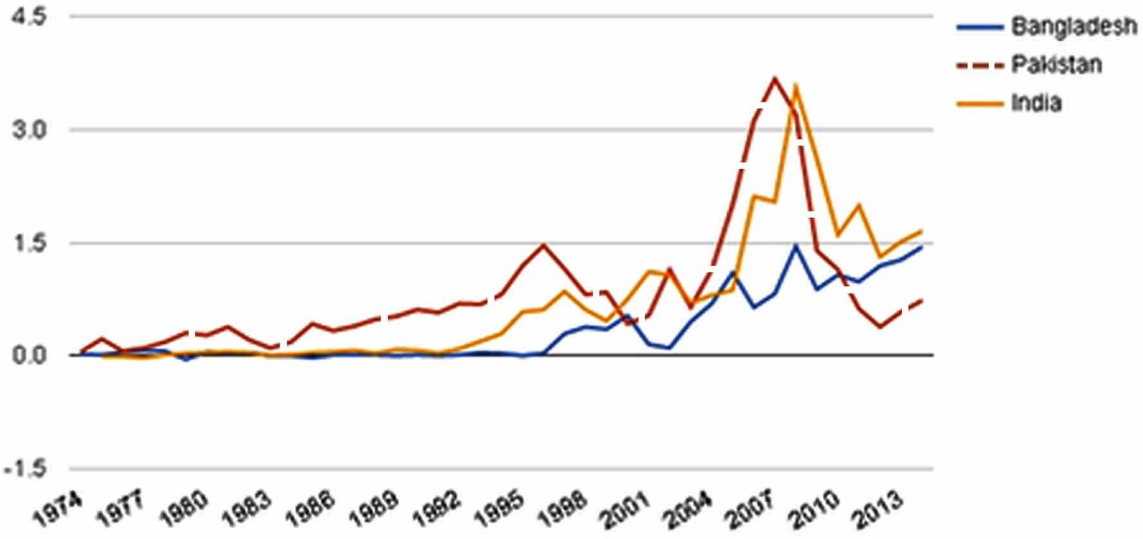
fostering macroeconomic stability. The United Nations Conference on Trade & Development (UNCTAD) in their 2013 World Investment Report states that developing countries take the lead in foreign direct investment (FDI). In 2012 developing economies received a higher inflow of FDI than developed countries. Also, Aizenmann, J. (2003) sees an increase in FDI in emerging economies. Thus, based on the increase of FDI it seems like companies are more interested in investing in emerging markets. However, investing in developing economies is not without risk. Ghemawat & Khanna (1998) argue that doing business in emerging economies is challenging due to information asymmetry and uncertainties. Political and economic risks are also significant risks. Institutions, both formal and informal, provide rules and procedures that reduce uncertainties involved in economic exchange. Informal institutions such as codes of conduct or conventions can trim down these uncertainties. Formal institutions via rules and regulations, laws, effective judicial systems and other institutions can reduce the uncertainties and provide effective enforcement mechanism. Codes of Institutional quality can be helpful by creating a more stable environment and accordingly reduce risks for multinationals associated with investing in developing countries.

However, for most of the countries, success in attracting sufficient amount of FDI inflows is not an easy job. Because of diversity in nature of factors affecting FDI inflows between countries, it is difficult to assess all these factors provided some of them are related to government political system. Governance indicators are identified by many researchers as significant determinants of FDI. The research acknowledges the gap in literature on the relationship between Institutional quality indicators and FDI flows particularly with respect to the Sub continental countries namely Bangladesh, India, and Pakistan.

Due to deep-rooted corruption, weak political and institutional structure, subcontinent is a very interesting region for case studies. Sahoo (2006) believes that there is a gap between policies and their implementations in this regions due to its dysfunctional institutional quality. Therefore, it may be worthwhile to provide strong foundation for a policy formulation through exploring the relationship between FDI and institutions based on country specific analysis. Subcontinent is a very interesting case study, because it is one of those regions which has experienced political turmoil in one form or the other, wide spread corruption, worse law and order situations, etc., which seem to be hurdles in attracting FDI in this region. The objective of the study is to find the impact of institutional quality on FDI(both inward and outward) of these three south Asian countries.

## PRESENT STATUS OF FDI IN SELECTED SOUTH ASIAN COUNTRIES



Like many other developing countries, South Asian nations have been experiencing increased FDI inflows over the past decade as developing countries get a larger share of cross-border investments once sent to developed countries. Nonetheless, South Asia's FDI inflows remain the lowest relative to GDP among developing country regions. Of the inflows that do reach South Asia, India dominates, with much of the inflow reaching the service sector and very little going into industry, agriculture, or mining.

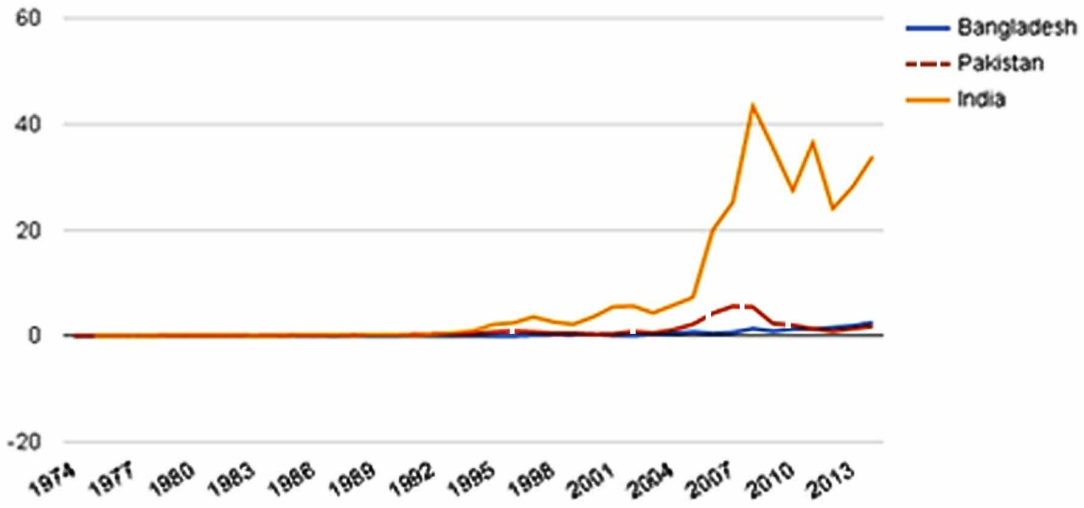
This series shows in Figure 1 net inflows (new investment inflows less disinvestment) in the reporting economy from foreign investors, and is divided by GDP. Foreign direct investment are the net inflows of investment to acquire a lasting management interest (10 percent or more of voting stock) in an enterprise operating in an economy other than that of the investor. It is the sum of equity capital, reinvestment of earnings, other long-term capital, and short-term capital as shown in the balance of payments.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 1. FDI percentage to GDP in subcontinents*
*Source: World Bank.*

Foreign direct investment refers to direct investment equity flows in the reporting economy. Broadly, It is the sum of equity capital, reinvestment of earnings, and other capital. Direct investment is a category of cross-border investment associated with a resident in one economy having control or a significant degree of influence on the management of an enterprise that is resident in another economy. Ownership of 10 percent or more of the ordinary shares of voting stock is the criterion for determining the existence of a direct investment relationship. According to the Figure 2, India leads regional inflow of FDI in south Asia accounting for $34 billion investment during 2014 and the upward trend is likely to continue in the upcoming years.

South Asia has seen FDI increases in the past decade and reaped their benefits; however, the region lags the rest of the other developing nations. Weak fundamentals have prevented more FDI flows into South Asia. The composition of FDI is heavily focused on the service industry, which may reflect the region's comparative advantage in this sector, but also may indicate that FDI into other sectors, such as manufacturing, is low due to insufficient infrastructure and cumbersome regulations discourage FDI inflows to these industries more than into services.



## INSTITUTIONAL QUALITY AND ITS PRESENT STATUS IN SELECTED SOUTH ASIAN COUNTRIES

Institutional quality entails a guidance process that is institutionally and technically structured, that is, based on principles, norms, procedures and practices to collectively decide about common goals for coexistence and about how to coordinate and cooperate for the achievement of decided objectives. There are as many definitions of the term Institutional quality as there are contributors to the theoretical discourse. Available literature indicates that definition of the term varies from situation to situation as well as from party to party. For example, to the development actors such as the World Bank, the term

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

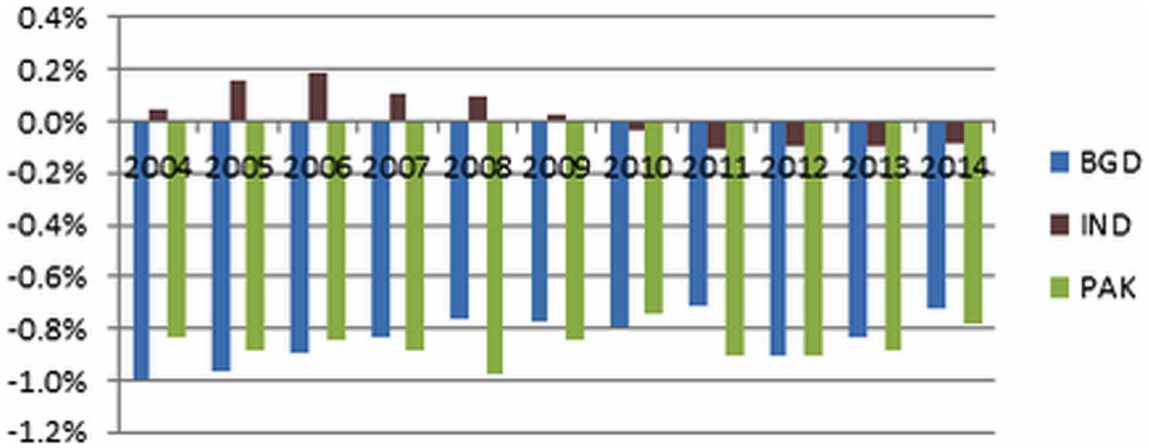
*Figure 2. FDI in subcontinents (billion USD)*
*Source: World Bank.*

bears a meaning completely different from the meaning understood by the Civil Society; in the case of public enterprises or social institutions meaning of the term tends to be completely different from the meaning it bears when applied for the profit-seeking organizations. And day after day the variations in meaning continue to increase.

In the light of its definition, the World Bank (2003) explicitly recognizes six dimensions of Institutional quality for measurement in countries as part of a research project in support of its assistance activities:

1. Voice and accountability;
2. Political stability and absence of violence;
3. Government effectiveness;
4. Regulatory quality;
5. Rule of Law; and
6. Control of corruption.

## 1. Rule of Law

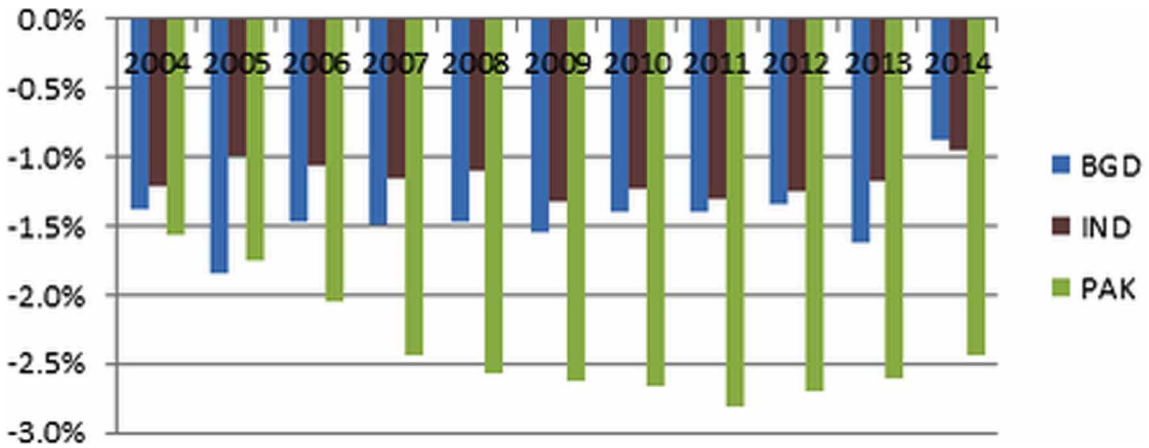


The rule of law specially defined as the existence of a set of formal rules and enforcement mechanism has been regarded as the basic condition for economic development. Better rule of law desire large economic growth. But in subcontinent countries rule of law is not in not preferable. Graphically it is shown in Figure 3 that, from 2004 to 2008, the rule of law in India was pretty good. Lately, from 2008, it became negative.

In 2011, it was in −0.11% while in 2012 and 2013 it was in −0.10%. At last in 2014, it was in −0.09%. The present condition of Bangladesh and Pakistan is not up to mark. In 2005, it was −0.97% and during 2014, it was 0.72%. Pakistan's rule of law in 2008 was in its extremely tremendous point −0.98%, though it was −0.78% in 2008 which represents the laggard rule of law in Pakistan. This graph indicates that the rule of law ratio in subcontinent is not so good for the economy

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 3. Rule of law index in subcontinents*
*Source: World bank global database.*



## 2. Political Stability

Political instability adversely affect in the economic growth by lowering the rates of productivity. It is regarded by economist as serious malaise to economic performance.

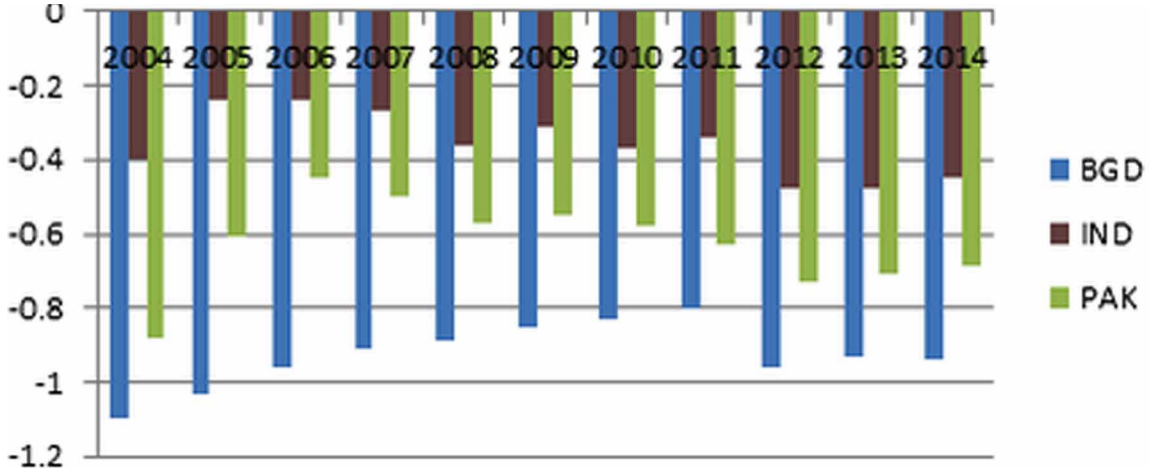
Our collected data shows in Figure 4 that, political stability was unsteady in the subcontinent. The status of political stability was inferior. Out of the three countries, the situation of Pakistan was dangerous. In 2011, Pakistan's political stability rate was −2.81%, which is its most adverse level. Bangladesh's political stability was −1.39% and India's political stability was −1.30% at the same time. From last ten years' political stability of Bangladesh, India and Pakistan as figured in sum, which is figured as −15.87%, −12.77% and −26.20% respectively that clearly shows the political imbalance of the three countries.

*Figure 4. Rule of law index in subcontinents*
*Source: World bank global database.*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## 3. Regulatory Quality

The regulatory quality indicates the efficiency of the legal and operational institutional performances of the country. It can also reflect the bureaucratic situation of a country. Normally the scale of regulatory quality ranges from -2.5(weak) to 2.5(strong). In our estimation in Figure 5, it has been found that none of these south Asian countries scores positive sign meaning that the regulatory quality of these sampled countries are lower than the average.



## 4. Corruption Perception Index

Corruption perception index ranges from 0 to 100. The common perception of corruption in this region is not satisfactory at all. Although India is comparatively performing better than Bangladesh and Pakistan but the growth rate of higher perception is still lower. According to Figure 6, in 2004 the average score of corruption perception index score was around 30 in India and it increases only up to around 38 in 2014. The similar trend exists from Bangladesh and Pakistan.

## 5. Voice and Accountability

The voice and accountability is one of the most important institutional quality factors which ensures the human rights and legal situations of a country. The index of voice and accountability ranges from -2.5 to 2.5. Other than India, both Bangladesh and Pakistan scores negative scores in terms of voice and accountability shown in Figure 7.

## LITERATURE REVIEW

Kaufman, Kraay and Zoido-Lobaton (1999) have aggregated a database of hundreds of cross-country governance indicators into six fundamental indicators: voice and accountability (VACR), political stability and absence of violence (PSR), government effectiveness (GER), regulatory quality (RQE), rule of law (RLR) and control of corruption (CCR). The VACR indicator is about political freedom of government selection and freedom of media while the PSR indicator reflects the likelihood of government maintaining order in case of destabilization by unconstitutional means. Further, the GER indicator reveals the quality of public and civil services, and the policy formulation and credibility. Furthermore, the RQE

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

indicator represents policies and regulations that permit and promote private sector development. The RLR indicator illustrates agents' confidence in and abidance by the rules of society. Finally, CCR shows the extent of using public power for private gain (Kaufmann et al., 1999a, b).

However, the relationship between Institutional quality indicators and FDI remained debatable in empirical research for a long period of time. Some of the studies focused on only one indicator such as political stability, corruption, RLR and RQE while the others examined all the six indicators. Investigation of this relationship is given in La Porta et al. (1999), Edwards (1990), Jaspersen et al. (2000), Hausmann and Fernandez-arias (2000), Globerman and Shapiro (2002), Asiedu (2002, 2011), Samimi and Ariani (2010), Ahmad et.al (2014). While some of these studies failed to find significant relationship between governance indicators and FDI, the majority of them confirmed the significance of the relationship. For instance, Globerman and Shapiro (2002) find that improving governance attracts foreign capital and creates conducive conditions under which MNCs operate. Gangi and Abdrazak (2012) investigate the impact of governance on FDI flows using a panel data of 50 African countries. They find that three out of the six World Bank's governance indicators are statistically significant: VACR, GER and RLR. The rest of the indicators (i.e. political stability, CCR and RQE) are insignificant.

With regard to the relationship between Institutional quality and FDI, the prevailing view is that countries with Institutional quality tend to attract more FDI because in the absence of Institutional quality, investment cannot be protected (Globerman and Shapiro 2002) and poor governance increases costs and uncertainty (Cuervo-Cazurra 2008a). Due to the relatively irreversible nature of FDI, foreign investors are keen to minimize unnecessary risks resulting from poor governance. Although poor governance may influence the entire economy, it may act as a deterrent to foreign firms. For example, the low level of 'bureaucratic quality', which involves extensive regulation, discretion rather than rule, red-tape, lack of skilled personnel, administrative inefficiency, unfair tax system, complicated rules to establish a firm, lack of transparency and weak protection of property rights, may generate opportunities for rent-seeking and cause inefficiencies. The unpredictable and low quality of government services may increase firms' exposure to additional risks and their operational costs (Drabek and Payne 1999). The high levels of bureaucratic quality also act as a shock absorber and tend to minimize the risk associated with drastic revisions of policy when governments change and there are interruptions in government services. The lack of transparency can increase information cost and lead to corruption. Weak property rights may increase risks and reduce investment.

Laws could be restrained or governments could overturn court decisions for political reasons. Weak legal provisions and the lack of effective legal enforcement could result in high levels of corruption. The lack of law and order may create conditions in which corruption can easily thrive. Random interpretation and enforcement of laws and regulations can create uncertainties that civil servants can take advantage of in their corrupt activities (Johnson and Dahlström 2004). The transaction costs such as negotiation costs, search costs, surveillance costs and enforcement costs can be higher in poorly governed countries. According to North (1990), reducing the transaction costs by constraining the behavior of economic agents and reducing the risk of opportunistic behavior is the main function of institutions.

Zhu (2007) argues that foreign firms are heterogeneous in dealing with poor governance and strategically adjust to the local environment in order to get business contracts. In a Institutional quality environment with well-developed laws, courts, democratic institutions and property rights protection, the firms play the game according to the rules as misbehavior would cost them heavily in terms of legal sanctions as well as reputation. However, in a poor governance environment where foreign firms compete with both domestic and other foreign firms, they adjust to the local business climate, and pay bribes in order

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

to get business contracts that magnify the problems of poor governance in target countries. Therefore Zhu (2007) states that 'in more democratic and developed countries, increasing FDI inflows are likely to contribute to reduction of corruption, while in non-democratic and less developed countries, a rise in FDI inflows is associated with a higher level of corruption'.

Zhu (2007) also suggests that in a poor governance environment, foreign firms would have few incentives to try to improve governance. Those firms that benefit from poor governance through paying bribes would obviously have no incentives to speak out against it. Those firms that lose business contract because of corruption may prefer to remain silent for two reasons. First, speaking out or prosecution often fails because of the weak legal system and the strong relationship between the winner and the courts. Second, business is a repeated game and losers in a single business contract may not want to damage their relation with local authorities given the opportunities to get contracts next time. Complaining about poor governance is likely to create more hostility and reduce opportunities to get future contracts.

In the case of corruption, the literature is richer compared with the other governance indicators. The dominant 'sand the wheels' view suggests that corruption deters FDI as it is a sign that the government is malfunctioning, which adds costs to foreign investment. Many researchers have argued that high corruption levels deter FDI in the transition countries (Resmini 2000; Hellman, Jones and Kaufmann 2002; Cuervo-Cazurra 2006). This implies that FDI should be lower with corruption in a country with relatively high quality of governance. In this case, corruption entails costs and has no distortions to grease. Although limited, a few empirical studies have found no negative link between corruption and FDI in non-transition countries (Moskalev 2007) which question the overall validity of the 'sand the wheels' argument.

Finally, it cannot rule out the possibility that poor governance itself may be a source of better investment opportunities for MNCs. Poor governance may be a source of rent not only for corrupt politicians and policy makers in the target countries but also for large MNCs. As Li (2005) argues, in a relation-based system, the political system tends to be dominated by powerful rulers and policies tend to favor big business, which provides fertile ground for large MNCs that have large sources to finance their rent seeking activities. Such arguments are not new. Many scholars have argued that undemocratic and authoritarian regimes in developing countries provide investors with higher returns and attract more FDI (Bellos & Subasat 2012).

Furthermore, recognizing that FDI as a key factor for economic growth and important tool for bringing technology to recipient countries, it has received great attention from many economists in recent literature. The literature on FDI can be categorized into three main groups: the first group investigates the effect of FDI on macroeconomic indicators, such as economic growth, exchange rate, rates of inflation, balance of payments and rates of unemployment. The second group examines the impact of FDI on different factors such as technology transfer to recipient countries, management practices by national firm and labor skill and productivities in hosting countries. The third group focuses on the determinants of FDI and the main driving forces for its inflow and outflows to different countries. This topic remains a hot issue for researchers from different disciplines for a long period of time. Their main concern has been to identify the key variables that cause variation in FDI and hence can be used as instruments for economic policies conducive for FDI attractiveness. This group can be subdivided into two sub-groups: the first sub-group undertaken at country level using time-series data. In these studies determinants of FDI were examined for individual countries over specific period of time. The variables identified by these studies include, GDP growth, GDP level, degree of openness measured by balance of trade, real exchange rate, political stability, market size measured by per capita income and size of population,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

domestic investment, the return or cost of capital rate as variable reflecting the costs of production in the host countries. The second subgroup undertaken across a set of country level over specific period of time using panel data an example of which includes Samimi and Ariani (2010).

In the literature there were no studies that examined the relation between Institutional quality and FDI flows especially to the Sub continental countries. However, the impacts of some of the Institutional quality indicators on FDI flows were examined as part of the determinants of FDI. Because of that, our review of the literature concentrated on the empirical studies that were related to the determinants of FDI. This can help identify the main factors that cause variation in FDI flows to different countries and at the same time investigate the relation between Institutional quality indicators and FDI flows. It has been apparent from the foregoing literature review that although there is no dearth of research done on various aspects of governance and FDI, no work done on the nexus between Institutional quality and FDI especially in India, Pakistan and Bangladesh. To this end, the prime focus of this paper to find the impact of Institutional quality on FDI inflow for the sampled countries.

## DATA AND METHODOLOGY

### Data

In this part of the paper the impact of Institutional quality on FDI using panel data analysis is explored. Empirical analysis is performed on sample 3 South Asian countries namely Bangladesh, India and Pakistan in the period between 2003 and 2014. All Institutional quality indicators such as corruption control, Political stabilities, regulatory quality, startup procedure, startup time and startup cost etc. have been taken from the Heritage Foundation, the database of World Bank.

### Methodology

This research is conducted to econometrically analyze the relationship between FDI and Institutional quality factors. The methodologies applied in this study are both static and dynamic.

#### Static Models (Fixed and Random Effects)

The panel data is used in analyzing the FDI determinants. In the panel data, the used model consists n cross-sectional units, denoted n=1, ...,N, observed at each of T time periods, t=1, ...,T. In data set, the total observation is n × T. The basic framework for the panel data is defined as per the following regression model:

$$Ynt= \alpha+\beta Xnt+ \varepsilon nt \quad (1)$$

In functional form, FDI = f (Institutional variables, Macro-economic Variables)
Econometric specifications:

$$FDI= \alpha+\beta 1COR+ \beta 5GDP+ \beta 9PS+ \beta 9REQ+ \beta 9\ SP+ \beta 9\ SC+\beta 9\ INF+ \varepsilon \quad (2)$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Here, Y represents the dependent variable FDI,
Independent variables:
FDI = Foreign Direct Investment
COR = Control of Corruption
GDP = Gross Domestic Products
PS = Political Stability
REQ = Regulatory Quality
SP =Startup Procedure
SC = Startup cost
INF = Inflation

## Dynamic Models

This study employs the pooled mean group (PMG) estimators to address to estimate non-stationary dynamic panels in which the parameters are heterogeneous across groups Taking into account that analyzed 3 economies are different with the respect to their economic policy, the two mentioned dynamic panel models are estimated. Since, the focus of this paper is the impact of regulatory quality on FDI in the long and in the short- run, in order to capture that relationship empirically, the following equation is estimated:

$$FDI_{it} = \gamma_{0i} + \gamma_{1i} GDP_{it} + \gamma_{2i} CORs_{it} + \gamma_{3i} PS_{it} + \gamma_{4i} RQ_{it} + ł_{it},\ i = 1, 2, ..., N;\ t = 1, 2, ..., T \quad (3)$$

where FDI is the Foreign Direct Investment, *gdp_growth* is the annual percentage GDP growth rate, *COR* is the Control of Corruption, PS is the political stability and RQ represents the regulatory quality. Error term capturing the effects of unexpected shocks to *FDI* is denoted by $ł_{it}$. The subscripts *i* and *t* denote country and time respectively, suggesting an unbalanced panel. Since FDI differs across countries in the short-run, this assumption is hereby implemented by using conventional statistical criteria and determining lag length of each variable. Furthermore, an important issue that needs to be dealt with in econometric analysis is the dynamic structure of FDI model, assuming that certain economic aspects prevent immediate adjustment of FDI to changes in its fundamental determinants. Accordingly, the first and foremost step of the empirical analysis was to choose the lag order of ARDL model by applying the Schwarz information criterion (SBC). Even though there was no clear evidence of a most common representation, after choosing a country specific lag order of the ARDL model by applying the SBC information criterion, the preferred specification for the whole sample of analyzed countries was an autoregressive distributed lag ARDL (1,0,0,0,0) model:

$$FDI_{it} = Ł_i + \beta_{10i} GDP_{it} + \beta_{20i} COR_{it} + \beta_{30i} PS_{it} + \beta_{40i} RQ_{it} + \gamma_i FDI_{t-1} + \eta_{it}$$

That is, FDI is lagged once, whereas *COR (*Control of Corruption), PS is the (political stability) and RQ (regulatory quality), GDP are given in levels.

According to Engle and Granger (1987) if the variables are I(1) and co-integrated, the error term is an I(0) process for all countries (i). Furthermore, co-integrated variables show great responsiveness to any deviation from long-run equilibrium, so this feature implies an error correction re-parameterization of equation (2) such as:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$\Delta FDI_{it} = \dot{N}i\ (FDI_{i,t-1} - \gamma_{0i} - \gamma_{1i} GDPt_{it}) - \beta_{1li}\Delta \mathrm{GDP}_{it} - \beta_{2li}\Delta COR_{it} - \beta_{3li}\Delta iPS_{it} - \beta_{4li}\Delta RQ_{t} + \eta_{it} \quad (4)$$

where,

$$\phi_i, = -(-1-\gamma_i), \gamma_{0i} = \delta_i / (1-\gamma_I)\gamma_{1i} = (\beta_{10i} + \beta_{11i}) / 1-\gamma_I$$

Parameter $\phi_i$ is the error-correcting speed of adjustment term, so we expect it to be significantly negative under the prior assumption that the variables of interest show a return to long-run equilibrium

Here, the dependent variable is the Foreign Direct investment.

## FINDINGS

### Descriptive Statistics

To better understand the preliminary features of the data the descriptive statistics of all the variables selected are presented in Table 2. The average of our dependent variables, the FDI of 3 countries used in the study is 9.49 in natural logarithm form. The average GDP growth rate is 6.02%. The mean of all other independent variables are also positive except political stability and Regulatory quality. From the socioeconomic perspective, the negative mean of the PS and the RQ signifies that the political stability and the Regulatory Quality of these 3 countries are less than the standard level.

### Correlation Matrix

The correlation matrix between the selected variables is presented in table 6. From the main variables of our study, socioeconomic determinants, all the variables are positively related to the FDI except the startup time. From the macroeconomic perspectives, the relationship between the GDP and the FDI is negatively correlated on the other hand Inflation has a negative relation to the FDI.

*Table 1. Details of the independent variables*

| Variable | Definition | Descriptions |
|---|---|---|
| GDP | Annual GDP Growth rate | Taken from the World Bank Database |
| INF | Inflation | Taken from the World Bank Database |
| COR | Control of corruption | Ranges from -2.5 (weak) to 2.5(strong). |
| PR | Property Rights | The property rights index (0-100). Collected from The Heritage Foundation |
| PS | Political Stability | Ranges from -2.5 (weak) to 2.5(strong). Collected from the World Bank Database. |
| REQ | Regulatory Quality | Ranges from -2.5 (weak) to 2.5(strong). |
| SP | Startup Procedure | Taken from the World Bank Database |
| SC | Startup cost | Taken from the World Bank Database |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

| Obs. | 33 | 33 | 33 | 33 | 33 | 33 | 33 | 33 |

**Notes 1:** The dependent variables FDI is Foreign Direct investment, GDP indicate GDP growth rate, PS measures the political stability COR refers the Control of corruption, SP refers stratup procedure, SC refers the Startup cost, INF refers Inflation

*Table 3. Correlation matrix*

| | COR | LFDI | GDP | PS | REQ | SP | SC | INF |
|---|---|---|---|---|---|---|---|---|
| **COR** | 1 | | | | | | | |
| **LFDI** | 0.863 | 1 | | | | | | |
| **GDP** | 0.318 | 0.367 | 1 | | | | | |
| **PS** | 0.268 | 0.313 | 0.722 | 1 | | | | |
| **RQ** | 0.755 | 0.861 | 0.319 | 0.136 | 1 | | | |
| **SP** | 0.716 | 0.838 | 0.299 | 0.190 | 0.835 | 1 | | |
| **SC** | 0.217 | 0.348 | 0.619 | 0.764 | 0.300 | 0.382 | 1 | |
| **INF** | -0.257 | -0.168 | 0.3791 | 0.449 | -0.058 | -0.239 | 0.499 | 1 |

**Notes 1:** The dependent variables FDI is Foreign Direct investment,. GDP indicate GDP growth rate, PS measures the political stability COR refers the Control of corruption, SP refers stratup procedure, SC refers the Startup cost, INF refers Inflation

As expected corruption of corruption and political stability favors the FDI in the courtiers but the late startup time causes the negative FDI in the sampled countries. Finally, since there is no value more than .85, we can say that there should not be any multicollinearity.

## Model Estimations as a Whole

### Static Model

In static relationship, the literature usually applied least square methods of fixed effects (FE) or random effects (RE). The FE estimator is the most restrictive of all. It imposes equality of all slopes coefficients (both short and long run) and equality of error variances across units or countries and only the intercept across units or countries are allowed to vary. On the contrary, Random effect estimator also imposes equality of all slope coefficients (both short and long run) but allows error variances and intercepts to differ across countries. It assumes random intercepts, the mean of which is captured by the constant term and the variances of which is captured by the variance of the error term. To find which model is superior,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

this study tested the Hausman test. Since the probability of Chi-square value (7.45) with P-value 0.019, it can be said that random effect model is comparatively more suitable than fixed effect model meaning that this study accepts the result of random effect model.

The analysis of the variables confirms with the findings of a numbers of the previous literature while providing some new ground for study. In both Static models such as the fixed effects and the Random Effects, the results of the analysis proved a number of variables have a significant impact on the FDI of the country. In all our analysis, it has been found that the institutional /socio-economic factors such as Regulatory quality, Control of Corruptions are positively correlated to the FDI.

Since the Hausman test has proven that in our case random effect is more suitable than fixed effect.[1] This paper will give more focus on random effect from the static model. As expected, high startup cost causes the negative FDI in the sampled countries. It has been found that 1% increases in the regulatory

*Table 4. Result of static and dynamic models*

**Notes 1:** The dependent variables FDI is Foreign Direct investment, GDP indicates GDP growth rate, PS measures the political stability COR refers the Control of corruption, SP refers stratup procedure, SC refers the Startup cost, INF refers Inflation

**Notes 2:** The dependent variables FDI is Foreign Direct investment, is a proxy measure of size, calculated as a natural logarithm of total bank assets. GDP indicate GDP growth rate, PS measures the political stability COR refers the Control of corruption, SP refers stratup procedure, SC refers the Startup cost, ST startup time. D.FDI is Foreign Direct investment in differenced form. d.GDP indicate GDP growth rate in differenced form, d.PS measures the political stability in differenced form . d. COR refers the Control of corruption in differenced form, d.SP refers stratup procedure, d.SC refers the Startup cost, d. ST startup time in differenced form.

**Notes 3:** Estimations are performed using the PMG estimator of Pesaran et al. (1999); the reported short-run coeficients and the speed of adjustment are simple averages of country-speciic coeficients; all equations include a constant term; standard errors are in brackets

**Notes 4:** Values in parenthesis are t statistics, (***), (**), (*) indicates significance at 1, 5, and 10% level respectively.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

quality can increase 1.07% in FDI. The Control of corruption can also bring positive outcome for the FDI. If there is 1% level of corruption control increase, it will increase 0.041% percent of FDI. The burucratic problems such as long stratup procedure and the startup cost decreseas FDI by -0.12% and -0.001% percent respectively. From the macroeconomic perspectives, it has been found that only inflation has inverse and statistically strong relationship with the FDI for these sampled countries.

### Dynamic Heterogeneous Model

The Table 4 presents the results of the baseline model of FDI specified by the equation (iv). Furthermore, the Hausman test of long-run homogeneity of coefficients is employed in order to determine which estimator is more appropriate. According to Pesaran et al. (1999), the MG estimator provides consistent estimates of the mean of long-run coefficients, but these are inefficient if slope homogeneity assumption holds. However, if the slope coefficients are indeed homogeneous, then PMG estimator is consistent and efficient. That's why, this study employs PMG estimators.

According to results presented in Table-4, error correction mechanism is in place, since the adjustment coefficient has the correct negative sign and is statistically significant on 1% significance level. The average value of the error correction coefficient (according to PMG estimator) is -0.97 implying that equilibrium is reached in less than 1.5 years. In the above table, it can be seen that the GDP, Regulatory quality and the control of corruptions are positively related to the performance of FDI inflow in the long run. According to PMG model, 1% increases in the GDG growth rate increases FDI by 0.53%. Regulatory quality also effects positively on the growth of FDI. For example if there is 1% increases in the regulatory quality, 0.67% of FDI will be increased. The same trend exists in the control of corruption variable where 1% increases in the control of corruption bring 0.05% of FDI.

Furthermore, according to estimated model, all three control variables have statistically significant influence on FDI in the short run with economically meaningful signs, stressing a positive influence of those variables on FDI, with having the largest coefficient (0.67).

## CONCLUSION AND FUTURE RESEARCH IMPLICATIONS

The importance of institutions can hardly be exaggerated. These are hallmarks of development. For strong institutions are often associated with good governance, transparency, accountability and integrity, while weak institutions breed poor governance, macroeconomic mismanagement, endemic corruption, and serious misallocation of resources. Evidently, developed countries have fairly strong institutions, while institutions are extremely weak, especially in least developed countries. Institutional quality is highly associated with FDI given the relative irreversible nature of this type of capital flows. Corruption, loss of public confidence in the government, likelihood of destabilization of the government by unconstitutional means, rent-seeking and uncertainties about law enforcement will all create a highly risky atmosphere for FDI. It has been found in the study that the Institutional quality indicators such as Regulatory quality, control of corruption have significantly positive impact on the performance of FDI for the long run for all the three countries. Since these two factors were found to be significant determinants of FDI inflow into the countries, policymakers should give proper focus onto these indicators in order to make the region an attractive destination for the potential foreign investors. As because each of the three countries put emphasis on sustainable growth of GDP and since contribution of FDI to GDP

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

for all the three countries have been meager(less than 1.5%) the countries must ensure unhindered FDI inflow by addressing Institutional quality issues such as Control of corruption and Regulatory quality in policy making. In the absence of solid property rights, foreign firms may have very few incentives to engage in new investment as the return on their investment may be uncertain. 'Law and order' may be a major concern for foreign firms. The empirical analysis presented in this study offers a powerful set of factors as key contributors to FDI growth— regulatory quality, control of corruption, reduced trade protection, and greater investment openness.

## KEY TERMS AND DEFINITIONS

**ARDL:** Autoregressive-Distributed Lag- A commonly used testing for the presence of long-run relationships between economic time-series.

**FDI:** Foreign direct investment (FDI) is an investment made by a company or individual in one country in business interests in another country.

**Institutional Quality:** Institutional quality is the comprehensive attributes that captures law, individual rights and high quality government regulation and services.

**MNC:** An enterprise operating in several countries but managed from one (home) country.

**PMG:** Pooled Mean Group (PMG) is the econometric techniques where long run coefficients to be should be identical, but allows the short run coefficients and error variances to differ across groups.

## ENDNOTE

[1] To find which model is superior, this study tested the Hausman test. Since the probability of Chi-square value (7.45) with P-value 0.73, so, this study accepts the result of random effect model.

## ABSTRACT

*This chapter is divided into two parts. The first part examines panel data evidence concerning empirical significance of the determinants of Foreign Direct Investment (FDI) in CLMV countries. Theoretical and empirical findings and outcomes on FDI have been considered to test the model for the aforementioned nations. The data has been taken from the World Bank through 2005-2014. Findings accept the four proposed hypotheses and the results are significant. The second part explores the trade and FDI situation in CLMV through secondary data, and establishes that India has potential to augment bi-lateral ties through this route. Literature review for this section also corroborates with the findings of the first part.*

## INTRODUCTION

The economic reforms of the 1990s in the developing countries were poised to bring about a sea change in the global market system. However, the post reform era exhibited a bleak growth trajectory for the countries. The Latin American crises, not just put a halt to the reform era but what ensued was years of lost growth opportunity. The starkest scenario was in Sub-Saharan Africa that was enmeshed in extreme poverty and debt. The Middle East, which had countries reeling under stagnation, became the breeding ground for terror activities. Finally, the currency crisis dealt a major blow to the promising growth take off exhibited by the Asian Tigers.

However the steady growth of both China and India, post the adoption of liberation strategies, came to salvage the situation. It had rippling effects on the world market due to increased demand for raw materials to fuel its export-led growth. This acted as a boost to the African and Latin American economies, as commodity prices ascended. With the developing economies recovering from their downturn, BRICS began to emerge as a major powerhouse (Jim O'Neill assigned the acronym BRIC to identify the four large countries, Brazil, Russia, India, and China, that encompass over 40% of the world's population, and whose fast-growing economies best represent the beginning of a new era of emerging markets) (Hidalgo, 2013). Thus began the golden era of the emerging economies wherein the advanced economies grew on average a 1.6% a year, while the 154 economies defined as emerging by the International Monetary Fund (2007) expanded by 6.2% every year. The emerging economies are classified as follows:

- Central and Eastern Europe and the Former Soviet Union (now the Commonwealth of Independent States (CIS)) (Kvint, 2008).
- Latin American countries emerging towards a market-based economy.
- African countries.
- Asian economies (India, China, and CLMV)

The late 1980s race to transform into market economies has led to the categorization of countries that are at various points along the track into transition economies. At present, the transition economies in Asia primarily comprise of Cambodia, Lao PDR, Myanmar, and Vietnam (CLMV). The 1997-1998 financial and economic crises had alerted the Association of Southeast Asian Nations (ASEAN) on the need to strengthen intraregional cooperation, which in turn resulted in the creation of a blueprint of the ASEAN Economic Community (AEC) in 2006. The ASEAN Economic Community Blueprint, which was signed by the ASEAN member countries in 2007, focusses on the following four core areas:

1. ASEAN as a single market and a base international production with elements of the free flow of goods, services, investment, skilled labour, and freer flow of capital;
2. ASEAN as a region with high economic competitiveness, with elements of competition rules, consumer protection, intellectual property rights, infrastructure development, taxation, and e-commerce;
3. ASEAN as a region with equitable economic development with elements of small and medium enterprise development, and the initiative for ASEAN integration CLMV countries (Cambodia, Myanmar, Laos, and Vietnam);
4. ASEAN as a region to be integrated fully into the global economy with elements of a coherent approach to economic relations happen outside the region, and increase participation in global production networks (Association of Southeast Asian Nations, 2008).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The AEC with an integrated market and a three-year grace period for the less developed CLMV countries is slated to come into existence by the end of 2015. Despite the promise held forth by the AEC, there are pertinent concerns regarding successful implementation, given the development gap among member countries.

Against this backdrop, the chapter's aim is to examine a) the determinants of FDI flows to the CLMV and b) how India's developments and prospects are in investing with the CLMV. The former is undertaken with the help of panel data techniques, while the latter is exploratory in nature.

## BACKGROUND

In the late 1990s, the CLMV joined ASEAN, raising apprehensions about a gap in average per capita GDP between older and newer members. As a consequence, the Initiative for ASEAN Integration (IAI) was formed by the ASEAN for regional integration policy. Its aim was bridging this developmental rift, which was plagued by inequalities in per capita GDP and differences in extents of human development, such as, life expectancy and literacy rates, etc. Other than the IAI, additional programmes for the development of the Mekong Basin (where the CLMV economies are located) that would focus on infrastructure development have also sanctioned.

In general, ASEAN (with the exception of Singapore) does not have the financial resources to extend substantial grants or loans to the new members. Therefore, it usually leaves the financing of these infrastructure projects to international financial institutions and to developed countries. The CLMV has somewhat managed funding and investment from these institutions and countries, especially from the ASEAN-6 (Indonesia, Malaysia, Philippines, Brunei Darussalam, Singapore, and Thailand). The focus is specifically in areas where the development gap needs to be bridged through the IAI programme. Other programmes intended for the development of the ASEAN-4 (Indonesia, Malaysia, Philippines, and Thailand) also take advantage of the geographical proximity of the CLMV economies and tend to invest in infrastructure development in areas like transport, tourism, and power transmission to enhance mutual benefits in trading amongst each other (Severino, 2008).

The opening up of the centrally planned economies of the CLMV countries through trade and foreign direct investment (FDI) into the global market has resulted in fast growth and macroeconomic stability for Vietnam, Cambodia, and Lao PDR. They have even managed to recover from the global crisis of 2008-2009 because of trade and investment linkages with the economically larger regional neighbours that have helped strengthen these economies and boost export growth in the sectors such as apparel, tourism, agricultural products, and hydropower. However, for a better economic future, growth and development reforms in these economies seem to be imperative. While Myanmar is just about politically stabilizing at the moment, its economic liberalisation compared to the other three siblings is still very gradual (Organisation for Economic Co-operation and Development, 2013).

As mentioned before, the development financing of the CLMV has been largely left to institutions and other developed and neighbouring nations due to the various constraints face by the IAI. Employment generation, skills development, market linkages, availability of additional capital and foreign exchange, increasing consumer benefits (through lower prices, availability of variety and raising demand), etc., are some of the aspects that the CLMV need help with in bridging the development gap. These insufficiencies are, to a certain extent, fulfilled by investing nations who gain economic advantages by gaining access to global markets and fulfilling the resource and efficiency seeking requirements by liaising through

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

trade and Foreign Direct Investments (FDI) with the CLMV. Some factors that are hinder investment are corruption (Transparency International, 2015), global competitiveness (World Economic Forum, 2015), and ease of doing business (World Bank, 2015a) – all of which are fairly low on the scale for the CLMV economies. However, in the recent years these four nations have experienced increasing shares of intra-ASEAN FDI flows. This indicates the catching-up process of industrialization in less developed economies (Abe, 2011). For example, Table 1 below shows the recent data for FDI inflows in CLMV economies (in USD million) from 2009 to 2013.

According to the World Investment Report 2014 (United Nations Conference on Trade and Development, 2015), FDI inflows in the low-income CLMV countries amounted to $13.2 billion in 2013, which is a 7% increase since 2012 (refer to Table 1). The higher inflows in 2013 have been partly because of improved FDI flows in Cambodia, Myanmar, and Vietnam. In addition, in 2013, the CLMV region accounted for 10.5% of total FDI inflows to the ASEAN region. Among the CLMV countries, FDI inflows into Vietnam were the highest at $8.9 billion in 2013, followed by Myanmar with $2.6 billion worth of inflows and Cambodia with $1.4 billion.

It is to be noted that ASEAN Member States as a group are a leading investor in the CLMV countries. This aids in reinforcing regional connectivity and contributing to the increase in intra-regional investment. According to the ASEAN Investment Report (Association of Southeast Asian Nations, 2015), ASEAN investment to Cambodia, the Lao People's Democratic Republic, Myanmar and Vietnam rose by more than 75% in 2013, attracted by wage cost differentials, market potential and opportunities.

During the last five years, FDI inflows in Myanmar have increased at an annual average of 30.5% (2009-2013) and in Cambodia by 30.8%. These countries have received an increasing amount of FDI driven by the desire of investors to reduce costs for labour intensive manufacturing, to harvest mineral resources and to participate in infrastructure projects. The low-income CLMV countries have emerged as a positive aspect for the ASEAN region, particularly for labour intensive FDI and value chain activities. These low-income countries have also experienced a rise in investment in the extractive sector and infrastructure, including those under contractual arrangements. A number of large transnational companies (TNCs), including Nike (USA) and Adidas (Germany), have strengthened their contract manufacturing activities in the low-cost production locations of the CLMV region.

Attracted by growth prospects, Japanese companies invested $1.8 billion in Vietnam in 2011, while $4.4 billion worth Japanese investments were approved in 2012. Some of the other sectors that have seen significant FDI inflows in recent years in Vietnam include banks, property and infrastructure. However,

*Table 1. FDI inflows in CLMV economies, $ million*

| Country | 2009 | 2010 | 2011 | 2012 | 2013 |
|---|---|---|---|---|---|
| Cambodia | 539 | 783 | 815 | 1,447 | 1,396 |
| Lao PDR | 190 | 279 | 301 | 294 | 296 |
| Myanmar | 973 | 1,285 | 2,200 | 2,243 | 2,621 |
| Vietnam | 7,600 | 8,000 | 7,519 | 8,368 | 8,900 |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

there has been a shift in investment interests, with a rise in FDI into manufacturing, retail and technology, among others.

In Lao PDR, Chinese investments in infrastructure have been increasing. Cambodia and Myanmar have emerged as attractive locations for investment in labour-intensive industries, including textiles, garments and footwear.

Over the past few years, foreign participation in extractive industries (including both oil and gas, and metal mining) has also helped boost FDI in this region. In Myanmar, new investments in extractive industries have seen increased inflows, especially after the lifting of sanctions. In the oil and gas industry, companies from India, South Korea, Thailand, and Singapore have entered into oil and gas exploration activities, and are ready to expand their operations. For instance, Total (France) and Chevron (USA) have long held stakes in oil and gas projects, but only after the recent easing of sanctions are the two companies expanding their operations in Myanmar. In metal mining, among others, a joint venture between a local company and Ivanhoe Mines (Canada) started operating a large copper mine in 2004, and later a Chinese investor has become involved instead of the Canadian company. Following the introduction of a new mining law in 2013, investors from China, India, Philippines, Russia, Vietnam, and the USA have expressed interest in mining, expanding the number of possible contributors of FDI inflows to extractive industries in Myanmar. A number of companies from Europe and the USA have also recently established or are establishing operations in Myanmar. For instance, Hilton is opening a hotel in Yangon under a management contract.

Again, it is notable that resource-rich countries have continued to receive significant FDI in the extractive and agricultural industries (e.g. Indonesia and Myanmar). The share of manufacturing in total FDI flows in the CLMV countries is proportionately greater than that in the other ASEAN Member States. This difference partly reflects the stages of economic development among member countries and the locational cost advantages of the CLMV countries for labour-intensive manufacturing operations, which often connect with the operations of affiliates in other ASEAN Member States (Association of Southeast Asian Nations, 2015; United Nations Conference on Trade and Development, 2015).

In 2014, however, Asian LDCs saw a 2% drop in FDI inflows, a negative growth for the first time in four years. This was mainly owing to declines in seven Asian LDCs, including Bangladesh ($1.5 billion, a decrease of 5%), Cambodia ($1.7 billion, an 8% fall), and Yemen ($1 billion of divestment), despite strong FDI growth in the Lao PDR (69%) and Myanmar (62%). FDI inflows to Haiti faced a 50% reduction (United Nations Conference on Trade and Development, 2015; CLMV Capital Asia, 2013; Shiells, 2013; Export-Import Bank of India, 2014).

Although CLMV poses a lot of potential for investment, the distribution of inwards FDI from the ASEAN to the four economies have a small range between the lower side of $1.0–9.9 billion (Cambodia, Vietnam, Myanmar) or $0.01–0.9 billion (Lao PDR) (United Nations Conference on Trade and Development, 2015)

## MAIN FOCUS OF THE CHAPTER

### The Determinants of FDI to CLMV: A Brief Investigation

As mentioned in the previous section, literature points out and experts have recommended that FDI in international trade (inward and outward flows) is crucial to regional cooperation and development. The

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

CLMV, a part of MRB (Mekong River Basin) countries that have limited and inadequate literature and published data. Therefore, it becomes a challenge to get insights into this region in the light of Asian economies in transition. However – as some previous studies have emphasized – the positive effects of trade and FDI on growth have been a key driving force behind the East and South East Asia's development parameter and performance since the mid-1980s. The liberalization of trade and investment regimes undertaken by the reforming and transitioning economies in the region has improved the economic and business environment, favouring the expansion and trade and specifically FDI flows. This has led to the governments formulating outward oriented policies for economic development through integration of international markets. Thus, the trade-FDI nexus has shown promise in this region (CLMV).

Foreign direct investment (FDI) is the flow of capital through multinational companies (MNCs), from one country to another. There are many factors that affect the extent and direction of such flows. Some reasons include the utilization of economies of scale and scope, the use of specific economic and geographic advantages (Hymer, 1960), life-cycle pattern of products or simply because competitors are engaged in similar activities. Governments may also bring about policy competition by altering domestic labour market conditions, corporate taxes, tariff barriers, subsides, privatization and regulatory regime polices, etc., in order to attract FDI to the domestic economy (Tsoukis, Agiomirgianakis, & Biswas, 2004).

The mid-1950s witnessed an interest in the effects and outcomes of FDI, especially after the initial growth models were proposed (Solow, 1956). Since then, the extent of multinational activities has significantly augmented over the past two decades, implying FDI as a desirable element for economic development, mostly because it is characterized by a combination of capital, technology, marketing (Balasubramanyam, Salisu, & Sapsford, 1996), entrepreneurship and human resources management.

Rugman and Dunning (1973) and Dunning (1981, 1993, 2001) provide a comprehensive analysis based on ownership, location and internationalization (OLI) model. The study points to the fact that the size, growth, domestic savings, country's solvency, trade openness and macroeconomic stability variables are the catalysts of FDI (Ranjan & Agrawal, 2011).

Romer (1993) also emphasizes upon the role of FDI in transferring these factors across borders. Specifically, Romer (1993) considers FDI as one of the instrumental elements in the diffusion and dissemination of knowledge and assimilation of technologies and ideas.

The factors responsible for FDI inflows to transition economies (Central and Eastern Europe) are country risk, labour cost, host market size, and gravity factors. In a paper published in 2000 by Bevan, Estrin, and Grabbe (2000) it was found that during the period 1994 to1998, country risks were influenced by private sector development, industrial development, government balance, reserves, and corruption.

FDI often takes a form of capital flows from a parent company to its foreign affiliate by relocating technical factors from one region to another and substituting capital movement with labour mobility in host regions while profiting from domestic markets. Ethier (1986) suggests that one more driving force could be uncertainty and asymmetric information (Latorre, 2008).

Amongst many academic evidences that try to understand the reasons for cross-border investments, Mundell (1957) said that FDI could be determined by relative factor endowments and factor costs. He adds that in the presence of barriers to trade and migration, and with the existence of large differences between capital-rich and capital-poor countries, the incentive for capital flows is greater. The geographical distribution of latter-day investments, however, suggests that FDI does not target only low GDP-level and low-wage countries. In fact, many studies now suggest that additional explanatory variables affecting FDI should be incorporated in a general equilibrium model. In this context, many researchers have incorporated such additional variables that are assumed to affect cross-border investment decisions.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Market size, domestic labour market conditions, cultural and language differences, exchange rate stability, governmental and geographical indicators, corporate restructuring and macroeconomic evaluation of FDI cash-flows, financial incentives, political instability, etc. are some of them (Tsoukis et al., 2004). New Trade Theories (NTT) and New-New Trade Theories (NNTT) have attributed FDI stimulus to the importance of product differentiation, existence of imperfect competition or trade costs and economies of scale in investment choice, capacity of the domestic market share from indigenous firms, self-selection of firms, educational variables and role of human capital accumulation, and the gravity model (Black & Krugman, 1991; Krugman and Venables, 1995; Benhabib & Spiegel, 1994; Deardorff, 1998; Melitz, 2003; Chaney, 2008).

FDI and Portfolio investment flows analyzed by Garibaldi, Mora, and Sahay (2002) to 26 transition economies in Eastern Europe including the former Soviet Union from 1990 to 1999 indicates that market size, fiscal deficit, inflation and exchange rate regime, risk analysis, economic reforms, trade openness, availability of natural resources, barriers to investments, and bureaucracy – all affect the FDI flows considerably.

While some of these studies conclude that there are growth benefits associated with FDI, many tend to find no effects or limited effects (results that are not robust across alternative specifications) through traditional channels such as capital accumulation for developing countries (Kose, Prasad, Rogoff, & Wei, 2009; Dabla-Norris, Honda, Lahreche, & Verdier, 2010). Sound macroeconomic policies can create a general stimulus for FDI spillovers to domestic investment by raising the marginal product of new investments and creating an enabling environment for technology diffusion (Mody & Murshid, 2005; Dabla-Norris et al., 2010).

As cited so far, it is clear that there are multitudes of academic investigations that indicate various results from the same set of parameters that affect FDIs in different ways and proportions under non-similar circumstances. Therefore, it is difficult to get substantial and reliable aggregate information about the determinants related to FDI that can be generalized across varied socio-economic circumstances.

The following section explores the standard determinants of FDI inflow to CLMV with help of Panel Data analysis. The techniques are borrowed from (Baltagi, 1995; Hsiao, 1985, 1986; Woolridge, 2003), and others.

The model has been based according to the FDI determinants given by UNCTAD (Table 2) (Walsh & Yu, 2010) such as market size, labour cost, trade openness, infrastructural facilities, gross capital formation, labour force, macroeconomic stability, and growth prospects, etc.

*Table 2. FDI determinants (as given by UNCTAD)*

| Determining Variables | Examples |
|---|---|
| Policy variables | Tax, trade, privatization and macroeconomic policies |
| Business variables | Investment incentives |
| Market related economic determinants | Market size, growth and structure |
| Resource related economic determinants | Raw materials, labour costs and productivity |
| Efficiency related economic determinants | Transport and communication costs and labour |

Source: United Nations Conference on Trade and Development, 2015

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Data from the World Bank has been used for a period of ten years (2005-2014). Given the lack of data, many significant variables such as the infrastructure index, cost of labour, transport and communications, efficiency of socioeconomic parameters could not be introduced or proxied in the model that has been used. The data set is sparse, and there are only six variables that could be employed to check the FDI determinants in CLMV.

## Market Size

Market size indicates potential for consumption and hence, trade. It can be measured by Gross Domestic Product (GDP), GDP per capita income, and size of the middle class population. These are expected to be positive and significant determinants of FDI flows. Literature made available through studies undertaken by Lankes and Venables (1996), Resmini (2000), Bevan et al. (2000), Garibaldi et al. (2002), Nunes, Oscategui, and Peschiera (2006), and Sahoo (2006) – all point towards the same findings. In contrast, Holland and Pain (1998) and Asiedu (2006) have found out that growth and market size are insignificant determinants of FDI flow (Narayanamurthy, Perumal, & Kode Chandra, 2010).

**Hypothesis 1 (H1):** Market size is proportionate to the amount of FDI attracted.

## Economic Stability and Growth Prospects

Higher market growth indicates a potentially larger market and more prospects that are promising. FDI, therefore, tends to flow to the countries with larger market size and higher economic growth rates in which larger economies of scale could be provided for FDI to exploit their ownership advantages (Culem, 1988). A country which has a stable macroeconomic condition with high and sustained growth rates will receive more FDI inflows than a more volatile economy. The proxies measuring growth rate are GDP growth rates, industrial production index, interest rates, inflation rates (Amaya & Rowland, n.d.; Dadush, Dasgupta, & Ratha, 2000).

**Hypothesis 2 (H2):** Stable macroeconomic conditions with high and sustained growth rates attract more inward FDI.

## Trade Openness

International trade tends to boost and support FDI. Much of FDI is export oriented and may also require the import of complementary, intermediate and capital goods. Most MNCs are now trading through Global Value Chains (GVC). In either case, volume of trade is augmented, thereby increasing trade openness (Lankes & Venables, 1996; Sahoo, 2006). Trade openness can be proxied as the ratio of the total trade by GDP (Nunes et al., 2006).

**Hypothesis 3 (H3):** Liberal business and economic policies attract more inward FDI.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Gross Capital Formation

Increase in the gross capital formation helps the economy grow. This in turn, will result in improving the investment climate and attract FDI. Krkoska (2001) and Lipsey (2000) found that there was no significant impact on FDI with an increasing rate of capital formation. This finding is purely from the dataset that they used for the study. However, a positive or negative and significant relationship between FDI and capital formation is anticipated.

**Hypothesis 4 (H4):** High gross capital formation implies potential for consumption and spending, thereby, attracting FDI.

Therefore, the present exploration has following four hypotheses:

**H1:** Market size is proportionate to the amount of FDI attracted.
**H2:** Stable macroeconomic conditions with high and sustained growth rates attract more inward FDI.
**H3:** Liberal business and economic policies attract more inward FDI.
**H4:** High gross capital formation implies potential for consumption and spending, thereby, attracting FDI.

While the dependent variable in this study (in all four countries) is Log of FDI Net Inflows (BoP in current USD); the independent variables are:

- GDP (in current USD).
- Inflation (CPI).
- Trade Openness.
- Work Force Participation Rate.
- Gross Capital Formation.

The independent variables that are expected to determine FDI flows have been chosen based on previous literature and availability of dataset for the selected period.

Based on the hypothesis posed, the estimated model is as follows:

FDI = f (market size, economic stability and growth prospect, trade openness, labour force, gross capital formation) (1)

Equation (1) can be changed into mathematical form using log-linear model:

$$LFDI_TOT_{it} = \alpha + \beta_1 LGDP_{it} + \beta_2 INF_{it} + \beta_3 LLFPR_{it} + \beta_4 LGROSSK_{it} + \beta_5 TR_OPNS_{it} + e_{it} \quad (2)$$

where:

$LFDI_TOT_{it}$ – log of net inflow of Foreign Direct Investment (BoP in current US dollars) for country i at time t.

$LGDP_{it}$ – log of Gross Domestic Product in current US dollars for country i at time t and is the measure of market size.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$INF_{it}$ – Inflation Rate for country i at time t, which is the measures of growth prospects of a country.
$TR_OPNS_{it}$ – trade openness for country i at time t and is computed as the ratio of import of goods and services plus export of goods and services divided by GDP.
$LLFPR_{it}$ – log of total labour force participation for country i at time t.
$LGROSSK_{it}$ – log of gross capital formation (% of GDP) for country i at time t.
$e_{it}$ – error term over the time t.

## Findings from the Descriptive Statistics and Panel Data Estimation

The descriptive statistics and correlation analysis for the variables are given in the Table 3 and Table 4.

Trade openness (TR_OPNS) has the maximum value of 119.5749 and a standard deviation of 31.68617 (from Table 3). This is followed by the gross capital formation (GrossK) that has a value of 27.06087 and a standard deviation of 6.962616; while, inflation (INF) has a value of 7.595854 and a standard deviation of 5.547673. Clearly, trade openness is largely varied in the CLMV countries and bears significant impact on the attraction of FDIs. Also, gross capital formation seems to be next in line, in terms of attracting FDI but it is far behind in the impact that trade openness has (in this data set and study). The standard deviations of gross capital formation and inflation are close in value though there is a distinct gap in the measure of their means.

*Table 3. Descriptive statistics for the dependent and independent variables*

| Variables | Value | Standard deviation | Minimum value | Maximum value |
|---|---|---|---|---|
| LLFPR | 1.8971620 | 0.0127132 | 1.8842290 | 1.9164540 |
| LGDP | 10.2641300 | 0.5725018 | 9.4370460 | 11.2335600 |
| GrossK | 27.0608700 | 6.9626160 | 17.0979100 | 39.5662700 |
| INF | 7.5958540 | 5.5476730 | -2.9320740 | 22.6733200 |

The Correlation Coefficients' matrix show very high correlation amongst several variables. This does bring about a problem of multi-collinearity in the model. However, that problem is taken care of by the inherent techniques used in panel data analysis.

Intuitively, the variables do have a bearing on the FDI inflows in a host nation and can therefore, be considered in the model.

In the panel data analysis the Hausman (1978) test rejects the Fixed Effects model and hence, the Random Effects model is accepted. The findings from the Random Effects (RE) and the Ordinary Least Squares (OLS) models are given in the Table 5.

The results from Table 5 indicate the following:

- The regression from the RE model fits well. The adjusted $R^2$ is largely significant at 0.81 that means that the variation in the dependent variable is well explained by the independent variables in the model.
- All explanatory variables have the right signs (direction of change) though they may not be significant in several cases.
- The co-efficient signs for one out of five variables are negative. Positive values for coefficients indicate a positive impact of the determinant variable on FDI inflow and vice-versa. In this model, only the inflation (INF) variable has a negative sign.
- The coefficients of gross domestic product (LGDP) and trade openness (TR_OPNS) are statistically significant at high level of 1%, while the inflation rate (INF), gross capital formation (GrossK), and labour force participation rate (LLFPR) are also significant, but at 5%.
- Out of the five variables considered in the model, FDI inflows in the CLMV is more responsive to the variables: LGDP, GrossK, and TR_OPNS.

Hence, all four hypotheses that were set at the beginning can be accepted.

## India and CLMV: Prospects and Progress in FDI

The adoption of the "Look East Policy" by India in 1992 was an initiative towards developing extensive economic and strategic relations with the ASEAN nations (including CLMV countries). Since then India has progressed from a dialogue partner to the present status of a strategic partner. The economic

*Table 5. Results from the Random Effects (RE) and the Ordinary Least Squares (OLS) models*

and trade linkages which saw an expansion of trade volume stand as evidence to the deepened economic ties. During the last ten years, India's total trade with the CLMV countries has grown from $1.1 billion in 2004 to $11.2 billion in 2013, which was more than a ten-fold increase. Trade balance was in India's favour, with the surplus amounting to $2.6 billion in 2013 (United Nations Conference on Trade and Development, 2015). Among the CLMV countries, India has a trade deficit with Myanmar, owing to increased imports of pulses and forest products from the nation. In the last four years, India's trade balance with Lao PDR also flipped to a deficit, stemming from increased imports of copper ores and concentrates from the nation.

India's exports to the CLMV countries comprise pharmaceuticals; machinery and instruments; vehicles other than railway; plastics and articles thereof, and cotton. On the other hand, India's key imports from the region include rubber and articles, wood and articles of wood, ores, slag and ash, mineral fuels, oils and distillation, products, and coffee, tea and spices.

India and the CLMV share similar potential in manufacturing – these countries have a young workforce with labour abundance. The CLMV countries are also large potential markets for Indian products. The region has a population of 165 million, growing incomes, and a rapidly expanding middle class. In Vietnam alone, the middle class is expected to increase from 2 million in 2014 to 33 million by 2020.

However, India also faces competition from CLMV because of the integrated global value chains in South East Asia. For example, instance, in 2013-14, the phone manufacturer Nokia moved its operations from India's Chennai to Vietnam's Bac Ninh province largely to take advantage of cheaper regional logistics (Dixit, 2015). In fact, a survey by the Japanese External Trade Organization (JETRO) in December 2014 showed that base monthly salaries for manufacturing employees of Japanese-invested companies in CLMV countries were lower than those in India. While base monthly salaries in India were reported at $239, those reported for CLMV countries were $113 in Cambodia, $112 in Laos, $127 in Myanmar, and $176 in Vietnam (Japan External Trade Organization, 2014).

## Investment Opportunities in CLMV

As India is trying to tap the emerging industrial power of the CLMV economies, it is also seeking cooperation from individual cities in these countries. Some of the major potentials for investment and collaboration between India and the CLMV nations are:

- Basic Infrastructure: An area of grave concern, infrastructure situation of the CLMV region is amongst the lowest in the ASEAN region. The key reason being, limited economic capacity to invest in infrastructure. Development of infrastructure essentially encompasses railroad, airport connectivity, logistics and water supply, among others.
- Power: Cambodia has one the lowest electrification rates outside Sub-Sahara Africa and some of the highest energy costs in the world (World Bank, 2002).
- Agriculture and Allied Activities: There is gross lack of technology and logistical support for this sector. CLMV being largely agrarian, this sector could be capitalized upon to increase profits and steer growth.
- Financial Services: Financial sector in the CLMV region which is still relatively underdeveloped due to its isolation from global banking system, also presents opportunities for collaboration.
- Information and CommunicationsTechnology (ICT): With countries in the CLMV region still on the path of modernization and computerization, ICT is a potential area of investment.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Healthcare: The CLMV countries are overwhelmed with inadequate healthcare services, and thus face difficulties in meeting health needs of the population.
- Education: The CLMV countries face the common problem of low education participation, widespread adult illiteracy, and poor quality of education.
- Extractive Sectors: Mining and Oil and Gas.
- Tourism: The CLMV region is considered as one of the fastest growing tourism destinations in the world, bringing in foreign exchange, creating jobs, and contributing to economic growth. While the CLMV countries have strong comparative advantage in tourism in terms of natural and cultural heritage sites, this potential needs to be fully tapped to make it an instrument to spur broad based economic growth.

## SOLUTIONS AND RECOMMENDATIONS

While the econometric analysis shows that the chosen variables are statistically significant, literature and data confirm that although the CLMV nations are still lacking in trade openness, gross capital formation, tax laws, ease of doing business, transparency, etc., they do have the right climate to be tapped for FDI. CLMV countries need transport (physically links an area or region), logistics (not only physically links an area or a region but also harmonises the corridor institutional framework to facilitate the efficient movement and storage of freight, people, and related information), industrial (links key industrial nodes in a geographical area through integrated supply chain networks; these supply chain networks provide value-added activities along the corridor in order to meet respective customers' requirements), and economic (is able to attract investment and generate economic activities along the less developed area or region; physical linkages, logistics facilitation and supply chain integration must be in place in the corridor as a prerequisite) corridors to be developed urgently (Banomyong, 2010). Although CLMV nations are trying to address these issues, India's goal of deepening economic relationship with the CLMV countries also faces a number of challenges. For example, despite sharing a border that is 1,643 km long, India's immediate neighbor Myanmar is not connected to the country by rail and there is only one poorly maintained road that connects the two countries. In addition, infrastructure projects in the pipeline like the Kaladin Multimodal project and the India-Myanmar-Thailand highway are fraught with uncertainty in terms of execution. The construction of the trilateral highway has experienced numerous delays and may miss its 2016 completion deadline. Another challenge is the Indian government's policy itself. The government has still not defined which sectors need to be focused on by investors in the proposed manufacturing hubs.

India also faces competition from other countries already investing in CLMV. While connectivity may hinder Indian investment, in December 2014 China pledged $11.5 billion to develop 92 high priority investment and technical assistance projects in the Greater Mekong Sub-region, which includes the CLMV countries, Thailand, and China's Yunnan Province and Guangxi Zhan autonomous regions. 46% of these projects will be based in the CLMV countries. Although trade between India and the CLMV countries has increased ten times in the last decade, it is not quite robust in comparison to these countries' economic relations with other partners such as China and other ASEAN countries. Intra-ASEAN FDI in CLMV countries stood at $3.5 billion in 2012-2013 and Chinese FDI in CLMV countries stood at $2 billion. In the same period, more than 80% of Chinese FDI in the four countries went to manufacturing.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Setting up manufacturing facilities in CLMV could help India tap into the highly integrated regional value chain networks within Southeast Asia and between Southeast Asia and China.

The "Make in India" campaign to set-up manufacturing infrastructure outside the country will help Indian companies will benefit from utilizing the easier logistics, integrated supply chains, and cheaper labor costs in the CLMV region. Competition with foreign companies in the CLMV will also increase the competitiveness of Indian businesses and as a result the quality of Indian goods and services which means that in the long-term, Indian companies will bring better production practices and improved technology back home. Provided that connectivity between India and CLMV countries improves, government support for investment ensures that companies will "Make in India" by utilizing regional supply chains (Dixit, 2015). In addition, the strong suit that India has in IT, Indian firms in this sector could have many prospects in the CLMV countries – investment in business affiliates and subsidiaries, as well as, joint ventures in the areas of e-governance, financial services and e-education, could serve both, India and the CLMV, well. Indian companies could also share their know-how in software programmes and services for banks and financial institutions in the region. India can actually participate in financial services, automotive industry, education and healthcare, given the comparative and competitive advantage that it has over other ASEAN (especially, CLMV) countries. The bilateral ties can be enhanced through technology exchange, development of investment promotion agencies, and regional co-operation such as the Mekong-Ganga Cooperation (MGC). Multilateral funded projects in infrastructure development, agriculture, health and education, as well as mining of natural resources, could well pave the way for augmented FDI opportunities.

## FUTURE RESEARCH DIRECTIONS

While India should look at streamlining opportunities and tapping investment potential in CLMV countries, the four nations should also make the investment environment strong. Since very little research pertaining to this aspect is available and data is scarce, a better understanding of macroeconomic variables and finding ways to enhance international relations between the CLMV nations and India would definitely bring up recommendations that could help in the implementation of enhanced multi-lateral trade and investment and strong regional cooperation.

## CONCLUSION

The CLMV have had steady growth in FDI inflows over the past decade or so, however, there are many lacunae in the socio-economic and political parameters, which, if developed and enhanced, would definitely make them an attractive economic group to invest in. In such an event, the four-some could well be a potentially dominant bloc to reckon with in the ASEAN and AEC. In addition, India's expertise, knowledge-sharing and investment in many sectors that need upgrading and expansion in the CLMV countries, are bound to enhance bilateral ties and increase socio-economic prosperity that is mutually advantageous for both, India and the CLMV.

## KEY TERMS AND DEFINITIONS

**ASEAN:** The Association of Southeast Asian Nations is a politico-economic organisation of ten Southeast Asian countries formed in 1967. The CMLV has recently been a part of the ASEAN.

**CLMV Countries:** Cambodia, Laos, Myanmar, and Vietnam are known as CLMV countries. These countries are a part of ASEAN and transition economies, as well.

**Foreign Direct Investment (FDI):** FDI takes place when there is an existence of a controlling proprietorship in a business enterprise in one country by an entity based in another country.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Gross Capital Formation:** Capital accumulation/formation refers to the stock of capital and/or its growth, usually by augmenting saving and investment at the macroeconomic level. The gross measurement of capital formation is usually calculated before deduction depreciation.

**Inward Foreign Direct Investment (FDI):** When a foreign entity invests in a local economy by purchasing another business or establishing new operations for an existing business.

**Market Size:** In economic terms, a proxy for the potential market size can be expressed as Gross Domestic Product (GDP). The confines of a market (in the context of the chapter) are the economic size of the concerned country trying to attract FDI.

**Panel Data:** This term is used in Econometrics and Statistics, for multi-dimensional data frequently involving measurements over time. Time series and cross-sectional data are special cases of panel data that are in one dimension only (one panel member or individual for the former and one time point for the latter).

**Trade Openness:** This refers to the inward and/or outward orientation of an economy to trade with other countries. Some determinants of trade openness are trade barriers, import-export, infrastructure, technologies, scale economies, and market competitiveness.

**Transition Economies:** These are economies that are undergoing structural changes in order to become market-driven economies.

# Chapter 31
# Real Estate Crowdfunding: 2015 and Beyond

**Steven A. Cinelli**
*REMARQ, USA*

## ABSTRACT

*Like a juggernaut, "crowdfunding" has hit the media, the financial markets and the common narrative by storm. Incipient in many ways, the intermediation of financing transactions online has become a billion-dollar industry. As technology has advanced, even recreated, industries, there seems none more primed than "finance", an inherently information business. By creating improved efficiency, both art and science of finance are enriched. A 21st century vestige of the 1980's syndication business, real estate seems to be enjoying the fruits of the crowd, with $1 billion of property financings conducted online in 2014, with an expected $2.5 billion this year. For sponsors and investors, there appears legitimacy to the online approach, underscored by the level of venture capital now finding home in this burgeoning sector. Yet, like its progenitor, might real estate crowdfinance find legislative, regulatory, and practical headwinds, stunting its progress? Still early, with business models, scalability and sustainability still suspect, the current momentum seems promising.*

## WELCOME THE CROWD

While coined as a term only a few years ago, "crowdfunding" certainly has taken the markets by storm. Now in its pubescent period, the investment and financing methodology of aggregating small amounts of capital through online interactive platforms now accounts for billions of dollars (or Euros or Yen) in capital formation and a breadth of new investment opportunities for global participants. Gaining visibility in non-securities based fundraising, *ala* perquisite platforms such as Kickstarter and IndieGoGo, the power of technology to efficiently expose private investment offerings is creating a changed landscape for existing (and largely analog) financiers and intermediaries. This is particularly the case within the real estate realm. 2014 was a breakout year for real estate crowdfunding, with over $1 billion being infused into property-related investments through a hundred or so platforms, with an expected 250%

growth this current year (2015) (Massolution, 2015). Whether the growth of real estate crowdfunding is a function of discerning and executing a new and improved way of intermediating capital providers with capital users, or rather taking advantage of an opportune moment as swelling regulatory and legislative oversight hampers the commercial banking mother lode, it does appear that the market, as of now, shall be characterized by exceptional progress. But we do remain judicious in our view of the quality and expanse of such advancement, and core to this view, is the sustainability of the underlying crowdfunding business model, particularly for real estate.

## IF THERE'S A HISTORY, THERE'S NO MYSTERY

As I commented in the 2015 Massolution Real Estate Crowdfunding Industry Report, what we are witnessing is largely a 21st century manifestation of the real estate syndication model heavily utilized during the 1980s, at least for commercial real estate endeavors. Working either as a principal or as an intermediary, groups would raise funds from "syndicates" of accredited investors through the private placement of limited partnership offerings, with proceeds being used to acquire, rehabilitate, construct, or reposition commercial or multi-family real property. In the effort to aggregate such funds, the "syndicator" or say, sponsor, would prepare a placement memorandum, sometimes consisting of hundreds of pages, which it would provide individual investors generally by snail mail, and then "dial for dollars". Participant investment sizes were set at a level to induce broad participation, but not so low to the extent of creating a "herding cats" phenomenon. The verbal exchange between fundraising sponsor and prospective investors tended to be laborious, as many of the questions or comments were redundant from investor to investor, regardless the size of a particular investment commitment, whether $25,000 or $250,000. Telling the same story time and again, was a characteristic of the syndication process. And then there was the monitoring of who received a book, what the nature of the conversation was and finally allocating time to complete the one-on-one sales process. Post fundraise, the communication between sponsor and investors was equally arduous, layering more paper, snail mail, and repetitive repartee.

Enter crowdfunding, or more explicitly, the analog nature of fundraising communication between sponsor and investors going digital. Rather than authoring a paperback tome, crowdfunding platforms expose dozens if not thousands of investors simultaneously to an investment proposition through engaging and informative websites, with customer relationship management (CRM) systems to support both outreach and ongoing investor management. Simply, this has become the process of telling the story singularly to a plurality, underscoring the efficiency of digital communications. Consider the cost and time savings of creating a single digital copy and allowing through invited online access compared to the mailing out 500 individual books, and then following up on each. And yes, pursuant to securities regulations, each of the old style books were to be manually numbered and controlled. Further imagine if such "book" required an amendment or introducing an update in the project. The efforts and costs to distribute what needed to be shared for informed investment decision making drastically have been reduced. This has wide ranging implications: in reducing the cost of intermediation, smaller transactions might be economically "syndicated", as one can only assess so much in intermediation fees so as not to severely impact investable funds, nor gouge the economics in the end for the investor.

Another aspect of online syndication is that a broader audience can be reached. There has been nomenclature applied here, such as the "democratization" of investing, which respectfully has a semblance of truth. Reducing the cost of intermediation, and specifically on a per investor basis, smaller minimum

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

investment sizes can be handled, leading to larger syndicates, which allegedly can be managed efficiently. A 1980s syndicator would be glassy eyed with a thousand participants in a million-dollar deal, and probably couldn't charge enough to make it worth his while, let alone spend time on property requirements.

Certainly one key difference from the syndicators of yesteryear is that the motivations on investors' part to invest has changed. Back in the 1970's and 1980's, individual marginal tax rates were elevated to 70% (Taxfoundation, 2015) for incomes over $200,000 and a key selling point of the syndications was that the periodic passive losses from owning real estate (largely through the depreciation expense) could be used to offset an investor's other ordinary income, thereby reducing taxes. Thus real estate syndications were real tax driven, as tax shields, and potentially in the end, if the property materialized a gain on sale, even better. Because of the huge demand for such tax shields, there was an onslaught of demand and syndicators continued to aggressively accumulate investor capital to put to work. What transpired though leading to a compression of this industry were: (i) the excessive level of investment led syndicators to invest in weaker properties and the actual losses ensued; and (ii) the federal government changed the tax laws, so that no longer could passive losses offset ordinary income. In effect, the syndication industry came to a halt.

A key difference between that period and now is the offerings made by the crowdfunding syndicates are investor motivation and the common usage of debt as a financing structure for the underlying properties rather an ownership equity position. Rather than owning the property as an equity holder, and advantaging the passive losses, the typical financing structure is a first lien secured loan, which would get paid back with interest upon the disposition or refinancing of the property. The interest rate on the loan, typically between 8% and 14%, addresses the appetite for yield that current investors maintain. We do recognize that many platforms offer equity type investments, but over 80% of 2014 RECF financings were embodied as secured promissory not

But back to the democratization spin: this is really not a new twist. In 1960, under an act of Congress, the Real Estate Investment Trust Act (Taxfoundation, 2015) was instituted, creating a mutual fund methodology for real estate investing. It was observed that real estate, particularly large commercial buildings and diversified portfolios of income-producing properties were the exclusive province of institutional investors, and legislators developed REITs as means for small investors to aggregate their funds to be deployed into larger real property. And to support the use of REITs as an investing aggregate, they were assigned a favorable tax treatment (namely the REIT itself was non-taxable subject to it distributing 90% of its income). The REIT methodology has proven to be advantageous to income-seeking investors, by offering portfolios of both real property ownership interests (equity REITs) and real property mortgage loans (mortgage REITs). The REIT industry is significant, with over $900 billion (REIT, 2014) of REITs outstanding, ninety percent of which are in equity form. In fact, taking the US lead, there are now REIT genres in over thirty countries.

## APPETITE FOR ALTERNATIVES, REAL ESTATE IN PARTICULAR

Over the last twenty years and in particular the seven years, spurred with the convergence of the financial crisis and a broader quantitative easing from the Federal Reserve and other central banks, there has been dramatic shift in investment portfolios to alternative assets, and in particular real estate. With interest rates resting at an all time low, many investors are not only seeking out higher returns yet are desperate to find them given their own requirements. Think about pensions funds, whether public or

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

private, that must address actuarial payout requirements to their respective retirees. Close to half of public pensions in the US are underfunded, so not only are they challenged to meet quotidian payouts, but they have catching up to do for the accruals that continue. Bonds, or debt obligations of private and public sector entities, including the sovereigns, may be less risky than holding real estate, but investors have recognized that spreads between prime commercial real estate assets and high quality bonds have increased significantly over the last ten years, and their risk/return thesis has steamrolled the growing interest into enhanced real estate allocation. Currently we have seen interest rate differentials of close to 300 basis points (3.00%), between prime assets and high rated bonds, thus in a low interest environ, one can understand the move.

In general, alternative assets are increasingly becoming a staple in larger investment portfolios. For decades, traditional or core assets, such as public equities and bonds, represented the bulk of an investment portfolio, whether that is an individual investor or an institution overseeing billions of dollars of investable funds. But certainly over the last ten years, we have seen a demonstrable allocation away from core assets into many things alternative, such as private equity, venture capital, real estate, hedge funds, and even commodities. This has been a function of macroeconomic challenges and conditions, coupled with a growing comfort in what had been heretofore considered illiquid assets. And we are witnessing this practice across investor classes.

From a current macro view, public equities are priced up, elevating to price/earnings (19x-27x for S&P500 based on the analyst, The S&P500 PE Ratio, n.d.) and other performance ratios to levels not reached in since the tech bubble years in the early 2000's. With a historical ten-year average of a P/E of 15, certain analysts believe that the equity market is over priced by 30%. This could continue to propel upward though assuming a return of the retail (small) investor into the market, who has been sitting on the sidelines since the financial crisis of the late 2000s, and the elongation of quantitative easing by the Federal Reserve Bank, keeping interest rates low and liquidity available. But low interest rates have softened the appetite for fixed income investments, like bonds, as investors are seeking higher returns that what is readily available. Further, as analysts suggest equity prices are high, they also anticipate that market interest rates will gradually rise, negatively impacting bond prices. All said, investment capital must find a home and with the challenges of generating targeted and required returns, we are witnessing a marketed shift to alternatives.

But this is not defaulted assertion, one of chasing yield, for the reallocation to alts. Alternative assets provide investors new avenues to manage portfolio risk and return, correspondingly targeting certain outcomes, addressing exogenous factors such as interest rate movement and inflation. In fact, alternatives have become a strategic imperative in most larger portfolios. Many sizable investors whom once allocated a small portion (<5%) in search of pure "alpha" (above market returns), have now developed increased internal capability to pursue alternatives as a fundamental strategy. This is not manifested as a merely an increased allocation to managed venture or private equity funds, which still command expensive costs with management fees and carried interests. This is rather the desire to commit more funds, with better economics, including high levels of direct investing in these asset classes.

For institutional investors, alternatives will account for over 26% of their portfolios, according to a McKinsey & Company 2014 research report (McKinsey Company, 2014), and this escalates to about 30% for those investors with over $10 billion of assets under management. And in respect to such portfolios, nearly ten percent is dedicated to real estate.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## REAL ESTATE AS AN ASSET CLASS

In assessing asset classes, investors' focus is generally on return, but in the context of other characteristics and criteria, such as liquidity, principal risk, comparability to other classes, interest rate levels, and volatility to name a few. And the basic premise is that the higher return being sought, the higher the risk being taken. With respect to real estate, some of its attributes are as follows:

- Its a tangible asset, i.e., you can see it and touch it.
- It typically generates return in two ways - through current income and capital appreciation
- With the exception of investing through publicly traded REITs, it is generally considered illiquid, meaning it will take some time to monetize the asset into cash, and when it is monetized, there is a high friction cost, such has there are typically selling or brokerage commissions.
- It is generally viewed as a complementary addition to the portfolio as it has low correlation with the core asset groups, i.e., its value moves independent of stocks and bonds, and thus can diversify or reduce overall portfolio risk.
- It is considered a hedge against inflation, as its income may rise through rents as overall price levels increase.
- It is financed with a combination of equity and debt. Debt investors may enjoy a fixed return through interest and principal payments while mitigating their risk with a secured interest in the property. Equity investors capture a variable and hopefully higher overall return, through rents and property price appreciation, which is enhanced by using the "leverage" of the aforementioned debt.
- And lastly, real estate's value tends to be highly localized due to market conditions, credit availability, and the timeliness and breadth of information available on the property.

In terms of investing in real estate, there are various methods, such as investing in pools of properties with others or on an individual property level, and in the financing instrument itself, namely equity or debt. As discussed, there are REITs (Real Estate Investment Trust), which enable investors to pool resources together and purchase a larger property or its underlying debt.

Other mechanisms to invest in real estate are through smaller limited partnerships or other Special Purpose Vehicles (SPVs), which also enable individual investors to pool funds to acquire medium sized properties, generally outside the range of the single investor individually. Sponsored generally by a syndicator, this further allows for diversification as well as passive investing, as sponsors serve as managers, for which they are compensated. Crowdfunding makes use of LP and other SPV structures to hold investment interests on behalf of the small investors providing for some level of bankruptcy or liability remoteness. And as stated, with either REITs or LP structures, real estate crowdfunding is the newest way to aggregate funds, but typically using online communications to facilitate capital raising and ongoing reporting back to the investors.

An additional way to gain real estate exposure is by acquiring property on one's own, be it residential or commercial, which is then rented out to a tenant. The investor, now landlord, bears all the responsibility of being the sole owner, such as being obligated on the mortgage financing, property taxes and insurer, dealing with maintenance and repair issues, and generally managing the relationship with the tenant. Certainly, there is a tradeoff in such active investing with doing something more passively, but there are costs and return limitations in the case of aggregated investing.

## TYPES

Real estate is not a one size fits all proposition and the crowdfunding industry has been exposing most to its investor communities. There are many subclasses of real estate, each enjoying different attributes, risk elements, and return expectations. Further, depending on the subclass and the purpose of the underlying financing, which investment capital is deployed, time horizons may differ, as well as the nature of return being sought. As earlier described, real estate can offer two means of return – current income and capital appreciation, and based on the structure of the financing program and type of property, returns could emanate from either or both means.

Amongst the various subclasses are (Massolution, 2015):

- **Commercial and Industrial (C&I):** This subclass generally consists of office buildings, warehouse and distribution facilities, and retail space, which are leased out to private and public parties, thereby generating rental income. Such leases can be structured on short-term or long term basis, consist of flat payments or have periodic adjustments, and can even be tied to the operating performance of the lessee, in the case of specialty retailers with "percentage rent" clauses. In recent years, there has been considerable investment in redeveloping existing properties as many of the most active urban areas are gentrifying and repositioning themselves, creating incremental lease rates, and thus yield for investors. This subclass constitutes the largest proportion of the REIT industry.
- **Hospitality:** Think hotels and resorts: these properties generate income from providing lodging paid on a short-term basis, while offering amenities, such as food and beverage services, i.e., restaurants, golf, spa, social function services and business conference facilities. Generally suffering during recessionary times as both business and vacation travel becomes anemic, hospitality participants have enjoyed a substantive upsurge since 2011, with improving economic conditions buoying both business and consumer spending. During 2014, one RECF platform offered a partial equity interest in the Hard Rock Cafe Hotel, combining both economic incentives with patronage elements.
- **Multi-Family Residential:** This subclass refers to those properties deriving rental income for periodic residency, such as apartment buildings, but also cooperatives, duplexes and condominiums, which may be individually owned, and serve as rental property or primary residences. As purchase prices of single family residential have risen over the last three years, the demand for rentals has escalated significantly, which in turn has provided compelling income streams for multi-family investors.
- **Single-Family Residential (SFR):** This represents properties independently owned and detached from other properties, which serve as either primary (or secondary) residences or used for rental purposes. The value of US SFR properties approaches nearly $20 trillion, making it the second largest asset class in the US. Globally, residential real estate has been estimated at over $110 trillion, witnessing a considerable move upward over the last four years, bouncing off the temporal nadir of the crisis years. New means of SFR exposure have been practiced during such time as large real estate private equity firms and sponsors, such as Blackstone, Starwood Waypoint, Colony and others have accumulated large SFR portfolios or have purchased bulk packages, known as "tapes", of SFR properties owned by mortgage lenders, a result of foreclosing on delinquent home loans. Such bulk purchases are generally done at deep discounts, with properties then becoming part of a growing rental home portfolio.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Infrastructure:** Generally, this subclass includes projects funded by either public sector entities or in collaboration with private sector participants and non-governmental organization (NGO). Included projects would be roads, bridges, storage facilities, educational facilities, student housing, agriculture, including vineyards and forest lands. In many cases, municipalities may take the lead by "floating" tax-exempt bonds, or some combination of NGOs and for-profit organization participate with complementary funds. We have categorized this as potential revenues may be derived from such projects to repay the capital provider, such as a bond issuer.
- **Community Projects:** A subset to "infrastructure", there is a growing public sentiment and participation in financing community projects for the purpose of improving the socio-economic condition, rehabilitating dilapidated structures or creating a structure (e.g. fountain) honoring a community leader or organization. These developments are generally not "revenue generating", so no economic return or reimbursement is being sought by capital providers.

## FINANCING AND INVESTMENT STRUCTURES

There are generally two approaches used in the structure of the applicable financing. The first approach is for capital providers to invest as equity participants, wherein they own a contractual percentage of the property being financed. Depending on the legal structure being used (to be discussed herein), such equity investors are "shareholders", much like stockholders are in an operating company, and whose economic return is largely based on the appreciation of such company. Certainly, such property "equity" holders may also participate in the current income that is generated from said property, such as corporate shareholders may enjoy periodic dividends. With the current interest rate environment, many real estate equity investors are primarily attracted to the stream of payments from lease income, and secondarily to the overall appreciation of the property, which would be realized upon its disposition. Net rental income as a percentage of the original investment principal may compare favorably with other fixed income alternatives, such as treasury bills and bonds, and corporate obligations.

The other approach is to serve as a lender on the project, i.e., provide capital in the form of secured debt. This has been the predominant form of finance for projects finance through crowdfunding platforms. From a risk and return perspective, investing in debt is generally lower risk, given that the property as collateral is pledged in support of the loan and such debt ranks senior to the equity in the case of liquidation. But with lower risk comes a lower anticipated return. Such return is generally limited to an interest rate, which in most crowdfunding cases, is fixed during the life of the investment. But given some apparent lack of credit availability from conventional sources, such as commercial banks, various platforms (like Patch of Land) provide high yield short term loans up to 12 to 18 months. Another area of debt financing which we will discuss is in the residential mortgage space, with platforms following the lead of non-bank mortgage originators offering attractive, price-driven, low friction mortgage loans to homebuyers and homeowners.

In either the debt or equity structures, sponsors or the platform will frequently set up an investment entity, a Special Purpose Vehicle (SPV) as earlier referenced, which serves as the aggregator of investor funds and acts as the nominal owner of or lender to the project. For legal, regulatory and management reasons, the SPV will be the single owner of the investment structure and be overseen by the sponsor, who will manage the project on an ongoing basis. The SPV structure has been used in large part to have a single "voice" or vote on select matters, and would represent as a single shareholder for corporate gover-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 1.*

| Structure | Debt | Equity |
|---|---|---|
| Role of Investor | Lender | Owner (Shareholder) |
| SPV Structure | Limited Liability Company, Limited Partnership, S-, C-, B- Corporation, Delaware Statutory Trust | Same |
| Fundamental Characteristic | Loan collateralized (secured) by real property and assignment of leases | Ownership Interest in the Property |
| Documentation | Promissory Note and Mortgage or Deed of Trust | Title of ownership on Grant Deed or Warranty Deed. Shareholder Agreement |
| Rights and Defaults | Creditor Rights – can pursue foreclosure in the case of default, such as non-payment of interest and/or principal when due | Shareholders Rights – Subject to underlying Investor Rights Agreement |
| Terms and Conditions | Fixed Maturity and Payment timing; Limitation on additional debt; balance sheet and operating covenants | Evergreen Maturity; voting rights; registration rights; and rights of first refusal on subsequent financings |
| Investor takes Property Price Risk | No. Debt is a fixed principal obligation | Yes. If the price rises, the investor enjoys gains. If price drops, investor incurs loss. |
| Economic Return | Periodic payments of interest on outstanding principal balance of loan, plus the return of principal. | Periodic payments of Income or dividends, plus participation in the price movement of the property, either up or down. |
| Liquidation Preference | Priority position over Equity. | Subordinate to Debt. |
| Transferability | Yes, subject to securities laws | Yes, subject to securities laws |
| Legal Recourse to Owner | Possibly, depending on legal structure of investment vehicle and terms of Debt by Lender | No. Generally limited to investment amount. Sometimes Equity Agreement includes capital calls, i.e.., request for additional equity investment. |

nance purposes. While there are many SPV structures, the typical form is a Limited Liability Company/ Corporation (LLC), which blends elements of a corporation and a partnership, providing creditor and liability protection for LLC members, and pass-through tax treatment so that the SPV is not taxed as the entity level, thereby avoiding two layers of taxation – at the corporate level, and when distributions are made, as the member or shareholder level.

Table 1 is a comparison of the two financing approaches (Massolution, 2015).

It is worth noting that with the onslaught of crowdfunding, approximately 80% of the platforms and 90% of the funds raised to date have been in a loan or debt structure. On one hand, firms like Patch of Land, have made a market in providing short-term, high-yield loans to sponsors and developers seeking to renovate and "flip" a property. In 2014, Patch completed approximately sixty-five transactions, with an average transaction size of $350,000 (Massolution, 2015). Since then, both its overall capacity and average transaction size have increased precipitously.

The largest of the RECF platforms in terms of capital deployed, LendInvest, has focused on providing mortgage loans to aspiring homebuyers and homeowners, predominantly in the greater London market. During 2014, it is estimated that over $200 million of mortgage loans were originated by LendInvest, with a global reach continuing.

## PLATFORM APPROACHES

While we have identified during 2014 nearly 100 platforms engaging in some level of real estate finance intermediation, such platforms take different approaches to how they conduct their activities. This is really a matter of what they do, and for whom, as well as the types of economics they may derive.

We distinguish between "objective" and "subjective" platforms, or in more colloquial terms, "marketplace" facilitators and "direct issuers". In the former case, there are numerous platforms that have constructed their respective platforms to serve as a *utility* for sponsors and other types of fund raisers. They have built the infrastructure for sharing an investment proposition with their online network of investors, and handle most activities through the fundraising process. Simply, their sponsor client is "renting" the platform to enable the fundraise, wherein the platform is compensated in usage fees. From a business model standpoint, these platforms are driven by volume of transactions and increase fee generation.

In the "subjective" category, this is generally sponsor-based, i.e., the platform is directed as an extension of the sponsor, possibly even owned by the sponsor to efficiently raise funds. Relationships with the investor network likely pre-exist, with now such relationships being moved from an analog engagement to one digitally. This is very much the 21st century version of the older syndication model, where technology is used as the means of communication, but the economics of the syndicator remain the same – earning various layers of fees, coupled with a significant profit participation.

There is a third approach, considered a hybrid, which in most ways is a marketplace utility as described above. However, as an added feature to the service offering, certain platforms have arranged for interim financing, via lines of credit, where the platform will pre-fund the investment opportunity, assuring the sponsor has the capital to pursue his effort, and then take it upon themselves to remarket on a fractional basis the project to its investor base. Taking principal risk in terms of pre-funding, such platforms remain confident that their investors will afford the necessary take out. A number of the platforms that have raised venture and operating capital, have used their balance sheet liquidity to enable such warehouse financing to take place, rather than third party credit facilities. Of course for taking such risk, these hybrid platforms earn higher fees and may in fact participate in the overall performance of the financed project.

## THIS IS STILL A FINANCE BUSINESS

While we can wax on about the merits of the internet in capital formation, a most pressing palaver is one that is fundamental within the media industry: what is more crucial - content or distribution – to the success of a platform? Certainly we can default to affirming both, indicating that one needs to develop strong and absorbable content, while cultivating reach. But in the end, finance is an information business, and although the 'net enables investors to be engaged globally at tremendous pace, the quality of the content will determine winners from losers. Democratizing the investment process by introducing more levels of investors, one need take heed that while enabling investors to participate, are they being delivered appropriate information to make an informed investment decision, and further, do they have the acumen to comprehend the content and its caliber? And do the new world intermediaries, in their betrothal to online engagement, actually assess and, as many espouse, "curate" the transactions with the appropriate level of insight and discipline, or shall we see the exposure of deals adversely selected, as fundraising sponsors see this as a new, and maybe only, path to raising funds for their projects?

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

As a directed aside, there has been an active, though lengthy, exercise at the Securities and Exchange Commission to reassess the current definition of "accredited investor" (Accredited Investor, n.d.). As of now, nearly every RECF platform exclusively directs its opportunities to the accredited investor. Developed as part of the Securities Act of 1933, the SEC provided an exemption to public registration of securities if issuers were to sell to those investors of means, namely those that had both the financial capacity to lose the capital they invest, but also had the wherewithal to investigate the merits of the opportunity. While earlier amorphous as to what constituted "means", in 1982 in a partial rewrite of the '33 Act, Regulation D was established defining an 'accredited investor' in terms of specific income and net worth levels. Yet since 1982, the absolute levels of income ($200,000 for single natural persons; $300,000 of married couples) and net worth ($1 million) have not been adjusted, with the exception of the personal residence exclusion from net worth. Well, over thirty-three years, one does recognize the value of the dollar has been impacted by time and inflation. Inflation adjusted, income and net worth levels to remain on par with 1982 would see a "bump" in income levels to $600,000 and a net worth threshold of over $3 million. This would in effect "de-democratize" the private investing world, removing nearly 70% of the currently classified "accrediteds" from the market.

In current Commission discussions about the definition, a key proposal deals with the financial acumen of the investor to determine whether or not s/he is capable of assessing the risks, given professional status, academic training, or germane credentials, such as a CPA or CFA. While not promulgated, the concept of credentials and observed acuity to determined accredited status makes tremendous sense, and, as stated, the ability to understand and assess the risk was core to the original definition. It does not go unnoticed that most of the wealth of the US is based in privately held companies and the ownership represented in unregistered securities. The existing exclusion for "insiders" (i.e., directors and officers) is predicated on knowledge of the company and its prospects.

This diversion into how the SEC may reconstitute the definition of accredited investor is apposite to the role of content provided by the crowdfunding platforms. Depending on the platform, and how they consider their role as a procurer of content, it is implied that is a level of responsibility on these screens to investing to provide adequate and comprehensible content for decision review and making, particularly as they are being paid to facilitate

## CUSTOMER PROPOSITIONS

While we recognize that certain platforms are appendages of direct sponsors to supplement their direct fundraising activities, we will really address those platforms that are "fee for service" providers. Specifically, a sponsor of a real estate investment project is engaging a crowdfunding platform to assist in and manage the fund raising process, as would an investment bank or registered intermediary. To wit, the platform is compensated, largely on its success to raise the requisite funds through its online intercession with its installed investor community. Because of securities regulations, this is a 'closed system' where investors need to be registered within the platform and communication on any offering is done within a secured environment. In effect, while the platform gets compensated by the sponsor (user of capital), the sponsor engages the platform given its base of investors, prescreened with a hopeful appetite for the 'product' the platform avails. In essence, as with any intermediary, there are two customers - the buyer and the seller, in other words the sponsor and the investor.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## LET US REVIEW THE PROPOSITIONS FOR AND TO BOTH

Why would a sponsor engage a platform? Simply, to raise capital on its behalf. The use of intermediaries to drive the fundraising process is an old discipline, but one that typically has scale issues. The time and effort to develop content, package, distribute, engage and close investors is considerable, and sponsors may generally choose to allocate that responsibility to "hired help". Intermediaries, particularly investment banks, are engaged given a demonstrated ability to work with stables of investors, understanding their respective desires and inclinations for investment opportunities.

Sponsors, or users of capital, have a series of motivations for using a real estate crowdfunding (RECF) platform. Fundraising becomes much more efficient, as the financing process is the creation and delivery of information passed on to investors for review. By using an internet-based platform, the reach "horizontally" and "vertically" is tremendously enhanced. From a nomenclature basis, "horizontally" addresses the breadth of reach using online means; in other words, as simple and timely as communication can take place with an investor in San Francisco, the same communication concurrently can take place with investors in New York, Los Angeles, Chicago, even Rome and Hong Kong. Rather than using analog means, simultaneous distribution and reception of content through digital means has altered the landscape measurably. This is about telling a story "singularly to a plurality", as earlier stated.

Additionally, the use of technology allows the investment story to be shared in a more robust way, rather than merely in written format. The ability to depict the story "vertically" can enhance the investor engagement, deepen the knowledge of the project for the investor, which together can improve the likelihood that the investor may participate. Being able to use content beyond that which is "flat", such as script and photographs, sponsors and platforms can utilize videos, 3-dimensional depictions, interactive modeling, and provide online interviews with the principals: all of which creates more resonant story-telling.

Beyond the sharing of the investment to the network, technology also creates efficiency in ongoing investor management. Certainly, pitching the opportunity is key, but the administrative benefits through the fundraising process, say which may require updates, amendments or edits, can be performed with greater efficacy, and including post-transaction reporting. Do note that applied digital technology also addresses the ability to deal with more participants which may have smaller individual investments. Imagining an analog offering of $5 million, with a minimum investment of $5,000. Translating into up to 1,000 investors, this could be an absolute nightmare if dealing solely with analog (paper and phone) communications. This ability to deal with more fragmented networks enables broader reach to more levels of investors as compared to requiring larger minimum investment sizes.

And from the sponsor's standpoint, by having the ability to aggregate smaller sums from a larger contingent of investors, may in fact improve the overall economics of the deal for the sponsor. Many times, when a single large investor, *ala* an "anchor" investor, participates, such investor may desire to improve its own economics as it may view itself as critical to getting the deal done. This may translate into lower management or transaction fees to be earned by the sponsor, or a reduced profit participation. Either way, the "democratization" of investment can avail benefits to both the smaller investor and the sponsor.

Lastly, a growing motivation for sponsors to use such platforms is that financing may be committed up front. Whether a sponsor-driven platform or a hybrid, numerous platforms are taking "principal" risk, wherein they are prefunding the investment, intending to lay off the investment to their investors afterwards. For the sponsor, he receives his targeted funding without the risk of a crowd market's dismissal

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the opportunity. Quite true that there is a cost for such "bridging", but for the sponsor, his returns are more clearly based on the funded project's performance, so eliminating the risk of the initial step (of funding), it appears to be a worthwhile tradeoff.

## AND FOR THE INVESTORS

We also much consider the motivations from the other side of ledger, namely that of the investors. There are a number of reasons for the growing participation in crowdfunded real estate opportunities. One observation is that investors can have access to incredible numbers of investment alternatives, delivered efficiently and comprehensively in a web environment. Rather than searching out investments through reams of paper prospectuses, an investor can review either on one RECF site or various sites a multitude of investments. Like angel investing and the syndication activities of years gone by, much private placement activity was highly localized, i.e., that investors with relationships with sponsors were generally geographically nearby, and thus the opportunities were also characterized by such local flavor. Now, with the expanse of online communication, investors can be exposed to sponsors and projects from hundreds of locations, which allow for broader opportunity and diversification.

Additionally, within the breadth, investors also gain access to varying structures and return elements. Different platforms may offer short-term debt while others, longer-term debt, or possibly a hybrid of debt and equity to enhance a prospective return. Also, as with syndications, investors can benefit from the active engagement of the sponsor, rather than pursuing real estate investing on their own, dealing with "toilets, tenants and taxes". Sponsors, and hopefully the platforms, conduct significant review of the project, its potential and its risks, disclosing such to enable informed decision making. For many investors, they desire to deploy capital on a passive participation basis, relying on those sponsors to deliver the returns being advocated.

But this is an investment process that is not without challenges for the investors, which must be recognized. In general terms, the investments being facilitated by the platforms are unregistered securities, and as such, have a high degree of illiquidity, in other words, they cannot be resold on a simple and efficient basis. While there are discussions by some platforms of developing secondary markets and trading, this shouldn't be expected in the near term, and thus investors need realize that an indefinite holding period is likely.

And as mentioned above with respect to an "anchor" investor possibly impacting the economics of the sponsor, the lack of one can prove deleteriously expensive for the participatory investor. Whether through egregious fee levels, profit participation, and administrative expenses, investors are subject to the financial whims of the sponsor, which according to certain accounts, sponsor and non-sponsor platforms may enjoy as much as 40% of an investment's economics, at times without any principal exposure. This can serve to dampen the normalized returns to the capital provider.

One other area that has yet been broadly tested has been the role of the platform in a transaction that may not perform as anticipated. While sponsor-directed platforms have an economic motivation to deal with challenges on behalf of their investors through profit participation, other "objective" platforms may find themselves in a conflicted position. For example, while the platform is raising capital for its paying client, the sponsor, it has developed and brought to the table its investor network to participate in the sponsor's project. What happens in the case difficulties ensue with the project, such as cost overruns, financing or marketing issues, or even suspect activities? What if the financing needs to be restructured

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

or refinanced or compressed from a loss? Which side of the table does the platform sit on – that of the sponsor, who has compensated the platform or that of the investors, which need to feel that their interests are being addressed in a fiduciary capacity, in hopes of mitigating risk? This to date has not yet been tested, with some of the platforms indicating the "outsourcing" to others for risk-mitigation and restructuring assistance, we do believe the jury is out on how sideways deals may be moderated and remedied.

## SIZE OF THE MARKET

Over the last three years we have seen explosive growth in the real estate crowdfunding industry. Initially buoyed by a mere handful of platforms engaging in short to intermediate term commercial real estate loans or meager equity participation in relatively small rehabilitation or development projects, we have now witnessed a seismic shift in both number of platforms as well as types of financings being conducted. This phenomenon further has global breadth, as markets through Asia and Europe, Latin America and Canada, have developing platforms, particularly in the area of residential mortgage lending. In fact, one of the most notable crowdfunding projects was consummated in Colombia, where Prodigy Networks raised on behalf of the sponsor, approximately $172 million from 3,100 investors. A $240 million, 66 story, mixed-use residential/commercial building, BD Bacatá, is the tallest building in Colombia and certainly marks the power of the crowd.

The real estate crowd funding market continues to accelerate its growth and we anticipate this to continue as key segments, like originating single family mortgages, benefit from continued restrictive behaviors in the commercial banking market. From meager beginnings in 2012, where less than $20 million of financing was intermediated through online platforms, according to Massolution 2015 RECF Industry Report, we witnessed over $1 billion in 2014 volume with 2015 expected to advance by 2.5x that level, achieving about $2.6 billion across real estate asset classes and structures (Massolution, 2015). A snapshot of the market's growth is shown in Table 2 as we look at it from different perspectives.

### Type of Real Estate

Since the beginning, C&I real estate has dominated the RECF product suite, with the exception of the BD Bagata project in Colombia in 2013, a mixed use (retail/residential) property sponsored by Prodigy Networks. Multi-family and single family residential properties continued to find interest within the platforms either in terms of "fix-and-flip" short term financing, or more recently, the growing appetite for first mortgage loans requested by sponsors in longer term rehabilitation and repositioning projects or homeowner/homebuyers in permanently financing their homes. Certainly, LendInvest, to date the most prolific of the platforms in terms of volume, has arranged over $200 million of mortgage financing in the London market.

We do anticipate that the growth in the home mortgage space will continue at a solid pace and to include the RECF players, as alternatives to bank originated mortgage loans have been on the rise since the financial crisis of 2008-2010. Non-bank originators now account for over 40% of US mortgage loans, of which 90% are ultimately being purchased by the government sponsored enterprises, Fannie Mae and Freddie Mac (Light, 2014). Notable US student loan platform, Social Finance (SOFI), expanded its product offering in 2015 by introducing higher loan-to-value, interest only owner-occupied purchase money and refinance loans, and is estimated to close nearly $400 million during this calendar year, with

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 2. RECF growth (in millions)*

| Hybrid | $7.0 | $17.0 | $42.0 | $77.0 | $125.0 | $550.0 |
| Total Financing | $19.0 | $377.2 | $1,014.9 | $2,615.0 | $5,945.0 | $127,300.0 |
| YOY Growth | | 1985% | 269% | 258% | 227% | |

institutional investors purchasing the growing pools. Through the European Union, Asia and elsewhere, mortgage originators are still largely the commercial banks, with covered bond programs offering the liquidity for refunding, with the commercial banks participating with many of the platforms as they become new source of originations.

Geographically, the US still dominates with over 90% of the North American volume. Of the 85 platforms identified by Massolution, 70 were domiciled in the US, with close to a dozen new platforms getting ready to launch in 2015. Europe, led by LendInvest, is witnessing additional activity across sub-classes of real estate, and the current year should see more than a doubling of total financing activity. Asia, while slower to develop in the real estate market, notes that dozens of platforms have launched or are soon to launch to hopefully follow the exceptional growth experienced in the peer-to-peer lending environment, which has built a $20 billion annual market with close to 1400 platforms in China alone.

As mentioned, the financing structure of most real estate crowdfunding projects takes the form of debt. Whether by ease of use or capturing the demand for higher yield, debt structures have been used across types of property and geographies. This is not uncommon across other financing segments in the crowd and P2P lending arena. P2P consumer lending, led by stalwarts LendingClub and Prosper, carved a niche for yield hungry investors, while SME (small to medium sized enterprises) platforms, or small business lending, has also attracted yield players as well as small banks, which are asset hungry, but can't originate on the same cost structure. In fact, OnDeck Capital, a leader in SME lending and a 2014 IPO, had disclosed that its average loan interest rate is over 51% per annum in its S-1 filing in

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

(now since lowered to 28%). Why with interest rates as stratospheric as that are platform originations steamrollering financing across classes and geographies? Certainly investors are keen, but the overall availability of credit has led many borrowers to trade access to credit over cost of credit.

There is a confluence of factors that we believe account for the tremendous rise in marketplace lending, including of course within real estate. While we believe the marketplace lending is disruptive and providing a new avenue for capital to reach desirous capital users, we believe this is largely a response and opportunity afforded due to the financial crisis of 2008-2010 and the legislative and regulatory oversight placed upon the commercial banking sector. Whether from the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010, or the Third Basel Accord of similar year, more stringent capital levels, risk management and compliance requirements, stress testing guidelines, and market liquidity risk assessment have collectively contributed to how commercial banks conduct themselves and practice the art of banking and finance. In simple terms, the banking industry was subjected to a major scolding by the regulatory regime, which viewed the practices and results of the major banks threatening capital markets and amplifying systemic risk within general economies, leading eventually to a pull back on the industry's traditional business line, the extension of credit. From 2009 through 2013, lending fell off tremendously and then began to rebound, but this laid an opening for others to enter the field, drawn largely to areas where the banks had taken a significant hit, such as commercial real estate loans, consumer credit, and single family mortgage loans. This has become a bastion of the crowdfunding contingent.

With blistering penalties, added compliance costs and requisite reserves, coupled with an interest rate environment making it difficult to generate needed loan/deposit spreads, the lending activity of most banks, large and small, witnessed slower growth. Certainly, coming out of the recession period, centered with the financial crisis, there has been growth, but we see non-bank entrants playing increasingly larger roles. Many major banks generated the preponderance of their respective income from activities outside of conventional balance sheet lending, but whether due to the Volcker Rule or other disciplines, such activities have been required to be tempered if not eliminated. What's left is low margined business, that of credit extension, particularly if these lenders do lend and hold the loan. True, there is aggressive loan sales, particularly in the mortgage space (to the GSEs), but for markets that either securitizations or sales cannot take place, it seems like the industry would rather sit on the sidelines, holding (somewhat) gilt-edged sovereign securities, avoiding upped capital and reserve levels if they choose to reenter the lending streams as once they did. It is worth noting that over the last thirty years, the number of commercial banks have been reduced from north of 14,000 to about 5,500 currently (see Figure 1).

This recent retrenching of the banking industry during a period of external capital demand has given increased rise to what's become know as "shadow banking", i.e., the extension of credit outside the regulated commercial banking framework. According to recent reports, credit extension outside the banks now rivals loans on bank balance sheets in the US (59% for banks to 41% for non-banks, per Goldman Sachs) (Nash & Beardsley, 2015). And in fact, total liabilities in the "shadow" are estimated to exceed $120 trillion, including swaps and other derivatives.

But to regress, the changing and challenging banking environment has given rise to new players to address the funding needs of consumers, businesses, sponsors and investors. We do believe this to continue indefinitely and shall assume that in the near term, the buoyant competition between banks and non-banks will assimilate into various partnering efforts (see Table 3).

Table 3 represents the top producing RECF platforms according to the Massolution 2015 RECF Industry Report (2015). Some of the notable findings are:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Most platforms indicate a capability to avail both debt and equity finance on behalf of the sponsoring issuer. Ultimately, we have seen that 90% of the financing that has been done by the platforms is in a debt-like structure. The most common is a short term first lien loan, generally being used to finance a rehabilitation project.
- There is a growing movement into the owner-occupied single family residential mortgage space, with SOFI and Sindeo, playing off the success of LendInvest in the UK.
- Volumes continue to increase, particularly for those that have received some form of venture funding. They have had the ability to leverage their balance sheets, and either commit capital to close deals up front, later to syndicate the investment to their investors.

There has been additional movement in the recent year with a number of platforms now funded, beginning to experience some level of scaling. It is still suspect as to the overall revenue generation and sustainability, but we are seeing progress. Some of the RECF platforms (Times Realty News, 2015) that are demonstrating recent growth and deserve some notable profile are:

- *Realty Mogul* is a well-funded RECF platform which recently completed a $35 million Series B financing round, moving its total funding to north of $45 million. It has apparently consummated $80 million of property financings, largely debt, though there is a mix of equity participations in larger deals which it provided a minority tranche of the total equity. The company reports that it has invested in 240 different properties, which have a total project cost of nearly $500 million.
- *Fundrise* garnered quite a bit of visibility when it raised a significant funding round ($40 million) early in its development, from investor social media company RenRen and a series of New York commercial real estate developers. Uniquely, Fundrise has not limited its activities to accredited investors like the rest. It was first (and only) RECF platform to conduct securities offerings under Regulation A, i.e., under $5 million of funds raised, and before the Regulation A+ limits were established. It is estimated that Fundrise has completed $60 million of capital raises.
- *Patch of Land* has carved itself a niche is high-yield short term debt investments. Reducing the size of the participations to $5,000, accredited investors can participate in these short term loans, which yield from single to mid-teen digit returns. To differentiate its efforts, it has been practicing bridging the financing, using its own balance sheet, to fund a loan, later syndicating it to its investor network. Having raised over $24 million in venture financing, it has the capability to warehouse many of the loans it originates. Additionally, it is one of the few firms that is investing as a principal in its transactions. As of this writing, Patch has funded nearly $27 million in over 100 projects.
- *RealtyShares* began its activities in 2013 and has experienced some decent growth by offering both debt and equity participations in commercial and residential projects. Noteworthy, it has even included a bitcoin payment option. Recently, the company raised a $10 million Series A round. Thus far, it is estimated that RealtyShares have raised approximately $10 million for projects this calendar year.
- *iFunding*, another player in the real estate space, further reduces the minimum investment to $1,000 for accredited investors, placing such money into a variety of projects, whether multi-family residential, office or warehouse. It continues to experience growth as it placed just over $15 million in invested capital last year, and has seemingly doubled the volume through 2015.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- *EarlyShares* is another emerging platform that actually began as a corporate finance platform, raising capital form early stage growth companies. Catching the wave of real estate investing, it began to focus on high-yield real estate investments, marketing average preferred returns of 7% and targeted overall internal rates of return of 18%.
- *Sharestates* is a New York based platform offering one-year senior secured debt investment opportunities, largely along the East Coast. The type of real estate focused on is generally multi-family, but the firm has moved into other subclasses. Of recent note, it inked a partnership with Ranger Capital, a mixed strategy asset manager, that has been increasingly committed to expanding its alternative asset portfolio. Under the partnership, Ranger is planning to invest up to $30 million in Sharestates deals.

## HOW DO THE RECF PLATFORMS MAKE MONEY?

Many platforms have different operating approaches and as such they derive revenues in different ways. It is almost tautological on how the platforms state the benefit to each of their respective constituencies. There have also been certain accounts that the fees charged along the way have been excessive, on a deal by deal basis, where as much as 30% of the economics of a deal may be subsumed by the platform, rather than enhancing investor returns. Table 4 is an overview of the variety of fees or methods of compensation derived by the platforms.

## HAVE THEY DELIVERED?

While we have discussed the growth in the market in terms of the number of operating platforms as well as growing volumes of transactions, can we state that the platforms are really delivering a "new world" of real estate financing and investing? Here are some takeaways from our research over 2014 (Massolution, 2015):

- Total project costs per deal ranges from $300,000 to $10,000,000.

*Table 4.*

| Compensation to RECF Platforms | % of Industry Revs by Fee Type |
|---|---|
| Application/Advisory Fee | 3.0% |
| Construction/Development Fee | 1.0% |
| Platform Usage Fee | 20.0% |
| Transaction/Success Fee | 32.0% |
| Financing Fee | 10.0% |
| Management Fee | 18.0% |
| Administrative Fee | 8.0% |
| Carried Interest/Profit Participation | 8.0% |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Funded participation by the crowd ranges from $150,000 to $4 million.
- Average crowd funded deal size in 2014 was $800,000.
- "Crowd" is being redefined – there are more institutional investors.
- Over 500 campaigns were run in 2014.
- Platforms averaged between 4 and 25 campaigns, but this is changing with size of platform and type of financing offered. Certain platforms, such as LendInvest consummated nearly 350 campaigns in two years.
- Success rate of completed funding – 65%, with that number improving with more platforms moving towards prefunding deals.
- Average all-in yield was 11.2% - 7.8% current + 3.4% capital appreciation.
- And – investment results are promising, as most deals are short-term loan, with good performance, yet equity is a longer term hold, which is too early to tell how returns will be.

## DRIVERS TO FURTHER GROWTH

By all accounts, this is a growth space. While we recognized under 90 platforms in 2015 within the US, we now are identifying close to 150. Again, this doesn't address the dozens of international platforms through Asia and Europe. And many of the existing platforms are accelerating their respective growth, given both macro- and micro- conditions in the market. But growth, quantitatively and quantitatively, can be much different based on strategies and resource availability. With an apparent "wind at their backs", here are a number of drivers to continued growth:

- Relatively low interest rate environment leads to higher allocation to real estate investment allocation. The search for yield is being partially satisfied with offerings of high-yield short term secured loans or payouts on attractive lets.
- Many sponsors are developing their own platforms as the ability to connect, control, converse and even cajole investors through online vs. analog communication has proven beneficial. We are also seeing that a number of intermediary platforms are now deciding to take "principal" investment risk, and hopefully add to their company value through portfolio returns.
- Continued regulatory and capital pressure on commercial banks, a fundamental source of commercial real estate (CRE) lending, has created a bit of credit pull back, opening opportunities for crowdfunding and other shadow banking endeavors.
- Improving sophistication of platforms in terms of what they offer to sponsors and investors. Whether that is bridging the financing, or offering solid aftermarket reporting, those differentiators can accelerate preference to certain platforms.
- Capital availability is a huge stimulant to growth. And that is capital in two flavors. A number of platforms have raised internal growth capital from the venture community, which allows them to build capacity in deal review and processing, as well as using their balance sheets to securing bridge loans to pre-fund the crowd offerings. Further, institutional investors, similar to the P2P lending space, are increasingly participating in this space, with dedicated capital commitments to select platforms. In one respect, this negates the "crowdfunding" descript, as one or two larger players taking down an entire issue would not be characterized as a "crowd". So this reverts to the earlier observation of RECF is the digitized version of the 1980 syndication model.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- With the aforementioned capital, and pre-committed and sizable investor participation, various platforms are doing larger deals. Like the P2P industry, the processing costs of a transaction, independent of size is largely the same. With larger deals, where transaction fees based on size are paid, the economic model improves.
- We anticipate seeing more strategic alliances and alignment between these *avant garde* platforms and their banking brethren, particularly in areas that origination costs for the banks has become unworkable. This is particularly expected in the single family residential mortgage market.
- While the mantra thus far has been about "deal flow" and "upsizing the deal", we do believe that in the end, within the finance world, the primary proposition of value will arise from data production and monetization strategies. With the exception of a mere handful, data monetization has not registered as important. We believe this will change.
- And while real estate is contained within the illiquid alternative asset grouping, as transaction volumes in size of deal and number, we anticipate seeing a return of the securitization market, with private label securities, which may include pools of crowdfunded offerings. SoFi has successfully securitized nearly $1 billion of student loans, and is intent of doing the same with their direct mortgage business.

And in discussing opportunity, we cannot be naïve in assuming clear sailing for unbridled growth. True, there will be obstacles. Some of the concerns to growth emanate around risk management, which in terms may alter the success of any particular crowdfunded investment. Could it be poor underwriting of the risk up front, i.e., adverse selection of deals; or post-funding oversight, i.e., if a deal goes sideways, how is risk mitigated and managed? Here are some of the issues that we believe will arise, which could have a dampening effect on the growth:

- While real estate crowdfinance may facilitate $2.5 billion in fundings for 2015, it is less than 1% of overall real estate financings conducted in the US. With an estimated $1.5 trillion in single family mortgages and just over $1.2 trillion in CRE financing estimated in 2015, the role of the "crowd" is *de minimus*. Nonetheless, the marketplace finance platforms are operating in the domain of a highly regulated commercial banking industry, and as one pundit suggested "If it looks like a bank, it could get regulated like a bank". One of the provisions with the Dodd-Frank Wall Street Reform Act addressed substantive non-bank financial firms, and in its "too big to fail" concerns established oversight on selected "systemically important financial institutions" (SIFIs). Using largely balance sheet tests (e.g., asset size, leverage, debt levels), these SIFIs are subject to the compliance requirements of their commercial banking compatriots. Among the acknowledged SIFIs are Metropolitan Life, Prudential, AIG, and GE Capital (Wikipedia, n.d.). Will any of the marketplace platforms become the size to warrant SIFI oversight? Highly questionable. But the regulatory and legislative tails into those operating in the "shadows" is a possible concern, independent of size.
- Risk management, particularly for problematic transactions, will reveal a needed capability and sustainability of many platforms. As we saw in the 1980s, as capital was abundant, syndicators were deploying funds is less than admirable projects. There compensation structures were premised on getting the deal done, with front end fees, only to see the ultimate project waste away.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Might we witness the same with the current portfolio of RECF platforms? One mitigating factor is that most transaction structures involve senior secured debt, as opposed to the earlier equity participations. Certainly deploying creditor rights as opposed to being subjected to them offers a risk mitigant this time around.

- Further to the above point, we are currently seeing a weakening in credit performance in P2P and SME lending. Is this due to stretching one's underwriting protocols to "do the deal" and sustain growth, or are broader economic conditions weakening? Finance is as much science as it is art. We incurred the wrath of over-lenient financing from the banks leading to the financial crisis of 2008-2010. Might the quest for growth lead to underwriting leniency?
- Currently, the transaction sizes within RECF are relatively small. The average transaction size in 2014 was under $800,000 with the mean transaction size about half of that (Massolution, 2015). While we know there are platforms that have raised capital, are using their balance sheets, and have institutional commitments for what they offer, most are still undercapitalized and focused on very small transactions. This raises the question of business and revenue models, and their respective sustainability. If a platform successfully consummates a $500,000 senior loan, it may make in total fees up to $35-$40,000. With personnel review, infrastructure, technology and general overhead, dozens if not more transactions need be processed to achieve breakeven if not ongoing profitability. Note that such transactions are generally not review per a simple credit scoring module, as each property, sponsor, risk factors and other variables are different. So we ask, at what point does this become a scalable model? Intermediation in these CRE and other transactions can be laborious, even if you use online connectivity with investors. There is still front end analysis, structuring, and monitoring to be done. How much margin can one derive if one only generates $40,000 in gross revenues?
- And as a subset to the above, how should these platforms be valued by the investment community? Should they be valued off of transaction volume, revenues, earnings, or other self derived metrics, such as size of investor base, possibly ongoing (recurrent?) portfolio management fees? Late last year, as Lending Club and OnDeck Capital prepared to price their respective IPOs, this author questioned the market valuations place on them. In comparative terms, while in the consumer or small business lending businesses, they were being valued at revenue and asset multiples 10-20x other companies with larger dedicated franchises, such as Wells Fargo, Capital One, and JPM Chase. Yes, those are banks, but they have deployed significant technologies to conduct their business, and they are diversified. Should LC or ONDK enjoy what can only appear as "technology multiples" vs. financial institution multiples, even though the fundamental business is lending. Since the IPOs and the immediate aftermarket run up, both have settled at about half their IPO prices, and are doing whatever they can to perform and justify even the current values.

## CAPITAL MARKETS, ENTERPRISE VALUES AND EXIT STRATEGIES

As earlier references, capital access for the platforms has been a key driver to their respective growth. We have witnessed many raising venture capital even some strategic funds to progress. Further, firms like Realty Mogul and Sharestates have, like the top P2P lending platforms, received committed capital for usage within their markets to insure capacity to fund offerings.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Dot.com Redux?

During the early 2000's, the investment markets got whisked up in the next generation of commerce, namely the *dot.com* phenom. It appeared that a new value proposition was placed on companies that decided to move their business intercession to the internet for reasons of more efficient and less costly distribution. In fact, many upstarts decided to go directly on line to sell goods and services bypassing conventional distribution and sales channels. In many ways, there seems to be similarity in the growth of online financing platforms. During the dot.com days, there were those that succeeded (and still are) while there were many crash-and-burns. Rather than espousing the digital connection as the driver, the winners knew their basic businesses: Ebay in auctions, PriceLine in travel, Amazon in logistics, and eTrade in brokerage. But then we saw others like Webvan.com, which should have learned better the economics of the grocery business or Pets.com, which seemingly misgauged just how big its market was and its pet owning customer behaviors.

We know that venture capital has found a nice home in crowdfunding, particularly in real estate. But we ask on what basis are models being defined and valued. Recall the dot.com valued "eyeballs" even it there was no way to monetize such. Is investor network size or sponsor relationship bases to value? We have alluded to what the business of these platforms is – namely efficient intermediation for which fees are paid for success. The economics are still suspect with small transaction sizes, level of review and transaction volume.

A question that is raised refers to the potential value creation of such platforms for their investors. Many which have raised operational funds, upwards of $50 million, and at valuations that place post-money values in excess of $130 million. While we know the space is claiming to be "disruptive" to other real estate financing methodologies, such as banks and direct funds, we question whether the business and revenue models support such lofty values, and if so, what supports this. Unlike the P2P space, which is characterized by replicable financings, where some level of credit scoring and actuarial analysis can be performed, thus availing scale, can the RECF platforms be operated with the same mechanisms? Each transaction is seemingly different, requiring certain "laborious" analysis, assuming that the platform is doing some level of review and diligence. So the question is how many transactions can a platform undertake in a given week, a month, a year? As reflected in the mortgage origination business, it used to be that a loan officer could process 8-10 transactions a day. Now, maybe two, with the continued adds of regulatory and compliance requirements. With a cost of labor, and the size of deals which drive revenues per deal, how scalable is the model?

But we ask how should these companies be valued, based on their outlook for revenues and profitability, or on the use of technology to intermediate financial transactions? To expedite the review and processing of transactions, facilitated by technology is a plus, but will the investment results prove out in the end, or will, as some speculate, that adverse selection will creep in. Major financial institutions, all of which deploy technology across their organizations. But yet, they are still valued as financial institutions. For them, technology is a way to reduce costs, thereby providing desired financial services more swiftly and hopefully profitably. But that is their score card - delivering a product or service on a profitable basis. Referring to the platforms, technology too is an enabler, but should not be viewed as the end-all. These companies need to be measured the same way. What do they sell? How do they generate revenues? And can they generate revenues, servicing their clientele, on a profitable basis? We believe the jury is still out.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Let's ask what does create value for the platforms, all of which will hopefully evolve into revenues and ultimate profitability. We see four main pockets of value, which we believe that platforms should position for:

1. **Differentiation:** While many platforms are offering the same "product" to their respective investor communities, such as short-term high yield notes, we ask what's the difference between one and the other, separating a platform from the pack? A good example of differentiation is SOFI, which began in refinancing student loans, but its recent move into mortgage lending is notable. Rather than offering what thousands of mortgage originators (online or offline) are pushing, it has structured a high loan-to-value (~90%) without the historically required mortgage insurance. Its underwriting process and focus is creating a unique niche, yes, differentiation, that continues to set it apart.
2. **Unique Customer Engagement:** Certainly nicely designed and user friendly websites are a given, but how and what the websites may do to enhance the lifetime value of the customer to the platform is a key. Besides generating fees on completed transactions, how frequently does the investor (and sponsor) return to the site and are there further ways to monetize that relationship. Might this be through "paid" analysis and research, or other products that could be cross-sold? How "sticky" and "monetizable" is the environment that the platforms engage their customer?
3. **Revenue Model and Scalability:** We have discussed this earlier. Do the platforms have a unit economic model that is profitable on a fully-loaded deal by deal basis, using applied technology? Or do they have to reach a certain level of volume, either in total dollar volume or number of transactions? Like the P2P industry, profitability is becoming visible largely with increased loan sizes, not sheer numbers of deals. What must be the volume, transaction size and fee level to have positive unit economics?
4. **Data and Analytics:** Finance is an information business first and foremost. The use of technology can move and refine information much more nimbly than humans, and with higher frequency transactions, ability to track performance, introduce indigenous and exogenous factors into the mix, new insights can be introduced. Improved risk management, pre- and post- deal, as well as improved pricing the risk can be the result. While some platforms understand this in basic terms, few have developed data strategies, including monetization of the fruits of their activities. We do believe this to be the ultimate Holy Grail of technology enabled intermediation.

Through various conferences and articles, platform principals have been queried as to where is the inherent value within their models. The responses are deemed suspect and in fact, we believe that in the end, are just basic business practices, coincident to all platforms, offering limited incremental value. We don't believe they necessarily "create value". Here are some of the typical responses:

1. **"Quality Deal Flow":** Many platforms espouse the nature of their deal flow, i.e., financial opportunities that they have been introduced to for consideration of funding. Building a successful portfolio of deals, proving execution history and ultimate investment performance, like a Goldman Sachs, builds reputation and more outside interest to "shop there". But stating that one sees $10 billion of transaction opportunities to yield $10 million being pursued, becomes a logistic issue as well as tough to place value on. Establishing relationships with highly successful sponsors that become "in house" exclusive clients, has some merit, but in the nascent stage of the industry, it would seem that few platforms have earned the desired reputational capital.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. **Diligence:** Being exposed to new transactional opportunities is critical, but more so is the review and analytical process to determine whether an opportunity should be pursued and if so, how to structure it. A challenge is that large intermediaries have teams to assess and deliberate, and ultimately choosing to move forward on its selections, for which they are compensated upon completion. The fees paid to larger intermediaries tend to reflect the relative size of the deal, i.e., bigger fees for bigger deals, which allow for broad upfront effort. When it comes to smaller transactions, fees tend to reflect such size, so is the level of diligence more limited? Or given the structures of the offerings such that diligence can be compressed, e.g., with short term secured loans. And as technology is applied, can the diligence become enhanced with lesser levels of labor, and produce improved decision making?
3. **Investor Network Numbers:** A key benefit of using an intermediary is the breadth of its relationships to funding sources. Rather than a principal who is seeking funds directly "dialing for dollars", using an intermediary with established contacts in the investment community facilitates the fund raising process. Further, it is hoped that the likelihood of successful fundraising is improved, as intermediaries may have a unique sense of their investor sentiments and appetite for a particular issue. When comparing to an online platform, such investor relationships may not be as close knit and generally, the sheer numbers of online investor networks, while impressive, may not be characterized by the same strength of relationship. While the numbers may suggest the law of average in terms of more investors lead to a higher chance of success, one may ask is it better to have 10,000 small investors rather than 1,000 active larger investors to effectuate at deal? And are such networks proprietary to a platform, or do investors, seeking new places to deploy investable funds, sign up to many platforms? Numbers alone seem not to tell the story, rather, how active are the networks to get the job done.
4. **Visibility to Break Even Operations:** This is a little discussed topic, in part as the industry is in development and growth mode. As referenced, small transactions, still requiring a level of analysis and processing, tend to generate smaller fees. Has the economic model, on a deal by deal basis, been assessed and what might have to be achieved to attain breakeven operationally?

## PROGNOSTICATIONS

As an industry in development, with new entries and methodologies, what might we experience in the coming periods? While we have alluded to the significant growth over the last year and forecasting similar rates over the next few years, what may be possible futures for this space? Here are some of the observations that may impact, positively and negatively, for further expanse. To characterize the "what if's", allow us to deploy a couple metaphors, black swans and butterflies. This descriptive we used in the Massolution RECF Industry Report which was released in the Spring 2015 (Massolution, 2015).

A "Black Swan" hails from Nasim Taleb's manuscript on Black Swan theory, which addresses hard-to-predict impactful events that with hindsight could have been expected. And the "butterfly effect", articulated by Edward Lorenz, implies that small changes in conditions in one area can result in huge differences elsewhere.

Some of the black swans we may reflect upon are:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The demise of the "2 and 20" partnership model. Much of the institutional capital invested in alternative assets are generally managed through investment funds, where the manager garners a management fee, e.g., an annual 2% fee based on funds being managed, and a profit participation (or carried interest), which generally tracks at twenty percent (20%) of the earnings after return of initial capital. Over time, based on the performance of the funds, this can be a very expensive proposition to institutions, and many have developed internal capabilities to invest directly, thereby bypassing the aforementioned economic costs. With broader access to opportunities availed online, with professional underwriting, disclosures and portfolio management, it is conceivable that institutional investors will see the marketplace platform approach to deploying capital directly as a viable option, rather than through funds.
- While "crowdfunding" has typically been identified as small sponsors, entrepreneurs and other fundraisers using platforms to aggregate disparate capital for diminutive ventures, we have seen large corporate entities jumping into the fray. Not necessarily motivated by capital formation, but rather striving for better connectivity from their end consumer or client. Companies like Nike, Warner Brothers, CocaCola and Proctor & Gamble, have used the power of the "crowd" to facilitate engagement benefiting product development and marketing. As with consumer products, will larger real estate sponsor groups tap into crowd methods, harvesting a larger portion of the market for their own fund raising. Very likely, as we have already experienced
- Unsavory litigation. While most of the crowd platforms are operating under the 'accredited investor' exemption, i.e., offering investments to those that can 'fend for themselves', it is anticipated that eventually some form of Title III of the JOBS Act or Regulation A+ with enable non-accredited investors to participate in private and/or illiquid offerings. As such, might there be an occasion that a small investor, whom loses money in a deal, conclude that disclosures or overall management of a deal were less than adequate, casting a legal pursuit. Have the platforms accounted for such contingency? Or rather, while espousing the broader "crowd", will the platforms just remain affixed under the Regulation D exemption?
- Many platforms have successfully raised capital as referenced, with lofty valuations. With the IPO aftermarket performance of Lending Club and OnDeckCapital, will this put a damper on fundraising and valuations of companies pursuing marketplace finance. Recent exception is SoFi which consummated a $1 billion private financing led by SoftBank, valuing the business well into "unicorn" status. We remain cautious of both the flows and valuation of capital into this space. In fact, we do anticipate that there will be more strategic investment directed here, led by larger financial institutions.
- In the wake of The Dodd-Frank Wall Street Reform Act, financial institutions, large and small, have been subject to increasing levels of regulatory scrutiny as a result of the financial crisis of 2008-2010. Even large non-commercial bank financial institutions, characterized as Systemically Important Financial Institutions (SIFIs), such as Metropolitan Life, Prudential and GE Capital, are now subject additional layers of reporting and review. We have seen recently that the largest players in the P2P lending industry are now in dialogue with regulators about better or best practices, as well as risk management. We assume that as the RECF platforms gain in size, and intruding on the historic landscape of the banks, there will be the prospect of regulatory review, beyond the SEC's oversight of securities issuance. How this effects the practices and viability of the platforms is subject to speculation.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

And now, what about changes that might cause broad ripples, i.e., having a butterfly effect on the industry and its future. Among the "butterflies" we might just see are:

- Changing the definition of Accredited Investor. Having not adjusted the definition since 1982, the SEC has been reviewing what characteristics should define a "natural person" investor to participate in private (unregistered offerings). On one hand, by inflation adjusting the financial requirements (income and net worth) from the 1982 level to levels 2.5x higher would reduce the overall number of possible investors that could participate in such private offerings by almost 70%. In a constructive and historically sound manner, the SEC is reviewing other methods of "accreditation", such as professional and academic acumen as the tests for participation. We mention "historical" as the original exemption provision in the Securities Act of 1933 referred to not just the financial capacity of the investor, i.e., the ability to absorb losses, but also the ability to conduct an intelligent review of the investment opportunity. This "informed decision making" viewpoint is critical, particularly now in the "information age", and the ability to disseminate broadly requisite content to investors. This new approach may open up private markets, while underscoring the responsibility of platforms to articulate offering materials for investor consumption. Ultimately, this could enhance the overall numbers exponentially.
- While Title III of the JOBS Act has not been promulgated as of yet, there have been over twenty US states that have developed intrastate constructs for crowdfunding, thereby allowing unaccredited investors to participate, albeit limitedly, in private offerings. Will the states continue to take this up on their own in wake of the sluggishness at the federal level? We believe so.
- Crowdfunding is a subset of the growing "shadow banking" evolution, namely the extension of credit outside the regulated commercial banking market. We do see that both borrowers and lenders have a growing comfort in transacting outside the banking system. And with improving controls, risk management and accessibility, we see this to continue and accelerate.
- While access to investments through online mechanisms can avail investments to larger investor communities, this is not just about access but about opportunity. While the SEC's mandate has been proffered to mitigate risk through disclosure and reporting requirements in the '33 Act and '34 Exchange Act, crowdfunding should also be viewed as contributing to investment opportunity. Heretofore, venture and other alternative investments have been the province of the "upper class" which has the "qualifications" to participate in such higher-yielding investments, where the common investor could not gain access. In the narrative about income and wealth disparity at venues like the World Economic Forum in Davos, we need to find ways for broader communities to have access to compelling investments in order to build wealth, though the approach need be couched with certain protections and limitations. But of the three million businesses in the US, only 5,000 have public registered stock for investing and trading. Given that the preponderance of wealth has been created in privately held companies, might not a thoughtful approach to availing a more expansive miscellany of investments be constructive and economically elevating? We believe that the SEC, while in its quest to wrestle with risk, should also create frameworks for broader participation.
- Lastly, and in particular to the millennial generation, the crowdfunding phenomena has embellished philanthropic activities. This has been positively felt by small non-profit organizations, as well as community development real estate projects. We expect that this trend will continue at an accelerated pace.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## FINAL OUTLOOK

The real estate crowdfunding industry will continue with its explosive metric of growth. From new platforms, to expansions of product offerings and improved risk management protocols, and finally, growing investor comfort in the online investing practice: this bodes well for this burgeoning market both in the US and abroad.

We anticipate seeing a phenomenal growth in the residential mortgage market, which has already seen the impact of non-bank originators absorbing over 40% of the market's demand. New US entrants, such as SoFi and Sindeo, will further the competitive landscape in a trillion dollar setting. Already, LendInvest in the UK has demonstrated leadership.

There will be regulatory creep, as more activity is conducted through these platforms, with increasing scrutiny to protect both users and suppliers of capital. As one pundit exclaimed, "if it acts like a bank, it should be regulated like one"

2016 will mark a year of wins and losses. We will witness platforms gaining in size and capabilities, becoming formidable members of the financial markets. We will also see that the current frothiness of value, driven by amorphously described "disruption", see some dampening, and result in numerous platforms being shuttered or consolidating with others. That assumes that they recognize what the value they are creating really is.

Many platforms, and in particular their venture investors, may have had visions of public offerings during the coming 12-24 months at lofty valuations. Early litmus tests (LC and ONDK) and equity market conditions may cause rethinking in monetization strategies. Might we see two step partnerships with larger institutions, desirous of a "fintech" exposure begin to take investment positions, later fully absorbing these platforms: quite possible.

Overall, while playing in the "shadows", there will be much light shining from this industry over the coming years.

# Chapter 32
# The Effect of International Financial Reporting Standards Adoption on Foreign Direct Investment and the Economy

**Christopher Boachie**
*Central University College, Ghana*

## ABSTRACT

*This chapter examines the effect of International Financial Reporting Standards (IFRS) adoption on Foreign Direct Investment (FDI) and Ghanaian economy. It is a cross sectional survey study, with the population consisting of both Preparers and Users of financial statements. Stratified Random sampling method was adopted to gather primary data. Findings showed that IFRS has been adopted in Ghana and it is perceived that IFRS implementation promotes FDI inflows and economic growth. This study recommends all stakeholders to have full implementation to reap benefits of the IFRS and principle - based standards. The implication is that preparers need to work on their skills and expertise gap through training and development and to ensure that these standards are included in the academic and professional curricula. Moreover, regulatory bodies should monitor and enforce these standards but where local content is needed, convergence should be the solution.*

## 1. INTRODUCTION

The importance of international accounting practice studies has grown over the past few years in order to meet economic agent demands and to facilitate international business practices. It is essential to understand that international accounting convergence is an important topic for capital market regulators, investors, markets, governments and all others who deal with financial information of public companies. This brings out the importance of accounting as being an essential fiscal tool for various economic agents. The merit of international accounting convergence lies in its ability to minimize negative effects resulting

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

from diversity of accounting practices in different countries (Cordeiro, Couto, & Silva, 2007). In such a scenario, the introduction of International Financial Reporting Standards (IFRS) for listed companies in many countries around the world is viewed as one of the most significant regulatory changes in accounting history (Daske, Hail, Leuz, & Verdi, 2008).

This research constitutes an extension of the study conducted by Zeghal and Mhedhbi (2006) who concentrated on the major factors that influence the adoption of IAS by the developing countries. However seeing the considerable rising number of emerging countries intending to apply the IFRS and with the accelerated processes over the years ranging between 2008 and 2015 this chapters' contribution consists mainly of testing the effect of IFRS on two parameters: FDI and economic growth.

The adaptation of International Financial Reporting Standard has become a hot topic globally after a series of arguments. Although there are still different schools of thought endlessly arguing in favour of individual countries, why and how to adopt IFRS, the academic and business community begin to look further into IFRS empirically today. One of the hot topics is whether countries will benefit economically or not if they adopt IFRS. This problem is being expounded and discussed widely by scholars but failed to reach agreement globally. It is pity that there are few empirical literatures about the relationship between the adoption of IFRS and foreign direct investment and the economy. The aim of this chapter is to investigate the interaction between IFRS, foreign direct investment and the Ghanaian economy. This chapter contributes to the literature on IFRS by answering two questions: (i) is there any significant relationship between the adoption of IFRS and FDI? (ii) how does FDI inflow affect economic growth in Ghana? The remainder of this chapter proceeds as follows. The second section provides literature review and develop hypothesis. Third section describes the research design and the data. Fourth section reports the empirical results and fifth section concludes

## 2. LITERATURE REVIEW

### 2.1 Background

Internationalization of economic trade and globalization of businesses is on the ascendency. Consequently, financial statements prepared according to a nation's local accounting system may hardly meet the needs of investors, business partners, financiers and decision-makers who are conversant with international standards. Meanwhile, developing and emerging markets are the target of the world's leading industries that are operating in the saturated western countries. To better undertake their activities in developing countries; they must adopt international accounting standards that suit needs (Zeghal & Mhedhbi, 2006). Foreign investment is a major boost to the economies of developing countries. An investor may demand vivid and comprehensible financial information from a firm. This underscores the reason why developing countries must adopt International Accounting Standards (Zeghal & Mhedhbi, 2006).

To bridge the gap between accounting standards among countries, the International Accounting Standards Committee (IASC) was founded in 1973 by a group of professional accounting practitioners with an attempt to formulate a uniform and global accounting standards that would aim at reducing the discrepancies in international accounting principles and reporting practices. In this light, the International Accounting Standard (IAS) was proposed which has actively been championing the uniformity and standardization of accounting principles over two decades now. Meanwhile, in April 2001, the International Accounting Standards Board (IASB) took over the setting of International Accounting Standards

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

from the International Accounting Standard (IASC). Henceforth, the IASB updated the already existing International Accounting Standard (IAS) and referred to them as the International Financial Reporting Standards (IFRS). This study focuses on how Ghana as a typical case of a developing economy adopted the International Financial Reporting Standards and the possible effect on the economy.

In January, 2007, the Minister of Finance and Economic Planning - Ghana formally launched the adoption of IFRS. By December 2007, listed companies, government business enterprises, banks, insurance companies, securities brokers, pension and investment banks and public utilities have adopted IFRS and prepared their financial statements in accordance with the IFRS. In an address to the participants at the launching, the minister referred to a Report on Observance of Standards and Codes (ROSC) on Ghana that the world bank issued in March 2006, and noted that 'the adoption of IFRS would address certain weaknesses the ROSC of Ghana has identified' (UN, 2007).

There are proponents as well as opponents who have arguments for and against the global adoption of IFRS. According to Barth (2007), the adoption of a common body of international standards is expected to have the following benefits: lower the cost of financial information processing and auditing to capital market participants as users, familiarity with one common set of international accounting standards instead of various local accounting standards by Accountants and Auditors of financial reports, comparability and uniformity of financial statements among companies and countries making the work of investment analysts easy, attraction of foreign investors in addition to general capital market liberalization. Ball (2006) stated that many developing countries where the quality of local governance institutions is low, the decision to adopt IFRS will be beneficial. Lipsey and Chrystal (2003) noted that FDI often generates somewhat higher-paying jobs than might otherwise be available to local citizens, it generates investment that may not be possible with the local resources only, it links the recipient economy into the world economy in manners that would be hard to achieve by new firms of a purely local origin. According to Lipsey and Chrystal (2003) the FDI alters country's comparative advantages and improves its competitiveness through technology transfer and effects myriad externalities, domestic investment which can alter a country's volume and pattern of trade in many income enhancing directions. Countries that suffer from corruption, slow-moving, or ineffectual government are likely to resist the change (La Porta, Lopez-de-Silanes, Shleifer, &Vishny, 1999) but in such countries, the opportunity and switching costs are lower which makes the possibility of adopting IFRS advantageous. Kumar (2007) stated that the foreign capital has the potential to deliver enormous benefits to developing nations. In addition to helping bridge the gap between savings and investment in capital-scarce economies, capital often brings with it modern technology and encourages development of more mature financial sectors. Capital flows have proven effective in promoting growth and productivity in countries that have enough skilled workers and infrastructure. Some economists believe that capital flows also help discipline governments' macroeconomic policies.

Omneya, Abd-Elsalam and Weetman (2003) have examined the language effect on the first introduction of IFRS in Egypt. Through a sample of 72 locally listed companies, the authors have shown that Egyptian companies continue to encounter difficulties in implementing IFRS, given the disparities between the IFRS spirit and philosophy in respect of the local accounting traditions and cultures. This chapter reports evidence that adoption of IFRS has a positive effect on FDI and the economy. Chamisa (2000) has examined the international standards' role in improving the quality of financial information produced for a stock market in the developing countries. He noted that these standards are critically and crucially important for the developing countries with an active financial and capital market and are devoid of such importance regarding the other developing countries. Actually, this observation has been

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

confirmed through the study conducted by Zeghal and Mhedhbi (2006) dealing with a sample examination composed of 32 developing countries having adopted the IAS and some other 32 countries which have not adopted them. They show that the developing countries enjoying capital markets, advanced education levels and high economic growth rates are most inclined to adopt the IFRS. Moreover, on examining the development of accounting regulations in Jordan, Al-Akra, Jahangir, and Marashdeh (2009) have analysed the impact of economic, political, legal and cultural factors on promoting the accounting practices. They concluded that the political and economic factors are the elements which contribute most to this development. From all that has been mentioned in the literature review, one can deduce that the research in the field of IFRS adoption determinants with respect with to the developing countries remains limited with somewhat mixed results. In fact, most of the reviewed studies have highlighted the importance of institutional criteria factors (economic growth, education level, capital markets) along with some specific features regarding these countries' operating companies (size, indebtedness levels, the quality of external audit) in deciding to adopt these standards.

## 2.2 Definition of Foreign Direct Investment

Foreign direct investment (FDI) in developing economies has grown rapidly following financial and political transformation. To increase their share of FDI inflows, most countries have eased restrictions on foreign direct investment, strengthened macro stability, privatized state-owned enterprises, instituted domestic financial reforms, capital account liberalization and granted tax incentives and subsidies. Ghana for instance through the Free Zones Act, 1995 and the Ghana Investment Promotion Act 1994 has granted certain tax incentives and investor protection policies to attract foreign investors and also make the environment conducive for their operations. This initiative and policy taken in Ghana have increased the number of foreign direct investment and helped in economic growth.

FDI has been defined by the International Monetary Fund as an investment that is made to acquire a lasting interest in an enterprise operating in an economy other than that of the investor, the investors' purpose being to have an effective voice in the management of the enterprise (IMF, 2012). Denisia (2010) also considers the definition of FDI from a macroeconomic view point, and indicates that FDI is a particular form of capital flows across borders, from countries of origin to host countries, which are found in the balance of payments. The variables of interest according to Denisia (2010, p. 54) are capital flows, stocks and revenues obtained from investments.

### Foreign Direct Investment (FDI) in Ghana

The country of Ghana has the fastest growing economy in Africa with a GDP (US $) close to 42 billion (IMF, 2012). The 25 years of comparatively healthy management, competitive business environment, and sustained reductions in poverty levels has boosted Ghana's economy. Blessed with abundant natural resources, agricultural sector accounts for roughly one-quarter of GDP and employs more than half of the workforce, mainly small landholders. 2013 Index of Economic Freedom shows that Ghana's economic score is 61.3 and is ranked 7$^{th}$ out of 46 in the Sub-Saharan African region making its the overall score rise above the world's average. The Government of Ghana has been taking significant steps to draw FDI into the country, according to the 2013 Investment Climate Statement. To encourage foreign investment, the Government has replaced the previously unfriendly regulations with investor friendly laws. The Ghana Investment Promotion Center (GIPC) Act, 1994 (Act 478) governs investment in all sectors of

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the economy except minerals and mining, oil and gas and the Free Zones. Sector-specific laws further regulate banking, non-banking financial institutions, insurance, fishing, securities, telecommunications, energy, mining, and real estate.

## 2.3 Role and Nature of Foreign Direct Investment in Ghana

Foreign direct investment (FDI) plays an extraordinary and growing role in global business. It acts as agent of economic growth through generating and transplanting of technology, managerial skills and linkages to the world market. It provides Ghanaian firms with new marketing channels, cheaper production facilities, products, skills and financing. It provides an inflow of foreign capital and investment in addition to an increase in job opportunities in Ghana.

Companies who invest abroad are mainly looking to take advantage of cheaper wages, advanced infrastructure and skilled workforce and a less regulated business environment. As countries develop and approach industrialized nation status, inward FDI contributes to their further integration into the global economy by engendering and boosting foreign trade flows. Apparently, several factors come into play. They include the development and strengthening of international networks of related enterprises and an increasing importance of foreign subsidiaries in MNEs' strategies for distribution, sales and marketing (Andre-Pascal, 2002).

### Trend of Foreign Direct Investment

When Rawlings first seized power in 1979, he adopted a radical and anti-business stance; growth fell to -3.2% and an FDI inflow of $2.8 million in 1981. The state of the economy witnessed a further negative growth rate of 3.5% in 1981 to 6.9% in 1982 in the year of his second advent; however, net inflow of FDI remained constant at $16.3 million (Tsikata, Asante, & Gyasi, 2004). In 1983, the Government of Ghana initiated the Economic Recovery Programme (ERP) and later Structural Adjustment Programme (SAP). These policies were adopted primarily to reverse the post-independence economic decline, reduce the impact of the 1980 debt crisis and, facilitate the attraction of value-added FDI inflows to Ghana. The ERP has been described as being generally successful at stimulating more FDI inflow through the lowering of inflation, the removal of tariff barrier which were greater impediments to FDI inflow and the abolishing of exchange rate controls. (Aryeetey, Barthel, Busse, Loehr, & Osei, 2000).

Since the advent of the Economic Recovery Programme (ERP) in 1983, three historical phases of FDI flows in Ghana can be distinguished (Tsikata *et al*., 2000). The first period which spans from1983 to 1988 had a sluggish FDI net inflows, averaging US$4.2 million per annum, and the highest and lowest inflows during the period being US$5.6 million in 1984 and US $2.0 million in 1985 respectively. The high FDI inflow in 1985 was as a result of the establishment of a new investment code (PNDCL 116) that was to serve as the central Investment promotion Agency. Under this investment code were several incentives including tax holidays, exemption for import duties on capital and accelerated depreciation allowances. The second period which starts from 1989 to 1992 also recorded moderate inflows averaging US$18.1 million per annum with the highest and lowest inflows being US$22.5 million in 1992 and US$14.8 million in 1990, respectively. In addition, the period 1993 to 1996 witnessed significant (remaining in three digits) and oscillatory FDI net inflows, which reached a peak of US$233 million in 1994 (with the privatization of Ashanti Goldfields Company AGC), but dropped to US$106.5 million in 1995 before coming back to US$120 million in 1996. The peak inflow in 1944 was due to revision of the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

investment code which ultimately led to the passing of the GIPC Act, 1994 (Act 478). The government also established the Ghana Investment Promotion Council (GIPC) to not only encourage and promote investment in the country but also to coordinate investment in the country. The Gateway project was also initiated, along with all its incentives to make the country attractive to foreign investors. Furthermore, in 1994 the investment code was reviewed to improve the investment climate through:

1. The gradual but effective removal of administrative and some other bottlenecks that hindered the flow of private investment.
2. A review of the tax system to take into consideration the private sector investment by reducing the tax to 45% maximum by 1997 for some enterprises.
3. The establishment of retention accounts and foreign accounts for some companies in order to ensure that part of their profits are retained in the country to finance importation of essential spare parts, raw materials and machinery.
4. The enhancement of credit expansion in 1987 and 1988 to ensure that there was adequate finance to support the priority sectors of the economy.
5. The liberalization of the financial system.

1997-2003 saw flows oscillating, decreasing from US$81.8 million in 1997 to US$56 million in 1998 (the lowest over the 1993-2003 period), then peaking at US$267 million in 1999 before falling to US$115 million the following year. FDI dropped further to US$89 million and US$50 million, respectively, in 2001 and 2002 owing to the effect of the September 2001 attack on the United States and the consequent global FDI drop of 41% in 2001 and 21% in 2002 (UNCTAD, 2005). In 2003, the FDI recovery to US$137 million was due to a massive boost in FDI with the merger of Ashanti Goldfields and AngloGold and the beginning of a US$400 million gold mine investment by the US firm, Newmont. The period 2004 to 2011 also witnessed significant and increasing FDI net inflows, which reached a peak of US$3.2 billion in 2011 with the privatization of Ashanti Goldfields Company.

## 2.4 The Volume of Foreign Direct Investment Flows before and after IFRS Adoption

Ghana is one of the African countries that have attracted the most FDI targeted at the region. Consistently, FDI inflows to the country have been very high compared to most other African countries. In 2002, the country attracted a total FDI inflow amounting to $50.93 million. This increased steadily to $636.01 million in 2006. Ghana adopted IFRS in 2007. The FDI flows into Ghana have persistently increased from $1,383.18 million in 2007 to $3,227 million in 2013. There was a sharp increase of $747.17 million from 2006 to 2007. This can partly be attributed to the adoption of IFRS as foreign investors gain confidence in the Ghanaian market. This trend remained roughly stable until 2013 where FDI increased from $2527.35 million to $3,222.24 million in 2011 (see Table 1).

The economy of Ghana has depended on the following areas:

- **Manufacturing:** Ghana's industrial base is relatively advanced. Import–substitution industries include electronic manufacturing. RLG Communications is the first indigenous African company to assemble laptops, desktops, and mobile phones and is West Africa's biggest information and communications technology and mobile phone manufacturing company. As of 2012 there

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 1. FDI profile in Ghana, 2002-2013*

| Year | Volume of FDI (US$'m) |
|---|---|
| 2002 | 58.93 |
| 2003 | 136.75 |
| 2004 | 139.27 |
| 2005 | 144.97 |
| 2006 | 636.01 |
| 2007 | 1,383.18 |
| 2008 | 2,714.92 |
| 2009 | 2,372.54 |
| 2010 | 2,527.35 |
| 2011 | 3,222.24 |
| 2012 | 3,294.52 |
| 2013 | 3,227.00 |

Source: (GSS, 2015)

were four major companies in the textiles sector: Akosombo Textiles Limited, Tex Style Ghana Limited, Printex Ghana, and Ghana Textile Manufacturing Company.

- **Telecommunications:** Ghana's telecommunications statistics indicated that as of 2013 there are 26,336,000 cell-phone lines in operation. Competition among mobile-phone companies in Ghana is an important part of the telecommunications industry growth of Ghana, with companies obtaining more than 80 per 100 persons as mobile phone and fixed-line phone users. The mass media of Ghana is among the most liberal in Africa, with Ghana ranking as the 3rd freest in Africa and 30th most free in the world on the worldwide press freedom index.
- **Private Banking:** The financial services in Ghana have seen a lot of reforms in the past years. The Banking (Amendment) Act 2007 included the awarding of a general banking license to qualified banks, which allows offshore banks to operate in the country. Barclays Bank, Limited was the first to be awarded the general banking license in Ghana. It has therefore become possible for non-residence individuals and foreign companies to open offshore bank accounts in Ghana.
- **Hydrocarbon and Mining**: Ghana has 5 billion barrels ($790\times10^6$ $m^3$) to 7 billion barrels ($1.1\times10^9$ $m^3$) of petroleum in reserves. A large oilfield which contains up to 3 billion barrels ($480\times10^6$ $m^3$) of sweet crude oil was discovered in 2007 (GSS, 2015). Oil exploration is on-going and the amount of oil continues to increase. Ghana produces crude oil, as of 15 December 2010, and until June 2011, Ghana exploited around 120,000 barrels per day and is expected to increase production up to 2.5 million barrels per day in 2014. Ghana has vast natural gas reserves, which is used by many foreign multinational companies operating in Ghana. The hydrocarbon industry has had major implications for regional and urban development in Ghana and these are likely to substantially increase in the years to come. Mining has gained importance in the Ghanaian economy since the turn of the 21st century, with a growth of around 30% in 2007. The main mining extractions are bauxite and gold.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Tourism:** The Ministry of Tourism has placed great emphasis upon further tourism support and development. Tourism contributed to 4.9% of GDP in 2009, attracting around 500,000 visitors (Ghana Investment Promotion Centre, 2015). Tourist destinations include Ghana's many castles and forts, national parks, beaches, natural reserves, landscapes and World Heritage buildings and sites.
- **Agriculture:** Ghana National Agricultural Export is the government arm that operates, maintains, and oversees the planting of cocoa, cashews, and other crops for export. Since its inception, it has drastically assisted the government in boosting agricultural sales. Agribusiness accounts for a small fraction of the gross domestic product. The main harvested crops are corn, plantain, rice, millet, sorghum, cassava and yam. Unlike the agricultural livestock, forestry, and fishing sectors, the crop sector is key to the Ghanaian agricultural industry.

## 3. RESEARCH HYPOTHESES

### 3.1. Economic Growth

Since the creation of IASB, countries have tried to improve their accounts by applying IAS criteria. Having been developed and prepared by an international standard setting accounting body, these standards are heavily dominated and inspired by certain facts held by the developed countries (Zehr & Abdelbaki, 2013). Indeed, on examining the IASB composition and structure, it clearly appears that the developed countries over predominates as compared to that of the developing countries. This geographical discrepancy manifested itself in terms of topics treated and covered by these elaborated standards. In fact, the latter are generally advanced and proposed by the developed countries' representatives and, thus, raise the problems that are most faced by firms operating in these countries. This confirms the fact that accounting development has never been dissociated from economic development. Arpen and Radebaugh (1985) have considered that economic development is indeed the fundamental variable that deeply influences the development of accounting seeing that it affects other functions in society. On the academic level, the results highlighting the IFRS relationship with economic growth are controversial. Indeed, while the study of Zeghal and Mhedhbi (2006) has demonstrated that the IFRS adoption is more tolerable by the developing countries with high economic growth. Woolley (1998) has observed that, in an Asian context, no significant differences could be noticed in terms of economic growth among IFRS adopting and those applying their local standards. In light of the IFRS literature on adoption (Hove, 1986; Chamisa, 2000; Streets, 2002; Standish, 2003; Zeghal and Mhedhbi, 2006; Al-Akra et al, 2009), a set of hypothesis have been derived that pertains to studying the effect of the developing countries' economy on the adoption of IFRS.

**Hypothesis 1**

**Ho:** There is no significant relation between IFRS adoption and FDI inflows in Ghana.

**$H_1$:** There is significant relation between IFRS adoption and FDI inflows in Ghana.

**Hypothesis 2**

**$H_0$:** The stock of FDI inflow does not lead to economic growth in Ghana.

**$H_1$:** The stock of FDI inflow leads to economic growth in Ghana.

## 3.2 Adoption and Implementation of IFRS in Ghana

In 2004, the World Bank and the Ministry of Finance and Economic Planning (MOFEP) commissioned a Report on the Observance of Standards and Codes (ROSC) in Ghana (World Bank, 2005). Reporting on the accounting and auditing practices in Ghana, ROSC observed that Ghana suffer from international weaknesses in regulation, compliance and enforcement of standards. Also, various weaknesses were identified in the laws and regulations governing financial reporting.

Although Ghana Accounting and Auditing Standards have been based on International Accounting Standards and International Standards on Auditing, respectively, they were out dated and significant gaps existed in comparison with the international equivalents. More so, full compliance with Ghana National Accounting Standards was not often achieved; some listed companies inappropriately claim compliance with International Accounting Standards. These were as a result of weak capacity and inadequate functioning of the Institute of Chartered Accountants. These also affected the monitoring and control of professional accountants' training and practice.

ROSC therefore recommended that the statutory framework, enforcement mechanisms, professional education and adoption of International Financial Reporting Standards (IFRSs) without any modifications, should replace the existing Ghana National Accounting Standards (World Bank, 2005).The Institute of Chartered Accountants Ghana, the country`s Accounting

Standard Setter joined the International Federation of Accountants (IFAC) in the year 2005. IFAC passed a directive by requesting its member countries to adopt IFRS. Consequently, Ghana put things in place and successfully launched the International Financial Reporting Standards (IFRS) on January 27, 2007. The conformity to the international accounting standards has been a major event championed by all to meet the ever increasing demands in the corporate reporting world. This mandated all public interest entity companies such as banks, listed companies, insurance companies, security brokers, pension funds just to mention but few to publish their financial statements for the periods covering or after 1 January 2007 in accordance with IFRS. But due to challenges of companies fully implementing the IFRS, 2008 was set as the reporting date. However, IFRS for Small and Medium Scale Enterprises (SMEs) were expected to be fully adopted in 2010. Though some opponents were of the view that the Institute of Chartered Accountants Ghana should not hasten the process but should do some consultations, whiles others believed it was a step in the right direction. The adoption was facilitated because, many believed it was not a matter of convenience but convergence and that if it delayed, the world will continue to move ahead (table 2).

Table 2 indicates absence of certain standards in GNAS in areas of accounting for government grants and disclosure of government assistance, borrowing cost, impairment of assets, intangible assets, financial reporting in hyperinflationary economies, first-time adoption of international financial reporting standards, non-current assets held for sale and discontinued operations, accounting and reporting by retirement benefit plan, share based payments, events after reporting date, related party disclosure and accounting for Agriculture. More so, there were differences in the treatments of the disclosure of Capital Surplus and Income Surplus, the effect of certain changes in accounting policies, deferred tax assets and liabilities, accounting for intangibles, dividend declared pending ratification and basis for segment accounting.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 2. Analysis of IFRS, Ghana National Accounting System (GNAS)*

| No | IFRS | Ghana (GNAS) |
|---|---|---|
| IAS 1 | Detailed framework for the preparation of financial statements | Several aspects of the framework were omitted. Particularly, the qualitative characteristics of financial statements were not visible |
| IAS 1 | Requirements to include statement of Changes in Equity | Not required under GNAS but the Companies code requires the disclosure of Capital Surplus and Income Surplus which could include some of the items to be included in the statement of changes in Equity |
| IAS 8 | Changes in Accounting Policy | GNAS requires that the effect of certain changes in accounting policies should be included in the extraordinary items in the current period |
| IAS 27 | Non-controlling interest is to be separately disclosed for both parent and subsidiary on the face of the income statement and the statement of financial position | GNAS omits the IAS disclosure of minority interest on face of income statement |
| IAS 12 | Recognition of deferred tax assets and liabilities for all temporary differences | GNAS requires deferred tax assets and liabilities to be created only for timing differences relating to depreciation |
| IAS23 | Full disclosure of borrowing costs | Disclosure for borrowing costs and the capitalization rate was absent |
| IAS41 | Provides extensive guidance on account for agriculture and biological related assets. | GNAS does not have a substantive standard on accounting for Agriculture |
| IAS38 | The recognition and measurement of intangible assets differs depending on whether they are purchased individually or acquired through a business combination, or whether they are internally generated | No substantive accounting standard dealing specifically with accounting for intangibles, example, measurement and recognition except goodwill in business combinations, but requires disclosure for Goodwill, patent, trademarks and similar assets |
| IFRS 5 | Requires separate disclosures for discontinued operations | There is no substantive standard that provides detailed guidance on discontinued operations |
| IAS 40 | Treats changes in value on investment property directly in the statement of comprehensive income | No substantive standard specifically for investment property, but accounting for investments in GNAS requires that investment property be accounted for as long term investments or as Property Plant and Equipment |
| | Requires that dividend liability should only be created when dividend is declared and not when it is proposed as these may or may not be ratified | GNAS allows dividend declared pending ratification at Annual General Meeting to be recognized as appropriation of retained earnings and forms a component of liabilities in the statement of financial position |
| IFRS 8 | Leaves it up to management to decide on the definition of operating segment and the financial information provided but should reflect the way the business is managed | GNAS did not identifying primary or secondary segments but did required that industry segments and geographical segments be used as a basis for grouping the operations of an entity |

## 3.3 IFRS, FDI, and the Economy

The harmonization of financial reporting globally through the International Financial Reporting Standards is an accounting response to the integration of world capital markets. The IFRS is a global GAAP, setting principles–based and globally accepted standard published by the IASB to support those who adopted the preparation and presentation of a high quality, transparent and comparable financial statements that will aid easy interpretation. The presence of significant differences among various national accounting systems causes an information asymmetry of local investors at the expense of foreign ones, who do not

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

possess detailed knowledge of local economic and political environment. Consequently, prohibitive informational obstacles to cross-country investments occur (Pagano, Röell, & Zechner, 2002); and foreign investors have to pay a 'penalty premium' in transactions with the local investors (Gordon & Bovenberg, 1996). Rossi and Volpin (2004) highlighted the importance of good accounting practice as an important factor for increasing the chance of cross-country investments. The gradual adoption of the IFRS worldwide reduces and eliminates the costs of gaining information for the decision-making, as companies use the same system of financial reporting standards regardless their domicile. In this way, the IFRS as high-quality accounting standards contribute to the smooth functioning of global capital markets and shall promote the flows of foreign capital to adopting countries. Despite this important feature, research analyses the benefits of IFRS implementation only from investors' and microeconomic, perspective.

There are economic consequences of the IFRS adoption and that forms the focus of this chapter. Research about the role of the IFRS adoption on foreign direct investments is relatively new. This chapter extends the literature on the IFRS and its effect on the economy. The first comprehensive analysis of the effects of IFRS on FDI was performed by Ramos (2008) on the sample of EU countries. The author used a gravity model. The results provide evidence that the IFRS adoption has positively influenced FDI. Ramos (2008) assumed that accounting harmonization is a workable strategy to attract foreign investors by reducing their risks for investing abroad. Different approach was adopted by Farooque *et al.* (2009) who studied the interdependence of corporate governance and FDI inflows on the sample of twelve year data of 173 countries. Their research also comprises of the evaluation of IFRS adoption and legal origin on FDI and governance. Their findings show that IFRS have stronger effect on the governance rather on FDI. However, through an increased quality of governance, the IFRS allows free movement of capital around the world. Beneish *et al.* (2010) found that the IFRS adoption in the European Union has significant impact on attracting foreign debt investment. The effect on foreign equity investments is relatively small. However, the results of the study are impaired because only four non- EU countries were used as control factors. Chen, Tang, Jiang, and Lin (2011) investigated the effect of widespread adoption of IFRS on bilateral FDI within the OECD countries. They found that the shift from local accounting standards to IFRS contributed positively to the FDI growth during the period between 2001 and 2005.

According to Kumar (2007) FDI which involves building long-term relationships with enterprises in foreign countries can be made in several ways. First, and most likely, it may involve parent enterprises injecting equity capital by purchasing shares in foreign affiliates. Second, it may take the form of reinvesting the affiliate's earnings. Third, it may entail short- or long-term lending between parents and affiliates. To be categorized as a multinational enterprise for inclusion in FDI data, the parent must hold a minimum equity stake of 10 percent in the affiliate (Kumar, 2007). Garkovic and Lavin (2002), noted that economic rationale for offering special incentive to attract FDI frequently is derives from the belief that foreign investment produces externalities in the form of technology transfer and spill overs. DeGregorio (2003), while contributing to the importance of FDI noted that it allows a country to bring in technologies and knowledge that are not readily available to domestic investors and increases productivity throughout the economy. Jeffrey and Spaulding (2005) also stated that FDI advantage includes; circumventing trade barriers, hidden and otherwise making the move from domestic export sales to a locally-based national sales office and capability to increase total production capacity, opportunities for co-production, joint ventures with local partners, and joint marketing arrangements.

According to Okoye and Akenbor (2012), there are perceived challenges to be presented by IFRS adoption and implementation. The intrinsic problems of aligning with IFRS pointed out that international accounting clearly has a language problem (Ukpai, 2002). Adams (2004) claimed that where an

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

accounting standard conflicts with government policy, the standard is revised. For example the LIFO method of stock valuation is not allowable for tax purpose in Nigeria. Another problem inherent with the adoption of IFRS is the universal tendency to resist change. Gambari (2010) noted that the successful adoption of IFRS entails assessing technical accounting, tax implications, internal processes, and statutory reporting, technology infrastructure, and organizational issues.

## 4. METHODOLOGY

Data for the study were obtained from questionnaire on IFRS, foreign direct investment and economy. The population of this study consists of preparers and users of financial reports. The preparers are (31) active quoted companies in Ghana Stock Exchange between 2007 and 2014 represented by Directors / Finance Managers responsible for the preparation of financial statements who are selected as respondents due to their involvement and knowledge of IFRS. The users of financial reports are investors represented by (100) Investment analysts firms and institutional investors identified from the list of capital market operators compiled by the Ghana Stock Exchange. Investment Analyst are selected as respondents for the fact that they are principal users of financial reports (Clement & Tse, 2003; Mangena, 2004), they have good investment knowledge which aids analysis of financial reports and decision making (Baker, 1998). They also provide analytical information that meets the needs of their clients (Gebhardt, Reichadt &Wittenbrink, 2004). The Analyst's financial report usage rate is higher than that of all other users. A sample of 100 persons was selected at random, representing 76% of the total population. The survey questionnaire instrument consisted of seven question with a - 5 Likert scale response options divided into two sections. The options available Very Relevant (VR), Relevant (R), No Effect (NE) Irrelevant (I), and Very Irrelevant (VI). Various methods were employed to test the reliability and validity of the survey design. For structured problems described by Likert 5-scale table, Cronbach's alpha values was used to evaluate the internal consistency, reflecting the reliability of survey design. Pilot survey was adopted for the reliability test and it yielded correlation coefficient of 0.88. It was structured in line with the research questions and hypothesis of the study. To establish the relationship between IFRS and FDI Pearson Product Moment Correlation Coefficient was used. This is calculated as:

$$r = \frac{n\Sigma xy - \left(\Sigma x\right)\left(\Sigma y\right)}{\sqrt{[n\Sigma x^2 - (\Sigma x)^2][n\Sigma y^2 - (\Sigma y)^2]}}$$

## 5. EMPIRICAL RESULTS (TABLES 3-8)

### Hypothesis 1

**Ho:** There is no significant relation between IFRS adoption and FDI inflows in Ghana.
**$H_1$:** There is a significant relation between IFRS adoption and FDI inflows in Ghana.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$r = \frac{n\Sigma xy - \left(\Sigma x\right)\left(\Sigma y\right)}{\sqrt{[n\ \Sigma x^2 - \left(\Sigma x\right)^2][n\Sigma y^2 - \left(\Sigma y\right)^2]}}$$

where

n = 5, Σx = 15, Σy = 65, Σxy = 314.50, $\Sigma x^2 = 55$, $\Sigma y^2 = 3{,}390.5$

$$r = \frac{5\left(275.5\right) - \left(15\right)\left(61.5\right)}{\sqrt{[5\left(55\right) - \left(15\right)^2][5\left(3,390.5\right) - \left(65\right)^2]}}$$

r = **0.57 (57%)**

*Decision:* The r calculated of 0.57 is greater than 0.5 level of significance. The alternate hypothesis is accepted. There is significant relation between IFRS adoption and implementation and FDI inflows in Ghana.

## Hypothesis 2

**$H_0$:** The stock of FDI inflow does not lead to economic growth in Ghana.
**$H_1$:** The stock of FDI inflow leads to economic growth in Ghana.

$$r = \frac{n\Sigma xy - \left(\Sigma x\right)\left(\Sigma y\right)}{\sqrt{[n\ \Sigma x^2 - \left(\Sigma x\right)^2][n\Sigma y^2 - \left(\Sigma y\right)^2]}}$$

where:

n = 5, Σx = 15, Σy = 65, Σxy = 279, $\Sigma x^2 = 55$, $\Sigma y^2 = 1{,}824.5$

$$r = \frac{5\left(275.5\right) - \left(15\right)\left(61.5\right)}{\sqrt{[5\left(55\right) - \left(15\right)^2][5\left(1,824.5\right) - \left(65\right)^2]}}$$

r = **0.92 (82%)**

*Decision:* The r calculated of 0.92 is greater than 0.5 level of significance. The alternate hypothesis is accepted. The stock of FDI inflow leads to economic growth in Ghana

## 6. DISCUSSION OF RESULT

The research work centres on determining the relationship between IFRS adoption and foreign direct investment inflow as basis for economic growth in Ghana. The results of hypothesis tested revealed that there is a significant relationship between IFRS adoption and FDI in Ghana. This is in conformity with previous studies (Zeghal & Mhedhbi, 2006; Al-Akra et al., 2009). It is clearly discovered that the economic growth including FDI constitutes a major determinant for adopting the international accounting standards. Actually, this result confirms not only the hypothesis 1of this study but also the assertions of the strong association of economic growth and the accounting standards.

The rigorous process of conversion of existing records to IFRS involved training and employment of appropriate manpower. Government and policy makers have to put adequate infrastructure and regulatory framework in place to address those issues hindering its full implementation. The implication of IFRS on the economy is the fact that financial reporting among the countries that have adopted IFRS is uniform and comparability becomes easier as well as the ease of interpretation of financial statements. This will in many ways boost global investors' confidence and lead to cross border financial transaction. The IFRS adoption will definitely enhance international accounting as a sub discipline within the field of accountancy (Glautier & Underdown, 2001). The survey also revealed that the adoption of IFRS will promote companies' access to global capital markets thereby exposing them to cross-border investments. This agrees with Zeghal and Mhedhbi (2006) findings. However, the responses revealed that IFRS adoption has neither made much impact in making timely and accurate reports available nor has it made the financial statements more reliable. Quoted companies which have adopted IFRS are able to generate more funds from foreign sources through the capital market.

## 7. RECOMMENDATIONS

From the findings of this study, the researcher hereby recommends the following steps to ensure a successful adoption and implementation of IFRS in Ghana. Government and the regulators should ensure that there is availability of training facilities and materials for professional accountants on the concept of IFRS and issues relating to its implementation and conversion. Compliance with IFRS should be mandatory for both listed and unlisted companies and failure should be marched with appropriate sanctions. Government need to release more funds to educate all stakeholders with special reference to the academics, staff and accounting students who will uphold the future IFRS in the country and develop plan to help properly equip the company for upcoming changes (Lewis & Pendril, 1996). Professional accounting bodies in Ghana need to make IFRS training a part of their training programme at a reduce cost. While monitoring the IFRS implementation timetable, both government and regulators should ensure that ethical environment and corporate transparency are observed.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## 8. FUTURE RESEARCH

The findings of this research raise concerns on a number of important issues and may provide avenues for further research. For instance, one economic development indicator was employed in this chapter. One can construct other indices following the literature which may require more data or effort to be assembled. In cases of impact of IFRS, a dynamic analysis could be employed such as multiple regression and the extension of sample size to include other African countries.

## 9. CONCLUSION

In this study, attempts were made to assess the relationship between IFRS adoption and FDI and the effect on the Ghanaian economy. Based on the findings, it was concluded that the adoption of IFRS is a right step in the right direction. Although there are many issues and challenges facing the implementation, the benefits outweigh the challenge. With adoption, Ghana companies will produce a more credible financial statements that will not only be uniformed but also provide a basis for better interpretation. This invariably will boost investors' confidence and attract cross border financial transactions which is the basis for economic growth.

The empirical analysis results have shown that developing countries most favourable to the adoption of IFRS are those having a high economic growth rate, a high level of education and a common law based on a legal system. Available statistics about international flows in the form of investment in recent years have raised the interest of economic research. The traditional neoclassical model using the assumption of pure substitution effect between labour and capital has been replaced by models, which work with social networks. Therefore, FDI are supposed to flow to countries adopting IFRS in the long-term perspective. In addition, the adoption of the IFRS is only the first step. Because of cultural differences, the discrepancies in the actual quality of their implementation in financial statements of companies from different countries exist. The IFRS adoption is only one factor influencing the decision, where to allocate investments.

## KEY TERMS AND DEFINITIONS

**Consolidated Financial Statements:** The financial statements of a group in which the assets, liabilities, equity, income, expenses and cash flows of the parent and its subsidiaries are presented as those of a single economic entity.

**Economic Growth:** It is an increase in the capacity of an economy to produce goods and services, compared from one period of time to another. It can be measured in nominal terms, which include inflation, or in real terms, which are adjusted for inflation.

**Financial Statement:** It is a formal record of the financial activities of a business, person, or other entity. Relevant financial information is presented in a structured manner and in a form easy to understand.

**Foreign Direct Investment (FDI):** It is defined classically as a company from one country making a physical investment into building a factory in another country. The direct investment in buildings, machinery and equipment is in contrast with making a portfolio investment, which is considered an indirect investment. In recent years, given rapid growth and change in global investment patterns, the definition has been broadened to include the acquisition of a lasting management interest in a company or enterprise outside the investing firm's home country.

**International Accounting Standards (IAS):** These are accounting standards issued by the International Accounting Standards Board (IASB) and its predecessor, the International Accounting Standards Committee (IASC).

**International Financial Reporting Standards (IFRS):** It is a single set of accounting standards, developed and maintained by the IASB with the intention of those standards being capable of being applied on a globally consistent basis by developed, emerging and developing economies. This provides investors and other users of financial statements with the ability to compare the financial performance of publicly listed companies on a like-for-like basis with their international peers.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Pearson Product-Moment Correlation Coefficient (r):** It is a measure of the strength of a linear association between two variables and is denoted by r. It represents a measure of the linear correlation (dependence) between two variables such as IFRS adoption and FDI or X and Y, giving a value between $+1$ and $-1$ inclusive, where 1 is total positive correlation, 0 is no correlation, and $-1$ is total negative correlation.

**The International Accounting Standards Committee (IASC):** It is an independent private-sector organization that in its own words is a 'body working to achieve uniformity in the accounting principles that are used by businesses and other organizations for financial reporting around the world.'

# Chapter 33
# Economic and Political Factors Affecting Foreign Direct Investment in the MENA Region

**Betül Gür**
*Istanbul Commerce University, Turkey*

## ABSTRACT

*This study examines the relationship between variables thought to have an effect on foreign trade investment (FDI) including volume of trade, GDP growth rate, trade credit risk and political stability. Specifically, this study is concerned with the 1981-2012 period in the MENA region, made up of the Middle East and North African countries of Algeria, Bahrain, Egypt, Jordan, Morocco and Tunisia. Another objective of the study is to determine whether economic factors are more impactful than political factors on the FDI flow to MENA countries. In order to investigate long-term relationships between the variables, three cointegration analyses were used including Pedroni, Kao and Johansen, and Fisher. Coefficients were interpreted using the FMOLS and the DOLS methods. The Holtz-Eakin Causality Test was also applied. As a result of the analysis, volume of trade was found to be the most important factor determining FDI. Economic factors were found to be more influential for FDI than political factors.*

## INTRODUCTION

Changes in the world economy and politics in the last quarter of the twentieth century have brought new geographies to the fore. This study examines the Middle East and North Africa (MENA), where world politics and economy have been continuously shaped from the past to the present. In this region where changes are occurring and new balances are being sought, the main determinants of foreign direct investment (FDI) are analyzed. In addition, the hypothesis that economic factors are more impactful on the FDI flow to MENA countries than political factors is tested.

This empirical analysis explores the FDI flow to the MENA countries of Algeria, Bahrain, Egypt, Jordan, Morocco and Tunisia during the period 1981-2012. It investigates the effects of economic variables in conjunction with political stability, on FDI in these countries. Volume of trade, growth in gross

domestic product (GDP) per capita, and trade credit risk are the economic variables in the study. In the framework of the results gathered from the analysis, the study gives solutions and recommendations and makes future assessments.

Importantly, the impact of trade credit risk on FDI is analyzed as an economic indicator for the first time in this discussion. A further contribution to the extant literature is that this is the first empirical study which considers the effects of the political stability factor on FDI inflows to the MENA countries together with political developments such as the Arab Spring. Against the backdrop of the MENA region, this study defines FDI and introduces its importance. The major factors that determine FDI inflows into a country are discussed accompanied by a thorough literature review. Information about the empirical methodology and data are given and the empirical analysis results are evaluated. Finally, solutions, recommendations, future trends and conclusions are mentioned.

## BACKGROUND

FDI involves the establishment of a new company, the acquisition of an existing company, or the increase of one's capital in foreign countries. Foreign capital intends to achieve high profits. In making investment decisions, it considers the country's growth performance together with economic and political risks. Therefore, low risk countries with high growth rate or potential are expected to attract more foreign capital (Ağayev, 2010).

There are factors related to the economic, political, and investment climate which influence FDI: market size, openness index, tax burden, labor costs, skilled labor, natural resource stocks, technology level, exchange rate, inflation rate, population growth rate, unemployment, rate of growth, macroeconomic stability, trade risks, political stability, bureaucratic structure, institutional and social structures, transparency, transportation costs, and infrastructure are some of these factors.

Many studies point to the host country's market size as an important factor in FDI decisions. Alam and Shah (2013) investigate potential determinants for FDI in their panel data analysis of 10 OECD countries. They conclude that investors are influenced by variables such as market size, labor costs, and the quality of infrastructure, and that policies should be implemented to improve infrastructure and reduce labor costs. In the short term, there is a bi-directional relationship between market size and labor costs. Quality of infrastructure affects labor costs and market size in the short term. Zang and Markusen (1999) also conclude that market size and labor force are influential factors in FDI.

High population and a high population growth rate can be considered as factors encouraging FDI since they influence consumer demand in the domestic market and reflect the size of the market. However, they may have a weak effect on FDI depending upon purchasing power and GDP per capita. Resmini (2000) concludes that Central and Eastern European countries with a high population are able to attract more FDI flows than those with low population. According to Erçakar (2004), demographic factors of the countries are closely related to the degree of FDI that is likely to enter the country. It is generally accepted that FDI providers seek countries with a high rate of population growth, high unemployment, and low domestic investment, as labor costs tend to be cheaper.

According to Carr, Maskusen, and Maskus (2004), FDI providers from the United States choose countries with skilled labor while FDI providers from other countries choose developing countries with less skilled labor. This choice made by countries other than the United States shows that investment in other countries follows an approach based on low level of wages. Açıkalın, Gül, and Yaşar (2006),

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

in their study of the Turkish economy in the period 1980-2002, analyze the relationship between real wages and FDI with a cointegration test and identify a long-term relationship. Schneider and Frey (1985) suggest that high wages deter FDI.

Sawalha, Mazouzi, and Pellet (2013) also suggest the development of human capital in the host country has a positive impact on FDI flows. De Mello (1997) concludes in his study consisting of 32 OECD members that FDI has a positive influence on a country's economic growth by complementing domestic investment. This influence reveals itself by contributing to labor qualification and the acquisition of new management skills. In their study of 69 developing nations during the period 1970-1989, Borensztein, De Gregorio, and Lee (1998) found that FDI inflows have a marginal role in growth, which is also connected to the host country's level of human capital. In short, a powerful and positive interaction was found between educational indicators that were used to represent the human capital and the FDI. They concluded that in developing countries with low levels of human capital FDI inflows have negative impacts.

Transnational corporations account for the world's most important resource in research and development (R&D) activities. Their level of technology is much higher than the current level of technology in developing countries. Therefore, the potential these companies have in introducing important technological developments is very strong (OECD, 2002). Nunnenkamp (2004) states that FDI is not only a tool that allows the transfer of capital to developing countries. Technology not only increases productivity in developing countries, but also is a powerful mechanism for know-how transfer. Thus, foreign investment can lead to increased productivity not only in sectors where foreign capital is found, but also throughout the economy (Carkovic & Levine, 2002; Nunnenkamp, 2004).

There is a significant amount of competition among developing countries to attract FDI. Çak and Karakaş (2009) state the total tax burden that includes corporate tax as well as the burden composed of wages, profit distribution, and foreign trade taxes is an important variable for FDI. Both the corporate tax rate and the total tax burden can be said to have a negative impact on FDI. Egger & Raff (2011), in their panel data analysis on 43 countries spanning the years from 1982 to 2005, have found a significant relationship between tax rates and FDI. Erçakar (2004) also reaches a similar result. The effects of tax incentives on FDI in MENA countries were investigated in an OECD research project in 2007. The results put forward that the impact of taxation and investment incentives on FDI is limited. Political stability, economic stability, legal framework, and bureaucracy are seen as strategically more important for FDI.

In Edwards' (1990) study on developing countries, it is suggested there is a strong positive relationship between FDI and exchange rates. According to Froot and Stein (1991), there is a negative relationship between exchange rate and FDI. Real devaluation in the host country's national currency will increase welfare for foreign investors. Froot and Stein conclude that depreciation of the dollar increases FDI levels in the host country. Dabour (2000) concludes that FDI in oil exporting countries contributes to their economic growth. Moura and Forte (2010) suggest that FDI will contribute to the host country's economic growth economically, politically, and socially.

In his study of 25 transitional economies, Ağayev (2010) has found a strong causality from FDI to economic growth and also a weak one in the opposite direction. Accordingly, FDI inflows to transition economies support economic growth. Similarly, an increase in growth rate attracts more FDI to the country. The existence of causality from economic growth to foreign capital investment supports the idea of system-endogenous growth dynamics proposed by growth theories. In the Chakraborty and Nunnenkamp (2008) study on India, FDI in the long-term has a positive effect on the amount of production in the host country. Nath's (2005) study on 10 Central and Eastern European transition economies

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

covering 1990-2000 and Emmanuel's (2013) study on Nigeria from 1986 to 2011 both demonstrate that FDI has a positive effect on economic growth.

However, the host country may not always receive the expected benefits from FDI as funds generated in the host country by a branch company are transferred to the foreign parent company. Such a transfer can be considered a negative condition which prevents the accumulation of resources in the host country. What is important is to prevent local firms from failing against FDI-generated competition and being completely excluded from the market (Gedikli, 2011). In contrast to the neo-liberal economists, Keynesians argue that the benefits of FDI will not be the same for all host countries. How much the host country will benefit from FDI depends on several factors.

First, it is important that there is complete information flow in the market. Inadequate and inaccurate information can lead to wrong investments. Sometimes the interests of foreign investors and of the host country do not coincide. In this case, the government of the host country makes a variety of regulations (Zilinske, 2010). When foreign investors in the host country become a monopoly in the domestic market, this leads to a "crowding out effect". In Kumar and Pradhan's (2002) study spanning the years 1980-1999, while no FDI effect was observed in 31 host countries, a crowding out effect was observed in 29 countries and a crowding in effect was observed in 23 countries.

In Agosin & Mayer's (2000) study on 39 Asian, African, and Latin American countries spanning the years 1970-1996, a crowding out effect was observed in Latin American countries. Alagöz, Erdoğan, and Topallı (2008) put forth that there was not any bi-directional significant relationship between FDI and economic growth in Turkey during the period 1992-2007. Similarly, Lipsey's (2006) study on Central and Eastern European countries and Carkovic and Levine (2002) in their study covering 72 countries in the years 1960-1995 suggest there is a negative relationship between economic growth and FDI.

## FOREIGN DIRECT INVESTMENT IN THE MENA REGION

In the last 30 years, one of the most important indicators of globalization has been the marked increase in FDI flows. Since the 1980s, markets have started to become globalized with the gradual removal of trade barriers. Countries have faced serious competition to obtain a larger share of international investment by transnational corporations. From the perspective of increasing FDI flows, changes have been observed both for the investor and the host countries. Disadvantaged regions which have until recently been regarded as marginal zones today draw FDI flows. Developing countries such as Brazil, Russia, India, and China (BRIC), and others such as South Africa and Malaysia have started to make and host FDI at the same time (Chauvin, 2013).

FDI in the world generally flows to developed countries since they do not have infrastructure problems, do not incur extra costs, and have economic and political stability. However, in 2004 before the Global Financial Crisis of 2008, a total of 5,800 of 9,800 new investment projects went to developing and transition countries. China had the largest share of these new projects with a total of 1,529 investments. There were 685 new projects in India, a total of 377 in Russia, a total of 258 in Brazil, a total of 173 in Singapore, a total of 156 in the United Arab Emirates (UAE), some 154 in Mexico, a total of 125 Malaysia, a total of 122 in Hong Kong, a total of 121 in Thailand, and 100 in Korea. Among the developing countries, China attracted the largest amount of FDI totaling US$70 billion.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Inflows of foreign capital experienced the greatest increase in Australia, Switzerland, Luxembourg, and Sweden. Worldwide FDI, which experienced a limited contraction of 14% in 2008, was more deeply affected by the Global Crisis in 2009. A 39% decrease in global FDI inflow of around US$1 trillion occurred in 2009. In 2008, FDI inflow to developing and transition countries did not fall but instead increased by around 35%. However, following six years of uninterrupted growth, FDI flow to developing countries fell by 39% in 2009. Among developed countries, England, Sweden, Spain, Japan, and the United States experienced over 50% decrease in FDI inflows (Erçakar & Karagöl, 2011).

According to the 2013 World Investment Report by the United Nations Conference on Trade and Development (UNCTAD), global FDI flows declined immediately after the Global Financial Crisis due to the debt crisis and recession in Europe. However, this led to a shift of capital to developing countries. The share of FDI inflows to developing countries rose for the first time to above 50% in 2010 and reached 50.9% in 2011. In 2012, the share of FDI inflows to developing countries was 58.5%. Again in 2012, the United States attracted the most FDI with US$167.6 billion. China ranked second with US$121.1 billion followed by Hong Kong with US$74.6 billion.

Among developing countries, China, Hong Kong, Brazil, Singapore, the British Virgin Islands, Russia, Chile, India, Indonesia, Colombia, Kazakhstan, Mexico, and Argentina attracted the most FDI. According to the report, in recent years the course of FDI has shifted from European Union (EU) countries to South and East Asia due to the current crisis in Europe. FDI inflows ranking to the MENA countries are shown in Table 1. According to the UNCTAD's 2014 World Investment Report, global FDI flows in 2013 increased by 9% and reached US$1.45 trillion. This trend of growth of FDI flows is expected to reach US$1.6 trillion in 2014, some US$1.7 trillion in 2015, and approximately US$1.8 trillion in 2016.

According to the Report (UNCTAD, 2014), developing countries represent half of the top 20 countries in FDI flow. Developed countries make up for 39% of total FDI, whereas developing countries account for 54%. The Asian region, including China, which attracts the most foreign investment reached a figure higher than US$420 billion. Middle Eastern and North African countries, known as the MENA region, did not have their fair share of the FDI flows. In 2013, there were only two MENA countries among the most FDI attracting 20 countries. These countries are the UAE which ranked 16th and Saudi Arabia which ranked 19th. In the first quarter of 2014, international investors were largely cautious with their FDI spending due to low growth rates made permanent in the Eurozone, China's slowing economic growth, heated political instability in the MENA region and the rising political and military tensions in the east of Ukraine (OECD, 2014).

MENA countries can be divided into some sub-groups in terms of their levels of development. The Arab Republic of Egypt, Jordan, Morocco, Tunisia, Lebanon, and Djibouti are labor-abundant and resource-poor countries. Algeria, the Islamic Republic of Iran, Iraq, the Syrian Arab Republic, and the Republic of Yemen are both labor- and resource-rich. Saudi Arabia, the UAE, Kuwait, Libya, Qatar, Oman, and Bahrain have insufficient labor; however, they are nations with rich natural resources (World Bank, 2007). Among these countries, Malta, Sudan, as well as the West Bank and Gaza are also in the data bank of World Development Indicators. Israel is the only developed country among the countries of the MENA region. The MENA region owns 60% of world oil reserves and 45% of world natural gas reserves. Eight of the twelve members of OPEC are in the MENA region. Therefore, when analyzing the FDI flows into the MENA region, both political factors and economic factors need to be taken into consideration (Turkishtime, 2013).

Oil-rich countries Saudi Arabia and the United Arab Emirates demonstrate the greatest growth in terms of FDI over time. Since 1990, FDI in the MENA countries has increased steadily (see Table2). FDI to the MENA region increased the six-fold between 1990 and 2000 and 12-fold between 2000 and 2010. Despite the increasing dynamism of economies in the countries of the MENA region during the last 10 years, only a 5.5% increase was experienced. This figure is very low compared with the 20% FDI inflow at the beginning of the 1980s (Chauvin, 2013).

The FDI inflows to the MENA region in 2001 exceeded US$95 billion by 2008. This figure corresponded to 14.4% of the total FDI to developing countries. The significant increase in FDI was mainly caused by positive economic developments in the oil-rich countries, business environments, legal regulations, and privatizations in various countries. However, this positive trend deteriorated due to the global crisis, and FDI inflows decreased by 25% in 2009 and 12% in 2010. The political instability in the region which began in 2010 together with regime changes can be interpreted to have had a negative impact on FDI inflows to the MENA region (see Table 3).

Consequently, a region that is perceived as rich in oil revenues received almost no share of global economic development inflows. During the early years of globalization, 1981-1990, the region's annual growth rate was 0.7%, and in the 2000s it equaled 3.4%. Through 2015, the region's average annual growth performance is expected to be 4.3%. The MENA countries' unstable political structures and security issues that have now become permanent, make it necessary to take political factors into consideration when analyzing FDI inflows to these countries (Turkishtime, 2013).

Additionally, in these oil-rich countries about 90% of imports and 50% of national income are dependent on oil revenues. Such a monolithic economic structure has an adverse effect on the region. Fluctuations in oil demand and prices in global markets disproportionally affect the MENA region countries. The fact that countries in the region that are not dependent upon oil revenues have faster and higher growth rates than those that are dependent upon oil revenues illustrates the negative effects of fluctuations in oil prices (Turkishtime, 2013).

## Data, Methodology and Empirical Results

This study spanning the 1981-2012 period examined the major factors affecting FDI inflows to the MENA countries of Algeria, Bahrain, Egypt, Jordan, Morocco, and Tunisia. These are countries for

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

which relevant data is available compared to other MENA countries. In addition, political stability is also analyzed in the study as one of the factors affecting FDI inflow. Countries which have experienced political instability in recent years are selected. In addition, the study tests the hypothesis that economic factors are more influential than political factors on the FDI flow to MENA countries.

The research method makes use of three different cointegration analyses to determine whether there is are relationships among the variables in the long term. These include the Pedroni, Kao, and Fisher Johansen cointegration tests. Coefficients are interpreted using the Full Modified Ordinary Least Square (FMOLS) and the Dynamic Ordinary Least Square (DOLS) methods. In addition, the Holtz-Eakin Causality Test is applied. The variables were gathered from the World Bank World Development Indicators Database and Oxford Economics Databank. As previously stated, there are many factors that affect FDI flows to a country. In this study on FDI inflows to MENA countries, the volume of trade, GDP per capita growth rate, trade credit risk and political stability, and their effects are analyzed in Table 4.

Trade volume, GDP per capita growth, and trade credit risk, show the economic factors affecting FDI inflow into a country. These indicators refer to the country's economic stability, openness index and degree of integration with the world economy. An increase in the share of foreign trade in a country's GDP indicates its openness to foreign markets and its integration with the world economy. Çak and Karakaş (2009) note there is a positive relationship between total trade volume and FDI.

Gao (2005) states that as openness and integration increase, FDI and economic growth also increase. Reduction of trade barriers and development of transportation and communication technologies help innovation and technology shift from developed countries to developing host countries. According to Dabour (2000), the degree of openness of the host country has a impact on FDI. Chakrabarti (2001) emphasizes trade deficit is a determinant of FDI.

Trade surplus is seen as an indicator of a dynamic and healthy economy and encourages FDI. Schneider and Frey (1985) refer to the presence of a strong positive relationship between trade surplus and FDI. According to Sadni-Jallab, Gbakou, and Sandretto (2008), there is no significant independent impact of FDI on economic growth in MENA countries. The lack of growth effect of FDI does not depend on the degree of trade openness or GDP per capita. Furthermore, FDI has a positive impact on the economic and macroeconomic environment of stability.

Shirazi, Rodrigues, and Karnik (2008) made use of panel data analysis in their study of 15 MENA countries over the 1980-2003 period. The analysis results were significant in that openness, inflation and service sector were determined to be crucial for FDI inflows to the MENA region. Openness and the service sector have a positive effect while inflation has a negative effect on FDI. El Sayed (2011), in his work spanning the 1995-2009 period for 19 MENA countries, concluded that economic factors such as openness in commerce and market size are decisive in attracting FDI flows. Jabri, Guesmi, and

*Table 4. Variable definitions*

| Variables | Definition |
|---|---|
| Foreign direct investment, net inflows (% of GDP) | FDI |
| Trade (% of GDP) | TRA |
| GDP per capita growth (annual %) | GDP |
| Trade credit risk rating (7=lowest risk) | TCR |
| Political stability risk rating (7=lowest risk) | PSR |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Abid (2013) in their panel analysis spanning the 1970-2010 period for the MENA countries reached the conclusion that openness of the economy and increases in growth rate attract more FDI flows to the MENA countries. Together with economic instability, the exchange rate negatively influences foreign investment inflows.

According to Chakrabarti (2001), GDP per capita growth in the host country is an indication of its market size. Market size is considered one of the most important determinants of FDI. GDP per capita growth refers to purchasing power and level of economic development. Shirazi et al. (2008) highlight the importance of the level of economic development in different sectors to FDI inflows to a region. If FDI flows into a country for its high purchasing power, then there is a positive relationship between GDP per capita and FDI. However, if it is targeting sales to third countries, high GDP per capita means high labor costs, and a negative relationship can be said to exist between FDI and GDP per capita (Çak & Karakaş, 2009). The assumption that foreign investors invest in emerging markets for the sake of exports is also supported by Carr et al. (2004). Accordingly, in developing countries, more than 60% of total sales are made in the domestic market of the host country.

In this study, in order to measure the impact of trade credit risk on FDI flows, the trade credit risk rating from Oxford Economics data bank is used as a variable. Zero refers to the highest risk and seven refers to the lowest risk. A trade risk occurs when bank counterparties, in any way, do not fulfill their obligations. The most extensive source of credit risk is the credit allocated to bank customers (Ayanoğlu & Ertürk, 2007). According to Lewandowski (1997), trade credit risk refers to access to bank loans, short-term financing, access to capital markets, credit rating, and debt in default or debt rescheduling.

In accordance with the credit agreement, credit customers are obliged to pay interest and principal payments by a certain date, and credit risk is created when they have a tendency to fail to do so. While there is always such risk, an economic crisis environment increases the risk. When sales revenues decline and funding opportunities become limited due to tightened credit conditions and increased financing costs, the private sector may experience degradation in its repayment capacity, have difficulties in cost-effective re-sourcing, and slip into default. The increasing rate of default by companies whose financial structures have weakened and whose sales revenues and profitability are declining, may have an adverse effect on banks' profitability and capital structure due to non-performing loans (Güngör, 2012).

In this regard, trade credit risk is not just an economic crisis indicator. It creates a bottleneck both in the banking system and the real sector leading to a deepening of the existing crisis. Therefore, as one of the indicators expressing the economic stability, trade credit risk is expected to encourage FDI inflows when reduced.

According to Ianchovichina et al. (2013), resource-intensive and nontradable sectors are insensitive to political risk. However, political instability has a negative effect on foreign investments in tradable sectors.Onyeiwu (2004) uses the Freedom House's Index of Political Freedom to identify a negative relationship between political rights and FDI. In this study, the effect of political instability on FDI flows is measured using the political risk rating taken from the Oxford Economics data bank. Again, zero refers to the highest risk and seven refers to the lowest risk.

When the subject of study is the MENA region, one cannot ignore the effects of political risks on FDI. Political risk is comprised of many elements such as government stability, socioeconomic conditions, investment profile, internal conflict, external conflict, corruption, military influence in politics, religious tensions, law and order, ethnic tensions, democratic accountability, and bureaucracy quality (The PRS Group, nd). In his study on the relationship between FDI and political instability in 58 developing countries, Edwards (1990) makes use of the CET index developed by Cukierman, Edwards, and

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Tabellini to measure political instability. As a result, the study finds that reduction in political instability and polarization increases FDI flows to the country.

In a similar study, Schneider and Frey (1985) revealed that political instability has a significant effect on FDI. Other things being constant, FDI flows to more democratic and politically stable countries. Chakrabarti's (2001) study in 1994 on 135 countries including many MENA countries is based on the BERI political risk index (Business Environment Risk Intelligence). This index measures political instability within a framework of internal factors such as rallies and street events (ethnic and religious fractionalization, fractionalization of the political spectrum, etc.) and external factors (dependence on and/or importance to a hostile power, etc.).

The study results show there is a strong relationship between FDI and variables including per capita national income, taxes, wages, trade balance, external openness, and the exchange rate. According to Chakrabarti, many factors such as strikes, riots, civil wars, and coups together with change or deterioration in economic management are closely related to political stability. However, it is more difficult to measure political stability than economic indicators. He asserts that the indicators available in the extant literature are not adequate enough to measure political stability thoroughly and comprehensively. There are yet no academic studies in the literature that examine whether or not the decrease in FDI inflows to the MENA countries after 2011 is caused by political instability. While some are of the opinion that public order and democratic accountability are influential on FDI inflows, others believe these two are not influential at all (Ianchovichina et al., 2013).

## Panel Unit Root Test Results

As in all-time series analyses, the panel data methodology used in conducting both time and cross sectional analyses requires that variables be stationary in order to show the real relationships between them. This study investigates common unit root processes with panel unit root tests according to Levin, Lin, and Chu (2002). It also examines the unit root process for each unit (firm) in parallel with Im, Pesaran, and Shin (1997). The stationarity in individual invariant series is analyzed using the Augmented Dickey Fuller (ADF) (1979) test. The results of the stationarity analyses of the data used in the panel regression are given in Table 5.

As seen in Table 5, the results of unit root tests applied to variable levels show that the series are not stationary at [I(0)] level. Series are shown to include unit root problems. Therefore, the first differences of the series are calculated revealing that the series are [I(1)] stationary. Thus, the first difference of the series is used in the analysis.

## Panel Cointegration Test Results and Evaluation

In order to investigate whether there is a long-term relationship between variables, three different cointegration analysis methods – Pedroni, Kao, and Johansen Fisher – were used. In 1999, 2000, and 2004, Pedroni presented tests which allow for heterogeneity in cointegration analysis. This test allows for heterogeneity in cointegration vectors. It not only enables dynamic and fixed effects to vary between panel sections, but also allows the cointegrated vector to differ between sections under the alternative hypothesis. Pedroni's approach is different from McCoskey and Kao's approach in its cross-section assumption trend and in the context of null hypotheses with no cointegration.

| Cusum path lies within the confidence interval bounds at %5, It is not observed structural breakpoint. | | | | | | |

Positive features of the Pedroni tests include the ability to allow for more than one explanatory regressor, enable cointegration vector diversification across different parts of the panel, and facilitate heterogeneity of errors in cross-sectional units. In order to cover within and between effects, seven different cointegration tests were presented which are divided into two different categories. The first category contains four tests pooled in the "within" dimension. The second category contains the other three tests in the "between" dimension. The first three of the four tests in the first category are non-parametric tests. The first tests variance ratio type statistics. The second is similar to the Phillips-Peron (PP) (rho) statistics, and the third is similar to the PP (t) statistics. The fourth one deals with parametric statistics similar to ADF (t) statistics. In the second category, the first one of the three tests is similar to the PP (rho) statistics while the other two are similar to PP (t) and ADF (t) statistics.

Before the panel cointegration analysis, different criteria were assessed to set the suitable lag length and the results are provided in Table 6. Analyzing the criteria reveals that that different lag lengths were obtained. As the error correction model complied with the AIC, HQ, and SC criteria in diagnostic tests and many studies in the literature are based on these criteria, analyses were made for lag 2.

Cointegration test results are presented in Table 7. According to the results of all the tests, a long-term relationship or cointegration exists except in the case of the group rho and group ADF tests. According to the majority of the test results, except for the two tests, a long-term relationship and co-movement was detected among the variables tested for the long-term. After determining the existence of the relationship, FMOLS and DOLS were applied to find the coefficients (the degree and the direction) of the long-term relationship.

## FMOLS and DOLS Coefficient Cointegration Results

In the literature for model estimation in panel cointegration, FMOLS by Pedroni (2000), DOLS by Kao & Chiang (2000), and the vector error correction method by Breitung (2002) are used. These are employed to identify the relationship among the cointegrated panel data variables. The DOLS method is a parametric approach that adjusts autocorrelation by adding to the model lagged values of the first difference. FMOLS is a non-parametric approach in autocorrelation correction. The FMOLS method is quite biased in small estimator results. As the DOLS method can be applied to small samples and allows for the combining different variables in the analysis, it has a number of advantages in estimating cointegrated vectors (Esteve & Martinez-Zahonero, 2007).

After the cointegration tests, in order to estimate the ultimate refraction coefficient of this relationship, two different methods (the FMOLS method developed by Pedroni [2000, 2001] and the DOLS method) were used to test for consistency between estimators and expectations. Panel FMOLS and DOLS estimation results are given in Table 8.

While the FMOLS method is used in correction refractions in standard fixed effect estimators (which are caused by problems, such as autocorrelation and heteroscedasticity), the DOLS method includes dynamic elements in the model and may resolve refractions in static regression (particularly ones arising from endogeneity problems).The FMOLS method, which allows for a significant amount of heterogeneity between individual sections, takes into account the possible presence of a correlation among the constant term, the error term and the difference among independent variables.

The FMOLS results show FDI increases by 21% when the TRA variable is increased by 1 unit and by 18% when the GDP variable is increased by 1 unit. According to the DOLS results, FDI increases

by 19% when the TRA variable is increased by 1 unit and by 16% when the GDP variable is increased by 1 unit. A positive correlation is seen between the explanatory variables of TRA and GDP and FDI. The idea that an increase in the share of trade volume within GDP has a positive effect on FDI flows to one country is widely accepted in the literature and supported in this research. Similarly, the idea that an increase in GDP per capita growth positively influences the flow of FDI is supported within the framework of the research results. This positive relationship reveals itself both in the panel general and in the results for each individual country. In all of the countries surveyed, the most important variable affecting FDI inflows is the TRA variable indicating volume of trade. GDP per capita for all countries ranks second in influencing FDI.

The FMOLS results indicate FDI decreases by 13% when the TCR variable is increased by 1 unit and by 9% when the PSR variable is increased by 1 unit. The DOLS results show FDI decreases by 14% when the TCR variable is increased by 1 unit and by 10% when the PSR variable is increased by 1 unit. A negative relationship is seen between the explanatory variables of TCR and PSR and FDI. Increasing trade credit risk adversely affects FDI flows. Similarly, elevated political risk in the country adversely affects FDI flows. This negative relationship is obtained both in the panel general and in the results for

each individual country. In all the countries surveyed, the TCR variable indicating trade credit risk ranks the second in affecting FDI inflow, whereas the PSR variable indicating political risk ranks the last.

The results of the analyses reveal there is no statistically significant relationship between the PSR variable and FDI for Algeria, Bahrain, Jordan, and Morocco. This can be explained by the fact that these countries are politically more stable than Egypt and Tunisia. In addition, not only PSR but also the TCR variable is not statistically significant for Algeria. In particular, volume of trade and GDP per capita

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

growth variables are influential in determining the FDI inflows to the country. High trade credit risk negatively affects foreign investors who make direct investments in the country. Consequently, there is no relationship between FDI inflows to Algeria and trade credit risk and political stability. As Algeria is among the oil-rich MENA countries, foreign investors ignore trade credit risk and political instability.

In light of these results, variables considered for their long-term relationships point to a minimum of one directional causality. Therefore, in the next step examining the long term relationship between the variables, the causal hypothesis was tested.

## Panel Causality Test Results and Evaluation

Pedroni's heterogeneous panel cointegration test shows if there is a long-term relationship between variables, but does not provide information about the direction of causality. Causality is traditionally tested with the standard two-step Engle-Granger causality test. However, in this study, due to measurement errors and problems about parameter estimation arising from variables that are not included in the model, the traditional causality test was not considered optimal. In this context, Holtz-Eakin, Newey & Rosen (1988) causality test was used. Holtz-Eakin causality test results in Table 9.

Before the results of the panel causality analysis are reviewed, system GMM estimation consistency should be considered. To accomplish this, three basic tests were conducted: (1) the Wald test, which indicates whether the variables in the model variables are significant as a whole; (2) the Arellano-Bond (AB) test which reveals whether there is a model autocorrelation problem in the model; and (3) the Sargan test which indicates whether the instrumental variables are valid. Wald $\chi 2$ test showed that each model is significant as a whole. The validity of instrumental variables used in system GMM estimation, (in other words, whether there are over identification constraints in panel estimations), is analyzed with the Sargan test.

The validity of instrumental variables was tested with the null hypothesis, which displays the relationship between instrumental variables and error terms, and it was concluded that instrumental variables are valid. The AR(1) test developed by Arellano & Bond (1991) tests the null hypothesis that "there is no first order autocorrelation", while the AR(2) tests the null hypothesis that "there is no second order autocorrelation is not". AB test shows that there is no problem of autocorrelation in the AR(2) process. The analysis reveals there is bidirectional causality from FDI to TRA and GDP variables and from GDP to TRA and FDI variables. Conversely, there is no causality between FDI and PSR or FDI and TCR. PSR and TCR variables are the cause of FDI; however, FDI is not the cause of TCR and PSR variables (Table 9).

## Solutions and Recommendations

This study examines factors affecting FDI inflows to the major MENA region countries whose economies are largely dependent on oil. Because the MENA countries are constantly experiencing political instability resulting from the international sharing of their oil resources, the study also discusses economic and political factors and determines which has more impact on FDI inflow. Since the majority of the countries' revenues are supplied from a single source such as oil, there is labor and capital flow from agriculture and service sectors towards natural resources sectors. As a result, costs in the production and agriculture sectors increase and the country's growth rate falls. In addition, due to the increasing volume of exports, the real exchange rate also increases in value.

Because the increasing value of real exchange reduces competition, the share of production cannot stabilize and export diversity is lost. Unemployment increases due to the reduced production because the natural resources sector is not employment intensive. For these two reasons, natural resources cannot be seen as a blessing for the country in the long term. In 2010, dependence on natural resource exports was 96% in Algeria and 58% in Bahrain, respectively. It was 35% in the non-oil-rich country Morocco, 33% in Jordan, 19% in Egypt, and 18% in Tunisia. Fluctuations in growth rate are less severe in the MENA countries which are less dependent on natural resource revenues. However, these countries have limited sectoral diversity, trade volume and global integration due to their autocratic regimes and socioeconomic problems (Sözen, Uslu, & Öngel, 2011).

As the results of the analysis illustrate, these problems have an adverse effect on FDI inflows. With new developments in the world, and new important countries and regions, FDI flow is shifting more towards countries called transition economies or emerging markets. For the MENA countries covered in this study, it is concluded that trade volume representing market size and GDP per capita growth representing economic growth are the two most important variables positively affecting FDI inflows. The countries in the study are countries that are not rich in oil and natural gas reserves compared to other MENA countries. Therefore, their share of FDI is limited. To compensate, they must be oriented towards other industries to attract FDI input.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Sectoral diversity in economic activity and foreign trade should be guaranteed, and market size should be increased. And for the market size to be increased, the market should be liberalized and the economies of these countries should be more integrated with international markets. The results of this analysis show that the political risk factor is considered less important than economic factors by foreign investors when making investments in MENA countries. Although the countries discussed in this study are not oil-rich compared to other MENA countries, their economies depend heavily on oil revenues. Before providing more FDI, foreign investors expect these countries to increase economic growth, market liberalization, and market size.

## FUTURE TRENDS

The MENA region can be expected to hold an important place in global economic competition and in shaping international economic policies and politics. In today's changing political and social environment, the region's integration into the liberal world will increase. However, the focus will likely be on the competition that will occur in different sectors other than oil resources. The region has already started to draw attention with remarkable new projects in alternative energy resource development. Although the solar resources of the regions are highly abundant, a large proportion of renewable energy sources are not currently being utilized.

European Union member countries which are aware of this potential have developed perhaps the biggest and most prominent project in the region's history – the DESERTEC Project – designed to harness solar, wind, hydro, bio, and geothermal energy in the MENA region and transfer it to Europe through high-voltage direct current transmission. The European Commission announced that 9.1 billion Euros would be included in the 2014-2020 EU budget to further develop plans for a transmission network of energy from the MENA region to the EU. It is safe to say that the competition that has been going on solely for oil in the region may turn to different energy investments in the future (Turkishtimes, 2013).

Not only energy investments but also industrial investments should be diversified. Trade volume should be increased with countries such as Turkey where it is easy to meet on common ground. In this context, FDI inflow opportunities from Turkey to the region should be considered. Additionally, longer-term reforms should be implemented to ensure socioeconomic development and current reform efforts should be continued. Investment policies and tax policies should be updated, entrepreneurship should be supported, and competition should be increased. Trade policy should be revised and integrated with the global value chain.

In recent years, corporate governance reforms and regulatory reforms have been launched in order to improve economic growth (OECD, 2013a). OECD (2013b) published a report titled Regulatory Reform in the Middle East and North Africa: Implementation of Regulatory Policies to Boost Economic Growth. According to the report, the countries have been making effort to implement regulatory reforms for some time. The report highlights economic growth and social welfare reform policies, since they play a significant role in creating employment opportunities and reducing unemployment. In addition, the report also deems it necessary for the whole civil society to be included in the process of creating and implementing regulatory policies. It is also underlined that each country should follow policies specific to its own needs and demands.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In other words, there is no single policy proposal that would work for all of the countries. The findings of the report and the problems for regulatory reform policies can be summarized as follows:

- MENA countries have started various regulatory reforms. However, these reform policies are still very new for these countries
- MENA countries do not have a holistic approach to regulations and policies
- The regulatory reform policies are aimed at simplifying the existing arrangements
- The regulatory reform policies in the MENA countries differ in terms of institutional mechanisms when it comes to practice. Actors, institutions and capacities are dependent on the political-economic structures of the countries concerned
- Rather than the arbitrary and isolated regulatory reform programs in some areas identified by the OECD, an inclusive and systematic approach will enhance the anticipated benefits of these policies
- It has been a few years since the MENA countries began their regulatory reform programs. However, speaking from OECD experience, it may take many years before the public could start seeing the benefits of these reforms

## CONCLUSION

Lack of domestic savings in developing countries pushes these countries to seek external sources. It is possible to find external sources in two ways: external borrowing or FDI. There are different opinions in the extant literature regarding he effects of FDI on economic growth. However, host countries with quantitative and qualitative improvements and developments are in serious competition to receive a share from global FDI flows.

Faced with increasing competition among countries for FDI, foreign investors have a number of key factors to consider when making investment decisions. These factors are economic, political and investment related. They include: the size of the market, level of integration with the global economy, total tax burden, human capital, natural resources stocks, exchange rate, inflation rate, population growth rate, unemployment, rate of growth, macro-economic stability, economic risks, political risks, bureaucratic structure, institutional structures, social structures, transparency, transportation costs, and infrastructure.

FDI flows, growing rapidly since the 1980s, go mainly from developed countries to developing countries. However with the speeding up of liberalization and integration, new actors in the world economy began to emerge. Today, countries such as Brazil, Russia, India, China, South Africa, and Malaysia attract FDI flows the most. It can be seen that in the countries of the MENA region the FDI stock has increased in recent years. However, despite increasing dynamism in the MENA region over the last decade, FDI flows are still at low levels when compared with other transition economies.

The subject of this study is the analysis of the main economic and political factors that affect FDI flows to the MENA region during 1981-2012. Among the factors that affect FDI flows, trade volume, GDP per capita, trade credit risk and political risk factors were investigated. Trade volume and GDP per capita are the key variables that indicate a country's degree of openness to foreign markets and economic stability. For the first time in the literature, this study analyses the effects of trade credit risk on FDI inflow. Oil, natural gas and other natural resources found in the MENA countries turn the region into a stage where international politics and economy have been shaped throughout history. As a result, the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

region has always experienced internal turmoil, wars, and political conflicts. Therefore, political risk factor is another key variable discussed in this study.

As political risk indicators are more abstract and difficult to quantify compared to economic indicators, only a small number of studies on political instability were found when reviewing the literature for the factors affecting FDI flows. MENA countries with recent political instability were chosen as a part of the study. In addition, whether or not countries provided the necessary data was taken into consideration during the selection process. Algeria, Bahrain, Egypt, Jordan, Morocco, and Tunisia were selected. This study contributes to the academic literature as it is the first empirical study to examine the effect of not only trade credit risk but also of political risk on FDI inflow in the light of current political developments such as the Arab Spring.

After unit roots were examined, three different cointegration analyses developed by Pedroni, Kao and Johansen, and Fisher were made in order to investigate whether there was a long-term mutual relationship between the series. These tests revealed that although the variables are not stationary themselves, they demonstrate a long-term relationship when their linear combinations are stationary. Cointegration tests show that the variables have a cointegrated relationship in the long term.

In order to estimate the ultimate refraction coefficient of this relationship and to test for the consistency between estimators and expectations, two different methods were employed – the FMOLS method developed by Pedroni (2000, 2001) and the DOLS method. Across the panel, TRA and GDP were found to have a powerful influence on FDI. TCR and PSR variables have less effect. Pedroni's heterogeneous panel cointegration test shows whether there is a long-term relationship between variables, but does not provide information about the direction of causality. Causality is traditionally tested with the standard two-step Engle-Granger causality procedure.

However, in this study, due to measurement errors and problems about parameter estimation arising from variables that are not included in the model, the traditional causality procedure was not considered appropriate. In this context, this study makes use of dynamic panel data models estimated with generalized method of moments (GMM) developed by Holtz-Eakin et al. (1988) and Arellano & Bond (1991). A causality was identified from FDI to GDP and TRA. At the same time a linear causality, in other words a bidirectional causality, was obtained from GDP and TRA to FDI. In contrast, FDI is not the cause for TCR and PSR while PSR and TCR are the cause for FDI.

The analysis from this study permitted the following conclusions to be reached:

- The increase in the volume of trade in the MENA countries increases FDI flow. In all of the countries surveyed, the most important variable affecting FDI inflow is the volume of trade
- The increase in GDP per capita growth in the MENA countries increases the flow of FDI. This variable ranks the second in affecting FDI for all countries
- Increased trade credit risk adversely affects FDI inflows to the countries in question. In all of the countries examined, trade credit risk takes third place as the variable affecting FDI inflow
- Similarly, an increase in political risk adversely affects FDI inflow. The GDP variable ranks last in affecting FDI for all countries
- In the countries surveyed, economic factors are more influential on FDI than political factors
- Among economic factors, the volume of trade is more important than the GDP per capita growth rate. Not all of the countries in the study are oil-rich but their economies are largely dependent on exports of oil, natural gas, other natural resources or agricultural raw materials. This causes

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

these countries to experience instability in economic growth, which in turn affects FDI inflow negatively

- GDP per capita in these countries is affected by fluctuations in oil prices. Therefore, in developing countries, especially in the MENA region, it is not a true indicator of economic stability. In this case, it can be seen as normal when foreign investors in the region do not take it as an indicator in the first place
- Political instability in these countries appears to be the factor least affecting FDI. This may be due the fact that the instability in the region is considered continuous and endemic
- FDI in the region is the biggest in oil-rich countries of Saudi Arabia and the United Arab Emirates. The share other MENA countries receive from FDI is limited and is proportionate to their oil and other natural resources. Therefore, the expected benefits from FDI in these countries cannot be enough for their economic growth
- In order to achieve sustainable and steady economic growth, politicians, and administrators have to promote strong and open economic performance by increasing sectoral diversity instead of oil dependency. They need to create a competitive environment which would allow FDI inflows to these sectors
- Historically, the transfer of oil, natural gas, other natural resources, agricultural raw materials and agricultural products found in the MENA region to world markets, has been the main issue for international politics and economic relationships. Foreign investors started to invest in the region in the form of FDI in the 1980s with increasing liberalization trends. In this regard, it can be said that these countries' economic growth and GDP per capita growth remain in second place in determining FDI inflow. In fact, even the political instability in the region has less effect on FDI flow. Political instability in the region swings the balance and shapes foreign investors' future investment plans
- It is necessary for the MENA region to become a part of the globalization process to receive a greater share of FDI. Its energy-dependent revenues should be reduced, political stability should be guaranteed, economic and social reforms should be implemented, and economic growth should be more private sector-oriented. Therefore, it can be seen that the MENA region in recent years has been trying to reduce its energy dependency and diversify its economy. Investments in different sectors in recent years have accelerated; however, the economic diversification of the region's countries is not yet sufficient

## KEY TERMS AND DEFINITIONS

**Cointegration Analysis:** An analysis is investigates whether there is a long-term mutual relationship between the variables.

**Foreign Direct Investment (FDI):** Investing in another country by establishing a new company, acquiring a company or increasing a company's capital.

**GDP Per Capita Growth:** Growth in per individual share from GDP (gross domestic product) which represents the monetary value of all final goods and services produced in a country within a year.

**Holtz-Eakin Causality Test:** An improved version of the Granger causality test.

**MENA Countries:** Middle East and North Africa countries (Algeria, Arab Republic of Egypt, Bahrain, Djibouti, Iraq, Islamic Republic of Iran, Israel, Jordon, Kuwait, Lebanon, Libya, Malta, Morocco, Qatar, Oman,Republic of Yemen, Saudi Arabia,Sudan, Syrian Arab Republic, Tunisia, United Arab Emirates, West Bank and Gaza).

**Political Stability Risk Rating:** Rating of a country's risks in terms of government stability, socioeconomic conditions, investment profile, internal conflict, external conflict, corruption, military in politics, religious tensions, law and order, ethnic tensions, democratic accountability, bureaucracy quality, etc.

**Trade Credit Risk:** When a party which is considered a counter party by a bank does not fulfill its obligations to the bank in any way.

**Trade Percentage of GDP:** The share of a country's imports and exports in nominal gross domestic product.

# Chapter 34
# Financial Market in Nepal: Challenges of the Financial Sector Development in Nepal

**Narayan Prasad Paudel**
*Kathmandu University School of Management, Nepal*

## ABSTRACT

*The Nepalese financial sector is attributed of banking sector and non-banking sector. There is exponential growth in the number of financial institutions in Nepal in the last decade. The existing legal framework and institutional setup in Nepal is not conducive to the overall financial sector and private sector development and thus there is an urgent need for reformation in these sectors. The major impediments to private sector involvement in infrastructure development projects include the political and administrative instability; lack of consistent planning; lack of effective institutional support in designing and development of private sector infrastructure projects. Talking about the capital market and capital gains In Nepal, capital gains on securities transactions are taxed as ordinary income to corporations and individual investors while in most of the emerging markets capital gains on investments in stocks and bonds are not taxed, which need to be reformed as per the international practices.*

## BACKGROUND

The major obstacle to the private sector capital formation and economic development in Nepal is the high cost of capital which is associated with the lack of competition in the financial sector and the poor performance of government owned-banks. In this regard, it can be observed that gap between lending and borrowing rates has widened in recent years while the overall performance of the banking system has showed little improvement despite the growth of private banks in the 1990s. In line with above reference The Nepal Bank Limited (NBL) retrenched its operations, consequently, the market share of private banks doubled more than 37 percent, while the market share of the Rastriya Banijya Bank (RBB) remained unchanged at about 32 percent. Nevertheless, some members of the business community believe that the private joint venture banks have not contributed sufficiently to the economic well-being

of the nation. Instead, these institutions are sometimes viewed as benefited from the inefficiency in the financial sector (i.e., wide-loan deposit spreads). If this is the case, the Nepalese economy could benefit from the added competition that would be provided from the development of a money-and-bond market for private issues of securities. In Nepal, universal banking is permitted whereby commercial banks and quasi-banks (i.e., deposit-taking finance companies) may perform investment banking services within the same organization. Commercial banks, however, are not actively involved in capital markets. While authorized to act as underwriters they ordinarily do not participate in this line of business as extensively as finance companies. Commercial banks do not act as money managers or instead, sponsor mutual funds. They do not serve as brokers or market-makers on the floor of the stock exchange either. Commercial banks, however, are active participants in the markets for treasury bills and government bonds. Since the secondary market is relatively inactive, their role is largely limited to primary market transactions.

Over the past 20 years Nepal's financial system has become wider and consequently the number and the type of financial intermediaries have grown rapidly. In addition, recent reforms have made banks more stable, yet the access to financial services remains limited for many people in many parts of Nepal and in recent years it has been declining. During the last 40 years, Government of Nepal has tried much to increase access to formal financial services for small business and low-income households.

The government has introduced directed lending programs for small businesses and low-income households and it has required/encouraged banks to open branches outside Kathmandu Valley. Also it has created specialized wholesale and retail institutions, and lowered market entry to foster the development of different types of financial institutions.

The Nepalese financial sector is composed of banking sector and non-banking sector. The banking sector comprises Nepal Rastra Bank (NRB) and commercial banks. The non-banking sector includes development banks, micro-credit development banks, finance companies, cooperatives and non-government organizations (NGOs) that regulate limited banking activities and other financial institutions such as insurance companies, employee's provident fund, citizen investment trust, postal saving offices and Nepal stock exchange.

There is tremendous growth in the number of financial institutions in Nepal in the last decade. In the beginning of the 1980s, when financial sector was not liberalized, there were only two commercial banks, and two development banks performing banking activities. There were no micro-credit development banks, finance companies, cooperatives and NGOs. After the liberalization of the financial sector, it has made a hall-mark of progress both in terms of number of services. After 1984, there was rapid entry of joint venture commercial banks in to the Nepalese financial market. In the first phase, the Nepal Arab Bank (presently known as NABIL) (1984), the Nepal Indo-Suez Bank (1985) and the Nepal Grindlays Bank (1987) entered the market. In the second phase these banks were followed by the Himalayan Bank, the Nepal SBI Bank, the Nepal Bangladesh Bank, the Everest Bank, the Bank of Kathmandu and the Kumari Bank. In the third phase many development banks have emerged in the market.

In Nepal, the banking sector is one of the sectors which have been able to sustain by facing the test of time due to political instability in the country and it has established itself as the most profitable sector. Currently, with the increased rate of various problems in the country, banking sector is able to prosper with less difficulty. But the growth of financial institutions seems to be slowing down due to the entry of new players leading to a harsh competition. One of the signs of such problems has been the credit crunch faced by financial institutions in recent months. As a result, banks are looking for new geographic locations in order to diversify the portfolio of customers.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Despite government efforts, the access to formal financial services is declining in Nepal. Financial intermediation is stagnating, the number of bank deposits and loan accounts per citizen is falling, and lending targets for low income households have generated excess liquidity among microfinance institutions without significantly increasing their outreach.

The use of bank services in Nepal is limited. Therefore, financial NGOs and cooperatives play a vital role in providing both deposit accounts and loans, and informal borrowing has exceeded formal borrowing to a greater extent.

About 26 percent of Nepalese households have their bank accounts. To assists this job, financial NGOs and cooperatives run as close as the second largest provider of deposit accounts, serving about 18 percent of households. These institutions are the preferred providers for low-income households. Also, they are close to banks even for wealthier households. Microfinance and regional rural development banks are distant third providers for deposit accounts, serving only 4 percent of households– mainly the poor in the rural areas.

Increasing financial access to small business and low-income households requires that financial institutions be able to serve these segments in a financially sustainable manner. Lending profitably to small businesses requires a high level of efficiency, while operating microfinance institutions with large outreach requires a high level of professionalism and technical skills. Nepalese financial institutions are struggling to meet these requirements.

To serve small business profitably, banks need to minimize transaction costs and generate a large number of high-quality loans. But Nepal's financial sector finds it difficult to serve small and micro businesses profitably due to the following reasons:

1. Banking procedures for small business loans are too complex because such a lending process is unnecessarily long and expensive for business and bank both.
2. The most popular bank product, i.e. overdraft, (line of credit) is inappropriate for many small businesses, which do not deposit their revenues in banks.
3. The interest rates that banks charge on loans to the small business do not adequately reflect the cost of serving them.
4. Banks require a high level of immovable collateral, while small businesses tend to have only movable assets.
5. Although Nepalese banks have sophisticated management information system, they generally do not use it to measure staff and loan performance; which is crucial for profitable small business lending. Since the legal and regulatory framework is not a binding constraint on bank lending to small businesses, it could be improved to facilitate such loans.

## Challenges of the Financial Sector Development in Nepal

The prudential regulations and supervision laws; process for foreclosure and bankruptcy, credit information on borrowers, valuation of collateral, and recovery of loan payment system constitute the basic financial infrastructure for any country. But in Nepal's case there are many problems.

The following points indicate the existing problems of the financial sector development in Nepal, (GMA, 2000):

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. The inefficient and in-competitive commercial banking system has been pointed out as the main cause for high interest rates in Nepal. The governmental protection granted to the dominant but inefficient government owned/managed banks that maintain a large spread by charging a high rate of interest to meet their high cost of operation, and bad debt provisions has been pointed as the main reason for the in-competitiveness of the banking system. This has resulted in the borrower's paying high rate of interest to maintain inefficient government banks. It has an adverse impact on investment and growth.
2. The financial infrastructure is weak. It has contributed to financial sector inefficiency in Nepal. Prudential regulations for commercial banks are lax compared to the international standards in some crucial aspect. The lack of basic financial infrastructure, the unequal supervisory enforcement of the existing regulation, and the undue protection given to government owned banks are regarded as the major impediment to the investment and economic growth of Nepal.
3. Nepal's legal framework is inadequate in regard to the land record, bailment and bankruptcy. Moreover, court procedures for payment defaults or collateral recoveries tend to be excessively slow, unpredictable and inefficient. Banking activities are regulated by at least six different Acts, while a number of small savings and credit cooperatives are not licensed by the central bank to conduct banking operations. They are not compelled to fulfill prudential regulations, including "fit and proper" assessment.
4. Banking supervision practices in Nepal do not comply with Core Principles defined by the Basle Committee. Regulations on banking activities, in many cases, are inadequate, too lenient and inconsistent. Enforcement is particularly weak. Most of the regulations allow for long delays in correcting non-compliance. They do not set mandatory financial or legal penalties nor do they prescribe actions to be taken by banking authorities
5. Regulations relating to the internal control and audit, interest rate risks and foreign exchange transactions, concentration of credit exposure, capital definition, liquidity, loan classification and provisions, single borrower limit, and accounting policies need to be revised and harmonized with international standards.
6. The Nepal Rastra Bank (the Central Bank of Nepal) has no statutory independence from the Ministry of Finance. Being on the board and as a shareholder of various commercial and development banks, the government of Nepal faces a conflict of interest which it has been unable to resolve.
7. The banking supervision system does not provide legal protection for supervisors, nor operational independence and adequate resources.

## Some of the Critical Problems of Financial Sector Development in Nepal

The critical problems of financial sector development in Nepal include the following:

A. In-competitive commercial banking system;
B. Weak financial infrastructure,
C. Weak and inadequate legal framework;
D. Undue protection given to government owned commercial banks;
E. High rate of interest to maintain the inefficient government banks;
F. Weak supervision and enforcement of financial regulations;

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

G. Lack of independency of the Nepal Rastra Bank and the lack of statutory protection to supervisors responsible for the enforcement of existing financial regulations.

The existing legal framework and institutional setup is not conducive to the overall private sector development and thus there is an urgent need for reformation. There is lack of effective and appropriate institutional arrangement for the enforcement of existing legislation dealing with regulatory, disciplining, disclosure and corporate governance mechanism. The status of the enforcement of legislation relating to the redress of grievances of investing public in the matter of financial irregularities, malpractices and capital market operation is very poor. The mechanism for settlement of commercial and business disputes, and the issues relating to privatization and liberalization in general is inefficient. The following are the additional major impediments to private sector development:

- Lack of legal framework meeting the international standard,
- Lack of forward-looking attitudes on the part of the government,
- The political instability, political interference,
- Lack of commitment to develop the system of governance,
- Lack of trained professionals in civil service, judiciary (legal, account) and audit professional to deal with issues related to commercial and business matters.
- The slow process of liberalization,

Furthermore, the lack of trained manpower, and physical facilities in the institutions and authorities responsible for surveillance and enforcement of financial, corporate and securities regulations such as the Nepal Rastra Bank, the Office of Company Registrar, the Securities Board, and NEPSE etc. can also be taken as an a serious impediment to private sector development.

## Prospective Measures of Financial Sector Development in Nepal

The financial sector is the backbone of the economy. It works as a facilitator for achieving sustained economic growth by providing efficient financial intermediation. The Modern financial system is important in the economy in order to pool and utilize financial resources, to reduce costs and risks, to expand and diversify opportunities, to increase the allocative efficiency of resources and to promote the productivity and facilitate economic growth. While a sound and healthy financial system contributes to the growth of the real sector on a sustainable basis, uncertainty and fragility in the financial system adversely affect the targeted objectives of economic development.

The following points signify the possible measures of financial sector development in Nepal:

A. Empowerment of the Nepal Rastra Bank (NRB) by removing the control of the Ministry of Finance;
B. Removal of the undue protection given to government banks by eliminating branching and other restriction on private banks;
C. Enforcement of prudent regulation on all banks equally;
D. Enhancement of the supervision capacity and modernization of NRB;
E. Treatment all financial institutions equally;
F. Improvement in the accounting and audit standards;
G. Establishment of an effective and efficient credit information bureau;

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

H. Enactment of new legislation to strengthen financial infrastructure.

## Role of Private Sector in Financial Sector Development in Nepal

The establishment of parliamentary democracy in 1990 opened the way for sweeping economic reforms, and a program of great scope was carried out, between 1991 and 1994. This embraced policies on finance; foreign and domestic trade and investment, industry and foreign exchange; and a start to privatization. A change of government, then, led to a hiatus in privatization and a setback in macro-economic stabilization, but the governments which have ruled since September 1995 have re-launched both.

The government which took office in April 1998 did not have a majority of seats in the Parliament but, significantly, it apparently had the necessary support to move forward with privatization and stabilization. The Prime Minister said his party aimed at winning the confidence of the other parties in the Parliament "and move ahead with a common agenda".

The approach paper drafted by the National Planning Commission for the Ninth Plan, whose implementation reaffirms very clearly the strategy of transition to a more market-oriented and private sector-led economy pursued since the early 1990s. It also offers support for privatization through wide share-issuance to public investors.

Nepal's own liberalization has been greatly reinforced by that of India, with which its economy is very closely linked.

## Problems and Prospects of Private Sector Investment

Regarding the investment environment in the sectors of electricity, telecommunication, transportation and water supply, the major impediments to attract private investment are the absences of stronger private sector involvement in infrastructure. The major impediments to private sector involvement in infrastructure development are: the political and administrative instability; lack of consistent planning; lack of effective institutional support in designing and development of private sector infrastructure projects; reliance on unsolicited proposals; difficulty in obtaining commercial lending and the lack of government support arrangements.

## Problems Relating to the Private Sector Development

A. Lack of matching procedural and institutional structure designed to attract as many interested investors as possible. The present passive approach by the government carries the danger of not making the use of the private financing option to the extent possible.
B. Lack of a proactive and strategic approach to the involvement of private investment in infrastructure. The government is treating private sector development participation as the last resort means of financing a project.

## Ways for Effective Development of the Private Sector in Nepal

The following could be the possible measures for effective development of the private sector in Nepal:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

A. Reformation of existing legal framework conducive to the private sector development which matches the international standards.
B. Establishment of some new institutions and strengthening the capability of the existing institutions to ensure effective enforcement and supervision of the regulatory measures under various legislation for the efficient operation of the capital market, financial system, implementation of the infrastructure projects and smooth operation of private sector development activities in general.
C. The government should follow the competitive tendering system while awarding the infrastructure project in the private sector and to accept direct or contingent financial responsibility to support commercial credibility of a specific infrastructure project which is not otherwise commercially viable.
D. Appropriate training for the staffs of different regulatory institutions and for professionals involved in the dispute settlement process such as judges, lawyers etc.

The appropriate legal framework required for efficient functioning and the operation of the International Finance Services Centre should be developed as domestic legislation. While developing such legislative incorporation, internationally accepted standards and practices should be taken into consideration.

There are important areas of the private sector development suffering due to the lack of appropriate legislation. New legislation is required to cater the need of the private sector development which requires the legal framework to come at par with the international standards for the purpose of: (i) building the confidence of the investing public including foreign investors, (ii) for the establishment of new institutions providing effective mechanisms for the enforcement of the capital market legislation and effective regulation of financial transactions and (iii) for providing an effective mechanism for the settlement of disputes relating to various commercial and financial transactions, issues relating to privatization and matters relating to, or arising in course of formulation and implementation of infrastructure development projects. In addition to new legislation, some of the related existing legislation requires reformation. Some of these may be amended and some should be replaced by new legislation.

## Issues for the Private Sector Development in Nepal

The tax system can be reformed to encourage disclosure and stimulate capital formation. The government can accelerate the sale of the shares of the National Insurance Company which remain in the hands of the state. With this in view, the government should review the adequacy of existing regulations. In the interim, period, the government should also review existing insurance procurement practices in order to create a level playing field between the state-owned company and the private sector.

Private sector support measures should be taken to strengthen certain agencies and organizations which play a key role in the enabling environment for private sector development.

It can be noticed that the Improvement is essential for the following fields:

1. A careful consideration should be given in creating a Small Business Executive Agency to handle licensing and registration requirements for small businesses as a self-regulatory organization under Federation of Nepalese Chambers of Commerce and Industry (FNCCI).
2. NRB should publish guidelines granting greater flexibility to joint venture banks and finance companies in staffing headquarters office in Nepal, in order to encourage continuity in management and the transfer of state-of-the-art technical and operational skills.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. Foreign lawyers and accountants (individual and companies) should be permitted to practice in Nepal. It will be necessary to abolish current restrictions on the right of foreign lawyers and chartered accountants to practice in Nepal, amending relevant legislation.
4. It is necessary to review the adequacy of the regulatory framework for various industries (insurance, banking, airlines, energy, communications, etc.) as the process of privatization moves forward.
5. There is a need to develop a competition policy. It will be necessary to review current policies, laws, regulations and practices to eliminate privileges for state owned enterprises as compared with the private sector. The government should consider the institutional arrangements for the regulation and enforcement of a competition policy.

## Practical Problems of the Private Sector in Nepal

The high cost of capital to private business enterprises can be attributed as a major constraint on the private sector development. While there are many impediments to be overcome, it was widely believed that the further development of the capital market in Nepal could contribute to a more efficient allocation of savings, expansion of the private sector, and economic growth. Thus, several studies noted that the development of the Nepalese capital market is important for several reasons:

First, the primary or the newly issued market has the potential to provide a source of urgently needed long-term funding for the private sector. In order to avoid a mismatch in assets and liabilities, the Nepalese banking sector should most appropriately concentrate on short-term funding for business.

Second, the creation of an efficient secondary market with prices determined in a fair and transparent manner would instill public confidence and facilitate the allocation of capital to its most productive uses. This requires that investors have access to the accurate and timely information, improvement in the capital market infrastructure, and a more competitive environment in the delivery of financial services to issuers and investors.

Third, capital markets can facilitate the privatization of state-owned enterprises in a manner that allows broad public participation and provides an ownership structure that will support the long-term goals of the privatization program, including greater efficiency, transparency, sound corporate governance, good management practices, and increased revenues to the government. Finally, strengthening the capital market could help reduce the current dependence on external finance supplied by international lending agencies.

Asian Development Bank (ADB) estimates that the external financing for Nepal's development will account for 8.0 percent of GDP in 2008 while internally generated financing by bank and non-bank sources will account for 1.1 percent of GDP. In order to reduce the over-dependence on foreign assistance for Nepal's development requirements, ADB recommends further efforts to mobilize domestic resources more efficiently, including "major tax reforms and further measures to improve efficiency in the financial sector as well as to revitalize the capital market".

Under the primary securities market, macroeconomic conditions, political uncertainty, and the policy environment toward privatization have not been conducive to the expansion of the share market through public offerings.

## Private Sector and Strategic Opportunities in Nepal

Nepal's greatest opportunities for private sector development include (GMA, 2000) hydro-power sector and tourism sector, both derive principally from the Himalayas. The potential supply of hydroelectricity

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

far exceeds Nepal's own present and projected future demand. Schemes that would have a total capacity as great as 40,000MW have been economically and environmentally judged feasible. This compares with some 600MW of hydropower generating capacity now installed in Nepal, another 280MW under construction and projected demand in the country of 4000MW in the year 2014. But, by the same year, India's northern grid is expected to face a power deficit of around 20,000MW.

However, the Indian market for Nepalese power is more theoretical than actual at present. The Nepalese government understands this well and has taken a major step forward by concluding a Power Trade Agreement with India. This provides a legal framework which permits private parties in the two countries to enter into cross-border power sale/purchase agreements with each other. The conclusion of an agreement with India on the integrated use of the waters of the Mahakali river has established another landmark in relations between the two countries; and will open the way to a project which combines hydropower, irrigation and flood control once the arrangements for implementation have been finalized.

The Nepalese authorities are well aware that a constraint on Indian purchases at present is the financial weakness of the State Electricity Boards in India. But restructuring of these has begun, in some states, and the problem should prove to be one of transitions as India moves to a more market-oriented system.

The cost of eight schemes that account for half of the 40,000MW of potential installed capacity has been estimated at US$11,500 million, of which the vast majority would have to come from abroad because Nepal's total gross fixed capital formation in the year 2007 was less than US$2,000 million.

The government has enacted legislation to permit private investment, including foreign, in this sector and private investors are already playing an essential role in both large and small schemes.

Public and private sector investors from Norway, the US and Australia played a leading role in three hydropower projects at varying stages of development, the most advanced being Khimti-I (Norway), Bhote Kosi (Harza Engineering of the US), and the third being West Seti (the Snowy Mountain Corporation of Australia). The cost of these projects estimated at US$138, US$98million and US$ 1,000 million, and their generating capacity at 60MW, 36MW and 750MW respectively.

After pursuing a proposal to the government of Nepal for two years, the Enron Corporation of the US withdrew its application for a survey license for the 10,800MW Karnali-Chisapani project, in which it had calculated that it would have to invest US$6-9,000 million. According to the company, its investment alone would have added 43 percent to Nepal's GNP. In 1995, the World Bank withdrew from the 402MW Arun III project. These two decisions, and the intense political controversy which has been aroused by the Mahakali project, as mentioned above, have demonstrated that the difficulties and risks inherent in projects of such magnitude in Nepal are many and great. They are financial, commercial, economic, environmental, social, administrative and political ones. Indeed, the mismatch between the size of these projects and Nepal's own economy and the financial and administrative capacity are so great that it may be more realistic for Nepal to pursue a program of lesser projects, and develop a record of success in that before attempting mega-projects.

Feasibility studies for some seven medium-sized schemes selected for expansion of the domestic power system were due for completion by the end of year 2001. Their total cost was estimated to be worth US$1,039 million, with individual costs ranging from US$ 39 to 65 million. If they could be partly financed through the Nepalese capital market, this would provide a powerful dynamic to the development of that market, much as railway building helped drive the growth of capital markets in Europe and America in the 19$^{th}$ century.

Electricity generation was a state monopoly managed by the Nepal Electricity Authority until 1992. Since then a considerable legislative effort has been made by the government to open the sector to

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

private ownership and investment, both domestic and foreign. An Electricity Development Centre has been established to facilitate foreign investment. Foreign lawyers have paid tribute to the quality and pragmatic responsiveness of the Nepalese officials with whom they have dealt on the Khimti project, which demanded creative solutions to legal problems not encountered in Nepal before.

The government has asked the Foreign Investment Advisory Service (FIAS) of the World Bank group to review the institutional, legal and regulatory environment for the private sector investment in infrastructure (including electricity, airports, dry ports, roads, telecommunications, water and waste disposal) and to provide recommendations on how to make these sectors more attractive to foreign investors. The FIAS report is likely to contain important indicators for follow-up work, including technical assistance requirements.

The strengthening of Nepal's regulatory regime for electricity and other utilities deserves high priority as a target for technical assistance.

The potential of the Himalayas for the growth of tourism has only begun to be exploited. Tourism itself is in private hands, and foreign investment is permitted, except in activities which lend themselves most readily to small-scale enterprise. The strengthening of this sector was the objective of a tourism infrastructure development project financed by the Asian Development Bank approved in July 1996.

## Economic Reforms

Conducting an event study is the most direct and transparent way of assessing the impact of stock market liberalization on emerging market equity prices. However, unlike the typical event study in finance where an econometrician can be reasonably certain that the event in question is isolated from other influential events, the shift from closed to open capital markets usually coincides with four equally important changes in an economic policy: macroeconomic stabilization, trade liberalization, privatization, and the easing of exchange controls.

The theory used to explain the stock price effects of capital market liberalization assumes that everything else is held constant when this change is made. To construct an estimate that we can use to test the theory, it is necessary to hold constant the other reform measures and isolate a pure capital market effect.

To the extent that stock market performance depends on economic conditions, the decision to liberalize depends on the economy's current and expected future performance.

## Prospects of Financial Service Centre in Nepal

The study report prepared by Professor Howell E. Jackson of Harvard Law School and Professor William W. Park of Boston University contains two components. The study report begins with the two premises. Firstly, in order to provide a viable legal structure, Nepal must develop not only the substantive legal standard and regulation but also the enforcement mechanism to ensure compliance with those regulations; and secondly, that Nepal presently lacks the legal and regulatory infrastructure required to become an attractive and successful financial centre. It is supportive to the cause for setting up an International Financial Services Centre in Nepal as proposed by Ms. Collins & Associates Inc. of Boston, USA.

Professor Jackson has suggested three options for overcoming the deficiency of Nepal's legal system required for the establishment of an attractive and successful International Centre. The first option is to establish a unique Nepalese legal and regulatory structure (the indigenous model), the second is to adopt an existing foreign legal and regulatory structure for application in Nepal (the domesticated foreign

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

model) and the third, and the most preferred option by him, is the selection of one or more established laws and regulatory systems and incorporate those systems by reference directly into Nepali law. He calls this third option the Selective Incorporation of Foreign Legal System.

Three ways of incorporating foreign regulations into domestic laws have been suggested: (i) the incorporation of foreign regulation as a screening device, (ii) the incorporation of foreign regulation into domestic laws as a complete or near-complete substitute for domestic regulation and (iii) the incorporation of foreign regulatory structure through the contractual choice of the legal provision.

## Investment Environment in Nepal

The Foreign Investment Advisory Services (FIAS) has analyzed the environment for investment in the sectors of electricity, telecommunication, transportation and water supply based on the Nepal government's intention to attract private investment in these sectors. The report prepared by the FIAS team is based on the review of the legal and institutional arrangements in the various infrastructure sectors and the response received from the key government representatives, senior executives of the major infrastructure projects as well as private investors interested in infrastructure projects.

The FIAS report examines the present environment for private sector investors in infrastructure, pointing out the major impediments to the stronger private sector involvement. The political and administrative instability, lack of consistent planning, lack of effective institutional support in designing and developing of private sector infrastructure projects, reliance on unsolicited proposals, difficulty in obtaining commercial lending the lack of government support arrangements, etc. have been identified as major impediments to private sector involvement in infrastructure development.

Three major problems can be pointed out as impediments to private sector involvement in infrastructure development, (Paudel, 2010).

1. The government's heavy reliance on investors' initiation to develop projects except in the telecommunication sector in which the new regulation prescribes a competitive tendering process among the interested parties,
2. Lack of an appropriate strategy that establishes private sector investment as the preferred option for the development of infrastructure project; and lack of matching a procedural and institutional structure designed to attract as many interested investors as possible. The present passive approach by the government carries the danger of not making the use of the private financing option to the extent possible, and
3. Lack of a proactive and strategic approach to the involvement of private investment in infrastructure. The government is treating private sector development participation as the last resort means of financing a project.

The Foreign Investment Advisory Services (FIAS) has advised the government to give up the present practice of introducing tax benefit as a strategy for attracting foreign investment in infrastructure projects. Since the private infrastructure projects seem to be more location independent, the general availability of benefits such as tax holding will generally not create attraction to investors. Instead of tax incentive, the government should focus on providing support to alleviate the specific risk element burdening the individual project.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

FIAS recommends that the government should develop a more comprehensive strategy across all infrastructure sectors integrating the private financing option into the government's overall development efforts to make better use of private financing, and specially foreign direct investment. More specifically the following course of action has been suggested: (i) the government should adopt a comprehensive capital expenditure planning procedure in which private financing is explicitly considered and analyzed. The process should be driven by the potential for commercial viability. Such projects should be taken off from the public sector priority list. Different alternatives should be explored to make the project commercially viable, which do not seem otherwise commercially viable; (ii) the model of the Electricity Development Centre (EDC) may be adopted with required modification to strengthen institutional capacity to handle a private infrastructure project. The process of developing the private sector project could be strengthened if EDC were to be formally involved in all major steps of the process, including the project identification, the preparation of feasibility study and tender documentation; and the negotiation of crucial element such as power purchase agreements. In establishing EDC as a key authority responsible for the implementation of private infrastructure projects across all sectors, while its focus should remain on electricity sector given its tremendous potential. Other sectors could benefit in this way from the skills and expertise available. A key requirement is that such an agency should be politically independent to function as an effective and neutral advisory body to the government as a whole. It needs to enhance its capacity by hiring financial and legal experts; (iii) the government should make much more use of competitive tendering techniques. It would limit the danger of corruption allegations by challenging the awards of a project and improve the number of structure of private infrastructure projects. In some cases when the specific project structure is less clear or in which indigenous proposals by private sector experts are required, unsolicited proposals might still remain the most appropriate approach. Ultimately, these proposals may be converted into competitive tenders by paying the proponent in case he could not win in the competitive award process; (iv) the government should develop a more proactive approach to support the private infrastructure project. The support may take the form of the service/product guarantee and/or a specific support to individual projects to enhance their commercial viability. Possibly, even minor contribution from budget or donor sources might be sufficient to structure a project in such a way that it becomes commercially viable.

Recently, Investment Board Nepal has been established to initiate the bigger projects. Through the Investment Board Nepal Detail Project Report, of the few of the bigger project including Upper Karnali Hydropowr Project with the participation of Indian GMR Company has been finalized and signed.

Despite of above development and investment opportunities, the existing legal framework and institutional set-up in Nepal is not conducive to the overall private sector development and thus there is an urgent need for reformation. The following are the major observations in this area.

1. The legal framework required for the overall private sector development is inadequate. In some areas the existing legislation is redundant, while in some important areas there are no appropriate statutes and regulations, in some areas there is a hiatus between different types of legislation, whereas in some areas the existing legislation is not up to the international standards;
2. There is a lack of effective and appropriate institutional arrangement for the enforcement of existing legislation dealing with regulatory, disciplining, disclosure and corporate governance mechanism**;**
3. The status of the enforcement of legislation relating to the redress for grievances of the investing public in the matter of financial irregularities, malpractices and capital market operation is very poor; and

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. The mechanism for the settlement of commercial and business disputes and the issues relating to privatization and liberalization in general is inefficient, outdated, dilatory and highly unpredictable.

## Way Forward for the Overall Private Sector Development and Investment in Nepal

The remedial measures for the above problems can be classified into the following major categories:

A. Reformation of the existing legal framework conducive to private sector development which matches the international standards.
B. Establishment of some new institutions and strengthening the capability of the existing institutions to ensure effective enforcement; and supervision of the regulatory measures under the legislation for the efficient operation of the capital market, financial system, implementation of the infrastructure projects; and smooth operation of private sector development activities in general.
C. The government initiation of the competitive tendering system while awarding infrastructure projects in the private sector; and the accept once of the direct or contingent financial responsibility to support commercial credibility of a specific infrastructure project which is not otherwise commercially viable.
D. Appropriate training for staffs of different regulatory institutions and for professionals– such as judges, lawyers etc involved in the dispute settlement process.

## Institutional Mechanism for Private Sector Development

The institutional mechanism for the effective enforcement of law is more important than the enactment of new law. Lack of an appropriate and effective institutional mechanism for enforcement of existing laws and regulations has been identified as one of the major impediments to private sector development in Nepal. It has two aspects. Firstly, in some areas there are institutions but these are not effective due to the lack of required legal authority, trained manpower and physical facilities. Secondly, in some areas there is no appropriate and effective institutional mechanism in place to enforce certain legislation. For example, there is no effective institutional mechanism to develop infrastructure projects to be financed by private sector fund; and to supervise the enforcement of regulation applicable to non-banking financial transactions. For the purpose of remedying this deficiency, there is an urgent need to establish some institutions at the same time. The One-Window Committee within the Department of Industries should also be given equal importance in strengthening the capabilities of the existing institutions such as the Securities Board, NEPSE, the Nepal Rastra Bank, the Office of the Company Registrar, (Paudel, 2007).

### a) One Window Committee

The existing Industrial Enterprises Act 2049 has the provision of a One Window Committee. But the way it is functioning shows that it is not serving its purpose. There is an urgent need for its strengthening, clear-cut definition of its authority and the bindingness of its decisions on other government offices. The Committee may be developed into an Investment Centre having its final legal authority in the matter of granting all types of concessions, benefits and facilities under the Foreign Investment and Technology

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Transfer Act 2049 and the Industrial Enterprise Act 2049. Its decision should be binding on the rest of the government offices for the aforementioned purposes.

## b) Company Registrar/Company Law Board

1. The Office of Company Registrar at present registers the companies, receives annual reports from companies and grants permission to increase capital; and related amendments to articles and memorandum of association of the companies registered with it. It does not keep the follow-up of whether the company has filed the annual reports; held on annual general meeting or conducted proper accounting and auditing of the company's books and accounts. Due to this, the investors are left to the mercy of majority shareholders controlling the management.
2. The role of the Company Registrar requires massive restructuring. Its responsibility and accountability need to be clearly defined. The authority to register the charges of all types of movable assets should be given to the Office of Company Registrar. The Registrar should be vested with the clear cut authority to prosecute all types of defaulters under the Company Act; and the authority to adjudicate the matter of imposition penalty should be vested in the Commercial Court. The present system of the registration of mortgage of immovable assets in the respective District Revenue Office should continue.

## c) Nepal Securities Exchange Limited (NEPSE)

1. As an strategy for providing the foundation for building of public confidence in the stock exchange, the ownership and the governance, the pattern of the existing NEPSE should be changed. A highly desirable option would be to privatize it at an early stage of market development. It can be done in two stages. Privatize the Board of Directors as the first step towards the gradual privatization of NEPSE. The new Board of Directors of NEPSE should develop, for the submission to the government, a plan for the proposed ownership, operation, funding and management of NEPSE under the proposed private ownership. The plan should also contain appropriate organizational structure of NEPSE. Such a privatized Board of Director would be constituted by the majority of members representing the private sector (non-member users of the exchange facility such as issuers and investors). The representation of the public should also be ensured in the Board. Such public representation could be drawn from a broad range of professionals and organizations, academics, associations of financial analysts, institutional investors, etc.
2. NEPSE should be developed as a self-regulatory body. Its authority vis a vis the Securities Board should be clearly defined to remove duplication of authority. The effective self- regulation of NEPSE requires vesting some specific authorities with it, such as (i) the authority to enforce members' compliance with laws and regulations and NEPSE's own rules, (ii) governing structure that reflects the public interest and provides fair representation to its members, (iii) the access to membership based on competency and financial responsibility, (iv) the authority to frame by-laws that are adequate to protect investors and facilitate the efficient execution of securities transactions, (v) the authority to fix fees, dues and other charges that are reasonable and allocated equitably among members, issuers and other users of its facilities, (vi) the authority to impose sanctions on violations of the rules and regulations it is charged to enforce subject to a fair disciplinary procedure,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

(vii) the authority and resources for staff training in both regulation and operational matters and to design and implement investor education programs.

### d) Securities Board

1. The Securities Board should, in general, have full and final regulating, supervisory and enforcement authority over the capital market operation under the new Securities Exchange Act. The existing physical facilities and human resources capabilities should be enhanced to commensurate to its responsibilities and authorities.
2. The authority of the Securities Board should include among others: (i) anticipatory power for the protection of investors, (ii) power to step in on the insolvency of a registered person and take over the business, to close up operations and to transfer remaining business to another registered person, (iii) sufficient and detailed investigatory powers, (iv) power to establish an inquiry and disciplinary process in respect of contravention by registered persons and to prosecute the violation of securities law before the court of competent jurisdiction, (v) power to impose conditions on the certificate of any registered person after initial registration, (vi) power to enter into the memorandum of understanding with the Nepal Rastra Bank to determine their respective supervisory responsibilities over commercial banks and finance companies registered to conduct any form of services business.

## Empowering the Corporate Governance

The problems of corporate governance in Nepal is directly related to factors such as the lack of proper accounting and auditing standards; inadequate legal provision requiring disclosure and transparency in corporate governance; lack of effective remedy against the defaulting directors and auditors responsible for non-disclose and false-certification etc. This problem can be solved to a large extent if directors of a registered or listed company are made personally liable for non-compliance with its continuing disclosure obligations; and subjected to a financial penalty which should be paid by the directors personally. Similarly, accountants and auditors not fulfilling their statutory obligation of reporting the true and fair picture of the corporate governance and disclosure should be subjected to a penalty. This requires amendment in the Company Act. Similarly, accountants and auditors should be made personally liable for their negligence in performing audits and keeping account as per the existing law. The accounting and audit standards for public companies need to be strengthened through the effective implementation of provisions of the existing Chartered Accountants Act, 1997. This may also require amendment in the Company Act.

## BANKING AND FINANCIAL SYSTEM IN NEPAL

Over the past 20 years Nepal's financial system has become deeper and the number and the type of financial intermediaries have grown rapidly. In addition, recent reforms have made banks more stable. Still, access to financial services remains limited for many people in many parts of Nepal and it has been declining in recent years. Much of the past 40 years the Government of Nepal has tried to increase access to formal financial services for small business and low-income households.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The government has introduced directed lending programs for small businesses and low-income households. It has required banks to open branches outside the Kathmandu valley, created specialized wholesale and retail institutions, and lowered market entry to foster the development of different types of financial institutions.

The Nepalese financial sector is composed of banking sector and non-banking sector. The banking sector comprises the Nepal Rastra Bank (NRB) and commercial banks. The non-banking sector includes development banks, micro-credit development banks, finance companies, co-operatives and non-government organizations (NGOs) performing limited banking activities and other financial institutions such as insurance companies, employee's provident fund, citizen investment trust, postal saving offices and the Nepal stock exchange.

In Nepal the banking sector is one of the sectors which have been able to stand up the test of time amid the political instability in the country, and yet be able to be a most profitable sector in the economy. With the increasing problem in the nation, this sector has been able to prosper with less difficulty till now. But the growth of financial institutions seems to be slowing down due to the entry of new players leading to stiff competition. One of the signs of problems has been the credit crunch faced by the financial institution in recent months, so banks are looking for new geographic locations and diversifying the portfolio of customers.

## Competitiveness of the Banking Industry in Nepal

Due to the growing economic competition worldwide, Nepal's banking industry is sharpening its tools to face it. The Nepalese banking industry has opened the doors of modernization. It is striving hard to increase its market share, attract more customers, and to diversify deposits and loans portfolio to capitalize the untapped opportunities. As we can see from the recent trends of the growing number of commercial banks, there is a significant increase in competition. This is due to the banks present in the same market catering to the same target group. Not only is the number of commercial banks increasing but also there is a significant rise in the number of financial intermediaries such as development banks etc. Due to the untapped opportunities in the financial market of Nepal, the government is looking forward for deregulation of few rules and regulations due to which banks are trying to be more efficient in managing their interest rate ceiling, capital adequacy and loan rates.

The new Act has enabled other financial institutions to operate the services that were limited to commercial banks provided they meet the capital requirements as stipulated in the directives making competition even more intense in the small market. Similarly, the development banks have also started providing the remittance service which is assumed to be the major source of foreign currency inflow in the country. Some of the mergers and acquisitions that have taken place in the past few years have also increased the competitive intensity of the banks. NRB has been emphasizing the increase in the number of mergers and acquisitions among the banks in the few years ahead so as to slowly regulate the flow of money in the economy. The increased use of technology by the general public has compelled the bank today to move towards internet banking.

With the focus on globalization, these trends have increased competition in the banking industry in terms of the opening of number of branches and becoming customer centric. Besides competition, these trends have led to the economic growth of the country by enabling the simple and specialized banking services to reach the sector-wise population of the country. However, the competitiveness in the market has given rise to the concept of market leaders, followers and challengers.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The banking industry is one of the vital parts of the Nepalese financial sector. The banking industry has stood as the most vulnerable yet most profitable sector in the economy in the Nepalese context. Despite increasing problems in the nation, this sector has yet been prospering with much lesser difficulty. As mentioned earlier, there are 25 commercial banks, which cater to the society with banking services. Commercial banks have gained vital trust from the public side. With the wide reach and wide diversity of services, it has become one of the most important sectors of the economy.

Nowadays people seem to be getting much more attracted to the facilities provided by the banks compared to the past. The demand for banking services has also been increasing, which can be observed through the escalating numbers of branches of every bank. Despite the weak economy, with continuity of effort, formulating plans and selecting projects, the banking sector has been growing for past many years. Hence, despite the unfavorable economic environment, tremendous growth could be seen in the banking sector.

## Regulatory Influences

NRB is the apex body for all the financial institutions to imply the regulatory influences. NRB has formulated different laws, rules, regulations, policies, etc. that have an impact on every financial institution established in the country. For example, NRB has formulated a banking regulation to address the institutions interested in opening offices in Nepal. They are required to submit applications to NRB. NRB then reviews the existing competition in the banking sector, likely contribution to the development of banking and its status in international banking and then only grants the permission for opening offices for foreign banks.

## Legal Requirement for the Establishment and Operation of Commercial Banks in Nepal

NRB has made the rules and procedures for establishing commercial banks in Nepal. The existing legal framework of NRB establishing a commercial bank in Nepal states that:

Only on the recommendation of NRB, a bank shall be established as a company with limited liability under the Company Act. For obtaining such recommendation an application should be filled along with the particulars as specified by NRB. Only after receiving the recommendation of NRB, commercial banks can be registered according to the Company Act to functioning under the Act.

According to the Nepal Rastra Bank (NRB Act, 2002), financial institutions in Nepal can be classified into the following categories (table 1):

All commercial banks fall under ‘Class A’ category, requiring minimum paid-up capital of Rs. 1000 million. In the present Nepalese context, banking regulations have been formulated and regulated by the following Acts:

- NRB Act, 2002
- Banking & Financial Institutions Act, 2006
- Directives/Circulars issued by NRB (for prudential regulations)

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 1. Categories of financial institutions in Nepal*

| Class | Minimum Required Paid-Up Capital |
|---|---|
| A | Rs.1000 Million |
| B | Rs.320 Million |
| C | Rs.200 Million |
| D | Rs.100 Million |

## Classification of Bank

Ever since the first bank was established, the financial needs of people have been growing. There have been many changes around the world in regard to the banking sector. With every instant change in people's need, technological advancement, and changing world economy, there are many functions that bank needs to perform. A single bank is not able to perform with all the functions. So in the course of time many types of banks came into existence catering to the different needs of the public.

## The Central Bank

The Nepal Rastra Bank (NRB), the Central Bank of Nepal, was established in 1956 under the Nepal Rastra Bank Act, 1955, to discharge the central banking responsibilities including guiding the development of the embryonic domestic financial sector. Since their inception, there has been a significant growth in both the number and the activities of the domestic financial institutions.

To reflect this dynamic environment, the functions and objectives of the bank have been recast by the new NRB Act of 2002. Its preamble lays down the primary functions of the bank as:

A. to formulate necessary monetary and foreign exchange policies to maintain the stability in price, and consolidate the balance of payments for sustainable development of the economy of Nepal;
B. to develop a secure, healthy and efficient system of payments;
C. to make an appropriate supervision of the banking and financial system in order to maintain its stability, and foster its healthy development; and
D. to further enhance the public confidence in Nepal's entire banking and financial system.

NRB is eminently aware that, for the achievement of the above objectives in the present dynamic environment, sustained progress and continued reform of the financial sector is of utmost importance. Continuously aware of this great responsibility, NRB is seriously pursuing various policies, strategies and actions, all of which are conveyed in the annual report on the monetary policy.

## The Development Bank

After the enactment of the Development Bank Act 2052, many development banks were established in different places of Nepal. They are performing under the Development Bank Act 2052, the Nepal Rastra Bank Act 2058 and the Company Act 2053. These banks are helping the people as well as the nation

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

in economic development directly or indirectly. The major functions of the development banks are to finance and support for the development of the country rather than personal use.

## The Agricultural Development Bank

Developing the agricultural sector of the economy is the main motive or rationale behind establishment of these banks. With the motive the Agricultural Development Bank was established in 2013 B.S. under the Agricultural Development Act 2024. These banks were initiated to improve economic welfare of people and provide loans and capital for the agricultural sector. This bank provides agricultural production loan, agricultural facility loan, small and cottage industry loan, agro-profession loan, loan to buy land and loan for agricultural graduate. Usually, there are two types of banks prevailing under the Agricultural Development Banks. They are the land mortgage bank and the cooperative bank.

## The Exchange Bank

The exchange bank provides financial assistance for conducting international trade. It buys and sells the foreign exchange bills. This type of bank exchanges different foreign and indigenous currencies and transfers the fund to foreign countries. It provides facility to send money to foreign lands. It has branches and sub branches in the country and abroad. In Nepal, the functions of this bank are performed by the Nepal Rastra Bank and the commercial banks.

## The Industrial Bank

A bank, which is opened to support the industrial field of a country and it's all round development and expansion is an industrial bank. In the context of Nepal, the Industrial Development Corporation can be considered as the industrial bank. Its major functions are: to open new industries; to expand the present industries; to provide loan and technical assistances for small industries opened in the industrial areas; to encourage the possible investors to buy and sell shares, bonds or debentures; and to support the overall economic structure of a company.

## The Rural Development Bank

A rural development bank is established with the objective of uplifting the living standard of the people of rural areas by encouraging them to start the possible income generating occupation; by providing loan without security; and by providing necessary training and bank service. The rural development banks opened in Nepal have adopted and followed the system of the Rural Bank Bangladesh, in order to provide loans to the people who were deprived of institutional loan facility in the lack of security and guarantee. Hence the banks that are established to improve the economic condition of the farmers, laborers, masons, etc. are called rural development banks. Some of the rural development banks are the Eastern Rural Development Bank Ltd, the Far Western Rural Development Bank Ltd, and the Western Rural Development Bank Ltd. These banks are established with some fundamental goals for the equal distribution of the resources to all people and all regions.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## The Savings Bank

A saving bank is established with the objective of managing a huge amount of capital by collecting the small amount of money saved by the people in urban and rural areas. The main purpose of this type of bank is to encourage people to save more and develop lifelong saving habit. Thus, by collecting the fragmented small amount throughout the country a savings bank collectively invests it in the sectors which are productive and will yield good returns for the investors.

## Rural Development Banks (RDBs) and Microfinance Activities in Nepal

In 1992, Nepal Government, closely based on the Grameen Banking Model of Bangladesh, established two regional level rural micro finance development banks with the major share participation of NRB (66.75 percent and 58.5 percent), one each in the Eastern and Far-Western development regions. By June 1996, other three RDBs, one each in the other three development regions were established. NRB altogether has invested Rs. 195.0 million as equity into these five development regions. Establishment of RDBs is a major breakthrough in the microfinance sector development in Nepal. The main objective of RDBs was to provide credit to poorer households, mainly to women. The RDBs credit is provided for micro level income generating activities on group guarantee basis, (www.bwtp.org).

## Problems and Challenges

NRB has always been playing a crucial role in following resources to the deprived and poorer sector of the economy through development finance policy. It has undertaken various policies on development finance including rural and microfinance to generate employment and increase production and income of the poorer people.

The rural credit survey of 1991/92 has revealed that only 20 percent households have access to formal financial institutions and 80 percent had access to the services of the informal sector. This shows two important policy failures of the organized sector: one is the insufficient infrastructure and another is the insufficiency of the existing financial institutions to deliver rural credit.

In this background, at least two immediate policy measures are needed to implement in order to make microfinance institutions viable, competent and microfinance-friendly. Firstly, a policy is required for continued support from the government in social mobilization and group formation, as the primary objective of the microfinance institutions is to help alleviate poverty. Secondly, it is important to create a wholesale fund for financing microfinance in the longer term possibly at the minimum interest rate. Reaching out to remote places and motivating the rural people are other challenges to microfinance institutions in Nepal because the country has a diverse topography and thin population density.

The efforts of creating the regulatory environment in the microfinance sector are an advanced step towards remedying policy on microfinance operation. This policy correction has established Nepal as a pioneer in the microfinance sector development in the world.

The major challenge to microfinance is how to make this industry viable, sustainable and profitable. Reaching out to the majority of people with micro and rural finance, and making the financing institutions viable, sustainable and profitable are two different aspects of microfinance.

## The Reform Program for Regional Rural Development Banks

In 2001 the Government of Nepal and the Nepal Rastra Bank committed to a five-year restructuring program for regional rural development banks. This program included recapitalization of four of the five banks (equivalent to NRs. 163 million), reforms of the banks' operating practice, and progressive privatization of profitable ones. Reforms include introducing productivity measures for each bank, appointing executive directors through open competition, and implementing cost reduction schemes, such as for voluntary retirement. Under the restructuring program, 40-50 percent of shares of profitable regional rural development banks are to be sold to bank clients, while the Nepal Rastra Bank keeps up to 10 percent and the government up to 20 percent. The remaining shares are to be split among employees, other banks, and other investors.

As a result of the recapitalization and reforms, Western Regional Rural Development Bank and Eastern Regional Rural Development Bank generated profits in 2005. Improvements have also been seen in the 3 other regional rural development banks.

As per the restructuring program, privatization was completed for Western Regional Rural Development Bank in 2005. The bank is now owned by its clients (40 percent) and employees (1 percent), five commercial banks (23 percent), the government (17 percent), the Nepal Rastra Bank (10 percent). Although the privatization was successful, the performance of the privatized bank has not been very good. In 2005, it made a profit only due to the income generated by depositing its share of the deprived sector lending in other financial institutions.

The other profitable regional rural development bank, covering the Eastern Region, started its privatization program in December 2004. Under the program, the Nepal Rastra Bank divested all but 10 percent of its 67 percent share in the bank. Of that 57 percent, 42 percent is allocated to the bank's clients, 5 percent to its employees, and 10 percent to the public. It is not known when the program will be completed.

Divestment of shares from the regional rural development bank is an important step toward increasing private sector involvement in the microfinance sector. Still, as a token of its commitment to the sector, the Nepal Rastra Bank continued to hold 10 percent equity in all five banks, even after their privatization.

Between 1999 and 2005, the average number of inhabitants per branch rose from 36100 to 54000. Although every district has at least one bank branch, access is skewed toward the Central Region, where there is one branch for roughly every 50000 inhabitants compared with one for every 111000 in the Mid-Western Region. This regional disparity is mainly due to the fact that private commercial banks are concentrated in the Central Region, which contains 46 percent of their branches.

Private banks offer far better services than public banks. Many branches of public banks cannot offer the same range of products as their private counterparts due to lack of computerization. They also have very long delivery times. Moreover, none of the public bank branches offers electronic payment facilities.

## Microfinance and Services to Low Income Households

Nepal's formal microfinance institutions can play a key role in delivering financial services to low-income households. Yet many potential clients of microfinance institutions prefer to save with and borrow from informal sources. The microfinance sector's limited ability to serve low-income households is reflected in its narrow outreach, sluggish growth, high liquidity and low profitability.

The following points explain the unsatisfactory state of Nepal's microfinance sector:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

A. A complicated geopolitical environment.
B. Weak technical capacity in key areas, such as accounting and auditing, strategic planning, financial analysis, and human resource management.
C. Lack of commercial orientation and slow professionalization– mainly because microfinance is often considered a charitable activity.
D. Distortion arising from the government's deprived sector lending program that generates high liquidity among many microfinance institutions, as these institutions are encouraged to borrow beyond their needs and invest these low-cost funds in other financial institutions.

Although often cited as an obstacle, Nepal's legal and regulatory framework is not a binding constraint on the growth of the microfinance sector.

## Microfinance Institutions and Financial Services in Nepal

Microfinance institutions play a key role in providing financial services for low income households. Yet many microfinance clients prefer to save with and borrow from the informal sector. Financial NGOs and cooperatives, followed by microfinance development banks and regional rural development banks, are the largest providers of financial services for low income households. Still, many microfinance clients prefer to use the informal sector for deposit accounts and loans.

The reason is that informal providers offer products and services better suited to the needs of low-income households, that is, with quick availability and no requirement for immovable collateral. Low income households are much more likely than wealthier ones to have irregular incomes. In addition, many of their non-routine expenditures are for health care. Thus, they often require quick access to financial resources. Moreover, half of Nepal's low-income households cannot use their homes as collateral because they do not have required documents and because their dwellings are in a bad area, in poor condition, or both. Informal providers better serve the needs of such clients by offering faster services and requiring no collateral.

The limited ability of formal microfinance institutions to adequately serve low-income households is reflected in their poor outreach, sluggish growth, high liquidity, and low profitability. Although regulated microfinance institutions represent only the tip of the iceberg of Nepal's microfinance sector, they are broadly the representative of the sector, if not better performing.

Several factors explain the poor state of the formal microfinance sector in Nepal, including the complicated geo-political environment, weak technical capacity, lack of commercial orientation, and distortions arising from deprived sector lending policies. These factors affect the sector's profitability, which can be discussed under the following headings:

1. **Complicated Geo-Political Environment:** The geo-political environment of Nepal-- a mountainous country that has been experiencing conflict in past few years--poses significant challenges. The performance of many small farmers' cooperatives and financial NGOs and cooperatives has been severely affected by the political conflict and turmoil. The conflict has affected all formal microfinance providers, though to different degrees, depending on their location and ownership structure.
2. **Weak Technical Capacity:** Formal microfinance institutions suffer from limited capacity in key technical areas such as accounting and auditing, strategic planning, financial analysis, and human

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

resources management. This weak technical capacity clearly shows the sector's growth. Most microfinance providers face similar challenges: lack of professionally trained staff in technical areas, weak internal control systems, no internal or external audit mechanisms, inadequate management information systems, and low capacity for product development. In this regard, Rural Microfinance Development Center (RMDC) has provided crucial capacity building and "hand holding" support for its borrowers. It has limited resources for such activities. Significant additional efforts are required to build capacity in the sector– both for providers of_technical assistance to microfinance providers and for the sector itself.

3. **Lack of Professional and Commercial Orientation:** Lack of professional and commercial orientation of the sector hampers its profitability, and many stakeholders still recognize microfinance a charitable activity. By design, NGOs do not have profit motives. In addition, they tend to have weak governance structures due to lack of a clear ownership structure.
4. **Distortion arising from deprived sector lending policies:** Priority and deprived sector lending has led to high liquidity and distorted capital adequacy ratios among formal microfinance institutions. The balance sheets of Nepal's licensed microfinance providers have extremely high levels of liquidity with investments and liquid funds accounting for more than 20 percent of assets in all these institutions. This situation is particularly striking for microfinance and regional rural development banks and financial NGOs.

Such a high level of liquidity and loans is the result of the deprived sector lending window. In some cases, because commercial banks are uncertain about the capacity of some microfinance providers they lend to, they ask the providers to invest these low-cost funds in fixed deposits. The microfinance providers earn a profit on these investments; the interest rate margin is usually 2-3 percent.

5. **Low Profitability:** These various obstacles translate into low profitability in the formal microfinance sector. During the period of 2005, 8 of 20 financial cooperatives and 4 of 47 financial NGOs recorded profits over NRs 1 million. Despite central bank's reform program, just two of the five regional rural development banks recorded profits that year.

Overall microfinance development banks perform better than other microfinance providers. But they also have weaknesses that hamper their growth. Their management systems have not improved in line with their outreach and experience, and their accounting and internal controls should be strengthened. Accordingly, microfinance development banks have not been able to keep pace with international best practices in microfinance.

Moreover, supervision of the microfinance sector is not robust: institutions that pose no systematic risk are supervised while large ones are not, and supervisory capacity is very weak. Out of 76 microfinance institutions that the Nepal Rastra Bank currently supervises, 47 are financial NGOs, which account for only 3 percent of the deposits of regulated institutions. Some of these NGOs have fewer than 200 clients. Moreover, as noted, the regulated microfinance sector only represents the tip of the iceberg: there are a lot more microfinance players about which little is known. In addition, the institutions currently regulated are not adequately supervised.

## Microfinance Institutions (MFIs)

A microfinance institution is an organization that offers financial services to the low-income population. Almost all of them offer microcredit and only take back small amounts of savings from their own borrowers, not from the general public. Within the microfinance industry, the term 'microfinance institution' is used to refer to a wide range of organizations dedicated to providing these financial services. Such organizations include NGOs, credit unions, cooperatives, private commercial banks and non-bank financial institutions (some that have transformed from NGOs into regulated institutions) and parts of state-owned banks.

## Clients of Microfinance

The typical microfinance clients are low-income persons that do not have access to formal financial institutions. Microfinance clients are typically self-employed, often household-based entrepreneurs. In rural areas, they are usually small farmers and others who are engaged in small income-generating activities such as food processing and petty trade. In urban areas, microfinance activities are more diverse and include shopkeepers, service providers, artisans, street vendors, etc. Microfinance clients are poor and vulnerable non-poor who have a relatively stable source of income.

## Exposure of Microfinance in Nepal

Nepal is one of the poorest countries in the world, and the poorest in the South Asia region. Its poverty reduction rate is low. The main reasons for this low poverty reduction rate are: (i) low per capita income, (ii) concentrated urban growth, and (iii) high population growth rate. Out of a population of 29 million, 25% are in below the poverty line. Most of the poor people live in rural areas and have little opportunity. Microfinance can help poor people who have no collateral, but willingness to work and a desire to do some business activities from which they will acquire employment as well as income. Although many programs have been implemented for poverty alleviation in Nepal, only microfinance programs are seen as poor targeted and rural based.

In Nepal agro-based co-operatives were initiated in the 1950s as a first step in microfinance. Poverty alleviation rural based programs were initiated through the Small Farmers Development Program (SFDP) on a pilot test basis in 1975 by ADB/N. The success of the pilot tests in Dhanusa and Nuwakot districts encouraged policy makers to expand formal rural based microfinance programs.

SFDP is now being transformed into several autonomous, self-help organizations called Small Farmers Cooperatives Limited (SFCL) and these organizations are managed by farmers themselves. Other microfinance development programs, such as Priority Sector Lending Program (PSLP), Intensive Banking Programme (IBP), Production Credit for Rural Woman (MCPW) and Rural Self-Reliant Fund (RSF) have been implemented. After studying the pros and cons of various microfinance development programs the government began to rethink the delivery mechanisms of microfinance.

In 1992, the government set up two Grameen Bikash Banks as a replication of the Bangladesh Grameen model of microfinance delivery. The government also created a situation to encourage participation in the microfinance by the private sector. Subsequently, the organizations such as Nirdhan*, Centre for Self-help Development (CSD), Chhimek came into existence. Rural Microfinance Development Centre Ltd. (RMDC) was also established to support microfinance institutions by giving wholesale credit, ini-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

tiating training and other necessary support to MFIs. MFIs are dependent on small savings from group members. As a part of development finance microfinance is targeted at specific groups of people, falling in the lower bracket of society. Financial services include savings, credit and other services such as micromoney transfer and microinsurance. These services were differentiated by types of service employment and income orientated objectives, target group, target community, target area and credit at home.

In the past decade, microfinance has been recognized as a particularly effective development intervention for three basic reasons:

1. The services provided can be targeted specifically at the poor and the poorest of the poor.
2. These services can make a significant contribution to the socio-economic status of the targeted community.
3. The institutions that deliver these services can develop, within a few years, into sustainable organizations with steadily growing outreach. In this context, it is important to make a couple of distinctions:
    a. Microfinance is more than the provision of credit. It involves the provision of other financial services (most usually savings and insurance) and recognizing that even the poor have a variety of needs, not just credit.
    b. Securing sustainable access to microfinance for low-income communities involves building (or reforming) microfinance institutions- not just the delivery of time-bound microfinance programs (such as offering short-term revolving funds).

In Nepal there are a wide range of institutions active in the microfinance sector, each with its own way of going about the task of making financial services accessible to the poor. Some writers distinguish between the so-called informal and formal sectors, but given that many of the informal organizations are in fact registered societies, the preferred terms to use are community-based sector and institutional sector.

## The Regulatory Status of Microcredit Institutions

Microcredit institutions are regulated by various laws, such as the Nepal Rastra Bank Act (2002), the Agriculture Development Act (1967), the Cooperative Act (1972), the Finance Company Act (1985), the Development Bank Act 1996, the Social Welfare Act (1991), the Company Act (1947), the Financial Intermediary Act (1998) and the Insurance Act. It appears to be over regulated but in reality the situation is just the opposite. There is some difficulty to regulate all microcredit institutions because there are many MFIs established under different acts doing microfinance activities. The ultimate responsibility to develop, regulate, monitor and supervise is of NRB. NRB had issued regulations for the development banks which were engaged in microfinance, as a guideline to develop MFIs activities on 24th February, 2003.

NRB is going to issue an Umbrella Microfinance Act very shortly to streamline the regulation of microfinance. The issues were also discussed in the second National Microfinance Summit 2010. (Second National Microfinance Summit Declaration Feb 16, 2010)

## Regulation of Microfinance in Nepal

The microfinance sector in Nepal is regulated by the Priority Sector Lending Program, Financial Intermediary Act 1998, Development Banks Act 1995 and Cooperative Act (1972).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. **Priority Sector Lending Program:** The central bank (NRB) imposes 'priority sector' lending on commercial banks, which entails lending a certain percentage of their deposit liability to the deprived population. The ratio of priority sector lending has increased from 5% to 12%, of which, 0.25 to 3% must be invested in the 'deprived' sector, targeting at the poorest of the poor.
2. **Financial Intermediary Act 1998:** The NGOs providing microfinance services are registered under the Financial Intermediary Act 1998, which provides a limited banking license to NGOs. To date, fourty seven NGOs are registered under this Act and providing financial services.
3. **Development Banks Act 1995:** The two apex organizations as well as five Regional Micro finance Rural Development Banks (RRDBs) and four private rural microfinance banks are registered under Development Bank Act 1995. This Act was merged under Bank and Financial Institution Ordinance (BAFIO)-2004.
4. **Cooperative Act:** Cooperatives are regulated by the Cooperative Act and supervised by the Ministry of Agriculture, Department of Cooperatives. Out of various types of cooperatives, savings and credit cooperatives are providing microfinance services. There are 8000 registered Cooperatives of which 2700 are savings and credit cooperatives.

## Regulation of Microfinance Institutions

Bangladesh is the first country in South Asia to start a modern microfinance revolution. Bangladesh and Sri Lanka made impressive results in reaching out to poor borrowers, mainly women. Even in the socially conservative country like Afghanistan, association and involvement of women in credit programs are accepted. The Indian progress in microfinance is based on the Self-Help Group Model. In Nepal and Pakistan, microfinance institutions are more aggressively regulated.

## Challenges in Micro Credit Delivery in Nepal

Nepal has a varied topography at varied development stages, a mix of different cultures and different ethnic groups, which challenges the successful delivery of microfinance. The major challenges are:

1. Formulating a microcredit delivery mechanism that is better suited to the people in hills and mountains.
2. Successfully extending the outreach to the hills and mountains.
3. Redesigning existing programs of the formal MFIs to better target the poorest.
4. Unsustainable delivery mechanisms of government initiated MFIs and programs

## Improving Access to Financial Services in Nepal

Stable, privately owned financial sectors do not necessarily create inclusive financial systems as evidenced by international experience. Hence, governments have a reason to be concerned about expanding access.

Although this is a relatively new area of economic development, general consensus has been reached on the following issues:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

A. Every government is better placed to function as a facilitator rather than a direct provider of financial services. Facilitation involves creating an enabling environment and, if needed, supporting initiatives that can help private institutions increase access.
B. Any effort to expand access should address sustainability issues among providers of financial services -that is, help them profitably reach their desired market segments, rather than require them to lend to specific sectors or open branches in specific areas.

These principles have already been proven true in Nepal. Despite government efforts, regional rural development banks are the worst-performing microfinance institutions, and their branches remain concentrated in the Central Region. Meanwhile, as priority sector lending requirements have been reduced, banks have withdrawn from the sector,_and despite its high liquidity, the microfinance sector's loan portfolio is stagnating.

Priority sector lending, which seeks to increase access to credit by small business, is considered a burden by banks. Almost 40 years after such lending was introduced, banks are reducing it, as the Nepal Rastra Bank lowers requirements for it. Banks perceive priority sector lending as a sort of annual tax that they must pay to do business, as they are not equipped with the right products, procedures, and lending technologies to serve small business profitably.

Public banks are struggling with negative equity, and profitable private banks have few incentives to seek out new markets or develop product for new market segments. If left to their own devices, banks would probably develop appropriate lending methods for small business, but only after a few years as competition increases in the corporate and consumer segments.

## Capital Market and Regulation in Nepal

The main regulators of capital markets and intermediaries providing broker and dealer services for primary and secondary markets are the Securities Board, Nepal Rastra Bank (NRB), and Nepal Stock Exchange (NEPSE), a self-regulatory organization under the Securities Exchange Act, as amended. NRB is responsible for the supervision of securities market intermediaries (other than brokers) while the Securities Board is responsible for the supervision of NEPSE, the registration and supervision of stock brokers, and the granting of licenses to finance companies and others acting as issue managers, underwriters, market-makers, or portfolio managers. The Registrar of Companies, in conjunction with the Securities Board, is responsible for the supervision of prospectus and periodic disclosure documents filed by listed public companies. It should also be noted that the Insurance Board regulates the investment activities of insurance companies. Also, in many countries insurance companies have established subsidiaries to provide money management services or to engage in capital market activities normally provided by a securities broker-dealer. In Nepal, there is a need to establish a regulatory body to supervise private provident funds. It would appear advisable to establish an independent, self-funded, Financial Services Commission to regulate all non-bank financial services.

Under BAFIA, the Finance Company Act and the Banking Act; NRB supervises and regulates finance companies and commercial banks. In Nepal, these organizations are also permitted to provide investment banking type services (acting as underwriter and/or issue manager). In this regard, it is noteworthy that the risks associated with investment banking activities are quite different from those associated with commercial banking or the quasi-banking functions performed by deposit-taking finance companies. While such entities must also obtain a business license from the Securities Board to conduct capital

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

market activities, the Securities Board is not directly involved in off-site supervision, or the on-site inspections program which is administered by NRB. In obtaining a license from the Securities Board, however, certain minimum capital requirements must be met by anyone proposing to act as an issue manager, underwriter, market-maker, portfolio manager or stock broker.

## Barrier of Capital Market Development in Nepal

The development of the Nepalese capital market is important for several reasons. First, the primary or new issues market has the potential to provide a source of urgently needed long-term funding for the private sector. In order to avoid a mismatch in assets and liabilities, the banking sector should appropriately concentrate on short-term funding for business. Second, the creation of an efficient secondary market with prices determined in a fair and transparent manner would instill public confidence and facilitate the allocation of capital to its most productive uses. This requires that investors have access to accurate and timely information, improvement in the capital market infrastructure, and a more competitive environment in the delivery of financial services to issuers and investors. Third, capital markets can facilitate the privatization of state-owned enterprises in a manner that allows broad public participation and provides an ownership structure that will support long-term goals of the privatization program, including greater efficiency, transparency, sound corporate governance, good management practices, and increased revenues to the Government. Finally, strengthening the capital market could help reduce the current dependence on external finance supplied by international lending agencies. During the Inception Mission, the high cost of capital to private business enterprises was identified as a major constraint on private sector development. While there are many impediments to be overcome, it was widely believed that the further development of the capital market in Nepal could contribute to a more efficient allocation of savings, expansion of the private sector, and economic growth. This is in keeping with the findings of a recent IMF Country Report on Nepal. Thus, the IMF study noted that a well functioning capital market is important for Nepal to support the efficient channeling of private savings to investment, and facilitate the transition to indirect monetary control. While headway has been made through various reforms since the late 1980s, the capital market is still in an early stage of development with many structural weaknesses. At the very beginning of an emerging market economy, it is important that the Government create the right policy environment to facilitate the creation of a critical mass of financial instruments, issuers, and investors. The government can also create incentives for capital mobilization, remove impediments to private sector development, educate investors, and provide basic legal and regulatory reforms. Legal reforms must provide a securities law with adequate regulatory and enforcement powers to the government regulator. In Nepal, legal reforms are also necessary in order to harmonize the Securities Exchange Act with the Companies Act, the Banking Act and the Finance Company Act. Collectively, each of these acts, as well as the Provident Fund Act and the Insurance Act, has a significant impact on the development of the capital market, the securities industry, and institutional investment.

The following facts indicate hindrances to capital market development in Nepal:

A. Obstruction in relation to attracting foreign direct investment, mobilization of foreign as well as domestic capital, lack of investor confidence, restriction on foreigners to purchase shares in the local market, the non-liberal tax policy; shortcomings in accounting and auditing of non-financial companies.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

B. Inconsistencies in and overlapping of securities related legislation related to public issue of securities and continuing disclosure obligations of public issuers and collective investment funds and the inadequacy of some key provisions in securities legislation.
C. Inadequate and unstructured existing Nepalese securities legislation to meet the international standard. There are provisions in the Act which should be relegated to the Regulations, and there are important provisions of substance in the Regulations which should have been contained in the Act. There are also provisions that are duplicated in both the Company Act and Stock Exchange and the regulation which can create confusion and conflict.
D. The inadequate regulatory framework for non banking financial institutions (NBFIs), capital market activities including private pension funds, insurance companies, and bank trust services and venture capitals.
E. The inadequate legal provision to ensure prompt and complete disclosure on the part of directors and penal provisions for defaulters.
F. Absence of the securities investor protection fund for the protection of the investor.

For the capital market development, the followings actions need to be taken by the Government of Nepal and the private sector so that a critical mass of instruments, issuers and investors can be achieved.

Strengthen the legal and regulatory framework; encourage the development of full service investment banks and securities firms; link capital market development to privatization of state-owned enterprises; rationalization of tax policies towards capital formation and secondary market transactions; increase the quality and timeliness of information available to investors; improve governance requirements and minority shareholder rights; strengthen the capital market infrastructure; establish an efficient secondary market in government debt to provide a benchmark for the money and bond market; eliminate restrictions on foreign portfolio investment gradually; launch a country-wide investor education and awareness programs; and train regulator and market professionals.

## Role of Non-Bank Financial Institutions in the Capital Market

There are two types of non-bank financial institutions (NBFIs) that are important to the proper functioning of the capital market. The first are securities market intermediaries such as broker-dealers, investment banks or merchant banks which are involved in the mobilization of financial resources through the capital market to meet the financing needs of business enterprises and the Government. They are in direct competition with the traditional commercial banking function of taking deposits and providing loans. In Nepal, these functions are currently performed by deposit-taking finance companies and commercial banks. At the present time, there are no full service securities broker-dealers or investment banks in Nepal. The second type of NBFI acts in the capacity of a fiduciary in managing the money of clients, usually by investing in financial market instruments. These include contractual savings and institutional investors such as provident funds, insurance companies and collective investment funds.

There are a number of NBFIs and market practitioners that are essential to the operation of a capital market. These include brokers, dealers, and underwriters of securities, investment advisors, credit rating agencies and institutional investors in the form of investment companies, pension funds, and bank trust departments. The functions of a broker, dealer, or underwriter may be performed by specialised securities firms, investment banks, or by diversified financial firms offering a wide array of financial products (i.e., universal banks or merchant banks). Depending upon the legal framework, regulatory considerations,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

and institutional arrangements, individual financial institutions (i.e., finance companies and commercial banks) are able to offer both bank and non-bank financial services. From a public policy standpoint, it is important to keep in mind that there are different risk factors and potential for conflicts of interest that must be taken into consideration in the regulation of such diverse financial entities.

One of the obstacles to private sector capital formation is the failure to mobilize the extensive savings already available for investment in the capital market. This pent-up demand could be released if legal and institutional obstacles to investment in the capital market were removed. Resource misallocation has been encouraged by practices in the insurance industry and in the administration of the Employee Provident Fund, which has contributed to excess liquidity in the banking sector and a shortage of long-term funds to finance private business expansion through the capital market. Also, private provident funds operate without the benefit of a Private Pension Fund Act, which would encourage investment diversification to meet fiduciary obligations and avoid conflicts of interest. In an appropriate legal and regulatory environment, private pension funds could be expected to experience rapid growth over the next decade. This has been the experience in both emerging and developed markets.

Structural changes and regulatory reforms in the Nepalese capital market would promote increased capital mobilization and demand for securities through contractual savings and institutional investment.

## Information Disclosure Practices in the Nepalese Capital Market

In order to make effective, accurate and informed decisions, investors must have access to accurate and timely information. This is often not the case in Nepal. While banks, finance companies and insurance companies are perceived to provide meaningful information for investors on a timely basis, disclosure to investors is not adequate for many non-financial listed companies. It has been argued by some financial market analysts, leaders of private industry and independent authorities that a major reason why financial information is not presented correctly in disclosure documents is that the system of tax collection works against it. There are good grounds for believing this to be the case.

The lack of accurate and timely information is forwarded as an important reason why investors to a considerable extent have lost confidence in the stock market. In some cases, companies listed on the exchange may have ceased operations or at least are in non-compliance with reporting requirements to the Nepal stock exchange, Nepal Rastra Bank (NRB), the Registrar of Companies and the Securities Board.

In general, the quality of information available to investors in listed companies, or to financial institutions making loans to private limited companies or public limited companies is not adequate by international standards. Financial and investment professionals do not believe that they have access to timely and reliable information for the purpose of making investment or lending decisions.

The Nepal Stock Exchange should adopt appropriate policies, membership and fee structure to attract members outside Kathmandu, including introducing brokers that need not be present on the floor or carry customers' accounts. All types of securities firms, including broker-dealers, issue managers and full service securities firms should be eligible for membership. Following the enactment of the new Securities Law, listing rules should be amended to ensure that an adequate number of shares are available to public investors. Inactive securities should be de-listed or traded on the second section of NEPSE. Listed companies not meeting periodic disclosure requirements or holding annual meetings should be de-listed. Under the new Securities Law, over-the-counter trading in securities should be permitted. Also, the private placement of securities should be clearly defined. The tax system should be simplified

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

and rationalised (i.e., equal tax treatment for dividends and interest on private and the government debt securities and bank deposits) to encourage private sector capital formation.

There should be no capital gains tax on securities transactions to encourage long-term investment through the capital market. Listed companies displaying good corporate governance practices should receive a lower corporate tax rate (i.e. 5 or 10 percent lower) than other companies. The Ministry of Finance (MOF) and NRB should prepare a paper considering options for the establishment of a secondary market in government debt instruments to enhance pricing efficiency and provide a benchmark for private issuers of debt securities. The government should foster the development of money and bond market for private issuers of securities. In order to prepare for privatisation, a level playing field in the conduct of the insurance business should provided for. Restrictions on foreign direct and portfolio investment should be reviewed with a view to the elimination of unnecessary impediments. The government should review existing restrictions on foreign portfolio investment to determine the speed at which such restriction can be liberalized. The time table for opening a local capital market to foreign investment should be established. In order to foster international best practices in securities regulation and enforcement, the Securities Board should join the International Organization of Securities Commissions (IOSCO). This should be done prior to the opening-up of the Nepalese stock market to foreign portfolio investment in order to facilitate international co-operation in enforcement.

Improve corporate disclosure and transparency. Strengthening public company disclosure by streamlining a regulatory process and granting clear authority to the Securities Board to administer a disclosure program and suspend listed companies for non-compliance. Amend securities law and companies act, as appropriate, to eliminate duplication of work effort and to transfer initial and periodic disclosure supervision to the Securities Board.

Amend the securities law to grant Securities Board clear enforcement power regarding disclosure by public companies and compliance with listing standards.

At the current level of development of Nepal's financial sector, banks and finance companies do not have sufficient power to demand high quality financial information from potential borrowers. At the same time, investors in the capital market in some instances do not have access to accurate and timely information. This has resulted in a high cost of capital to the private sector in the form of bank loans where spreads are traditionally wide. Also, the capital market has not been able to achieve its full potential in mobilizing capital for the private sector development or in the privatization of state-owned enterprises.

Furthermore, the accounting and information systems at many state-owned enterprises have hindered effective management of those enterprises and has slowed the process of privatization. In order to correct this problem, it is essential to improve the quality of information available to investors, lenders, and the government. In order to do this effectively, it will be necessary to have comparable disclosure, accounting, and audit standards for (i) listed companies, (ii) private limited companies and public limited companies seeking credit from banks and finance companies, and (iii) state-enterprises owned by the government. In the short run, improving information and disclosure may increase the cost of doing business but in the long run it can be expected to reduce the cost of capital to the private business sector and the Government. Indeed, the urgent need to approve accounting and audit standards was recognized by the Government with the enactment of the Chartered Accountants Act of 1997.

There is a perception that private commercial banks, finance companies, and insurance companies have a better track record concerning disclosure to investors than those enterprises operating in the non-financial sector. This may be due at least in part to the fact that the financial institutions are required to produce higher quality financial reports in order to adhere to the prudential and reporting standards of

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the regulatory authorities. Also, deposit-taking financial institutions are subject to on-site inspections by NRB on a periodic basis and on-going off-site monitoring. Furthermore, many of the finance companies and all private commercial banks are joint venture firms that are accustomed to the discipline of meeting international accounting standards. Finally, the financial regulators require that audited reports be produced on an annual basis by a qualified auditor. Failure to comply with this requirement could result in the loss of their business license.

## Transparency in Corporate Reporting

Today the minority of shareholders and other stakeholders are demanding a much higher level of transparency and are no longer easily satisfied. The Securities Board must therefore recognize that transparency is necessary to create and protect share value.

Investors must bear the responsibility for understanding and analyzing the information they use while making judgments about risk and return. Should they not find the full information required they should refrain from such investments or hold only themselves accountable for their decisions? The answer to this question is yet to be identified.

## Legal Framework on Dividend and Share Prices in Nepal

The consistent declaration of dividend exhibits the profitability and financial strength of the company. The dividend policy followed in between is vital for the company, especially those planning to be listed on the stock exchange. The steady dividend definitely assists the company to penetrate the stock market and generate cash through public issues. Dividend, to the companies already listed, is the foremost tool to measure the value of its share. It is not important whether the dividend is paid or not, but the declaration of dividend is the key word of whole gambit. The payment or nonpayment of dividend does not affect the creditworthiness of firm. The timely payment of dividend increases the attraction of investors affecting positively in the capital market, whereas the non-payment of dividend means the indirect reinvestment of the retained earning which ultimately is beneficial to investors.

## Present Regulation on Dividend Policy in Nepal

Following are the relevant provisions made by various regulations and directives regarding dividend:

Nepal Rastra Bank Act, 2012, section 32 (1) (a)

The section authorizes the bank to put ceiling in the payment of dividend by commercial banks and finance companies. This we can take as authoritative provisions.

Nepal Rastra Bank Directive No. 13:

This directive requires certain conditions to be complied with by finance companies before the distribution of dividend as under:

1. that shares taken by the promoters are fully paid

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. That the share capital as stated in the memorandum and articles of association is issued to the public and listed in the Stock Exchange Market.

## Finance Company Act, 2042

As per the Section 29 of the Act, a finance company, before declaring dividend, is required to transfer to the reserve fund, out of its net profit a sum not less than the amount as stated under:

Where the amount in the reserve fund is less than 50% of its paid up capital, then the amount to be transferred to reserve fund is not less than 50% of the net profit, and

Where the amount in the reserve fund is more than 50% of its paid up capital, then the amount to be transferred to the reserve fund is not less than 25% of the net profit.

## Commercial Bank Act, 2031, Section 18

The section requires compliance with before the declaration and distribution of the dividend by the commercial bank as under:

- That adequate provision is made for the preliminary expenses not yet written off and accumulated losses of the previous years,
- That, provisions of loan loss, capital adequacy ratio, transfer of profit to reserve fund etc. are complied with the first.

## Companies Act 2063, Section 140

This section contains the provision regarding the post declaration of the dividend as under:

Excluding the cases stated as under, a company is required to pay the dividend to its shareholder within forty days of declaration of dividend.

- Where any law prohibits for the payment of the dividend.
- Where the right to receive the dividend is disputed.
- Where the dividend could not be paid because of a natural cause.

If the dividend is not paid within forty days of declaration of same, it is to be paid with interest as prescribed.

## Banks and Financial Institutions Act 2063

Banks and Financial Institutions Act (2063) has replaced the Agriculture Development Bank Act, 2024; the Banijya Bank Act, 2031; the Finance Company Act, 2042; the Nepal Industrial Development Corporation Act 2046 and the Development Bank Act, 2052. The section 46 of the Act requires the compliance with the following provisions before banks or finance institutions declare or pay the dividend to shareholders:

- That provisions for all preliminary expenses, accumulated previous years losses, risk assets are made.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- That the minimum capital fund as prescribed is maintained.
- That the statutory transfer to general reserve fund complied and
- That the shares appropriated for issues to the general public is issued and fully paid up.

Apart from the compliance with above provisions, banks or financial institutions are required to obtain prior approval from the Nepal Rastra Bank before the dividend is declared. The dividend should be paid only out of the realized profit. The notional profit, revaluation reserve should not be taken in account of the dividend purpose. Most importantly, the dividend should be paid only on the fully paid shares.

## Government's Long Term Plan Regarding Capital Market Development in Nepal

The Tenth Plan (2002) document of the Government of Nepal has mentioned that the long-term approach of the capital market in Nepal is to avail financial resources for infrastructure development in the area including roads, electricity, communication, water management etc. by granting the opportunities to the general people in the share ownership of such developmental activities and institutions. The plan has further expressed its hope that the Nepalese Stock Exchange Market would be widened and broadened in such a way that at least five percent of the total population would be counted as real investors. The plan has also added that total transactions in the market share of institutional investors would be raised to a minimum of 25 percent of GDP.

1. In the Tenth Plan it has been clearly stated that the government is committed to create opportunity for a number of people to reap benefits from the return obtained by directing investment in income generating portfolio of assets.
2. The Plan has pursued some objectives to develop the capital market in the country. This include the following:
    a. The participation of the general public would be raised through the medium of the stock exchange in projects with the private sector involvement and the rate of return would be made available to them.
3. The quantitative targets set by the plan in terms of the capital market can be expressed as: The number of people investing in the share capital of organized institutions would be raised at least to three percent of the total population of the country.
    a. Organized institution to raise Rs.7 billion through primary issues.
    b. The amount of transactions in the secondary market to reach Rs.12 billion.
    c. The value of capitalization in the stock market to reach 15 percent of GDP.
    d. Additional 40 companies to be listed in the stock exchange market.
4. The Government of Nepal has stated that the following strategies would be adopted to accomplish the stated objectives of the capital market:
    a. The security exchange market would be modernized
    b. The regulatory system of the security exchange market would be made effective.
5. The policy adopted by the Tenth plan relating to the capital market:
    a. It has been stated that effective regulatory norms related to the organized sector and the capital market would be established as a measure to protect the interest of investors.
    b. Allocative and operational efficiency of the capital market would be enhanced.
    c. The stock market would be made transparent and reliable.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

6. The Tenth Plan of GON has emphasized the following framework of the program and the implementation mechanism:
   a. One window system would be established for the public issue through the Security Board.
   b. Ownership change would be made instantaneously just after the dealing of security.
   c. A simple method would be developed for the share issuance and dealings of the public enterprises which have been privatized.
   d. A permanent committee would be constituted encompassing the agencies i.e. the Ministry of Finance, The Nepal Rastra Bank, The Security Board, and the Insurance Board, for developing a healthy and competitive financial market in a coordinated way. This would ensure the development of regulatory agencies for future. The secretariat of the Committee would be in the Security Board.
   e. Based on feasibility studies, stock exchange facilities would be expanded into other regions enabling savers of those regions to deal in such markets.
   f. The regulatory benchmark would be established for the Security Board and the Nepal Stock Exchange.
   g. Arrangement would be made to publicize procedures in different aspects relating to stock exchange activities.
   h. A code of conduct would be in place for the employees of security market and also for the director, manger, auditor, advisor of organized enterprises and security dealers.
   i. Institutional arrangement would be in place to impart training on several aspects of the capital market including regular study and research.
   j. In order to check persons to take undue advantage out of dealing of securities and having access on unpublished sensitive information a sever penalty clauses would be enacted.
   k. While privatizing, government enterprises shares would be sold through the Security Market to the maximum possible extent.
   l. The Nepal Security Exchange Market would be privatized in the process of modernization and would be developed as a self-regulatory agency adopting the good governance practices.
   m. The security deposit system would be established to save investors from possible forgery and fraud in security dealing and for the immediate ownership transfer system of the securities dealing.
   n. In this issue, some provisions have been made in the Securities Act.
   o. The investor's security fund would be established to save the investors against the possible loss through the security brokers or to minimize the loss and risk.
   p. A legal system would be made to enable the dealings of government debenture and the collective saving program suitable for various investing groups.
   q. Arrangement would be made to enable the dealings of government debentures through the security market thereby presenting the benchmark for returns and increasing liquidation.
   r. Legal reformation and the development of an investment regulatory system, having security regulatory sectoral-right, would be pursued to encourage the incoming of contractual savings in the capital market.
   s. Arrangement would be made for annually submitting 'compliance report' to confirm whether the securities issuing organized security dealings have complied with the act, law, rules or not.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

t. The process of entrance and exit of security dealers would be made simple through the adoption of prudential norms.
u. The Necessary regulation of the capital market, market conduction, manpower development as well as educational training and information for investors would be provided.
v. The gradual automation of the dealings of the security exchange market would be carried on, on the basis of feasibility.
w. Developing procedures would be developed having the facility to conduct dealings from the local level and the OTC market would be established through the expansion of floor trading existing centrally.
x. The central deposit system would be instituted and applied to make the clearance of security account transparent and prompt as well as for the settlement, (Tenth Plan of the Government of Nepal, 2003-2007).

## Financial Markets and Institutions in Nepal

A financial market is a market in which financial assets (securities) such as stocks and bonds can be purchased or sold. Financial markets facilitate financing and investing by households, firms, and government agencies. The main participants in financial market transactions are households, business (including financial institutions), and governments that purchase or sell financial assets. Financial markets facilitate the flow of funds from surplus units and to deficit units. Those financial markets that facilitate the flow of short-term funds (with maturities of less than one year) are known as money markets, while those that facilitate the flow of long-term funds are known as capital markets. Securities with a maturity of one year or less are called money market securities, whereas securities with the maturity of more than one year are called capital market securities. Money market securities generally have a higher degree of liquidity (can be liquidated easily without a loss of value). However, capital market securities are typically expected to generate a higher annualized return to investors.

The Securities Board, NRB, and NEPSE are the main institutions regulating capital markets and intermediaries. Under the Finance Company Act and the Banking Act, frequent supervision of finance companies and commercial banks is performed by NRB. While the responsibility of Securities Board is to supervise the activities of NEPSE, the registration and supervision of stockbrokers, and the granting of licenses to finance companies and others acting as an issue manager, underwriter, market-maker, or portfolio manager. Under the Securities Investment Trust Act of 1997, the Securities Board is also responsible for the registration and supervision of investment funds. The Registrar of companies, in conjunction with the Securities Board, is responsible for the supervision of prospectus and periodic disclosure documents filed by listed public companies. The Insurance Board of Nepal regulates the investment activities of insurance companies.

## Nepal Rastra Bank (NRB) as a Capital Market Regulator

Under the current regulatory scheme, the supervision of finance companies and commercial banks acting as a underwriter, issue manager, market-maker or portfolio manager are supervised by NRB, which includes the administration of prudential standards, financial reporting, off-site monitoring, and on-site inspections for compliance with applicable rules and regulations. NRB is also responsible for the overall supervision of commercial banks and finance companies, including their activities in the markets for

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

treasury bills and government securities. Since, finance companies and banks are permitted to underwrite the securities of private issuers, the central bank plays a significant role in the supervision of the establishment of prudential standards, intermediaries engaged in investment banking (issue managers and underwriters) and other capital market activities. At the present time, the Securities Board does not participate in the NRB's program to inspect and monitor the financial conditions of finance companies and commercial banks that are licensed to conduct capital market activities (GMA Capital Market Ltd., 2000) .

## Securities Board Nepal as a Regulator of the Capital Market

The Securities Board of Nepal (SEBON) was established on 26 May 1993 under the provision of the Securities Exchange Act 1983 (first amended). It was established with the objective of promoting and protecting investors by regulating the securities market. Besides the regulatory role, it is also responsible for the development of securities market in the country. The main objectives of the Securities Board Nepal is to promote and protect the interest of general investors, to supervise and monitor the activities of the Nepal Stock Exchange and other related firms carrying on securities business and to render contribution to the development of the capital market by making securities transactions fair, efficient, healthy, and responsible.

Currently, SEBON is focusing on improving corporate governance, improving policy and procedures to make securities markets more attractive to private and closely-held corporate houses, enhancing professionalism of securities businesspersons, and developing a clear regulation for merchant banking business. The other prioritized works of SEBON include increasing market access to investors by upgrading market services, promoting debt markets by developing a clear regulation for a debenture trustee, introducing necessary provisions for the transferability of rights, and developing required regulations for mutual funds, (Annual Report SEBON, 2007/08).

## Major functions of the Securities Board, Nepal

- To advise the government on the issues related to the development of the capital market and the protection of investors' interest.
- To approve the stock exchange for the operation and oversee them for healthy trading of securities.
- To regulate and register market intermediaries involved in the primary issue as well as in the secondary trading of securities.
- To regulate public issues of securities including the mutual and trust funds.
- To monitor and supervise the securities transactions.
- To conduct research and studies in the areas of capital market.

## Financial Institutions in Nepalese Securities Market

Commercial banks are the important financial institutions in the economy. They are the vital medium for monetary policy transmission. The stability and profitability of commercial banks depend on the sound management of their assets and liabilities. Thus, the aim of every commercial banks management is to optimize the portfolio of assets and liabilities with regard to its specific business policy, (NRB Economic Report, 2003/04). Commercial banks are performing the key role in the Nepalese securities market.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

'Among the 56 companies classified under group 'A', commercial banks hold 19.64% of 'A' group, which is, 11 in number. In the FY 2005/06, out of the total paid up capital Rs.20008.55 million recorded in NEPSE, commercial banks hold 42.60% weight. Regarding the annual turnover, out of total annual turnover Rs.3451.43 million transacted in NEPSE, commercial banks weight has been recorded 78.12%. Similarly commercial banks have contributed 70.96% of total market capitalization value of Rs.96813.74 million recorded in NEPSE transaction, in the FY 2005/06, (Annual Report SEBON, 2005/06).

Finance companies are mushrooming in Kathmandu Valley, whereas, their presence out of the Valley is very thin, (NRB Economic Report, 2003/04). Among the 56 companies classified under group 'A', finance companies hold 57.14% of 'A' group, which are, 32 in number. In the FY 2005/06, out of the total paid up capital Rs.20008.55 million recorded in NEPSE finance companies hold 12.82% weight. Regarding the annual turnover, out of total annual turnover Rs.3451.43 million transacted in NEPSE the weight of finance company has been recorded 8.86%. Similarly, finance companies have contributed 5.17% of total market capitalization value of Rs.96813.74 million recorded in NEPSE transaction in the FY 2005/06.

As of February 2014 as per the report prescribed on (nepalstocks.blogspot.com), Nepal Stock Exchange has classified altogether 130 companies as ´A´ class companies at the country´s sole bourse. NEPSE has been classifying listed companies since fiscal year 1996/97 as per the Securities Listing Bylaws 1996. At present there are 230 listed companies in NEPSE. In the last fiscal year, 120 companies were categorized as class ´A´ companies. As per the bylaws, only the companies having minimum paid-up capital of Rs 20 million and at least 1,000 ordinary shareholders can be categorized as class ´A´ companies. Likewise, they should have posted profit for three straight years. Also, the book value of their share should not be less than the paid-up value. Similarly, only those companies submitting their particulars of business and statements of income and expenditure of the concerned financial year within six months of the completion of the fiscal year can be categorized as class ´A´ companies. Like past year, banking and financial institutions have dominated the list of the ´A´ class companies. Twenty-five commercial banks, 58 development banks and 27 financial institutions have made it to the elite list. Similarly, 14 insurance companies and three hydropower companies have been categorized as class ´A´ companies. The list also includes one company each from Manufacturing and Production, Others and Hotel sectors. Thou the categorization of the companies are done on the basis of analysis and performance of the company, some stock investors and analysts does not fully agree to this categorization method.

## The Primary Securities Market and Legal Arrangement

The primary market allows issuance of new securities helping the issuer companies to raise funds for starting new enterprise or for expansion and diversification of the existing ones. Normally, securities once issued get listed in the Stock Exchange enabling securities holders to dispose them at their convenience. Attraction for investing in new securities is interlinked with the liquidity provided by the stock exchange. The primary market is characterized by the overwhelming presence of retail investors and a very small role of institutional investors. This may be attributed to the limited size of the new issue market and non-availability of risk financing and merchant banking type of intermediary institutions to support the growth of the market, (Kafle, 2004).

The public issue activities through the primary market are regulated by the "Securities Exchange Act, 1983" and the regulation and guidelines made under the act as well as the Companies Act 1997". The related regulations and guidelines are "Securities Exchange Regulation, 1993", Securities Regis-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

tration and Issue Approval Guidelines, 2000", "Issue Management Guidelines, 1997", "Bonus Share Issue Guidelines, 2002" and "Securities Allotment Guidelines, 1997". Similarly with the objective of providing the public issuance related services to the issuing companies in a professional manner, a mandatory provision has been made that the issuing company must take the services of issue manager registered in SEBON.

## The Impact of the Changing Capital Market Structure

The changing structure of a capital market has had some positive impact on the volatility, liquidity, and transaction cost.

## Volatility

Volatility plays a key role in assessing the risk/return trade-offs and forms an important input in asset allocation decisions. It is widely accepted that large fluctuations in market returns carry important negative effects on risk-averse investors. Besides, they have important economic implications, especially for the overall domestic investment, and for the flow of funds from abroad. Volatility is caused by a number of factors ranging from technical or short-term to fundamentals. Several macroeconomic variables like inflation, money supply, interest rates etc. also affect the movements in share prices directly or indirectly. The market microstructure too wields influence on volatility.

## Liquidity

One of the most important outcomes on the equity market, particularly from the viewpoint of economic policy, is stock market liquidity. The term 'liquidity' is related to transactions costs. A liquid market is one where transactions can be done with low transactions costs.

## Transaction Costs

Transaction costs have a significant bearing on returns as they can substantially affect the national gains from investments. Transaction costs also impact volumes and volatility and reduction in trading cost could induce the investor to trade more frequently leading to increased volumes. The empirical evidence suggests that increased trading volumes by increasing liquidity results in reduction in volatility. Transaction costs apart from including explicit cost, such as brokerage fees, etc. also include some implicit components, such as market impact cost, clearing and settlement cost arising due to counter party risk, paper work cost and bad delivery, etc. despite the growing popularity of stock markets during the eighties and the first half of the nineties, the transaction costs were high due to physical movement of papers, bad deliveries due to existence of securities in physical form, less transparent method of trading, etc. Changes in the market microstructure, such as automated trading, dematerialization. Increased liquidity, guarantee of trades and increased competition in the supply of brokerage services and resultant reduction on brokerage fees have brought about a significant reduction in transaction cost. The transaction cost in India now compares well with that in the best markets of the world. Reduction in the transaction cost is an excellent signal of improvement in the overall market efficiency and capital market growth.

## The Nepalese Securities Market: Regulations, Trends and Challenges

The development of the securities markets is part of the development process of the overall economy. All countries with effective securities markets have the opportunities of attracting foreign players thereby increasing the level of foreign investment. It is a pathway to increased foreign investment. It would not be surprising if we came to find out that the investment of German-based companies listed in the New York Stock Exchange (NYSE) is higher than that of the American companies themselves.

When we look at the security market of Nepal, the only security we can think of its stocks. Our security market is still at a primitive stage and has to be improved in order to develop the capital market of the country. Publicly traded companies do not only run efficiently with higher economies of scale but also provide a framework for healthy and disciplined corporate governance. This further enhances the need for development of the security market and strengthening of the capital market.

It has already been explained that the Nepalese securities market mostly consists of publicly traded stocks. Therefore we can analyze the security market by looking at the trend in the Nepal Stock Exchange. It is disappointing to know that the NEPSE index has been showing a downward trend for quite a long period now. Due to the lack of corporate discipline, many companies have also been de-listed from the stock exchange. The stock trade volume also decreased which implies that the investors' confidence in the security market is decreasing.

Security exchange regulations were initiated in Nepal a decade after implementing the Security Exchange Act, 1983. In the same year, The Security Exchange Board Nepal (SEBON) was also established to promote and protect investors by regulating the security market. Apart from that, SEBON is also responsible for the development of the security market. To get the investors' confidence it is necessary to make the securities market healthy, transparent and efficient and with this view the government has provided SEBON with various authoritative powers. To make SEBON's operations more effective, the second amendment of the Security Exchange Act has brought the security market intermediaries under the jurisdiction of SEBON. This has made it mandatory for the security traders (brokers) to register with SEBON before starting security business and to submit their statements of financial and trading activities.

SEBON has been supervising the stock market since its establishment in 1993. Its supervisory role has wider scope and extends from the maintenance of company transparency to the monitoring of brokerage firms. A company that does not fulfill the requirements placed by SEBON is delisted from the stock exchange due to the failure to comply with the rules and regulations of the governing body.

Actions taken against companies that do not comply with the guidelines are some of the measures taken to protect investors. In the same manner, SEBON has also rated the listed shares in order to provide investor with more insight of the stock market. Though in other countries, private companies do the ratings after a detailed analysis, SEBON has been doing this under the provision of the Securities Listing Bylaws, 1996. Under this law, stocks are rated "A" if the company:

1. Has been profitable for the past three years,
2. Has a book value of shares more than the paid up value,
3. Has submitted financial reports within six months of the closing of the fiscal year,
4. Has paid-up capital worth Rs. 20.00 million,
5. Has at least 1000 shareholders, and
6. Has floated shares to the public as per the Security Listing Bylaws, 1996. If any of these provisions are not met with, the shares are rated B.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Why has the security market not flourished despite these measures? The current law and order situation of the country, economic slackness, inadequate private sector development, and low level of internal savings have adversely affected the security market. Apart from this, there are many other factors creating hurdles in the expansion and development of the security market. Implementation of the corporate and financial governance project has also been delayed. The governance system would enhance the institutional capability of SEBON. Another important factor is the limited size of the market due to the lack of policies regarding the promotion of public issues. The modern sectors of the country such as telecom, airlines, roads, hotels etc. are also under the government and private ownership, which has further limited the market. Public issues of such sectors would create wider choice for investors. Lack of infrastructure, the backbone of a well functioning capital market, is another prime reason. Unless necessary measures are taken to develop the existing unutilized resources (like standard audit systems, investment advisors etc.) and to introduce unavailable resources (like credit rating agencies, e-trading facilities etc.), we cannot intensify the development of the capital market. Lack of institutional investors, and professionalism, concentration only in stock markets security trading only in the capital city etc. have also laid back the development process. Lack of coordination between SEBON and other regulatory authorities while formulating policies that affect the security market is further hindering this market.

A good capital market is an essential requirement to give a better shape to our economy. Thus it is necessary to take various measures that can enhance the development process of the capital market. All the above mentioned drawbacks have to be looked upon and settled to create a strong capital market. Stability in the political situation and a good law and order situation are essential for the growth of the capital market. The infrastructures to promote the stock market and other securities have to be improved. Market expansion to other cities to accumulate the savings from investors in different regions is also essential to promote the security market. Creating regulatory jurisdiction for public issues from various regulatory authorities to a single authority will also promote the security market. Membership in the International Organization of Securities Commission (IOSCO) could help in getting information and new development practices. Collecting sufficient resources and getting the membership in IOSCO are urgent needs for developing the security market in Nepal.

## The Primary Securities Market in Nepal

Securities available for the first time are offered through the primary securities markets. The issuer may be a brand-new company or one that has been in business for many years, whereas in the secondary market, existing securities are simply being transferred between parties, and the issuer is not receiving any new fund. After their purchase in the primary market, securities are traded subsequently in the secondary market.

The primary market for securities is the new issues market which brings together the supply and demand or sources and uses for new capital funds. In this market the principal source of funds is the domestic savings of individuals and business; other suppliers include foreign investors and governments.

The principal uses of funds are: the long term financing of the investment in housing, the long term investment of corporations and other business, and the long-term borrowing of the government.

In a highly developed capital market by far the largest proportion of individual's savings reaches the new issues market indirectly via a financial intermediary. Moreover, most individual investors are unfamiliar with the new issues market and its institutions, such as underwriters and selling syndicates which serve as middlemen between the corporate demanders of funds and the individual investors and

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

financial institutions which supply the funds. To most investors the term securities market is synonymous with the stock exchange.

## Investment Banking and Broker-Dealer Services

The functions of a broker, dealer, and underwriter are essential to the efficient operation of the money and capital market. In Nepal, there are no full service securities firms or investment banks. Stock brokers are small in size. There are not many branch offices outside Kathmandu Valley. Investment banking services are provided as an adjunct to other financial services provided by finance companies and to a more limited extent by commercial banks.

In Nepal, the functions of a broker and dealer have traditionally been separated in order to avoid the potential for conflicts of interest. While well intentioned, this approach to regulation has resulted in a highly segmented financial services industry. Under the securities law, broker, market-makers, dealers, issue managers, and underwriting services are defined. Furthermore, the Securities Board requires a separate license for each of the five types of broker-dealer activities. Under the current regulatory framework, a broker may only perform the function of a broker and firms engaged in the other four defined categories of securities activities may not act as a broker on the stock exchange. As a result, Nepalese finance companies are able to perform the relatively risky functions of a market-maker and underwriter but they are precluded from taking on the less risky function of acting purely as a broker, buying and selling stock on behalf of customers. This is because the functions of broker and dealer may not be combined. As a result, finance companies have chosen to perform the function of underwriter rather than act as broker on the floor of the stock exchange. At the present time, the broker can only participate in the new issues market by collecting application forms from potential investors on behalf of issue managers in return for a commission.

The complete separation of the functions of a broker and dealer has not allowed for the development of diversified securities firms which can offer a full range of broker, dealer, and investment banking services to meet the needs of issuers and investors. Furthermore, the brokerage business is not economically viable as a standalone business at the present time due to the low transactions volume of recent years. Since a stock brokerage firm may not perform the economic function of an issue manager or underwriter, this has limited the ability of brokers to participate in the distribution of securities in the new issues market and has resulted in the artificial separation of the primary (i.e., new issues market) and secondary market in securities. As a result, the stock market is deprived of additional potential sources of liquidity. While full service securities companies should be encouraged to develop in Nepal, individual brokers should not be permitted to perform the function of both broker and dealer in the same security. This is necessary in order to avoid potential conflicts of interest and possible attempts at market manipulation. Thus only securities companies with adequate capital and appropriate regulatory safeguards in place (i.e., compliance officers and adequate accounting and information systems) should be permitted to perform the functions of both broker and dealer. The Securities Board should also require that NEPSE develop appropriate guidelines for securities companies performing the dual function of broker and dealer.

The mobilization of savings for investment in productive sectors requires a more competitive and innovative financial sector. Government policy actions should encourage the development of financial service firms such as investment banks or full service securities firms that will perform the essential economic functions of broker, dealers, investment bankers, money managers, and related capital market services. It is essential to consider the role of existing institutions in the financial sector along with the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

possible need for new business entities such as diversified securities firms that might provide a full range of capital market services for the Nepalese economy. Also there is a need to allow for the creation and licensing of introducing brokers to service areas outside Kathmandu.

## Roles of Investment Bankers in the Securities Market

Billions of dollars worth of new securities reach the market every year. The traditional middleman in the primary market is called an investment banker. The investment banker's principal activity is to bring sellers and buyers together, thus creating a market. He normally buys the new issue from the issuer at an agreed upon price and hopes to resell it to the investing public at a higher price. Usually a group of investment bankers join to underwrite a security offering and form what is called an underwriting syndicate. The commission received by the investment banker in this case is the differential or spread between his purchase and resale price. The risk to the underwriter is that the issue may not attract buyers at a positive differential.

## Stock Market Liquidity

Turnover to market capitalization and turnover to the GDP ratio are two main indicators of market liquidity. Increased transaction costs are believed to make the market illiquid. In developing countries capital markets are not competitive comparable to goods market. This is mainly due to market imperfection resulting from government intervention in the financial market, a limited number of market participants, mismatch of demand and supply of securities, etc, as a consequences stock market fluctuation is a common feature in Nepal. The frequently changing price effect is fully-reflected in the turnover and market capitalization value. The term 'liquidity' in the stock market is quite different than financial liquidity or economic liquidity. It says that not only the adequacy of capital denotes the market in state of liquidity but also the willingness and ability to purchase the securities is equally required. Furthermore, the promptness of changing hands of securities or converting them in terms of cash denotes the degree of liquidity. The stock market also imparts liquidity to securities holders. (Paudel,2010).

Liquidity is one of the important factors to investors. This offers an opportunity for investors to invest in long-term ventures, while the market also enables them to convert their securities into liquid cash before the maturity of the project. The liquid stock market makes the investment less risky and more attractive. It encourages savers to invest in long-term projects, because they can sell the security quickly and easily if they want to get back their savings before the project matures. Stock market liquidity is positively and robustly correlated with contemporaneous and future rates of economic growth, capital accumulation and productivity growth.

In terms of securities, liquidity may be measured by the size of the spread between the bid and asked prices, with smaller spreads suggesting greater liquidity. Furthermore, it is reasonable to assume that many investors would find more liquid securities to be more attractive, keeping everything else the same.

An efficient capital market is a market that channels liquid capital quickly to where ever it will do the best. In a general term liquidity is defined as funds or money available for investment or an asset is said to be liquid that can be converted into cash readily. The term liquid asset is used to describe money and assets that are readily convertible into money. Different assets may be said to exhibit different degrees of liquidity. Money itself, by definition, is the most liquid of assets; other assets have varying degrees of

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

liquidity. Depending on the ease with which they can be turned into cash. For assets other than money, liquidity has two dimensions: (a) the time necessary to convert the asset into money and (b) the degree of certainty associated with the conversion ratio, or price realized for the asset. It refers to those assets that can be converted into cash immediately like banks deposits, treasury bills, national saving certificate, shares, bonds, debentures, gold, foreign currencies. The safeguard and the fair return on investment define the size of liquidity. According to various researchers and studies the money market is in the state of excess liquidity and the main challenge is to the utilization of available resources or liquid funds in a productive sector. When the fund freezes, opportunities for investment are minimum and limited, and it supports to promote liquidity. However, in Nepal there are opportunities and likelihood but no effective steps are taken. As a result, such capital is being more and more passive on the one hand and losing the hope of economic development on the other. As a result investors are in "wait and see" position. For example, the Taragoan Regency Hotel Ltd. issued primary shares of Rs. 160 million and Rs. 260 million was collected within a week. Likewise, the Hotel Raddision issued primary shares of Rs. 125 million while there was a collection of Rs. 710 million, which is nearly six times more than required. In April 2010, the Agricultural Development Bank Nepal has issued primary shares nearly of Rs 1 billion, and about 3 times has been collected. The aforementioned examples demonstrate that the huge amount of capital is seeking better investment opportunities. Furthermore, as a result of deduction in the interest rate by commercial banks, the public hesitate to make deposits. Since no better alternatives are available other than the stock market, the public shifted towards stock market. The price of stocks as well as the mobilization of capital started to increase. It attracted the general public to invest in the stocks that pushed the price further. Consequently, the prices of some stocks were overvalued due to some imperfect practices and market rumors. But, as time passed by, the outcome was the drastic fall in stock prices and investors hesitated to invest in stocks of companies by reason of such movement of the price.

However, a change in the interest rate on deposits alone cannot affect the price of securities. There may have various reasons behind. The market capitalization is increasing continuously along with the fall in the average rate of interest. It was due to the increase in the number of enlisted companies in the stock exchange. At present, commercial banks occupy the topmost position in the market. Investors are investing mostly in the banking sector because most of them are performing very well and distributing handsome rates of dividend to shareholders. The capital gain due to the increase in share values is another reason.

Stock market sectors systematically react to different stage of the financial and business cycles, as measured by shifts in the liquidity environment. The response of the liquidity of money market is negative with stock trading. The fall in the prices of stock facilitates liquidity. There is a relationship between interest rates and liquidity. The change in the interest rate affects the supply of money. If the rate of interest is high, the demand for money is less than the supply. There is surplus liquidity. If the stock market is well developed and the corporate environment is brighter, individuals shift from the money market to the stock market. Interest rates act as an important factor in making investment decisions. Liquidity is deeply affected by the interest rate. As the interest rate goes up, the market price of existing securities falls, and vice versa. This happens because the buyers of securities are attracted towards bank deposits.

Though liquidity is identified as one of the major economic problems in the country but no effective steps have been taken to manage it.

The huge amount of funds is being inactive due to lack of investment opportunities. A numbers of factor are responsible for mounting liquidity. The major points are:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Failure to mobilize the funds in productive sectors
2. The unavailability of physical infrastructure
3. Fail to achieve investors' faith
4. No effective demand of capital for the long-term investment
5. Scarcity of a favorable environment for both national and foreign investors
6. Unable to develop the sense of safety and security in the mind of investors
7. Political uncertainty
8. Ineffective rules and regulations in order to support long-term investment policies
9. No strong vision of government and concerned bodies

The well-developed and organized stock market plays a vital role in the mobilization of savings. The more liquid stock market encourages savings mobilization in long run profitable projects. First, liquid stock markets make investment less risky and more attractive because they allow savers to acquire an asset (equity shares) and to sell it quickly and cheaply if they need to access to their savings or want to change their portfolios. Many profitable investments require a long-term commitment of capital, and investors are often reluctant to relinquish the control of their savings for a long period. This problem is solved by the stock market due to the freedom of entry and exit. Second, liquidity in the stock also improves the allocation of capital and increase prospects for long term economic growth by facilitating long-term, more profitable investment. Therefore, companies have permanent access to capital raised through equity issues. Third, liquid stock markets also lead to more savings and investments by making investment less risky and more profitable.

## Process to Obtain Membership of the Stock Exchange

The corporate bodies wishing to be a member has to submit an application in a prescribed format within the time specified along with the certificate of incorporation, tax certificate, Memorandum of Association, Articles of Association and the concerned Act, rules and regulations in the case of a corporate body other than a company after the incorporation and the projected B/S and PL A/C for the next three years, last three years' audited financial statements, if the year of incorporation is less than three years, the B/S and A/C of investment in shares of subsidiary company or investment made in its parent company's share capital, details of share investment in any other company other than subsidiary, the name, address, number of shares subscribed and the amount invested by shareholders having more than 5% of the share capital need to be submitted, (www.nepalstock.com).

## Board of Directors

The Board of Directors of NEPSE consists 6 directors in accordance with the Securities Exchange Act, 1983. Six directors are nominated by the Government of Nepal and different institutional investors. Two from among the licensed members, and the General Manager of NEPSE is the Ex-Officio Director of the Board.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Capital Structure

The authorized and issued capital of the exchange is Rs.50 million. Of this Rs.30.41 millions was subscribed by Government of Nepal, the rest by Nepal Rastra Bank, Nepal Industrial Development Corporation and licensed members.

## Listing

Trading on the floor of NEPSE is restricted to listed corporate securities and government bonds. At present, 159 companies have listed their securities to make them eligible for trading. Besides this, the NCM Mutual Fund enlisted its units to make them eligible to trade on the floor.

## Listing Fee

The listing annual fee to be paid by the listed company is based on the capital of the company.

## Review of Studies on Nepalese Capital Market

Bhatta, G.P (1995) has concluded that many listed companies in Nepal have high unsystematic risk or specific risk. He realizes the need of an expert institution to provide consultancy services for the investors to maximize their wealth through rational investment decision. Bhatta's major findings were that investors expect higher returns from those stocks which associate higher risk. The Nepalese capital market is not efficient, so the stock price does not contain all the information relating to the market and the company itself. He again highlights that, neither investors analyze the overall relevant information of the stocks nor the members of stock exchange try to disseminate the information. So the market return and risk both may not represent the reality. He further asserts that investors in Nepal have not yet practiced to invest in the portfolio of securities. His analysis of two securities portfolios shows that the risk can be totally minimized if the correlation is perfectly negative. In this situation, the risk can be totally diversified but when there is perfectly positive correlation between the returns of the two securities, the risk is un-diversifiable. Finally, Bhatta concluded that the negative correlation between securities return is preferred for the diversification of risk. Bhatta D. (2003) found that without proper analysis of individual security, portfolio security, the industry and overall market, it is almost impossible to beat the stock market. Generally knowledge about political, economic and technological trends are more advantageous. He further found that stocks had greater volatility risk than other investments. Stocks take a random and unpredictable path. Obviously the stock market is risky in the short term. In most of cases, portfolio management of listed finance companies in Nepal is not systematically organized. He further asserts that for the effectiveness of portfolio management in Nepal, the stock market should be developed, computer-based technology and information systems should be adopted, training and development program about portfolio management should be conducted. Bhatta further concluded that the most of the finance companies had enough unsystematic risk that means there is no effective portfolio management of listed finance companies. One of the major problems to manage the portfolio is volatility of different securities in the capital market. Finally he concluded that, for the portfolio securities selection in Nepal, technical analysis does not work effectively but fundamental analysis can make difference.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Shrestha, S.C (1999) concluded that, the stock market liquidity is positively and robustly correlated with contemporaneous and future rates of economic growth, capital accumulation and productivity growth.

Tuladhar, P. (2002) reported that, most of the listed companies in her sample were quite risky and the return on stocks was fluctuating every year. She had further documented that some companies' common stocks were experiencing a higher rate of return at relatively lower risk. Shrestha, A. (2004) concluded that there is a positive relationship between portfolio return and risk (in most of the cases). Adhikari, R. H. (2005) reported that all the commercial banks' stocks were under- priced, so all the banks had stocks with good investment opportunities. He further claimed that investors could be benefited by purchasing such under-priced stocks of a banking group.

## CONCLUSION

The access of formal financial services is declining in Nepal. To increase the financial access to small business and low income households Nepalese financial institutions start serving them in a financial sustainable manner and hence must exhibit the high level of financial and professional efficiency. Despite of severe problems in financial sector development in Nepal, government and regulators need to think about enforcement of prudent regulations and enhance the supervisory role. Government of Nepal needs to think of reforming prevailing legal framework so that Nepalese private sector can evolve and grow at par with international standards. The capital market in Nepal forms a significant part of infrastructure development. Legal framework of capital market development in Nepal requires reformation in major important aspects. The efficient capital market can only facilitate the privatization of state-owned enterprises in a manner that allows broad public participation and provides an ownership structure that will support long-term goals of the privatization program, including greater efficiency, transparency, and sound corporate governance. One of the obstacles to private sector capital formation is the failure to mobilize the extensive savings already available for investment in the capital market. Structural changes and regulatory reforms in the Nepalese capital market would promote increased capital mobilization and demand for securities through contractual savings and institutional investment. Perception of the common people in Nepal is that private commercial banks, finance companies, and insurance companies have a better track record concerning disclosure to investors than those enterprises operating in the non-financial sector. Hence, non-financial sector in Nepal need to exhibit greater operational efficiency and professionalism to make existing and potential investors aware and happy.

## KEY WORDS AND DEFINITIONS

**Banking:** Any task related to bank.
**Capital:** Investment made in any project.
**Challenges:** Possible future threat and opportunities.
**Companies:** Any institutions registered under the company act 2063.
**Development:** Infrastructural and human progress.
**Disclosure:** Making public.
**Exchange:** Place where commodities and product change the ownership.
**Financial:** Related to finance.
**Government:** That governs the state.
**Institutions:** Any types of organized entities.
**Market:** Place where the buyer and seller can make exchange of agreement and products.
**Nepal:** Developing country.
**Plan:** Road map to accomplish any goal.
**Problems:** Prospective challenges that need deep care and address.
**Regulation:** Mechanism of ensuring good governance.
**Securities:** Long term or short term instrument of investment.
**Stock:** Investment made in securities.

# Chapter 35
# Home Country-Specific Determinants of Outward Foreign Direct Investment in Developing Economies

**Rıfat Karakuş**
*Çankırı Karatekin University, Turkey*

## ABSTRACT

*The outward foreign direct investments of developing economies have showed significant increase in recent years. Rising outward foreign direct investment stock of developing economies makes its determinants and consequences crucial. The aim of this study is to determine the home country specific determinants of outward FDI. For this purpose, a panel data analysis is performed with the data of BRICS and Next Eleven countries for the period from 1994 to 2014. The analysis results reveal that inward foreign direct investment, interest rates and technological capability of home country have positive influence and total labor force of home country has negative effect on outward FDI of developing economies.*

## INTRODUCTION

Foreign direct investment (FDI) is defined as "a category of cross-border investment made by a resident entity in one economy (the direct investor) with the objective of establishing a lasting interest in an enterprise (the direct investment enterprise) that is resident in an economy other than that of the direct investor" (OECD, 2008). The lasting interest implies the existence of a long-term relationship between the direct investor and the enterprise and a significant degree of influence by the direct investor on the management of the enterprise. Ownership of at least 10% of the voting power is generally accepted that the investor has enough influence on management of the enterprise although in some examples less than 10% of the voting power can provide active management ability or more than this voting power cannot be enough for creating a direct management authorization.

FDI can be classified in two forms from point of a reporting economy. Inward FDI indicates the all direct investments by the non-residents in the reporting economy and outward FDI refers to investments which made to another economy by reporting economy residents. When FDI of whole world economy is handled, superiority of developed countries attracts the attention as expected. Naturally FDI flows from more industrialized to less-industrialized countries, or from capital-rich to capital-scarce developing countries. However, in recent years reverse flow of FDI from developing economies to other economies have showed increase with the effect of globalization process. (Bano & Tabbada, 2015) As shown in the Figure 1, total outward FDI stock of world economy has had a tendency to increase from 1980 to 2014 except the years 2001 and 2008. Also percentage of developing and transition economies outward FDI has been ever-growing from 2003 to 2014 although the percentage of developed economies has revealed a downward spiral. Besides when outward FDI stock growth rate of economies is observed, developing and transition economies have given an outstanding performance from 2004 to 2014 except the year 2009.

Developed economies have nearly 80 percent of world outward FDI stocks. Their existing operations support this weight on total of FDI thanks to reinvested earnings. Developed-economy multinational enterprises (MNEs) have operated in other countries for long time and they have advantage of these operations profits. They can invest with the profit of existing operations as outward FDI, so their dominance on outward FDI of world proceeds. When the top 20 home economy of outward FDI is observed, the density of the developed economies is perceived. Respectively, United States, Hong Kong, China, Japan, Germany, Russian Federation, Canada, France, Netherlands, Singapore, Ireland, Spain, Republic of Korea, Italy, Norway, Switzerland, Malaysia, Kuwait, Chile, Taiwan Province of China are the top 20 economy which have outward FDI around the world. 11 economies in top 20 and 10 economies in top 15 are the developed economies. (UNCTAD, 2015) Although the dominance of developed economies is shown in total, capacity of the developing economies is non-negligible. Developed-economy MNEs make their invested in other economies with reinvested earnings ever-increasingly, however the developing-economy MNEs mostly use equity for outward FDI and with these equity investments they

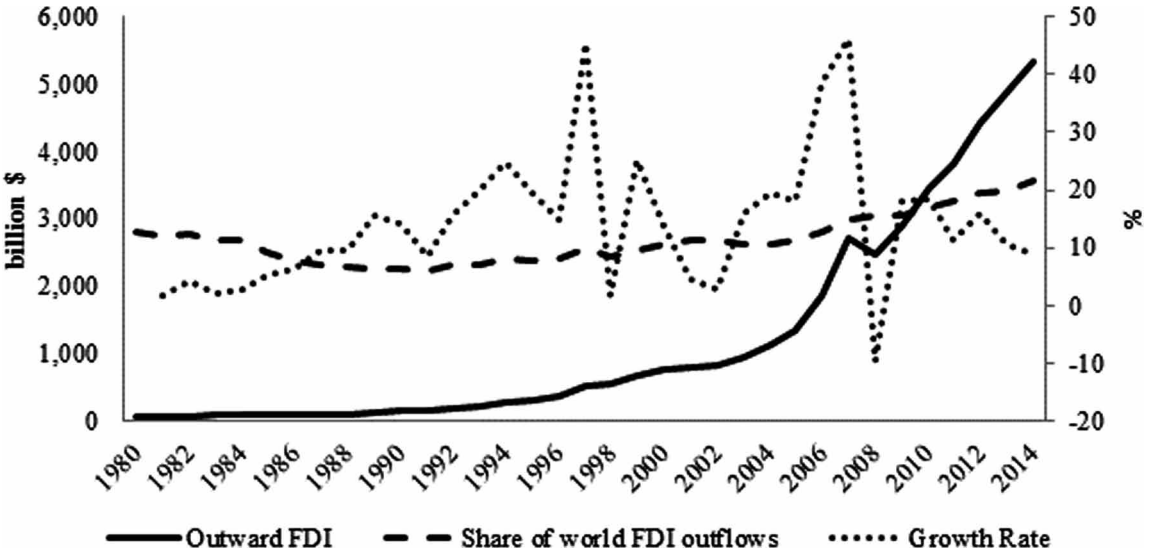
*Figure 2. Capital source of outward FDI from developed and developing economies*
*UNCTAD, 2015.*

[a] Economies included are Australia, Belgium, Bulgaria, Canada, Croatia, Cyprus, the Czech Republic, Denmark, Estonia, Finland, Germany, Greece, Hungary, Iceland, Ireland, Israel, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Norway, Portugal, Slovakia, Slovenia, Spain, Sweden, Switzerland, the United Kingdom and the United States.
[b] Economies included are Algeria, Anguilla, Antigua and Barbuda, Aruba, the Bahamas, Bahrain, Bangladesh, Barbados, Belize, the Plurinational State of Bolivia, Botswana, Brazil, Cambodia, Cabo Verde, Chile, Costa Rica, Curaçao, Dominica, El Salvador, Fiji, Grenada, Guatemala, Honduras, Hong Kong (China), India, Indonesia, the Republic of Korea, Kuwait, Lesotho, Malawi, Mexico, Mongolia, Montserrat, Morocco, Namibia, Nicaragua, Nigeria, Pakistan, Panama, the Philippines, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Samoa, Sao Tome and Principe, Seychelles, Singapore, Sint Maarten, South Africa, Sri Lanka, the State of Palestine, Suriname, Swaziland, Taiwan Province of China, Thailand, Trinidad and Tobago, Turkey, Uganda, Uruguay, the Bolivarian Republic of Venezuela and Viet Nam.

increase share on world outward FDI stocks. Also future expectations about the outward FDI predicts that developing MNEs investments in other countries will gradually increase with the effect of investments that is currently made and will create reinvested earnings in the future.

The outward FDI stock of developing economies and their share versus developed economies is growing. Also developing-economy MNEs are hot prospect for the future. Hence the affecting factors and consequences of developing-economy FDI outflows become significant. For this reason, this study aims to determine the relationship between FDI outflow of developing economies and selected home country specific determinants namely income, trade openness, exchange rate, interest rate, technological capability and labor force. By using data of BRICS and Next Eleven countries between 1994 and 2014, a panel data analysis will be performed and effects of home country specific factors on outward FDI of developing economies will be analyzed. In the chapter, firstly the outward FDI from developing economies will be investigated, and then related literature will be reviewed. Finally to determine the effects of home country specific factors on outflow FDI, a panel data analysis will be performed and the results will be discussed.



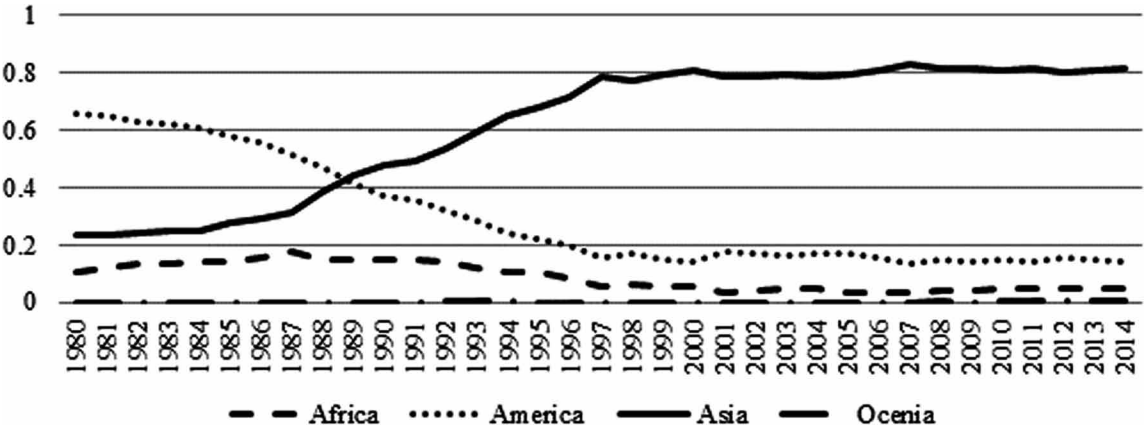
## BACKGROUND

Although developed economies keep the leading position for outward FDI around the world, cross-border investment activities from developing economies have continued to rise from 1980s until today. Outward FDI of developing economies which was only about 70 billion $ in 1980 had reached to 5.320 billion $ in 2014. Cross-border investment activities of the developing economies have delivered great performance in comparison with developed economies. Parallel to increasing volume of outward FDI,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 3. Outward FDI from developing economies: 1980-2014*
*UNCTAD, 2015.*

share of developing economies on world FDI outflows have improved perpetually during the recent years. While the developing economies FDI outflows in world economy is only 6 percent in 1991, their share approximated to 22 percent in 2014. Also the growth rate reveals the performance of developing-country MNEs according to cross-border investments. Although there is a fluctuant growth rate in recent years, it is almost always positive and implies that the outward FDI stock of the developing economies continues to rise.



When FDI outflows of developing countries are examined regionally, the impact of the Asia economies is felt during the recent years. In 2014, nearly 82 percent of the developing economies outward FDI belonged to Asia economies. In developing Asian economies, Eastern Asia economies have the biggest portion of the outward FDI with a nearly 69 percent of whole Asia. Countries such as China, Hong Kong, South Korea, Taiwan become prominent the Eastern Asia. Other big part of the Asia outward FDI (about 21 percent) belongs to South-Eastern Asia economies which contain Indonesia, Malaysia, Philippines, Singapore, Thailand and Vietnam as developing countries. Subsequent to Asia economies, American economies have the second big part of the developing economies outward FDI. Although in 1980s outward FDI of American economies have had the three times more than Asia economies, in recent years their investments have become only one fifth of Asian economies. In America region, developing economies of South America (Brazil, Chile, Uruguay, Bolivia, Venezuela, etc.) step forward with about 78 percent of outward FDI of whole America. Another region that outward FDI share in developing economies have declined is Africa and the large part of this little share appertains to Southern Africa developing economies.

The developing country MNEs can make cross-border investments in not only developing countries but also developed countries. As shown in Graph 5, some of the developing economies have investments in developed economies more than developing or transition economies. For example, in 2012, outward FDI stock of Republic of Korea is mostly presence in the developed countries by 75, 4 percent. On the other hand, some developing economies FDI stocks abroad are mostly presence in developing econo-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

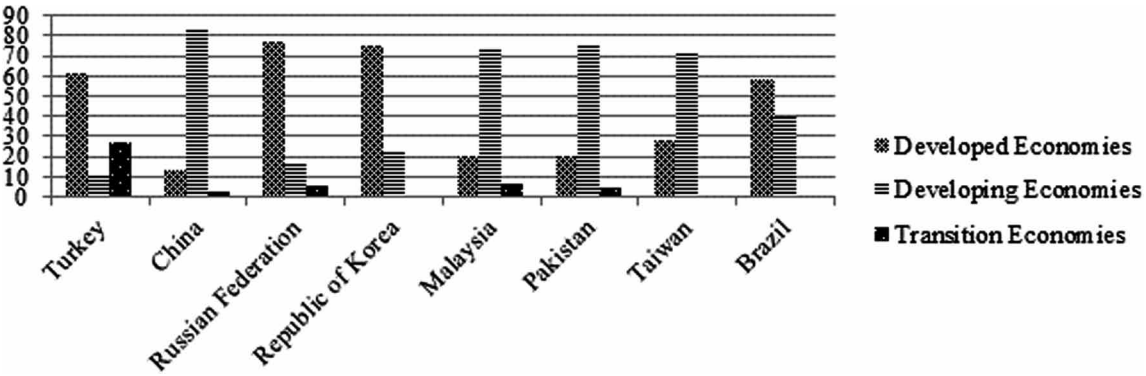


*Figure 4. Regional FDI outflows as a share of developing country outflows*
*UNCTAD, 2015.*

mies such as China, Malaysia, Pakistan and Taiwan. As a conclusion, it is easily seen that developing-economy MNEs can attempt to new investments around the world regardless of where. They are able to make cross-border investments as well as in developing countries, as long as they find opportunity for high-yield investments.

Developing-economy MNEs make cross-border investments in the form of both merger and acquisitions (M&As) and greenfield projects. MNEs from developing and transition economies are consolidating their role as investors in cross-border M&A operations. The share of these MNEs in the total (net) value of cross-border M&As rose from about 10 per cent in 2003 to almost 40 per cent in 2012 and has remained stable since then. Also developing economies have gained 10 percentage points in the global value of announced greenfield FDI projects, from 20 per cent in 2005 to 30 per cent in 2014. Developing-economy MNEs make investments abroad in three main sectors: primary, manufacturing and services. In recent years, services sector especially finance and construction investments are remarkable. (UNCTAD, 2015)

*Figure 5. Outward FDI stock of selected developing countries by host economy development class: 2012*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

There are several home country specific factors which may affect the outward FDI of a country. Mainly income level, openness to trade, exchange rate, interest rate, inflation rate, human capital and technological capability are discussed with their effects on outward FDI.

Income level of countries may be evaluated as one of the main factors that can affect FDI outflows. Investment Development Path (IDP) theory, that was originally introduced by Dunning in 1981 and improved by this author and others (Dunning 1986, 1988, 1993, 1997; Dunning & Narula 1996; Narula 1996; Duran & Ubeda 2001, 2005) is well-known theory about the economic development and FDI outflows of the countries. According to IDP theory, net outward investment position (the difference between outward direct investment stock and inward direct investment stock of a country) follows a five stage path in relation to level of economic development which is denoted by the Gross Domestic Product (GDP) or GDP per capita. In the first two and last stages of the path net outward investment of the countries decline while GDP or GDP per capita increase. However, in the third and fourth stage of the path net outward investment and GDP or GDP per capita of countries rise concurrently. So income level of countries is decisive on FDI outflows. There are also other reasons to predict the effect of income level on FDI outflows. Developed economies can create available financial markets that lead to entrepreneurial development. (Alfaro et al., 2004) In addition increasing GDP or GDP per capita has a significant effect on savings (Gersovitz, 1988). More entrepreneurs can reach required financial resources easily when economic development is achieved. This situation makes companies more capital intensive and so more competitive. Consequently more entrepreneurs become multinational and FDI outflows increase with the effect of increasing income level.

Trade openness is another important factor that can affect the FDI outflows of countries. Imports and exports of countries are the core indicator of trade openness. More liberalized economies gain knowledge about foreign markets and this valuable knowledge provide opportunity to operate or manage production abroad (Kueh et al., 2010). Also importing economy multinationals become market-favorable when they make investments in the home markets of the import producing companies (Kyrkilis & Pantelidis, 2003). For this reasons, a higher degree of openness is expected to provide a higher level of outward FDI activity.

Exchange rate influences the import and export of countries as well as inward and outward FDI. Appreciation of currencies support import and hinder export. In a similar way, appreciation of currencies encourages the FDI outflows and depreciation of currencies discourages the FDI outflows because capital requirement of foreign investment in domestic currency is pushed up (Aliber, 1970). Theoretically a positive relationship between exchange rate and FDI outflows is expected.

Interest rates create opportunity cost for investments. In the same time, higher interest rates affect the cost of capital. So lower interest rates reduce opportunity cost of foreign investment and enable capital abundance to investment (Kueh et al., 2010; Kyrkilis & Pantelidis, 2003). Likewise increasing inflation has negative effects on outward FDI because it results increase in interest rates and depreciation in currency (Buckley et al., 2007). The excepted influence of interest and inflation rates is similar and negatively correlated with outward FDI.

Quality, delivery time and production costs of goods and services are critical factors for companies that want to remain competitive. These factors become more significant with competitive pressure in the world. The technological knowledge of companies allows improvement in quality, decreasing in delivery time and production costs (Giardini & Ceretti, 2005). The technological capability of whole economy can be measured by patent applications and high technology exports and a positive relationship is expected between these variables and FDI outflows of countries.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The countries' ability to create, acquire and organize human skills adds value MNEs as well as technological capability. This ability attracts inward FDI and encourages outward FDI. Knowledge capital in other words skilled labor force of countries can contribute FDI outflows (Narula, 1996). On the other hand companies direct their investments abroad to minimize their production costs. Labor costs are one big part of the production costs and lower labor cost becomes attractive for MNEs (Svetlicic, 2007). When considered from this point of view increasing labor force keeps labor cost lower in home country and companies do not need to invest abroad. So effect of human capital on FDI outflows can differ by countries.

Also the question of what affect the outward FDI of economies have been subject to many empirical studies. Parallel to volume of outward FDI, the studies mainly focused on developed countries. However, in recent years along with the popularity of developing-economy MNEs empirical studies for these economies stand in the literature. Studies that analyze the effect of home country specific factors on outward FDI of developing economies are summarized below.

Williams (2009) examined the effect of GDP per capita, GDP per capita growth rate, interest rate, literacy rate, level of corruption, current account balance on outward FDI of 15 small island developing economies. A five year panel data for the years 1998-2002 was used to estimate the model. The results reveal that per capita income, per capita income growth rate (i.e., economic growth) and the level of corruption in the home market are the factors that influence local firms to invest in foreign market through foreign direct investment. Per capita income has a negative effect on outward FDI, however per capita income growth rate and level of corruption influences the outward FDI positively. Converse effects of per income capita and its growth rate are remarkable. Increase in per income capita is evaluated as consumer richness and consumers in home market become richer, there is no need to go abroad. So a negative relationship between per income capita and FDI outflows occurs. However increase in per income capita growth rate is expressed as growing of home economy. When home economy becomes larger, but market size is small, firms will seek customers in other markets and this leads to more FDI outflows.

Verma and Brennan (2013) investigated the selected macroeconomic determinants of Indian outward FDI. By using data between 1981 and 2009, time series analysis was applied. Analysis results revealed that GDP, human capital (approximated by the number of enrollments of students in tertiary education) and openness of the economy (approximated by the ratio of exports plus imports to GDP) had a positive influence on FDI outflows. The positive effect of human capital is also seen in type of outward FDI of India. There has been a tremendous increase in service outward FDI from India in recent years. In addition, export activities of the country enable MNEs to obtain information regarding foreign markets and knowledge as well as skills in establishing operations abroad. So export level makes positive contribution to FDI outflows. On the other hand, contrary to expectations any statistical effect of exchange rate, interest rate and technology capability on outward FDI could not be detected.

Saad et al. (2014) to determine the push factors of Malaysia outward FDI performed a multiple regression analysis by using data between 1981 and 2011. In the study, exchange rate, exports, GDP, inward FDI, natural resources availability, patent numbers and labor productivity of home country were used as independent variables and their effect on outward FDI was researched. Results of the analysis revealed that there is a statistically significant and positive relationship between export level, GDP, inward FDI and outward FDI, and also negative relationship between exchange rate, labor productivity, patent numbers and outward FDI. The result on labor productivity level indicates the requirements of technical capabilities cannot be met thus pushing MNEs to involve in overseas production.

In recent years, Asian developing economies have gained importance on world FDI outflows. Bano and Tabbada (2015) tried to answer the question that what drives outward FDI in developing countries and more specifically, what are the home-country determinants of outward FDI? By using data of China, India, Indonesia, Malaysia, the Philippines and Thailand between 1990 and 2010, the effect of savings rate (as percent of GDP), GDP, foreign reserves, exports and FDI inflow on FDI outflows was researched. According to analysis results, there is a statistically significant and positive relationship between GDP, foreign reserves and outward FDI and negative relationship between savings and FDI outflows for these six economies. The findings suggest that for a developing country to aspire to be a capital exporter through FDI, it must possess all or most of the high domestic savings rate, an export-oriented economy, a GDP that is growing rapidly and substantial international reserves.

Determinants and motives of outward foreign direct investment from China's provincial firms are investigated by Chen (2015). Data of 30 provinces for the period from 2003 to 2012 are used to determine the relationship between OFDI and the home-side variables of China's provinces. Per capita GDP, patent numbers, FDI inflows, export to GDP ratio, import the GDP ratio and GDP are selected as home country specific independent variables. The results of the study reveals that provincial economic development (GDP per capita), innovation and technology (patent numbers), and export to GDP ratio are statistically significant determinants and positively affect the outward FDI, while FDI inflows, import to GDP ratio and provincial market size (GDP) are not statistically significant.

## EFFECTS OF HOME COUNTRY SPECIFIC FACTORS ON OUTWARD FDI

### Data Set

To determine the relationship between outward FDI and home country specific factors, BRICS (Brazil, Russia, India, China and South Africa) and Next Eleven countries (Bangladesh, Egypt, Indonesia, Iran, Mexico, Nigeria, Pakistan, the Philippines, Turkey, South Korea and Vietnam) selected as the sample that represents the developing countries. Yearly data for the period of 1994-2014 is used in the study. Outward FDI stock US Dollars at current prices and current exchange rates in millions (OFDI) is the dependent variable of the analysis and used as logarithm. The data source for outward FDI is data center of UNCTAD. The effect of home-country specific factors on outward FDI is determined with the model that is formulated as Equation 1:

$$\log OFDI_{i,t} = \beta_1 + \beta_2 \log IFDI_{i,t} + \beta_3 \log GNI_{i,t} + \beta_4 \log CPI_{i,t} + \beta_5 \log ECXR_{i,t} + \beta_6 \log_{i,t} TLF + \beta_7 \log_{i,t} TIE + \beta_8 \log IR_{i,t} + \beta_9 \log PN_{i,t} + \beta_{10} \log HTE_{i,t} + u_{i,t} \quad (1)$$

In the equation, "i" refers to the countries; "t" represents the period t; "log" reveals the logarithm of related variable and $OFDI_{i,t}$ expresses the outward FDI of i country for t period. Independent variables being located in the equation are explained in Table 1.

For all-time series variables, the stationary of the series is essential. When the variables in a regression are nonstationary, correct R-square values and t-statistics cannot be generated by the analysis. (Greene, 2012) For preventing spurious relations between the variables, unit root tests are applied and nonstationary series are included the model with first or second differences which provides stationary series. For

*Table 1. The explanation of the independent variables*

| Independent Variable | Description | Source |
|---|---|---|
| $logIFDI_{i,t}$ | The logarithm of the inward FDI stock (US Dollars at current prices and current exchange rates in millions) of home country i for period t. This variable is selected to express foreign investments made by non-residents in country i. | UNCTAD |
| logGNI | The logarithm of GNI (current international $) of home country i for period t. GNI variable refers to economic size of the countries for related period. | WORLDBANK |
| logCPI | The logarithm of annual consumer price indices Index Base 2005 of home country i for period t. Consumer price index is added to equation as inflation measurement. | UNCTAD |
| logEXCR | The logarithm of the annual currency exchange rate (1.00 USD) of home country i for the period t. | UNCTAD |
| logTLF | The logarithm of the total labour force annually (absolute value in thousands) of home country i for the period t. This variable represents the workforce of the home countries. | UNCTAD |
| logTIE | The logarithm of the total export and import of goods and services (current US$) of home country i for the period t. Total of the export and import is added to model to exhibit the openness of home country to global economy. | WORLDBANK |
| logIR | The logarithm of the lending interest rate (%) of home country i for the period t. Lending rate is the bank rate that usually meets the short- and medium-term financing needs of the private sector. | WORLDBANK |
| logPN | The logarithm of the patent applications that are worldwide patent applications filed through the Patent Cooperation Treaty procedure or with a national patent office for exclusive rights for an invention of home country i for the period t. This variable refers to the technological capacity of the countries. | WORLDBANK |
| logHTE | The logarithm of the high-technology exports (current US$) of home country i for the period t. This variable also refers to the technological capacity of the countries. | WORLDBANK |

the variables of this analysis, Levin, Lin and Chu (2002) unit root test is performed and stationary of the series is determined. (Table 2) According to unit root test results, only logEXCR and logHTE series are stationary at the I(0) level. However all of the other variables are stationary at the I(0) level and series generated by first difference of these variables are included to analysis.

*Table 2. Unit root test results*

## Panel Data Analysis

By using 16 countries data for the period 1994-2014, to identify home-country specific determinants of outward FDI of developing countries is aim of this study. Using a panel data regression analysis for these aim and data set is appropriate. With panel data, it is possible to bring together the regression data and time-series data. With panel data, observation of subjects over time unlike regression data and observation of many subjects unlike time-series data are possible. (Frees, 2004) For the data set of this analysis, 16 cross-section and 20 time-series for each cross section, using panel regression analysis is necessary and brings along the advantages of panel data.

In this analysis, it is endeavoured to determine the effect of nine independent variables (logIFDI, logGNI, logCPI, logEXCR, logTLF, logTIE, logIR, logPN, logHTE) on dependent variable (logOFDI). However, there may exist exogenous variables, excluded due to data availability or difficulty of measuring, which should be included for obvious effects on the outcomes. The existence of correlation between these excluded variables and explaining variables cause the correlation between the error term of the regression model and independent variables and induce biased results and estimation. To avoid biased results and estimation in other words to create precise analysis results identification of individual and/or time effects in the model is crucial. After identifying individual and/or time effects in the model best suitable panel model will be selected. (Bozkurt & Akman, 2016)

Individual and/or time effects in the model may be investigated with different tests. If related test results reveal that there is individual and/or time effects in the model, type of the effects should be specified. By using Hausman (1978) tests, it is decided that fixed or random effects model is more appropriate for the panel data analysis. However, if according to tests results there is no individual and/or time effects in the model, pooled ordinary least square should be used as the most suitable model.

## Panel Data Model Selection

As mentioned above, determination of individual and/or time effects in the model is crucial to select precise panel data model. To determine the individual and/or time effects, seven tests are used and their results are reported in Table 3.

LR Test (1) examines $H_o$ which argues that standard errors of the individual and time effects are zero. According to this test result there is no individual or time effects. LR Test (7) also retests the time effect in the model and reveals that there is no time effect identically. So it is concluded that the model is free from time effect.

$H_0$ of F Test (2) examines that all individual effects are zero, $H_0$ of LR Test (3) and Score Test (6) examines that standard errors of individual effects are zero and $H_o$ of LM Test (4) and ALM Test (5) examines that variances of individual effects are zero. According to LR Test (3) and LM Test (4) there is no individual effects and pooled OLS is appropriate model for this analysis. However F Test (2), ALM Test (5) and Score Test (6) results reveal that individual effects exist in the model. When all test results are discussed together, whether individual effects in the model exist or not is irresolute. For this reason, panel data analysis will be performed by pooled OLS model, also according to Hausman Test results fixed or random effects model is used as an alternative.

If there is individual and/or time effects are in the model, fixed or random effect models will be used. To determine the appropriate model, Hausman (1978) Test should be performed. $H_o$ of Hausman Test is that difference in coefficients is not systematic. If null hypothesis of Hausman Test is accepted, random

| Pooled OLS | YES | NO | YES | YES | NO | NO | YES |

effect model should be chosen. If null hypothesis of this test is rejected, fixed effect model is suitable for the analysis. Hausman Test result for this study is shown in Table 4. According to test results, null hypothesis is accepted and so random effect model is suitable fır the analysis. After this results panel data analysis is performed with both pooled OLS and random effect models.

## Heteroscedasticity and Autocorrelation Tests

If the error terms in a regression equation do not have a constant variance, the heteroscedasticity occurs. When heteroscedasticity problem is current in an equation, the OLS estimator remains unbiased. However, the estimated standard errors are biased, so the usual t statistics or F statistics cannot be used properly. Even if standard errors could be correctly measured, the OLS estimator is no longer BLUE (unbiased and efficient). Also if the error terms in a regression are serially dependent, there is autocorrelation which cause same problems with heteroscedasticity.

To determine whether heteroscedasticity and autocorrelation problems exist in panel regression models, varied tests are applied and their results are represented in Table 5. According to test results heteroscedasticity and autocorrelation problems occur for pooled OLS model. Random effect model is free from autocorrelation, but heteroscedasticity is also in effect. To avoid the consequences of heteroscedasticity and autocorrelation, robust standard error estimators of Newey and West (1987; 1994) and Driscoll and Kraay (1998) are employed for pooled OLS model. To present the effect of heteroscedasticity on results in random effect model robust standard error estimators of Huber, Eicker and White (1967; 1967; 1980) and Rogers (1993) are preferred.

## Estimation Results

The results of the correlation matrix between dependent variable (OFDI) and all variables used in the model are revealed in Table 6. The highest positive correlation (0.79) occurs between outward FDI and inward FDI. Besides, the lowest positive correlation (0.09) appears between outward FDI and total labor force. The highest negative correlation (0.13) is attained between outward FDI and currency exchange rates and the lowest negative correlation (0.01) occurs between outward FDI and interest rates. Although there is high correlation between some independent variables, variance inflation factors (VIF) for these variables are smaller than 10, so there is no question about collinearity in regressions.

Table 7 presents the main results of panel data analyses. Firstly, all of the models (F and $Chi^2$ statistics) are statistically significant at 1% level which means that the set of independent variables have the ability of explaining dependent variable logOFDI. Explanatory power of the models is 71%. In other words $R^2$ statistics reveal that the independent variables used in the model can explain the 71% of the movements in dependent variable.

According to pooled OLS regression with Newey-West standard errors, there is a statistically significant relationship between outward FDI and inward FDI, total labor force (TLF), patent numbers (PN) and high technology exports (HTE) for developing economies. Any effect of other variables on outward FDI cannot be proven. Except HTE, other three independent variables (IFDI, TLF and PN) have statistically significant effect on outward FDI according to pooled OLS regression with Driscoll-Kraay standard errors. Both random effect models show that there is a statistically significant relationship between outward FDI and inward FDI, interest rates, patent numbers and high technology exports for countries creating the model sample. However, effect of other variables on outward FDI is found as insignificant.

Firstly, both pooled OLS and random effect models indicate that inward FDI of developing economies has a positive influence on outward FDI of these countries. Too close coefficients of the models point that 1% increase in inward FDI creates respectively 0.37-0.38% increase in outward FDI. Patent numbers

is another independent variable that its influence on outward FDI is found as significant. Outward FDI of developing economies is positively associated with patent numbers, with a 1% increase in the patent numbers increasing outward FDI by 0.31% and 0.33% according to pooled OLS and random effect models respectively. Effect of high technology exports on outward FDI is determined as significant by three methods. Its effect on outward FDI is the highest in all. 1% increasing in high technology exports results 479.74% and 489.61% increase in outward FDI in other of different methods. Total labor force variable is detected by pooled OLS model and interest rate is determined by random effect model as significant. Although the total labor force has a negative influence on outward FDI, interest rate has a positive impact on outward FDI. If total labor force increases 1%, outward FDI will decrease 0.97% and if interest rate increases 1%, outward FDI will increase 17.98%.

## SOLUTIONS AND RECOMMENDATIONS

The results of the analysis reveal that inward FDI, interest rate and technological capability (approximated by patent applications and high technology exports) of home countries have positive influence on outward FDI of developing economies. Influence of inward FDI and technological capability is coherent with theoretical expectations. Inward FDI supports economic level, know-how and liberalization of countries and positive effect of inward FDI on FDI outflows makes sense. Similarly technological capability by creating competitive advantages is anticipated to contribute MNEs. On the other hand, positive relationship between interest rates and outward FDI is surprising. Increasing interest rates creates higher opportunity cost and cost of capital and discourages companies from investments. However empirical results exhibit a reverse situation. Companies can reach lower cost financial instruments in countries where they invest and they may invest abroad when interest rates increase in home country. This alternative is compatible with the analysis results. The negative effect of total labor force on outward FDI is another result of the study. More labor force in home country dissuades companies from investing abroad.

The findings of this analysis may have some practical implications for developing country policy makers. After evaluating the consequences of FDI outflows, policy makers may use related factors as a tool to support FDI outflows or discourage from FDI outflows. To support the outward FDI, countries can promote technological capability and encourage inward FDI by support packages. On the other hand the effect of interest rates on outward FDI is not ignored. Mainly rising interest rates is a useful tool to attract foreign funds to country. However analysis results reveal that interest rates have a positive effect on FDI outflows and rising interest rates results to increase in FDI outflows. This contradictious effect of interest rates on fund inflow and outflow should be examined closely by policy makers.

This study contributes to general understanding of the determinants of developing economies' outward FDI. By using a wide country set and a large current data period respectable results for companies and policy makers are generated. However there are some limitations. Firstly effect human capital is measured only from the point of total labor force because the data representing the skills of labor force is not available for whole data set. Future studies can use more independent variables such as corporate tax rate and investment policy of the home countries. Also host country and firm level determinants of the outward FDI can be added to analysis in future studies and limitations of this study will be eliminated.

## FUTURE RESEARCH DIRECTIONS

This study contributes to general understanding of the determinants of developing economies' outward FDI. By using a wide country set and a large current data period respectable results for companies and policy makers are generated. However there are some limitations. Firstly effect human capital is measured only from the point of total labor force because the data representing the skills of labor force is not available for whole data set. Future studies can use more independent variables such as corporate tax rate and investment policy of the home countries. Also host country and firm level determinants of the outward FDI can be added to analysis in future studies and limitations of this study will be eliminated.

## CONCLUSION

In this chapter, the effects of home country specific factors on outward FDI of developing countries are discussed. Cross-border investment activities from developing economies have continued to rise from 1980s until today and outward FDI stocks of developing countries reach a significant volume as of today. So the factors affecting the outward FDI of these countries have importance. In accordance with this purpose, panel data analysis is performed with the data of BRICS and Next Eleven countries for the period from 1994 to 2014. Inward FDI, GNI, consumer price indices, currency exchange rate, total labour force, total export and import of goods and services, lending interest rate, patent applications and high-technology exports are used as independent variables of the analysis. The results of the analysis reveal that inward FDI, interest rate and technological capability (approximated by patent applications and high technology exports) of home countries have positive influence on outward FDI of developing economies.

## KEY TERMS AND DEFINITIONS

**BRICS:** An acronym for the combined economies of Brazil, Russia, India, China and South Africa.

**Greenfield Investment:** A form of foreign direct investment where a parent company builds its operations in a foreign market from the ground up.

**Human Capital:** A collection of resources—all the knowledge, talents, skills, abilities, experience, intelligence, training, judgment, and wisdom possessed individually and collectively by individuals in a population.

**Investment Development Path:** A theory that was originally introduced by Dunning in 1981 and explains the relationship between national income and net outward foreign direct investment in a five stage path.

**Next Eleven:** A term to represent eleven countries - Bangladesh, Egypt, Indonesia, Iran, Mexico, Nigeria, Pakistan, the Philippines, Turkey, South Korea and Vietnam.

**Panel Data Analysis:** A statistical model which enables the data sets containing cross section and time series together.

**Trade Openness:** A measure of economic policies that either restrict or invite trade between countries.

**UNCTAD:** The United Nations body responsible for dealing with development issues, particularly international trade – the main driver of development by its 194 member States.

# Chapter 36
# Proactive Law as Competitive Advantage in Crowdfunding

**Jack Wroldsen**
*Oklahoma State University, USA*

## ABSTRACT

*This chapter explains how the paradigm of proactive law as competitive advantage can help entrepreneurs succeed in crowdfunding campaigns. Business law scholars have developed theories of "proactive law" and "law as competitive advantage" to show how law can be transformed from an obstacle into a strategic business advantage. This chapter analyzes the evolving crowdfunding landscape through the lens of proactive law as competitive advantage. The chapter proposes several types of innovative securities designed to create competitive advantages in crowdfunding offerings. For example, one type would give crowdfunding investors long-term equity interests while simultaneously eliminating short-term corporate governance challenges for small crowdfunded companies. Apart from securities, the chapter also describes how a proactive approach to law can enhance crowdfunding campaigns in multiple areas, from intellectual property to tax efficiency. To conclude, the chapter suggests expanding the theory of proactive law as competitive advantage to additional areas of entrepreneurship, beyond crowdfunding.*

## INTRODUCTION

Despite encountering regulatory obstacles, crowdfunding continues to emerge as a viable business model for funding early-stage entrepreneurial ideas. This chapter proposes a theoretical construct to aid entrepreneurs in carrying out crowdfunding offerings in the face of legal uncertainty. Specifically, this chapter investigates a concrete research question: How can the legal theory of proactive law as competitive advantage help entrepreneurs succeed in crowdfunding campaigns?

The chapter is organized as follows. It first briefly explains the legal landscape that different types of crowdfunding offerings confront. Then Part I develops a conceptual framework of viewing law proactively as a competitive advantage in crowdfunding campaigns. Part II applies the framework to provide specific examples of how entrepreneurs can leverage law to succeed in crowdfunding offerings.

To conclude, the chapter moves beyond crowdfunding to suggest how further research should develop the theory of proactive law as competitive advantage in the broader context of the disruptive innovation that entrepreneurship breeds. The chapter focuses on US law, though the principles of proactive law as competitive advantage are broadly applicable anywhere.

## BACKGROUND: REGULATORY LANDSCAPE OF CROWDFUNDING OFFERINGS

The origins of online crowdfunding were not auspicious. Initially, crowdfunding resulted in more cease-and-desist letters than business success stories. But over time, the creative force of entrepreneurship continues to propel crowdfunding models to break free from the antiquated legal shackles that have restrained crowdfunding's development. Accordingly, today's legal panorama for strategic management of crowdfunding campaigns is vastly improved—and significantly more complex—than just a few years ago.

From a legal perspective, entrepreneurs must choose one of two types of crowdfunding offerings: the fork in the regulatory road is whether the crowdfunding campaign will offer securities (e.g., stock, interest-bearing loans, or another form of profit-sharing interests) or something other than securities (e.g., a pre-purchased product, token rewards, or donative support of a nonprofit enterprise, including non-interest bearing loans). Laws treat crowdfunding offerings of *securities* differently from *non-securities* (Fallone, 2014). Of course, entrepreneurs may also develop hybrid crowdfunding campaigns that offer a combination of a security and a non-security.

The evolution of laws on crowdfunding of *securities* has differed markedly from that of *non-securities*. Both paths, though, epitomize the disruptive interplay between law and entrepreneurship. Innovative entrepreneurship can be a two-edged sword that both creates new business opportunities and simultaneously challenges, and even destroys, stagnant legal regimes. In crowdfunding, the unique paths that *securities* and *non-securities* forms of crowdfunding have traversed can be likened metaphorically to tree roots in both their power and resourcefulness.

### Laws on Crowdfunding of Securities

The history of crowdfunded securities exemplifies how the disruptive force of entrepreneurship can topple regulatory obstacles to build new industries—like tree roots that undermine the foundation of a cement wall, causing the wall to collapse. At crowdfunding's inception, a regulatory wall prevented entrepreneurs from offering equity securities through crowdfunding in the US (Hazen, 2012; Heminway & Hoffman, 2011; Pope, 2011). In 2010, for instance, a US crowdfunding company named ProFounder Financial invited entrepreneurs to sell stock in start-up companies to the general public over the Internet. Such a seemingly innocuous business model was in fact a direct assault on the regulatory wall that barred crowdfunding offerings of securities. As a result, ProFounder was forced to shut down its website and cease all crowdfunding activities (Bradford, 2012).

Another prominent challenge to the regulatory wall in the US occurred in 2011 through the online BuyaBeerCompany crowdfunding campaign. The crowdfunding initiative to buy Pabst Brewing Company enjoyed phenomenal viral success in social media. In six months it attracted over $200 million in online pledges from more than five million people. But the BuyaBeerCompany campaign offered an "investment certificate" to crowdfunding contributors in a way that violated US securities laws, so gov-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

ernment regulators shut down the illegal campaign before the company could collect investment funds and purchase the target beer company (Bradford, 2012).

In view of these legal setbacks to crowdfunding offerings of equity securities in the US, a broad coalition of social media activists, business leaders, scholars, and politicians banded together to advocate legal reform (Wroldsen, 2012). And by 2012, the crowdfunding seeds planted by entrepreneurs and watered through social media had spawned invasive tree roots. The roots burrowed under the cement wall of legal obstacles that outlawed crowdfunding offerings of securities, causing the wall to crumble. The CROWDFUND Act was signed into law in the US on April 5, 2012. The Act creates, and directs the Securities and Exchange Commission (SEC) to implement, a limited channel for small or start-up companies to sell up to $1 million of securities per year to the general public through crowdfunding (Bradford, 2012).

The entrepreneurial victory is tempered, though, because the Act has yet to become operational, as the SEC has not yet published final regulations. In addition, the Act is fraught with legal requirements that may add excessive costs that limit the Act's usefulness for start-up companies (Bradford, 2012; Hurt, 2015). Nonetheless, the Act represents an important step forward in efforts to legalize US crowdfunding campaigns that offer securities to investors.

As discussed in Part II below, by creating the possibility of online crowdfunding for securities, the CROWDFUND Act lays the groundwork for entrepreneurs to seize competitive advantages in crowdfunding offerings. And though this chapter addresses US crowdfunding laws specifically, laws in other countries (e.g., the U.K., Nordic countries, France, Italy, Germany, Hong Kong, Australia, Egypt) are moving in a similar direction (Weinstein, 2013). Thus, all over the world opportunities are opening up for entrepreneurs to create competitive advantages through crowdfunding.

## Quasi-Crowdfunding Offerings to Wealthy Investors

Before proceeding to a more detailed discussion of how entrepreneurs can use law proactively in crowdfunding campaigns, it is helpful to sketch briefly two other emerging trends in online securities offerings. The first is online stock sales made exclusively to wealthy investors. The second is online peer-to-peer lending.

Apart from the CROWDFUND Act, securities in start-up companies can also be sold online in quasi-crowdfunding offerings to wealthy investors, known in the US as Rule 506 offerings. The JOBS Act of 2012 made it legal in the US for start-up companies to advertise stock sales to the general public over the Internet, so long as the companies only sell stock to so-called accredited investors. In brief, accredited investors are investment companies (e.g., private equity firms) and wealthy individual investors (e.g., people having over $1 million in net worth or $200,000 in annual income) (Parsont, 2014).

Hence, the tree roots that toppled the regulatory wall barring crowdfunding offerings also destroyed the barrier that prevented entrepreneurs from openly advertising their stock offerings to wealthy investors. Though selling securities only to accredited investors can hardly be characterized as true *crowd*funding—a group of wealthy investors is not the same as the diverse crowd that makes up the general public—the regulatory barriers are significantly fewer than those guarding crowdfunding offerings. Predictably, online stock offerings that are only available to wealthy investors are a common business strategy of private companies in the US and many other countries (Parsont, 2014; Pollman, 2012).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Peer-to-Peer Lending in Crowdfunding

Another form of securities crowdfunding that has thrived even before passage of the CROWDFUND Act is peer-to-peer lending of interest-bearing notes. Under US securities laws, interest-bearing crowdfunded loans typically qualify as securities subject to regulation. But where crowdfunding of equity securities required a new law (the CROWDFUND Act), the crowdfunding business model of interest-bearing peer-to-peer lending managed to fit within the existing regulatory framework. In short, crowdfunding websites that facilitate interest-bearing peer-to-peer loans (such as Prosper and Lending Club) register the loans with the SEC to avoid violating securities laws (Chaffee & Rapp, 2012; Verstein, 2011).

## Laws on Crowdfunding of Non-Securities

Beyond *securities* offerings, entrepreneurial creativity also triumphed with respect to crowdfunding of *non-securities*. The triumph, though, was of a dramatically different character than the development of legal opportunities for crowdfunding of *securities*. The development of the crowdfunding market for non-securities shows how entrepreneurs exploit small cracks in the regulatory minefield to grow thriving new industries—like a tree sprouting from amidst the rocky, arid terrain on a rugged mountain top.

Some of the first green shoots were websites that deftly avoided the heavily-regulated world of securities offerings. These websites prohibited crowdfunding offerings of stock, or any other security (such as interest-bearing loans). Instead, the sites sought to nurture innovative crowdfunding business models in the regulatory fissures where securities laws do not apply. For instance, several sites facilitated crowdfunding campaigns that offered online contributors a variety of rewards (like a collector's edition T-shirt, or insider access to a movie production) or the opportunity to pre-purchase innovative products (like a smartwatch, or a new video game). Other sites avoided securities laws by soliciting donations or offering non-interest bearing loans (such as micro-lending to small-business owners in developing countries). In these ways, the non-securities form of crowdfunding capitalized on an unregulated market niche and quickly expanded into a multi-billion dollar industry. Hundreds of websites have proliferated under the non-securities crowdfunding model, including sites like Kiva, Kickstarter, IndieGoGo, and SellaBand.

# PART I: PROACTIVE LAW AND COMPETITIVE ADVANTAGE

Progressing from this brief background of the entrepreneurial emergence of both securities and non-securities crowdfunding models, the remainder of the chapter explains how crowdfunding laws can be leveraged as an opportunity rather than lamented as a hindrance. The chapter's research method is a strategic review of business law scholarship on "proactive law" and "law as competitive advantage." The former stems primarily from European scholars and the latter from US researchers.

Methodologically, Part I provides a conceptual overview of the two theories. Previous research has developed the theories in the broad context of business management and executive decision making generally. But the theories have not been tested specifically in the entrepreneurial context of strategic management of crowdfunding campaigns. Accordingly, Part II applies the theories to the emerging regulatory schemes covering crowdfunding campaigns to assess their viability in the crowdfunding environment.

Then, the conclusion interprets Part II as a first step in a larger project. Crowdfunding can be viewed as an example of disruptive innovation where new technologies (aided by new laws) give rise to new

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

business models that can threaten traditional businesses. If theories of proactive law as competitive advantage yield insights for crowdfunding entrepreneurship, as Part II contends, then future research should expand the theories to encapsulate disruptive innovation in all of entrepreneurship, not solely entrepreneurship expressed through crowdfunding.

## Conceptual Framework: Proactive Law

In Europe, the Nordic School of Proactive Law (2015) has advanced the perspective that law should be embraced as an asset, not avoided as a liability. Instead of reacting to legal problems that are forced upon a company, often in the form of *ex post* litigation, a proactive law approach considers *ex ante* how to use laws and structure business decisions to avoid legal disputes altogether. Proactive law is thus preventive rather than reactionary, analogous to healthcare treatment that aims to avoid disease (e.g., vaccinations) and foster well-being (e.g., exercise and nutritious diet) instead of cure sickness after the patient is already ill (Siedel & Haapio, 2010).

Beyond simple prevention of legal problems, proactive law also promotes legal strategy as a core component of business strategy. Proactive law invites insights from other business disciplines in order to guide legal decisions towards accomplishing business goals, not merely avoiding negative outcomes. For example, from its inception the proactive law movement has found natural synergies with information technology (Siedel & Haapio, 2010). And synergies abound in many other business disciplines, such as marketing, sales, finance, management, and accounting. Proactive law is a forward-looking approach to law, integrating legal strategy into business goals before any legal problems arise.

## Conceptual Framework: Law as Competitive Advantage

In the US, a similar theoretical approach to proactive law has developed, but with different terminology. Viewing law as a competitive advantage in business, US scholars apply to the legal field the competitive advantage paradigms from strategic management research (Bagley, 2010; Bird, 2008, 2011; Siedel 2002; Siedel & Haapio, 2010, 2011). One prominent strand of this research defines a firm's sustainable competitive advantages vis-à-vis the firm's rivals as including only those resources of the firm that meet four criteria (Barney, 1991). First, a resource must provide value. Second, it must be rare or unique. Third, the resource must be difficult for competitors to copy. And fourth, there must not be equivalent substitutes for the resource.

Applying the four-pronged strategic management paradigm, legal scholars have demonstrated that a firm's legal environment is an intangible resource that can function as a sustainable competitive advantage (Bagley, 2010; Bird, 2011). The four attributes that strategic management research mines for competitive advantage can be applied to law as follows. First, strategic management of a firm's legal environment undoubtedly creates value for the firm. Whether the value springs from mere avoidance of costly legal violations or arises from revenue-generating activities such as patent protection, a firm's legal strategy (or lack thereof) has the unambiguous potential to contribute positively or negatively to the firm's bottom line. Especially in the Internet age, where social media can impact a firm's public image so quickly and powerfully, crafting a legal strategy that leads to a favorable public reputation can be vital to maintaining goodwill and promoting business opportunities.

Second, though laws themselves are obviously not rare, a firm's own particular mix of legal issues is often unique. The uniqueness arises from a host of different decisions that firm management makes to

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

position the company to confront certain laws and not others. For example, a firm incorporated in one jurisdiction (say, France) faces different corporate laws than a firm in another jurisdiction (say, Delaware). Further, a firm that relies on many part-time or contract workers encounters different employment laws than a firm with a predominantly full-time workforce, and in either case the labor laws vary greatly if workers unionize. Similarly, if a firm defends its intellectual property through closely-guarded trade secrets (such as Coca-Cola's renowned but confidential recipe), then its legal concerns vary enormously from a company that pursues an active patent portfolio (such as Apple or Samsung). In sum, through a multitude of small and large managerial decisions, a firm positions itself to confront its own unique, or rare, blend of legal and regulatory issues.

Third, a firm's strategic decisions with regard to certain legal issues can be difficult for competitors to copy. In the first place, imitating a competitor's legal strategy requires knowing what the competitor's legal strategy is. But legal advice is usually confidential and privileged. And to the extent legal advice is discerned through a company's observable actions, the cause and effect relationship can be ambiguous. Legal strategy can also be difficult to imitate when it is embedded in company relationships, whether relationships with regulators, employees, customers, or suppliers. For example, legal contracts form the basis of commercial relationships, but the relationships are more complex than what can be reduced to contractual provisions. Therefore, even if a firm could copy a competitor's contract verbatim, the contract's words stand for a much more nuanced social relationship that is not easily cloned. Relational aspects such as trust, shared plans and goals, cooperation, and opportunism—though represented and memorialized through legal contracts—in practice transcend the documents themselves. Legal contracting strategy, then, can only be mimicked through complex interpersonal behavior and performance, not mere reproduction of words on a page (Bird, 2011; DiMatteo, 2010).

The fourth component of resources that offer sustainable competitive advantages—lack of substitutes—is also true of a firm's legal environment. In the modern economy, there are no complete substitutes for the rule of law. Companies cannot opt out of the legal regimes that mandatorily apply in their jurisdictions. Even though some firms and individuals operate at the margins of the mainstream economic and legal system (e.g., the informal or extralegal economy) or establish alternate means of transacting business (e.g., close-knit communities that engender trust among members), ultimately the activities are still subject to laws that apply in the location where the activities take place. Furthermore, in the long term, commercial activities that seek independence from the formal legal system are difficult to scale into the mainstream economy without also integrating into the formal legal system.

Firms do have flexibility in determining which substantive laws apply to them most directly (as discussed above with respect to the rarity component of the competitive advantage analysis), but a company would be hard-pressed to develop a substitute legal environment to govern its affairs in place of the existing legal system. Accordingly, if a firm achieves a competitive advantage through use of laws and the legal system, a rival firm will not easily erode that competitive advantage by substituting an equivalent legal system, notwithstanding marginal competitive threats from extralegal transactions or close-knit communities.

In sum, law can function as a sustainable competitive advantage. A firm can leverage law to create value and cultivate its own unique mix of legal issues. And a firm's creative use of law can be difficult for competitors to copy or design around with equivalent substitutes.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Conceptual Framework: Crowdfunding Offerings

So, strategic management of a firm's legal environment can be conceptualized through the related theories of proactive law and law as competitive advantage. Next, the theories can be deployed to further the purpose of this chapter: how can entrepreneurs use crowdfunding laws proactively to foster competitive advantage in crowdfunding offerings? As an initial step, a proactive law approach integrates legal strategy with business strategy from the outset. In crowdfunding, failing to involve legal strategy can be disastrous because an otherwise successful crowdfunding effort could be entirely derailed by regulatory violations. For instance, had the organizers of the BuyaBeerCompany crowdfunding campaign consulted legal counsel before launching the campaign, they could have structured the offering to comply with securities laws. The difference could have meant going down in history as one of the most successful crowdfunding efforts ever ($200 million from five million participants!) instead of being remembered as a vivid illustration of failed legal (and thus failed business) strategy.

Beyond avoiding calamity, a proactive law approach is driven by affirmatively achieving business goals. To apply proactive law in the crowdfunding context, then, it is a necessary first step to identify the business priorities that the crowdfunding offering is designed to achieve. Once the company's priorities are identified, legal requirements can be brought to bear on deciding how best to achieve the business goals.

For example, is the primary objective of the crowdfunding offering to deepen the public's awareness of a company through social media (a marketing objective), or simply to raise money (a finance objective)? If marketing goals are preeminent, then what kinds of incentives are most effective at attracting attention in the online, social media environment? For example, would the target market be more interested in buying shares of stock, pre-purchasing a creative product, lending money to the company, engaging in a creative contest, or participating in an online dialogue within a select community? Perhaps the business goals would coalesce around a desire to increase social media exposure, create an online community of like-minded people, and invite ideas for future product development, for example. In that case, a proactive approach to crowdfunding laws might suggest a non-securities crowdfunding offering in order to lessen legal hurdles without sacrificing company objectives.

In contrast, say the business goals of the crowdfunding offering were primarily to raise money, with less emphasis on the marketing objective of broad public exposure through a wide crowdfunding campaign. In that situation, a proactive legal approach might develop a legal strategy involving a securities offering to wealthy investors in order to most effectively achieve business goals. There would be no legally-imposed limit on the amount of money the company could raise, so long as only accredited investors purchased stock in the offering. The legal strategy would therefore achieve the business goal of raising as much investment capital as possible. But such an approach is not without business risk: if the offering appealed to the general public, then a company could squander potential goodwill because non-wealthy investors would be legally barred from participating. For this reason, legal strategy should follow business priorities in designing crowdfunding campaigns that target essential business objectives.

## PART II: CROWDFUNDING LAWS AND COMPETITIVE ADVANTAGE

Entrepreneurs are well served by proactively uniting legal strategy with business objectives at the beginning of a crowdfunding offering. Doing so not only helps prevent future legal problems but also works to

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

achieve business goals. Part II deepens the analysis and describes more specifically how entrepreneurs can cultivate competitive advantages by using law proactively in crowdfunding offerings.

The first suggestions are made with respect to crowdfunding campaigns that offer *securities*: entrepreneurial companies should offer innovative crowdfunding securities that cater to the strengths of crowdfunding investors while simultaneously eliminating corporate governance problems associated with crowdfunding offerings of securities. Afterwards, the chapter highlights how entrepreneurs can use law proactively in crowdfunding offerings that include *securities* or *non-securities* in order to prevent future legal problems and maximize the value of crowdfunding efforts.

## Corporate Governance and Crowdfunded Securities

As described above, a resource that functions as an enduring competitive advantage creates value, is unique (or rare), is difficult to imitate, and lacks substitutes. Especially because laws related to crowdfunding of securities are so new and remain in flux, substantial opportunities exist to develop competitive advantages. But the opportunities to seize competitive advantage in crowdfunding offerings of securities are often masked by the challenges that crowdfunding poses for traditional stock offerings. Typically, start-up companies seek a small number of investors who each invest a relatively large amount of money, often either angel investors or venture capitalists. Start-up companies have limited resources and therefore justifiably want to avoid the logistical difficulties and corporate governance concerns involved with managing relationships with many investors. In addition, start-up companies value the advice and connections that sophisticated investors (like experienced angel investors and venture capitalists) provide to fledgling operations.

For the most part, crowdfunding of equity securities runs completely counter to all of these natural impulses of start-up company founders. Understandably, then, there are multiple reasons why entrepreneurs might hesitate to embrace stock offerings through crowdfunding. Traditionally, company founders would be crazy to accept hundreds, or thousands, of small investors, yet in a crowdfunding offering a company would seek exactly that. Furthermore, many crowdfunding investors would likely not have extensive investment experience with start-up companies. Coupling a lack of investment experience with the inherent uncertainty of start-up businesses is a combustible recipe for crowds of disgruntled shareholders.

And many disgruntled shareholders in a start-up company presents numerous corporate governance concerns for management. For instance, shareholders have the right to vote, whether for directors on the board, amendments to the company's governing documents, or fundamental changes to the company's business, such as a merger or large acquisition. For a small company, managing shareholder votes when hundreds or thousands of investors are involved can be an excessive cost and intrusive distraction. In addition, shareholders, as partial owners of the company, can demand to see the company's books and records, which can be not only time-consuming and inconvenient but also the impetus behind shareholder lawsuits (Schwartz, 2013).

Apart from voting rights and requests to inspect books and records, shareholders can also propose shareholder resolutions for management's consideration. Resolutions can be a powerful tool for shareholders to spread complaints or bad press about the company, especially in crowdfunding's social media environment. More aggressively, and depending on a variety of factors, shareholders can launch proxy contests and tender offers in an effort to oust company management and take control of the company (Schwartz, 2013).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Finally, the company's directors and officers can have personal liability to shareholders for breach of fiduciary duties. Potential personal liability for entrepreneurs can be a huge disincentive to offering stock to the general public, especially in view of the high uncertainty and unpredictability of start-up companies. Companies may purchase directors' and officers' (D&O) insurance to protect management against personal liability, but it would be yet another cost and distraction for a small company to deal with as a result of having shareholders. In sum, the costs, logistical complications, and legal risks associated with having hundreds or thousands of small shareholders could be enough to scare an entrepreneur away from selling stock through crowdfunding (Schwartz, 2013).

## Transforming Concerns into Opportunities

With so many potential negatives, it is fair to ask why any rational start-up entrepreneur would dare to offer securities through crowdfunding (Dorff, 2014). And precisely in that question lies the opportunity for entrepreneurs to use crowdfunding laws proactively to develop competitive advantages. The unsettled landscape of securities crowdfunding affords the opportunity to create value through a differentiated, unique stock offering that would be difficult for rival firms to imitate. And a value-creating, unique, and inimitable resource without clear substitutes is the essence of a competitive advantage.

To accomplish such a feat, a proactive approach to law must transform obstacles into opportunities. The primary obstacles to a crowdfunding securities offering, beyond the potential costs of preparing the offering, are ongoing corporate governance obligations owed to a large number of shareholders, and the concomitant risks that arise from such obligations. A proactive approach must ameliorate the corporate governance concerns without sacrificing the reasons investors would want to participate in a crowdfunding offering of securities. Those reasons might vary in some situations, but in large part rational investors would be motivated to invest in crowdfunded equity securities offerings in order to be ground-floor owners of a company that could grow and produce a sizeable return on investment.

Surely the motivations of backers of *non-security* crowdfunding offerings might differ. In that situation, backers often have motivations that are not purely financial. Maybe they believe in the social mission of the crowdfunding initiative. Perhaps they are fans of the creative work that the crowdfunding sponsor is developing. Or they are simply pre-purchasing a product they find appealing.

But the primary reason for offering securities through crowdfunding is to give backers a share in the upside potential of the business idea. When developing a proactive approach to a securities crowdfunding offering, then, it is important to keep investors' interests in focus. At the same time, entrepreneurs must avoid the numerous downsides of a start-up company having hundreds or thousands of small investors, especially in relation to corporate governance complications.

## Securities Designed for Crowdfunding

One creative solution is to design unique securities that are specifically tailored to crowdfunding. And scholars have put forth at least three proposals that entrepreneurs could fine tune and implement to create a competitive advantage. The three possibilities relate to using the flexibility of contracts to avoid the burden of shareholder rights, including 1) future rights to own stock, with no short-term shareholder rights (O'Connor, 2014; Wroldsen, 2012), 2) short-term profit sharing, known as "unequity," instead of long-term stock ownership (Heminway, 2012), and 3) debt securities instead of equity securities (Schwartz, 2013). If crowdfunding is to evolve as a new form of investing in start-up companies, en-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

trepreneurs should not shy away from experimenting with novel forms of securities that are uniquely tailored to crowdfunding's strengths and weaknesses.

First, entrepreneurs could design securities that give investors a share of any long-term stock appreciation but remove shareholder rights in the short-term. A similar approach would be to sell initially only the *right* to purchase a future security—with the actual security to be issued at a later date—so as to ensure that crowdfunding investors do not have shareholder rights unless and until the start-up company becomes a success. Either way, the goal would be to give investors what they want (i.e., a chance to share in the long-term upside potential of a promising start-up venture) while also letting small companies avoid the corporate governance downsides of having excessive numbers of small shareholders. Crowdfunding investors would lose the voice associated with shareholder rights, but many crowdfunding investors might view the sacrifice of formal shareholder rights as an acceptable trade-off because crowdfunding investors could be more focused on expressing their voice through social media than through exercise of traditional shareholder rights.

## Non-Voting Convertible Preferred Stock

More specifically, one way to structure the securities would be similar to non-voting convertible preferred stock that early-stage investors already frequently purchase, outside of the crowdfunding context. The approach is born out of the venture capital community where non-voting convertible preferred stock has become a complex investment instrument that reflects the requirements of venture capital investors. In brief, preferred stock is a flexible contractual instrument that allows investors to specify particular rights that are appropriate for particular investments. When investing in start-up companies, for example, venture capitalists typically negotiate control rights and representation on a start-up company's board of directors, along with numerous other investor protections contained within the preferred stock instrument, such as preemptive rights, anti-dilution protection, and registration rights (Gilson, 2003; Smith, 2005).

To work effectively in crowdfunding, non-voting convertible preferred stock would likely need to be modified from the form used in venture capital investment transactions (Wroldsen, 2013). An innovative entrepreneur could offer crowdfunding investors a simplified version of non-voting convertible preferred stock. The stock could be sold without any voting or other corporate governance rights. Then, upon a future triggering event, such as an acquisition of the company or an initial public offering (IPO), the non-voting preferred stock would convert into common stock, giving the investor an equity ownership position in the company (see example below under "Competitive Advantage: The Case of Oculus Rift").

From the investors' perspective, the key components of the preferred stock must ensure that investors are protected against dilution of the value of the shares and have the right to continue investing in future crowdfunding offerings. From the company's perspective, the key component would be that the crowdfunding shares cannot convert to common stock until the company is large enough, and successful enough, to manage the logistics of a large stock conversion and the corresponding rise in corporate governance obligations. For an enterprising entrepreneur, the field is ripe for offering crowdfunding investors a simple equity instrument that provides upside potential for investors while simultaneously not overwhelming the start-up company with corporate governance headaches.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## Future Rights to Equity Ownership

Another way to accomplish a similar goal would be to crowdfund solely a *right* to purchase securities in the future instead of selling the securities themselves in the crowdfunding campaign. This approach provides more certainty that crowdfunders do not have any shareholder rights because initially they do not even own non-voting preferred stock. Instead, they own a contractual right to either a future number of shares or a future percentage ownership of the company. But that future ownership would only spring into existence if the company reached certain milestones, such as specified revenue figures, an acquisition event, or an IPO. In addition, granting future rights to equity avoids the notoriously acrimonious haggling over the speculative valuation of an early-stage venture because the valuation need not be fixed until a later stage in the company's development.

For instance, the company could set aside a certain number of shares, or a certain total ownership percentage (e.g., up to 10 percent of the equity interests of the company, on a fully diluted basis), as a pool that would be available to crowdfunding investors only if a future qualifying event occurred. Akin to pools of shares available only to employees, this approach would provide certainty as to the company's total commitment to crowdfunding investors (e.g., up to 10 percent, or some other percentage, of the company's total shares would be earmarked for crowdfunding investors). The company could then engage in multiple rounds of crowdfunding offerings as the value of the company increased, while still retaining the cap on total equity available to crowdfunding investors. And past crowdfunding investors could hold pre-emptive rights to participate in subsequent crowdfunding offerings. Pre-emptive rights would allow crowdfunding investors to continue to invest in the company's crowdfunding offerings, thereby avoiding substantial dilution of their positions when additional crowdfunding offerings occur.

Compared to specifying the contractual terms of non-voting convertible preferred stock in advance of the crowdfunding offering—when uncertainty about the company is at its highest and firm resources are at their lowest—selling rights to future ownership holds the advantage of greater simplicity. Of course, complexities would inevitably arise if the company reached its growth milestones and issued the shares that were previously promised to crowdfunding investors. But at that point the company would have more resources to address a complex stock offering. The approach would allow crowdfunding investors to realize long-term profits if the start-up company turned out to be successful. Simultaneously, the approach would postpone the corporate governance problems that arise when a small company has many shareholders until after the company became successful, if ever.

Outside of crowdfunding, the venture capital community has recognized the need for simplified early-stage investment contracts (Coyle & Green, 2014; Janofsky & Loten, 2015). For instance, the influential Silicon Valley business accelerator, Y Combinator, developed a Simple Agreement for Future Equity (or "SAFE") in December 2013 (Graham, 2013). The SAFE is a "deferred equity investment" that avoids the inherent difficulties of establishing a valuation of an early-stage venture and "prioritize[s] accessibility over comprehensiveness" (Coyle & Green, 2014). The creator of the SAFE, Carolynn Levy, stressed that she developed the innovative contracts "for a community rather than for a client," which fits crowdfunding's social and interconnected ethos perfectly (Coyle & Green, 2014). Conceptually, then, the SAFE could be a harbinger of what crowdfunding investment contracts that promise future equity ownership may look like someday.

## Competitive Advantage: The Case of Oculus Rift

Beyond the specifics of how the crowdfunding offering is structured, in principle entrepreneurs can achieve competitive advantage by offering crowdfunding investors a long-term profit-sharing interest that is decoupled from traditional shareholder rights. In place of shareholder rights, the company could encourage frequent social media interaction and be transparent about its operations in order to authentically involve investors in the company, even though the investors have no formal shareholder rights to enforce against the company. Such a strategy grows out of crowdfunding's native social media character and celebration of the wisdom of the crowd.

To date, though, crowdfunding communities lack access to an investment interest in the company's long-term prospects, particularly in the US. A company that seized the opportunity to provide such a long-term profit-sharing interest (once legally permitted), along with the existing community aspects of crowdfunding, would immediately distinguish itself from the hordes of firms clamoring for social media followings based solely on crowdfunders' affinity for the company, its product, or its mission. The strategy would be an ideal application of proactive law's emphasis on designing a legal solution (i.e., long-term ownership interests for crowdfunders but without short-term shareholder rights) to further a business goal (i.e., a more cohesive social media community unified through mutual profit incentives).

For example, the Oculus Rift crowdfunding campaign and subsequent sale to Facebook is illustrative. In 2012, the US virtual reality company Oculus VR raised approximately $2.4 million from over 9,500 people through a rewards-based crowdfunding campaign on Kickstarter to further its development of a virtual reality gaming headset known as the Oculus Rift. Then, in 2013, Oculus raised $91 million in traditional venture capital equity financing. In 2014, less than two years after the Kickstarter campaign, Facebook purchased Oculus for $2 billion—before Oculus had even shipped a retail product (Mitchell, 2014; Gara & Kolodny, 2014).

Though the Oculus founders and the venture capitalist investors hit the jackpot financially, many of the crowdfunders who had supported Oculus in the Kickstarter campaign were livid. The Kickstarter supporters received nothing when Oculus was acquired, and some viewed the transaction as a betrayal. They were not shy about voicing their displeasure on social media, "raging" against the Facebook sale and "flooding the Kickstarter page with negative comments" (Makuch, 2014). A statement summing up much of the frustration was, "I backed Oculus Rift on Kickstarter and all I got was this lousy T-shirt" (Berman, 2014). Had Kickstarter backers received equity for their contributions, estimates for the return on investment ranged from 145x to 200x (Barnett, 2014; Jeffries, 2014).

If a start-up company sold long-term equity interests to crowdfunding investors—instead of merely providing rewards, like T-shirts—then crowdfunders could share in celebrating an exit event for $2 billion as a tremendous success. Social media would buzz with glowing testimonials about the company. Instead, the exit event for Oculus embittered some of the company's own supporters and ignited a firestorm of criticism on social media. Learning from the Oculus example, entrepreneurs should proactively create long-term equity interests for crowdfunding investors, even while eliminating shareholder rights prior to an exit event. This approach can cultivate a mutually-beneficial relationship in which crowdfunders do not feel used but instead are welcomed as long-term participants in the company's success.

## Competitive Advantage: Equity Ownership for Crowdfunders

The strategy of providing crowdfunders with long-term equity interests without shareholder rights in the short term could meet the four criteria for turning a company resource into a lasting competitive advantage. First, it has the potential to create value in the form of cash investments that the company receives from crowdfunders in exchange for long-term equity interests in the company. Presumably, the company could raise more funds by selling equity interests than it could by using a non-securities form of crowdfunding. Even more importantly, the company could avoid alienating the crowdfunding backers who supported the company in its start-up phase. By sharing a portion of the upside potential in the company with crowdfunding supporters, the company could build value by crafting a long-term relationship of trust and mutual benefit.

Second, the strategy would be unique, at least initially, because crowdfunding laws have historically prevented such an approach. Once legal, though, the strategy would still require rare executive foresight, combining marketing acumen, financial creativity, operational dexterity, and legal complementarity. Third, in part due to the rarity of the offering, the strategy would be difficult to imitate. It would be an organic strategy that would define the organization itself rather than a simple contract that could be copied. All departments of the company would need to focus on the crowdfunding community, so competitors would need to emulate an entire organizational form in order to imitate the strategy.

Fourth, there are not any simple substitutes. One of the main reasons equity crowdfunding is in a nascent stage is that laws historically prohibit the practice. Apart from new crowdfunding laws (such as the CROWDFUND Act), there are no other legal methods for small, non-public companies to sell profit-sharing interests to the general public (registered stock offerings typically only make sense for large companies).

## Short-Term Profit-Sharing

An additional method for using law proactively to create innovative securities that capture competitive advantages in crowdfunding include "unequity" interests. Unequity interests are short-term profit-sharing securities stripped of corporate governance rights (Heminway, 2012). They are securities because they have a profit-sharing (or revenue-sharing) component, but they do not give investors any shareholder rights or long-term ownership interests. A start-up company might find unequity interests attractive for a time-bound sales opportunity: in exchange for crowdfunding contributions that the company would use to manufacture its innovative product, crowdfunding contributors would receive a percentage of the revenue from sales of the product, through a pre-determined date.

For instance, in exchange for a contribution of $50, a crowdfunding backer could receive $.10 for each product sold prior to the end of the year. The crowdfunding backer would break even once 500 items were sold (500 x $.10 = $50). Any additional items sold during that year would result in profit for the crowdfunding backer who helped facilitate the company's creation of the product. At the end of the year, though, the crowdfunding backer with an unequity interest would have no ongoing rights to the company's business or revenues.

Advantages of unequity interests begin with their simplicity. Crowdfunders do not obtain shareholder rights or even enter into a long-term contractual relationship with the company. Instead, crowdfunders participate only in the risk that a new product might not sell as well as anticipated. But if the product succeeds, then crowdfunders share in the immediate benefit of the product's sales, through a certain

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

date or until a certain amount of the product is sold. The company avoids any long-term entanglements and complications with crowds of investors, but at the same time the crowdfunding contributors do not receive any of the future upside if the company goes on to great success. Unequity interests also offer attractive marketing and branding opportunities to build goodwill because supporters of the product receive a tangible reward (cash) in exchange for their support of the company's product, all within a short period of time.

## Crowdfunding Debt Securities

A third option for entrepreneurs to consider is crowdfunding of debt securities instead of equity securities (Schwartz, 2013). Debt securities typically do not grant shareholder rights. Crowdfunding lenders would receive only the contractual rights specified in a loan agreement, such as the right to collect unpaid debts.

From the company's perspective, the benefits include avoiding any corporate governance obligations to shareholders and retaining all of the company's equity ownership. But the company must repay the debt; whereas, when *equity* interests are sold, the company has no repayment obligation to meet, and when *unequity* interests are sold, the company simply pays a portion of its sales revenue to the crowdfunding supporter for a limited period of time. From the crowdfunding investor's perspective, a debt security offers a return in a specified amount over a defined time period, but the crowdfunding investor does not share in any upside potential of the company beyond repayment of the debt at the specified interest rate. Where securities laws already accommodate crowdfunded offerings of debt securities more readily than in the US (in the UK, for instance), small companies have already begun offering so-called "mini bonds" through crowdfunding (Espinoza, 2015).

## Competitive Advantage: Unequity and Debt

With respect to both crowdfunded unequity interests and debt securities, entrepreneurs have the opportunity to capture competitive advantages by using law proactively. Both types of offerings create value for the start-up company and would be unique crowdfunding campaigns in today's market (especially in the US). Both approaches offer a financial return to crowdfunding investors, so they go beyond current crowdfunding models that only provide a social media community, a reward, a donation opportunity, or a product pre-purchase.

As for inimitability, unequity interests, despite their short-term character, can be transformative of an organization's structure and thus difficult to replicate, especially if an organization carries out multiple short-term unequity campaigns over a long-period of time. Crowdfunding offerings of debt securities, though, would likely be easier for competitors to copy simply because debt is a well-understood, traditional form of financing. Neither type of campaign has an easy substitute because securities laws make it difficult for small companies to sell unequity or debt securities to the general public in ways other than crowdfunding.

## Crowdfunding Securities or Non-Securities

Apart from how a company might design innovative securities for crowdfunding, entrepreneurs can also use law proactively to enhance other aspects of crowdfunding offerings. Companies that offer a product or a reward (or nonprofits that solicit donations or facilitate non-interest bearing loans) through

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

crowdfunding confront fewer direct regulations than when crowdfunded securities are offered. But as non-securities forms of crowdfunding mature, best-practices and downside risks are emerging; hence, the remainder of the chapter alerts entrepreneurs to particular issues in crowdfunding where a proactive approach to law is vital. The recommendations below focus on *non-securities* crowdfunding campaigns, but most of the recommendations apply to *securities* crowdfunding, too. Seven potential concerns are highlighted, in the areas of intellectual property, litigation risk, corporate formation, and tax law.

## Intellectual Property: Making Ideas Public

A proactive approach to intellectual property laws can mitigate at least three legal risks. First, disclosing an innovative idea online without proper patent protection can diminish or destroy the value of the idea (O'Connor, 2014). A similar dynamic exists under trademark law with respect to company and product names and logos. Before launching a crowdfunding campaign, therefore, entrepreneurs should determine whether filing for patent and trademark protection are worthwhile for their inventions, names, and logos.

For example, if the company has patentable ideas, filing for patent protection in advance of public disclosure can be important. In the US, a patent application must be filed within one year after an idea is made public. After one year, the idea enters the public domain and ceases to be patentable. Furthermore, the US is a first-to-file jurisdiction, so during the one-year period after public disclosure, others can file a patent application on the idea, potentially before the original inventor. At a minimum, filing a provisional patent application before public disclosure of the idea can be a low-cost way to set a pre-disclosure filing date and reserve a one-year period to decide whether to file a full patent application.

Outside the US, the timing of patent filings is often an even more pressing matter: many countries require patent filings to precede public disclosure of the idea. In those jurisdictions, ideas that are made public before a patent filing is submitted cease to be patentable at all. Accordingly, start-up companies with patentable inventions (or valuable trademarks) are wise to move proactively to protect intellectual property rights before publicizing a crowdfunding campaign.

## Intellectual Property: Infringing the Rights of Others

A second risk under intellectual property laws that can be proactively managed relates to lawsuits alleging that a crowdfunding campaign infringes the intellectual property rights of others. Publicizing an idea online through a crowdfunding campaign can expose a start-up firm to trademark-, copyright-, and patent-infringement lawsuits from more established competitors before the start-up is equipped to defend itself. For example, trademark infringement would involve using a company or product name or logo that is too similar to another company's trademark-protected name or logo. Vetting proposed names and logos before launching a crowdfunding campaign is a simple proactive step that entrepreneurs can take to avoid unnecessary legal conflicts and expensive rebranding efforts.

Copyright infringement can arise if the crowdfunding campaign uses third-party images, videos, music, or other content without first obtaining permission (usually in the form of a license). If a company fails to take the proactive step of obtaining a license to use third-party content, or creating its own proprietary content, then the company's crowdfunding campaign can be stopped in its tracks, even before the company collects any of the crowdfunding contributions that were pledged. Crowdfunding sites typically disable campaigns immediately after receiving a simple notice that alleges copyright infringement. Under the Digital Millennium Copyright Act (DMCA), failing to disable the campaign can

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

subject the crowdfunding site itself to liability for permitting alleged copyright infringement to continue. Entrepreneurs, therefore, should use copyright laws proactively to prevent having an otherwise successful crowdfunding campaign abruptly shut down for an entirely avoidable reason.

Patent infringement lawsuits can be even more detrimental to crowdfunding success. Patent infringement allegations can distract management for extended periods of time and potentially cripple a company's business model. For example, FormLabs, a start-up company in the US that makes three dimensional printers, raised nearly $3 million from over 2,000 backers through a 30-day crowdfunding campaign on Kickstarter in 2012. The campaign allowed FormLabs to successfully create its first product, but the campaign also attracted the attention of an established competitor, 3D Systems, which sued FormLabs for patent infringement. The lawsuit alleged that FormLabs' product infringed the designs 3D Systems had previously patented (Woodward, 2014).

In December 2014, after two years of legal filings and negotiations, the parties reached a settlement. Fortunately for FormLabs, despite the two-year distraction for company management, its business was profitable enough to allow it to defend against the patent infringement lawsuit and continue to grow (Brewster, 2014). But the same cannot be said for many cash-hungry start-ups. The best bet for entrepreneurs is to proactively examine the potential for patent infringement before exposing promising inventions to the world through a crowdfunding campaign.

## Intellectual Property: Incorporating the Wisdom of the Crowd

A third intellectual property risk in crowdfunding campaigns can arise when companies incorporate product suggestions from crowdfunding backers. Without proper legal protections, incorporating the ideas of others into a product can lead to legal disputes over ownership rights. For example, if a crowdfunding contributor suggests a new product feature on the company's crowdfunding message board, and the company integrates the feature, is the crowdfunding contributor entitled to any compensation or ownership? From a legal perspective, it would be helpful to draft, in advance, clear terms that definitively assign to the company all ownership rights in any suggested features or modifications posted in connection with the crowdfunding campaign.

And from a marketing and public relations perspective, it would be wise to integrate legal strategy into business goals by proactively communicating with crowdfunding backers and expressing gratitude for the crowd's suggestions. After all, crowdfunding backers who feel appreciated and included as part of a community are less likely to spread bad press or pursue legal claims. Consequently, entrepreneurs should plan proactively to use intellectual property laws to their advantage by integrating crowdfunding marketing strategy with legal objectives to ensure company ownership of products that incorporate suggestions from the crowd.

## Crowdfunding Litigation

Beyond intellectual property risks, a proactive approach to law is also central to avoiding two primary litigation risks in crowdfunding. If the crowdfunding campaign fails to deliver what is promised, disgruntled contributors can potentially band together to file a class-action lawsuit. Alternatively, as at least one state attorney general has already done, government regulators can sue the sponsors of crowdfunding campaigns for violating consumer-protection laws (Gross, 2014). In the business planning phase, therefore, entrepreneurs should realistically assess the company's capabilities, including product specifications

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

and supply chain flexibility to meet demand spikes that can result in the wake of popular crowdfunding campaigns. Bold innovation that overcomes seemingly insurmountable obstacles is a hallmark of the entrepreneurial spirit. But in crowdfunding, overpromising and failing to deliver not only alienates backers and customers, it is a recipe for fraudulent misrepresentation lawsuits or other unsavory allegations.

### Corporate and Tax Laws

Finally, entrepreneurs who take a proactive approach to crowdfunding laws should not overlook two straightforward legal issues in crowdfunding that relate to basic corporate and tax law. Raising capital as an entity instead of as an individual can shield crowdfunding entrepreneurs from personal liability. Launching a crowdfunding campaign may be a personal decision to give creative voice to a dream. But raising money is a business activity, so establishing a business form for the business activities is usually a wise decision. Establishing a limited liability company or corporation is typically a simple and inexpensive task to complete online. Once the company is created, it is a good idea to obtain an employer identification number (EIN), open a bank account in the company's name, and conduct business in the company's name, while following applicable corporate formalities.

Lastly, strategic tax planning can help mitigate the effects of receiving significant crowdfunding income before incurring offsetting expenses. When raising money through a non-securities form of crowdfunding, such as Kickstarter's reward or pre-purchase model, the contributions a company receives are typically treated as income (not capital contributions, as in equity crowdfunding for securities) (Dietz, 2014). So, for example, if a start-up company with minimal income or expenses raises $1 million in a 60-day crowdfunding campaign, the cash influx can change the company's tax situation dramatically. If the company's tax year closes soon after receiving the income, there might be little opportunity to incur expenses to deduct against the $1 million crowdfunding income. Treating tax laws that apply to crowdfunding proactively, entrepreneurs can develop a plan in advance for handling crowdfunding contributions in a tax-efficient manner.

## CONCLUSION

This chapter demonstrates that the "proactive law as competitive advantage" theoretical paradigm yields valuable insights for entrepreneurs to execute crowdfunding offerings successfully. Incorporating a proactive, *ex ante* approach to law when planning the business aspects of a crowdfunding offering affords at least two benefits. First, like preventive medicine, companies can avoid crowdfunding's legal pitfalls altogether instead of being forced to treat legal maladies after they occur.

Second, using laws proactively can create competitive advantages in crowdfunding offerings. Developing a competitive advantage goes far beyond simply managing a company effectively. Competitive advantage grows out of a transformative culture that embraces law as a proactive opportunity and overcomes the natural tendency to view law as an obstacle. Entrepreneurs can create value by linking their legal strategy to their business goals, developing unique crowdfunding offerings, and cultivating a favorable public image through social media. The uniqueness, or rarity, of the crowdfunding campaign should complement a company's very identity, making the strategy difficult to imitate or replace with similar substitutes because of its intimate connection to a company's particular mission, organizational structure, or other foundational principle.

Beyond crowdfunding, the theoretical approach of "proactive law as competitive advantage" has much to contribute to further research at the intersection of law and entrepreneurship. This chapter demonstrates the viability of the theory in one area of entrepreneurship (crowdfunding). The next step in the research is to develop the theory in relation to entrepreneurship more broadly. For example, additional analysis should reveal how the paradigm of proactive law as competitive advantage applies in the context of disruptive innovation versus sustaining innovation. The former encapsulates new technologies that threaten existing market leaders, whereas the latter includes incremental improvements that existing market leaders make to their products.

Research on proactive law as competitive advantage should further illuminate the dichotomy between disruptive and sustaining innovation. For example, where first-mover advantage is high, as in disruptive innovation, does proactive law as competitive advantage serve as an even greater entrepreneurial incentive? Or is proactive law as competitive advantage an equally beneficial approach in the context of sustaining innovation?

This chapter takes an initial step towards uniting the study of entrepreneurship with theories of proactive law as competitive advantage. Crowdfunding, though, is only one example of entrepreneurial innovation in the modern economy. In view of the fundamental importance of entrepreneurship and innovation to international economic competitiveness, a greater understanding of the links between legal strategy and entrepreneurial success would be beneficial.

## KEY TERMS AND DEFINITIONS

**Competitive Advantage:** A company's ability to provide unique, long-term value in a superior way than its rivals.

**Corporate Governance:** How a company is managed and controlled, including, for example, rights to vote at company meetings, participate in board meetings, and receive periodic updates on performance.

**Debt:** Securities that offer the holder a pre-determined rate of return over a specified time period and typically do not give the holder corporate governance rights.

**Disruptive Innovation:** New technologies or business models that threaten status-quo market leaders.

**Equity:** Long-term, profit-sharing securities that give the holder corporate governance rights along with an ownership interest in the company.

**Preferred Stock:** Securities that specify particular rights and preferences, often combining elements of debt and equity securities and typically including corporate governance rights.

**Proactive Law:** A forward-looking approach to law that integrates legal strategy into business goals before legal problems arise.

**Securities:** Investment instruments that the Securities and Exchange Commission regulates (in the US).

**Unequity:** Short-term, profit-sharing securities that do not give the holder corporate governance rights.

# Chapter 37
# Objective and Subjective Aspects of Decision-Making Support at the Mesoeconomic Level

**Anastasia Y. Nikitaeva**
*Southern Federal University, Russia*

## ABSTRACT

*This chapter substantiates the importance of improving management effectiveness of mesoeconomic systems in current economic conditions and the features of mesoeconomy as a management object which defines the high complexity of decision making at the meso level. There are approaches, methods, and technologies which provide support of the decision making process via the integration of formal methods for objective data analysis and methods of accounting to solve semi-structured complex problems of mesoeconomy. A cognitive approach, and an approach involving the integration of the On-Line Analytical Processing and Data mining technologies with methods of a multi-criteria assessment of alternative, in particular methods of Multi-Attribute Utility Theory are considered in the chapter. Cognitive mapping of interaction between state and business in a mesoeconomic system are included as a case-study.*

## INTRODUCTION

Today evolutionary development of national economies in the global economic environment greatly depends on the level of management efficiency in meso-economic systems. This is due to the fact that the meso-level of the economy acts as a kind of an economic space center, the connecting element between individual economic entities of micro-level and a higher macroeconomic level of state or suprastate governance. On one hand, at the meso-level there is an opportunity to fully realize the systematic approach to management and to create effective institutional mechanisms enhancing economic development, but on the other hand to provide adaptation of the mechanism of management to tasks and features in the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

functioning of specific economic systems. Thus, firstly at the meso-level there is a possibility to transmit and implement managerial impulses of macro-level and through the stimulation of the formation and activation of certain economic ties and relations to achieve significant changes in the socio-economic development; and secondly, to adapt tools and institutes of development to the needs and the potential of concrete meso-economic systems, which are significantly different.

Together this allows considering meso-economies as a kind of development center which will create positive impulses that, in turn, will affect the entire hierarchical structure of the economy under condition of the effective management. Because of this and due to the binding of the economic potential to the specific areas and territories in the global economy, the formation of competitive advantages occurs mainly at the meso-level and the processes of globalization and regionalization or localization occur parallel.

The meso-economy is a complex, open, and dynamic socio-economic system. Thus, the specific features of meso-economic systems which are shown in the complexity of their structure, uncertainty, and unevenness of development, the inaccuracy of an assessment of parameters of such systems, differentiations of social and economic characteristics of components and subsystems, determines the complexity of making effective decisions in the managerial process. A significant number of tools have been developed in recent years to improve the efficiency of the decision-making process in economic systems of various levels.

However, in most cases the use of traditional tools of decision support at the meso-level is complicated either by insufficient data availability for analysis or the inability to rely only on objective indicators in managerial processes and so forth due to the importance to consider account the social (ecological/ethical/cultural) dimension of the development of meso-economic systems. Solving the problem of effectiveness of meso-economic management systems is possible through exploration of the targeted system and justification of decisions based on structuring of problems in complex and uncertain situations and the lack of statistical information about the current processes and phenomena.

This is possible by using methods and tools of neuroeconomics which allow encoding the subjective value of decision-making, determining the role of emotions in decision-making, investigating the interaction of emotional and rational mechanisms of decision-making, analyzing and modeling the basis of social and economic interaction and, thereby, overcoming the limitations of the classical economic theory and increasing the efficiency of decision-making processes at the meso-level.

This chapter focuses on explaining the approaches, methods, and technologies supporting management decisions at the meso-level of economy that take into account and integrate the objective and subjective aspects of managerial decision-making based on a combination of quantitative and qualitative procedures, including the analysis of possibilities of their application for the increase of management efficiency of meso-economic systems in modern economies.

## BACKGROUND

Over the past 10 years, meso-economic systems were deeply investigated by a number of research projects (e.g., Gorelova, Matveeva, & Nikitaeva, 2007; Kleiner, 2011; Kolesnikov, 2009; Wolfram, Torsten, & Henning, 2015; Ng, 1987). The term "meso-economics" dates back to the 1980s when several economists began to question a bridge between two main economic paradigms in the mainstream economics: micro- and macroeconomics. The term "meso-economics" has two meanings. First, it reflects the subject sphere of research – the part of a national economy located in economic space between the macro- and

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

micro levels. This sphere includes branches, markets, regions, major cross-sectoral economic systems, business networks and clusters grouped according to various criteria (Kleiner, 2011). However, meso-economics is the scientific discipline that studies this subject area and possesses specific approaches, methodology, and tools.

In some work devoted to meso-economic systems, the researchers focus on the formation of a unified theory of operation for all types of meso-economic systems, as well as the development of an integrated management methodology for the meso-economy. The creation of a methodological and methodical approach to the analysis and synthesis of meso-economic systems is most often based on the genetic characteristics of national economies and specific tasks of a certain period in its development (e.g., Kleiner, 2011; Druzhinin & Ionov, 2001; Inshakova & Samokhin, 2008). Along with general theoretical and methodological developments, significant amount of research is devoted to the study of specific types of meso-economic systems: regions, clusters, and industries; and development of managerial mechanisms and the technology for them (Amin,1999; Kleiner, 2011; Moulaert & Mehmood, 2010; Porter, 2001; Scott & Garofoli, 2007; Vázquez-Barquero, 2002).

Another perspective of the meso-economic systems consideration (especially clusters, networks and regions) suggests their study as various groups of institutionally-coordinated agents, interacting arenas and subpopulations of human agents, firms and other organizations. In accordance with this approach, the meso-economy is a complex system consisting of a large number of heterogeneous elements, interacting in nontrivial ways. Accordingly, the properties of meso-economic systems and forecasts of its development cannot be determined through analysis of these individual elements, but it requires a comprehensive study of the phenomenon of self-organization and behavioral processes (Wolfram, Torsten, & Henning, 2015, p. 421). This approach is closely connected to synergetic one for researching complex socio-economic systems (Knyazeva & Kurdyumov, 1999).

Considering the important role of meso-economy in ensuring successful economic development of the micro- and macroeconomic systems, a significant amount of research has been devoted to the development management of meso-economic systems (Granberg, 2005; Kiselyova, 2007; Kolesnikov, 2009). In scientific research on the development management of meso-economic systems, an important place has been occupied with cases and works revealing the specific features of meso-economies (Druzhinin, 2005; Puppim de Oliveira, Ali, 2011; Rodríguez-Pose & Comptour, 2011).

The understanding of the importance of effective management of meso-economic systems to ensure economic growth and development and simultaneously the complexity of decision-making process at the meso-level has led to the emergence of scientific activities aiming to develop novel approaches, models, and analytical tools for decision support in complex systems with semi-structured problems. Among these approaches, an important role is played by the cognitive mapping approach (Gorelova, Verba, & Zakharova, 2004; Knyazeva, & Kurdyumov, 1999; Vanwindekens, Stilmant & Baret, 2013; Gorelova, Matveeva, & Nikitaeva, 2007).

In addition, the development of decision making methods in complex socioeconomic systems has been implemented in other areas of researches in recent years. Despite active development of instrumentation and decision support systems based on quantitative data analysis (Lotov, Bushenkov, & Kamenev, 2004; Katsko, Krepishev, & Sennikova, 2011) and subjective methods of modeling the problem situation (Anich & Larichev, 1996; Pirlot & Bouyssou, 2009; Saati, 2008), integration of appropriate techniques, corresponding to meso-economic systems to improve the efficiency of their management development has not been sufficiently implemented.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Combining emotional (subjective) and rational (cognitive, objective) systems in the decision-making process recently has occurred in the course of research in neuroeconomics bringing together neuroscience, economic science, psychology, and several other disciplines (Klyucharev, Smits, & Shestakova, 2011). Studies on the duality of decision-making processes (Kahneman, 2003), mechanisms of subjective utility determination in the selection process out of the possible alternatives, risk account (Knutson, Taylor, Kaufman, Peterson, & Glover, 2005; Kuhnen & Knutson, 2005; Rangel, Camerer, & Montague, 2008), temporary discounting (McClure, Laibson, Loewenstein, & Cohen, 2004) are of particular importance in the context of the given research. However, for meso-economics and for improving the efficiency of decision-making at the meso-level, neuroeconomics, characterizing the peculiarities of emotional and rational systems of decision-making, is not used sufficiently.

Despite a considerable amount of research on the chosen area of interest, research on meso-economy management is mainly concentrated either on a strategic level of decision-making with help of methods of expert assessment and quality tools of strategic analysis, or on management of certain types of meso-economic systems or subsystems. This is largely determined by the complexity of decision-making formalization of procedures at the meso-level. There is an obvious lack of high quality of scientific papers on the development of methods of meso-economy management based on simultaneous consideration of objective and subjective characteristics of management process. The level of technological support of decision-making is insufficient for the effective management of complex socio-economic systems on the meso-level. In turn, research on the development of methods and tools to support managerial decision-making in complex systemsare more focused on the corporate sector of the economy and / or technological systems, and are insufficiently used in the management of various meso-economic systems.

Thus, sharing the attitude of researchers, highlighting the importance and complexity of effective management of the development of meso-economic systems, it is appropriate to focus in this chapter on identifying the specific characteristics of meso-economy as an object of management. The analysis of approaches, methods, and tools used in this area of research which consider the objective and subjective aspects of managerial decision-making, based on a combination of quantitative and qualitative procedures (methods of activating the thinking of experts and methods of formalization of complex systems, subjective methods of modeling the problem situation and quantitative data analysis) to improve the efficiency of the decision-making process at the meso-level.

## MANAGEMENT OF MESO-ECONOMIC SYSTEMS: FEATURES AND TOOLS FOR DECISION-MAKING SUPPORT

### Meso-Economy Features as an Object of Management

Theoretical studies and practical experience show that sustainable competitive advantages in the global economic system are largely dependent on geographically-localized factors (Amin, 1999). For example, studies by Enright (2000) show that out of 160 industrial clusters, more than 60% are world leaders and only about 20% are characterized by weak competitiveness. Comparable results were obtained in relation to the characteristics of the innovative capacity of clusters (Enright, 2000). Along with clusters other meso-economic systems demonstrate a higher level of competitiveness in today's global economy through the use of consolidated potential of businesses and synergies. The competition on the world

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

market increasingly involves the regions but not the individual enterprises and organizations at the microlevel. In recent years, this has led to increasing attention of researchers to meso-economic systems of different types.

On one hand, meso-economic systems can be considered an intermediate level between the macro- and micro levels of an economy which can provide a transfer of administrative impulses from macro to microeconomic level and get an appropriate feedback. On the other hand, in some extent it is an independent system, existing in countries with a market economy. Meso-economy represents a part of national economy located in the economic space between macro- and micro level. While microeconomy studies empirically verify existing objects – firms, for example – and their behavior, and macroeconomy operates on the aggregated data and the designed objects modeling this or that aspect of interaction of groups of economic subjects, the meso-economy is compelled to serve as the conductor of various levels of hierarchy of the economic sphere and to work with diverse and very different objects.

In fact, the meso-level of the economy is considered a certain economic space center, an intermediate link (or rod) connecting economic agents on micro and macro level of national and/or supranational governance. Additionally, meso-economic systems have a fairly high level of independence and integrity. Their size, structure, resource availability, and functioning features allow application of a systematic approach to managing the economy to create effective strategies and institutional mechanisms of development while ensuring the adaptation of the managerial mechanism by objectives and specific features of functioning of the economic systems at the meso-level.

Modern researchers have identified four main components of meso-economy:

1. Branch meso-economy (branches and subsectors of a national economy).
2. Interindustry meso-economy (inter-industry vertical complexes, steady agrarian and industrial complexes or military industrial complex).
3. Regional meso-economy (regions, territorial clusters, and other regional groups of organizations).
4. Interregional meso-economy which is based on the territorial social and economic formations. (Kleiner, 2011, p. 6).

In this case, such economic systems as branches of industry, regions, large inter-sectoral economic complexes, industrial clusters, and agglomerations could be treated as meso-economic systems which belong to the class of socio-economic systems and contain active elements. This means their basic element is the human being; human activity determines the characteristics of all processes of functioning and development of such a system. Connection, due to which these systems exist, characterize the complex and contradictory relationships between people based on their interests, values, motives and attitudes.

For example, from an economic point of view building a nuclear power plant may become a rational way to solve the electricity shortage problem in the region as a meso-economic system. However because of a number of reasons (e.g., for fear of emergencies with nuclear reactors), the population of the region can prevent this decision, preferring a more expensive way to purchase energy from the neighboring regions.

In spite of a large variety all meso-economic systems have some common features:

- The presence of independent objects in their composition.
- The presence of a complex set of relations between objects, including elements of competition, cooperation, coordination, and co-evolution.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The presence of many subjects, the development of which is non-linear, and the interaction has non-trivial character.
- Failure in determining the strategic priorities of development, based on formal criteria only.
- Absence of a single management center.

On this basis, it is possible to assume that it is inexpedient to apply directly the traditional methodology of macroeconomic modeling, based on concepts of perfect market or a planned regulation, either the methodology of microeconomic modeling, based on concepts of rational behavior of a subject and a choice for optimal solutions made by well-known criterion with given constraints for making effective decisions at the meso-economic level. Instruments of decision-making support at the meso-economic level should consider system characteristics of meso-economy, functioning on an integrated methodological platform of systemic, institutional, and evolutionary paradigms in economics (Kornai, 1998; Kleiner, 2011).

Meso-economy as a system is complex and can be characterized by a large number of elements and relations between them and the environment, different kinds of uncertainty, imprecision of quantitative and qualitative estimation of parameters in such systems, different levels and obviousness of the development, nonlinearity of processes inside the system, and many others. In this regard, the problem of forecasting and governance of complex systems development is being considered as semi-structured. Simultaneously, the need to establish effective governance mechanisms of meso-economic systems and the development of appropriate tools to support managerial decision-making process is becoming increasingly important.

The management of meso-economy from a system approach position assumes:

- Problems of meso-economy are defined with taking into account the relationship with systems of a higher level hierarchy which includes the considered system and with which it is linked by common goals.
- The purposes of meso-economy should be considered in connection with a system in general or with larger systems.
- Sustainable development of the system cannot be obtained by making small changes to existing accepted forms; it is based on planning, assessing and making decisions that involve new and positive changes for the system as a whole.
- The system approach and system paradigm are based on such methods of reasoning as the induction and synthesis, which are different from the methods of deduction, analysis and reduction, used to improve systems.
- Planning of the sustainable development of the meso-economic system represents a process in which the scheduler assumes the role of a leader, in order to lead, but not to be lead by someone (Gorelova, Zakharova, & Radchenko, 2006).

Thus, for effective system management of meso-economy, it is important to understand the specificity of its relationships and their mutual influence and to find, first of all, the points of the managerial influence, the activation of which will allow to achieve positive changes in terms of resource constraints in the system as a whole; secondly, to find ways for the effective activation of such points. This requires improving the model and analytical tools to support the corresponding decision-making. In such a case the process of decision-making at the meso-level cannot be fully formalized, as it heavily depends on the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

value orientations of individuals defining the strategy. However, the subjective approach to the decision making process in a given perspective may also not be sufficiently effective, because people without using appropriate analytical tools may not simultaneously take into account all the internal and external factors, affecting meso-economic development.

Meso-economy as a control object has its own peculiarities; thus, to accept effective administrative decisions it is important to use such methods and technologies that can identify patterns and characteristics of the appropriate system development and apply them to determining the strategic guidance and plans for their implementation, based on objective data and subjective preferences, use of the potential of economic and mathematical methods and human intuition, value preferences and experience of specific subjects of management.

## Abilities to Integrate Objectively and Subjectively Focused of Decision-Making Process Support Instruments

Over the twentieth century, the complexity of managerial decision-making has continuously increased and is today higher than ever before. A rapidly changing world, including many interrelated subjects and objects, constantly provides new challenges for decision makers. This is especially important in meso-economic systems due to the fact that to provide for their successful development it is necessary to make non-standard decisions in conditions of uncertainty. One of the main actual directions of increasing of administrative activity efficiency is its automation. The main results of automation include improving the quality, rapidity and efficiency of management decisions, and increasing the efficiency of management as a specific type of activity. Automation of administrative activity is performed using the entire set of available methods and affects the entire range of management activities. An increasingly important role, respectively, in support of the activities of the subject of management is played by the decision support systems (DSS), allowing to estimate a set of various alternatives and to choose the best opportunity.

The results of several studies show that many systems of decision support for the management of meso-economic systems, of most interest are On-Line Analysis Processing technologies (OLAP) which are an adequate instrument of consideration for problems with a complex structure. OLAP class applications and technologies are designed to collect, store, and analyze multidimensional data in support of the management decision making process. To be considered an OLAP application, the DSS is also required to be a high-speed system.

An important feature of OLAP is the ability to analyze large volumes of data describing the studied object or process from different angles by providing analytics with tools for working with multidimensional data. The same quantitative characteristics can be described, represented and evaluated from different sides. The system must provide a multidimensional conceptual view of data, including full support for multiple hierarchies, as this is the most logical way to conduct strategic analysis. The data that the application works with are coming from transactional systems. On the basis of the analysis of these data the report with which the user works is under construction. This report is the main instrument for working with an OLAP application. Reports the user creates on his own, choosing dimensions, levels of aggregation, or receives regular reports with pre-defined structure. Thereafter, different analytical tools are used to the data selected for concrete research.

For example, analysis of information on innovative regional clusters can be conducted on such measurements of measures such as types of products, years, companies-participants of the cluster and such measurements of facts as cost, selling price, and the amount of goods sold. In OLAP applications, in

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

addition to specific to OLAP methods, are methods used for the discovery of new knowledge such as Data Mining (DM) methods whch can be defined as the process of decision support based on the search of hidden patterns within the data (Parsaye, 1998).

Thus, the DM method is designed to detect previously unknown dependencies and works regardless of users, sometimes in fully automatic mode. As a rule, the application of this class handles very large volumes of data. DM methods focused on fulfilling the tasks of reporting, classifying, clustering, anomaly detection, induction rules, correlation, and regression analysis. In meso-economic systems, DM can solve a wide variety of tasks. For example, it can refer the regions of a particular cluster to increase the targeting of measures for economic policy or to optimize the selection of suppliers by product groups within the value chains for vertical clusters.

Actually, the OLAP application is to build a report that is a subset of the multidimensional cube and use in relation to them both OLAP-operations, and specific methods, for example, such as data mining. Analytical study of the problem with the use of DM is a specific process of obtaining new knowledge, built on the use of a variety of techniques which include decision trees, fuzzy logic methods, evolutionary programming, artificial neural networks, genetic algorithms, and other neuroeconomic methods.

A set of OLAP and DM methods used in combination are suitable for analysis of evidence and consideration of the problem situation from different sides, although it does not sufficiently supports the incorporation of subjective positions of decision-makers, and processing of information, bearing a qualitative assessment of objects. Therefore, it makes sense to use OLAP applications as a base platform for information-analytical support of decision making at the meso-level, but methodological apparatus of corresponding DSS should be expanded through the integration of technologies that allow taking into account subjective factors and parameters.

In other words, in the decision-making process in the meso-economic system the process of building a model of objective reality must followed by the process of creating the selection criteria based on their subjective assessment by the decision-maker. It is caused by the compliance of current state of economic system to the development purposes, and also the actually desirable future condition of the system is defined, eventually, by the person. However, the objective limits of human capacity for simultaneous assessment of multiple parameters determine the need for the application of specialized techniques.

In case of a large number of alternative criteria, the decision-makers' activity becomes so complicated that errors become inevitable. To solve problems with too much complexity for humans, multi-criteria methods for decision support are used. The model of preferences and policy of the decision makers is constructed using them. Methods based on models of subjective nature allow abstracting from the subject area and solve within a single algorithm the structured tasks of choosing between alternatives.

Widespread and repeated software implementation in the world theory and practice has received three approaches to multi-criteria assessment of alternatives in solving problems that lack of objective models:

- Analytical Hierarchy Process (AHP).
- Multi-Attribute Utility Theory (MAUT).
- ELimination Et Choix Traduisant la REalité (ELECTRE).

As the results of several studies show (Pletnyakov, 2012), the MAUT and AHP methods are the most promising for efficient working with a multidimensional OLAP-cube in the decision support system for making difficult decisions in relation to semi-structured problems. The process of using MAUT for

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

working with OLAP-cube is fairly simple, in its framework each containing important for making decision cube dimension is evaluated using a utility function (Pletnyakov, 2012).

Using a combination of these objective and subjective approaches and their analytical units allows:

- Determining accurately the position of decision-makers on the importance of indicators and criteria. These methods give the opportunity to express a position of decision-makers with high precision and to obtain a correct idea of the meaning of the criteria in needs for building integrated indicators based on the views of several different decision makers in different positions.
- Choose the alternative that best meets the criteria. In case of finding the exact values of criteria it is a technical problem to be solved by the following the algorithm of the method.
- In case of a wrong choice to correct the importance of a particular criterion and to use the assessment of the importance of criteria in the future.

In fact, implementation of the proposed approach first permits the analyzing of information on the construction of objective models of meso-economy, its subsystems and problematic situations, and then providing instrumental support for the subjective assessment of validity, and selection of targets and criteria of their achievement by the decision maker. This provides the opportunity to actually combine formal mathematical methods as well as intuition and experience of the specific people. Initially, empirical knowledge is used as a source of information and at the decision-making stage, experience and knowledge about the importance of certain factors which are not amenable to formalization, are used by management.

A methodologically valid decision-making process has significant advantages over a choice made only on the basis of experience and intuition of experts or decision-makers. Even in case of the wrong choice, it is known by what criteria it was accepted and it is possible to conclude that the position was wrong. If the decision-maker wishes to follow intuition, it is possible to receive positive result but not information about how the decision differs taken earlier, and if different, in what direction. In case of successful adoption of solutions based on special calculation and analytical methods, the replication of successful experiences is possible. Therefore, it is possible to expect essential increases of efficiency of decision-making processes in general, in case of integration of the considered methods of support of decision-making within a uniform system.

In this manner, the use of OLAP and DM methodologies in combination with the MAUT allows analyzing objective data across different meso-economic parameters, identify hidden dependencies and patterns of its development in an automated process and take into account the subjective preferences of the decision-maker while choosing strategic guidelines. However, the use of appropriate technologies requires specific skills for decision-making process and comprehensive IT support. This approach is not the only one to solve the problem of efficiency increase in meso-economic decision-making by considering the simultaneous consideration of its objective and subjective components. A cognitive approach and tools of its practical implementation have significant potential in this context.

## Potential of Cognitive Mapping in Support of the Meso-Economic Decisions-Making Process

A cognitive approach already discussed is a variant of integration of assessment methods of objective reality and subjective preferences of decision-makers which also permits simultaneous use of the potential of formal methods and expertise of the people to improve the process of decision making at the meso-level of the economy. Cognitive mapping is based on the methodological platform of epistemology, cognitive psychology, neurophysiology, anthropology, linguistics, information theory, decision theory, theoretical computer science, and the theory of artificial intelligence. It allows solving semi-structured problems by using intuition, experience, associative thinking and guesswork of experts, as well as providing a tool for transferring of such knowledge for quantitative calculations. Cognitive mapping focuses on the structuring knowledge of experts in a particular subject area and can be used in meso-economic decision making support systems development.

The technology of cognitive modeling allows defining possible and rational ways of management of a situation to provide the transition of purpose from initial negative states to positive. The technology of cognitive modeling allows meso-economic management to be proactive and avoiding potentially dangerous situations to be alarming and conflicting and, in case of their occurrence, to make rational decisions.

The main task of constructing cognitive models is to provide better understanding of an observed event, phenomenon, and process. Modeling sets to the researcher a certain scheme within which it is possible to test concrete hypotheses and, which allows predicting events. Cognitive models, based on the information processing scheme, are a heuristic construct used to organize the existing volume of literature, the stimulation of further research, coordination of research efforts and facilitate communication between scientists and decision makers. Cognitive models are based on conclusions drawn from observations. Their tasks are to provide intelligible representation of character of the observed, to help make predictions in the development of hypotheses, to develop mechanisms of managerial decision-making process.

The great advantage of a cognitive model is that it allows one to view the entire picture in details so as to integrate logic and imagination. Cognitive mapping consists of the following: the development of the structure of gained knowledge of the subject area (defined by a list of the main concepts of the subject area), the identification of relationships between concepts, and the definition of the relation of the subject area with the surrounding world. Thus, cognitive mapping is a convenient tool for the study of semi-structured problems, promotes better understanding and identifying contradictions and qualitative analysis of systems (Gorelova, Verba, & Zakharova, 2004).

The logical stages of cognitive model creation reflect consecutive transition from allocation of the basic factors characterizing a problem situation (including the target and operating factors) to a group of factors in the blocks forming tops or "concepts" of a cognitive map, further to definition of connections between factors, to identification of cause and effect chains, creation of a cognitive map and, at last, drawing up the equations of a cognitive model and checking its adequacy (Gorelova, Zakharova, & Radchenko, 2006). Cognitive modeling begins with the development of a cognitive map of the object. The cognitive map – a structural diagram of causal relationships in the system – is created to understand and analyze the behavior of a complex system.

Let the system consist of a set of the V separate elements. Two elements Vi and Vj of system on the scheme can be represented as separate points-tops and if the Vi element is connected with the Vj element by relationship of cause and effect, they should be connected by the focused arch. It is quite possible that consequences can be the cause of change of other factors. It is probable that consequences

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

can be the cause of change of other factors. Cause and effect chains can be quite long and complicated. The causality analysis is required, for example, to predict the development of the situation, implementation of various schemes of management processes in the system. After creation of the cause-and-effect relationships, strategies of decision-making in a given subject area are defined.

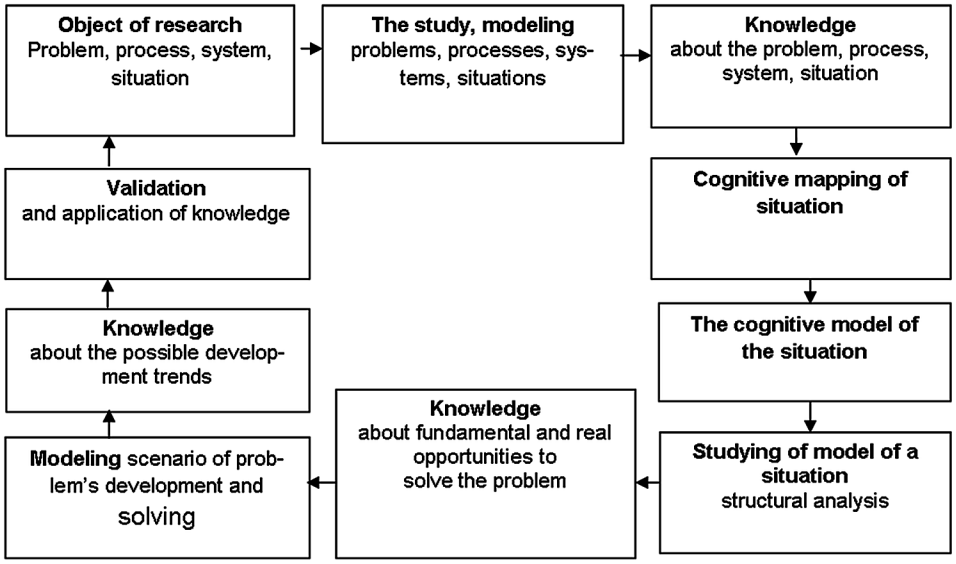
Definition of elements of the object studied with a definite purpose and establishment of communications between elements is conducted with the help of experts by collecting and processing statistical information on the basis of studying of literary data via theoretical knowledge in a particular subject area. Cognitive structuring is resulted by development of the informal description of knowledge about a particular subject area which can be represented in the form of a diagram, graph, matrix, table, or text. The schemes of cause-and-effect relationships, interpreting the views and opinions of decision-makers, referred to as cognitive maps. The concept of cognitive maps – maps of cognition – is initial in the cognitive analysis and modeling of difficult situations (Gorelova, Matveeva, & Nikitaeva, 2007).

The cognitive map displays only the fact of existence of influence of factors at each other. Its main advantage is the ability to perform qualitative simulation. The complex nature of influences of factors, dynamics of changes of influences depending on change of a situation, temporary changes of factors are not displayed in a cognitive map. Considering all of these circumstances requires transition to the next level of structuration of information, displayed in a cognitive map (i.e., transition to a cognitive model is required). At the level of the cognitive model, each connection between factors of a cognitive map reveals to the corresponding equation which may contain both the quantitative (measured) variables, and qualitative (unchangeable) variables.

Process of cognitive modeling includes the following stages.

**Stage One:** The cognitive analysis of a difficult situation (immersion in a problem, identification of a problem) consists of a number of actions: statement of the problem and research objectives, the study of the current situation or process from the position of set goal; collection, systematization, analysis of existing statistical and qualitative information on problems (sources of information: statistical reports, documents, experts, media, private sources, etc.); the allocation of the main characteristic features of the process under study and identification of the relationships between them; determination of actions of the basic objective laws (e.g.,economic, social, political, ecological) of studied situation developments that will allow marking out objective dependences and tendencies in the processes happening in situations; definition inherent in the studied situation of requirements, conditions, restrictions; allocation of the main subjects connected with a situation, determination of their subjective interests in development of this situation that will allow to define possible changes in objective development of a situation, to allocate factors which subjects can really influence; definition of ways, mechanisms of action, implementation of economic and political interests of the main socio-political subjects that will allow to define further strategy of behavior and prevention of undesirable consequences of development of a situation.

**Stage Two:** Creation of a cognitive (graph) model of a problem situation consists of the following actions: allocation of the factors, according to experts characterizing a problem situation (allocation of the basic (main) factors describing a problem essence, allocation in total of basic factors of target factors, allocation in total of basic factors of the governing factors which will be a potential leverage over the situation in the model, definition of the factors - indicators reflecting and explaining development of processes in a problem situation and their influence on various spheres (e.g., economic, social, etc.); grouping of factors in blocks; the factors that characterize the area



EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the problem and defining processes in this area are combined in one unit; there may be options depending on the specifics of the problem, objectives of analysis, number of subjects, situations, etc. Allocation in the block certain group of integrated indicators (factors), on which change can be judged. The general tendencies in this sphere, allocation within the block of indicators – factors – characterizing tendencies and processes in this sphere; definition of connections between factors (definition of connections and interrelations between blocks of factors that will allow to define the main directions of influence of factors of different blocks at each other, definition of direct connections of factors in the block: definition of the direction of influences and interferences between factors (i.e., identification of a chain: "reason – consequence"), determination of character and extent of influence, definition of connections between factors of various blocks; the creation of a cognitive map (graph) of a given situation; drawing up equations of a cognitive model of the situation; checking of an adequacy of the model.

**Stage Three:** Modeling. Cognitive modeling of processes in a situation is represented in the form of cyclic procedure (Figure 1).

Knowledge regarding the studied problem is widening; hence, the initial model is constantly improving. Thus, a cognitive modeling toolkit allows conducting structural and dynamic studies of complex structured objects which include socio-economic systems of the meso-level, and identifying a causal links between their basic components. The practical significance of the presented approach is determined by the ability of the assessment of the meso-economic effects of management actions on the basis of scenario analysis to improve the quality and soundness of decisions. In other words, a cognitive approach allows defining the basic characteristics of meso-economic system and to simulate scenarios of its development to identify effective management decisions with regard to their impact on the system as a whole. Thus, one of the main features of the cognitive model is a construction of a unique cognitive model for each meso-economic system.

*Figure 1. Procedures of cognitive modeling (Gorelova, Matveeva, & Nikitaeva, 2007)*

## Cognitive Mapping of Interaction between State and Business in Meso-Economic System

Cognitive mapping of interaction between the state and business in meso-economic systems of the Southern Russian region will be presented as a case-study. The appropriateness of considering this case in our research is determined by the fact that a significant potential for improving the efficiency of development of meso-economic systems is incorporated in the space of partnerships between the state and business. Numerous examples of establishing public-private partnerships in developed and developing economies demonstrate significant positive effects for both participants of partnership relations and the economy as a whole due to the integration of capabilities and institutional resources of public and private structures.

Thus, the use of such forms of cooperation as business participation in the expertise of draft laws and regulatory impact assessment and creation of expert and advisory bodies, development of strategies and regional development programs, cross-sectoral personnel rotation, implementation of administrative reforms, leads to the improvement of state regulations which also includes the avoidance of redundant functions, adoption of balanced decisions, reduction of administrative barriers, improvement of the investment climate, growth of professional competencies among officials and improvement of public administration efficiency. Together, this helps to create an institutional environment that promotes effective economic development (Nikitaeva, 2007).

However, in some countries, including the modern Russian economy, the potential for cross-sectoral collaboration is significantly underutilized. Public-private partnership is not often a strategic priority since its potential is underestimated. Dependences between the proliferation of public-private partnerships and development of meso-economic systems are not clearly defined. Consideration of a meso-economic system of interaction between government and business as a subsystem of the regional economic system as a whole with the use of a cognitive approach will provide information to understand the essence of the occurring processes and form the basis for creating appropriate management decisions in the future.

Some results of study over the modern Russian system of interaction of state and business allow concluding that, on one hand, the main problems in the area under consideration is the class of semi-structured, the tendency of domination of the uncertain dependences, signs, and characteristics is observed. On the other hand, a number of effects, arising from the interaction between government agencies and commercial companies, are quantifiable, and requires determination of the relevant parameters and monitoring schemes. This gives the possibility of modeling the process of managing the interaction of state and business in the economic system of the region based on a combination of quantitative and qualitative procedures, and to increase the effectiveness of the adoption and implementation of management decisions aimed at the improvement of existing mechanisms of inter-sector cooperation through the development of an appropriate decision support systems.

To solve this problem, it is possible to use a cognitive approach assuming a combination on the basis of consecutive application of various methods of modeling of difficult systems including methods aimed at activating the use of intuition and experience of experts, and formalized representation methods of complex systems. The application of the cognitive approach allows building a systemic-functional model of interaction of state and business, which will present the main elements of the system in conjunction with the components of the economic system of the region and reflect the functional relationship between the factors determining the specificity of interaction between government and businesses in meso-economic projections.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

It gives the opportunity to run a dynamic system behavior modeling of interaction between government and business with application of cyclic procedures according to the scenario approach. From the formal perspective the cognitive map (the basis of cognitive model) is a symbolic directed graph (digraph) as:

$$G = \langle V, E \rangle, \tag{1}$$

where: V is the set of tops, tops ("concepts") $V_i \in V$, i =1, 2,…, k are the elements of the studied system; E is a set of acrs, arcs $e_{ij} \in E$, i,j=1, 2, …, N represent the interrelation between tops $V_i$ and $V_j$; the impact of $V_i$ on $V_j$ in the studied situation can be positive ("+"sign above the arc), when the increase (decrease) of one factor leads to an increase (decrease) in other negative ("- "sign above the arc), when the increase (decrease) of one factor leads to a decrease (or increase) in the other, or absent (0). Cognitive map G can be represented by a matrix of relations $A_G$ .

A matrix of relationships $A_G$ – is a square matrix, of which lines and columns are marked with tops of graph G, and on crossing of an i-line, j - column stand (or not) number one if the relation between the Vi and Vj elements exists (does not exist) like:

$$A_G = \left[ a_{ij} \right]_{k \times k}, a_{ij} = \begin{cases} 1 \text{ if } V_i \text{ is connected with } V_j \\ 0 \text{ if } V_i \text{ is not connected with } V_j \end{cases} \tag{2}$$

Building a cognitive map of interaction between government and business was based on a consistent application of the methods of structuring the "top down" and "bottom-up". Initially a detailed study of selected consolidated blocks of factors and then aggregation of the selected indicators were conducted with the conservation cause-and-effect relationships of their mutual influence. The choice of the concepts of systemic-functional cognitive model of interaction between government and business in the economic system of the region and the determination of cause-effect chains requires some explanation.

The state in the considered context represents a complex of institutes and officials and includes public authorities, and also public institutions implementing functions of regulation, and functions of providing services and managing state property. State institutions and organizations are represented in the system, on one hand, as a key component of the management subsystem of the system of interaction, but on the other hand as the main subjects of cross-sectoral collaboration. The public authorities play a dominant role in the budget process, prioritization of the distribution in expenditure of the regional budget, providing, respectively, the impact on the quality and of the populations' well-being in the region.

In addition, the regulatory impacts of governmental structures significantly affect regional markets of goods and services. Legislative and rulemaking activity of the state bodies has a direct impact on the formation and development of the institutional environment of the region. State agencies performing the functions of providing services and managing state property, are the major stakeholders in the development of public-private partnerships, particularly in infrastructure, investment and social spheres.

The impact of public authorities on business companies is conducted through the formation of a specific institutional environment, the use of various forms and technologies of interaction with the business community and its individual representatives, as well as through direct and indirect financial incentives and the regulation of business actors at the expense of the regional budget. Thus, tax assignments of business make bulk of receipts of revenues of the regional budget that puts its fullness

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

into direct dependence on activity of business firms. Another group of factors affecting the regional budget is associated with functionality of regional markets of goods and services, while the demand is determined by the population and by commercial companies (which play a leading role in shaping the supply in regional markets).

A component "business" includes the key performance indicators of business companies in the region, including profitability, production, number of enterprises and organizations, the number of people employed in this sector of the economy, etc. Separation of blocks of indicators of investments and innovations seems reasonable in the framework of a cognitive model. This is due to the fact that these two concepts, although closely linked with accomplishing their businesses, are most dependent on the activities of the regional authorities, the institutional environment of meso-economy, simultaneously providing a significant impact not only on the performance of commercial structures, but also on the competitiveness of the regional economy. Moreover, it is necessary to consider investment and innovative activity of state organizations and, among them, research and educational institutions.

A set of indicators "interaction of state and business" includes the basic principles, forms, and technologies of direct cooperation between the government and business structures, forming the core mechanism for the implementation of public-private partnerships. It is the interaction that influences the processes of transformation of the institutional environment, the success of business development and transformation in the governmental bodies under the influence of the feedback loop. Direct two-way connection of an interaction concept with the top of innovation is due to the stimulation of innovative activity in the result of joint efforts of actors from different sectors as well as provision of innovative forms and technologies of cooperation between state institutions and business.

Regional risks are considered in this model from several positions. First, from the point of view of economic entities: for business firms enterprise risks are in direct dependence on degree of uncertainty of the business environment that allows speaking about existence of the inverse functional connectivity of the regional risks of commercial companies, and the interaction between the state and business in the region (including information exchange). In turn, the assessment of enterprise risks of companies corresponds to decisions on innovative and investment activity of economic entities. Thus, it is necessary to emphasize that innovation and investment are factors enforcing risks emergence due to the nature of these phenomena. Secondly, internal and external risks of regional economy are considered, including economic, political, social, environmental, financial, investment, criminal, and legislative risks are in the number of regional risks.

It should be noted that functional relations of certain types of risks with other concepts of the cognitive map can be both direct and indirect. In particular, increases of investment productivity of businesses and creation of new industrial facilities in most cases have a negative impact on the environment of the regional socio-economic system, as it increases environmental risks. The creation of new jobs within the same sample contributes to the reduction of social risks in the region. Based on the analysis of existing information (in the form of quantitative and qualitative data) about the condition of the system of interaction between state and business in the context of a particular socio-economic system of the region, a list of factors and indicators that characterize the area of a cognitive map was offered.

1. Regional budget may be defined as: $X_1, x_1^i \in X_1, i = \overline{1, n_1}$, where:
   $x_1^1$ - balanced budget;
   $x_1^2$ - budget expenses;

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$x_1^3$ - budget income;
$x_1^4$ - budget of development;
$x_1^5$ - the functioning budget;
$x_1^6$ - share of own income of the consolidated budget of the region in its full expenses;
$x_1^7$ - interbudgetary relations;
……
$x_1^{n1}$ - other indicators.

2. Indicators of state organizations may be defined as: $X_2, x_2^i \in X_2, i = \overline{1, n_2}$, where
$x_2^1$ - integrity of systems of public administration in the region;
$x_2^2$ - quality of public administration;
$x_2^3$ - the number of officials;
$x_2^4$ - administrative reform;
$x_2^5$ - regional policy;
$x_2^6$ - population confidence in the authorities;
$x_2^7$ - the activities of state organizations performing the function of providing services;
$x_2^8$ - characteristics of state-owned assets in the social, educational, infrastructure and other spheres;
……
$x_1^{n2}$ - other indicators.

3. Population of the region may be defined as: $X_3, x_3^i \in X_3, i = \overline{1, n_3}$, where:
$x_3^1$ - population;
$x_3^2$ - the number of economically active population;
$x_3^3$ - the unemployment rate;
$x_3^4$ - average income per capita;
$x_3^5$ - the standard of living;
$x_3^6$ - GDP per capita;
$x_3^7$ - national and cultural features;
$x_3^8$ - the coverage of social services;
……..
$x_3^{n3}$ - other indicators.

4. Regional markets for goods and services may be defines as: $X_4, x_4^i \in X_4, i = \overline{1, n_4}$, where:
$x_4^1$ - dynamics of prices in regional markets;
$x_4^2$ - supply and demand;
$x_4^3$ - saturation of the regional markets;
$x_4^4$ - types of branch markets;
……
$x_4^{n4}$ - other indicators.

5. Institutional environment may be defineds as: $X_5, x_5^i \in X_5, i = \overline{1, n_5}$, where:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$x_5^1$ - legal environment;
$x_5^2$ - development of market economy institutions in the region;
$x_5^3$ - administrative barriers;
$x_5^4$ - the development of market infrastructure;
……
$x_5^{n5}$ - other indicators.

6. Business may be defined as:: $X_6, x_6^i \in X_6, i = \overline{1, n_6}$ , where:
$x_6^1$ - the output of products and services;
$x_6^2$ - basic production assets;
$x_6^3$ - profit / loss;
$x_6^4$ - the number and sizes of business entities;
$x_6^5$ - branch structure;
$x_6^6$ - exports and imports, interregional exchange;
$x_6^7$ - the number of people employed in business structures;
$x_6^8$ - average salary of employees;
$x_6^9$ - corporate social responsibility;
……
$x_6^{n6}$ - other indicators.

7. Investments may be defines as: $X_7, x_7^i \in X_7, i = \overline{1, n_7}$ , where:
$x_7^1$ - the total value of investments in the region;
$x_7^2$ - investments into fixed capital (fixed capital formation??);
$x_7^3$ - the share of residents ' investments in the regional economy in the total value of investments;
$x_7^4$ - sources of investment;
$x_7^5$ - investment efficiency;
……
$x_7^{n7}$ - other indicators.

8. Innovation may be defined as:: $X_8, x_8^i \in X_8, i = \overline{1, n_8}$ , where:
$x_8^1$ - innovation activity of enterprises and organizations;
$x_8^2$ - innovation-focused investments;
$x_8^2$ - the structure and the number of types of innovation in the region
……
$x_8^{n8}$ - other indicators.

9. Interaction of state and business may be defined as: $X_9, x_9^i \in X_9, i = \overline{1, n_9}$ , where:
$x_9^1$ - the forms and technologies of interaction between government and businesses;
$x_9^2$ - models of public-private partnership;
$x_9^3$ - the role of business in making decisions at the meso-level;
$x_9^4$ - organizational and infrastructure parameters of interaction;

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$x_9^5$ - economical and administrative parameters of interaction;

$x_9^6$ - balance of private and public interests;

$x_9^7$ - information support of interaction;

……

$x_9^{n9}$ - other indicators.

10. Risks may be defined as: $X_{10}, x_{10}^i \in X_{10}, i = \overline{1, n_{10}}$, where:

$x_{10}^1$ - economic risks;

$x_{10}^2$ - political risks;

$x_{10}^3$ - social risks;

$x_{10}^4$ - ecological risks;

$x_{10}^5$ - financial risks;

$x_{10}^6$ - investment risks;

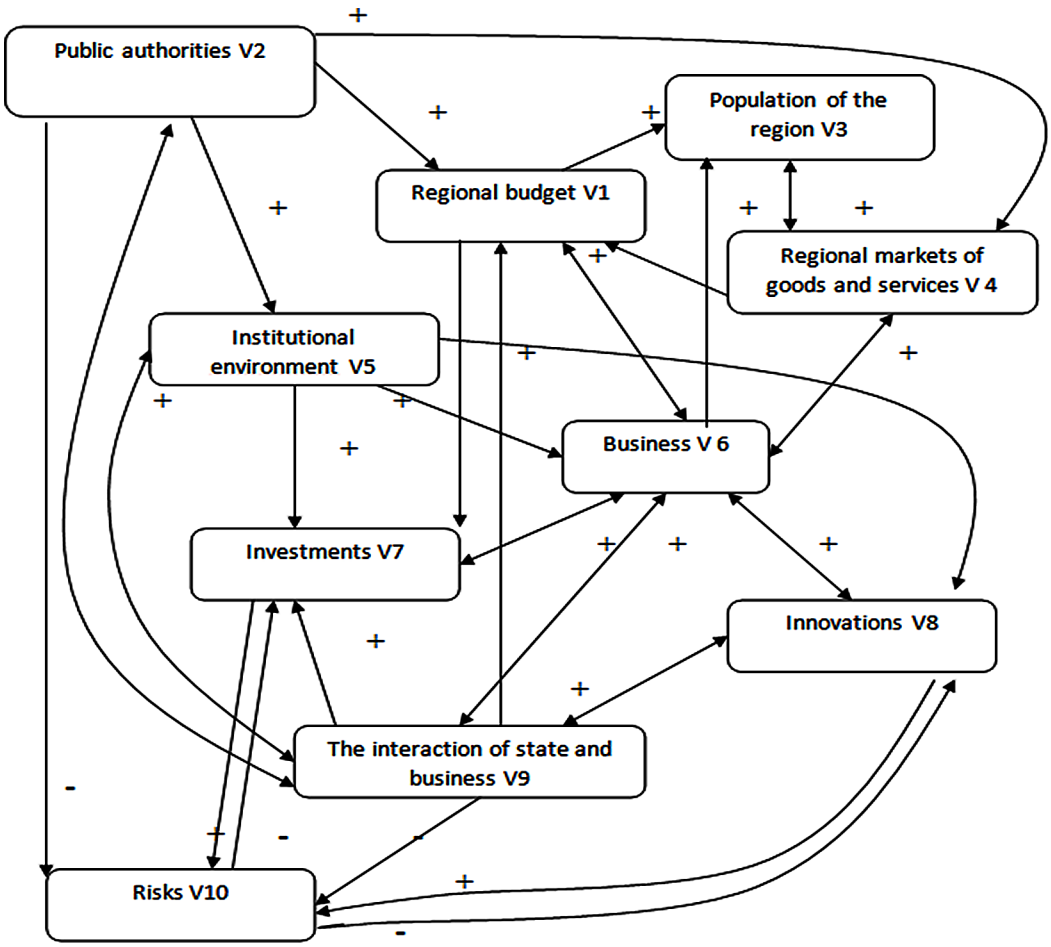
$x_{10}^7$ - legal risks;

……

$x_{10}^{n9}$ - other types and indicators of risks.

The purpose of the developed model is to research the influence of interaction between government and business on the economic system development in the region in order to determine the directions, scope, and power of managerial actions that ensure the desired change of the target factors, which are the concepts of "population", "regional budget", "business". Such earmarking of targeted factors requires some adjustment. First of all, it is consistent with these strategic goals of Russia's development as the improvement of people's welfare and poverty reduction on the basis of dynamic and sustainable economic growth, as well as the way to achieve the stated objectives, consisting in the solution of a problem of the dramatic increase in the competitiveness of three components: human rights, state institutions and business. The regional budget is selected as one of the main indicators of quality of activity of the regional public authorities.

Creating a cognitive map on which the interaction system of state and business are embedded in the economic system of the region. Due to the fact, that when making management decisions it is necessary to assess the full range of consequences of regulatory decisions, since the goal of management in the proposed context is the use of cross-sectoral collaboration as a mechanism for the successful development of meso-economic systems. In this case, and state organizations and business structures are both factors of governance in the framework of interaction management of the state and business and integral components of the regional economic system, whose functions go far beyond multi-sectoral partnerships. The cognitive map of the system interaction of state and business in the regional economic system, reflecting the basic, strongest dependencies of the analyzed phenomena is presented in Figure 2.



Type of the cognitive model most corresponding to the tasks solved in research taking into account the existing restrictions, is the vector functional graph (F-graph) which represents a tuple:

**K=<G, X, F>,** (3)

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 2. The cognitive map of the interaction between the state and business in the regional economic system*

where:

1. G=<V,E> - vector graph;
2. X – set of parameters of tops V; X={$X^{(Vi)}$}, i=1,2,…,k, $X^{(Vi)}$={$x^{(i)}_g$}, g=1,2,…$n_i$; i.e. each top of the parameter vector is independent from each other and put in compliance $X^{(Vi)}$, (or one parameter $x^{(i)}_g=x_i$, if g=1); X:V→R, R – set of real numbers;
3. F=F(X,E)= F($x_i$, $x_j$, $e_{ij}$) – the functionality of transformation of arches putting in compliance to each arch or a sign (“+”, “-”), or weight coefficient $\omega_{ij}$, or function f($x_i$, $x_j$, $e_{ij}$) = $f_{ij}$ (Gorelova, G., Matveeva L., Nikitaeva A., 2007).

When choosing the sign dependence of the tops of the graph on the cognitive map the matrix of contiguity of the offered configuration of a cognitive map will look as follows:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$R =$

| | $V1$ | $V2$ | $V3$ | $V4$ | $V5$ | $V6$ | $V7$ | $V8$ | $V9$ | $V10$ |

In the functional graph generated, perturbation coincides with the received perturbation and is equal to the sum of the elementary impulses acting on a top in the given time. Under the influence of various perturbations, the values of the variables at the tops of the graph may change; a signal received at one of the tops, is distributed along the chain to the other, amplifying or fading. The rule (PR) for the change of parameters in tops at the moment $t_{n+1}$ (Gorelova, Zakharova, & Radchenko, 2006, pp. 203-208).

Let the $x_i$ parameter depend on time (i.e. $x_i(t)$, t=1,2,3,...). Then it is possible to define the spread of perturbations on the graph (i.e., the transition of the system from state t-1 to t, t+1,…).

Let the value of $x_i(t+1)$ in the top $v_i$ depend on $x_i(t)$ and from the tops adjacent to Vi. Let $V_i$ be adjacent to $V_j$, let $p_j(t)$ – change in $V_j$ top in t time point, then the influence of this change on the $x_i$ parameter at the time of t will be described by the $\pm p_j(t)$ function depending on the sign of an arch connecting $V_i$ and $V_j$. Generally, if there are some tops of Vj, adjacent to Vi, the spread of perturbation on the graph is determined by the rule defined as in:

$$x_i(t+1) = x_i(t) + \sum_{j=1}^{k-1} f(x_i, x_j, e_{ij}) p_j(t), \tag{4}$$

where initial values of X(0) are knows in all tops and an initial vector of perturbation of P(0).

Modeling can be performed by steps or pulses. The essence of such modeling is that one of the vertices of the graph is set to a definite change. This activating top actualizes the whole system performance. Let present the $f_{ij}$ function between tops $V_j$,$V_i$ using the coefficients $\lambda_{ji}$, $\omega_{ji}$, characterizing the sign ($\lambda_{ji}$: «+» or «-») and the degree of influence of $\omega_{ji}$ parameter of $V_j$ top to the parameter of Vi top; replace the $p_j(t)$ function of influence of change in top of $V_i$, adjacent to $V_j$, with an impulse:

p(n) = x(n+1) – x(n), where x(n), x(n+1) – the values of the indicator in top V in the steps of the simulation at time t=n and follows t=n+1. Then the formula (4) is converted to the form:

$$x_i(n+1) = x_i(n) + \sum_{j=1}^{k-1} \lambda_{ji}\omega_{ji}[x_j(n+1) - x_j(n)], \tag{5}$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In models of this type, the coefficients $\omega_{ij}$ characterizing the interaction of adjacent tops can be defined either by expert or statistical methods. The rule (PR) of change for parameters in the tops at the time of $t_{n+1}$ if impulses came to $t_n$ time point in tops:

$$x_i(t_{n+1}) = x_i(t_n) + \sum_{v_j : e=e_{ij} \in E}^{k-1} f(x_i, x_j, e_{ij}) P_j(t_n) + Q_i(t_{n+1}), \tag{6}$$

The impulse generated by the change of a parameter in top:

$$P_{v_i}(t_{n+1}) = \sum_{v_j : e=e_{ij} \in E}^{k-1} f(x_i, x_j, e_{ij}) P_j(t_n) + Q_i(t_{n+1}), \tag{7}$$

As in the f-graph the impulse in the pulse process is represented by the ordered sequence without reference to time, it is possible to use formulae "in n-th time". Then:

$$x_{v_i}(n+1) = x_{v_i}(n) + \sum_{v_j : e=e_{ij} \in E}^{k-1} f(x_i, x_j, e_{ij}) P_j(n) + Q_i(n+1) \tag{8}$$

$$P_{v_i}(n+1) = \sum_{v_j : e=e_{ij} \in E}^{k-1} f(x_i, x_j, e_{ij}) P_j(n) + Q_i(n+1) \tag{9}$$

The impulse process model is a tuple <F, Q, PR> where the F – F-Graf, F=<(V, E), X, W>, $Q=Q(t_n)$ is a sequence of perturbations, PR – the rule of change of parameters. To use the impulse process model within a cognitive approach to assess the impact of management actions on target factors will make a plan of the experiment — the plan of filing a single initial pulse $q_i$ in the top of the chain $q_i$ =+1, $q_i$ = -1, additional single impulses on various n - steps of the simulation (Table 1).

*Table 1. The plan of making managerial impulses to the concepts of the interaction model of state and business in a meso-economic system of the region*

| No | Impulses $q_i$ | Q - Vector of Pulses in the Top | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|

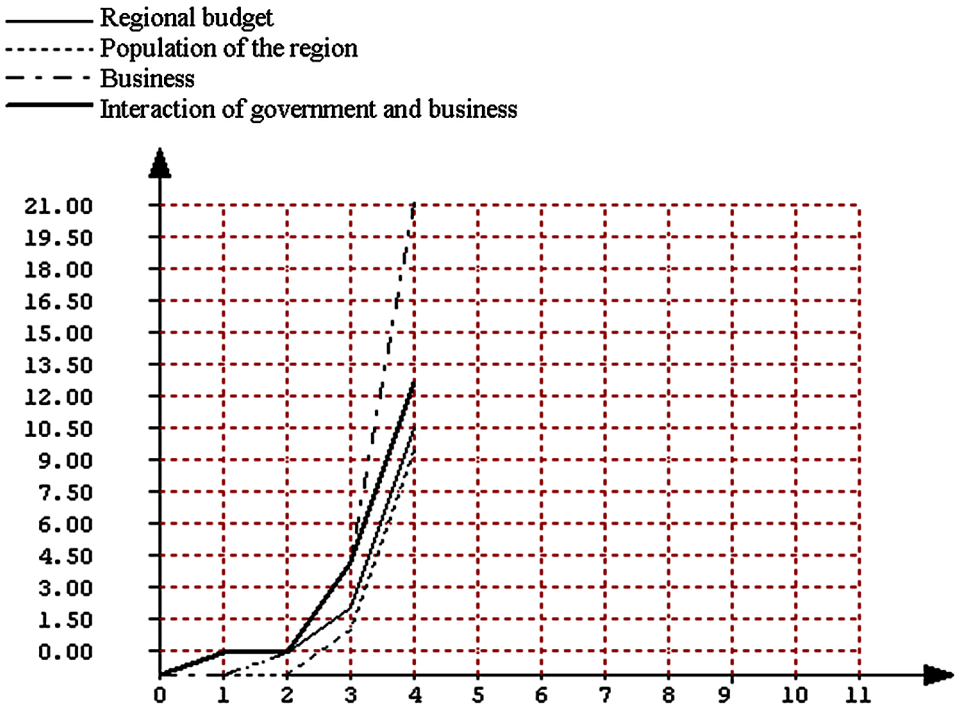
EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use



The considered impulses in the practice can have rather accurate economical and administrative interpretation in a quantitative or qualitative form. For example, the single positive impulse in the concept "interaction of the state and business" can correspond to the adoption of the regional law on concessional agreements, stimulating implementation of public-private projects. The negative impulse in the same top can result in reduction of informational openness of public authorities.

To conduct this experiment developed by Radchenko & Gorelova software permitted the solution of all problems in a complex by implementing the methodology of cognitive modeling of meso-economic systems. Thus, emphasis is on the implementation of structural analysis functions: identifying patterns of development situations, identifying "good" and "bad" scenarios, the analysis of the various subsystems interaction and interacting components, search of mechanisms of influence in the management system. Algorithms of the using software are based on cognitive and scenario modeling, theory methods of graphs and the theory of systems.

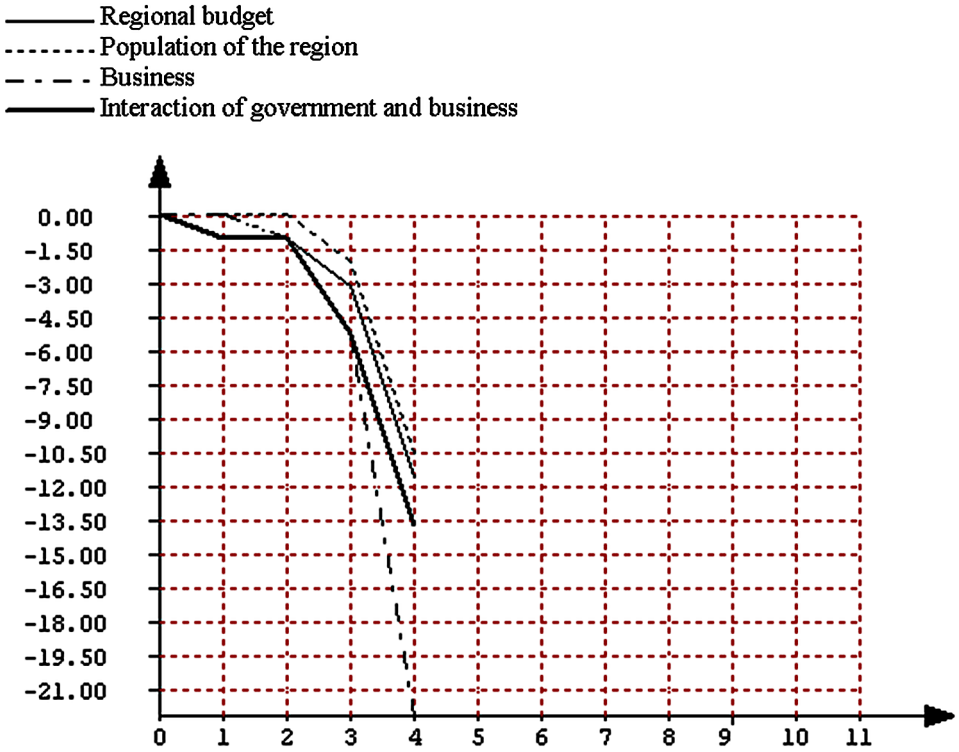
**Scenario One:** When making a positive single impulse into V9 top – "Interaction of the state and business" through four cycles of the simulation there is a clear tendency of growth of the target factors, and the highest rates of positive dynamics characters for businesses whereas indicators of the regional budget and the population change more slowly, though with rather high rates (Figure 3).

Prolongation of the scenario with the set initial impulse of q9 = + 1 shows a continuation of observed trends (experiment was conducted to the 17th step of modeling).

*Figure 3. Pulse processes at $q_9 = +1$*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Scenario Two:** Making of a negative single impulse into V9 top – "Interaction of the state and business" shows a mirror to the first scenario development of a situation (Figure 4).



**Scenario Three:** Characterizes development of a situation on conditions of simultaneous entering of a positive single impulse into top of V5 and a negative single impulse into V9 top. The simulation results show that if on the first steps impulses in relation to resulting factors partially compensate influence of each other, already at the fourth step the obvious tendency of a prevalence of negative consequences of deterioration of interaction of the state and business over the initial positive impulses brought on institutional environment of regional economy (for example, due to reduction of administrative barriers) as shown in Figure 5)

These tendencies only amplify further and if the institutional environment worsens slower rates, businesses and the regional budget react to the negative impulse brought in the corresponding top, rather strongly (Figure 6).

The dominant influence of changes of the parameters of V9 top allows for the concluison that improving of the efficiency of institutions in the region should be carried out in conjunction with improving of the interaction between government and business.

**Scenario Four:** Describes the changes of the target factors in the system of interaction between state and business, incorporated in the structure of meso-economic relations when entering a positive single impulse into V9 top ("interaction of the state and business") and negative – in V5 concept ("the

*Figure 4. Pulse processes at q9 = - 1*

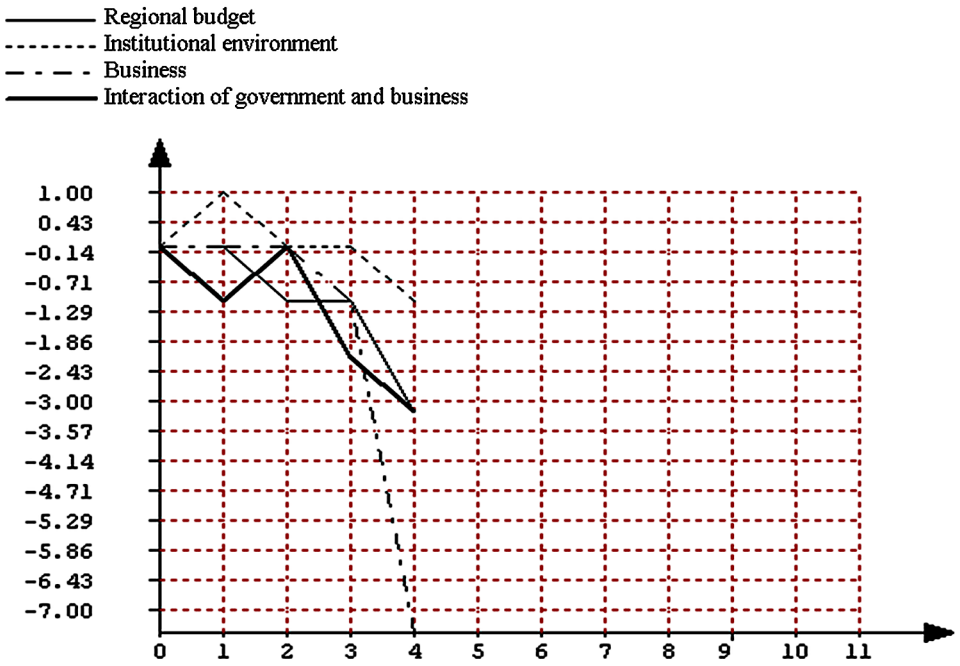
*Figure 5. Pulse processes at $q_5 = +1$, $q_9 = -1$ (steps of modeling 1-4)*



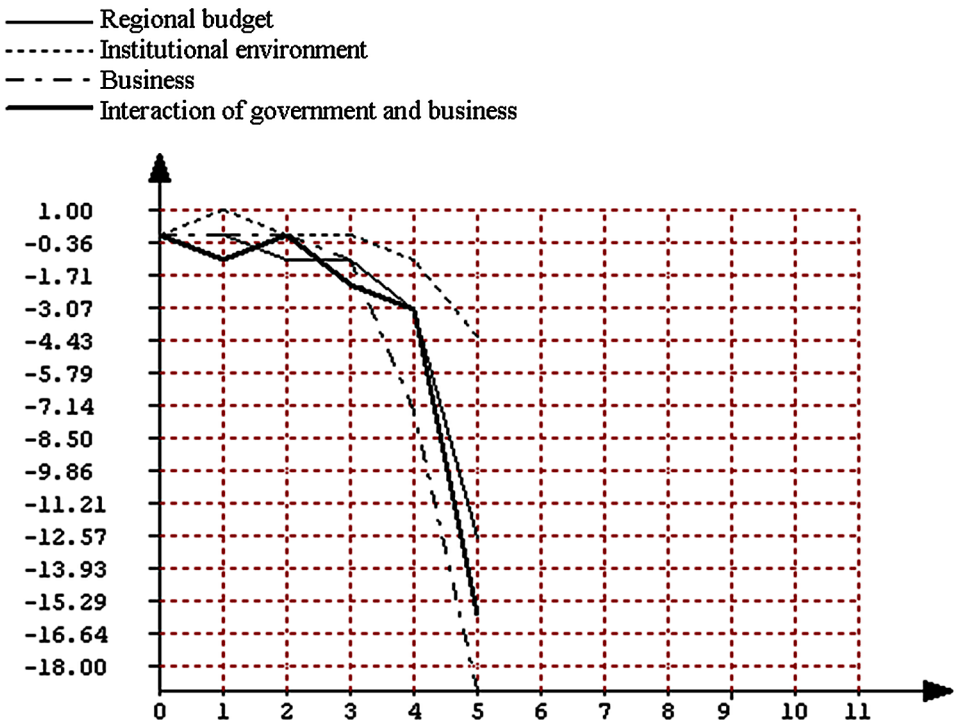


*Figure 6. Pulse processes at $q_5 = +1$, $q_9 = -1$ (steps of modeling 1-5)*

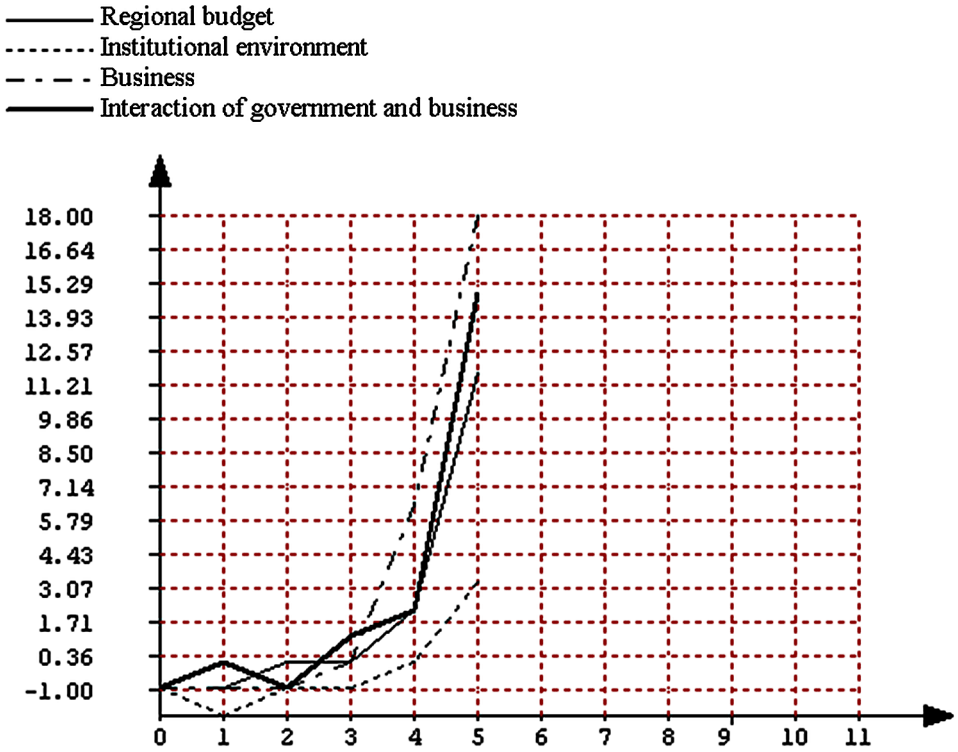
EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use



institutional environment"). In reality this scenario may reflect a situation where the development and adoption of the development conception for regional innovation clusters is accompanied by a parallel deterioration of the fiscal environment of small and medium business conduction, which is observed in particular in the Rostov region of the Russian Federation.

That is actually the situation opposite to the previous set of impulses that is considered. Development of the scenario shows that already through two steps of modeling the institutional environment overcomes a negative initial impulse due to the positive role of interaction between the state and business, and further, all the tops show a positive trend (Figure 7).

**Scenario Five:** Entering of a positive single impulse into V7 top – "Investments". Simulated development of the situation shows that a negative relationship between tops "Interaction of state and business" and "Risks" implemented through the concept of "Business" positive correlation between tops V5 and V9, as well as other functional dependencies of a cognitive model can lead to a certain reduction of risk on some steps of modeling even on condition of increase in investment and innovation activity (Figure 8).

Target factors begin to respond to managerial influence corresponding to this version of events through two steps that reflects the time lag necessary in order that impulses came to the interconnected tops due to their transfer on arches of a cognitive map. It corresponds also to real economic practice when time

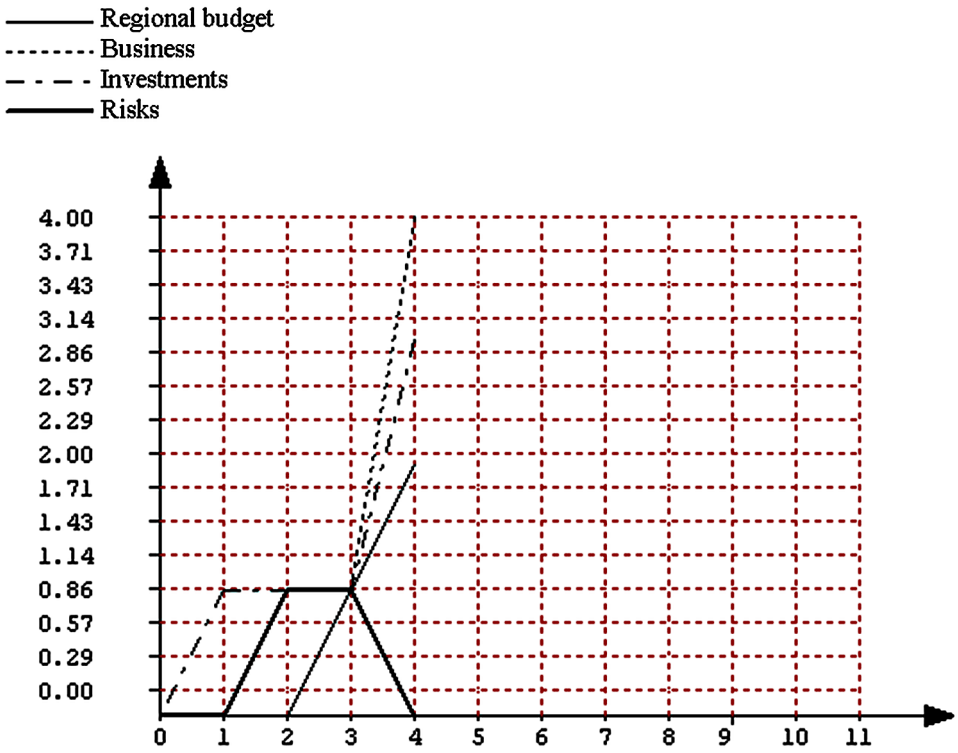


*Figure 7. Pulse processes at $q_5 = -1$, $q_9 = +1$*

*Figure 8. Pulse processes at $q_7 = 1$ (steps of modeling 1-4)*

for receiving return on investments is required. The steady growth of target factors at lower growth rates of risks is observed further (Figure 9).

**Scenario Six:** Reflects simultaneous entering of negative single impulses into V5, V7 tops and a positive single impulse in V9 top. The analysis of a situation in dynamics allows to conclude that in spite of the fact that on the first steps negative influence of managing factors (which received negative impulses) on business (as a target factor) is observed, since the third step of modeling the condition of the institutional environment in the region is leveled and growth of indicators of business is observed. The following step reflects positive dynamics and operating, and all target factors (Figure 10). Tendencies of growth of indicators of target tops remain at experimental prolongation.

The results of the conducted experiment provided an opportunity to draw some conclusions related to the specific behavior of the meso-economic system of interaction between state and business to the capabilities of the methodology applied to the scenario analysis.

First of all, it is important to note that positive and negative impulses in top "Interaction of the state and business" have stronger impact on a condition of target factors, than impacts on other concepts of a cognitive map. Moreover, at simultaneous entering of multidirectional impulses into the managing concepts, one of which is "Interaction of the state and business", through several steps of modeling (from two to five) changes of target indicators are caused by development tendencies of the relations of

state and business. This demonstrates the importance of improving the efficiency of interaction between government and business in conjunction with the strategic management of the regional economy.

Using the proposed model allows to generate alternative options for management decisions regarding the interaction between government and business and to carry out the most effective, in the context of specific realities of the meso-economy. The practical significance of the model can be enhanced as a result of its development in accordance with the specific objectives of socio-economic systems in the areas that provide additional adjustment of the model as an element of the decision making mechanism based on the available empirical data:

- Detailing indicators of the concepts of cognitive maps, which characterize the components of the economic system of the region, and the definition of their values to improve the accuracy of calculations.
- Clarification of identified functional dependencies to determine the weights of the dependencies of the tops of the graph.
- Converting the model to determine ways of improving structural stability of the system.

The advantages of using the discussed methodology, based on a systematic and cognitive approach and adapted to the needs of meso-economy management, consist of the possibility to assess changes of target factors in the regional development on the basis of introducing impulses of various force, orientation and frequency, corresponding to certain governmental influences with economical and administrative interpretation.

It increases efficiency of the decision-making mechanism of meso-economic scale and assess the full range of consequences of regulatory impacts through the application of the model taking into account complexity and coherence of components of meso-economic systems in the conditions of uncertainty of an environment at limited volumes of reliable information for forecasting of development of a situation by statistical methods.

## SOLUTIONS AND RECOMMENDATIONS

Since the dynamics of meso-economic systems, acting to some extent as cores / development centers and basis of modern global economy, in many ways determines the nature and pace of socio-economic development of national economies (being in many ways a conductor of regulating impulses of a control subject at national and supra-national levels, and also economic level of their implementation), an important role is given to the search of methods and tools to increase management efficiency of meso-economies of different types with consideration of their common characteristics and patterns of development.

To improve the effectiveness of decision-making support in meso-economic systems, it is desirable to apply approaches that combine methods of formal data work with the subjective information and personal preferences within uniform methodology. It can be the application of the approach, integrating the OLAP and Data mining technologies with methods of a multi-criteria assessment of alternatives, and also the use of cognitive approach, allowing to apply the methods, aimed at the activization of the use of intuition and expert experience, and methods of the formalized representation of complex systems, and also other approaches respecting the set requirements.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Thus, for the practical application of the given approaches and methods fundamental role is played by their implementation in the form of the decision support systems, since it greatly expands the number of users of the corresponding technologies. Nevertheless, even the available software applications, which are not always united on the platform of a unified support system for decision-making acceptance, can significantly improve the quality of decision-making at the meso-level through the application of these approaches. This requires the adoption of the conceptual framework of decision-making as a methodological background.

## FUTURE RESEARCH DIRECTIONS

Currently, methods and technologies that will form the analytical apparatus of decision support systems are developing dynamically. Especially high dynamics of growth is shown by Business intelligence (BI) technologies, including OLAP technologies. While the fairly new, but increasing trend is the integration of different methods and technologies within a single software application, reflecting attempt of researchers to unite on a common methodological platform ways to work with objective and subjective aspects of solving semi-structured problems. However, not all of the considered methods can be used together.

Consequently, more research is needed to find the optimal combinations of approaches and methods, working with objective and subjective aspects of the decision-making process, and to identify areas of their convergence. In addition, the use of appropriate technologies requires a certain investment (in the development or acquisition of software) and ensures a sufficient level of staff for their practical application. Accordingly, it is important to study issues of evaluating the effectiveness of decision support systems with non-standard tools supporting the objective and subjective components of the decision making process.

Another point that should be taken into account when addressing issues of information and analytical support of decision making in meso-economic systems is associated with the tendency to strengthen the role of compatibility of information systems used in the modern world. All of these questions actually have set the trends for further research in this area.

## CONCLUSION

Thus, meso-economic systems play an important role in the modern economic development, possessing also specific features as object of management. By combining and effectively using the potential of various economic entities, meso-economic systems have a great potential as points and centers of economic development and become important actors in the global competition. In addition the complexity of decision-making, in meso-economic systems (e.g., regions, clusters, agglomerations, industries, etc.) leads to of the use of appropriate tools and information technologies to support managerial decision-making processes. Appropriate tools should allow management entity to identify explicit and implicit patterns of development and the relationships of meso-economic systems, analyze reliable data and consider the subjective preferences of the decision maker, simulate possible scenarios of events during the implementation of specific management actions.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Using appropriate technologies, the decision support technologies should allow the user (expert, decision maker, etc.) working effectively with objective and subjective models of reality. It is possible, firstly, in case of application of the cognitive approach, to model meso-economic dynamics; and secondly, when integrated as part of the process of decision making, OLAP and Data mining technologies, and methods of multi-criteria evaluation of alternatives. The case study of the cognitive model construction has shown that its use helps to obtain non-trivial results. In particular, it shows that development of state-and-business cooperation in the region is able to neutralize a number of negative events which are associated with risk increase, deterioration of the institutional environment in meso-economy and have a stronger positive impact on the meso-economic dynamics even in comparison with development of such concepts as investments and innovations.

## KEY TERMS AND DEFINITIONS

**Business Intelligence:** Methods and tools to translate raw information into a convenient form for conducting business analysis and search of strategic development opportunities at the expense of processing large volumes of unstructured data.

**Cognitive Mapping:** Methodology which allows simultaneous use of potential of formal methods and expertise of the people to improve the process of decision making by structuring knowledge of experts in a particular subject area and using methods of complex system formalization.

**Data Mining:** The collective name used for designation of set of detection methods in earlier unknown, uncommon, practically useful and available for interpretation knowledge necessary for decision-making in various spheres of human activity.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Decision Support Systems (DSS):** The interactive information system using data and models of a choice of decisions that provide users with convenient and efficient access to information resources and providing them with a variety of opportunities for processing information and decision-making.

**Meso-Economics:** The section of economic science connected with the study of behavior, the contents and essence of the intermediate systems, standing between micro and macroeconomic systems of national economy and having an important independent value.

**Meso-Economy:** Set of social and economic subsystems of the average level of economic hierarchy and the subsystems lying at lower levels of hierarchy, in particular, enterprises and their groups.

**OLAP (Online Analytical Processing):** A class of applications and technologies designed to collect, store and analyze multidimensional data in order to support management decision making processes.

**The Decision Maker:** The subject of the decision (the manager), empowered and responsible for the consequences of the taken and implemented management decisions.

**The Decision-Making Theory:** The field of knowledge studying the patterns of individuals to choose ways of solving different types of problems and ways of rational choice of the best of possible alternatives.

# Chapter 38
# The Institutional Imperatives of Local Economic Governance:
## Lessons from a Small Island Developing State

**Eris Dawn Schoburgh**
*The University of the West Indies, Jamaica*

## ABSTRACT

*In Jamaica, a "new" local governance framework comprises a federated system of development committees (community development committees [CDCs], development area committees [DACs], and parish development committees [PDCs]) purportedly working in partnership with local authorities. Local governance is thus premised on the idea that utilization of local skills, knowledge, assets, and initiatives will lead to economic transformation. Focus has also shifted to micro, small and medium enterprises (MSMEs), given their local embeddedness and potential to foster local economic growth. This chapter investigates the extent to which local economic development (LED) model implementation is supported by appropriate governance structures. It argues that implementation of an LED model represents a decisive shift from local governance to local economic governance, which currently lacks a cohesive policy framework. The consequent effect is nothing more than atomized organizational actions that engender competition among localities and communities rather than a clear growth strategy at the local level.*

## INTRODUCTION

From reading the leading regional newspapers, there can be little doubt that a major topic on the minds of Caribbean policy leaders is the state of Caribbean development. Indeed, the so-called "wicked problems", combined with complexities of small size that further exacerbate the extent of integration into the global economy and levels of public debt, have challenged the economic growth agenda for most of the post-independence period for the majority of small island developing states (SIDs) in the region. An article in the *Jamaica Observer* of November 10, 2013 attributes the following view of the state of Caribbean economies to Dr. Kenneth Anthony, Prime Minister of St. Lucia:

*(T)he Caribbean is experiencing 'a tragedy of the times', on account of governments being engaged in one form or another of self-denial while the Caribbean remains in the throes of a major crisis like it has never ever experienced before... the spectre of evolving into failed societies is no longer a subject of imagination…how our societies crawl out of this vicious vortex of persistent low growth, crippling debt, huge fiscal deficits and high unemployment is the single most important question facing us at this time…a grave economic crisis is gnawing away at Caribbean countries while governments are busy looking inward – each busy with their own agenda rather than pursuing a Caribbean solution to the economic crisis. (jamaicaobserver.com)*

As leader of a political administration and past legal advisor to the Caribbean Community (CARICOM), the Prime Minister's position makes him a legitimate bearer of the facts, however unsavoury. Furthermore, regional academic and policy discourses lend support to his views (Bernal, 2000; Briguglio, Persaud, & Stern, 2005; Hall & Benn, 2003; Payne & Sutton, 2001; UNECLAC, 2005; World Bank, 2005).

A 2012 ECLAC-AFD study on patterns of Caribbean development highlighted the region's search for an appropriate development model, even after decades of experimenting with approaches that run the gamut from "industrialization by invitation", transfer of technology, diversification of the economies, to promotion of regional integration. Increased incomes in some countries reflect significant socio-economic gains, but the ECLAC-AFD study found that these countries are threatened by low productivity, low levels of competiveness in certain productive sectors, fiscal and debt crises, natural disasters, and climate change. Further, up until the 1980s some economies relied on agriculture as the basis of their economic strategy, but following the loss of their preferential status as primary exporters to Europe, they have had to make the transition to tourism and offshore financial services as sources of income. The study concluded that "a lack of sustained growth in per capita incomes … makes it difficult to lift a large enough segment of the population out of poverty" (p. 8). The economic profile of Caribbean economies is shown in Table 1. Annual growth rates have fluctuated but have remained below world trends for the most part.

The ECLAC-AFD study highlighted the need for the Caribbean to adopt a new development strategy if the region is to successfully confront its social challenges and lessen the economic divide between the region and other rapidly improving economies of the world (p. 18).

For Jamaica, the focus of this chapter, a development path has been articulated in the Vision 2030 Jamaica National Development Plan (JNDP), the designated roadmap to "sustainable prosperity". The catchphrase *"Jamaica, the place of choice to live, work, raise families, and do business"* encapsulates the philosophy that underpins a mission to transform the country from middle income status to "one which affords its citizens a high quality of life and world-class standards in critical areas including education, health care, nutrition, basic amenities, access to environmental goods and services, civility and social order" (JNDP, p. XX11). Vision 2030 sets the parameters for sectoral and institutional reform initiatives, exemplars of which are the attempts to reshape the subnational sphere to create a context conducive to economic transformation of both people and places.

A number of reforms in the public sector had preceded Vision 2030. Local government reform since 1993 has sought to strengthen the democratic ethos and create a context for empowered citizenry and communities. Aligned to local government reform is a federated system of development committees – community development committees (CDCs), development area committees (DACs) and parish development committees (PDCs) – purportedly working in partnership with local authorities to establish a new

(ECLAC-AFD, 2012, p. 8)

local governance framework. This framework rests on the premise that utilizing local skills, knowledge, assets, and initiatives will lead to socio-economic transformation wherever local citizens/communities assume responsibility for their affairs. The emphasis on socio-economic transformation of the local space has given rise to the search for an economic mainstay of these spaces, as well as governance of economic activities. Focus has shifted to micro, small and medium enterprises (MSMEs), given their local embeddedness and in recognition of their potential to foster economic growth, and culminating in Jamaica's Micro, Small and Medium Enterprise (MSME) and Entrepreneurship Policy in 2013. Altogether these varied initiatives have placed local economic development (LED) firmly on the policy agenda in Jamaica. Local governance, which is implicit in the structural changes that have been made at the local level, has now transitioned into local economic governance, perhaps unintentionally. However, implementation of an LED model appears mired in a web of disparate and disconnected institutional arrangements that straddle central and local spheres.

This chapter uses an institutional analytical framework to investigate the extent to which the LED model is supported by appropriate governance structures. The critical question pertains to the character of local economic governance (LEG) in Jamaica or, more directly, whether such an institutional context exists or is even being contemplated. The chapter is divided into five sections: the first engages key concepts; the second examines the social forces that might explain the focus on development below the center; the third and fourth sections explain the policy strategies in Jamaica that suggest an LED model and analyze the issues in relation to the transition to LEG; and the fifth section presents the conclusion.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## CONCEPTUALIZATION

Two prior actions are required for institutional analysis:

1. Clarifying the concept of institution to define the scope of the analysis; and
2. Discussing the assumptive bases of economic governance drawing on institutionalist thought.

Answers to the question of *what is an institution* have varied depending on the perspective. The interpretation of institutions-as-equilibria that is found in the work of, for example, von Hayek (1967) and Schotter (1981), emphasizes the stability that emerges from actors' mutually understood expectations, preferences, and optimizing behavior. In other words, a particular social order emerges as a result of the interaction of individuals within that order, rather than from an external source. Thus an institution from this perspective is taken to mean "a regular behaviour pattern sustained by mutual expectations about the actions others will take" (Crawford & Ostrom, 1995, p. 583), and therefore an institution is merely an equilibrium. The institutions-as-norms interpretation advocated by Coleman (1987) and others rests on the assumption that observed patterns of interaction and institutions are derived from common understandings among a group about what is proper or improper conduct in a given situation. The institutions-as-rules interpretation that is associated with Shepsle (1989), North (1990), Ostrom (1990), and Williamson (1996), for example, assumes that some patterns of interactions are linked to a common understanding that actions that do not conform with set standards are likely to be sanctioned (Crawford & Ostrom, 1995). Drawing on all three perspectives, institutions may be defined as "enduring regularities of human action in situations structured by rules, norms and shared strategies, as well as by the physical world" (Crawford & Ostrom, 1995, p. 582). Simply put, they are "rules of the game".

Any contemplation of implementing an LED model leads naturally to modes of governance. LED may be defined as "a process which brings together different partners in a local area to work together and harness local resources for sustainable economic growth" (Cardiff Consensus, CLGF, 2011, p. 1). Neo-institutional thought espouses key assumptions about effective and efficient governance of the local economy. These assumptions establish a clear link between the economy and society, and ultimately clarify the nature of LED. The most pertinent assumptions are that:

- The local economy is more than an assortment of "atomized firms and market preferences driven by rational preferences and a set of rules" but is an amalgam of networks and collective influences that shape individual action (Amin, 1999, p. 5).
- The local economy is a highly-diversified set of activities due to the weight of culture and context.
- The local economy is subject to path-dependent change due to the contribution of inherited socio-institutional influences.

From the preceding discussion, which attempted to conceptualize significant dimensions of the framework guiding this chapter, it should be obvious that institutional analysis emerges as a comprehensive and complicated process. Institutional analysis is used to examine how individual or collective interactions and rationalities are structured by norms, practices, and rules to achieve a particular end-state. Collective rationalities and interactions are relevant to the policy issues and responses connected with LED implementation in Jamaica, specifically in light of their organizational context. However, it is beyond the scope of this chapter to attempt more than an abbreviated version of this type of analysis.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

LED-oriented policies are being implemented in the absence of a strong and coherent discourse around an LED model in Jamaica specifically, and the Caribbean Region generally, and as a consequence institutional analysis from the perspective of this chapter serves more as a diagnostic tool for identifying the requisite institutional endowments in support of successful LED model implementation.

## DECENTERING DEVELOPMENT

Perhaps the experience of developing countries, especially small island states such as the Caribbean, provides the best illustration that the "development project" has failed. Binns and Nel (1999) noted the impasse created in development thinking following generations of imported Western development strategies and projects that have had little impact on poverty in Africa. They pointed further to the "dubious results" of structural adjustment programs that in their view have created an "opportunity for more situationally relevant and people-centred development" (p. 389). Sachs's (1992, p. 1) observation that "the idea of development stands like a ruin in the intellectual landscape" suggests that the concerns are not merely about the definition of development, but also about strategies, actors, and their roles, and hints of challenges within geographical spaces that are beyond those of developing countries. Devolution of power to local authorities and communities represents a critical dimension of the "decentering movement" that connects development and governance at the local level. On this point Bardhan (2002) has contended that "in the matter of service deliveries as well as in local business development, control rights in governance structures should be assigned to people who have the requisite information and incentives and at the same time will bear responsibility for the (political and economic) consequences of their decisions" (p. 202). The growing momentum around a "new" paradigm that identifies localities or local/subnational geographical spaces as convenient realms in which to pursue economic growth and improved welfare for citizens might be explained by the influences of key interrelated social forces.

The first of these is the phenomenon of globalization, which has given new meaning to location in light of the increased movement of capital, goods, and people facilitated by changes in technology and competition. In one sense, global markets ease access to resources, capital, technology, and other networks, but in another they reduce the efficiency of the traditional concept of location in terms of approximate distance to markets. In addition, global competition has had contradictory consequences for economic geography, one of which is a diminished role for governments in shaping competitive forces (Wilson, 1995). Porter (1998, 2000) offered the concept of "clusters" as both theoretical and practical response to the illogicalities of globalization. By extension, Porter's concept strengthens Storper's (1997) proposition that localities consist of unique socio-economic elements and characteristics that give them important comparative advantage, making them sites of economic vitality and strength within national economies. Porter (2000, p. 15) defined clusters as "geographic concentrations of interconnected companies, specialized suppliers, service providers, firms in related industries, and associated institutions (e.g., universities, standards agencies, trade associations) in a particular field that compete but also cooperate". Clusters, in Porter's (1998, 2000) view, provide important insights for both government and industry about the relationship between a business and its environment, and the management tools that are required for competitiveness.

"Cluster thinking" shifts the focus from internal competiveness and strategic factors to external matters, such as business location. The argument is that "companies have a tangible and important stake in the business environments where they are located in ways that go far beyond taxes, electricity costs,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

and wage rates", and that "the health of the cluster is important to the health of the company" (Porter, 2000, p. 16). The implications for government decision-making reside in how economic priorities are designed. Nations' and states' competitiveness demands that sound macroeconomic policies are balanced with deliberate microeconomic interventions, suggesting a policy outlook that assigns new and different roles to levels of government and other institutional actors. "Cluster thinking" has a transformative development management agenda, therefore, for as Porter (2000) has argued:

*Government's more decisive and inevitable influences are at the microeconomic level. Among them, removing obstacles to the growth and upgrading of existing and emerging clusters takes on a priority. Clusters are a driving force in increasing exports and are magnets for attracting foreign investment. Clusters also represent an important forum in which new types of dialogue can and must take place among companies, government agencies, and institutions such as schools, universities, and public utilities (p. 16).*

Where the concept of clusters is relevant to developing countries is in the view that, as critical masses of unusual competitive success in particular business areas, clusters are "a striking feature of virtually every national, regional, state, and even metropolitan economy" (Porter, 2000, p. 15).

Wide-scale adoption of neoliberal policies represents the second set of social forces that may explain rediscovery of *the local* "as the site of empowerment and hence as a locus of knowledge generation and development intervention" (Mohan & Stokke, 2000, pp. 247–248). The governance imperatives accompanying these policies have reignited strong advocacy for decentralization, even though the assumed positive correlation with economic development is contested. Decentralization describes a process in which power is transferred from one level of government to another, explained by Mohan and Stokke (2000, p. 251) as:

*Decentralisation in its neoliberal guise treats the local as a functional, economic space with policies designed to increase the efficiency of service delivery. In this sense the market is seen as a universal principle without any 'geography', although the implication is that local political economies have their own coherence within this totaling logic. Decentralisation simply facilitates the efficiency of these nested local economies.*

The value of economic efficiency has long held sway in arguments in favor of decentralization. Efficiency is thought to reside in high-quality service delivery and regulations that create an environment conducive to investment. This position is associated primarily with *fiscal decentralization*, which promotes the idea that local outputs that are differentiated according to local tastes and circumstances result in higher levels of social welfare (Oates, 1993, p. 240). In other words, decentralization facilitates effective local decision-making on account of increased local knowledge about service delivery demands and supply factors, with greater opportunity to strengthen links with local businesses. Further, decentralization facilitates economic growth on a national scale because of the prospects for reducing corrupt practices.

The counter-arguments are just as convincing: that the level of administrative and institutional capacity required by decentralization can hardly be met at a local level, which is usually constrained by limited resources (human, material, technical). Weak institutional and administrative capacity leads to inefficient and ineffective service delivery (roads, water, etc.), which in turn limits the scope for achieving local economic developmental goals. Conyers (1990, p. 18) added the concept of *elite capture* to the debate,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

noting that "decentralization may increase the participation of the people at the local level but sometimes it is only a small privileged group that gets to participate". Indeed, elite capture can potentially undermine effective business development, as decisions are made to benefit certain individuals rather than to promote general economic growth or achieve collective welfare (Bardhan, 2002; Matinez-Vazquez & Rider, 2005). Thus local government activities with local economic development potential, such as planning, regulation, and business licensing, lose their public interest value through being converted into rent-seeking activities by private interests (Devas, 2011).

The early tension in development economics between the Keynesian interventionist state – with responsibility for correcting market failures and ensuring economic efficiency, growth, macroeconomic stability, and social development – and the minimalist state of the neoliberal era has eased somewhat with the emergence of a *third way* marked by institutional reforms. Support for the *third way* comes from institutional economic thought, three aspects of which were highlighted by Amin (1999). First, derived from economic sociology is the view that markets are social constructs and therefore economic behaviors are "embedded in networks of interpersonal behaviour" (p. 366). Second, evolutionary and cognitive psychology advances that "the creative, learning and adaptive capacities of economic agents are centrally dependent upon the rationalities of their constituent actor networks" (p. 367). Third, "old" institutional economics reinforces the idea that the economy is shaped by enduring collective forces, making it an instituted process. Amin (1999) explained that formal (rules, laws, and organizations), informal, or tacit institutions (individual habits, group routines, social norms, and values) are a part of these collective forces, providing "stability in the real economic context of information asymmetry, market uncertainty and knowledge boundedness, by restricting the field of possibilities available, garnering consensus and common understandings and guiding individual action" (p. 367). In policy action, the third way is encapsulated in the concept of governance in which various actors are assigned a role in the process of development, signaling a shift away from the center. Thus institutions of the state and civil society collaborate to ensure learning, innovation, and "untraded interdependencies" (Cooke & Morgan, 1998; Storper, 1995). Innovation is at the core of economic competitiveness, whether at the level of firms, industrial sectors, or nation-states, and institutions are considered to have a *co-ordinating role* in reinforcing norms, routines, trust, and collaboration within the process of innovation (Leibovitz, 2003, p. 2615).

## INSTITUTIONALIZING LED: THE JAMAICAN EXPERIENCE

Unarguably, an LED paradigm is at an embryonic stage in Caribbean development discourse (see, for example, Schoburgh, 2014; Schoburgh & Martin, 2016), despite trends indicated elsewhere. But even in the absence of a specific LED ideological backdrop, governments in the Caribbean Region have not been idle, taking steps to respond to the economic niches created in local geographical spaces. Jamaica exemplifies this orientation in three policy frameworks, which from the perspective of this chapter represent the institutional foundations for an LED model.

### Federating Development Committees

The decentralization campaign that accompanied the neoliberal policies of the 1980s has given rise to a range of structures purporting to facilitate citizens' participation in development efforts, especially

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

in developing countries. Often referred to as *user committees/groups*, or *stakeholder committees*, or *development committees*, these structures are identifiable by a single interest such as women or small businesses, or a multiplicity of interests such as *community development*, and are argued to "catalyse the beginnings of autonomous civil society activity at the local level, so that a start can be made in prying open closed political systems" (Manor, 2005, p. 195; Cornwall & Gaventa, 2001). Some structures are more narrowly focused on *economic development* at the subnational level, which, according to Fraser (1967) presents opportunities for improved relations between government and industry because the former is made more aware of the needs of the latter.

Development committees in Jamaica broadly encapsulate values such as democratic decentralization, participatory development, and "good" [local] governance, as espoused in the literature. They are normatively advantageous from a socio-economic and political perspective, on account of their association with:

- Efficiency and effectiveness in public decision-making, given that their principal function is to bridge the divide between policy and community/local needs in the process of development.
- Equity, based on their design as structures open to all interests and perspectives that rely on local initiatives and creativity, thus facilitating greater social inclusion.
- Political and macroeconomic stability, because of the investment of their membership in quality of development outputs and thus their potential positive impact on governing institutions at the local level and, more widely, on public sector performance.

Development committees are also an institutional response to the effects of rapid urbanization manifesting in a spill-over of economic activities across geographical boundaries that confound systems of control and governance. And when the outcomes of urbanization are viewed in combination with the socio-economic perturbations linked to globalization, development committees represent one set of institutions located on the continuum of the direction in which the state is being "hollowed out".

The "federated" system of development committees in Jamaica can be placed against the background sketched above. Ministry Paper 7 of 2003 assigned them the task of leading the development process at the local level. As a consequence, the 783 communities (demarcated geographical spaces) that make up 14 parishes delineated further into 14 local authorities (i.e., 12 parish councils, 1 municipal council, and 1 corporation) consist of a plethora of single- and multi-purpose civil society organizations (CSOs), with some CSOs coalescing around specific development issues. Development committees in Jamaica range from community development committees (CDCs), through development area committees (DACs), to parish development committees (PDCs). They are "federated" in that the interactions at one level feed into the next, based on a hierarchy of interactions that culminates at the level of the PDC. The PDC is described by the Ministry of Local Government and Community Development as a partnership of stakeholders drawn from local businesses, civil society, elected officials (members of parliament and councilors), state agencies, and other groups, established to co-ordinate and monitor local development (Ministry Paper 7 of 2003, pp. 6–7). At the national level, all PDCs form the national association of parish development committees (NAPDEC) and, with the Social Development Commission (SDC), mediate the interactions between PDCs and other actors in local development, and leverage support for the process.

There is a degree of organizational equivalence between the local authority and the PDC: both are democratic organizations in that leadership is elected. Local authorities are political institutions that govern the parishes; PDCs are civil society organizations (CSOs) that are expected to govern LED in

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the parishes. Another mechanism, the development area committee (DAC), is established to represent the interests of cross-boundary geographical spaces that result from spill-overs of economic and social activities, which, in addition to blurring geographical limits, threaten the economic viability of town capitals. Clearly applying the concept of development committees in Jamaica responds to both normative and empirical pressures. But are development committees sufficiently equipped for LED model implementation?

## Localizing the Growth Agenda

The Micro, Small and Medium Enterprise (MSME) and Entrepreneurship Policy (MSMEEP), launched in October 2013, established an expansive institutional framework aimed at facilitating the development of the MSME sector in Jamaica. Several criteria based on country context and purpose have been used to define MSMEs. However, the MSMEEP adopted a single national definition, shown in Table 2, based on size, employee base, and sales that replaced the myriad meanings[1] used previously.

The economic developmental potential of MSMEs is well documented, especially their strategic importance to an LED model. Implicitly, the MSMEEP acknowledges their potential to transform localities positively via their role in employment, wealth creation, and business expansion, and explicit contribution to private sector growth and expansion and overall social development. As an illustration, MSMEs' portion of the labor force was estimated at 18.3% in 1990 and 18.1% in 1996, and certain categories of businesses have increased since the mid-1990s. For instance the Labour Force Survey of 2011 revealed that the Own Account Worker (OAW) category (i.e., any person who operated a business but did not employ paid help) accounted for 35.9% of the employed labor force. There has also been a steady rise in the number of MSMEs in the island, exemplified by the number of non-agricultural micro and small enterprises, estimated at 36,780 in 1983, 88,850 in 1990, and increasing to 93,110 in 1996. Clearly the growth of the informal sector, estimated at 40% of GDP and including many of the MSMEs, suggests scope for their growth, even in the absence of more recent estimates of their total number. Surveys conducted in 2003 and 2008 show that the activities of MSMEs in Jamaica are concentrated in wholesale and retail trade ($\geq$50% and >55.7%, respectively) and community and social and personal services sectors (22% and 23.3%, respectively).

The MSMEEP identifies the myriad challenges that have stunted the growth and development of MSMEs and, by extension, stymied government efforts to meet national economic growth targets. In the mix is the nature of their business processes: weak operational capacity and, in particular, marketing capacity, leadership, communication, and technical skills, and unfamiliarity with business support services. The claim is that a low capacity for innovation and low utilization of technology by Jamaican

*Table 2. Definition of MSME, Jamaica 2013*

MSMEs has reduced productivity and competitiveness in the sector (MSMEEP, 2013, p. 6). However, MSMEEP (2013) has singled out business informality as the greatest threat to the growth and development of the sector:

*Informal operations are obliged to remain invisible to the legal system and face restrictions in carrying out certain business activities. They also have a limited number of customers as well as limited access to certain government support (for example, participation in fifteen percent {15%} procurement set-aside) that is crucial to their survival (p. 6)*

This is compounded by the barriers (including excessive regulatory and administrative procedures, fees, and financial requirements) that MSMEs encounter in their attempts at formalization. At any given time it is estimated that the average micro and small business meets a little more than one third (36%) of the formal requirements, leading to the conclusion that the informal economy – estimated at 40% of GDP – is made up of MSMEs.

The foregoing empirical issues, combined with the government's priority on job creation and economic growth, have informed the MSMEEP's vision of "[a] highly entrepreneurial sector which fuels economic transformation through innovation, creativity and high performance" (p. 33) to the mission:

*To inculcate a deep-seated culture of entrepreneurship in MSMEs, reduce bureaucracy to improve the ease of doing business, build capacity, and provide timely and relevant support by forging strategic partnerships and linkages with key sectors within the society. (p. 33)*

The MSMEEP is pursuing policy, vision, and mission through 11 goals, including increasing the number of formal MSMEs by 10% each year; reducing the processing time for business registration by 60% by 2015; introducing entrepreneurship in the curricula of all primary, secondary, and technical institutions by 2020; and promoting and securing equity and equality of opportunity to enable women-owned and family-owned businesses to be effective economic actors in the MSME sector. Policy strategies respond to specific obstacles to MSME development, and will seek to improve the business environment, increase finance to the sector, enhance business development support, broaden the entrepreneurial and innovative base, and tackle cross-cutting socio-economic and environmental issues such social capital formation, gender-sensitivity, persons with disabilities, and youth.

MSMEs are acknowledged as an important dimension of a local economic growth strategy. Yet the MSMEEP seems disconnected from the local context, as the policy has been unable to establish a relationship between MSMEs and development committees, which in essence excludes significant dimensions of the creative and learning processes necessary for autonomous development. In truth, MSMEEP is a central government policy initiative challenging the idea of an alternative and innovative development path.

## Locating LED in Community Development

Formulated at the start of a period of national self-determination, the Jamaica Welfare Commission Act of 1965 outlined far-reaching social transformational goals. The Act built on its philanthropic foundations in the Jamaica Welfare Limited of 1937, giving birth to the Social Development Commission (SDC), a rational-legal institutional framework that fused social and economic development within the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

practical and ideological purview of the *community*. The *community* at this juncture was an important concept in development debates and there is general acceptance of its multidimensionality and complexity that go beyond simple geographical space. Making the community the target of social intervention was strategic for governments of developing post-colonial states as they integrated local initiatives into national developmental goals. Community development embodies a range of strategies deployed systematically to structure the innovative ways that individuals in a local geographical space – acting singly or in partnership with others – adopt to improve their circumstance. There has been a measure of "welfarism" in community development, given that the dominant development ideology of the period presumed that state and government institutions had a responsibility to direct public resources towards the most disadvantaged and economically vulnerable in society to remove the obstacles that constrain self-organization and development. Both dimensions converge in the functions of the Social Development Commission, as the underlying philosophy of the Jamaica Welfare Commission Act 1965 was that community development was a path to nation-building. This was an important value orientation, especially in a post-colonial setting. Community development thus relied on face-to-face interactions to aid the formation of social capital, theorized to be a critical precursor to the emergence of communities of interests. Implicitly, such communities produce the kind of solidarity that post-independence leaders felt would strengthen psycho-social connections, converting them into nationalism in the long run. Consequently the SDC, in addition to having responsibility for the affairs of the Jamaica Youth Corps, was assigned duties that encompassed all facets of community life. Thus, under Section 7 [1] a-d of the Jamaica Welfare Act 1965 the SDC is mandated to:

*(P)romote, manage and control schemes for, and to do any act or thing which may directly or indirectly serve, the advancement of sport; and the general interests and the social, cultural or economic development of the people of the island and in particular the rural and urban workers.*

Section 2 (1) a-d pertains specifically to the needs of the youth:

*(I)t shall be the duty of the Commission to carry out such community development projects and social welfare activities as, in the opinion of the Commission, are desirable…provide training and experience in community living and service and agricultural pursuits and skills ancillary thereto for young persons; provide and maintain residences and such other facilities and amenities as the Commission may consider necessary for the use or enjoyment of young persons undergoing training.*

The SDC, as noted elsewhere, reflects an integrated approach to community development (Schoburgh, 2006). The following timeline gives the clearest signal yet of how the local sphere of social interactions might be amalgamated with the broader national sphere.

**1960s:** Alleviation of social conditions of agricultural workers.
**1970s:** Community organizing, welfarist interventions, local enterprises development.
**1980s:** Community organizing, national youth service and skills building.
**1990s:** Poverty reduction, local governance.
**2000s:** Poverty reduction, wealth creation, local governance.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**2013:** LED, which had been an aspect of the SDC's functions since the Commission was formed, but which had been subsumed under the broader strategy of community development. Since 1996, the SDC has had to share aspects of its social intervention portfolio with the Jamaica Social Investment Fund (JSIF), established in line with government's emphasis on social policy and in particular as part of the national poverty alleviation program. The JSIF's activities are limited to channeling resources to small-scale community-based projects. However, its alliance with international technical bureaucracies such as the World Bank, which provided its start-up funding through a loan arrangement negotiated by the government, its demand-driven response to community needs, and its seeming isolation from bureaucratic norms and partisan political influences, have accrued to it much political capital at the local level and contributed to a perception that it is a more effective organization than the SDC. In fact, the JSIF claims to have approved 1,025 "sub-projects" between 1996 and 2007 that cover a range of community needs in all parishes in the island, of which 746 have been completed, impacting the lives of 1.5 million Jamaicans (see jsif.org).

Of course the SDC can claim a similar, if not more impressive rèsumè with respect to its activities in communities. Arguably its impact in communities is diffused as its mandate shifts periodically. These shifts are facilitated by the Jamaica Welfare Commission Act 1965 that empowers the Minister to give policy directions to the SDC "on matters of public interest". In 2012, Noel Arscot, Minister of Local Government and Community Development, acting in accordance with statute provisions, instructed the SDC to make LED the organization's primary goal over the period 2013–2015. The SDC's local economic development support program (LEDSP) was conceptualized and made the central pillar of the organization's corporate plan. On the one hand, crafting of the LEDSP illustrates the agility of the SDC; on the other, it introduces some institutional ambiguities in the governance of LED in Jamaica, such as:

- **Scope of its Role:** Will the SDC facilitate and co-ordinate all LED activities?
- **Relationship with Other LED Actors:** How will this be defined?
- **Relationship with the Community:** How will community expectations be managed given the traditional role of the SDC?

## ISSUES IN INSTITUTIONALIZING LOCAL ECONOMIC GOVERNANCE

From both theoretical and practical perspectives, LED is a response to the void created by the failure of the grand narratives of development of the modern period, and can be seen as an alternative approach to achieving collective welfare (Binns & Nel, 1999). Some LED analysts make a distinction between LED in developed countries of the North, which arguably involves activities (investment, big-business support, and large project development) of relatively well-resourced local agencies, and the developing countries of the South, where LED features greater reliance on community-based initiatives, utilizing indigenous skills, and seeking primarily to ensure survival, rather than participating in the global economy (Binns & Nel, 1999; Judd & Parkinson, 1990; Taylor & Mackenzie, 1992). These analysts also observe an evolution in LED strategies in the North. For instance *business attraction*, characteristic of "first wave" strategies emphasizing provision of incentives (subsidized loans, tax exemptions, direct payments) to get specific firms to relocate to local communities, has made way for *business retention*, indicative of "second wave" strategies that take the form of indirect industry-level assistance (e.g., marketing, revolving loan funds) with emphasis on entrepreneurship, industrial clusters, and public-private

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

partnerships. The goal of improved quality of life marked the gradual shift to public investment and economic development at the community level (Binns & Nel, 1999). These "third-wave" community-oriented strategies create opportunities for low-income and low-skilled workers, who were previously overlooked in "first wave" and "second wave" LED implementation that privileged mainly private sector initiatives and incentives with demand for a high-skilled labor force (Bradshaw & Blakely, 1999; Koven & Lyons, 2006; Olberding, 2002).

LED model implementation in Jamaica is at a very early stage but it is safe to say that, even at this point, there are strong similarities with "third-wave" strategies of the North, despite consideration being given to facilitating entrepreneurship and private sector development. Clearly all three policy responses discussed in previous sections of this chapter demonstrate the varied approaches to LED model implementation and governance, such as markets, bureaucratic hierarchies, associations, and networks. For instance, the Ministry of Industry and Commerce, with responsibility for implementing the MSMEEP, might be construed as the bureaucratic hierarchical mode of LEG, even though it is an organizational operative of the central government. LED initiatives are expected to form part of the functional scope of the SDC, as outlined previously. Thus the SDC, along with local authorities (i.e., local government) that have been mainly excluded from this investigation, is indicative of the hierarchical bureaucratic mode as well. However, the SDC (as well as local government) has a dual governance character in that they are sites for associative interactions and so can function as networks. Finally, development committees straddle markets, associations, and networks, given their location outside of the public domain. Implicitly all nodal points in LED model implementation in Jamaica are connected in their focus on tapping the economic potential at the local level. But they do so in loosely coupled systems and interactions with undefined boundaries. Perhaps the policy responses in Jamaica at this initial stage reflect the tone of the discourse surrounding LED model implementation, which Hollingsworth (2000) noted as fragmentary. The critical question, conceptually as well as empirically, is: What is the relationship between the different approaches to LED?

The answer resides in how the new rules of the game are designed. Facilitating individual and collective pursuit of economic welfare and development of private enterprise relies on an enabling environment at the local level. For sure an enabling environment for private enterprises, at both national and local level, is an essential ingredient for making a sustainable impact on development goals such as reducing poverty and creating employment. Clearly, an enabling environment for an LED model implementation points to the quality of economic governance, which relates to the extent to which government policies, laws, and regulations set the rules of the game for business and influence, positively or negatively, the performance of markets, the incentives to invest, and the cost of business operations (Amin, 1999; Amin and Thrift 2000). So what do the policy responses in Jamaica portend in this cautious transition to LEG? Institutional approaches exemplified in the work of Ostrom (2007), Hollingsworth (2000), Amin and Thrift (2000), Amin and Hausner (1997), Amin and Thrift (1995), and Nutt-Powell, Landers, Nutt-Powell, and Sorrell (1978) have espoused certain preconditions for effective LEG, suggested by the following questions. Do policy responses promote associations over individual activities? Is voice facilitated? Are facilities for negotiation accommodated? To what extent are recursive rationalities of behavior evident in the design of each policy action? Is LED a function of a plurality of autonomous organizations? To what extent does each perform a supporting role for the other? How innovative are policy responses? These are the main criteria against which *development committees*, the MSME policy, and the SDC's LEDSP are assessed to determine what needs to be done, if anything, to substantiate the move towards successful LED model implementation. Table 3 shows the results of the analysis.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

A reiteration of the position of this chapter with respect to LED is warranted: at this juncture an LED model is neither articulated clearly by the government, nor finds strong support in academic research or development discourse in the Caribbean, outside of this researcher's outputs and the work of the Commonwealth Local Government Forum (CLGF) whose activism, with all its best efforts, has remained in the realm of political discourse. The reason for this is that the original tone of the discourse about the value of the subnational/local has centered around local governance, which, though it acknowledges the necessity of integrating other actors into local policy processes, raises the importance of political institutions and their democratic functionality over their economic functionality. Conceptually, then, LED has no home and is barely linked to local government, contending for intellectual space with the broader concept of community development. Those issues notwithstanding, LED is demonstrated in policy practice and even more so outside of formal policy, if one takes into consideration the expansive informal economy that characterizes the environment of SIDs in the Caribbean. The level of informality in Jamaica is adequate rationale for formal adoption and implementation of an LED model. And from the perspective of this chapter, the three policy responses assessed in Table 3 signal the government's attempts in Jamaica to decenter development, if only cautiously.

The LED strategies cumulatively fulfil two of the criteria of LEG: that policy responses in contention exhibit an appreciation for LED as a *multi-actor domain*; and that *sensitivity to local path dependencies* is *sine qua non* to effective economic governance. Weaknesses are evident, however, in the extent to which the other criteria are met. For instance, *opportunities for strategic visioning, learning, and adaptation* are evident in application of the development committees' concept and the SDC's LEDSP emanating from a policy directive, but appears to be absent from the MSME policy. However, this positive ori-

entation to an economic governance framework is countered by certain threats. Take, for example, the PDCs that much depends on in LED model implementation. Ministry Paper 7 of 2003 envisioned that PDCs would be incubators for inculcating values of "participatory local governance" with the support of other democratic structures like the CDCs, and importantly undertake long-term strategic planning for their respective parishes (pp. 6–7). The policy seems imprecise about the role of PDCs, and the other development committees for that matter. By definition this role ought to be developmental in orientation, which does not preclude the organization functioning as a site for democratic participation. Rather than linking PDCs with "participatory local governance", perhaps the appropriate link is with local economic governance. Truth be told, for the most part the requisite institutional elements in support of LED are invisible in PDC operations. And this is so even in cases where the PDC is active, such as the Manchester PDC. PDCs are voluntary organizations, which is not intrinsically an encumbrance to their effective functioning. However, in the absence of a clear purpose and mandate, systems of accountability, and clearly articulated criteria in consonance with their purpose, and against which they are adjudged on their effectiveness in fulfilling their mandate, one is hard-pressed to detect their *development* orientation. Again the Manchester PDC bears credence here, for it formulated its development plan for the parish for over three years but has failed to proceed towards implementation. But the weak development orientation of development committees is merely one aspect of the problem.

The SDC has a degree of economic governance responsibility in that all CSOs fall within its oversight; development committees are no different. The SDC (along with local authorities) could be seen as median governance mechanisms at the local level, providing the kind of institutional thickness that is required in economic governance. But in relation to the PDC, the SDC winds up reinforcing the ambiguity in the role of the PDC through the assessment rubric that the SDC deploys (see Table 4).

The indicators of performance – active, partially active, inactive/dormant, and defunct – further distance the PDC from its development function. A four-year activity trend analysis of development committees provides a startling picture (Figure 1). Clearly an active status does not say anything about the substantive functions that are required to ensure business is competitive or employment is created. Perhaps this status of PDCs might explain the absence of development committees from the MSMEEP. Therefore, while the idea behind establishing development committees is an excellent one, it is in the practice that the concept falters.

*Strategic visioning, learning, and adaptation* are also implicated in the design and location of the MSMEEP. To begin with, central government steered this initiative, given its direct alignment with Jamaica National Development Plan (Vision 2030), which negates the "localness" of implementation and the degree to which "recursive rationalities" are facilitated. The MSME policy responds to a genuine local concern – private business development – that is the core of successful LED model implementation. But it is disadvantaged by the existing structural frailties of the business environment that were identified in the *Doing Business Report* and that formed the initial focus of the policy. In fact, the MSME

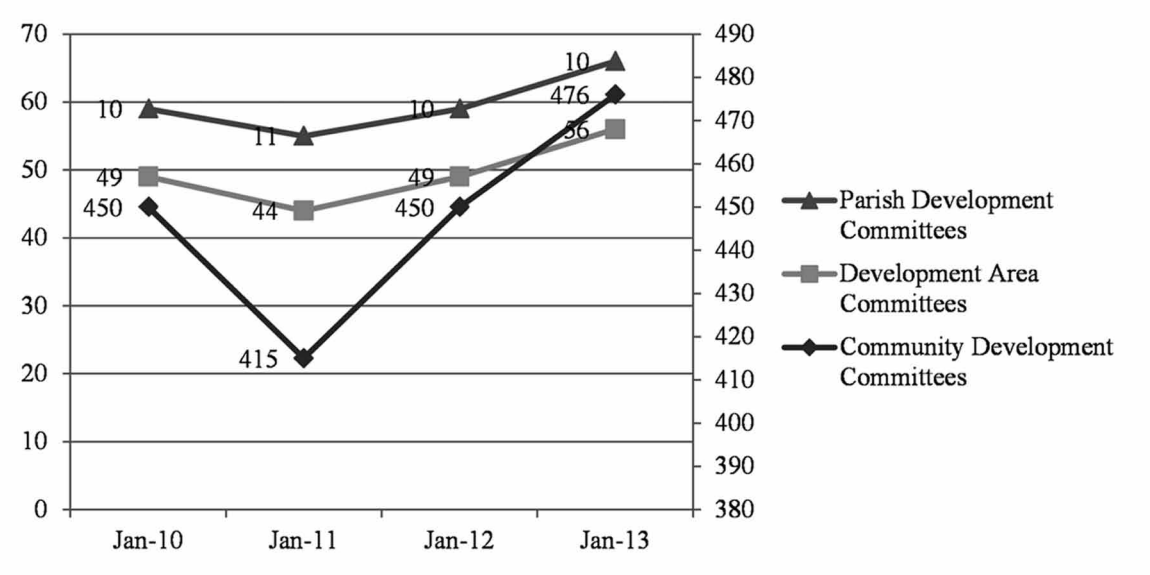

*Table 4. Indicators of level of activity of development committees*

| | |
|---|---|
| Active | Governance group should have met at least once every three months |
| Partially Active | Governance group should have met at least once every six months |
| Inactive/Dormant | Can be resurrected /reactivated |
| Defunct | No possibility of recovery/reactivation |

*Figure 1. Activity profile of development committees*

policy declared that a whole-of-government approach was necessary for improving the regulatory and administrative environment for businesses in general.

Altogether the issues converge around the nature of the institutional arena, at the center of which is a difficulty in assigning new roles and delegating functions. The issues of size of these island-states and the role of the center in charting economic destiny may explain the propensity for development analysts to adopt a position in which the subnational level is hardly seen as a viable independent economic space. Rather, the worth of the subnational level is connected to the value it adds to the center, in both politics and economics. Such a perspective may be partly legitimized by centralized decision-making structures as the dominant risk management modus operandi. Aid governance might be blamed for reinforcing the inflexible arrangements that are associated with development policy because of the conditionalities that come with the programs. For instance, Jamaica signed its second IMF agreement in 2012 (the first was in 2007) and the country is held to strict economic targets with little space for experimentation. Yet aid governance rides on doctrines that complement an LED paradigm and therefore the implications of this dichotomy in Caribbean development discourse are far-reaching. Caribbean development policies and strategies are devoid of apposite alternatives that account for contextual economic opportunities. Participation of other actors in the process of development, so stoutly encouraged in both post-bureaucratic paradigms of state management and aid governance, has little grounding in a normative framework informed by LED ideologies and philosophies. Thus the acknowledged economic value of the informal economy, emergent businesses, or civil sector engagement is not integrated into a coherent framework. Each issue is analyzed separately and in relation to national development criteria, which understandably is the ultimate goal of LED, but which in reality disregards the local context and the impact on communities.

LED model implementation in Jamaica highlights how critical are the issues of co-ordination in effective LEG. Usually co-ordination, especially economic co-ordination, is the domain of national mechanisms, and thus LEG introduces *new* "rules of the game". Localizing economic development brings to the fore the critical role of networks in the process of co-ordination that are believed "to integrate vertical

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

programmes and facilitate the flow of information about opportunities and about resources that need to be mobilized to seize these" (Bennet & McCoshan, 1993 cited in Helmsing 2001 p. 300). Networks, according to Helmsing (2000, p. 47), "facilitate externalities of economic decision-making to become internalised by better attuning decisions to each other, and by preventing negative, and maximising positive externalities". Essentially LED model implementation relies on co-ordination. Further, co-ordination is at the core of LEG. This symbiosis is illustrated in Jessop's (1998) definition of governance as "any mode of coordination of interdependent activities" (p.29). Jessop (1998) identified three activities that are relevant to LED: the anarchy of exchange, which refers to the unfettered use of market mechanisms; organizational hierarchy that at the subnational level raises the import of local or regional governments as governance structures; and self-organizing "heterarchy" that includes "self-organizing interpersonal networks, negotiated inter-organizational coordination, and de-centred, context-mediated inter-systemic steering" (p. 29). Jessop explained the latter two forms as involving "self-organized steering of multiple agencies, institutions, and systems which are operationally autonomous from one another yet structurally coupled due to their mutual interdependence" (p. 29). Policy strategies in Jamaica symbolize these different modes. At this stage each operates in a silo, leading to the conclusion that implementing an LED model represents a decisive shift from *local governance* to *local economic governance* but which, at this juncture, lacks a cohesive policy framework linking the different strategies in a seamless network of economic and social interaction. The resultant effect of the policy initiatives has been nothing more than atomized organizational actions that engender competition among localities and communities, rather than establish a clear growth strategy at the local level.

## FUTURE RESEARCH DIRECTIONS

The adjustments to institutions at the local/subnational level in the Caribbean reflect a search for an alternative paradigm for development, that is more in alignment with the dominant discourse, which favors more participatory and place-based approaches. However, there are questions about the institutional and capacity requirements of subnational governance and development. Important research problematics are indicated in the context of SIDs like the Caribbean, given issues relating to geography and population size, resource constraints, and the countries' precarious integration into the world economy. Altogether these issues suggest the need for both descriptive and prescriptive analyses of the appropriate infrastructure at the subnational level that can support an economic growth agenda.

## CONCLUSION

Rediscovery of the "local" has come on the heels of the failure of large scale projects, usually implemented by national governments to promote economic growth and employment, and improve citizens' quality of life. Individual responsibility and independent economic action underpin neo-liberal free market ideology. And, on account of the general proclivity of the poor, particularly in the South, to adopt measures of survival and chart their own economic destiny, an appropriate context is created for LED initiatives. SIDS must undertake a short learning curve in an environment in which a plethora of ideas and doctrines exist about managing the political economy. For many SIDS, development is not merely elusive; the process of experimentation that accompanies each idea or doctrine complicates matters, resulting at times

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

in only partial implementation of plans or programs. Jamaica's efforts to reshape the subnational sphere to create a context conducive to economic transformation of people and place illustrate this point. The truth is that the efforts are insufficiently integrated. And, therefore, from institutional analysis it is clear that a critical ingredient for effective LEG – co-ordination – is missing. From institutional analysis also comes an appreciation for economic relations as a function of established rules of the game that require radical change to establish a new order.

# Chapter 39
# Foreign Direct Investment in India Opportunities and Challenges

**Suranjan Bhattacheryay**
*Indus Business Academy, Bangalore, India*

## ABSTRACT

*Foreign Direct Investment (FDI) is the dispersal and optimisation of resource packages like human, financial, knowledge, physical and reputational resources. The motivational factors such as natural resources, market resources, strategic resources, efficiency resources, locational advantages, etc., influenced Multinational Enterprises (MNEs) to perform various activities in the host countries. MNEs internationalise business mainly to acquire intangible assets and for balancing resources which they do not possess. India is in receipt of continuous capital flow due to favourable policy management and a strong business environment. Globally, Indian corporations continually display significantly better equity earnings over other countries both developed and emerging. The Government of India is very keen in simplifying FDI rules with an ultimate aim to attract more investors with zero hazards.*

## 1. INTRODUCTION

Foreign Direct Investment (FDI) is the spreading and value enhancement of resource packages by Multinational Enterprises (MNEs) in a host country where a company based in another country looks for business activities. Resource packages are the combination of human, financial, knowledge, physical and reputational resources. MNE's goal is to perform commercial activities and to retain strategic control in the host country. Host countries are based in another country, having high business potentials. MNE crafts value and placates stakeholder desires by operating across national borders. Normally, host countries are historically well aware about the local stake holder requirements. Accordingly, while operating across national borders, MNE is in disadvantage position as compared to firms from host country. MNEs engage themselves in Foreign Direct Investment (FDI) if the host country has locational advantage in

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

relation to the home country. Value plan strategy on the foreign activities must be more eye-catching to MNEs, than the alternate value enhancement at home. The under noted key motivational factors influence MNEs to perform various activities in the host countries.

## 1.1. Natural Resource

This motivation leads to the hunt for financial, physical or human resources in host countries. All these means are primarily not easily available and trademarked. However, to make them available, MNEs, besides their optimal uses, add high value creation. Favourable institutional environment is the key factor which allows MNEs to access these resources.

## 1.2. Market Resource

Initially MNEs search for the customers in host countries and conclude by encompassing productive activities when foreign market confers higher value to the firm. Host country's locational advantage motivates MNEs to conduct economic activities in that location to enlarge their market size. Locational advantage is the incidence of customer's inclination which leads to procure firm's products. Looking for market by MNEs, is not the same as mere export. It involves MNEs multiple business activities, helped to transfer/convert bundle of resources and to retain strategic control over the host country.

## 1.3. Strategic Resource

MNEs motivation to invest is the aspiration to improve access to cutting-edge resources of host country through exploration, recovery and then laying into production. MNEs main thrust areas are to explore the cutting-edge resources, like up- stream, downstream, administrative, and reputational. The available/hidden resources are the locational advantage of the host country and are very difficult to access, examples, natural and market resource etc. FDI primarily decide by acquiring companies, tempting alliance activity/ making an insider in foreign knowledge group. The main thought behind it by MNEs is to become a recognised industry player in a set of advantageously knowledge development environment.

## 1.4. Efficiency Resource

It is the desire of the firm to capitalize environmental changes. In the process, MNEs international network leads to more attractive and ultimately helped to achieve consolidation with the concentration of Firm Specific Advantage's (FSA's i.e. having innovation capabilities and marketing capabilities) proprietary resources. Environmental changes comprise greater economies of scale through a rigorous process of technological breakthrough aiming shorter product cycle, increased industry focus on innovation, higher trigger on R and D investments besides smoothening trade and investment barriers. Locational advantages are the key factors to receive fresh FDI in host countries.

## 1.5. Locational Advantages

Locational advantages (natural and created) represent the entire set of strengths like reputation, skilled labour, growth facilities, scope of subsidiary industries, employment opportunities, common problems,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

economy gain, etc., surrounded in a specific location which is in operational at the highest level. MNEs place focus in a host country where natural resource, knowledge, transport, etc., are easily available besides having comfortable trade-barriers. MNEs success mostly depends on the advantages of favourable local environment. Utilised locational strengths of the host country are required to be assessed with the available/ untapped strengths. Further, an ongoing comparative assessment should be in place with other locations:

- Location advantages are the key contributing factor for FSAs that can be geared up by locally operating firms relative to firms operating elsewhere, examples are:
  - Ample natural resources may support in creating a prosperous firm in the natural resource industry like Agriculture, Forestry, Fishing, Hunting, Mining, Quarrying, Oil and Gas Extraction etc.;
  - A superior scholastic system will help firms that shape classy human resource skills;
  - The presence of an exciting and fashionable local market for specific products will possibly substitute local uprising in the relevant industry;
- Location advantages do not converse identical strength to all local operational firms vis-à-vis firms operating away. Rather, the more active and proficient use of locational advantages made by some firms, are usually through grouping of these locational advantages besides exploring FSA's specific proprietary resources. Location advantages can vary widely based on the geographical opportunity. It delivered and facilitated all the firms operating in a particular country when the government designed an encouraging tax regime for some specific economic activities or pay attention on talent advancement of human resources while boosting general business. While locational advantages mounted up in some parts of a country, economic clusters is positioned on to that parts only. Accordingly, firms that are operating in that part of the country will receive all out business advantages and framed simultaneously the heart of the cluster besides creating the cluster boundaries. Geographical opportunities may:
  - Extend to a narrow cluster;
  - Be a broader region within a country;
  - Be a country or a region across more than a country;
- Location advantages also spread across the country borders intending to craft advantages to insiders at the expense of outsiders. Most of the regional trading and investment agreements spoke exceedingly for the creation of cross border location advantages. Besides motivation of the firm, locational- advantage can also be described in the spirit of deployment of firm's economic activity in that location.

## 2. REVIEW OF LITERATURE

Researchers, Anusha Chari and T. C. A. Madhav Raghavan (2011) examined that India's retail market remains largely prohibited to large international retailers like Wal-Mart and Carrefour. The liberalization move was opposed by opposition due to the apprehensions about employment losses, unfair competition resulting in large-scale exit of many domestic retailers.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Research Scholar, Mr. Rajib Bhattacharyya (2012) opined that the spectacular and unprecedented growth of FDI in the global economic landscape, over the last two decades, evidenced that FDI is an integral part of the development strategy of both the developed /underdeveloped and developing nations. FDI in the retail can enlarge market size by reducing transaction and transformation costs besides adoption of advanced supply chain.

Ms. Neha Dangi (2013) expressed that FDI is the lifeblood for the economic development of any country as it plays an important role in the long-term development, not only as a source of capital but also for enhancing competitiveness of the domestic economy. FDI in multi-brand retail supports the government's role of achieving remunerative prices for farmers.

Mr. Bobby Srinivasan (2014) opined that the Modi government is committed to ease FDI flows particularly in the areas of defence, insurance and infrastructure besides smoothening the tax regime for investors.

Nupur Goel (2015) had done a small sample survey for analysing the impact of foreign direct investment on unorganized retail sector. Outcome was on high impact on business in regard to profit declination, unemployment besides establishing the monopolistic type of situation in the retail market.

Ashima Mangla (2015) conducted study on Indian Retail Sector wherein the researcher expressed that FDI in retail will play an important role in the long-term development of a country by enhancing the competitiveness of domestic economy. India is being looked by many foreign investors due to rise in purchasing power, growing consumerism and brand proliferation.

Mr. Desti Kannaiah and Mr. A. Vinayagamoorthy (2016) studied that India being second most-populous country has immense scope for retail expansion besides increasing consumerism.

Dr. Kishor Jagtap and Smt. Sushma Verma (2016) studied that FDI globally is considered to be a significant component of development strategy of any country. India is no exception to it. Indian Market is constantly on the path of growth due to its increasing size and rise in purchasing power of the people.

Mr Dheerendra Kumar Baisla (2016), opined that FDI is a method of allowing financial resources, technology, and techniques, which enhance value in the diverse sector of economy. Basically, it is considered as a tool to economic development. Indian retail sector is one which carries great potential for attracting FDI.

Ms. Sanghamitra Samal and Mr. D.Venkatrama Raju (2016) studied that the economic development of a country is based on its "Industry Revolution" with more production and promotion which are mostly possible through the revolution of agriculture, industries etc. Inflows through Foreign Direct Investment (FDI) are the major facilitator to achieve the above.

## 3. RESEARCH METHODOLOGY

Researcher made this paper based on the secondary data, sourced and collected from various books, media, journals, government publications, newspapers etc. The paper is descriptive in nature. Collected data is presented in the form of tables. Tabled data analysed and studied in the form of charts, diagrams. Requisite internet searching has also been done for this purpose. Researcher also took help from some web sites and placed some charts etc from their sites in the paper.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## 4. PREPAREDNESS OF INDIA

Multinational companies internationalise business mainly to acquire intangible assets and balancing resources which they do not possess, and which are essential to develop a competitive advantage for survival in more competitive environments. Dynamics that formerly paying FDI attention to developing- countries, were political steadiness, policies in place and availability of cheap labour but now size of the market, expected growth potential and skilled labour, dominate. The transformational impact of liberalization during the last twenty-five years of Indian Economy, has been profound and substantial. Indian economy today, compared to what it was in 1991, undergone a veritable sea change.

Following tasks are being carried out, in phases, to attract foreign investors' attention:

- **Credible Evidence-Based Policy Options for Improved India-ASEAN Economic, Trade and External Relationship:** India has been hunting a combined multilateral, regional and bilateral approach to trade policy with its major trade partners i.e. the Association of the South East Asian Nations (ASEAN), which made them to form long relationships to establish a major regional research and policy hub;
- **Trade, FDI and Economic Growth Linkages in Selected South Asian Countries:** The linkages between FDI and economic growth had been the focus of sizable research for many years. However, the linkages are subject to empirical scrutiny and remain the topic of debate all-time;
- **Financial Decoupling of Emerging Asset Markets from Japan and US:** Financial Organizations have anxieties to persuade customers to invest newly developed Exchange Traded Funds (ETF), designed to track the performance of emerging markets.

Non-Financial Debts (NFDs) include amounts owed on credit cards, loans made to households in the form of mortgages, government agencies, non-profit organizations /corporations i.e. those are not in the financial sector. NFDs have been played also as a source of finance under FDI for the economic-development of any country.

Foreign -companies investing India, have goals to avail the benefits of the prevailing moderately lower wages and distinctive investment advantages such as tax reliefs etc. FDI facilitates host country to achieve technical expertise besides employment generation. The main reasons for continued foreign - capital flow in India, are for favourable policy management and strong business environment. Investors like the Indian monetary policy discipline such as inflation management, fiscal management. Government's continuous focus in narrowing the fiscal deficit, will ultimately facilitate Central Bank in lowering interest rates. In the process, domestic currency has become stable and strong, easing reduction in forex risk to overseas investors. Lower oil price coupled with improving fiscal management policy like shrinking government subsidies, will definitely be a sustenance in reducing Government's fiscal deficits to a great extent.

Domestic corporate's growth rate roving around at an average of 7%, displays significantly better than average equity earnings growth rate amongst 23 developed and 23 emerging markets. Near future looks better due to expected tax rate reduction in coming years and abolition of all taxes by replacing goods and services tax(GST). As per Bloomberg's data, average corporate earnings, MSCI India Index, will likely to be over 16% in near future.

A transparent, predictable and easily comprehensible policy agenda on FDI has been put in place by the Government with a provision to update every year, even as and when needed, to capture and to keep pace with the global/domestic regulatory changes. Government of India is very keen in simplifying

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

FDI rules further by enhancing investment limit in the existing sectors and to bring more sectors afresh both under automatic and approval route. Government's ultimate aim is to attract more investments with zero hazards.

## 4.1. Government Initiatives

Recent Government Budget has commended various reform steps under FDI Policy which will ease operations in number of potential areas like Asset Reconstruction Companies (ARC), Stock Exchanges, Insurance and Pensions besides smoothening fund raising and governing norms i.e. more transparency in tax related matters, higher FDI limits and establishing systems for speedy approvals process. To facilitate the budget plan, concerned-department, outlined liberalised FDI policy-rules by bringing more sectors under the automatic route. The main focus is to establish quicker approval process to exhibit India as an attractive investment destination.

Key initiatives are outlined below:

- Ministry of Finance (India) framed the residency permit policy for the foreign company executives:
  - Executives can enjoy long stay by investing US$ 2 bn or more, in India, through residency permits besides the benefits of special package on upscale housing, cheap rates for utilities, etc.;
- Asset Reconstruction Companies (ARC) that purchases bad assets or NPAs from banks at a negotiable price and helps banks to clean up their balance sheets, are allowed 100% FDI under automatic route. The main purpose is to manage growing concern of declining asset quality of Commercial Banks;
- FDI in construction sector contribute more than 8% of India's GDP. Recent amended policy on construction development Sectors includes:
  - **Simplification of area restriction norms:** Area restriction and minimum capitalisation norms will not apply, if 30% project costs of any housing project, spent towards affordable housing;
  - **Minimum capitalisation norms reduction:** i.e. US $5M. FDI is now allowed in any construction project, irrespective of size;
  - **Simplification of exit norms from project:** Foreign investors are allowed to exit from construction development projects, earlier 3 years locking periods, removed;
- FDI (100%) under Government approval on trading for food products originated in India, includes through E-commerce also;
- Under automatic route 49% FDI in defense sector, above, on approval by Government on case to case basis besides permitting to manufacture small arms and ammunition;
- Direct-to-home, mobile TV and teleports under "Broadcasting Carriage Services" up-to 100% allowed under automatic route;
- FDI-74%, allowed in private security agencies, against the existing norms of 49%;
- 49% automatic route allowed under FDI for Single Brand Product Retail Trading, beyond under Government route. Local sourcing norm for the foreign firms relaxed initially for three years of their commencement. On completion, next five years the Foreign Company have to meet the annual average rate of 30% domestic sourcing norm. Afterwards effective norms will be, on an annual basis, on trading on Retail Single Brand Product;

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Under Multi Brand Retail Trading 51% has been allowed under Approval Route;
- 74% FDI on pharmaceuticals industry through automatic route, over 74% under government approval process;
- 74% FDI allowed in Private Bank, includes FII's investments;
- Foreign Direct investment, on regulated Non-Banking Finance Companies (NBFCs), under the automatic route;
- The following cases are to be considered as domestic investments and will be exempted under FDI Cap Criteria's:
  - Investment made by Persons of Indian Origin in Non-repatriable mode;
  - Overseas Indian Citizens;
  - Non-Resident Indians;
- Insurance cap under FDI rose from 26% to 49%;
- FDI up to 100%, allowed in railway infrastructure (excluding operations) for founding network and providing requisite facilities for running bullet trains;
- Relaxed-norms for tea plantation, animal husbandry, mining, petroleum, natural gas sectors for the overall economic growth;
- **Recent Sweeping Reforms:** The Government has recently made sweeping reforms in the areas of defense, civil aviation, single-brand retail and pharma sectors for attracting more foreign investments:
  - Earlier, FDI beyond 49% was permitted through approval route in cases of access to modern and "State-of-the-art" technology. Government has done away with "State –of- the-art" technology clause;
  - 100 percent (Existing 74%) FDI under automatic route in brownfield airports (where funds are pumped into an existing airport) has been permitted;
  - In pharma, it has been decided to permit up to 74% FDI under automatic route in brownfield projects;
- Similar to domestic institutions, Foreign shareholding limit in Indian Stock Exchanges rose from current 5% to 15%, applicable for banking company, stock exchange, depository, commodity derivative exchange and insurance company. It, ultimately facilitates the following:
  - **Enhancement of Global Attractiveness and Competitiveness:** It comprises of 12 pillars such as institution, infrastructure, macroeconomic environment, health and primary education, higher education and training, good market efficiency, labor market efficiency, financial market development, technological readiness, market size, business sophistication and innovation;
  - **Scope of Acquiring and Adopting Updated Technology and to Implement Best Practices, Well Accepted Globally**: Among the main available sources of Foreign Technology, FDI plays a pivotal role, especially for countries having less advanced stage of technological development;
  - Indian capital market can foresee overall growth and development;
- Till now, Foreign Portfolio Investors are only, having access in secondary market. Henceforth, they can also acquire shares through initial allotment;
- Limit described above on Foreign shareholding limit in Indian Stock Exchanges (15%), applicable for the following:
  - Foreign Investment under Foreign Portfolio Investment;

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

  - Investments by FIIs (Foreign Institutional Investors);
  - Qualified foreign investment;
  - Investment by Foreign Venture Capital;
  - Non-Resident Investment;
- Almost all the regulators, under various sectors, have fixed minimum capitalization norms. The norms are exclusively eliminated under FDI policy;
- **Remittance and Repatriation:** In finance, repatriation means the process of converting foreign currency into domestic currency and subsequent remittances thereof or vice-versa. It depends on the exchange rate between the two currencies;
- **Remittances of Proceeds on Sale, on Winding up and for Liquidation of Companies**: See below:
  - Remittances for share and securities sales proceeds, are directed by "The Foreign Exchange Management (Remittance of Assets) Regulations, 2000";
  - Remittances, net of applicable taxes, permitted against the sale of shares and securities to the outside resident, if security puts on repatriation basis;
- **Remittance on Winding up/Liquidation of Companies:** Remittances, generated out of winding up proceedings of companies on liquidation, allowed, subject to applicable taxes and on providing the following:
  - No objection /Tax clearance certificate;
  - Certificate confirming full payment of the domestic liabilities or sufficient provisioning thereof;
  - All winding up formalities under Indian Companies Act, complied and supported with Auditor's certificate;
  - If winding up took place outside any court in India, requisite auditor's certificate covering that no legal actions are undecided in any Indian court, either on the company or on the applicant;
- **Dividend Repatriation:** Free Repatriation, subject to Tax deduction at source / Dividend Distribution Tax at source, without any limit;
- **Repatriation of Interest:** Free Repatriation, net of applicable taxes, without any restrictions.

## 5. RECENT MAJOR INVESTMENTS/DEVELOPMENTS

After through study, the researcher could find the following significant FDI announcements made during the recent past:

- Honeywell International Inc declared to establish a refining technology hub and the same will be used by Indian refineries for getting global standard transportation fuel. The aim is to curve crude oil imports besides producing ecologically preferable diesel fuels;
- Apple Inc permitted to open its first stores in India besides manufacturing in the country under new foreign investment rules that exempt 3 years to foreign retailers in sourcing 30 percent of the goods sold in company-owned stores locally. Apple now can sell iPhones, iMacs and iPads through resellers and to set up its own shops in India. Its first development centre will generate employment potential of around 4,500 people;

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The new rules applicable to retailers also help Swedish furniture-retailer IKEA for setting up stores in India;
- A refrigerator plant worth INR2500M (US$ 37.28M) already installed by Panasonic Corporation. They further planned to invest at its existing facility, around INR 200M (US$ 3M) for lithium ion batteries;
- Vital Paper Products planned to set up a packaging product unit worth INR 600M (US$ 8.95 M). It is globally famous for the major supply chain players in the paper industry;
- Vistra Group Ltd, one of the reputed Hong Kong based professional services provider, acquired largest Corporate Trust Services provider named IL and FS Trust Com Ltd.;
- Banana-Republic, reputed US- fashion brand plans to open its first partnership store;
- Hong Kong based, Silver Spring Capital Management plans to invest over 20,000M (US$ 298 M) for construction of highways;
- Amazon will be set up 2.9 million sq. ft, the second largest global delivery centre, employing 13,500 people against the existing 1000 employees across different offices;
- One big seed plant by Biotechnology giant, Monsanto is in the process to set up;
- Japan Government agreed to extend loan for US$ 8110M for constructing first bullet train in India;
- Cool-pad Group Limited, China declared to set up their Research and Development (R and D) centre at US$ 300M;
- "Indian Railways" granted Diesel Locomotive Factory project worth INR 1,46,560M (US$ 2190M) to General Electric;
- French transport major "Alstom," has been awarded electric locomotive project worth INR 200,000M (US$ 2980M);
- Foxconn will set up a manufacturing plant US$ 5000M over the next three years;
- ThyssenKrupp group's elevator unit, Germany-based company, plans to set up a manufacturing plant EUR 44M (US$ 50.5M) with a target to double its group's revenue to US$ 1000M in next three-four years;
- PepsiCo will invest INR22110M (US$329M) for setting up a new core production facilities. Pepsi further decided to establish a juice manufacturing unit worth INR5000M (US$74.56 M);
- BSH Home Appliances Group, to develop local technologies, opened its first technology centre in India;
- Ford Motor Co. planned to set up a mobility solutions, business services and product development centre at INR 13,000M (US$ 189.2M) aiming to establish a global technology and business centre;
- Around 175-200 hotels will be set up by JW Marriott over the next four years;
- Holitech Technology (China), produces basic chemical materials and electronic products, plans to invest US$ 1 bn;
- UAE-based Gamma Group will invest around INR 3,000 crore (US$ 436.5 million) in the infrastructure, health and education sectors and will generate around 2,000 indirect and direct jobs;
- For better efficient logistics market, FM Logistic Asia plans to invest EUR 50 million (US$ 52.9 million) in the next four years;
- For the development of tourism and hospitality, 86 Memoranda of Understanding (MoUs) aggregating INR 15,000 crore (US$ 2180M) were signed in the first Incredible India Tourism Investment Summit- 2016.

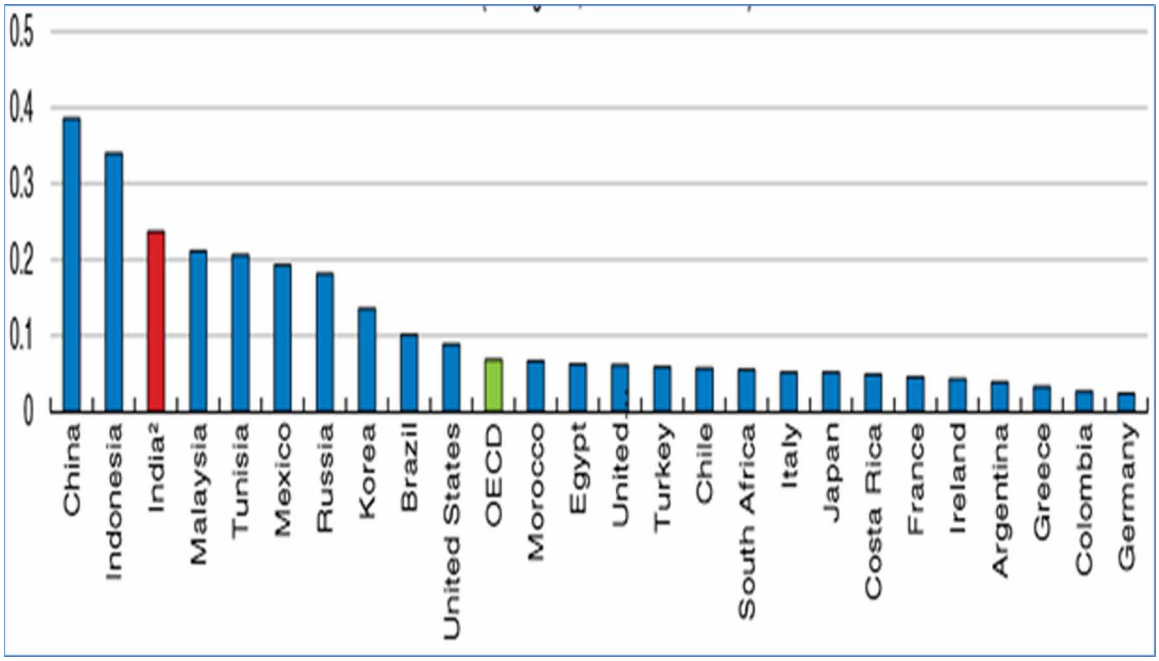
## 6. GLOBAL POSITIONING

Regional Comprehensive Economic Partnership (RCEP) plans to ease existing investment rules. India likely to be awarded the most favoured nation (MFN) treatment within the ten top countries like US, Hong Kong, China, Ireland, Netherlands, Switzerland, Singapore, Brazil, Canada. RCEP report also demonstrated that on account of continued economic turnaround in India, the FDI inflows are exhibiting an upward trend in India. Global Competitiveness Index makes ranking grade for considered countries on specified factors like country's quality of institutions, prevailing macroeconomic environment, quality of education, potential market size and infrastructure potential etc. India improved its position by 16 marks to 55 amongst 140 countries as per the latest Competitiveness Index by World Economic Forum's.



### 6.1. FDI Restrictions

On-going reforms on FDI restrictions are the major contributor which can well define a country's performance in inviting foreign investment. The reforms are made through an investment package by improving different policy areas. The FDI regulatory restrictiveness index measures statutory restrictiveness on Foreign Direct Investments across 22 economic sectors.

The OECD FDI restrictiveness index reveals that India is among the top reformers of FDI regulatory restrictiveness index 2016. The highest is, the more restriction. As per the OECD Report (2017), presently, China is the most restricted country followed by Indonesia and India. FDI restrictiveness Index is the lowest in Germany (see Figure 1).

Domestic restrictions on FDI were remained relatively high in 2015 in relation to many emerging economies and OECD countries and subsequently made ease afterwards.

*Figure 1. Exhibit 1 (Source: OECD report'17)*

## 6.2. Recent Global Comments

Foreign Direct Investment plays an important role for any country's overall economic growth. Accordingly, countries are required to showcase, on a routine basis, their preparedness/competitiveness to raise the confidence level of the global investors. As per the A T Kearney Foreign Direct Investment (FDI) confidence index report, India has placed himself globally in to 8th rank in the year 2017:

- Recent global thoughts, Indian Stocks, Bonds, Currencies, in the Asian emerging countries, are less dependent on external demand, resulted as the most popular picks for investors besides making strategic call;
- Tokyo-based emerging-markets trader Masakatsu Fukaya recently said, "The best pick is India because of its good fundamentals, room for further rate cuts and higher yields, all of which are making good conditions to attract fund inflows;"
- Western Asset Management Co, widely known for its global fixed income products, favors Indian Bonds;
- Pioneer Investment Management, a global investment manager, dedicated to keep always "overweight" positions due to Government's on going reform processes, improving growth and relatively high yields;
- I G Asia, a service provider, contracts for difference (CFDs) with IG – the flexible way to trade the financial/forex markets, favors Indian equities;
- CLSA Ltd, a global analysist, and BNP Paribas, like Indian shares;
- Peter Kohli, CEO of DMS Funds, recently told, India will follow bull market for the next five years;
- Global beliefs that India is expected to have the fastest GDP growth rate, to beat China, very fast;
- "Emerging Global Thought" on India, are most favourable as the current forward valuation levels exhibit sustainable growth at a sound price for the long term.

# 7. GROWTH SUMMERY

India Foreign Direct Investment, IFDI (July'2017) reached at US$ 3409Million. Average FDI since 1995 to 2017 was US$1252.56 Million. The inflow was all time high at US$5670Million in Feb'2008 and was low at US$60Million in Feb'2014.

## 7.1. Present Position

Ending March' 2016, out of 18,549 reporting Indian companies, 17,008 companies, had in their balance sheet, FDI or Overseas Direct Investment (ODI). Ending March 2016, 649 companies had investments on bi-directional direct investment. FDI was attracted by 14,383 and ODI was invited by 1,976, Companies. In the same period, 15,032 companies reported to have inward direct investment, include 10,794-Foreign Subsidiaries Companies i.e. single foreign investors, more than 50% equity holding. ODI reporting Indian companies stood at 2,625 and out of which 2,093 having 3,320, Foreign- Subsidiary Companies:

| | | |
|---|---|---|
| Cumulative (FDI) amount of Inflows (Equity plus Re-invested earnings plus other capital) | | US $453.183bn |
| Cumulative (FDI) inflows (Equity Amount) (Excluding remitted amount through RBI's (Central Bank) "NRI Scheme" | INR 16,400bn | US $310.137bn |

Source: FIPB

- **Coverage:** (Tables 1, 2 and 3) Unlisted companies have played a pivotal role:
  - Majority received inward FDI;
  - Unlisted companies attracted share at face value of FDI equity capital (INR3926.2 bn) vis-à-vis, listed company (INR 118.0 bn);
  - The share (face value) of foreign equity participation for non-financial companies was much larger (Rs3461.7bn) in comparison, finance companies (INR582.5 bn);
- **Inward and Outward Direct Investment:** (Table 4) FDI(Inward) raised at INR 20,140 bn at market value with a much larger share (93.4%) than debt. Prior year FDI was INR 19,813.4 bn. Total market value of ODI reached at INR 5,790.2 bn from the previous year of INR 5,637 bn. Under ODI, 80.5%, a major share, contributed Equity participation. A marginal increase on market value i.e. from 28.5% to 28.7%, in the proportion of outward to inward direct investment, was noticed;
- **Other Direct Investment:** (Table 5) Other investments liability comprise deposits, currency, trade credit, loans. Other outstanding liabilities through unrelated non-resident publics put up at INR 12640.8 bn in March' 16 against INR12333.1 bn as on March'15. Corresponding overseas assets as of March' 2016, accounted for 35% of such liabilities;
- **Inward and Outward FDI (Source/ Destination Countries):** (Tables 6 and 7) Mauritius was on the top of the list of countries, contributed 20.8% followed by USA (17.4%), UK (15.1%), Singapore (10.9%) and Japan (8.0%). An Indian company, attracted ODI mainly, from Singapore (20.6%) followed by Mauritius (17.7%), Netherlands (14.0%) and USA (10.3%);

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Inward FDI (Activity/Sector Wise):** (Tables 8 and 9) a major foreign participation through equity investments (75.9%) attracted by Manufacturing and Services sectors only. FDI, at market value, comprising Equity and Debt through Manufacturing and Services sectors, contributed INR10006.3 bn (INR10208.1 bn a year ago) and INR 8,590.8 bn (INR7748.4 bn a year ago) respectively. More foreign attraction was noticed in manufacturing and services sectors;
- **Cumulative FDI Flows in to India (2000-2016):** (Refer Table 10) Around 69% of investments received under FDI, are made through equity, long term financial instruments. Long term investment on the host country, thought when the investors have confident on the strategic growth in that country. Total FDI as of March'2016 reached US$ 40 bn, 29% increase over and above the same period of 2015 (US$ 30.93 bn):
    - Service sector attracted the highest equity inflow under FDI at US$ 6.9 bn during 2015-16. Computer hardware/ software sector, ranked after service sectors with US$ 5.9 bn;
    - Equity inflow through FDI, for the month of March 2016 alone, reached at US$ 2.47 bn, 0.35bn over in the same period last year, witnessing year on year growth of 16.5%. Highest equity inflows witnessed from Singapore at US$ 13.69 bn. Mauritius, ranked 2nd with US$8.35bn, followed by USA at US$ 4.19bn, Netherlands US$2.64bn and Japan at US $2.61bn;
    - During the year 2016, total inbound Mergers and Acquisitions value reached at $30.8 bn comprising 176 deals vis-à-vis $19bn, a 62.3 per cent over the corresponding year 2015.

## 7.3. Latest Position

See Tables 11 and 12.

- FDI received under equity mode till March'2017 stood at US$ 43.476 bn, rose by 9% in dollar term, year-on-year basis. FDI in equity inflow under services sector attracted the highest, amounting US$ 8.68 bn, followed by telecommunications – US$ 5.56 bn and trading-US$ 2.33 bn. FDI equity inflows for March 2017 alone, was US$ 2.45 bn;
- Ending March'2017, FDI equity inflows were highest from Mauritius (US$ 11.16 bn), then Singapore (US$ 5.46 bn), Japan (US$ 2.56bn), and USA (US$ 2.03 bn);
- As per Grant Thornton India's report (Assurance, Tax and Advisory firm), there were 59 PE transactions worth $1.22 billion in July'2017, against 88 deals worth $826 million in the corresponding month last year. As the market consolidation is much expected in sectors like e-commerce, telecommunication due to facing cash crunch, Mergers and acquisitions are likely to be the favored route for foreign direct investment flows into India in the coming years;
- As per The Financial Times report- 2017, India was ahead of China and the US in regard to FDI inflows:
    - The main reasons for the continuous growth, are government's thrust in improving "Ease of doing business", relaxing FDI norms in various sectors. In the last three years, the government eased 87 FDI key rules across 21 major sectors. Under the ease-of-doing-business drive, the government launched a portal to replace the website of the "Foreign Investment Promotion Board," a body was responsible earlier for FDI approval. Now the approval is entrusted to respective ministry;

Source: FIPB

    - Foreign Direct Investment (FDI) grew by 37 per cent to USD 10.4 billion during the first quarter of the current fiscal (April-June'2017) vis-à-vis. USD 7.59 billion during the same period last year;
- FDI is estimated at a CAGR of 20-24% and is expected to touch US$ 68 bn by 2025, from only US$ 1 bn in 2015;
- India's balance of payments (BoP) improved, due to continued-inflow of foreign investments resulted stabilising international value of Indian currency.

## 8. SUCCESS OF THE PRESENT GOVERNMENT IN BRINGING FDI DURING THEIR RULING

To ascertain, the Researcher took out FDI Inflows for the years 2008-to 2012 (Before the ruling of the present Government) and for the years 2013 to 2017 i.e. during the ruling of the present Government.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## 8.1. Data Collection

For the purpose of ascertainment, FDI inflow data were collected from the "Foreign Investment Promotion Board's, India (FIPB) latest reports.

## 8.2. Methodology

To test the success level, 5 years before and post 5 years FDI inflow data of the earlier and the present ruling Government are collected. Keeping in view the objective of the study, t-test was employed. This has been used as a statistical tool to find out whether the initiative for attracting FDI by the present Government had any significant effect over the earlier Government. t-test is carried out, based on the following equation:

$$t = \left( \frac{X_2 - X_1}{S} \right) \sqrt{\frac{N_1 N_2}{N_1 + N_2}}$$

where, $X_1$ is the mean of 5 years before period and $X_2$ is the mean of 5 years FDI inflows, during the present Government. $N_1$ and $N_2$ are the number of observations. S is the combined standard deviation. For a confidence level of 95%, we have a t-value of 2.306 for a total sample size of ten. If we have an outcome with a t-value greater than 2.306, then Hypothesis H1 is considered true else H0 is considered true.

**Hypothesis H0 (Null Hypothesis):** There is no significant difference between pre and post-period.
**Hypothesis H1:** Significant difference between pre and post periods persist (see Table 13).

*Table 13. FDI inflows*

| Year | In Million US$ |
|---|---|
| 2007-08 | 34843 |
| 2008-09 | 41873 |
| 2009-10 | 37745 |
| 2010-11 | 34847 |
| 2011-12 | 46556 |
| 2012-13 | 34298 |
| 2013-14 | 36046 |
| 2014-15 | 45148 |
| 2015-16 | 55559 |
| 2016-17 | 60082 |

Source: FIPB

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## 8.3. t-Test: Calculation

$X_1$ (Mean from 2008- to 2012) = US$39173M

$X_2$ (Mean from 2013 to 2017) = US$46227M

S1 (Pre period Standard Deviation) = 5032,

S2 (Post period Standard Deviation = 11469,

$$\text{S (Combined SD)} = \sqrt{\frac{\Sigma\left(X_1 - \bar{\bar{X}}_1\right)^2 + \Sigma\left(X_2 - \bar{\bar{X}}_2\right)^2}{N_1 + N_2 - 2}} = 8856$$

$$\text{Then t} = \frac{39{,}173 - 46227}{8856}\sqrt{\frac{5\times 5}{5+5}}$$

t = 1.26

As the t value is less than 2.306 it is not statistically significant. However, FDI inflow, since 2015, has increased significantly during the tenure of the present Government with an average y-o-y growth of19%, exhibited in Figure 2.

## 9. SENSEX

SENSEX is the benchmark index pertaining to the capital market of any country. It needs to be technically formulated in such a way that should have a wide acceptance among the global individual investors, institutional investors fund managers and foreign investors. The goals of the index are:

- Market movement's measurement;
- Benchmarking of funds' performance;
- For index based derivative products;
- BSE Sensex Index adopts, globally accepted, "Free-float Market Capitalization" i.e. proportion of shares of a publicly traded company that is traded in the stock market, considered for index building. Major global index providers like S & P, Dow Jones etc used Free-float methodology;
- S & P BSE Sensex Index: Yearly Sensex movement of Bombay Stock Exchange for the past five years (see Table 14).

Remarkable 49% growth, in the Indian equity market has been observed during the last five years. Since the globalisation process takes place, the stock market efficiently managed global competitiveness

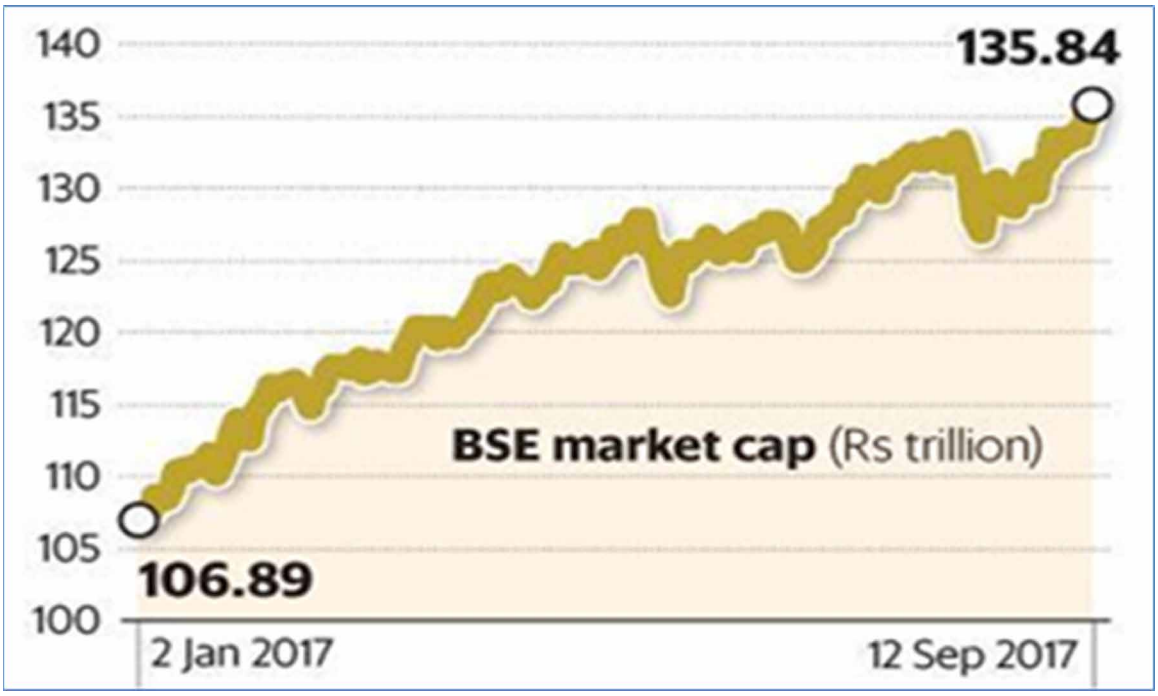
in spite of delicate activities by various bull and bears. Similarly, Sensex trend for the decade exhibited booms and busts of the Indian equity market also.

## 9.1. Market Capitalisation



The value of India's listed companies recently reached a new high at Rs135.84tn. It was Rs 106.89tn as on 2/1/2017, 27% growth in 9 months' period (see Figure 3).

BSE's mid and small cap indices also hit a new high. Normal gross domestic product is expected to grow at 11%.

*Figure 3. Exhibit 3 (Source: Bloomberg)*

## 10. ROAD AHEAD

India require around US$ 1tn, under their 12th Five-Year Plan (2012–17), for the holistic infrastructure sectors growth comprising highways, ports, airways, etc. Major supports are required from FDI inflows. Major activities, attracting FDIs at market prices contributing around 50%, like Manufacturing Sector followed by service sectors, covered about 40% includes 'Information and Communication Services', 'Financial and Insurance Activities' etc. Global FDI is expected to rise by 5% to $1.8 trillion in 2017. India retains 3rd spot on UNCTAD's list of investment destinations:

- To continue the present status, India needs to adopt the following:
  - Emphasis on the right balance between regulations in place and liberalization process, encouraging investment for sustainable development;
  - Further relaxation in liberalizing the entry requirements of the key economic factors such as infrastructures, aviation, mining, financial services and real estate;
  - Continue to have restrictions, on the national security and related areas, a great challenge.

The positive business climate was further kindled with the launch of "Make in India" initiative in September 2014 by the PM. PM's ambitious 'Make in India' initiative has been able to attract the world's attention to India as a manufacturing hub. The program aimed at driving new innovativeness designed to stand-in uniqueness, to protect intellectual property and to facilitate investment through building best-in-class manufacturing infrastructure. The success of the program will largely depend on the preparedness

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

to provide the necessary infrastructure in terms of energy, technology, skilled manpower, land, simpler regulations to the industry to become a manufacturing super power nation.

To enable technology in manufacturing companies and run 100% integrated digital supply chain, domestic software companies have to step up and provide platforms which are tuned to Indian ecosystems. Furthermore, the core to "Make in India" campaign is to bring more foreign MNCs to set their facilities in India, which will create employment opportunities for the countrymen.

India currently ranks 99th in labour market efficiency among 148 countries. India needs to provide an efficient employable workforce i.e. skilled labourers. Simultaneously, India needs amendment in the restrictive labour and land laws. India's further preparedness is required to boost its manufacturing sector through road-rail-sea-air infrastructure linking, required to bring in Raw material to manufacturing plants as fast as possible and to take finished goods as quickly as possible to rural, urban and international markets.

While Government keenness on attracting foreign investment into the country to boost the country's economy faster, the make in India Lion can roar out loud only when more policies are prepared enough to support and nurture the manufacturing sector to grow and make India as world's manufacturing hub. Foreign Institutional Investors which started selling after Trump's win also upturned their trend in the recent past and invested in shares worth US$ 43.476 bn (2016- 2017). Historically, India's economy is founded through cash transactions. Moreover, a substantial transaction operates, informally. Privileges of the Government on the recent move on demonetisation (flushing out illegal cash) are to resist corruption and tax evasion besides crippling criminal enterprises and terrorists. After the recent demonetisation move and GST implementation, the Sensex gathered substantial points and Nifty also traded firmly above its crucial psychological level, signifies strong global markets. Rupee also traded at higher level, near 1-month high, 65.36 against the US dollar, boosting the sentiment in equity markets. Less cash economy will ultimately march into a digitized credit system to frame India as one of the best attractive country in the eyes of global investors.

# Chapter 40
# On Some Aspects of State-Owned Enterprises' Foreign Direct Investments (SOEs' FDI): The Case of Polish SOEs' FDI

**Marta Anna Götz**
*Vistula University, Poland*

**Barbara Jankowska**
*Poznan University of Economics and Business, Poland*

## ABSTRACT

*This chapter seeks to enrich the existing literature by discussing the broader context of international engagement of state-owned enterprises (SOEs). It discusses the rationale for examining foreign direct investment (FDI) done by SOEs and outlines the challenges which need to be addressed in this respect. It provides a brief overview of FDI carried by Polish SOEs. The authors applied the qualitative methodology of critical literature review and descriptive analysis of internationalization of Polish state-controlled firms. This chapter can contribute to the current studies devoted mainly to Chinese or other Asian emerging state-controlled multinationals by adding the Central and Eastern European (CEE), in particular the Polish, perspective. It concludes that given the well-recognised peculiarities of such entities adequate framework needs to be adopted to explore their foreign activities. The Polish multi-case study encompassing nine entities demonstrates that the group can be pretty heterogeneous and indeed can combine the specificity of multinational enterprises (MNEs) and SOEs.*

## INTRODUCTION

The reasons for state ownership fluctuate over time, but state-controlled firms appear to be a constant feature of the economic landscape (PWC, 2015). SOEs are often granted privileges that are not available to competitors, which gives them the undue advantage over their rivals. There is a clear need to

understand the behaviour and practices of SOEs in global context, beyond the borders, to identify the key concerns and to develop the rules safeguarding fair conditions for public and private market participants (Cuervo-Cazurra et al., 2014). The topic is even more relevant taking into account the last global economic crisis 2008+. The crisis period was related to the growing importance of SOEs and according to some researchers their importance will grow in the next years (Flores-Macias & Musacchio, 2009; Bremmer, 2010; Augustynowicz & Kwiatkowski, 2013).

This chapter discusses the rationale for exploring SOEs' foreign activities in the current world setting. The authors deliberately skip the review of the extremely broad literature devoted to emerging markets and mainly Chinese SOEs as these cases seem to differ substantially from European firms, at least due to the peculiarities of varieties of capitalism models adopted (Nölke & Vliegenthart, 2009). The authors instead focus on the perspective of global coordination. They review the studies and international reports which identify the evolving international role of SOEs. They also outline the main features of internationalisation process of Polish SOEs in the most advanced form of foreign direct investment (FDI). Such entities are featuring high on the agenda of currently negotiated agreements such as Transatlantic Trade and Investment Partnership (TTIP), or classic bilateral investment treaties (BITs). Their activities, in particular foreign operations, are in the spotlight of many international institutions which recognise the growing need of monitoring of SOEs' development.

This chapter is structured as follows. First, the authors present the background briefly introducing the distinct traits of state-owned enterprises. Next, they move towards the main issues of this chapter and outline the basic facts about the international engagement of SOEs as retrieved from databases. Special attention is being paid to Polish SOEs and their FDI against SOE from other CEE countries. Challenges stemming from growing foreign presence of many previously domestic oriented SOEs are discussed in the next section. Then, before formulation of conclusion the authors highlight some recommendations and future research directions. Last but not least, the chapter provides some concluding remarks, summing up in a way the conducted study.

## BACKGROUND: IDIOSYNCRASIES OF STATE-OWNED ENTERPRISES

The real-life phenomenon which are SOEs and their internationalization efforts call for the alteration within the varieties of capitalism. Some experts underline that e.g. the typology distinguishing between the liberal market economy (LME), capital market economy (CME), dependant market economy (DME) should be enriched with the fourth model of SME – the State-Permeated Capitalism (Nölke, 2015). This new version complements existing ones by accentuating the state influence on the economy also via nurturing domestic champions and their outward FDI. Though, even in Europe the traditional varieties of capitalism have been undergoing profound changes in the result of 2008 global financial crisis (Schweiger, 2014). Todays' approach seems to evolve towards more nuanced perception of state-owned or controlled companies away from simple dichotomy state or private which views SOEs as hybrid organizations, in which the levels of ownership and control by the state can vary significantly (Bruton et al., 2015). Modern state capitalism accommodating four new varieties - wholly owned state-owned enterprises, the state as a majority investor, the state as a minority investor, and the state as a strategic supporter of specific sectors - hence, challenges the conventional, very polarized view of state versus private ownership (Musacchio et al., 2015).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

There are large discrepancies in SOEs reporting by national statistical offices and responsible ministries. In the OECD countries only 10% of SOEs are publicly listed (OECD, 2004). Despite these differences SOEs in most OECD members respect the same general rules for insolvency and bankruptcy as private companies do. Accounting and auditing standards apply to SOEs as they do to private companies, and SOEs may additionally undergo controls carried out by specific state audit entities. They also have to observe stringent financial disclosure and transparency standards. In fact, in some countries such as Denmark or Poland, they are even obliged to follow some additional requirements.

Contrary to the legacy of old common wisdom assuming inferior economic results of SOEs Musacchio (et al., 2015), argue

*… that many of these firms following these new varieties of state capitalism are taking the stage in the global economy and are often performing at least equal to, if not better than, their private counterparts. 25 largest SOEs among the top 100 firms in the Fortune Global 500 have an average return on assets of 3.49% and an operating margin of 14%, which is comparable to the 3.44% and 5.7%, respectively, what can be found among the largest 75 private firms in the world. (Musacchio et al., 2015)*

Musacchio (et al., 2015) pointed to the emergence of a new form of state capitalism that is related to the transformation in the nature of SOEs. Nowadays governments can hold majority or minority equity positions. Public listing of these firms called for improvement of the financial reporting and higher transparency of governance which was possible thanks to independent board members. This kind of reforms attracted minority private investors (Pargendler et al., 2013) and gave rise to profitable businesses that expand in foreign markets. Next to the firms with the majority stake of the state companies with the government as the minority shareholder exists (Inoue et al., 2013).

SOEs have been mainly researched with respect to their domestic performance and apparent disadvantages - inferior efficiency, agency problems, ineffectiveness, and weak corporate governance (Shapiro & Globerman, 2009). It has been argued, that SOEs are "less able to develop capabilities or ownership advantages" that would be transferable to be exploited abroad, and which are a key driver for international growth (Kirca et al, 2012). Though, there is also a widespread recognition of numerous benefits accruing to these enterprises. The empirical analysis conducted by Christiansen and Kim (2014) indicates that, in addition to any financing advantages, large state-invested enterprises also seem to benefit from an unusually favourable position in their home markets. Most frequently cited advantages include: outright subsidisation (tax exemptions, favourable tax regimes or other in-kind benefits); concessionary financing and guarantees like credit below market interest rate; other preferential treatment by government (less restrictions, softer disclosure regulations, not required compliance with certain standards); monopolies and advantages of incumbency; captive equity as SOEs' equity is generally "locked in" and their managers are not expected as much as in private firms to deliver in terms of dividends or other rate of return etc. and exemption from bankruptcy rules and information advantages (Christiansen & Kim, 2014). For these reasons SOEs are prone to engage in economically irrational behaviour such as excessive capital investments or anticompetitive business practices, and in consequence disrupting the order of fair international competition. Thus, the OECD has been calling for ensuring a level playing field, or competitive neutrality between SOEs and private-sector companies (Capobianco & Christiansen, 2011).

# STATE-OWNED MULTINATIONAL ENTERPRISES: CONTRASTING CONCEPTUAL ISSUES WITH FACTS AND FIGURES

## Conceptual Issues on the International Engagement of State-Owned Multinational Enterprises

The operations of SOMNEs being embedded in organizational settings that differ from the private sector and additionally in diversified institutional context – different countries expose the need to review and maybe revise the prevailing international business theories focused on internationalization of firms. There is a clear need of explanations why SOE internationalize (Bass & Chakrabarty, 2014; Choudhury & Khanna 2014; Götz & Jankowska, 2016).

When one takes into account the fact that SOEs operate to fulfil the governmental priorities there is the question which if any of the priorities can impede or facilitate the emergence of SOMNEs. The traditional justification for the existence of SOEs rather indicates the inhibitory mechanism to SOEs' internationalization. Since SOEs operations go in line with the ambitions and goals of the politicians one can presume, that only if these ambitions and goals have anything to do with foreign expansion this kind of entities will internationalize. OFDI on the side of SOEs can reduce the export opportunities for domestic firms. The substitution of export activities by the OFDI operations can lead to negative balance of payment in the domestic market of SOEs. These implications work rather as a kind of impediment to SOEs internationalization (Mazzolini, 1980). The establishment of SOEs in particular industries can be explained by some resource constraints in the country (Vernon, 1979). These can be industries not attractive for the private sector and at the same time often not prone to internationalization. Exploitation of state ownership to improve the employment rate in the domestic economy will impede the internationalization of SOEs through OFDI since this internationalization mode can have negative impact on the situation in the domestic labour market (Mazzolini, 1980).

Nevertheless, the internationalisation of SOEs can be fostered by the political priorities related to the ambitions of state governments to dominate in particular industries worldwide. These aspirations can be sometimes even far away from the conventional wisdom and logic in business that is based on the rules of risk mitigation and profit maximisation. Financial goals can be put into the background and the power and dominance goals can be in the forefront. The lack of profitability logic is sometimes reflected in the set of target markets SOEMNEs focus on. The choice of markets can be based on the foreign policy priorities and not on the country-specific advantages the markets provide to foreign investors. It is quite visible in the case of Chinese firms (Ramasamy et al., 2012). The internationalization ambitions of SOEs can be fostered by their higher resilience to risk. Governments providing budget, resources and possessing the power to influence regulatory framework can reduce the risk related to international business operations. It is possible especially when SOEs come from countries with strong governments (Knutsen et al., 2011).

The liberalization of trade, FDI inflows and outflows, removal of any market entry and exit barriers result often in the growing intensity of competitive rivalry within particular national markets thus exposing the necessity to find new competitive arena even among SOEs. Foreign expansion can be used to stabilize the position of SOEs (Clifton et. al., 2011; Dau, 2012; Witt & Lewin, 2007). The competitive pressure in the domestic market faced by SOEs forces the managers to focus more on market goals than just on political and social implications of their operations. Combining the internal – SOEs specific features with the changes in their external settings of operations one can indicate that the motivations to

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

go international on the side of SOEs will work only if the regulatory framework is conducive. It means that the probability of SOEs internationalization is higher when the external circumstances they operate in resemble more the pure market economy conditions. With respect to internationalization processes, on the one hand SOEs can be the target of foreign takeover (IFDI), on the other hand they can themselves become a vehicle for carrying foreign investment abroad (OFDI), in which case their ownership matters much being either a liability or an asset.

As one of the pioneers in this area in 1979, Vernon identified likely challenges and problems to be expected due to internationalisation of SOEs (such as the inclination to use domestic inputs), which as it seems they have not materialised, perhaps also due to such early warning statements as these quoted in the Vernon's paper (1979). SOEs' engagement in internationalisation certainly reflects the political economy of home country (Dharwadkar, 2000). SOEs discussion has typically been framed around questions of efficiency, productivity or administrative bureaucracy. SOMNEs development requires new augmented approach which takes into account the fact that these firms are vehicles to exercise foreign policy and diplomacy goals. On the one hand, peculiarities of SOEs contribute to the traditional knowledge of MNEs by adding the "non-business argument, on the other hand studies on MNEs enhance the understanding of foreign expansion by SOEs by adding the "extraterritoriality" argument (Cuervo-Cazurra, 2014). Whereas the first assumes some irrationality with political objectives given priority over economic ones; the latter argument point to the extraterritorial dimension of the need to address market imperfection or export certain ideology. These extensions are further complemented with augmented versions of five theories. Agency theory focuses on the relationships between the agent who is tasked by the principal to perform an action in the principal's name and principal themselves himself (Holmstrom, 1979). SOEs typical dual agency problem needs to be extended in SOMNEs case into triple one including also the relations between headquarter and subsidiary managers. Transaction cost economics explains firm behaviour as deriving from the information asymmetries and imperfect contracting or opportunism (Williamson, 1985). In the case of SOMNEs, the perceptions of transaction costs differ mainly because the government has a different risk tolerance than private owners. Governments have larger budgets and resources that enable them to take more risks (Kaldor, 1980). The resource-based view focuses on how firms can develop own capabilities to achieve an advantage over competitors (Penrose, 1959). SOEs peculiar resources can be seen as an asset but also as a liability. If the earlier is true SOE would engage in larger riskier projects, when the latter is true SOEs would face some hostility in host country and hence prefer greenfield investments over acquisitions. Resource dependence theory analyses power relationships among two parties, where the one is able to exercise power over the other one which depends on the former. In case of SOMNEs a way to reduce the influence of politicians would be to depend less on government funds and support via internationalizing the firm (Noreng, 1994). Finally, the neo-institutional theory focuses on understanding of the legitimacy required to operate in a foreign country. Companies have to respond to various pressures and imitate practices that are perceived as legitimate (DiMaggio, Powell, 1991). A MNE faces two sets of such pressures on its legitimacy, from the home country headquarters and from the host country environment (Kostova & Zaheer, 1999). This conflict suggest that SOMNEs are more likely to select host countries in which their state ownership is perceived as more legitimate than these host countries in which there is less legitimacy of state ownership. Additionally, one may expect that regardless of the selected host country, SOMNEs are more likely than private MNEs to engage in legitimacy building actions under the umbrella of corporate social responsibility (CSR).

## State-Owned Multinational Enterprises in the Cross-Country Perspective: Facts and Figures

SOMNC is a legally independent firm with direct ownership by the state that has value-adding activities outside its home country; be they downstream activities such as sales subsidiaries, or upstream activities such as R&D centers (Cuervo-Cazurra et al., 2014).[1] A SOMNE represents a hybrid organizational form with the dual characteristics of both the state-owned enterprise (SOE) and the multinational enterprise (MNE). When compared with private MNEs, SOMNEs are generally less profit-oriented and have a more complex corporate governance structure. They have less autonomy to establish their strategies, but also experience a lower level of uncertainty in their external environment. As a result, SOMNEs have more difficulty than private MNEs in developing strategies and making organizational changes.

The developments of SOMNEs can be attributed to different global trends. First, is the fact that due to globalization challenges and increased competition SOEs have been less able than in the past to depend on governments for protection, and compensation for significant losses from the increased foreign competition in their local markets (Tan & Tan, 2005). This less favourable settings have forced SOEs to engage in OFDI, to compensate for suffered changes. Second trend is the establishment of new codes and regulations by international institutions guiding the international capital flows. Thirdly, privatisation processes enabling turning SOEs into SOMNEs were accompanied particularly after the 2008 crisis with opposite trends of MNEs turning into SOMNEs via nationalisation and bail-outs mainly.

Of the 2000 largest companies "Forbes Global 2000" (2010-2011), 204 have been identified as majority SOEs with ownership spread across 37 different countries. The numbers vary significantly by country, with China leading the list (70 SOEs), followed by India (30), Russia (9), the United Arab Emirates (9) and Malaysia (8). Among OECD countries SOEs operate in Norway, France, Ireland, Greece, Finland, Korea, Belgium, Sweden, Austria and Turkey. Their numbers do not reflect the share of the state in the whole economy but might be a proxy for the relative importance of the state among a country's most international business players.[2] The proportion of SOEs among the Fortune Global 500 has grown from 9% in 2005 to 23% in 2014, driven particularly by the growth of Chinese firms. SOEs global proliferation and increasing significance worldwide also as vehicles for FDI is testified by the numbers. Among 100 thousands MNEs only 650 are state owned MNEs (44% from advanced economies), though, they have more than 8500 foreign affiliates and out of 100 largest MNEs as much as 19 are SOMNEs (World Investment Report, 2011).

Figures provided by the Dealogic database (comprehensive information on international deals with the industry, region and main characteristics of the deal) demonstrate that deals done by Chinese and Russian SOEs account for 45% of all international transactions of SOEs. Among OECD countries, the top five countries with large state-owned enterprises' international transactions are France (415 deals), Italy (216 deals), Norway (205 deals), Japan (155 deals) and Germany (137 deals) (Christiansen & Kim, 2014). Significant number of transactions which took place among European countries seemed to illustrate the cross-border consolidation processes/integration of EU market (Christiansen & Kim, 2014). Although the growing role of state enterprises in the international marketplace does not yet present a serious macroeconomic challenge (Christiansen & Kim, 2014). Their international investment can if then fall into three categories. The first category refers to SOEs, that located in sectors where all other private enterprises operate internationally (e.g. hydrocarbons). The second type has been a wave of cross-border consolidations in the public utilities sectors in the EU area, which in many cases has involved SOEs. The third category embraces Chinese SOEs that in particular have been encouraged by their government to expand abroad as part of the so-called "go global" strategy.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Firms from the OECD countries are the largest owners of foreign subsidiaries, however, just less of 2% of their parent companies are SOEs (Kowalski et al., 2013). This is considerably lower than the share of SOEs on the "Global 2000 list", suggesting that private firms tend to be overall more active internationally than SOEs. To assess the extent of FDI done by SOE Kowalski (et al., 2013) conducted regression analysis.[3] Obtained results show that the SOEs do not differ from private firms with regard to their number of domestic subsidiaries but their number of foreign subsidiaries and as such the ratio of foreign over domestic subsidiaries is significantly lower than for private firms. These findings suggest that the SOEs among the world's largest publically listed companies tend to be less internationally oriented than their private counterparts. Nevertheless, there are considerable differences with respect to the quantitative magnitude of this aspect as SOEs in OECD countries tend to be relatively more domestically oriented than in emerging economies. Despite such orientation international institutions stress the need to explore cross-border implications of SOEs activities.[4]

The comprehensive list of 15 largest SOMNEs encompasses four companies from China and one from France, Norway, Sweden, Malaysia, Japan, Singapore, Qatar, Brazil, Russia, Venezuela and India (Cahen, 2014). Their TNI index varies between 2.7 (China National Petroleum - CNPC), and 82.9 (Qatar Telecom - Ooredoo) whereas government control ranges from 38% (Gazprom) to 100% (Chinese - Sinochem Group, China National Offshore Oil Corp; China National Petroleum, CITIC; Petróleos de Venezuela SA (PDVSA) from Venezuela, Vattenfall AB from Sweden and Petronas from Malaysia).

Based on qualitative study of foreign direct investment conducted by Brazil's Petrobras Cahen (2014) claims that SOEs can be either risk-seeking or risk-averse agents depending on the risk level related to the entry to the particular country and on institutional transformations in their home countries. SOES international behaviour reflects also different stages of evolution these firms undergo. SOEs' motivation for internationalization evolved in reaction to changing environment, in particular to conducted reforms. Besides, as it seems greater SOE internationalization leads to more efforts to modernize SOE managers' approaches.

## State-Owned Enterprises in Poland and Their Foreign Investments Against Other CEE Countries: Facts and Figures

Studies on OFDI by Polish firms are still relatively new research area and they often don't present the findings separately for state-owned firms (Ciesielska, 2014; Éltető et al, 2015; Gorynia, Nowak, Wolniak, 2010; Gorynia et al., 2015; Götz, 2014; Nowiński, 2015; Obłój, Wąsowska, 2012; Wąsowska, Obłój, 2013). Findings obtained by these authors to some extent confirm the classic theory developments, though, also stress the peculiarities of Polish emerging multinationals such as the relatively lower importance of psychological distance and political risk when expanding abroad.

According to "Forbes Global 2000" in 2011 Poland had 6 firms on the list all of them being SOEs (*The world's…*, 2012).[5] Such 100% dominance of SOEs in that ranking can be also spotted in Czech Republic. It is also high in Greece (25%) and Norway (20%). In other EU countries it is respectively: 10% in Austria, 13% in Belgium, 8% in Finland and France, 2% in Germany, 7% in Ireland, 3% in Italy, 4% in Sweden and 1% in UK. The high proportion of SOEs in Poland among largest companies additionally justifies the need to study this particular cohort of enterprises. These companies with the Ministry of Treasury as shareholder contribute to the economy by creating jobs, safeguarding tax incomes and generating considerably revenues particularly in strategic sectors such as energy (Baniak, 2015). Many of them thanks to their activity in the field of corporate social responsibility (CSR) are part of RESPECT index measuring other than purely

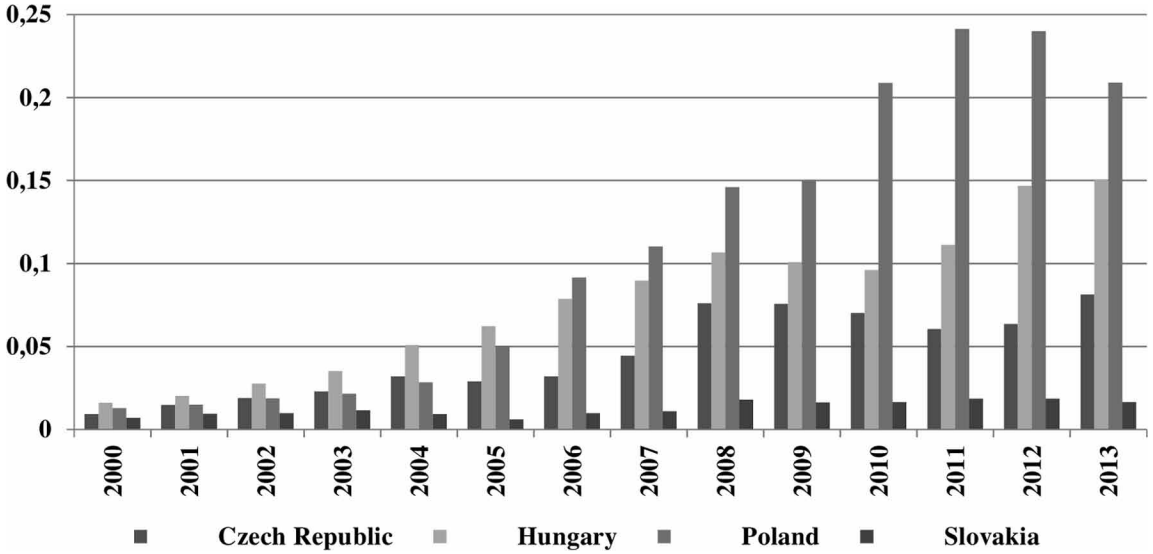
EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

economic performance of Warsaw Stock Exchange (WSE) listed firms. It shall be noted that out of 20 companies included in this ranking in 2013 almost 50% (9) are enterprises with state stake. Inspection of SOEs against the background of varieties of capitalism compiled by Musacchio (et al., 2015) revealed that Poland has some 498 firms with the central government as a majority shareholder and 691 firms with the central government as a minority investor (Musacchio et al., 2015, p. 117).

Besides scare lists and rankings which enable inferring some data on SOEs and their foreign activities in particular there are also other substitute dataset providing complementary information. OECD Indicators of Product Market Regulation (PMR), are a comprehensive and internationally-comparable set of indicators that measure the degree to which policies promote or inhibit competition in areas of the product market where competition is viable.[6] They measure the economy-wide regulatory and market environments and include also data on state control in particular public ownership - scope of SOEs and their governance.

Comprehensive data gathered and published by OECD with respect to PMR show the decreasing scope of public ownership in Polish economy as the value of index fall from 4.9 in 1998 to 4.3 in 2013. Likewise, the variable "state control" has declined in 2013 as compared to readings in 2008 and 2003. These figures can be enriched by insight on size, composition and outward orientation of the state sector (Christiansen, 2011). Comparison of the total number of all Polish SOEs in 2009 with most recent figures from 2012 points to significant drop from 1210 to 326 firms (OECD, 2013; 2014). Another source claims, that the number of such firms in Poland has decreased from 365 in 2010 to 198 in 2012 which means drop of more than 45% within relatively short period of time (Adamczyk, 2014). Due to the missing information on employment and value in 2009 it cannot be assessed how much this decline in number of SOEs translated into lower employment or value. Interestingly there is information only on two M&A deals done by listed SOEs in 2012 valued at USD 2896 million.

Following the transition commence for a long time, Polish OFDI was almost negligible and limited in fact to trade-supporting activities in selected key export markets (Zimny, 2013). It really took off after the EU accession in 2004. This year can be seen a symbolic watershed moment, but it has not been until then when Polish private sector had matured enough and first home-grown multinational enterprises (MNEs) and state owned enterprises (SOEs) also began investing abroad (Éltető et al., 2015). Transformation in early nineties induced several processes and triggered profound changes in economic landscape but foreign commercial expansion does not seem to be one of them. Although the ratio of OFDI stock from Poland to IFDI stock in Poland is still rather small and accounted for 25% in 2011, compared to 126% in the European Union, it has grown rapidly from 3% in 2000 and 7% in 2005. The recently observed in Poland wider approval for foreign expansion should be seen as the late result of long-term processes which started 25 years ago. So far, Polish governments have been running rather neutral policy towards OFDI or Polish MNEs. Notwithstanding, the natural conditions enabling firms to thrive, it seems Poland might adopt a more active approach in this respect, among others trying to turn SOEs into national champions and, eventually, into MNEs.



The low proportion of OFDI is not only a Polish feature, but shared with other countries of the region also among the Visegrad Group - V4 group which is presented in Figure 1.

Some state-owned enterprises also began investing abroad, sometimes with the Government's encouragement. Actually, despite certain communist burden and inefficiency SOEs might have had it easier to internationalize as most of their private CEE firms were then occupied with privatization, and modernization, focusing on the domestic market which offered plenty of opportunities and facing significant scarcity of multiple resources when trying to penetrate foreign markets (Ferencikova & Hluskova, 2015).

CEE countries are hence rightly branded by Kalotay (2010) as dwarfs when it comes to OFDIs. However, the increasing OFDI stocks presented in Figure 2, implies that all V4 countries are continually expanding their presence abroad. Poland due to its sheer size naturally leads the group. Two dates stand out: 2004 and accession to the EU after which OFDI stocks have picked up and 2008 when the value accumulated stagnated.

Nevertheless, available statistics presented in Figure 3 reveal that flows from V4 countries represent maximum 0,8% of world flows, and usually range within some 0,001 and -0,4. Even Poland (the largest country of V4 group with seemingly highest potential although visible leading within the group) has once barely exceeded the 0,6% mark.

The negligible role CEE region plays in world as sources of FDI can be again confirmed by figures on V4 OFDI stocks as a percentage of world total. Even group's leader Poland cannot claim more than 0,25%. The authors' earlier study (Éltető et al, 2015) shows that here has been no clear trend in all V4 countries with respect to OFDI flows. Sudden formidable surge or plunge of such flows may suggest the possible significance of single contracts / deal / acquisition which may distort the whole stream volume.

In the VCC Report it has been stated that in Poland 5 of the 19 firms have a significant state stake in them, although only two – PGNiG (73%) and LOTOS (53%) – are majority-owned by the state (Zimny, 2013). In 2012, the Report found that "the ranking includes some state-controlled firms but is dominated by private ones" (Zimny, 2013). Major Polish MNEs included a number of state-owned (or state-controlled) enterprises in the petroleum (PKN Orlen, LOTOS), gas (PGNiG) and chemical (Ciech) industries. In April 2015 the estimated value of foreign investment of key Polish SOEs totalled 30 billion PLN (Baniak, 2015).

Foreign acquisitions of Polish SOEs raised much controversies. Business media reported on that occasions of wider costs and losses for the whole society (Frączyk, 2014). Impairment losses and write-offs due to failed investment abroad have led to a decline in the share prices of investing enterprises. The largest state-owned companies seem to have a special talent for making losses abroad, losing a fortune,

yet belonging to Polish taxpayers. Quoted are failed investments in Norwegian oil deposits by Lotos in 2008, PKN Orlen purchase of Lithuanian refinery Mozejki in 2006, KGHM acquisition of copper deposits in Kongo in late nineties. These fiascos to some extent reflect home-made own mismanagement, though, not only. Hostile approach faced by Orlen in Lithuania and hurdles multiplied by Russian pipelines operator or misleading preparation of oil rig by subcontractor in case of Lotos Norwegian venture indicate other "external" factors. Affected enterprises seek compensation, try to utilise available tools such as the tax shield and sue to the international arbitrage tribunals. Altogether, the losses due to failed

foreign purchases make a considerable sum which by the fact of state ownership can be regarded as wealth reduction of the society and /or liability for country's budget (Irzyński, 2014). Apparently overly optimistic foreign acquisitions turned out to be miscalculated and brought about rather losses, write-offs and share prices' drop implying also the need to repay loans taken to finance the purchase. Write-offs do not mean of course a sudden outflow of money from firms' corporate bank accounts, though, they lead to the asset revaluation in balance sheets. Nevertheless, such investments can be also perceived as overdue internationalisation of Polish firms and an opportunity for the national economy and nation's wealth (Roguski & Furman, 2013). Geographic expansion is an important element of business strategy. And even when not smooth, it can enable to fail your way to success as it offers a chance to acquire know-how, built expertise, strengthen competences, and gain expertise. The media frenzy accompanying them may obviously be justified, though, one need to bear in mind that such firms are usual suspects and their moves are watched much more closely hence commented and criticised than those of private peers which might as well be unsuccessful.

Available insight on Polish FDI done by SOEs comes mainly from dedicated case studies and there is no single source providing exhaustive information on either MA or Greenfields by SOEs.[7] Hence, in order to assess the foreign expansion by Polish companies with the state as stakeholder first the list of such firms has been established. As the main reference serves Rzeczpospolita List of "2000 Polish firms" (Lista Polskich Przedsiębiorstw i Eksporterów, 2015). From all 2000 entities, have been selected companies with indicated state stake and simultaneously listed on WSE. In the first step 19 of such companies have been identified. Closer inspection of available data enables also excluding firms: with almost non-existent (reduced significantly recently following the privatisation processes), around/below 10% state stake or apparently not involved in foreign activity. This enabled setting up the final registry of nine Polish listed SOE conducting FDI. Table 1 offers synopsis of covered SOEs.

The state stake varies in the examined group between some 27% and 72%. Lotos and PGNiG are only two firms where the state owns more than 50% of stake. Explored companies run abroad not only core business units (mining, extraction or trading) but also servicing units dealing with auxiliary functions – ships chartering, placing Eurobonds etc.). Comparing and contrasting the examined Polish SOEs enables some simple profiling of them with respect to their foreign presence. Assessing each firm against the background of its peers illuminates certain idiosyncrasies and allows to capture the dominating trait. The authors are aware that interested companies may not share our judgement and see their foreign involvement differently. Though, our opinion derives from evaluating each firm in wider context of its peers' engagement. Based on such exercises, the authors would suggest that:

- PGNiG, Lotos, PKN Orlen and KGHM can be indeed regarded as multinationals. Their complex structure and various modes of involvement abroad renders such name. They set up new businesses, purchase existing firms and conduct not only activities of core business such as resources exploration, processing but also establish firms tasked with global coordination of such spread presence – they manage and exercise control over other entities within the group, serve for marketing purposes and are representative offices. Their foreign presence is both geographically and operationally diversified.
- Azoty is a resource-seeking firm, venturing abroad with clear aim of tapping into foreign mineral resources and realising hence concrete acquisition projects.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 1. Summary of Polish SOEs active abroad*

| SOE | State Stake (%) | Foreign Presence |
|---|---|---|
| PGNiG | 72 | 7 foreign subsidiaries out of total 31. Located in Germany, Norway, Sweden, the Netherlands, Lebanon, United Arab Emirates and Ukraine. Operating branch in Pakistan, representative offices in Belgium, Belarus, Ukraine, Russia. |
| Lotos | 53 | 15 out of 40 subsidiaries are hosted abroad, mainly in Lithuania, Cyprus, Norway and Curacao. |
| PZU | 35 | 11 out of 55 Group subsidiaries are abroad, in Ukraine, Germany, Romania, Latvia, Lithuania and Sweden. |
| PKP Cargo / PKP SA | 33 | 6 direct foreign subsidiaries, out of which 2 are in liquidation; in 2 PKP has more than 50% share and 7 indirect subsidiaries in Slovakia, Hungary, Czech Republic, Italy and the Netherlands. |
| Azoty | 33 | Companies run in Germany and in Africa in Senegal. |
| KGHM | 32 | 9 subsidiaries supervised directly by KGHM out of 52 entities in the Group are located abroad, and 26 affiliates being part of KGHM International. |
| Tauron | 30 | 2 subsidiaries out of 14 are located abroad along with 50% share in firms in Czech Republic and Sweden. |
| PKO BP | 29 | 6 out of 46 subsidiaries within the Group are located abroad, among them 4 direct and 2 indirect subsidiaries in Ukraine and Sweden. |
| PKN Orlen | 28 | 7 out of 36 entities constituting the group are located abroad – in Czech Republic, Lithuania, Germany, Sweden and Malta. |

Source: Own elaboration (data as on November 2015).

- PZU and PKO BP are distinctly regional, market-driven ventures preferring close neighbouring locations with activities being extension and replication of operations carried at home and constituting the core business.
- Tuaron can be regarded as rather a small-scale timid investor gradually expanding presence abroad.
- PKP Cargo investments seem to fit into strategic-asset and indirectly a market-seeking FDI as it purchases foreign railway carriers in order to serve foreign markets.

Given the state stake and scope of foreign presence it seems justified to name investigated firms as rather quasi-SOMNEs/para-SOMNEs – as they are owned or controlled by the state to the limited extent (as compared to Chinese SOESs), their expansion abroad has begun relatively recently and has limited reach.

## SOLUTIONS AND RECOMMENDATIONS

The dual nature and hybrid form of SOMNEs implies various challenges. This peculiarity is best summarised by He (et al., 2015) who stressed: the possible internal conflicts, management autonomy, varying expectations, perceived and tolerated uncertainty or readiness of risk taking and degree of flexibility.

In the current consensus view of many governments some rules of the game are required when state enterprises are engaged in commercial competition. This is mainly due to the fact that while governments have entered into numerous obligations with respect to international trade and investment, state-owned enterprises may frustrate the fulfilment of these commitments. Hence it must be stressed that it is not motives or efficiency of SOE what matter but trade- and investment-distorting effects with which these negotiators are concerned.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

In respect of state-owned enterprises, the EU seeks to impose certain substantive and transparency requirements for the moment being not included in WTO agreements.[8] Efforts are being undertaken to set up a joint platform of state-owned enterprise-related disciplines, which can be used in subsequent international trade agreements and forums to address state capitalism concerns. For the EU, government ownership is not problematic in itself but certain advantages provided by governments must be addressed.[9]

The prominence of SOE as topic of public debate and policy-makers' interests is reflected in currently negotiated TTIP (Wooton, 2015) and features high on the agenda of recently concluded TTP (Hufbauer, 2015). Trans-Pacific Partnership members are committed to assure the level playing field between SOE and private firms by limiting, for example, the preferential access to finance or new markets. Obviously, certain transition periods before new rules take effect and possible carve-out are taken into account. Trans-Pacific Partnership launches some discipline on accounting practices and governing boards and a requirement that SOE open their procurement of goods and services to foreign firms. The treatment of SOE is also topic being covered during the negotiations of comprehensive bilateral investment agreement between the EU and China (Bickenbach, 2015). The Commission believes that this deal needs to address unfair advantages enjoyed by Chinese SOEs. Various privileges of such enterprises on the one hand, can be detrimental for European companies investing in China, on the other hand, may offer Chinese SOEs investing in Europe an unfair advantage. The likely remedies include first and foremost more transparency - "inter alia the timely publication of financial accounts according to international standards, the disclosure of leading managers' past and present connections to government offices, the publication of any exemptions of SOEs from any measure, regulation or law, and the disclosure of any tax preferences or subsidies for any SOEs" (Bickenbach, 2015, p. 23). New rules would be not only in interest of European about also Chinese companies who might in that way be freed from continuous prejudices and suspicions.

Existing regulatory frameworks that discipline some forms of anti-competitive behaviour of SOEs have been designed with domestic objectives in mind or were conceived at times when the state sector was oriented primarily towards domestic markets (Kowalski, 2013). In terms of international trade and investment, it is difficult to identify explicit strategies of OECD governments to expand the activity of their SOEs abroad. This does not mean that the authorities have no means of shielding an SOE or a national champion from foreign competition, or of helping facilitate their expansion abroad.

There is already in force law which regulates at the international level foreign activities of SOEs (Kawase, 2014). Regarding outward direct investments, some international investment agreements (IIAs) concluded between home and host countries contain provisions exempting subsidies. Other preferential treatment for SOEs that is discriminatory and anticompetitive in nature by host countries may be found to be in non-compliance, for instance, with the principle of national treatment or that of fair and equitable treatment. Furthermore, a foreign investor can bring a claim against the government of its host country for the reason of SOEs' misconduct under the investor-state dispute settlement (ISDS) provisions of the relevant IIA. On the other hand, regarding inward direct investments, when a host country deals with strategic investment activities and anticompetitive business practices by foreign SOEs, it is effective to apply within the purview of the OECD Code of Liberalisation of Current Invisible Operations, domestic investment review and blocking processes for the reason of protecting national security and public interests. Many IIAs basically do not restrict such investment reviews without liberalisation commitments on investment. And most IIAs provide for national security and public order exceptions. The IMF's Santiago Principles and the OECD Declaration on SWFs and Recipient Country Policies can be cited as relevant international soft law (WIR, 2009; Götz, Jankowska, 2016).

## FUTURE RESEARCH DIRECTIONS

It is visible that there is no proper understanding of how institutions in the country of origin of SOEMNEs affect the strategies of outward investments (Kirca, 2010; Nielsen & Nielsen 2010, Wan, 2005, Wan & Hoskisson, 2003). Experts argue that attention should be paid to listed SOEs which display characteristics of both the state and private sectors. They may be motivated by objectives other than profits, and these are determined through a political process, on the other they are simultaneously subject to market forces.

There are however, many aspects missing form current international legal framework and the indication and characterization of these aspects could be the future focus of the study. It seems infeasible currently to require transparency of information such as the description of business and financial standing; to control outright government subsidies; to monitor person-oriented SOEs' strengths (like close relationships with influential politicians). Problems arise also in terms of how to quantify preferential treatment in environmental regulations for SOEs or SOEs' lax corporate governance. Even the definition of an SOE is another difficult issue to agree upon. Should the term 'state-owned' be taken literally as meaning 100% government ownership or more than 50% of its voting shares held by the government could be sufficient? What about "state-influenced enterprises"? (Shapiro & Globerman, 2009) Furthermore, treatment of enterprises owned by sub-national governments is seemingly another reason for splits among the negotiators.

Given the internationalisation processes of SOEs i.e. their higher involvement in trade and investment it seems inevitable to better monitor and asses these tendencies to help governments formulate informed and balanced policy responses. Existing law has mainly domestic inward perspective and does not seem adequate for international processes. National antitrust law can be used to deal with the abuse of dominant position by SOEs and to prevent anticompetitive effects associated with M&As by SOEs (Capobianco & Christiansen, 2011). Competitive neutrality arrangements in some OECD members aim to mitigate or eliminate competitive advantages of state-owned enterprises, with respect to taxation, or financing costs (OECD, 2012). In the EU, for example, the state interactions with other entities are governed by special rules in the areas of antitrust, state aid and transparency. WTO rules are generally ownership-neutral and the disciplines that they impose on government regulations and actions do not distinguish between situations where the provider of the goods or services is a public or a private. They can, nevertheless, discipline some government policies and actions involving state-owned enterprises, for example, when they receive trade-distorting state subsidies. Violation of national treatment or most-favoured nation principles, granting of subsidies or other forms of influencing trade by state-owned enterprises themselves can also be covered by WTO disciplines.

Yet, some of the definitional ambiguities have rendered application of these disciplines uncertain and some provisions allow countries to exempt state-owned enterprises' actions from certain WTO disciplines. Finally, many existing PTAs and BITs include specific provisions on state-owned enterprises, attempting to fill gaps in existing multilateral provisions.

The literature on SOMNEs is scant and mostly focused on Asia.[10] In fact what the authors know mostly come from the public administration, developmental economics and political economy literatures. Little is known about their international impacts and aspirations in the global arena and, in particular, about SOMNEs form CEECs.

## CONCLUSION

This chapter has been inspired by the recognised and growing interest in international dimension of SOEs activity. As it seems SOEs cause more concerns due to their outward orientation. This issue is additionally compounded by the scare data available in this respect. There is still very little reliable information on the importance of state-owned enterprises in today's global markets and on the exact nature of the advantages they may be enjoying because of their ownership (Büge et al., 2013). Some 10% of the world's 2000 largest corporations are fully owned or partially controlled by governments (Krist & Benka, 2013).

Right now there are almost no rules governing how SOEs may operate in international trade, and SOEs can have unfair advantages in competition with privately-owned companies that must respond to market forces. Given the predicted growth tendency several issues need to be addressed which require enhanced policy coordination and information sharing to prevent or mitigate politicization of their operating and low efficiency and to assure that the international trade and investment environment remains open, non-discriminatory and offering a level playing field – so called competitive neutrality. Nevertheless, on the positive note it needs to be stressed that as found by OECD "SOEs are becoming more "international", but not necessarily more "political" and "host countries have often welcomed the contribution from foreign state-owned investors" (Christiansen & Kim, 2014). Twenty years ago, concerns about unfair competition between private companies and state-owned enterprises were minimal as most SOEs concentrated on home markets. However, today many SOEs are significant players in global markets. On a domestic level, countries can keep SOEs in check by anti-trust actions. Internationally, however, current rules are weak and do not adequately address the issue. In the EU itself, the member countries rely on SOEs to differing degrees and the EU has had to develop rules to ensure a level competitive playing field. TTP and TTIP negotiations, present an opportunity to develop rules to ensure fair competition. Without effective international rules on state-owned enterprises, free trade and investment are endangered. SOEs require an explicit and deliberate regulatory treatment due to their unique properties (Kawase, 2014). Given the controversies they initiate it seems that one coherent approach to their regulation is a preferred way than the piecemeal and overlapping rules currently considered.

Polish companies covered in this study are in fact partially state-owned enterprises given the not high (and diminishing) share of the Ministry of Treasury as stakeholder. It seems questionable if despite their significant foreign presences and the fact that their FDI are accounting for the bulk of total Poland's OFDI they deserve to be called the SOMNEs (or given the above – partially state-owned/para state-owned); if the scale and scope of their foreign engagement suffice for such name? This descriptive exercise may promote better understanding of foreign activities of Polish SOEs. It may enrich current literature on SOMNEs and in particular fill the current gap with respect to other than Chinese state-owned foreign activity. It synthesises the available knowledge on the internationalisation of Polish state-controlled and owned entities. Hence, it complements existing studies devoted mostly to single firm – case studies.

Literature review suggest the need of covering many legal aspects of SOEs international activity (e.g. Blyschak, 2016). Exploring SOMNEs in global context might include comprehensive comparison either to private domestic peers or other SOMNEs from a region or a given industry and sector. Such contextual embedded analysis would also yield some insight to the peculiarities of SOMNEs. In other words, it is not only the concrete topic which needs to be addressed with respect to SOMNEs' operations but also the research setting and design of investigation which can shed light on various so far not examined issues.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Based on the authors' investigation following general conclusions can be drawn. It might be expected that the future research agenda on SOEs' international activity would evolve around the aspect of their low (lack of) efficiency and worse performance due to managerial deficiencies, agency problems or other state-related labilities. On the other hand, most likely the further exploration would tackle the undue competitive advantages and other benefits which accrue to SOMNEs and which stem from the state protection. Given the aforementioned controversies and polarised opinions on SOMNEs rise the authors believe that it is of utmost importance to design the research properly. So it can better capture the SOEs peculiarities against the background of other entities. The contextualisation hence should not be underestimate. True picture of SOEs' foreign activity can be painted reliably only if contrasted with private peers from the sector or other SOMNEs from the region. The broader context would provide more detailed assessment. It would enable diagnosing if SOMNEs are indeed so special class of enterprises or their foreign investments actually do not deviate from the behaviours of their private peers.

As revealed by the close examination of articles published by the FT 45 top journals during the most recent 15-years period only 39 out of them actually focused on SOEs (30 of them exclusively on China!) and although, inquiry into SOEs is rising, the research on the topic continues to be scarce (Bruton et al, 2015). The authors believe that their research and presented discussion might contribute to the contemporary debate on SOEs and SOMNEs in particular and address the encouragement of Bruton, Peng, Ahlstrom, Stan, Xu (2015, p. 95) to "devote additional attention to (SOEs) this important, adaptive, and enduring organizational form that generates approximately 10% of global GDP and represents some of the world's largest firms".

## ACKNOWLEDGMENT

Research has been undertaken within the project funded by the National Science Centre titled "State role in (post) crisis European economy – policy towards foreign direct investment" and allocated on the basis of decision number DEC-2014/13/B/HS4/00165.

## KEY TERMS AND DEFINITIONS

**Diversity of Capitalism and Varieties of State Capitalism:** Classification of types of capitalism which among others accounts for the role played in the economy by the state. Besides differentiating between liberal market economy, capital market economy, it recognizes various models of state capitalism with diversified scale of state intervention ranging from the wholly state-owned enterprises to subtle state aid facilitating development.

**Escape Motive:** The need to reduce the dependency on the state as potentially perceived by SOMNEs which can materialise via conducting investment abroad.

**Extraterritoriality Argument:** Tendency revealed by SOMNEs to perceive OFDI as a way to export certain ideology, expand zone of influence.

**Foreign Direct Investment:** FDI - the most advanced form of internationalisation, implies the highest commitment in running the activity abroad as compared to export or joint venture. It can take the form of acquisition (M&A) or greenfield projects.

**IDP - Investment Development Path:** The pattern describing the evolution of foreign direct inflows and outflows of a given economy and tracing it against the GDP developments. This construct shows whether a country is rather a FDI (capital and know-how) recipient or donor.

**International Investment Regime:** Vast collection of arrangement, agreements, partnerships and treaties (mostly IIA – international investment agreements and BIT – bilateral investment treaties) which set the perimeters of international expansion usually by private entities. Though, the increasing role of SOEs in the process of internationalisation leads to new generation of treaties and partnerships being negotiated / concluded which cover also these class of investors and controversial issues pertaining to them.

**Non-Business Argument:** Inclination revealed by SOMNEs to get involved in economically less (no) feasible projects, to incur unjustified higher costs, to accept more risk when venturing abroad and hence be less profitable than private business or even bring losses.

**State Owned Transnational Company / State-Owned Multinational Enterprise:** SOTNCs / SOMNEs – state-owned company active abroad, with affiliates and activities be they upstream or downstream performed in foreign markets. SOMNE / SOTNC can be created via nationalisation of existing MNE/TNC or via internationalisation of SOE. Polish SOTNCs – firms constituting the case study of this paper; group of selected nine Polish firms who met the criteria of state involvement – at least 10%, are listed on Warsaw Stock Exchange and possess affiliates abroad.

**State-Owned Enterprise:** SOE - broad term defined diversely in the literature usually stands for the company controlled, owned or invested by the state – mostly by the Treasury. The ownership and control can be expressed in various ways. Such firms are believed to enjoy special treatment (see: advantages), though, suffer also from certain inefficiencies, inflexibilities, etc. (see: disadvantages).

## ENDNOTES

[1] UNCTAD (WIR, 2011) defines a *state-owned multinational (SOMNE)* as an organizational form that is both a multinational enterprise (MNE) (i.e., the firm has one or more foreign affiliates engaged in value- adding activities in one or more foreign countries) and a state-owned (or controlled) enterprise (i.e., the firm has a minimum of 10% government ownership). The 10% cut-off is high enough that the state likely influences corporate governance and thereby affects firm performance.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

[2] The prevalence of SOEs also varies considerably across industrial sectors. Statistics on SOE sales, assets and market value among the world 's largest companies have been used to calculate Sectoral SOE Shares (SSS).

[3] Dependent variables: in the first regression the number of firm's domestic subsidiaries, in the second - the number of its foreign subsidiaries; and in a third - the ratio of foreign to domestic subsidiaries as a proxy for internationalization. As independent variables have served parent sales, profits, assets, market value and a dummy that equals one if the firm is an SOE and equals zero otherwise (Kowalski et al., 2013, p. 36).

[4] 2014 OECD Business Survey on State Influence on Competition in International Markets sheds additional light on concerns related to cross-border activities of state enterprises. It also summarizes key results from the OECD Database on National Practices and Regulations which contains information on national and international regulation with respect to state enterprises - announced in May 2015 as pilot project requiring refinements.

[5] Forbes Global 2000 - SOE sales, profits, assets and market value as a % GNI.

[6] Database on National Practices and Regulations with Respect to State Enterprises, http://qdd.oecd.org/subject.aspx?Subject=8f22ef7d-b780-4570-a4b1-7e0cb3ad7e04

[7] The problem with obtaining the reliable and comparable data for Poland is similar to the OECD studies (Christiansen, Kim, 2014, p. 26).

[8] An unprecedented step – commission releases TTIP negotiation proposal (Julien, Sohlberg, 2015).

[9] Textual Proposal - the European Union's initial proposal for legal text on "Competition" in TTIP. It was tabled for discussion with the US in the negotiating round of 10-14 March 2014 and made public on 7 January 2015. The actual text in the final agreement will be a result of negotiations between the EU and US. Textual Proposal Possible Provisions on Competition, http://trade.ec.europa.eu/doclib/docs/2015/january/tradoc_153030.pdf

[10] Special issue of the Journal of International Business Studies: Governments as Owners: Globalizing State-Owned Enterprises (2014) 45 (8), 919–942 contributes significantly to the so far rather limited research.

## ABSTRACT

*With the collapse of communism, some former communist States of Eastern Europe managed to muddle through their way to a market economy and entered the European Union. This brought about the acceleration of Foreign Direct Investment (FDI) among the European economies and accelerated the globalization process. Although there is plenty of research on FDI and trade among countries, the aim of this chapter is to analyze how trade between Portugal and the Czech Republic have evolved over form 2000 until 2015. The chapter seeks to complement previous studies on FDI and trade as Portugal and the Czech Republic are part of the European Union, but have had different historical, cultural, and economic paths. The main conclusion of the chapter is that trade between both countries has grown significantly. The main reason affecting trade between both countries is the economic unrest Portugal has been through since 2008.*

## INTRODUCTION

Although FDI and the analysis of trade have been extensively researched among scholars, as well as their effects for both home and host countries, far less attention has been placed on how countries that historically had hardly any trade between them – as they belonged to different economic blocs – have evolved over time, as is the case of the Czech Republic and Portugal, that entered the European Union (EU) in, 2004 and 1986, respectively. As such the purpose of this article is to analyze the commercial trade between the Czech Republic and Portugal between 2000 and 2015, who are the main players participating in this process, and how this has impacted on the Czech firms investing in Portugal and on Portuguese firms investing in the Czech Republic.

The chapter begins with the literature review on Foreign Direct Investment (FDI) and on how Czech firms have managed to internationalize. Afterwards, it is presented a brief presentation of both countries, Portugal and the Czech Republic, economically and culturally. For this the chapter contextualizes the analysis based on the EU context. The third section contains the main factors of trade. The fourth and fifth sections compare both countries historically and economically and evaluate both countries with an analysis of the evolution of the mutual trade during 15 years. Within the analysis two main events are introduced: 2004, when the Czech Republic joined the EU and 2008, when the global economic crisis started. The sixth section presents the main Czech companies operating and investing in Portugal and the main Portuguese companies operating and investing in the Czech Republic. The final section presents the conclusions.

## BACKGROUND

Studies about international trade, internationalization and FDI are abundant. Analyzing how the theories about internationalization have evolved, Ribau, Moreira, and Raposo (2015) conclude that for decades theories analyzed how trade and FDI between countries occurred. Subsequently, there was a huge focus on multinational firms, and only after the 1980s onwards focus on internationalization shifted to Small and Medium-sized firms (SMEs) and how important they are to international business.

International trade can be defined as the exchange of goods and services that connect people, businesses, and countries along international borders in global processes of production and consumption influencing, directly and indirectly, the way everybody lives live.

As a result of international trade, FDI has become one of the most significant factors for economic development, as it allows the international flow of goods among countries, enabling the recovery and / or modernization of the economies (Razin & Sadka, 2007). FDI is one of the results and, at the same time, one of the major drivers of international trade, where multinational and small and medium-sized enterprises (SMEs) started to play a leading role.

FDI allows not only the flow of goods but also the creation of jobs. One consequence of this increasing flow of FDI is that countries seek to implement economic policy measures to attract investment flows (Chenaf-Nicet & Ronjier, 2016). Moreover, as FDI embodies technology and know-how, there are potential benefits that are not very explicitly exposed as technology transfers, productivity gains, managerial and know-how transfers, and access to broader markets (Blomström & Kokko, 1998).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hanson (2001) supports that FDI generates positive spillovers for host countries. However, Lipsey (2002) finds that there is no consistent relation between the size of inward FDI and GDP or growth. Markusen and Venables (1999) defend that FDI could harm local industry.

Moreira (2008) defends that there are positive effects from FDI as there are positive technology accumulation among SMEs supplying their multinational clients. Görg and Greenway (2004) support that spillovers from foreign to domestically owned firms are mostly negative. Although there appears to be no consensus among scholar about the externalities of FDI, most countries are looking forward to increasing their international trade, as well as their share of FDI activities.

The lack of policy making supporting the internationalization of SMEs led Moini, Kalouda, and Tesar (2008) to propose that government policy makers in the Czech Republic need to understand the necessary linkages between their SMEs foreign market entry modes and the country's future economic growth. For the Czech Republic to improve its economic status in the European Union, it is mandatory to support Czech SMEs in order to underpin their competitiveness in the global marketplace.

Fink, Harms, and Kraus (2008) conclude that 40% of Czech firms enter the German market, followed by the Slovakian market (12%), and the Polish market (11%). Taking into account the different language skills of the old and new generations in the Czech Republic – as the older generation was used to learn only Russian as a second language and the new generation is more akin of learning English or German – they claim that the greatest obstacle for firms to penetrate in foreign markets is the language barrier (Fink, Harms, & Kraus, 2008), as German was selected as the most popular language in terms of international trade in this study, which might explain why Germany is the largest and the most attractive neighbor for the Czechs. Fink, Harms, and Kraus (2008) conclude that that self-commitment is particularly important in international business cooperation, as self-commitment positively influences the performance of both cooperating firms. As such trust-based relationships in the firms' internationalization process is a promising alternative particularly for SMEs.

Musteen and Datta (2011), when analyzing how Czech manufacturing SMEs learn about foreign markets, reinforce the importance of role of knowledge of prospective managers when developing a good understanding of the international markets. The better the improved understanding of the main factors to compete in foreign markets, the better entrepreneurs and SME managers perform in international markets.

Based on a qualitative study among entrepreneurs in the Saxon-Czech border area, Zanger, Hodicová, and Gaus (2008) conclude that entrepreneurs on both sides of the border experience feelings of foreignness towards the corresponding neighboring country, which limits the entrepreneurs' willingness to cooperate with companies from the neighboring country.

Cieślik, Michałek, Michałek, and Mycielski (2015) investigated the determinants of export activity comparing firms from the Baltic States and Central European Countries for three years: 2002, 2005, and 2009. They conclude that the results for both groups of countries are not different as firms' export performance was positively related to the level of productivity, firm size, the share of university graduates in productive employment, investment on R&D activities, and the internalization of firms measured by foreign ownership. Moreover, there are some differences among countries, namely the level of productivity was significant for the Czech Republic. Similarly, they also conclude that it would be advisable to formulate policy recommendations for the development of export promotion strategies as export performance could be improved by attracting export-oriented FDI, which can generate positive spillovers to domestic firms.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Based on the analysis of data collected in interviews with managers and founders of 67 Czech entrepreneurs, Zapletalová (2012) concludes that most of the firms follow a typical stage approach of outward internationalization. Moreover, very few firms follow the "rapid internationalization" approach followed by born-globals, which is a clear indication that internationalization is still a leapfrogging process for most SMEs. Based on the analysis of questionnaire-based research that involved 297, Zapletalová (2015) concludes that the historical context of centrally planned economy in the Czech Republic until 1989 is still affecting negatively the internationalization process of Czech firms, as their degree and level of internationalization is still significantly low.

The lack of language skills of key employees before entering foreign markets, the lack of employee experience with foreign market expansion, the time that elapses between the opening of the business and foreign market expansion, the lack of explicit objectives for export activities, the unclear definition of the strategy to be implemented abroad, and the lack of clear market segment focus are the main difficulties of Czech SMEs when expanding abroad (Kubíčková & Procházková, 2014).

According to Moini, Kalouda, and Tesar (2008), when compared to their non-exporting counterparts, exporting SMEs in the Czech Republic (a) tend to be larger, and more motivated in systematically exploring export opportunities, (b) utilize a larger percentage of their production capacity, and (c) have fewer problems in obtaining financial services. Exporting firms tend to face three major challenges when embracing international business activities: a financial burden, unknown foreign marketing practices, and locating prospective clients.

Símová (2010) follows an inward internationalization perspective and studied how the retailing industry in the Czech Republic went through dramatic changes from the early 1990s to mid-2000s. She concludes that there have been dramatic changes, quantitatively and qualitatively, as the Czech retailing industry has achieved a relatively high level of concentration and internationalization, as many international firms entered the Czech market.

Foreign direct investment in Portugal was analyzed by Moreira and Dias (2008), who concluded that Portugal went through several phases, and FDI skyrocketed since Portugal joined the EU.

The literature on internationalization of Portuguese SMEs is also abundant. For example, Lisboa, Skarmeas, and Lages (2011) explore the importance of innovation as a means for developing firm-specific advantages abroad. Moreira and Alves (2016) claim that internationalization is difficult for SMEs even when small psychic distances between countries are present. Carvalheira and Moreira (2016) support the idea that even artisanal firms can internationalize when opportunities arise. However, no single study was found regarding Portuguese SMEs internationalizing to the Czech Republic.

One can conclude that, on the one hand, the perspective towards FDI is multifaceted and, on the other hand, that there is no single study regarding foreign direct investment or trade analyzing how Portugal and the Czech Republic are interrelated. Moreover, the studies on Czech SMEs are almost unanimous referring the difficulties in internationalizing.

## BRIEF PRESENTATION OF THE CZECH REPUBLIC ECONOMY

The Czech Republic is a small central European country (about 79,000 $km^2$). As of 2015, it had around 10.5 million inhabitants (EuroStat, 2016a). The Czech currency is the Czech Koruna (CZK) and the GDP in 2015 was €163,948 million (€16,600/per capita) (Countryeconomy.com, 2016). The country's human development index (HDI) (used by the United Nations to measure the progress of a country),

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

was 0.870 points in 2014. As such, the Czech Republic is in the 28th place among 188 countries (CountryEconomy.com, 2016). The Czech Republic holds the 36th position of the Doing Business ranking (The World Bank, 2016).

After joining the EU in 2004, the Czech economy has continuously grown. However, this significant boost was affected by the economic crisis in 2008 and although the Czech economy has recovered quite fast, it has not been able to follow up with the previous, pre-crisis pace. Since joining the EU, the rate of the Czech export within the EU has doubled (81% from all the export) and the surplus of the trade has quintupled. The Czech Republic's main import and export partners are Germany, Slovakia and Poland. Although the Czech and German industries are strongly linked, the Czech economy is very dependent on the German one. Since joining the EU, the Czech Republic has been considered as a recipient of foreign direct investment from the EU. In comparison with the other Central European countries, the Czech Republic has the strongest share of Foreign Direct Investments inflows (Rusnok, 2014).

According the Eurocentrum Praha seminar, that was held in December of 2014 and where were discussed among others the economic models that would be the most suitable for the Czech Republic, Mr. Ales Chmelar – the Chief Economist at the European Section of the Czech Office of Government – presented various forecasts of economic development, which echoed since 1989. The development of the Czech economy was, as mentioned above, primarily influenced by inflow of foreign investment. The inflow peaked around the time of the entry into the EU in 2004. However, after the last economic crisis broke out, the Czech economy felt a steep fall in 2008. As such, the main objective of the Czech economic policies is the support of a long-term productivity growth (Government of the Czech Republic, 2015).

According to the Economic and Financial Affairs of the European Commission from 2015, the Czech economy returned to growth in 2014, following two years of contraction, and unemployment has been on a declining trend. The return to growth has been largely driven by domestic demand, with investment growing particularly strongly.

The Czech Republic's public finance outturns have improved markedly, but some issues remain in the areas of taxation, fiscal sustainability, and fiscal framework. The country continues to suffer from a relatively high level of tax evasion, although efforts are being made to fight this problem.

There is an overall high level of employment but certain disadvantaged groups remain underrepresented in the labor market. These groups include parents with young children, low-skilled workers, people with disabilities and gypsies.

The general government deficit has improved significantly since 2009 and the Czech public finances do not appear to face sustainability risks in the short term.

Real GDP growth is expected to strengthen further in 2016, although developments in the external environment might have a negative effect (European Commission, 2015).

## BRIEF PRESENTATION OF THE PORTUGUESE ECONOMY

Portugal is a small country (around 92,000 $km^2$) situated on the West coast of Europe. Its territory includes two autonomous regions: Azores and Madeira. It is one of the oldest countries in the world. Portugal has a population of around 10.3 million inhabitants (EuroStat, 2016a). Portugal's currency is the Euro (€). The country's GDP (nominal) in 2014 was of €174,385 million (€16,800/per capita). The service sector is the main contributor to the economy.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The human development index (HDI) (used by the United Nations to measure the progress of a country) was 0.830 points in 2014, 43rd place out of 187 countries. As for the Doing Business Ranking, Portugal occupies the 23rd place (The World Bank, 2016).

The majority of Portugal's commercial trade and foreign direct investment flow happens within the European Union. In 2015, 72.7% of exported goods and 76.4% of imported goods were traded with UE countries. Spain, Germany, and France stand out as the main partners both in terms of imports and exports. Regarding foreign direct investment, the Netherlands and Spain represent both the biggest percentage of inflow and outflow (AICEP, 2016a).

Regarding the most recent members (Bulgaria, Slovakia, Slovenia, Estonia, Hungary, Latvia, Lithuania, Poland, Czech Republic, and Romania), despite the increases caused by their entry in the European Union, they still account for a small part of Portugal's imports and exports (INE, 2008). The Czech Republic and Poland stand out as the main partners amongst this group.

The Portuguese economy has been severely affected by the international economic crisis. However, from 2008 to 2013, it has shown visible signs of international dynamic. Commercial trade and foreign direct investment have both increased. In 2013, exports surpassed imports for the first time in this period, forming 40% of the GDP (€67,000 million in goods and services). Spain, Germany, France, Angola, and the United Kingdom, Portugal's most important partners have seen their percentage in the total export/import reduced (see Table 1), which suggests a tendency to look for new markets.

Portugal has been increasing its investments in foreign countries, although it remains a bigger receiver than investor. As of 2012, Portugal occupied the 9th place amongst the UE27 countries in the FDI intensity index (INE, 2014).

Portuguese technological companies have also developed cooperative actions: 96% of them with national partners, 45% with UE27 partners and 9% with the USA (INE, 2014).

*Table 1. Percentage of Portugal's biggest partners in the total imported/exported goods*

| Country | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 |
|---|---|---|---|---|---|---|---|---|
| **% of Total Exported Goods** | | | | | | | | |
| Spain | 27.9 | 27.2 | 27.0 | 24.9 | 22.5 | 23.6 | 23.5 | 25.0 |
| Germany | 12.8 | 13.0 | 13.0 | 13.5 | 12.4 | 11.6 | 11.7 | 11.8 |
| France | 11.8 | 12.4 | 12.0 | 12.2 | 11.8 | 11.6 | 11.7 | 12.1 |
| Angola | 5.8 | 7.1 | 5.1 | 5.4 | 6.6 | 6.6 | 6.6 | 4.2 |
| United Kingdom | 5.5 | 5.6 | 5.5 | 5.2 | 5.3 | 5.5 | 6.1 | 6.7 |
| Total | 63.8 | 65.3 | 62.6 | 61.2 | 58.6 | 58.9 | 59.6 | 59.8 |
| **% of Total Imported Goods** | | | | | | | | |
| Spain | 30.8 | 32.8 | 32.1 | 32.3 | 32.0 | 32.3 | 32.6 | 32.8 |
| Germany | 13.4 | 13.2 | 13.9 | 12.3 | 11.4 | 11.4 | 12.3 | 12.9 |
| France | 8.1 | 8.3 | 7.2 | 6.8 | 6.6 | 6.8 | 7.1 | 7.4 |
| Angola | 5.4 | 5.8 | 5.7 | 5.4 | 5.2 | 5.2 | 2.7 | 1.9 |
| Netherlands | 4.7 | 5.3 | 5.1 | 4.8 | 4.8 | 5.0 | 5.1 | 5.1 |
| Total | 62.4 | 65.4 | 64.0 | 61.6 | 60.0 | 60.7 | 59.8 | 60.1 |

## THE MAIN FACTORS OF TRADE

In order to understand trade between Portugal and the Czech Republic, it is important first to understand the common market these countries are part of. Both countries have joined the European Union, Portugal in 1986 and the Czech Republic in 2004. This allows for both countries, as well as all countries in the single EU market, to take advantage of the free circulation of goods, capital, people, and services. It also allows goods to travel internally without being subject to customs duties, discriminatory taxes or import quotas. Investment is also made easier.

The Eurozone was created in 1999 (although not all member states joined) introducing a common currency, the Euro (€). This common currency eliminates fluctuations in the exchange rate providing predictability and safety and reducing transaction costs, which facilitates trade and capital movement. However, the Eurozone also has its disadvantages; the economy of a particular country might influence buyers and investors on their decision to buy Euro, thus affecting the Euro exchange rate (Geoghegan, 2014). While Portugal joined the Eurozone, the Czech Republic did not, which is a factor that surely affects trade between the two countries, which will be explored later on.

Various factors affect trade in Europe. While the EU facilitates trade, its member States do not all trade equally amongst themselves. Factors like direction of trade, distance, population, language, legal origins, currency, physical infrastructures, borders, and transport efficiency have an impact on trade between certain countries (Hanousek & Kočenda, 2014). As part of the analysis regarding goods, parts and components, capital goods, and consumer goods, this chapter summarizes them below, noting which factors may influence the trade between Portugal and the Czech Republic.

*The direction of trade does matter and we reject the hypothesis of a zero effect. (…) The trade links among the old EU members have been long established (…). The majority of the trade flows in parts and components within the EU is carried along the East–West alignment, as is trade in capital and consumer goods. (Hanousek & Kočenda, 2014, p. 19)*

The fact that most of Portugal's trade is carried out with old EU members can be explained by this factor. Commercial trade with its neighbors has been happening for a long time, and they are its biggest partners. Regarding the trade between Portugal and the Czech Republic, it is hard to understand to which extent this tendency affects trade; while Portugal does tend to import more from, than export to, the Czech Republic, the numbers are not so different as to confirm this trend.

*Distance negatively affects trade in all four types of goods. (…) However, the economic significance of distance is relatively low. (Hanousek & Kočenda, 2014, p. 15)*

While the geographic proximity of European countries is not very significant, it is important to note that most of Portugal's trade (within the EU) is with the countries closest to it like Spain; and Germany and France for the Czech's trade. This can lead us to believe that (cultural and geographic) distance might be one of the factors that explain the low levels of trade amongst the two countries.

*Population as a factor exhibits a positive effect on all types of goods. The combined populations of the country pairs represent the size of the market. (Hanousek & Kočenda, 2014, p. 16)*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Portugal and the Czech Republic have a similar number of inhabitants, around 10 million. While not the smallest, each country definitely has a small internal market. The sizes of both markets are one of the strongest reasons responsible for such a small interest in doing business with each other. Small markets can be often unattractive, especially in comparison with the bigger – in this case also closer – markets (Spain and Germany for example) that can provide economies of scale.

*A common language does not seem to matter excessively for European trade, (Hanousek & Kočenda, 2014, p. 16),*

which is understandable as in the European context there is a large number of different languages and companies deal mostly in English with their European partners.

*The effect of a common currency is largely statistically significant, but its economic impact is limited. (Hanousek & Kočenda, 2014, p. 17)*

While Portugal adhered to the Eurozone, the Czech Republic did not. This means trade is subject to exchange rates, which can also influence the exchange of goods between the two countries. According to the statistics of the CNB (Czech National Bank) from 2015, the Czech Koruna since 2000 has been significantly strengthening against both Euro (see Table 2) and US Dollar (Mrázek, 2015). The effect of the exchange rate on businesses can depend on several factors, like elasticity of demand, economic growth in other countries, percentage of raw materials imported, reason of an appreciation/depreciation, inflation or fixed contracts (Pettinger, 2013).

*The factor of hard physical infrastructure exhibits the lowest coefficients when compared with the rest of the infrastructure measures. (…) High level of physical infrastructure is (…) taken as a standard, despite existing differences between old and new EU countries. (Hanousek & Kočenda, 2014, p. 17)*

European countries are generally equipped with good infrastructures. Portugal is equipped with one of the most developed road networks in Europe, 14,310 km long (in the mainland, of which 2,988 km are highways), a railway 2,544 km long, 15 airports (a high number due to the many islands of Azores and Madeira) and 20 ports (AICEP, 2016a).

*The Czech Republic possesses one of the most advanced transport networks in Central and Eastern Europe. Its geographical position at the very centre of Europe makes it a natural crossroads for major transit corridors. An extensive network of transport routes serves not only the Czech Republic but also links the country to neighbouring and other European states, and the density of the transport network ranks the Czech Republic among the world's most advanced countries. (CzechInvest, 2013)*

*Table 2. CZK/EUR exchange rate: annual average*

| **Year** | 2000 | 2002 | 2004 | 2006 | 2008 | 2010 | 2011 | 2012 | 2013 | 2014 |
|---|---|---|---|---|---|---|---|---|---|---|
| **CZK/EUR Exchange Rate** | 35.61 | 30.81 | 31.90 | 28.34 | 24.94 | 25.29 | 24.59 | 25.14 | 25.97 | 27.53 |

Source: Own preparation based on data from the Czech Statistical Office.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Czech Republic features 9,435 km of railway, 10 airports and 127,693 km of highways.

*ICT [Information and communications technology] exerts the most influence on trade in parts and components and in capital goods. (Hanousek & Kočenda, 2014, p. 17)*

According to the ICT development index, which monitors and compares developments in information and communication technology across countries, Portugal (49th) and the Czech Republic (38th) are above the global average, while not reaching the European average (International Telecommunication Union, 2014). The two countries rank extremely close to each other. Considering parts and components are some of the most traded goods between both countries, this factor might be quite influential.

*Border and transport efficiency is the most influential factor for trade in primary and consumer goods. (Hanousek & Kočenda, 2014, p. 18)*

Shipping by sea has always been one of the most important means of transport that the goods exchange has been dependent on. In our case, this plays an inherent role for the Czech-Portuguese trade. The closest Czech ports are either Hamburg, Germany or Naples, Italy, which obviously makes shipping more complicated for the Czechs.

*The effect of the business and regulatory environment is quite pronounced for the trade flows of primary goods. (Hanousek & Kočenda, 2014, p. 18)*

This factor refers to indicators of irregular payments, favoritism, government transparency, and measures to combat corruption. The transparency index published, which measures how corrupt each country's public sector is perceived, shows that Portugal and the Czech Republic rank on 28th and on 37th position with similar values (Transparency International, 2016a; 2016b).

Clearly, there is no single factor influencing trade between both countries. However, market size, distance, and border and transport efficiency are the strongest arguments speaking against a bright future of the Czech-Portuguese trade.

## COMPARING BOTH COUNTRIES. MAIN SIMILARITIES AND DIFFERENCES

Becoming aware of essential similarities and differences between the Czech Republic and Portugal is important to analyze what opportunities and cultural challenges need to be overcome in order to bring these countries together and stimulate trade. This section summarizes them below.

### History

During last century both countries went through difficult times with Portugal being ruled by a right wing dictatorship during part of the century and Czech Republic being ruled by a communist dictatorship after the World War II.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Autocratic regimes suffered the influence of international actors that led Portugal to lose their former colonies, on one side, and the Czech Republic to break free from the tight control exercised by the former Soviet Union. With democracy both countries have managed to enter the European Union, and a process of Europeanization, in which the European Monetary Fund has played an important role in the institutional change and policy adjustments to their European counterparts (Petrovic & Solingen, 2005).

Historically, both countries have followed different paths. The Czech Republic has been part of the Duchy of Bohemia under the great Moravian Empire and afterwards of the Holy Roman Empire. In the sixteenth century it was gradually integrated into the Habsburg Monarchy. In the 1800s the Bohemian kingdom became part of the Austrian Empire. With the collapse of the Austro-Hungarian Empire after the World War I it became the Republic of Czechoslovakia in 1918. After the World War II it fell under the soviet influence until 1989 when the communist regime collapsed. In 1993 Czechoslovakia peacefully dissolved into two independent states: the Czech Republic and Slovakia. In 2004 the Czech Republic entered the European Union.

The Roman Empire had a strong influence in Portugal since the first century b. C. In the fifth century, with the decline of the Roman Empire, Iberia in general was influenced by Germans. In the eighth century Arabs occupied Iberia and Christians run away to the north of Iberia.

In 1139, with the Christian conquest, the Kingdom of Portugal was set up. Since 1297 Portugal is the European country that maintains its original frontiers.

As a result of an outward perspective during the XV and XVI Portugal expanded its borders abroad establishing the first global empire with foothold in Africa, South America, Asia and Oceania.

In 1990 a revolution ended the Portuguese monarchy and the first republic was set up. In 1926, due to social conflicts, a dictatorship was established that lasted until 1974, when a military coup ended the colonial war that was taking place since 1961. In 1986 Portugal entered the European Union (at that time European Economic Community).

The support of an industrial strong foothold allowed the Czech economy to withhold the changes it went through over time. Portugal was more outward oriented building an empire offshore which impeded the creation of an industrial network (Soares, 2015).

## Economy

Table 3 summarizes the main economic indicators for both countries. Currently in Portugal there is a structural lack of competitiveness, low levels of cooperation and little flexibility in determining wages and productivity. Foreign investment in Portugal has been low. Although the Portuguese economy has been growing, its growth has been slow. As such, Portugal needs to create jobs, readjust social policies, review labor legislation, and bring academia and the business community closer (Valles, 2015).

Portugal and the Czech Republic present the same value in the Global Competitiveness Ranking (4.5). Taking a closer look to each country's specific evaluation, one can find that Portugal surpasses the Czech Republic in most basic requirements: institutions, infrastructure and health and primary education. It is, however, drastically surpassed by the Czech Republic on the macroeconomic environment requirement, occupying the 128$^{th}$ position compared to the Czech Republic's 40$^{th}$. Most secondary indicators remain close, except for the financial market development requirement, where Portugal is in 104$^{th}$ place versus the Czech Republic's 44$^{th}$. Furthermore, the countries also vary in labor market efficiency, with Portugal

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 3. Comparing the Czech Republic and Portugal*

| Indicator | Year | Czech Republic | Portugal |
|---|---|---|---|
| GDP at current prices ($10^6$ €) | 2014 | 154,929 | 174,384 |
| GDP at current prices (€ per capita) | 2014 | 14,700 | 16,800 |
| Public Debt (% of GDP) | 2013 | 45.7 | 128 |
| FDI inflow | 2013 | 4,990 Million USD | 6,626 Million EUR |
| FDI outflow | 2013 | 3,294 Million USD | 6,199 Million EUR |
| Exports ($10^6$ €) | 2014 | 130,808 | 48,168 |
| Imports ($10^6$ €) | 2014 | 114,594 | 58,708 |
| Trade Balance ($10^6$ €) | 2014 | 16,172 | -10,605 |
| Global Competitiveness Ranking | 2016 | 37th | 36th |
| Doing Business Ranking | 2015 | 36th | 23rd |

Sources: Own preparation from EuroStat (2016b), INE (2014), CountryEconomy.com (2015; 2016).

finding itself in 83rd place versus the Czech Republic's 62nd, and market size. While the domestic market size ranking is close for the two countries, foreign market size ranks Portugal in 48th versus the Czech Republic's 27th (World Economic Forum, 2015a; 2015b).

With a GDP per capita in purchasing power parity similar to Portuguese, the minimum wage in the Czech Republic is of 337€ (9200 Czk). Salaries are on average 30% lower in the Czech Republic than in Portugal. The weight of social security in GDP is around 20%, less 6% of recorded between Portuguese (Valles, 2015).

Although some features and indicators are common, currently there are some aspects that distinguish the situation of both countries, such as Portugal's public debt, which has presented levels above 125% of the GDP (AICEP, 2016a), as opposed to the Czech Republic, which maintains levels below 46% (AICEP, 2016b).

In terms of income of the families, while Portugal presents high levels of inequality in income distribution, the Czech Republic exhibits low inequality. However, both countries presented income in Purchasing Power Parity (PPP) per capita that is only slightly more than half of the EU average (INE, 2005, p. 113, 209).

*Between 1995 and 2004, the unit labor costs fell 3.6% among the EU15.*

While in the Czech Republic this indicator fell as well, Portugal was among the few European countries that saw these costs increased (INE, 2005, p. 220).

*The unsustainability forecast of the social protection system has led the Czech government to a strict management of responsibilities and rights, significantly preventing the escalation of its weight in the economy. The contributions of employers, workers and pensioners are financing the system by about 75%. In Portugal, it does not exceed 45%, requiring of the state an additional effort of 12% of GDP. (Valles, 2015)*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The contributions are proportionally higher in the Czech Republic (34% employer and 11% employee) than in Portugal (27% employer and 11% employee) (Valles, 2015).

Regarding education, essential to the economy of a country, while Portugal presented the second highest rate of school dropouts in the European Union (EU 25), 38.6% as of 2005, the Czech Republic had one of the best performances in this area, 4.3%. It also surpassed the EU15 average of the percentage of people aged 20-24 that has completed at least secondary education, topping this list (INE, 2005, p. 92). Czech policies are based on incentives to bring universities closer to business, avoiding scenarios where unemployment of young graduates is alarming. These policies aim to increase added value growth in innovation-driven areas where competitive factors are based on design, innovation, research, and development in an economy that started from a strong industrial base. In 2013, the percentage of 30 to 34 year olds who had completed tertiary education increased significantly in comparison to 2002 in both countries, from 13% to 29.2% in Portugal and 12.6% to 26.7%. In the same year, Portugal and the Czech Republic also registered two of the lowest rates of early school dropouts, 5.4% and 19.2%, respectively. The Czech Republic has fulfilled its 2020 national target for this indicator (EuroStat, 2014).

Regarding investment in research and development, Portugal presented a considerable growth in 2004, staying at a top position. However, the Czech Republic surpassed it regarding the percentage of GDP that this investment represented (INE, 2005).

Although, especially due to the crisis, Portugal belongs between the less developed economies of the EU, its economy is growing linearly with its potential. The significant role in Portuguese economy is held by small and middle enterprises that are involved by 80% on the employment creation and by 60% on the Portuguese export. This feature is obvious also on quite high amount of Portuguese FDI abroad. There is a quite high concentration of enterprises especially on the north of Portugal and then around Lisbon. The south of the country is more agricultural and also touristic.

Portugal's trade balance has been historically negative, although this deficit has been decreasing thanks to a growing dynamic of Portuguese exports (BusinessInfo, 2014). "With a vibrant automotive industry, the Czech Republic has established itself as an open and dynamic market economy" (The Heritage Foundation, 2015). The Czech Republic is also strongly characterized as a mature host country for FDI (CzechInvest, 2016).

The most prospective fields where both counties supplement each other very well are: construction/ civil engineering, food industry, banking, telecommunications, car industry and tourism (BusinessInfo, 2014).

## FDI

Table 4 shows stock of FDI between Portugal and the Czech Republic Million Dollars at current prices and current Exchange rate, between 2000 and 2015. Table 5 shows the stock of FDI in % of gross domestic product. One of the main conclusions is the difference between inward and outward foreign direct investment has grown faster for the Czech Republic than for Portugal. This means that, as outward FDI (OFDI) is larger in Portugal than in the Czech Republic, the Portuguese economy is more outwardly oriented, whereas the Czech economy is still more inwardly oriented with massive FDI from Holland and Germany.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 4. Stock of FDI, in US million dollars at current prices and current exchange rate*

| | Outward FDI from Czech Rep. | Outward FDI from CZ to PT | Inward FDI to Czech Rep. | IFDI-OFDI | Outward FDI from Portugal | Outward FDI form PT to CZ | Inward FDI to Portugal | IFDI-OFDI |
|---|---|---|---|---|---|---|---|---|
| 2000 | 738 | - | 21,644 | 20,906 | 19,794 | - | 32,043 | 12,249 |
| 2001 | 1,136 | - | 27,092 | 25,956 | 22,091 | 1 | 38,188 | 16,097 |
| 2002 | 1,473 | - | 38,669 | 37,196 | 20,730 | 2 | 47,117 | 26,387 |
| 2003 | 2,284 | 18 | 45,287 | 43,003 | 33,914 | 147 | 64,589 | 30,675 |
| 2004 | 3,760 | - | 57,259 | 53,499 | 43,257 | 160 | 71,319 | 28,062 |
| 2005 | 3,610 | 167 | 60,662 | 57,052 | 40,927 | 15 | 66,697 | 25,770 |

When one analyzes OFDI from Czech Republic to Portugal, the total amount invested is 613 Million € highly concentrated between 2005 and 2007. However, the OFDI from Portugal to the Czech Republic is only 431 Million throughout 2001 and 2010, as such, it is possible to conclude that FDI between two countries still have a long margin to grow and that trade between both countries is strongly dependent on exporting activities.

## Hofstede's Cultural Dimensions

Hofstede's cultural dimensions (Hofstede Centre, 2016a; 2016b) are important to compare both countries in a cultural and business perspective, as shown in Table 6.

Both countries rank extremely close on Power Distance and Indulgence. This means that there is a clear hierarchical order accepted by society in both countries. It also tells us that both societies are relatively restrained in that they respect social norms and do not focus on leisure time as other self-indulgent countries. This can potentially help business between both countries since they can find a cultural connection and interact better while doing business. A common respect for the rules and the hierarchy of a company, for example, can help build trust and facilitate business.

Individualism, Masculinity and Long Term Orientation present the biggest difference between both countries. While the Czech Republic is closer to an individualistic society, Portugal is clearly collectivist. This could present an obstacle in a business context since Portugal focuses highly on relationship building and the group is more prevalent that the individual, while the Czech society expects the individual to take care of him/herself and those immediately close to them. In a business context, there might be clear differences as trust-commitment relationships might be much more prevalent for Portuguese firms than for Czech firms. Portugal, being a feminine country, values consensus and negotiation, while the Czech Republic, being a masculine country, focuses more on competitiveness and performance. Long Term Orientation is the dimension that polarizes the two countries the most. The Czech Republic is a pragmatic society that aims to achieve results, showing a better ability to adapt than Portugal, a country highly focused on its traditions and on maintaining them, where societal changes are seen with suspicion.

Both countries rank very high on Uncertainty Avoidance, with an extremely high score in Portugal. Both countries rely on rules and security and people focus on working hard. However, Portugal shows more prevalence in maintaining rigid codes of belief and in avoidance of unorthodox behavior.

*Table 6. Portugal vs. Czech Republic scores*

| | Portugal | Czech Republic |
|---|---|---|
| Power Distance | 63 | 57 |
| Individualism | 27 | 58 |
| Masculinity | 31 | 57 |
| Uncertainty Avoidance | 99 | 74 |
| Long Term Orientation | 28 | 70 |
| Indulgence | 33 | 29 |

## EVOLUTION OF THE CZ-PT TRADE

The evolution of the trade between both countries from 2000 until 2014 is shown in Table 7.

Starting the analysis in 2000 allows a brief look at the years before the Czech Republic joined the EU. According to the annual reports on the Foreign Policy of the Czech Republic – published every year by the Ministry of Foreign Affairs of the Czech Republic – and annual statistics reports published by the Portuguese National Institute of Statistics (INE), it is possible to observe a positive, growing trend in the trade evolution between Portugal and the Czech Republic.

### Years 2000 to 2004

In 2000, Portugal was holding an important position especially within the EU due to its chairing in the first half of the year. The attention that was paid to the mutual relationships has increased especially because of the planned extension of the EU. This was mirrored in frequent visits (heading mainly to Portugal) and intensive political dialogues of representatives of both countries about intensification of mutual relationships and cooperation. During the year several visits were held in both countries. An important moment was a visit from the prime minister of the Czech Republic, Mr. Miloš Zeman. The evolution of the international trade between the Czech Republic and Portugal shows the growth of the Czech exports. The mutual turnover reached 187.5 million EUR. Czech exports amounted to 124.9 million EUR. Czech imports from Portugal have totaled 62.5 million EUR, which is an increase around 80% from the previous year. The most important Czech exported items were machines and means of transport

*Table 7. Evolution of trade between the Czech Republic and Portugal (in $10^6$ €)*

| | Turnover | Imports | Exports | Balance |
|---|---|---|---|---|
| 2000 | 187.5 | 62.5 | 124.9 | 62.4 |
| 2001 | 225.9 | 84.4 | 141.5 | 57.1 |
| 2002 | 254.7 | 98.1 | 156.6 | 58.6 |
| 2003 | 239.3 | 113.6 | 125.7 | 12.1 |
| 2004 | 289.5 | 131.5 | 158.0 | 26.5 |
| 2005 | 370.6 | 136.3 | 234.2 | 97.9 |
| 2006 | 467.8 | 180.3 | 287.5 | 107.2 |
| 2007 | 562.3 | 239.0 | 323.3 | 84.3 |
| 2008 | 560.4 | 230.8 | 329.6 | 98.9 |
| 2009 | 518.7 | 228.6 | 290.1 | 61.5 |
| 2010 | 682.0 | 302.8 | 379.2 | 76.4 |

Source: Own preparation based on the Czech Statistical Office's External Trade Database.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

(54.7% - especially SKODA cars) followed by export of market products (37.7%) and chemicals (4.2%). Among the Portuguese main exports are machines and transportation equipment (44%), market products (27.9%), chemicals (9.2%) and raw material (8.4%) (Ministry of Foreign Affairs, 2001).

In 2001, the level of Czech-Portuguese relationship had been influenced by the membership of both countries in the North Atlantic Treaty Organization (NATO). Moreover Portugal had been supporting the Czech Republic in its effort to enter the EU. Portugal considered the Czech Republic as its potential ally due to similar geographical and economical extension. One of the most important visits held in this year was an official visit of the Portuguese president Mr. J. Sampaio. The main export commodities from the Czech Republic were again machines, means of transport (30.4% of all export are SKODA cars), metallurgical products – especially concrete steel and rails, tires, machines and devices for energy production, fabric, chemicals and glass-making (Ministry of Foreign Affairs, 2002).

The main commodities imported from Portugal were cork and its products, linen thread and fabric, cloth wear and footwear, electro technical products (Ministry of Foreign Affairs, 2002)

The year 2002 witness an increase in the Czech-Portuguese relations as result of the membership of both countries in NATO, and the preparations of the Czech Republic to enter the EU. Portugal was considered a prospective partner of the Czech Republic in the Union. Due to parliamentary elections (held in both countries in 2002) there were no high-level bilateral visits.

The main imported commodities from the Czech Republic were, much like the previous year, cork and related products, clothing wear, footwear, ball bearings, electro technical products, linen threads, glass-making, chemicals and metalworking machines. Portuguese investors were active in the Czech Republic in several enterprises from the fields of metallurgy and construction industries. Nevertheless, there is room for potential improvements for mutual economic relations (Ministry of Foreign Affairs, 2003).

Czech-Portuguese relations recorded in 2003 a significant boost. Portugal was considered by the Czech Republic as a key partner within the euro-Atlantic alliance, also due to the similar perception of International Policy aspects, as a result of their similar geographical size and geopolitical importance.

Portugal and the Czech Republic kept long-term intensive economic relations and a significant reinforcement was to be expected after the Czech Republic joined the EU. The trade between both countries maintained the same flow of commodities.

Portuguese investors visited the Czech Republic on behalf of many common enterprises from fields of metallurgy and construction (Ministry of Foreign Affairs, 2004).

## Years 2004 to 2008

The relationship between Portugal and the Czech Republic had been successfully developing on the bilateral and multinational level in the context of the EU and NATO. Intensive development had been noted also between governments and parliaments, also due to similar experience of both countries with a totalitarian regime, but also because of similar interest in good relationships with neighboring countries, close approach to the transatlantic connection and similar opinions about the arrangement of the EU. Czech-Portuguese relationships were also boosted by visits involving the highest political and diplomatic level.

Portugal and the Czech Republic have a long-term intensive economic relationship that increased significantly after the Czech Republic joined the EU. In 2004 a sharp increase of the Czech exports was registered (29%). Portugal held 33$^{rd}$ position of the foreign trade turnover of the Czech Republic. The

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

main Czech export commodities did not changed and were: means of transport, metallurgical products, devices and mechanical tools, electronics, glass, plastic products, natural rubber, rubber-based products, and cotton.

Neither the main imported commodities from Portugal changed: TV and car radio components, motor cars, metallurgical products, natural rubber, cork, clothing, footwear, and pharmaceutical products. Following the 2003 trend, an increased interest for textile fibers and metalworking machines was registered (Ministry of Foreign Affairs, 2005)

In 2005, the relationship between the Czech Republic and Portugal, within the EU and the Euro-Atlantic alliance, kept successfully developing bilaterally as well as multilaterally, stimulating mutual communication and parliamentary dialogue. In May 2005, a new honorary Consulate of the Czech Republic started activity in Funchal – the capital of the autonomous region of Madeira. Mutual economic relations proved significantly dynamic, especially after the Czech Republic entered the EU. Both the Czech exports to Portugal and Portuguese exports to the Czech Republic significantly increased and the turnover doubled since the year 2000. The main Czech export commodities are still means of transport, manufactured goods classified by the type of the material, cars and their spare parts, metallurgical products, glass, textile, tires and metalworking tools. The main Portuguese import commodities also did not register significant changes (Ministry of Foreign Affairs, 2006)

In 2006, Portugal and the Czech Republic continued its important partnership, not only within the EU and NATO but also outside of it. The countries are connected by close opinions and positions about some of the European questions as they are for example important supporters of the principle of solidarity. Both countries are recipients of the funds from the Cohesion Fund and the Structural Funds of the EU. During the year 2006 a Bilateral Cultural agreement between Portugal and the Czech Republic was discussed and formed and its signing set out to enable more active cooperation in the area of education, science and research, for example. Mutual economical relationships kept dynamically growing and traded commodities did not change from the previous years (Ministry of Foreign Affairs, 2007).

In March 2007 during the official visit of the Czech Minister of the Interior to Portugal, a software and information about the application of the program 'SIS One 4All' was officially handed by Portugal. The program is related to the integration of the Czech Republic to the Schengen area. Portugal took an important part during enforcement of the enlargement of the Schengen area and supported the entrance of the Czech Republic.

During the second half of 2007 Portugal was holding the Presidency of the Council of the European Union. Within the Presidency there were official visits by the Czech Prime Minister and the Minister of Foreign Affairs to Portugal. Moreover several contacts at the ministry level were established. These bilateral meetings have strengthened the existing alliance between both countries. Also, discussions about the coordination procedures of the institutional reform of the EU were held, while in the end there was an obvious convergence of the positions of both countries.

Mutual economic relations have been growing. In 2007, Portugal held the 31$^{st}$ position of the Czech exports and 34$^{th}$ position of the Czech imports. The main commodities have not changed significantly. Traditionally the highest individual items of the Czech export were personal cars and their components. The radios and sound reproduction devices, chemically produced fibers, pharmaceutical products and wine enriched Portuguese exports (Ministry of Foreign Affairs, 2008).

Between January 2007 and June 2008 a growing tendency was found in the trade between Portugal and the Czech Republic. Regarding imports, these countries were responsible for 945.6 million euros in 2007, 1.7% of total imports. The Czech Republic (ranked at 27$^{th}$ globally) was the main partner then,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

despite accounting for less than 0.6%. Regarding exports, in 2007 these countries were responsible for 848.3 million euros, 2.3% of total exports. The Czech Republic (25th) was the second biggest receiver of goods.

In 2008 mutual business relations between the Czech Republic and Portugal were developing very well. Especially since 1997, the Czech Republic registered a surplus and trade balance. Portugal kept the 30th position of the Czech export and 36th position of the Czech imports. The main export commodities from the Czech Republic are among others still machines and transportation. The main exports commodities from Portugal to the Czech Republic are above all machines and transportation, market products, chemicals, raw material (Ministry of Foreign Affairs, 2009).

## Years 2009 to 2015

In 2009 the business relations between Portugal and the Czech Republic were affected by the global downturn in economic activity. In regards to the Czech exports, Portugal has moved up from 30th to the 27th position, and from 36th to the 34th position regarding Czech import. The turnover has moved up from 34th to the 32nd position. Among the Czech export, to the commodities previously mentioned have been added products like telecommunications equipment, screens, projectors, devices for heating and cooling, musical instruments, papers and paperboards. The main Portuguese export commodities have been also enriched with products like tobacco, electronics, measuring instruments, metal and plastic products, waste paper, and cork products (Ministry of Foreign Affairs, 2010)

In 2010 trade increased significantly between Portugal and the Czech Republic. From 518.7 million EUR in 2009 the number has increased to 682.0 million EUR in 2010. The export and import commodities have been expanding and have started to vary more than in the past years. The previous Czech export commodities to Portugal have been enriched by the navigational aid apparatus, processing units, TVs, the steel parts of motor vehicles, brakes, tires, speedometers for vehicles, parts of electrical capacitors, seamless pipes. The main Portuguese import commodities to the Czech Republic were enriched as well by audio players for motor vehicles, tire materials, electric capacitors, radios with cassette recorders, bleached wood pulp (cellulose), parts of seats, brakes (Ministry of Foreign Affairs, 2011).

During the last 4 years, Portugal has been strengthening its position considering the Czech trade relations; from the 64th position in 1993 it has moved to the 33rd position (regarding total turnover) from in 2011. The year 2011 has registered a very high turnover of the trade between Portugal and the Czech Republic, 719.3 million EUR. The numbers have proven that the crisis has not affected the CZ-PT trade significantly. However, in 2013 the mutual trade has noticed just an infinitesimal growth, while the balance remained the same. This was a good sign for Portugal. The main commodities of Czech exports for 2013 were, much like previous years, cars (24.6%), electronics (24.3%), mechanical tools (17%), products from steel and iron (4%), metallic products (3.8%), tires and rubber products (3.7%), furniture (2.6%), plastic and its products (2.5%), toys and sport equipment (1.9%), aluminum and its products (1.2%). The main commodities of Portuguese export for 2013 were electronics (23.2%), cars (10.1%), high-strength textiles (9%), unmanufactured tobacco (8%), plastic products (6%), mechanical tools (5.8%), products from steel and iron (5.5%), pharmaceutical products (4.1%), tires and rubber products (3.1%) (BusinessInfo, 2014).

The year of 2014 has shown a significant increase of the Czech export. The turnover has reached the highest number, 799.0 million €, making it obvious that the trade between the Czech Republic and Portugal has been increasing and that the mutual relationships and economies resisted the crisis well.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The increase is moderated without significant deflections. This can mean a good prognosis of the future trade between those two countries.

As of 2014, the Czech Republic ranked at 18th globally with 0.67% of total Portuguese exports, and at 22nd globally with 0.7% of total Portuguese imports.

For the first time in history, trade between both countries was above the threshold of 800 million EUR.

## MAIN CZECH AND PORTUGUESE COMPANIES INVOLVED IN TRADE

### Main Czech Companies Trading with Portugal

The main Czech companies operating in Portugal are Skoda Auto and Moravia Steel. Skoda, a Czech car company, founded in 1925, is one of the oldest of this branch in the world. In 1991, became a subsidiary of the Volkswagen Group. In 2015, the company expects to strengthen its presence in the Portuguese market by 50%. «In 2014 the brand sales were slightly above the market average: grew 36.5%, although it has maintained its share compared to 2013. The fleets channel represented approximately 65% of total sales, with special focus on the taxi business, where the Škoda managed to extend their presence by 40% (Rebelo, 2015).

Moravia Steel Iberia is a Czech metallurgical company operating in Portugal, since 1997, based in Lisbon. It trades stainless steel products.

There are several Czech firms working as intermediary between PT and CZ, such as: Likor, Portugal-market, Kateřina Kročilová, Cerfis Wines, Café Portugal, and Um Porto. Excepting Café Portugal, all of them import Portuguese wines. Portugalmarket and Cerfis Wines also import Portuguese olive oil, and Café Portugal only imports coffee (Ministério dos Negócios Estrangeiros, 2012).

### Main Portuguese Companies Trading with the Czech Republic

The main Portuguese companies operating in Czech Republic are Mota-Engil and EFACEC. Mota-Engil, a Portuguese industrial conglomerate, works with civil engineering and construction, energy, steel works, transport concessions, environment and services. It also deals with logistics, retail and warehousing. EFACEC is a Portuguese group working with electro mechanics and electronics; it is the biggest company in this industry.

As Portuguese business established in Czech Republic, there are Café Oliveira and Trindadent. Café Oliveira is a very traditional Portuguese style of café, serving Portuguese snacks and wine. Trindadent is a Portuguese dental office based in Prague (Ministério dos Negócios Estrangeiros, 2012)

In 2013, 850 Portuguese companies exported to the Czech Republic, a number that has escalated from 748 in 2010 (AICEP, 2016b).

## SOLUTIONS AND RECOMMENDATIONS

One can describe those markets as economically similar but culturally different. The cooperation and exchange of goods have been significantly growing after the Czech Republic entered to the European Union. However, the 2008 crisis disturbed the dynamic economic trade growth between both countries.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Still, after a small decrease and stagnation of the trade between those two countries, the last years have registered a slow recovery and the prognosis seems to be positive. However, if Portuguese and Czech authorities desire to increase trade and foreign direct investment between the two countries at a more accelerated pace, it is necessary to promote trade fairs among potential investors in order to overcome cultural and economic barriers, as well as the strong feelings of foreignness between both countries.

## FUTURE RESEARCH DIRECTIONS

It would be interesting to understand how Portuguese firms are evolving in the Czech Republic and how Czechs firms are evolving in Portugal after their investment abroad. This would be important to understand how foreignness has affected their economic path abroad.

Taking into account the new important roles that have been given to economic diplomacy, it would be important to address how diplomats and economic players of both countries are deploying their strategies, and what resources are using to increase exports and trade.

## CONCLUSION

One of the main conclusions is that trade has been increasing over time. Although exports from Portugal to the Czech Republic show an almost constant growth, exports from the Czech Republic to Portugal show several fluctuation, as a result of the economic unrest Portugal has gone through since 2008 financial crisis, which is reflected on the trade balance constant ups and downs favoring the Czech Republic.

Another important conclusion is that despite the heavy historical, cultural and economic differences Portugal and Czech Republic are improving their trade rankings. However, despite their growing trend their main economic partners are the same: Spain, and Germany for Portugal, and Germany, Slovakia, and Poland for the Czech Republic.

As supported in the literature review (Fink, Harms, & Kraus, 2008; Zanger, Hodicová, & Gaus, 2008; Zapletalová, 2012; Kubíčková, & Procházková, 2014), Czech firms still follow a traditional sequential path when internationalizing their activities, showing strong feelings of foreignness and lack of understanding of foreign markets. As such, as most of the internationalization of Czech firms is to neighbor countries, the feeling of foreignness and the lack of understanding of foreign markets might be aggravated to far distant countries like Portugal, with which the Czech have more dissimilar cultural attributes.

Another conclusion is that despite this fruitful cooperation, both markets are too small, and possibly unattractive for a huge deeper future cooperation. Clearly, history plays a heavy role: Portugal is still concentrated in its former colonies, with a small psychic distance, common language, and close cultural gap, while the Czech Republic is still concentrated in its close neighbors, with whom they have close affinities.

One thing is clear, joining the EU was an important step for both countries to deepen their relationships. Future policy intervention is necessary to increase trade between both countries, as small and medium-sized firms may find it difficult to overcome their historical and cultural differences. This is tuned with what was proposed by Moini, Kalouda, and Tesar (2008) and by Cieślik, Michałek, Michałek, and Mycielski, (2015) who propose the formulation of export promotion strategies for SMEs and the attraction of export-oriented FDI.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

There are several areas, such as heavy industries or electronics, which would possibly be attractive and interesting for investments or trade of both countries. For Portugal the wine industry, cork, celluloses and paper, or agricultural (fruits, fish, seafood) products could represent a sizeable source of future income.

For the Czech Republic, as an industrial country, metallic parts, cars, and heavy industries are still representing the most important source of income. However, IT and pharmaceutical industries have good perspectives for growth.

At firm level it is important to emphasize that it is necessary that firms embrace more assertive modes of entry (as foreign direct investment and franchising) in order to control distribution of goods in the recipient country, as for example Skoda is doing in Portugal.

## KEY TERMS AND DEFINITIONS

**Balance of Trade (BOT):** The difference between a country's imports and its exports. When a country imports more than it exports, one can say that it has a trade deficit. When a country exports more than it imports, one can say that it has a trade surplus.

**Culture:** Considered the collective programming of the mind. The main consequence of this collective programming is that members of groups, categories, or countries will tend to behave homogeneously among them, bet heterogeneously between them. Culture is important in business as firms operating in different countries need to be aware of those differences. Several dimensions – Power Distance Index (PDI), Individualism versus Collectivism (IDV), Masculinity versus Femininity (MAS), Uncertainty Avoidance Index (UAI), Long Term Orientation versus Short Term Normative Orientation (LTO), Indulgence versus Restraint (IND) – have been put forward to meaningfully compare counties

**European Single Market:** Established by 12 countries in 1993 to ensure the so-called four freedoms: the movement of goods, services, people and money. With the European single market, EU citizens can study, live, shop, work, and retire in any EU country.

**European Union (EU):** A group of 27 countries (Austria, Belgium, Bulgaria, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, and the United Kingdom) that operates as a cohesive economic and political block. It was formed in 1993 with the purpose of achieving political and economic integration. Nineteen of the countries use the euro as their official currency.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Exports:** An export is a function of international trade whereby goods produced in one country are shipped to another country for future sale or trade. Exports contribute to the producing nation's gross output.

**Foreign Direct Investment:** A foreign direct investment (FDI) is an investment made by a company or entity based in one country, into a company or entity based in another country. It normally includes mergers and acquisitions, building new facilities, reinvesting profits earned from overseas operations and intra company loans.

**Imports:** A good or service brought into one country, but produced in another country. The higher the value of imports entering a country, compared to the value of exports, the more negative that country's balance of trade becomes.

**International Trade:** The exchange of goods and services that connect people, businesses and countries along international borders in global processes of production and consumption.

**SMEs:** Abbreviation of small and medium-sized enterprises. Although there are plenty of definitions across the world, the working definition used in this document is the one that was created by the European Commission, to permit a coherent and effective access of SMEs to European community funds.

# Chapter 42
# Promoting Service Quality and Customer Satisfaction in Global Business

**Kijpokin Kasemsap**
*Suan Sunandha Rajabhat University, Thailand*

## ABSTRACT

*This chapter explains the overviews of customer service, service quality, and customer satisfaction; the significance of service quality in global business; and the significance of customer satisfaction in global business. Customer service is the significant element required for a successful business. Knowing customer expectations and delivering excellent service quality can considerably promote the entrepreneurial success and business growth. Gaining high levels of customer satisfaction is very important to business because satisfied customers are most likely to be loyal and to make repeat orders and to utilize a wide range of services offered by business. High service quality effectively promotes customer satisfaction and customer satisfaction has a positive relationship with business revenue. The chapter argues that promoting service quality and customer satisfaction has the potential to enhance organizational performance and reach strategic goals in global business.*

## INTRODUCTION

Services industry plays an essential role in the economic globalization and a determining factor in strengthening the industry's competitiveness (Cheng, Hsu, & Huang, 2012). Regarding service quality perspective, service has to meet customer needs and customer expectations (Liu & Xie, 2013) and is considered as the difference of terms of service provision and the customer expectations of perceived service (Breja, Banwet, & Iyer, 2011). The active prediction of service quality certainly helps decision makers effectively manage their service operations to sustain the quality service to meet customer needs (Qiu, Wu, & Yu, 2011). Service quality can be evaluated by considering customer perceptions and customer expectations (Celik, Aydin, & Gumus, 2014). Categorizing service quality elements regarding their effects on customer satisfaction is required in modern business (Basfirinci & Mitra, 2015).

As competition in the services sector is increasing, the ability of companies to understand their customers and ensure their satisfaction with the services is becoming significant (Meidutė-Kavaliauskiene, Aranskis, & Litvinenko, 2014). In the highly competitive marketplace, customer satisfaction is one of the most critical success factors to many leading companies (Nahm, 2013). Customer satisfaction is viewed as a fundamental determinant of customer value (Eisenbeiss, Cornelißen, Backhaus, & Hoyer, 2014). Customer satisfaction is recognized as an attractive theme for the long-term business success, positive word of mouth (WOM), improved customer retention, profitability, and dynamic competitiveness (Ihtiyar, Ahmad, & Osman, 2014). Customer satisfaction concerning perceived quality is critical for customer retention (Steiner, Siems, Weber, & Guhl, 2014). Customer loyalty becomes a major concern for retail stores across the globe (Thomas, 2013).

This chapter aims to bridge the gap in the literature on the thorough literature consolidation of service quality and customer satisfaction. The extant literatures of service quality and customer satisfaction provide a contribution to practitioners and researchers by describing the theory and applications of service quality and customer satisfaction in order to maximize the business impact of service quality and customer satisfaction in global business.

## BACKGROUND

In a service-dominant paradigm, service is the essence of society and industry (Chen, Huang, Shu, & Wang, 2013). Customer is the most important part of any business of the services sector (Huang & Huang, 2012; Lu & Yang, 2010). Customer value leads to the effective workgroup performance in the digital age (Kasemsap, 2013a). Getting information from three types of customers (i.e., online customers, offline customers, and multichannel customers) helps executives and marketing managers get a better understanding of the implications of the reduction of the personal interaction and the extent to which the consequences of failure of a single channel to deliver the specific service output vary across different types of customers (Fernandez-Sabiote & Roman, 2012).

Service quality has gained the significant attention in the last two decades (Ramanathan & Karpuzcu, 2011). Service quality is the antecedent of customer satisfaction (Caceres & Paparoidamis, 2007; Gorla, Somers, & Wong, 2010). Service quality and customer switching behavior are the important factors that affect the service companies' market share and profitability (Liang, Ma, & Qi, 2013). The relationship between the dimensions of service quality and customer satisfaction may exhibit a nonlinear pattern which means that paying more attention to a particular dimension of service quality may not always lead to the higher customer satisfaction (Kano, Seraku, Takahaski, & Tsuji, 1984).

In the context of global competition, there has been an increasing awareness in improving the processes which are directly correlated with customer satisfaction (Chougule, Khare, & Pattada, 2013). Customer satisfaction is central to the marketing concept (Szymanski & Hise, 2000). Customer satisfaction involves an attitude toward a product or service that successfully provides a pleasurable level of the consumption-related fulfillment (Oliver, 2010). Customer satisfaction is considered as one of the most critical outcomes of marketing activities by the market-oriented firms (Kandampully & Suhartanto, 2000). Customer satisfaction contributes to the firm's profitability and customer retention (Fornell, 1992).

Customer satisfaction leads to the positive outcomes, especially in predicting the future intention to use the products and services (Zhao, Lu, Zhang, & Chau, 2012). Customer satisfaction is a fundamental dimension to drive the business outcomes and the performance of processes in modern organizations

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Kenett & Salini, 2011). Customer satisfaction analysis has become an important issue in strategic management (Greco, Matarazzo, & Slowinski, 2007). Overall customer satisfaction is a stronger predictor of buying behavior than any individual service quality dimension (Bruwer, 2014). Customer satisfaction can lead to the long-term benefits and customer loyalty (Tam, 2011). Ensuring customer satisfaction has become essential for the survival of services industries (Cheng, Yang, & Teng, 2013).

## PERSPECTIVES OF SERVICE QUALITY AND CUSTOMER SATISFACTION

This section emphasizes the overviews of customer service, service quality, and customer satisfaction; the significance of service quality in global business; and the significance of customer satisfaction in global business.

### Overview of Customer Service

Customer service has become increasingly important (Liao & Kao, 2014). In the era of experience economy, service providers have to provide customers with the high-quality service experience in order to attract more customers and achieve the higher customer satisfaction (Hsieh, Yuan, & Kuo, 2011). In the new service-dominant logic, customers and service providers are more interacted, involved, and immersed in the process with their skills and knowledge. Integrating the online and offline channels is associated with increasing customer retention (Ladhari & Leclerc, 2013). Frontline service employee plays a crucial role in developing and enhancing the relationships with customers (Genzi & Pelloni 2004; Gwinner, Gremier, & Bitner, 1998; Hansen, Sandvik, & Selnes, 2003).

It is important for service personnel to have the high ethical standards, be committed to the business, and be willing to serve customers (Lin, 2014). The relationship between customers and service employees are getting stronger and longer, which increases the importance of service encounter. Service convenience is a formative concept and contributes to the long-term exchange relationship between consumers and service providers (Dai & Salam, 2014). There are the effects of money gain and loss on the customers' perceived value of waiting time for service events as predicted by prospect theory (Lin, Xia, & Bei, 2015).

The adoption of cloud computing services depends on having the capability to ensure the quality of service to the cloud computing users (Choi & Jeong, 2014). Many business benefits are achieved through the utilization of technologies, such as cloud computing and virtualization (Kasemsap, 2015a). Researchers and practitioners should recognize the importance of cloud computing toward gaining sustainable competitive advantage in global supply chain (Kasemsap, 2015b). Wang et al. (2014) stated that cloud computing promises to provide the high-quality services with the service-oriented architecture. The interactions among the main effects of service quality, customer expertise, and perceived switching costs yield the additional insight into the change in the relative importance of technical and functional service quality in the customers' decision to be loyal (Bell, Auh, & Smalley, 2005).

Service management is defined as what is perceived by the tourists and decision makers during the process of service generation and delivery processes (Lin, Huang, & Yeh, 2012). Website quality, trust, merchandising, and customer service have positive effects on the online satisfaction for auction websites (Wu, Huarng, Fiegantara, & Wu, 2012). The purchase occasion affects the type and intensity of emotions, customer experience, and the likelihood of repurchase (Tombs & McColl-Kennedy, 2013).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The provision of logistics services is a crucial point in supply chain management that can influence the brand perceptions of customers (Oflaç, Sullivan, & Baltacioğlu, 2012).

## Overview of Service Quality

Zeithaml (1988) defined service quality as the judgment of a customer about a product's overall excellence. Heskett et al. (1994) stated that service quality has been identified as a significant element of success in attracting the repeat customers. Service quality is valuable in distinguishing itself from competitors toward obtaining competitive advantage in the service-oriented world (Rapert & Wren, 1998). Quality is one of the most important tasks of the rapidly growing services sector (Rahman, 2008; Xie, Wang, & Lai, 2011). McCollin et al. (2011) stated that service quality is difficult to quantify as it is a function of differing customer perceptions, the market conditions, the measurement process, and the interpretation of the collected data.

High-tech information technology (IT) firms are characterized by a path dependency of the generative learning, which must be recognized by managers toward managing the service quality operations (Soltani, Chau, & Liao, 2012). The interaction of conscientiousness and emotional stability influences service quality (Teng & Liu, 2014). The transfer of training is positively associated with both service quality and job satisfaction (Zumrah, Boyle, & Fein, 2013). Customers who are happier will evaluate service quality in utilitarian services in a more positive manner than do customers who are less happy (Hellén & Sääksjärvi, 2011).

The measurement of service quality is a relevant issue for modern organizations (Franceschini, Galetto, & Turina, 2010). Service quality can be investigated through the measurement of the extent to which service performance meets customer expectations (Basfirinci & Mitra, 2015). SERVQUAL model is developed to measure the service quality perspectives (Parasuraman et al., 1985, 1988, 1994). Parasuraman et al. (1985) developed the gap theory to measure the service quality construct and conceptualized service quality as the gap between the customer expectations about the service and the customer perceptions of the actual performance of the service.

SERVQUAL is a valuable tool for executing the managerial analysis where a gap is measured as the difference between customer expectations and customer perceptions (Celik et al., 2014). Five metrics of SERVQUAL include tangibles, reliability, responsiveness, assurance, and empathy (Awasthi, Chauhan, Omrani, & Panahi, 2011; Parasuraman et al., 1988). Tangibles comprise the physical appearance of the service facility, tools, staff, and communication resources. Reliability represents the ability of the service provider to reliably execute the promised service. Responsiveness shows the willingness of the service provider to immediately provide the service. Assurance practically relates to the knowledge and politeness of the staff and their capability in order to reveal the trust, faith, and confidence. Empathy describes the care and personalized attention of the employees to customers.

Originally tested in five service settings concerning retail banking, credit card services, repair and maintenance of electrical appliances, long-distance telephone services, and title brokerage (Ladhari, 2009), the measurement scale involves 22 items representing five dimensions of tangibles, reliability, responsiveness, assurance, and empathy. Carrasco et al. (2012) indicated that there are attempts to standardize the service quality evaluation (e.g., SERVQUAL instrument), which is a multiple-item scale for measuring service quality with several dimensions. Yu et al. (2014) explained that SERVQUAL can be an appropriate method to define and measure the customer satisfaction for the IT solutions. Four SERVQUAL dimensions (i.e., reliability, responsiveness, empathy, and tangibility) have a significant

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

influence on customer satisfaction (Marinković, Senić, Kocić, & Šapić, 2013). Employing the exploratory and confirmatory factor analyses, the retail service quality model (ReSERVQUAL) includes interaction and trustworthiness, store environment, understanding the consumers, and policy (To, Tam, & Cheung, 2013).

Since its introduction in the 1980s, the Kano model has become a popular model for evaluating the quality attributes (Chen, 2014). For example, the Kano model helps organizations explore the components of service quality of the commercial airline, affecting the customer satisfaction and the service characteristics on the customers' perception of quality (Basfirinci & Mitra, 2015). Kano et al. (1984) classified product features into five distinct categories (i.e., must-be quality, one-dimensional quality, attractive quality, indifferent quality, and reverse quality). Must-be quality can be defined as the basic attribute of service quality in terms of customer satisfaction (Basfirinci & Mitra, 2015). One-dimensional attribute will lead to customer satisfaction when fulfilled, and will lead to customer dissatisfaction when not fulfilled. Attractive attribute leads to the high levels of customer satisfaction when fulfilled, but do not cause any dissatisfaction when not fulfilled because they are not expected by customers, who may be unaware of product features (Shen, Tan, & Xie, 2000).

Although the Kano model was originally employed to enhance the product quality development in manufacturing, it has been applied to various services industries (Kuo, Chen, & Chen, 2010). In the services sector, the Kano model and SERVQUAL are broadly utilized in order to achieve the customer satisfaction in health care (Lim, Tang, & Jackson, 1999), tourism (Pawitra & Tan, 2003), banking (Chen & Kuo, 2011), and education (Sahney, 2011). Quality function deployment (QFD) is a systematic method that provides a method of translating the customer requirements into the technical requirements for each stage of product development (Bhattacharya, Sarkar, & Mukherjee, 2005; Karsak, Sozer, & Alptekin, 2002; Tseng & Lin, 2011). QFD has been regarded as a powerful customer-oriented design tool for developing the improved products to achieve the higher customer satisfaction by integrating many functions of an organization (Nahm, 2013). In the QFD process, rating the importance of customer requirements is a crucial step since it largely affects the target value setting of design requirements (Nahm, 2013). The successful QFD application may result in the greater customer focus, shorter lead times, and knowledge preservation (Liu, 2009).

QFD can be applied to the manufacturing sector, services industry, and logistics service (Baki, Basfirinci, Murat, & Cilingir, 2009; Bottani & Rizzi, 2006; Tu, Chang, Chen, & Lu, 2010). QFD supports the product planning on the basis of the customer's voice by a stepwise analysis and the deployment of customer requirements (Akao, 1990). QFD requires the collaboration among different business areas as a prerequisite for the design tasks (Bottani & Rizzi, 2006). The correlation between the requirements from customers and the determinants of service quality is analyzed with the fuzzy QFD in order to indicate the determinants of customer satisfaction (Su & Lin, 2008).

The analytic hierarchy process (AHP) (Saaty, 1980) has been broadly adopted to address the multicriteria decision-making (MCDM) problems according to the multiple criteria involving the subjective judgment of hierarchical structure (Cho & Cho, 2008; Liao & Kao, 2010). The AHP can be applied to measure the service quality of an organization (Ramanathan & Karpuzcu, 2011). The AHP includes six essential steps (Lee, Kang, & Chang, 2009; Murtaza, 2003): define the unstructured problem, develop the AHP hierarchy, perform pairwise comparison among decision factors, estimate the relative weights of the decision factors, check the consistency property of matrices, and obtain the overall rating for the alternatives.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

An extensive amount of research has focused on the chain of psychological effects from perceived service quality to customer loyalty (Frank, Torrico, Enkawa, & Schvaneveldt, 2014). Perceived service quality is prominent for service quality assessment from customer perspective (Sandmann, 2013). Perceived service quality falls short of customer expectations in five dimensions of service quality (i.e., tangibles, reliability, responsiveness, assurance, and empathy) (Mersha, Sriram, Yeshanew, & Gebre, 2012). If customer expectations are higher than the result of service process, then customer perceived service quality is not satisfactory (Huang, Wang, & Xue, 2012).

Perceived service quality positively influences customer loyalty (Johnson, Herrmann, Huber, & Gustafsson, 1997). Customer loyalty drives the long-term corporate profitability (Reichheld & Sasser, 1990; Zeithaml, Berry, & Parasuraman, 1996). Verbal scripting is shown to impact the customer perceptions of service quality (Victorino, Verma, & Wardell, 2013). The perception of service quality reveals an opportunity to augment the service quality through attention to activities that are associated with the supportiveness dimensions of service offering (Erasmus & Grabowski, 2013).

In the era of growing foreign tourism, providing excellent quality service at hotels is increasingly important (Yang, Jou, & Cheng, 2011). The attractiveness of tourism destinations is a topic of great interest to researchers and professionals wishing to understand the ability of destinations to attract tourists (Medina-Muñoz & Medina-Muñoz, 2014). Destination image influences service quality and perceived value (Kim, Holland, & Han, 2013). Regarding airline customer satisfaction and loyalty, there are the different factors of in-flight service quality that are important according to the customer seat class (An & Noh, 2009). In the case of the prestige class, there are six important service quality factors: alcoholic and non-alcoholic beverage, responsiveness and empathy, reliability, assurance, presentation style of food, and food quality; while the economy class has five important service quality factors: responsiveness and empathy, food quality, alcoholic beverage, non-alcoholic beverage, and reliability (An & Noh, 2009).

The relationship between perceived congruence of communication and service quality is mediated by a self-perceived performance (Özbek & Yuldashev, 2010). Regarding Internet banking, service quality dimensions include website attributes, reliability, responsiveness, fulfillment, efficiency, and privacy and security (George & Kumar, 2014). Hospital information has become an important infrastructure in the large-scale hospitals, and the incremental software development is significant for improving service quality (Kawamura, Kimura, & Tsumoto, 2014). Service quality perceptions positively influence the patient satisfaction with overall hospital care (Bakan, Buyukbese, & Ersahan, 2014). Wan et al. (2012) stated that a true buyer-seller relationship is a key determinant of consumer behaviors for the adolescent consumers of hairstylist services. The level of frontline employees' traits is positively related to the level of customer traits (Streukens & Andreassen, 2013).

## Overview of Customer Satisfaction

Customer satisfaction has been focused in marketing (Pyon, Lee, & Park, 2009). Hernon and Whitman (2001) defined satisfaction as a sense of contentment that arises from an actual experience in relation to an expected experience. Jaiswal (2008) considered customer satisfaction as a customer assessment in terms of whether service meets customer needs and customer expectations. Customer satisfaction has been well-studied concerning the behavioral aspects of marketing research (Hao, Yu, Law, & Fong, 2015). Customer satisfaction measures the customer's subjective experience with products and services. Two different conceptualizations of customer satisfaction (i.e., transaction-specific satisfaction and cumulative satisfaction) have been reported in the literature (Andreassen, 2000; Boulding, Kalra, Staelin,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

& Zeithaml, 1993). Cumulative satisfaction involves satisfaction as the customer's current experience with products and services (Fornell, Johnson, Anderson, Cha, & Bryant, 1996).

Parasuraman et al. (1991) stated that service providers must recognize the customer needs in order to fulfill the customer expectations to achieve the high customer satisfaction during the service experience. Managing customer expectations is an important perspective to enable customers to have a satisfactory experience (Clow & Beisel, 1995; Coye, 2004). Customer expectations' manifestation depends on how customers perceive and interpret the environmental factors influencing the formation of customer expectations (Gorla et al., 2010). Competent service providers can raise customer expectations in order to achieve a customer franchise and build a threshold that competitors must achieve to enter the market (Parasuraman et al., 1991). Service providers should encounter many difficulties in managing customer expectations, creating a favorable experience in a dynamic business environment (Ho & Zheng, 2004; Hubbert, Sehorn, & Brown, 1995).

An increase in profitability results from a growth in market shares, repeat purchases, an increase in productivity, and lower costs for acquiring and serving new customers (Reichheld, Markey, & Hopton, 2000). A significant work on the related customer satisfaction with consumer loyalty has been primarily reported in the services sector, such as banking, hospitability, electronic commerce, and telecommunications (Danaher & Gallagher, 1997; Hallowell, 1996; Shankar, Smithb, & Rangaswamy, 2003). Many research papers have been published on the effect of customer satisfaction and customer loyalty on customer profitability which is related to customer lifetime value (Qi, Zhou, Chen, & Qu, 2012). Customer value analysis not only empowers customers to express their preferences for various product features, but it also facilitates the company's justification of different customization solutions (Du, Jiao, & Tseng, 2006).

In order to focus the service employees' attention on delivering the high levels of customer satisfaction, many companies directly reward employees who deliver the high levels of satisfaction as reported in the companies' formalized satisfaction measurement processes (Jones, Taylor, & Reynolds, 2014). The impact of relational norms on customer satisfaction is bridged by the perceived service quality and customer trust (Lai, Li, & Lai, 2013). Service providers can gain benefit and raise customer satisfaction by managing customer expectation during service experience delivery (Hsieh et al., 2011). Service provider's service orientation predicts the customer's cognitive trust in the service provider above customer agreeableness concerning the affective and cognitive trust (Webber, Payne, & Taylor, 2012). Trust relates not only to customer trust in the individual companies, but also to the broader business context in which customer-seller relationships may develop in modern business (Hansen, 2012).

Consumer value relates to loyalty and price consciousness through consumer satisfaction (Hur, Kim, & Park, 2013). Sánchez-García et al. (2012) stated that the influence of satisfaction on loyalty is dependent on the time perspective of the intentions. The functional-utilitarian quality attributes (i.e., availability, efficiency, fulfillment, and privacy) may lose their ability to delight the customers as the customer relationship matures. Hedonic quality attributes (e.g., design, enjoyment, and image) only exhibit an increasing effect on customer satisfaction for more experienced customers (Falk, Hammerschmidt, & Schepers, 2010). Sorooshian et al. (2013) stated that hedonic dimension indicates the users' feelings of excitement presented in the place where their desired goals are the vital issues. Utilitarian benefit, hedonic benefit, nonmonetary cost, and alternative attractiveness are the significant predictors of customer satisfaction, which affects customer loyalty (Ha & Park, 2013).

Businesses need to pay attention to customer feedback to practically provide the service (Berry, Carbone, & Haeckel, 2002; Meyer & Schwager, 2007). Service quality is more important than information

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

and system quality in influencing customer satisfaction and purchase intention (Hsu, Chang, & Chen, 2012). Positive affectivity is associated with the customer satisfaction and the customer perceptions of service quality (Burns & Bowling, 2010). Ueltschy et al. (2009) stated that customer satisfaction is strongly influenced by culture. Many multinational corporations have implemented the cross-national satisfaction measurement programs for tracking and benchmarking customer satisfaction across their various markets (Morgeson, Mithas, Keiningham, & Aksoy, 2011).

The variability of customer satisfaction index is measured by the standard deviation or the coefficient of variation (Valentini, Battista, & Gattone, 2011). Many studies on factors that influence the customer satisfaction have been conducted for the consideration of improving the services offered by destinations, hotels, and travel agencies (Haber & Lerner, 1999; Macintosh, 2002; Ryan, 1995). Customer satisfaction is an important measure of service quality in travel agents (Filiz, 2010). Six Sigma is a customer-centric method which reduces process variation and optimizes development in global operations (Kasemsap, 2016). Six Sigma can be utilized to improve the service quality and increase the competitiveness of hospitality industry (Chen, Chen, Chang, & Hsu, 2010). Six Sigma, organizational learning, and organizational innovation have the positive relationships with the improved organizational performance (Kasemsap, 2013b).

It is important for the online travel agencies (OTAs) to understand the customer satisfaction of different segments (Hao et al., 2015). OTA websites play an essential role in the perspective of tourism, which includes information distribution, transaction facilitation, destination marketing, and connections among travelers (Ip, Law, & Lee, 2011; Law, Qi, & Buhalis, 2010). Tourism managers and researchers should pay more attention to customer satisfaction with their websites, and they increasingly turn to the advanced technologies for the insights into making their OTA websites more competitive (Chaudhuri, Dayal, & Narasayya, 2011; Turban, Sharda, Aronson, & King, 2008). Customer satisfaction leads to the repeat purchases and the increased likelihood of making recommendations for OTAs (Anderson, Fornell, & Lehmann, 1994; Chon, 1989; Oliver, 2010). Several studies have followed the behavioral science paradigm (Hevner, March, Park, & Ram, 2004) to investigate the networks of customer satisfaction (Del Bosque & San Martin, 2008; Yoon & Uysal, 2005; Yüksel, Yüksel, & Bilim, 2010). The evaluation of customer satisfaction is critical for OTA web design (Ip et al., 2011; Law et al., 2010).

Overall customer satisfaction serves to reinforce the brand loyalty (Tsai, 2014). Retail and service establishments should be aware of the customer perceptions of transitory bias concerning performance metrics (Trocchia & Luckett, 2013). The physical distribution quality and cost are positively related to the customer's purchase satisfaction and the customer's retention (Rao, Goldsby, Griffis, & Iyengar, 2011). The assessment of patients' satisfaction levels, and the knowledge of what factors influence satisfaction are very important for health care managers (Raposo, Alves, & Duarte, 2009). Satisfaction with health care is affected by the objective measures of service quality (Ly & Glied, 2010). The ability to provide the outpatient services with the exceptional quality is paramount to the long-term survival of hospitals, as the revenues from the outpatient services are predicted to exceed the inpatient revenues (Carlucci, Renna, & Schiuma, 2013).

## Significance of Service Quality in Global Business

Service quality is a measure of how well the service level matches customer expectations (Yang, Hsieh, Li, & Yang, 2012). Maintaining and improving service quality is necessary to achieve performance objectives (Sherman & Zhu, 2006). Continuous improvement of service quality results in the enhanced

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

customer satisfaction, the increased efficiency, and the maximization of business value of the service within the firm (Lepmets, Cater-Steel, Gacenga, & Ras, 2012). Service quality and customer satisfaction are the main influencers of service providers' switching intentions. Each service provider should seek to maximize its own profit by determining its service volumes and service quality (Nagurney, Li, Wolf, & Saberi, 2013). As service failures are inevitable, firms must be prepared to recover and learn from service failures (Lapré, 2011).

The improvement of service quality and customer satisfaction has been widely mentioned over the past decades (Su & Lin, 2008). Service quality is related to consumer satisfaction as it reflects the customers' evaluation of service providers' performance (Zhao et al., 2012). Service quality plays an important role by moderating the influence of intention to utilize the self-service technologies on consumer behavior (Lee, Chiu, Liu, & Chen, 2011). Service quality has a significant influence on the long-term behavioral intentions through the high levels of customer satisfaction (Chen, Lee, Chen, & Huang, 2011). Service quality and customer satisfaction are recognized as the major factors in maintaining the long-term business relationships (Rahman, 2008). Service quality plays a crucial role in improving the organizational profits because it is related to customer satisfaction and customer loyalty (Baker & Crompton, 2000; Leal & Pereira, 2003; Zeithaml & Bitner, 2000). Service employees play an important role in the customers' evaluations of service quality (Bebko & Sciulli, 2009) or the judgment of a restaurant experience (Wall & Berry, 2007).

The quality level of the delivered services has a significant impact on the scale economies and ownership effects (Destandau & Garcia, 2014). The assessment of service quality provides an important feedback for agents to assess its service to its customers (Filiz, 2010). The careful design of quality standards can allow the incentive regulation to achieve the cost savings without quality degradation (Ter-Martirosyan & Kwoka, 2010). The financial and psychological risks are affected by the reliability and empathy of service quality, while the functional and social risks are influenced by the cues of service quality (Chen & Chang, 2005). While there are short-term trade-offs between service quality and productivity, a focus on service quality in the long term may help increase customer satisfaction, thus improving service productivity and overall organizational performance (Choi, Lee, & Olson, 2015).

The relationship between service quality and customer loyalty is an important marketing perspective across different industries (Srivastava & Rai, 2014). Advancing research on service quality requires clarifying the theoretical conceptualizations and validating an integrated service quality model (Akter, D'Ambra, & Ray, 2010). A service quality model is used by service requesters to specify the expected quality levels of service delivery; by service providers to advertise quality levels that their services achieve; and by service composers when selecting among alternative services in a service composition (Jureta, Herssens, & Faulkner, 2009). Executives and managers should enhance the training program and keep their objectives in mind to satisfy the various demands of customers, to raise their perceived service quality, and to ensure gaining high level of customer satisfaction (Luoh & Tsaur, 2011). Service quality elements significantly contribute to consumer behavior (Ariffin, Abdullah, & Bibon, 2012).

Businesses have derived the various benefits from the offshore outsourcing of information and communication technology (ICT) services while managing the perceived risks regarding the service quality of information security delivered in the supply chain (Bahl & Wali, 2013). Customer orientation is the main factor that impels hotels to become the ambidextrous firms (Tang, 2014). Customer orientation helps firms create the effective service solutions to meet the customer needs (Grissemann, Plank, & Brunner-Sperdin, 2013; Sin, Tse, Heung, & Yim, 2005). Customer orientation enhances the managerial and financial performance (Sin et al., 2005; Tajeddini & Trueman, 2012). To ensure that superior

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

service quality is delivered, hotels should enhance their service capabilities to meet the customer needs and provide the greater value for customers (Narver & Slater, 1990; Zhou, Brown, & Dev, 2009).

Davis-Sramek et al. (2009) stated that both technical and relational order fulfillment service quality effectively influence satisfaction, which positively affects both affective and calculative commitment among retailers. Service quality and corporate social responsibility (CSR) have direct effects on brand identification and customer satisfaction and have indirect effects on customer satisfaction (via brand identification) and on service brand loyalty (via customer satisfaction and via brand identification) (He & Li, 2011). Maintaining an effective brand relationship is required for brand management in emerging markets (Kasemsap, 2014). The global retailers should manage the retail marketing mix elements and retail brand strategy in order to achieve the improved marketing outcomes in modern business (Kasemsap, 2015c).

Customer-centric strategy firms need to focus on the forward-looking indicators and ensure the relationship between decision rights, performance measurement, and reward systems (Bonacchi & Perego, 2011). Customer retention is a mediator in the service climate-firm performance chain (Towler, Lezotte, & Burke, 2011). The cell phone industry is in a particular position that lies in the intersection of high technology and services industry (Boakye, Prybutok, & Ryan, 2012). Cell phone provider's service quality and customer intention to switch the cell phone products significantly influence customer intention to switch the cell phone providers (Peng, Scott, Prybutok, & Sidorova, 2014). Dwivedi et al. (2010) stated that both service quality and secondary influence are significantly correlated with the consumers' behavioral intentions to change the Internet service provider. IT service quality is determined by the value that the IT service brings to both the IT service provider and its customers (Cater-Steel & Lepmets, 2014).

## Significance of Customer Satisfaction in Global Business

Customer satisfaction becomes the influential element toward promoting the repeated business relationships and increasing the long-term profitability in modern business (Wirtz, 2001). A loyal customer is a source of competitive advantage through the repeat purchase and the positive WOM (Thomas, 2013). WOM can contribute to the firm's success in an effective manner (Wangenheim & Bayón, 2007). The relationship between customer satisfaction and customer loyalty has been the focus of a good deal of research (Castañeda, 2011). The impact of customer satisfaction on customer loyalty varies across customers (Wang, Zhao, Wang, & Liu, 2007; Xia, Ping, Gao, & Jia, 2007). Customer loyalty is vital for the success of retail stores (Chiu, Wang, Fang, & Huang, 2014). Zeithmal and Bitner (2000) stated that the extent of satisfaction depends on service quality, product quality, price, and personal factors.

Customer satisfaction is cumulative and both prior satisfaction and post-recovery satisfaction should be recognized in the context of service recovery (Siu, Zhang, & Yau, 2013). Customer complaints and the handling of complaints play an important role in customer relationships (Faed, Hussain, & Chang, 2014). Customer and employee relationship-building actions affect the organizational value via the mediator of customer satisfaction (Luo, Wieseke, & Homburg, 2012). Customer demands (negative customer behaviors) and customer resources (positive customer behaviors) affect customer satisfaction through the frontline employees' customer-oriented attitudes and customer-oriented behaviors (Stock & Bednarek, 2014).

The concept of customer satisfaction has been analyzed in the academic literature on marketing and pricing (Roth & Bösener, 2015). Customers' reactions to price increases (i.e., repurchase intention) are strongly driven by two factors: the magnitude of the price increase and the perceived fairness of the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

motive for the price increase (Homburg, Hoyer, & Koschate, 2005). Raithel et al. (2012) stated that the factors known to influence customer satisfaction are important for investor behavior. The success of chief executive officers in managing customer satisfaction has a direct, personal, and economic impact in the pattern of their annual bonus awards (O'Connell & O'Sullivan, 2011).

In the financial services industry, the utilization of online channels improves customer satisfaction and enhances customer loyalty (Ladhari & Leclerc, 2013). Established financial theory focuses on the trade-off between risk and return (Kasemsap, 2015d). The impact of customer satisfaction on the institutional investor holdings is contingent upon the intangible asset intensity, the product-market demand uncertainty, and the financial market volatility (Luo, Zhang, Zhang, & Aspara, 2014). Customer satisfaction is the market-based asset that can contribute to the firm's value by increasing its stock market returns and reducing the riskiness of the stock market returns (Merrin, Hoffmann, & Pennings, 2013). Both customer satisfaction and the interaction between earnings and satisfaction have a significant influence on the firm's value (O'Sullivan & McCallig, 2009). Customer satisfaction reduces the negative deviation more than the positive deviation of the financial analysts' forecasts from the actual earnings (Ngobo, Casta, & Ramond, 2012).

The linkages among customer satisfaction, employee evaluation, and business performance data are crucial in modern business (Grigoroudis, Tsitsiridi, & Zopounidis, 2013). The relationships among customer satisfaction, customer retention, and firm profitability have been well-established in the marketing literature, and provide the extensive justification as to why customer satisfaction measurement is an essential point in the marketing-related decision making (Wu, DeSarbo, Chen, & Fu, 2006). Identifying relative weight of different dimensions of health care-related quality services, which concur together to determine the outpatients satisfaction, is very important, as it can help the health care managers allocate health care resources and identify managerial actions able to guarantee the higher levels of patients' satisfaction (Carlucci et al., 2013).

## FUTURE RESEARCH DIRECTIONS

The classification of the extant literature in the domains of service quality and customer satisfaction will provide the potential opportunities for future research. Customer relationship management becomes one of the most important business strategies in the digital age, thus involving organizational capability of managing business interactions with customers in an effective manner (Kasemsap, 2015e). Part of providing quality customer service is actively seeking customer feedback and establishing favorable relationship. The practical way to do this perspective is to establish customer loyalty programs. Building an attractive relationship with customers leads to the enhanced customer loyalty, thus increasing business profits.

Customer lifetime value is one of the most important measures of the worth of a customer. Customer lifetime value takes into account not only the customer's value, but also the expected value over their projected lifetime as a customer. Studying consumer behavior helps marketers understand consumer perceptions about a particular product or range of products. By studying consumer behavior, executives and marketing professionals can tap into consumer experiences with similar products to promote consumption and gain competitive advantage over competitors. The relationships among service quality, customer satisfaction, customer relationship management, customer loyalty, customer lifetime value, and consumer behavior will be the valuable topics for future research directions.

## CONCLUSION

This chapter highlighted the overviews of customer service, service quality, and customer satisfaction; the significance of service quality in global business; and the significance of customer satisfaction in global business. Customers expect the reliable service delivery in an easily accessible pattern. Customer service is the significant element required for a successful business. Customer service has an impact on both existing customers and potential customers. Customer service can provide business owners an essential learning experience to understand the dynamics of the modern business world and keep up with the latest business trends. Knowing customer expectations and delivering excellent service quality can considerably promote the entrepreneurial success and business growth. Providing high service quality is a crucial issue for business success. High service quality effectively promotes customer satisfaction and customer satisfaction has a positive relationship with business revenue.

Gaining high levels of customer satisfaction is very important to business because satisfied customers are most likely to be loyal and to make repeat orders and to utilize a wide range of services offered by business. Customer satisfaction is the best indicator of how likely a customer will make a purchase in the future. Customer satisfaction measures how products or services supplied by a company meet or surpass customer expectations. Customer satisfaction is significant because it provides marketers and business owners with an effective marketing metric that they can utilize to manage and improve their businesses. Customer satisfaction is also a major perspective of differentiation that helps executives and marketing professionals attract new customers in the competitive business environments. Promoting service quality and customer satisfaction in global business has the potential to improve organizational performance and gain sustainable competitive advantage in the digital age.

## KEY TERMS AND DEFINITIONS

**Customer Loyalty:** The likelihood of previous customers to continue to buy from a specific organization.

**Customer Satisfaction:** The degree of satisfaction provided by the products or services of a company as measured by the number of repeat customers.

**Customer Service:** All interactions between a customer and a product provider at the time of sale.

**Customer Value:** The difference between what a customer gets from a product, and what individual has to give in order to get it.

**Customer:** A person who buys products or services.

**Satisfaction:** The customer level of approval when comparing a product's perceived performance with his or her expectations.

**Service Quality:** An assessment of how well a delivered service conforms to the client's expectations.

**Service:** The product or service that is consumed by the end user and does not require any further processing.

# Chapter 43
# What Attracts Foreign Direct Investments in Asian Economies?
## An Institutional Approach to FDI

**Hironori Tohyama**
*Shizuoka University, Japan*

## ABSTRACT

*This chapter focuses on institutional configurations in host economies and examines the configurations that had a high propensity for foreign direct investment (FDI) inflows in Asian economies. While many previous studies on the relationship between FDI and growth focus on institutions in host economies, they are apt to search for one and/or best institutions. They do not perceive heterogeneous sets of linked institutions. This chapter contributes to the existing literature in a twofold manner. First, this analysis, based on multiple factor analysis, demonstrates a substantial variation in institutional configurations across Asian economies in attracting FDI. These Asian economies can be categorized into three clusters. Second, the fuzzy-set quality comparative analysis shows that two of the institutional configurations have a high propensity for FDI. The one found in Singapore relies on institutional complementarities similar to liberal market economies, while the other one, which is characteristic to Thailand, focuses on human capital formation in Asian welfare capitalism.*

## INTRODUCTION

Foreign direct investment (FDI) has gained importance in increasingly globalized Asian economies since the 1990s. However, some Asian economies seem to have attracted more FDI than others. This chapter focuses on institutional configurations in host economies and examines those institutional configurations that created greater potential for FDI inflows in Asian economies in the 2000s. While many previous studies on the relationship between FDI and growth focus on institutions in host economies,

they are apt to search for one and/or best institutions in order for host economies to attract FDI. They do not perceive the relationship between institutional configurations, i.e., heterogeneous set of linked institutions, and FDI inflows.

Our contribution to the existing literature is twofold. First, multiple factor analysis (MFA) demonstrates a substantial variation in institutional configurations across Asian economies that attract FDI. We categorize these Asian economies into three clusters based on institutional configurations. Second, fuzzy-set qualitative comparative analysis (fsQCA) shows that two of the institutional configurations create greater potential for FDI inflows. Of these, the one found in Singapore relies more on institutional complementarities similar to liberal market economies (Hall & Soskice, 2001), while the other one, which is characteristic to Thailand, focuses more on human capital formation typical in Asian welfare capitalism.

Our findings suggest that in order to attract FDI from multinational corporations (MNCs), governments in developing Asian countries should deregulate domestic product and labor markets, and create a well-functioning financial market. Alternatively, they should focus on human capital formation with relatively protected domestic markets.

## OVERALL TRENDS IN FDI

Since the 1990s, foreign direct investment (FDI) has played a leading role in globalizing Asian economies. Today, most Asian economies have become important destinations for FDI from advanced economies. FDI has several advantages for these economies, in addition to its direct effect on economic growth. FDI is often associated with technological transfer or the introduction of new knowledge and skills, which in turn improves the economic environment for long-term growth. While domestic firms may benefit from the inflow of new knowledge associated with FDI, the increased competition in domestic markets induced by FDI may put pressure on local firms to enhance their productivity and promote human capital mobility among firms. A combination of these factors can create the conditions necessary for increased long-term economic growth. It is therefore believed that FDI inflows contribute to economic growth in Asian economies (Lee, Lee, & Kim, 2011).

Figure 1 shows the ratio of regional inward FDI to world inward FDI from 1990 to 2014. During the whole period, the ratio for the African region is steady at nearly 3 per cent. The ratio for South and Central America remained steady at roughly 5 per cent until 2010, when it increased to nearly 8 per cent.

North America, i.e., Developed economies: America, was the largest recipient of FDI, accounting for nearly 30 per cent of the total FDI in the 1980s. However, its share gradually declined and approached the share of the EU in the 1990s. In the early 2000s, the regional share of North America dropped rapidly, whereas there was a steep rise in the share of the EU region. Since then, the EU has been the largest recipient of FDI, accounting for roughly 40 per cent in the 2010s. However, the ratio of inward FDI to total FDI in the EU region gradually declined to 33.70 per cent in 2013.

It is clear from Figure 1 that economies in the Asian region have attracted an increasing share of global FDI since the mid-2000s. The ratio of inward FDI in this region was relatively stable at roughly 15 per cent in the 1990s while there was the dip in the ratio around the East Asian Crisis. However, it began to rise in the mid-2000s and has continued rising. The ratio approached the North American level in 2010 and has remained roughly equal to it since. Clearly, this region has become one of the most attractive destinations for MNCs making direct investments. The overall trend in FDI indicates that Asian

Source: UNCTAD, World Investment Report, 2010..

economies are likely to become the largest recipients of FDI in the future. These findings lead us examine which economies in the Asian region have contributed to the growth of FDI in Asia.

Intraregional FDI has become increasingly important relative to other sources of FDI. From Table 1, we can see that the major sources of FDI have shifted in favor of economies in Asia. In the 1970s, the United States played a leading role, but Japan overtook the United States in the 1980s. The share of

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

these traditional sources has been declining since the early 1990s (the USA and Japan accounted for 10.0 per cent and 8.9 per cent respectively in 2001). Regional economic integration has provided a boost to intraregional investment, which increased from 22.4 per cent in 1981 to 30.7 per cent in 1991. It now accounts for around 40 per cent of the total FDI stock. MNCs from newly industrialized economies (NIEs)—Hong Kong, Korea, Singapore, and Taiwan—have been relocating their production operations within the region to take advantage of lower costs. This allows them to enhance their competitiveness and promote industrial restructuring and upgrading in their home countries. Through this process, neighboring host countries have gained increased access to capital and foreign markets.

FDI has served as a vehicle for transferring technologies and enhancing competitiveness. For low-income countries in the region, participation in regional production networks has become an effective way to build productive capacities, promote exports, further industrial development, and enhance economic growth. In recent years, FDI and industrial upgrading have generally followed a sequential path linking up economies at different stages of development, thereby creating new development opportunities. Electronics and other high-tech products continue to be a key industry that drives industrial upgrading. In this regard, China has steadily become a significant host economy (World Investment Report, 2009) and has established competitive positions in a series of high-tech products by leveraging FDI inflows.

Although FDI in Asian economies as a whole has rapidly increased since the 1990s, some economies have attracted more FDI than others. The performance of major economies in the region in attracting FDI also varied significantly (see Figures 2 and 3).

## AN INSTITUTIONAL APPROACH TO FDI

When MNCs invest in an economy, they encounter regulations or practices affecting FDI that are specific to that host economy. It is generally believed that these regulations or practices discourage MNCs to engage in FDI.

We can see the regulations imposed on MNCs with regard to FDI from the Investing Across Borders (IAB) dataset developed by the World Bank. This dataset is based on a survey of lawyers, professional service providers (mainly accounting and consulting firms), investment promotion institutions, chambers of commerce, law professors, and other expert respondents in the countries covered. For the 2012 IAB data, the World Bank surveyed about 3,500 respondents in 104 economies between November 2011 and April 2012. We compare FDI regulations in Asian economies based on this data.

Establishing a subsidiary of a foreign company takes less than a week in Hong Kong and Singapore, and takes about a week in Korea and Malaysia. In contrast, in China, India, Indonesia, Philippines, and Vietnam, it takes more than a month. We find a similar pattern for the number of procedures required to start a foreign subsidiary as a proxy for regulations on FDI. Hong Kong and Singapore have the least number of procedures (3 and 4 respectively). In contrast, China and Philippines have 18 procedures; India, 15; and Vietnam, 12.

These processes are costly and burdensome, particularly for small and medium MNCs. As the first point of interaction the foreign investor has with a country's administration, start-up procedures can seal a country's reputation as being investor-friendly or otherwise. Reforms in start-up procedures can lead to improved governance and reduced corruption, and signal that the government is open for FDI. As a result, economies could attract more FDI if they made their start-up procedures more efficient and transparent.

Data source: The World Bank Group, Investing Across Borders, New Foreign Direct Investment Regulation Data. http://iab.worldbank.org/Data/FDI-2012-Data.

Note: Data for China is available only for 2009.

However, the experience of foreign companies trying to invest in an economy does not seem to reflect success in attracting FDI (see Figure 2 and 3). In the 2000s, inflows to the two largest emerging economies, China and India, continued to increase. Among the four Asian NIEs, FDI inflows to Korea and Hong Kong continued to grow, but they declined in Singapore and Taiwan. In Malaysia and Thailand, FDI inflows fell slightly. A number of other South-East Asian countries, including Indonesia and Vietnam, have maintained growth in FDI.

Although it is widely believed that regulations discourage MNCs from undertaking FDI, not much is known about the kinds of regulations or institutions that affect FDI and the extent to which they do so.

As many previous studies on the relationship between FDI and growth suggest, empirical evidence that FDI generates positive effects for developing countries is ambiguous (Carkovic & Levine, 2005). FDI may influence growth mainly through indirect channels, and therefore, spillovers from foreign to domestically owned firms are not likely to be automatic, since local conditions have an important effect in influencing firms' adoption of foreign technologies or skills (Blomström & Kokko, 2003).

Thus, some studies explore the conditions necessary for FDI to have a positive impact on economic growth. For example, Balasubramanyam, Salisu, and Sapsford (1996) emphasize trade openness as being crucial for the potential growth effect of FDI, among other conditions. Alfaro, Chanda, Kalemli-Ozcan, and Sayek (2004) focus on financial markets, and identify the role played by local financial institutions as intermediaries in channeling the contribution of FDI to economic growth (see also Alfaro, Kalemli-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ozcan, & Sayek, 2009). De Mello (1997) argues that in order for FDI to have a beneficial impact on growth, host economies must attain a certain level of human capital accumulation, particularly in terms of education. Similarly, Borensztein, De Gregorio, and Lee (1998) formulate an equation for growth including interaction terms for human capital and FDI, and find that FDI enhances growth only in the presence of human capital.

While the above studies differ in terms of their emphasis on institutional factors when investigating the growth-enhancing effect of FDI, they all focus on institutions in host economies. Many other studies have investigated the relationship between institutions and FDI, and demonstrated the different ways in which institutions can affect FDI inflows. These include an efficient legal system (Djankov, La Porta, Lopez-De Silanes, & Shleifer, 2002), entry barriers (Alesina, Ardagna, Nicoletti, & Schiantarelli, 2005; Djankov, 2009), the regulation of labor market (Botero, Djankov, La Porta, Lopez-De Silanes, & Shleifer, 2004), and investors' protection (Djankov, La Porta, Lopez-De Silanes, & Shleifer, 2008). In fact, these studies aim to identify the institutions that matter the most for host economies to attract FDI. All these studies indicate that institutions, in general, seem to have an effect on FDI, but there is still limited and inconsistent knowledge regarding the specific institutions that play a significant role in attracting FDI.

The studies that are driven by the search for a good institution may be misguided. FDI is the inflow of private capital from an MNC to a firm in the host country. The inflow of FDI into a host country depends on its long-term attractiveness to MNCs. MNCs evaluate each economy not only in terms of a sole institution, but also in terms of the bundle of institutions (Pajunen, 2008) or, more precisely, the complementarities between institutions. Therefore, we argue that FDI is likely to result from the complementarity of institutions, and even if different countries have the same outcome, it is likely that this outcome has been generated by different institutional configurations. Varying configurations can generate the same outcome through different paths.

Therefore, we ask the following questions: which institutional configurations can we find in Asian economies and which of them has high potential for attracting FDI inflows? To answer these questions, we employ the varieties of capitalism (VoC) approach, which is useful for revealing the institutional diversity of Asian economies, and determining the relationship between institutional configurations and FDI inflows in Asian economies (Hall & Soskice, 2001; Amable, 2003).

Although FDI in Asian economies as a whole has rapidly increased since the 1990s, some economies have attracted more FDI than others (Figures 2 and 3). We are interested in determining whether this differential evolution of FDI in Asian economies is related with the institutional diversity of Asian economies, and in identifying the institutional conditions that encourage MNCs to engage in FDI.

Thus, our first task is to explore the institutional diversity of Asian economies. The second is to clarify which institutional configurations are related with increased inflows of FDI. In other words, we reveal the multiple pathways to greater FDI inflows from the institutional diversity of Asian economies. Many existing studies that suggest the positive effects of certain institutions on FDI inflows are mainly based on panel data because of the limited availability of institutional data. We believe that it would be difficult to reach a robust conclusion owing to the relatively small number of Asian economies. Moreover, because of the diverse combination of institutions in these economies, it would be difficult to address the problem using conventional statistical techniques such as panel data or regression analyses. Therefore, we employ fsQCA to explore the relationship between institutional conditions and FDI inflows.

The remainder of this chapter is organized as follows: Section 4 identifies the institutional diversity of Asian economies by applying MFA, which enables us to obtain indicators representing the institutional characteristics of each economy. Section 5 explores the multiple pathways from institutional conditions to FDI by applying fsQCA to causal conditions. Section 6 concludes.

## HOW DO HOST ECONOMIES DIFFER IN TERMS OF INSTITUTIONAL CONFIGURATION?

In this chapter, we consider 10 Asian economies: China (CHN), Hong Kong (HKG), Indonesia (IDN), India (IND), Korea (KOR), Malaysia (MYS), the Philippines (PHL), Singapore (SGP), Thailand (THA), and Taiwan (TWN). Using MFA, we investigate how each economy is characterized by their institutional configurations. This analysis aims to shed light on institutional diversity of Asian economies attracting FDI.[1] Also, we aim to obtain principal components and factor scores that will be used as proxies for institutions in the next section.

The variables in our data table correspond to 10 Asian economies in the 2000s. There are 22 variables from five institutional domains that are grouped as follows: financial market, labor market, product market, trade openness, government, and education (see Appendix for details). All the variables in the institutional domains are averaged over the sample years, largely in the 2000s.

We employ MFA, which is a multivariate analysis developed to analyze a population of individuals represented by groups of several variables and to characterize their inter-structure and intra-structure. MFA therefore enables us to seek a common structure present in these groups (Pagés, 2004; Abdi & Valentin, 2007; Bécue-Bertaut & Pagès, 2008).

MFA is performed in two steps. First, a principal component analysis (PCA) is performed on each data set (five groups of variables and 10 economies). The first principal component and factor scores obtained from this process can be used later as institutional data in each domain. It is then normalized by dividing all its elements by the square root of the first eigenvalue obtained from its PCA. Second, the normalized data sets are merged to form a unique matrix, and global PCA is performed on this matrix. Then, a global space is obtained in which we can compare the typologies provided by each group. MFA can thus be referred to as an extended version of PCA.[2]

Because MFA is an extended version of PCA, we retain the characteristics and interpretation rules of PCA. We thus obtain dimensions (principal components), eigenvalues, variance, and cumulated variance from MFA. We see from the result of MFA that the sequence of eigenvalues identifies two dominant dimensions that, together, account for 65.24% of total inertia. By visualizing the plane drawn by these two dimensions, we can compare individual economies and institutional spheres (see Figure 4).

Table 3 shows the correlation coefficients between these dimensions and variables that allow us to interpret each dimension. This table indicates that the first dimension is highly positively correlated with such variables as openness [logistics performance index (op3), trade (op4)], development of financial markets [domestic credit to private sector (fm3), market capitalization of listed companies (fm1), strength of investor protection index (fm4)], government effectiveness (gov2), and human development index (hd). In addition, this dimension shows a strong and negative correlation with variables representing regulated labor markets [difficulty of hiring index (lm1), rigidity of employment index (lm3), difficulty of firing index (lm4)], and regulated product markets [cost of business start-up procedures (pm4), start-up procedures to register a business (pm2), and time required to start business (pm1)]. In these findings,

Note: Significant level, 5%. For variables see Appendix.

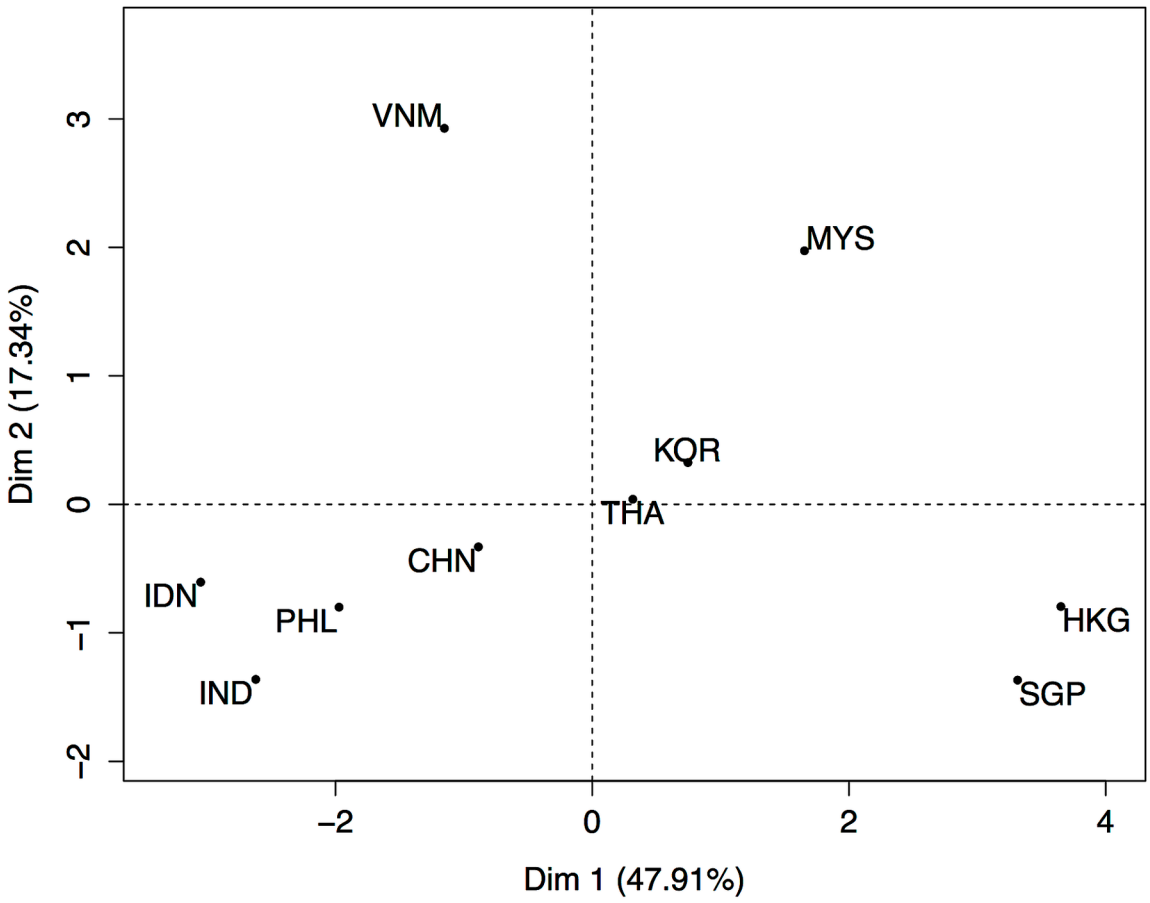
the positive side of the dimension represents the degree to which economies are developed in terms of financial markets, openness, and government effectiveness, while the negative side represents the strength of regulation in product and labor markets.

If we consider the second dimension, this is positively correlated with total government expenditure (gov1) and public spending on education (ed2). This dimension can be seen as a factor representing the government expenditure, especially on education; hence, it can be referred to as human capital formation.

Figure 4 illustrates where Asian economies are located on the global plane, which is constructed using the first two dimensions. On the right-hand side quadrant, we see Hong Kong, Singapore, and to a lesser extent, Malaysia, Korea, and Thailand as advanced economies in terms of financial market development, trade openness, and government effectiveness. Other economies located on the left-hand side quadrant indicate that these economies have highly regulated product and labor markets. Now, if we consider the upper quadrant of the dimension, we can see that Malaysia, Korea, Vietnam, and, to a lesser extent, Thailand may be characterized as economies focused on human capital formation.

Considering this result together with that of the cluster analysis based on the MFA data, the institutional characteristics in Asian economies can be described as follows:

**Cluster 1:** Singapore and Hong Kong.



Singapore and Hong Kong have well-developed financial markets, and their governments' efficiency in putting the policy focus on international market has led to excellent logistic management systems and high level of trade openness.

**Cluster 2:** India, Indonesia, China, and the Philippines.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 4. Institutional diversity of Asian economies*

India, Indonesia, China, and the Philippines can be characterized as economies having highly regulated labor and product markets.

**Cluster 3:** Korea, Malaysia, Thailand, and Vietnam.

This cluster consists of Korea, Malaysia, Thailand, and Vietnam, which share institutional similarities with cluster 1, except Vietnam. Additionally, these economies can be characterized as those focusing on human capital formation.

As mentioned above, the previous studies emphasize that developed financial market, level of education, or trade openness are crucial for economies to stimulate the growth of FDI, or that FDI inflows can be promoted by efficient legal system, deregulated labor market, or investors' protection. According to this study, we find economies in the first and fourth quadrants attract more FDI than other Asian economies (see Figure 2 and 3).

The results of MFA also suggest the possibility of a systematic relationship between the institutional diversity of Asian economies and FDI inflows. Therefore, the next task is to identify which institutional configuration matters in attracting FDI, and also to explore the causal relationship between those insti-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

tutional conditions and FDI performance, or multiple pathways to FDI inflows in Asian economies due to institutional factors.

## INSTITUTIONAL DIVERSITY OF ASIAN ECONOMIES AND FDI PERFORMANCE

FDI inflows in some economies may increase owing to the presence or absence of some institutional factors. As mentioned earlier, economies are evaluated by MNCs not only as individual institutions, but also as specific combinations of institutional conditions. Therefore, we explore the institutional configurations that attract FDI. At the same time, we identify multiple pathways to an outcome (FDI) from a combination of conditions (institutions) in Asian economies.

### Data and Methodology

In order to use FDI inflow as an outcome variable, we create FDI inflow performance index using sample Asian economies. It is the ratio of a country *i*'s share in total FDI inflows of sample Asian economies to its share in total GDP, which is given by

$$FDIperformance = \frac{FDI_i \Big/ \sum FDI_i}{GDP_i \Big/ \sum GDP_i}$$

where $i = 1, 2, \ldots, 10$. A value of one implies that the share of total FDI inflows and total GDP is equal. Hence, economies with a value higher than one attract more FDI than expected based on their relative GDP size. The index, accordingly, captures the influence on FDI of factors other than market size.

This analysis uses institutional variables as conditions, which are obtained from the result of MFA in the previous section. More specifically, factor scores based on the first principal component of each institutional domain are used as indicators representing institutional characteristics. We have five institutional variables according to institutional domains in the previous section, that is, high level of financial market development, high level of labor market regulation, high level of product market regulation, low level of international market orientation, and high level of human capital formation. All the data are averaged over sample years.

As mentioned above, the key issue is not to explore which institutional factor is the strongest in attracting FDI, but how different institutional conditions combine, and whether there is only one combination or several combinations for generating high FDI performance. In addition, we are focusing on a relatively small number of cases (10 economies) and considering these cases as diverse combinations of institutional conditions, we have a difficulty in addressing problems using conventional statistical techniques, such as regression or panel data analyses, owing to limited availability of institutional data. Therefore, any technique specifically designed to estimate the net effects of independent variables in linear-additive models would not be useful. In dealing with these problems, we employ fsQCA (Ragin, 2000, 2008; Kenworthy & Hicks, 2008). This allows us to identify hypothesized causal factors, or combinations of

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

those factors that are related to the outcome in terms of the logical language of set theory. Hence, this technique is appropriate for finding a combination of institutions, or multi pathways to outcome.

Pajunen (2008) also employed fsQCA to investigate a causal relationship between institutions and FDI. While his study is certainly a pioneering work in this field that focused on combinations of individual institutions, our analysis is more comprehensive that focuses on five institutional domains, each of which consists of many institutions and complementarity of domains, based on the VoC approach. Second, Pajunen analyzed 47 countries including both developed and less-developed countries, so that an institutional diversity within Asian economies may be obscured in his study; however, our analysis specifically focuses on Asian economies, so that we can indicate institutional diversity of Asian economies (as can be seen in the previous section). We have shown that institutional configurations in Asian economies are not homogenous.

fsQCA requires the use of set-theoretic variables. Fuzzy sets refer to the pseudo-continuous scale on which all cases are coded, and they range from zero to one. Because the interest is on how strongly cases conform to theoretical categories, fuzzy coding schemes are based on connection to qualitative anchors. Cases coded zero are considered "fully out" of a set, and those coded one are "fully in" a set. Membership along the continuum between zero and one can be determined qualitatively using a scaling procedure. For each of our variables, we use three qualitative thresholds of set membership: "crossover point" from "more in than out" to "more out than in" the set.

To specify the thresholds, we first apply quantile classification method to raw data, and then assume that median is the crossover threshold, the minimum number is the threshold for full set exclusion, and the maximum number is for full set inclusion. We finally use a mathematical rescaling with the logistic function to distribute the rest of the cases between these points.

Table 4 displays the fuzzy set scores for FDI performance index and five institutional conditions. The results are presented in equation form using letters as abbreviations for the conditions and outcome. FDI represents high level of FDI performance index; F high level of financial market development; L high level of labor market regulation; P high level of product market regulation; O low level of international market orientation; and E high level of human capital formation. Capital letters indicate the presence of a condition, while small letters indicate the absence of a condition. For example, F indicates a high level of financial market development, and f indicates a low level of financial market development. Most of the raw data are from the period 2001–2010 (see Appendix for details). We conduct fsQCA analysis using the R package for QCA (Thiem & Duşa, 2013).

## Empirical Results

The following section presents the results of the empirical analysis of the necessary and the sufficient conditions for the presence of a high level of FDI performance.

### Necessity Relations

Here, we investigate how economies with different degrees of membership score in different institutional configurations attract FDI. We begin by identifying what institutional factors or combinations of those factors are necessary for a high level of FDI performance. In doing so, we evaluate the results using both graphical representation and descriptive measures, namely, consistency and coverage scores. For analyzing the necessary condition, we need to assess to which degree cases are members of conditions

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 4. Fuzzy-set scores of FDI performance and institutions*

| Economy | Outcome | Condition | | | | |
|---|---|---|---|---|---|---|
| | FDI | F | L | P | O | E |
| | High Level of FDI Performance | High Level of a Financial Market Development | High Level of Labor Market Regulation | High Level of Product Market Regulation | Low Level of International Market Orientation | High Level of Human Capital Formation |
| CHN | 0.5257 | 0.4823 | 0.4746 | 0.5308 | 0.2883 | 0.0500 |
| HKG | 0.9500 | 0.9500 | 0.0500 | 0.0556 | 0.1179 | 0.5890 |
| IND | 0.1129 | 0.1048 | 0.7588 | 0.7617 | 0.9500 | 0.0542 |
| IDN | 0.1621 | 0.0535 | 0.9500 | 0.9500 | 0.6151 | 0.2506 |
| KOR | 0.0500 | 0.6064 | 0.8252 | 0.2360 | 0.6640 | 0.6895 |
| MYS | 0.4104 | 0.7004 | 0.1498 | 0.4196 | 0.1748 | 0.9367 |
| PHL | 0.1235 | 0.0500 | 0.8303 | 0.6255 | 0.7785 | 0.1159 |
| SGP | 0.9099 | 0.5819 | 0.0500 | 0.0500 | 0.0500 | 0.2740 |
| THA | 0.5150 | 0.5158 | 0.2828 | 0.1899 | 0.6432 | 0.6446 |
| VNM | 0.6254 | 0.0772 | 0.5357 | 0.5371 | 0.4192 | 0.9500 |

and outcome in relation to their overall membership in outcome. This indicator is referred to as necessity consistency. If the necessity consistency is high enough, the evidence is consistent with the hypothesis that the condition is necessary for outcome. For example, low consistency means that there is no subset relation between a combination of institutional factors and outcome. In addition, we analyze the necessity coverage. This evaluates to which degree cases are members of conditions and outcome in relation to their overall membership in conditions. Coverage assesses the empirical relevance of a consistent subset.

Table 5 shows the result of the analysis of the necessary conditions for the outcome, "high level of FDI performance." We set 0.90 as a threshold of necessity consistency, and 0.70 of necessity coverage for accepting a condition to be necessary.

For institutional condition abbreviations see Table 4.

In Boolean logic, logical AND (*) refers to the intersection of sets and logical OR (+) to the union of sets. As mentioned above, a capital letter indicates the presence of a condition and a small letter its absence. As can be seen in Table 3, a high level of FDI performance can be expected in countries characterized by high level of international market-orientated economies (o), low level of regulation in product

*Table 5. Necessary conditions for "high level of FDI performance" outcome*

| | | Consistency | Coverage | PRI |
|---|---|---|---|---|
| 1 | o | 0.924 | 0.765 | 0.515 |
| 2 | p | 0.923 | 0.717 | 0.473 |
| 3 | l | 0.938 | 0.807 | 0.525 |
| 4 | lp | 0.923 | 0.851 | 0.452 |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

market (p), low level of regulation in labor market (l), low level of labor market regulation combined with the low level of product market regulation (lp), and high level of financial market development (F) or high level of human capital formation (E) or both.

This result shows that deregulated markets and international market-oriented economies are necessary for the presence of the outcome "high FDI performance." In addition, a well-developed financial market or a high level of human capital formation is also necessary for the presence of a high level of FDI performance. The result indicates that there could be multiple pathways to high FDI attractiveness from MNCs in advanced economies.

Figures 5 and 6 graphically show the necessity relationship between institutional conditions and FDI performance. This relationship is indicated by the data points located below and to the right of the 45-degree line. Figure 5 shows a scatter-plot of the outcome "high level of FDI performance" and a low level of labor market regulation combined with low level of product market regulation (lp) as a condition. All the economies are on or very close to the 45-degree line, and this combination explains most of the cases. Therefore, this combination exhibits a condition that is more or less necessary for a high level of FDI performance (consistency 0.923, coverage 0.851).

*Figure 5. lp, necessity relationship between institutional conditions and FDI performance*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 6. F+E, necessity relationship between institutional conditions and FDI performance*

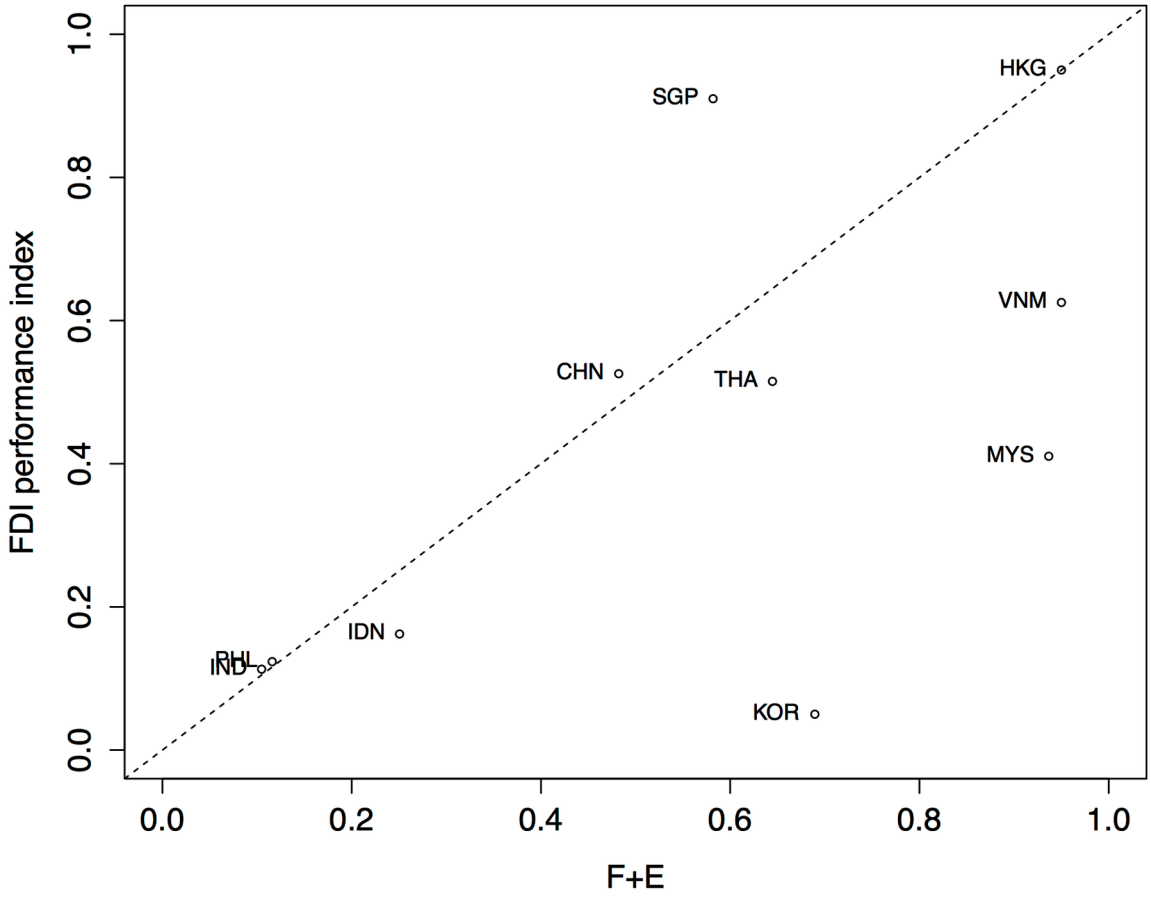

Figure 6 depicts a scatter-plot of the outcome "high level of FDI performance" and a high level of financial market development (F) or human capital formation (E) as a condition. It shows that most of the economies are located next to, or on the 45-degree line, except Singapore that is clearly above the line. This means that a high level of financial market development (F) or human capital formation (E) is a necessary condition for the presence of a high level of FDI performance (consistency 0.912, coverage 0.701).

## Sufficient Relations

Here, we are concerned with causal sufficiency—the ability of certain configurations of institutional factors to consistently produce high level of FDI performance. To test whether different paths to high FDI performance exist in Asian economies, we use a truth table approach that allows for a possibility that a given outcome may follow from several different combinations of causal conditions. Hence, it displays all logically possible combinations of causal conditions and indicates cases' distribution across those combinations.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6 presents the truth table. The "n" column denotes how many cases conform to the listed configuration. The "cases" column shows economies conforming to the relevant configuration. The "OUT" column tells us whether or not a partial causal condition is treated as an instance of high level of FDI performance. If the OUT denotes a one, we know that this combination is a consistency sufficient for the outcome. The 0s and 1s in each cell instruct how to consider a case's location, that is, its membership or non-membership in a particular fuzzy set. Formally, rows in the truth table can be interpreted as specification of the corners of the vector space, and they indicate the characteristics of the causal combinations represented by each corner.

We can assess all five causal conditions in Table 6: financial market development, labor market regulation, product market regulation, international market orientation, and human capital formation. We have four different configurations of institutional conditions as a result of fsQCA when setting 0.85 as a threshold of consistency: Flpoe + FlpOE + flPoe + FlpoE. However, Table 6 shows that there are only two different configurations to produce a high FDI performance. In the previous subsection, we found from the necessary conditions analysis that deregulated markets, financial market development or high level of human capital formation are necessary for an outcome. Yet, by adding sufficient conditions, we see that FDI performance should be in combination with "O" (economy focused on international market) or with "E" (human capital formation). These results show that high level of FDI performance results from different combinations of institutional conditions.

*Table 6. Sufficient conditions for "high level of FDI performance" outcome*

| F | L | P | O | E | OUT | n | Incl | PRI | Cases |

*Table 7. Analysis of sufficient conditions for "high FDI performance" outcome*

| Solution | Flpoe | + | FlpOE |
|---|---|---|---|
| Economy | SGP | | THA |
| Consistency | 0.945 | | 0.904 |
| Raw coverage | 0.486 | | 0.271 |
| Unique coverage | 0.284 | | 0.069 |
| Solution consistency | 0.951 | | |
| Solution coverage | 0.555 | | |

Note: The consistency threshold has been set at 0.9.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

We logically minimize the table using Boolean algebra. Table 7 shows the result, and it confirms the above argument based on Table 6. It is apparent that there are two routes for increasing FDI performance: (1) Flpoe OR (2) FlpOE.

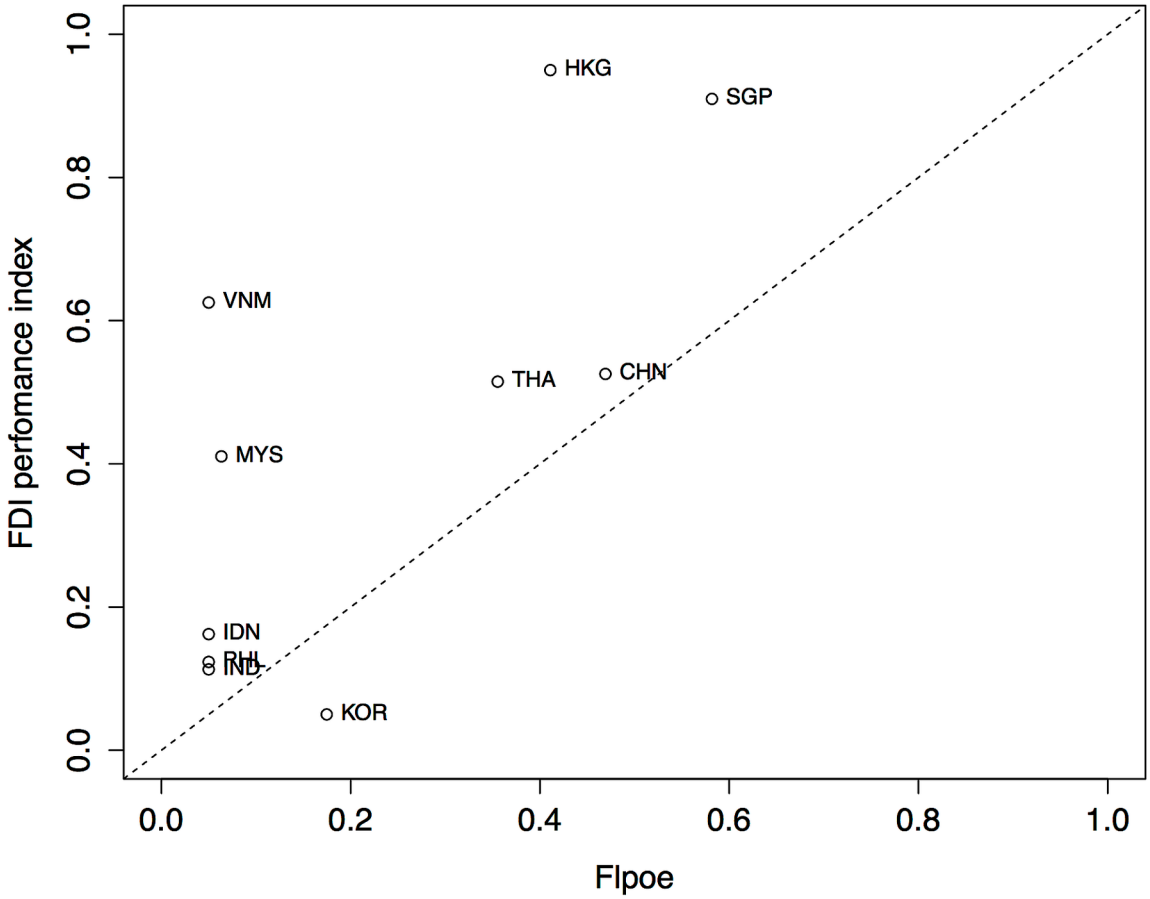
Consistency indicates the degree to which the solution is sufficient for producing an outcome, and coverage indicates the degree to which cases correspond to a combination of conditions. Looking at the parameters of fit, this solution suffices to generate good FDI performance because the solution consistency is high (0.951), and the solution coverage is relatively satisfying (0.555).

Asian economies attract FDI under certain combination of institutional conditions. These conditions are sufficient for FDI when combined with institutional conditions, which include

1. The presence of high level of financial development, the absence of labor market regulation, the absence of product market regulation, the absence of low level of international market orientation, and the absence of high level of human capital formation (Flpoe), or
2. The presence of high level of financial market development, the absence of labor market regulation, the absence of product market regulation, the presence of low level of international market orientation, and the presence of high level of human capital formation (FlpOE). Therefore, depending on the path, either trade openness (Flpoe) or human capital formation (FlpOE) matters.

Although these alternative paths are treated as logically equivalent, we assess the relative importance of the different combinations of causally important conditions based on the unique coverage of the paths (Ragin, 2008). Of the total solution's coverage of 0.555, 0.284 is uniquely due to the first path (Flpoe). Conversely, the second path (FlpOE) uniquely covers only 0.069. This implies that most of the cases with memberships in the second path also have memberships in the first path. Stated differently, most of FlpOE is Flpoe. Hence, the first path (Flpoe) is empirically more important than the second path (FlpOE).[3]

Figures 7 and 8 graphically presents the results. It shows two scatter-plots, each with fuzzy FDI performance on the Y-axis and one of two solutions from Table 5 on the X-axis. Note that for a condition or a combination of conditions to be sufficient, all cases should be located around or above the 45-degree line. We recognize that most of the cases (economies) are located above the diagonal line. Hence, FDI performance would be explained quite well by the relevant solution (Flpoe + FlpOE). This is the case for our two configurations; none of the economies lie far below the line.



Based on this criterion in Figures 7 and 8, it seems that institutional configuration "Flpoe" fits well to Singapore, Hong Kong, China, and Thailand. They obtain higher scores for this configuration than the other one. For institutional configuration "FlpOE", the score for Thailand is quite high. This indicates that configuration "FlpOE" fits best to Thailand. As mentioned above, this economy is characterized by not only well-developed financial and deregulated markets, but also human capital formation.

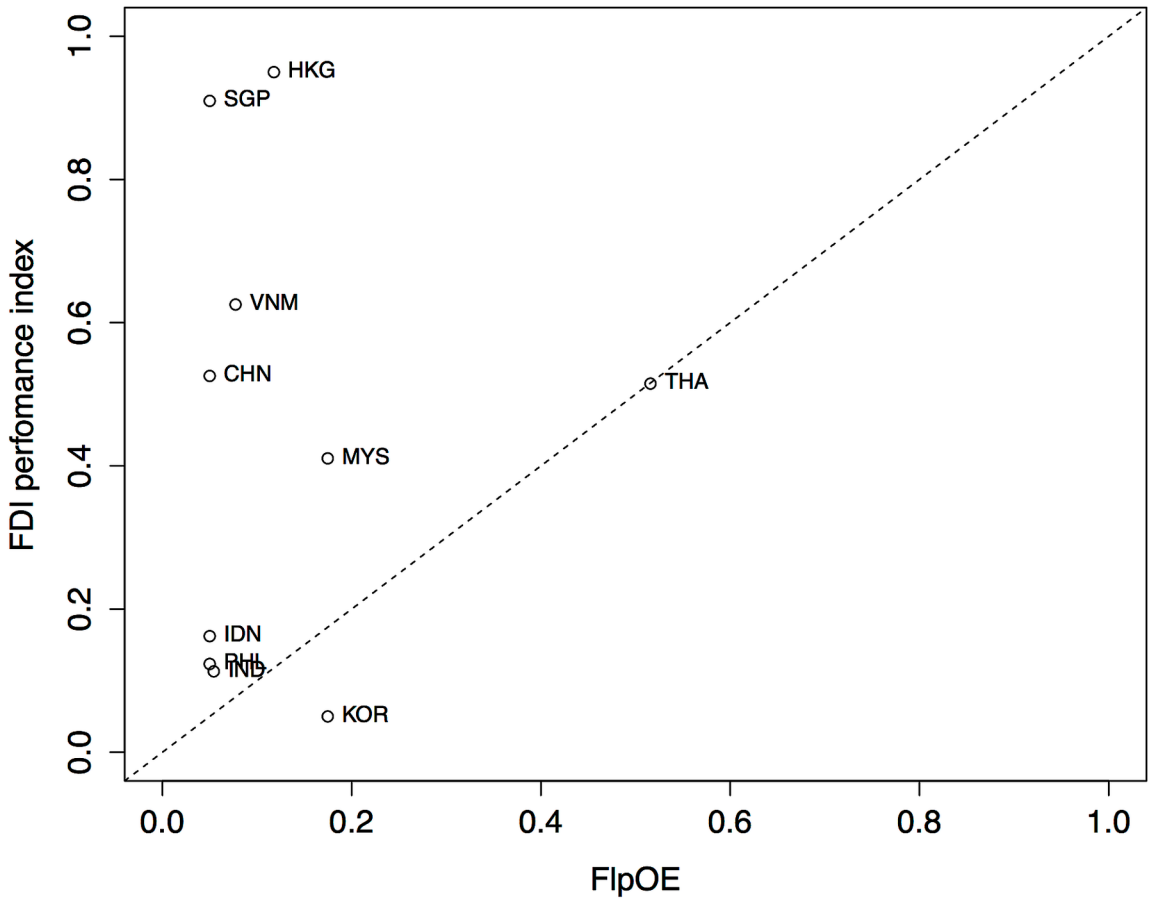
Singapore fits best to the former path, characterized by a high level of trade openness and an excellent logistic management system, as well as a well-developed financial market, and deregulated labor and product markets. In fact, labor relations in Singapore are the most flexible among Asian economies. There is no legislation that prohibits the firing of workers and no minimum wage. These institutional conditions are considered as crucial for attracting FDI from MNCs. Therefore, such conditions that allow Singapore government and business to focus on international market are likely to be the key to good FDI performance. Thailand conforms to the second path that is characterized by institutional conditions focused on human capital formation, as well as a well-developed financial market and deregulated labor

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 7. Two different paths to "high FDI performance", Flpoe*

and product markets. These institutional conditions, especially human capital formation, have been the distinctive contributing factor to entice FDI for Thailand from advanced economies.

Given these institutional configurations, the path followed by Singapore can be referred to as an open market-oriented one, or as a liberal market economy (LME)-type[4], and the path in the case of Thailand can be referred to as one focused on human capital formation. Thailand's path may be unique since most resources devoted to social policies are allocated to building human capital formation—spending on education and health—which are apparently institutional characteristics specific to Asian welfare capitalism (Holliday, 2000; Holliday & Wilding, 2003).



## Discussion

What can we infer from these findings? How do they contribute to the studies on FDI in Asian economies? Our analysis is different from the existing studies in two respects. First, we revealed institutional diversity of Asian economies based on MFA and fsQCA, which indicate that institutional complementarity matters, but not individual institutions, when investigating how FDI inflow is associated with institutions. Existing studies are more apt to search for one and/or best institution in order for host economies to at-

*Figure 8. Two different paths to "high FDI performance", FlpOE*

tract FDI. In other words, they do not perceive the relationship between institutional configuration and FDI inflows, and hence, they tend to overlook multiple pathways to a good FDI performance resulting from institutions. We found three different institutional configurations in sample Asian economies by applying MFA and a cluster analysis to five institutional domains. However, not all the clusters are associated with a good FDI performance. While some institutional configurations seem to be associated with FDI inflows, others do not.

Second, the fsQCA analysis revealed two causal pathways that generate high level of FDI performance among sample Asian economies. Many previous studies emphasized the importance of deregulated markets (Alesina et al., 2005; Djankov et. al., 2002; Botero et al., 2004) ("ol" in our Boolean terminology), or alternatively financial market development (Alfaro et al., 2004) ("F" in our Boolean terminology). To be sure, our findings are consistent with the previous studies and show the significance of institutions for Asian economies to attract FDI; however, those institutional conditions alone are not sufficient to produce good FDI performance. The results of fsQCA demonstrate that they are sufficient only when combined with the absence of low level of international market orientation (o) and the absence of high level of human capital formation (e), and alternatively, when combined with the presence of low level of international market orientation (O) and the presence of high level of human capital formation (E).

One of the two institutional configurations that have a high propensity for FDI inflows can be observed in Singapore. This economy is characterized by liberalized markets and a well-developed financial market. This implies that governments in developing Asian countries should put their policy focus on deregulating domestic product and labor markets, and creating a well-functioning financial market if they want to increase FDI inflows. This policy strategy could be referred to as LME-type.

More interestingly, there is another institutional configuration that is compatible with a good FDI performance. This pathway is followed by Thailand, whose institutional characteristics are the presence of low level of international market orientation and the presence of human capital formation. It implies that Thailand may focus on human capital formation with relatively protected domestic markets. This case indicates that liberalizing economies is not the only key strategy for developing economies to attract FDI. In short, Singapore's model relies more on institutional complementarities similar to LMEs, while Thailand focuses on human capital formation, largely seen as key characteristics in Asian welfare capitalism (see Tohyama, 2015).

## CONCLUSION

Asian economies have become increasingly attractive destinations for FDI and are likely to be the largest recipients of FDI in the future. Since the 1990s, FDI has played a major role in globalizing these economies. For low-income countries in the region, participation in MNCs' regional production networks is an effective way to build productive capacities, promote exports, further industrial development, and enhance economic growth. FDI and industrial upgrading have continued to evolve, thus creating new development opportunities. As advanced economies move towards more sophisticated value-added activities, more opportunities open up for their less developed neighbors; this allows developing countries to enter into a regional division of labor by increasing their investment in resource-based, labor-intensive activities. FDI has played a crucial role in this process, serving as a vehicle for transferring technologies and developing comparative advantages.

However, some Asian economies seem to be more attractive to MNCs than others. Several studies have addressed the question of what attracts FDI by focusing on institutions in host economies. Yet, these studies are inconclusive in determining which institutions matter, perhaps because they are in search of the "best" institution. For example, it could be an efficient legal system, entry barriers, the regulation of labor market, or investors' protection. They have empirically attempted to reduce the complexity of institutional systems by the computation of composite index for the regulation of labor market or legal system. They then test the way legal origins or the regulations impact FDI. One important outcome of their approach is that it provides a simple benchmark that can be easily adopted by policy makers.

These studies are based on the idea that difference in national institutions is due to the fact that some economies are closer from an institutional frontiers than others. The differences may be another expression of the development inequalities among economies. Development gap must be reduced through radical or gradual reforms towards the benchmark model. As a result, reforming regulations or institutions consists in guiding them towards the benchmark, i.e., the sort of institutional frontier given by some of the advanced economies' economic, legal and institutions. This approach allows us to measure institutional performance by a set of indicators and then to proceed to cross-national comparisons and ranking according to the benchmark.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

However, each economy can be characterized by a given set of institutions that might differ from the set that prevails in another country. No institution is likely to deliver its impact on economic behavior in isolations from remaining institutions of the system. Institutional configurations are heterogeneous set of linked institutions.

Thus, the previous studies rule out the possibility that there could be multiple pathways to high levels of FDI because of complementarity between institutions.

In contrast to these studies, we highlighted the importance of focusing on the complementarity between institutions, instead of individual institutions, when investigating the institutional conditions that attract FDI. We based our analysis on the VoC approach that allowed us to unfold multiple pathways to FDI inflows through institutions.

This chapter contributes to the existing literature by establishing a causal relationship between institutions and FDI as follows: First, MFA demonstrated a substantial variation in institutional configurations across Asian economies that successfully attracted FDI. The cluster analysis showed that Asian economies can be categorized into three clusters: Singapore and Hong Kong (cluster 1); India, Indonesia, China, and the Philippines (cluster 2); and Korea, Malaysia, Thailand, and Vietnam (cluster 3). These results suggested the possibility of a systematic relationship between institutional diversity of Asian economies and FDI inflows.

Second, and more importantly, fsQCA demonstrated that two institutional configurations have high potential for attracting FDI inflows. Of these, one relies more on institutional complementarities similar to LMEs, while the other focuses more on human capital formation, seen as a key characteristic of Asian welfare capitalism.

Our findings suggest that in order to attract FDI from MNCs, governments in developing Asian countries should deregulate domestic product and labor markets and create a well-functioning financial market. Alternatively, governments should focus on human capital formation with relatively protected domestic markets. In other words, institutional configurations in cluster 1 and cluster 3 are likely to be compatible with high inflows of FDI, while those in cluster 2 may be unattractive to MNCs.

A couple of questions will be left for further research. This analysis confined discussions on five socio-economic institutional domains. We excluded political factors, such as corruption, political stability, or political rights because we assumed that as markets develop and put pressure on agents in markets to comply with global and transparent rules, such factors will gradually disappear. However, particularly in developing economies, these factors may influence MNCs' decision to engage in FDI because of their concern for such factors.

Furthermore, our analysis is based on fsQCA. This technique is known to be useful when investigating a case that a given outcome may follow from different combinations of causal conditions, but it is not designed to examine the net effects (Eptesin, Duerr, Kenworthy, & Ragin, 2008; Ragin, 2008). Our future research interest is in identifying the impact of a particular institutional configuration on MNCs' decision making concerning FDI. In examining the net effects, we should take into account institutional configuration as well as individual MNCs' strategies.

Lastly, we acknowledge the need to exercise caution and not to mechanically utilize the results derived from fsQCA or MFA without drawing on theoretical and case knowledge. Given also that the availability of institutional data on Asian economies is limited, we need to reinforce our argument presented in this chapter by utilizing the results of descriptive and historical analyses.

## KEY TERMS AND DEFINITIONS

**Asian Economies:** Northeast Asian countries such as China, Japan and South Korea and Southern Asian countries such as the member of ASEAN.

**Asian Welfare Regime:** A model of welfare system specific to Asian economies, different from a model of what can be seen in North America, Europe and Scandinavian.

**Foreign Direct Investment (FDI):** Investment from one country into another that involves establishing operations or acquiring tangible assets.

**fsQCA (fuzzy-set Quality Comparative Analysis):** A version of Qualitative Comparative Analysis, i.e., an analytic technique that uses Boolean algebra to implement principles of comparison, based on fuzzy set.

**Institutional Diversity of Asian Capitalisms:** Diversity of Asian economies in terms of such institutions as product market, labor market, financial market, education, social security, and international trade.

**Multiple Factor Analysis (MFA):** A method of Multivariate Analysis, which allows us to analyze the variance of observations described by several sets of variables.

**Varieties of Capitalism:** Market economies classified into different types of economies based on specific architecture of complementary institutions.

## ENDNOTES

1 See also Harada and Tohyama (2012), Walter and Zhang (2012), Tohyama and Harada (2013) (2015), and Witt and Redding (2013) for analysis of institutional diversity of Asian economies.

2 In this analysis, we use an R package for multivariate analysis (FactoMineR) (http://factominer.free.fr).

3 Note that coverage gauges only empirical importance, not theoretical importance. Therefore, although the second path exhibits low coverage, it still could be relevant to theory.

4 In liberal market economies, "firms coordinate their activities primarily via hierarchies and competitive market arrangements. … market institutions provide a highly effective means for coordinating the endeavors of economic actors" (Hall & Soskice, 2001, p.8).

# Chapter 44
# The Effect of Foreign Direct Investment on the Economic Development of Mongolia

**Erdenebat Mungunzul**
*Economics Department, Graduate School, Daegu University, Kyungsan, Republic of Korea*

**Taikoo Chang**
*Economics Department., Daegu University, Kyungsan, Republic of Korea*

## ABSTRACT

*This article describes how foreign direct investment in Mongolia has reached 3.9 billion US$ mainly in the mining sector that amounted approximately 40% of the year's GDP. Even though FDI into Mongolia has been grown along with the country's economic development with trade openness to the world, a few studies have used regression analysis to analyze determinant factors of FDI. This article has estimated the determinants attracting FDI inflow into Mongolia by using two methods: applying single country (Mongolia) data using the determinants attracting FDI inflow into Mongolia from 1995-2014, and applying the determinants attracting FDI from the top investment countries using panel data, using random and fixed effects models from 2005-2013. The study results showed that GDP of Mongolia has a positive and significant effect on the FDI inflow. It was also revealed that the partner countries located either too far away from or too close to Mongolia pay little attention to and play a small investment role in Mongolian FDI.*

## 1. INTRODUCTION

Foreign direct investment is generally seemed as a way through which technology can spread from developed countries to developing ones. Although the evidence of relationship of foreign direct investment(FDI) with economic growth is not clear, several studies agree that absorptive capacity of host country does an important role of explaining FDI. For instance, it is stated that FDI is positively related and significant

only for higher income countries and has no impact in lower income countries. And it is asserted that contribution of FDI for economic growth is determined by its interaction to the human capital level in host country. Mungunzul and Chang (2016) showed that FDI does a different role in growth procedure because of differing trade policy regimes. Even though there are different shapes of overseas capital flows, FDI has been research topics. FDI is an investment done abroad through establishing a new company in host country or through acquiring shares to have full managerial power of existing foreign company.

This paper's goal is to determine the factors affecting the FDI flows into Mongolia through answering the following questions: Firstly, how FDI influences on economic development of Mongolia. Secondly, which factors can be identified with regard to FDI. Thirdly, what recommendations could be applied to induce FDI flows into the country.

## 2. METHODOLOGY AND DATA ANALYSIS

### 2.1. Research Model

A gravity model is a way of explaining FDI, not only the flow of FDI, but the effect of distance in FDI and relationship between FDI and trade of related countries by using econometric measure of distance. A gravity model can explain the relative market sizes of related countries and their distance each other. Mungunzul (2016) asserted that distance could be accepted as a measure of management cost in handling foreign activities, for example, cost of transportation and communications, cost of dealing with cultural and language gaps, costs of dispatching personnel overseas and the information cost of institutional and legal matters. Tinbergen (1962) and Pöyhönen (1963) suggested first version of the model. It has been argued that export is positively related to income of the related countries and the distance of the countries affects export. Several contributions have recently been made to this early version. A gravity model has been generally used for analyzing determinants of FDI inflows. In simple form, gravity model for FDI suggests that FDI has positive relationship with GDP levels in host and investing countries and negative relationship with the distance between countries. A number of empirical studies analyze bilateral FDI flows through the framework of the gravity model. The determinants of FDI flows to emerging economies was examined by Frenkel, Funke, & Stadtmann (2004).

Gravity model classic equation:

$$X_{ijt} = A\frac{Y_{it}^{B}Y_{jt}^{C}}{D_{ij}^{D}} \tag{1}$$

where $Y_{it}$ is GDP of country *i* at time *t*, $Y_{jt}$ GDP of country *j* at time *t*, $D_{ij}$ distance between related two countries, and A, B, C, D constants. The left-hand side variable, $X_{ijt}$, is FDI flows country *i* to country *j* in time *t*. The gravity models have found application in the empirical literature for more than just inspecting FDI inflows. The relationship of gravity has been generally applied in trade flows area and similar relationship holds for large area of spatial economic interaction, for example, telecommunications, overseas equity holdings and technology transfer (Navaretti & Venables 2004).

Gravity type equation of the FDI study as follows:

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$FDI_{ij} = b_0 + b_1 GDP_i + b_2 Pop_i + b_3 GDP_j + b_4 Pop_j + b_5 Distance_{ij} + b_6 Trade_{ij} + b_7 APEC + b_8 ASEAN + b_9 DAE + e_{ij} \quad (2)$$

where $FDI_{ij}$ and $Trade_{ij}$ represent reciprocal FDI and trade flows between related countries, and subscripts *i* and *j* represent home country and host country each. GDP is gross domestic product, Pop the population, and Distance the geographical distance between two countries *i* and *j*. APEC, ASEAN and DAE (Dynamic Asian Economies) are 3 dummy variables included in the estimation equations.

Pedroni (1999) suggested the test for two-stage panel co-integration to decide the long term FDI as follows:

$$Y_{it} = a_i + b_i X_{it} + e_{it}; \text{ t} = 1, 2, \ldots, \text{T; i} = 1,\ldots,\text{N} \quad (3)$$

where $Y_{it}$ represents FDI stock of country *i*, $a_i$ a constant term, $b_i$ a long-term coefficient, $X_{it}$ explanatory variables vector, and $e_{it}$ error term. The finding explained that the most important determinant of FDI was the market size, i.e., purchasing power of host country rather than the labor cost level. Bilateral trade and gross domestic product per capita had positive relationship with FDI.

The empirical model for gravity and FDI can be expressed as follows:

$$FDI^t_{ij} = f(GDP^t_i, GDP^t_j, dist_{ij}, trade^t_j, ULC^t_j, r^t_{ij}, risk^t_j) \quad (4)$$

where *t* is year, *i* the source country, *j* the host country, $GDP^t_i$ represents the size of the source country, $GDP^t_j$ the size of the host country, $dist_{ij}$ the distance between source and host country, $trade^t_j$ the openness of the host country, $ULC^t_j$ the unit labor costs in the host country, $r^t_{ij}$ is the interest rate gap between source and host countries, and $risk^t_j$ stands for the political risk of the host country.

## 2.2. Data Collection and Model Specification

The single panel data consist of yearly observations from 1995-2014. The data set has been collected from the World Bank. The data set consists of GDP, FDI inflows, and inflation measured by consumer price index. Trade openness is computed as the ratio of import plus export of commodity divided by GDP. The exchange rate is measured by currency value of related countries. The infrastructure development is measured by the infrastructure development index. Export is a measure of export of commodities divided by GDP.

The dependent variable is the FDI inflow and the independent variables that are expected to decide FDI flows were chosen, based on previous research and availability of data for the related period. The independent variables are market size, labor force and labor cost, geographical distance, GDP, inflation rate, trade openness level, real exchange rate, political stability index, infrastructure, and exports.

Log-linear regression method, which makes direct comparison possible between variables by using common measure, is applied to analyze relationship among independent(predictor) variables and dependent(criterion) variable. The fixed effects and random effects models are used for panel data of FDI flows from several developed countries into Mongolia. The panel data for 12 countries are used to analyze how the selected countries' FDI inflows are influenced through economic growth and other determinants factors by using annual dataset from 2005 to 2013.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The primary aim of this work is to determine which variables affect FDI in Mongolia.

### 2.2.1. Market Size

Market size is a typical determinant factor of FDI flows. The gravity model analysis for FDI suggests that FDI is positively related with GDP levels in host and home countries. Market size is usually measured by GDP. Countries with large markets receive more FDI flows compared to countries with small market size.

### 2.2.2. Labor Force

Labor force is an important determinant of FDI inflows. Multinational companies investing in host countries not only seek location of low wage level, but require skilled laborer or high quality of labor as indicated by high wages. The theory that human capital is a factor the FDI flow has been applied in the empirical literature. It has been tested that insufficiency of human capital does not courage foreign investment into under developed countries. The skill and education level might influence not only FDI inflow volume but also activities multinationals undertaking.

### 2.2.3. Labor Cost

Higher labor cost raises the production cost and is expected to limit FDI inflows. Labor cost is generally measured by wage rate. A few studies have found that labor force determines FDI flows positively. However, Resmini (2000) could not confirm the significance of wages, possibly because they used wages that are uncontrolled for productivity and exchange rates (Bevan & Estrin, 2004).

### 2.2.4. Geographical Distance

A gravity model can catch market size of the home and host countries and distance between them. This distance can be used as a size of the transaction cost in managing foreign activities, i.e., costs of moving and communication, dealing of cultural and language gap, dispatching personnel overseas, and the information costs of institution and legal sources.

### 2.2.5. Infrastructure Facilities

An established and quality infrastructure plays an important role of FDI inflows. Good infrastructure facilities will attract FDI inflows. The availability of quality infrastructure can be estimated by considering electricity, water, transportation and telecommunications.

### 2.2.6. Trade Openness

Trade openness is a key determinant of FDI where much of FDI is export related and might also require import of complementary, intermediate and capital commodities. The trade volume is related with trade openness, and thus trade openness is expected to be positively and significantly related with FDI.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

### 2.2.7. Exchange Rate

Exchange rate is a determinant factor of FDI inflows. Froot and Stein (1991) found that a weak host country currency increased FDI inflows in an imperfect capital market as depreciation brings host country assets cheaper relative to currency in the home country. On the other hand, however, a strong real exchange rate might strengthen incentive of foreign enterprises to produce domestically, that is, the exchange rate behaves as a barrier to entry of the market that might lead to horizontal FDI flows.

### 2.2.8. Political Stability

The political environment of a country can be a major factor affecting the investment decisions of foreign investors. The political stability of receiving countries may increase the level of FDI inflow. Researches of investors have showed that political or macroeconomic stability is one main concern of incoming foreign investors. Schneider and Frey (1985) asserted that political instability significantly could affect FDI inflows. Firstly, good governance is related with higher economic growth, which would attract more FDI flows. Secondly, poor governance that fosters corruption lead to add to investment costs and decrease profits. Thirdly, the big sunk cost of FDI brings investors more sensitive onto uncertainty, with the political uncertainty that comes from poor governances.

### 2.2.9. Exports

FDI and trade are not only generally complementary and bilaterally supportive but more inseparable as two factors of the procedure of economic internalization. FDI inflows may stimulate exports of domestic companies by industrial linkage and spill-over effects. This effect creates a big demand stimulus of domestic enterprises and increases exports.

### 2.2.10. Inflation Rate

Buckley et al. (2007) found that a fluctuating and unpredicted inflation rate of the host country created uncertainty and discourages of multinational FDI activities. The high inflation rate devalues the domestic currency, and moreover reduces the real return of investment as a result. Therefore, the government launches policies aimed at reducing the inflation rate to reduce the risk in the investment environment. Therefore, stable, low, and predictable inflation rate is to stimulate the inflow of foreign direct investment.

## 2.3. Model Specification

### 2.3.1. Factors Affecting the Ability to Attract FDI in Mongolia Using by Log-Linear Regression

The basic equation is as follows:

$$Y(FDI_{it}) = \beta 0 + \beta 1(GDP_{it}) + \beta 2(EXR_{it}) + \beta 3(EXP_{it}) + \beta 4(INF_{it}) + \beta 5(INFRA_{it}) + \beta 6(Openess_{it}) + \beta 7(POLITIC_{it}) + \varepsilon_{it} \quad (5)$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

where $FDI_{it}$ is the FDI in Mongolia in current US$ at time t:

- **$GDP_{it}$:** The GDP in current US$ of Mongolia at time t, and the measure of market size;
- **$EXR_{it}$:** The real effective exchange rate in Mongolia at time t, and the size of currency value;
- **$Openess_{it}$:** The trade openness in Mongolia at time t, and computed as ratio of imports plus export of commodities divided by GDP;
- **$INFRA_{it}$:** The measure of the infrastructure index in Mongolia;
- **$EXP_{it}$:** The measure of exports of commodities as percentage of GDP in Mongolia;
- **$INF_{it}$:** Measured by consumer price index showing annual percentage change of cost of the average consumer to acquire a basket of commodities that might be fixed or changed at a specified intervals, such as quarterly or yearly;
- **$POLITIC_{it}$:** The index of political and economic risk index in Mongolia measured by World Bank(from -2.5(weak), to 2.5(strong));
- **$\varepsilon_{it}$:** Is error term over time t.

### 2.3.2. Panel Data Analysis of FDI Inflows From the Selected Developed Countries to Mongolia by Using Fixed Effects and Random Effects Models

This section tests the factors deciding FDI flows from the several developed countries into Mongolia through using annual dataset of 12 countries from 2005 to 2013. The study used cross countries panel data and the variables are market size of related countries, trade openness in host country, and distance between home and host countries.

The basic equation is as follows:

$$Y(FDI_{ijt}) = \beta 0 + \beta 1(GDP_{it}) + \beta 2(GDP_{jt}) + \beta 3(DIST_{ijt}) + \beta 4(Openness_{jt}) + timedummies + \varepsilon_{ijt} \quad (6)$$

where:

- **$FDI_{ijt}$:** Is FDI in current US$ of country i at time t;
- **$GDP_{it}$:** Is gross domestic products in current US$ of country i at time t, and market size;
- **$GDP_{jt}$:** Is gross domestic products in current US$ of Mongolia at time t, and market size;
- **$DIST_{ijt}$:** Is the distance between Mongolia and country I;
- **$Openness_{jt}$:** Is the openness of trade in Mongolia at time t, and evaluated as ratio of imports and export of commodities divided by GDP;
- **Timedummies:** Is the dummy variable by year;
- **$\varepsilon_{ijt}$:** Is the error term in time t.

#### *2.3.2.1. Panel Data Regression*

Panel data consist of time series and cross section data. The time series variable observations are taken from 1995 to 2014. The cross-section data is taken from Netherlands, China(PRC), Luxemburg, Virgin Island(UK), Singapore, Canada, Rep. of Korea, U.S.A., Russia, Australia, Hong Kong(China) and Japan. The panel data are balanced without any missing observations.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Two different models are chosen to analyze the panel data model: the Fixed and Random effects model. This study also estimates the two models to incorporate best fit of the estimation.

### *2.3.2.2. Fixed Effects Model*

The fixed effects model deals constant as a group (or section) specific. It allows for a different constant for each group. The fixed effects model is also called Least Squares Dummy Variables (LSDV) estimators, because it includes a dummy variable for each group.

The fixed effects model equation as follows:

$$Y_{it} = \beta_0 + X_{it}\,\beta + Z_i\gamma + \alpha_i + \mu_{it} \tag{7}$$

where $Y_{it}$ is dependent variable measured of individual i in time t, $X_{it}$ the time-variant regressor, $Z_i$ the time-invariant regressor, $\alpha_i$ the unobserved individual effect, and $\mu_{it}$ the error term. The fixed effects model deals unobserved heterogeneity where heterogeneity is constant in time and correlated to independent variables.

### *2.3.2.3. Random Effects Model*

The random effects method has same description, except that samples were randomly selected, so instead of handling coefficients as fixed, some of coefficients are random.

The Random Effects model equation is as follows:

$$Y_{it} = \beta_{0it} + \beta_1 X_{1it} + \beta_2 X_{2it} + \ldots + \beta_k X_{kit} + \mu_{it} \tag{8}$$

$$\beta_{0it} = \beta_{0i} + v_{i,}\, v_i$$

is a standard random variable of zero mean.

In panel data analysis, generally, fixed effects model agrees that respective country differs in terms of intercept, but random effects model takes that respective country differs in terms of error.

### *2.3.2.4. Difference Between Fixed Effects and Random Effects*

The fundamental difference between fixed and random effects is of inference. Fixed effects analysis support only inference in the group of measurements (subjects, ...), whereas analysis of random effects allows to explain something about population. The difference can be simplified as follows:

- Fixed effects assume that the individual-specific effect is correlated to the independent variable;
- Random effects assume that the individually specific effects are not correlated with independent variables.

### *2.3.2.5. Hausman Specification Test*

The Hausman specification test is used to choose either fixed effects or random effects model as suitable panel data model. The Hausman test is the econometric method where the null hypothesis asserts that preferred model is random effects whereas alternative is the fixed effects. It tries to testify whether

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

unique errors ($u_i$) are correlated to regressors. If p-value < 0.05 (that is, significant), it is better to use fixed effects but if p-value>0.05, the random effects model is appropriate.

## 2.4. Empirical Results

### 2.4.1. Factors Affecting the Ability to Attract FDI in Mongolia by Using Log-Linear Regression

The data obtained from 1995-2014 were calculated through using SPSS and the results are spread as shown in Table 1.

The high magnitude of R-square validates the effectiveness of the regression and variables used. The adjusted R-square of 0.828 shows the strength of estimation. Table 1 shows that the estimated coefficient of GDP to the FDI is statistically significant in log-linear regression. As expected, its sign is positive.

### 2.4.2. Discussion of Empirical Results

#### *2.4.2.1. Relationship Between FDI and GDP of Mongolia is Positive and Significant*

The results reflect that FDI and GDP have a relatively positive and significant relationship. The estimated coefficient on FDI indicates that, with other variables held constant, FDI rises by 0.75% for a one percent increase in Mongolian GDP. The t- and p-values of 8.792 and 0.002, respectively, demonstrate the positive relationship. Table 1 shows results of the log linear regression model confirming the positive effect of GDP on FDI ($p < 0.01$). In line with our empirical result, many researchers also found that FDI and economic growth are positively and significantly related.

#### *2.4.2.2. Relationship Between FDI and Exports of Mongolia is Positive but Insignificant*

Through the empirical results, FDI and Exports have positive relationship (t-value=1.848) but insignificant (p-value =0.087). This insignificant effect of exports on FDI into Mongolia is explained as follows.

*Table 1. Regression results of factors affecting FDI inflows into Mongolia*

| Variables | Value | Standard error | t | Pr> \|t\| | Lower bound (95%) | Upper bound (95%) |
|---|---|---|---|---|---|---|
| LogEXP | 0.205 | 0.111 | 1.848 | 0.087 | -0.035 | 0.444 |
| LogINF | 0.054 | 0.104 | 0.515 | 0.615 | -0.171 | 0.279 |
| LogGDP | 0.747 | 0.197 | 8.792** | 0.002 | 0.322 | 1.173 |
| LogINFRA | 0.148 | 0.192 | 0.767 | 0.457 | -0.268 | 0.563 |
| LogPOLITIC | -0.043 | 0.112 | -0.382 | 0.709 | -0.285 | 0.200 |
| LogOpeness | 0.069 | 0.106 | 0.649 | 0.528 | -0.160 | 0.297 |
| R square : 0.882 | | | | | | |
| Adjusted R square : 0.828 | | | | | | |
| DW stat. : 1.56 | | | | | | |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Being a landlocked country, Mongolia has just one destination place for its coal, the China, if there are not infrastructure developments easing access to third country markets such as Rep. of Korea, Japan, or India. Given that almost than 90% of Mongolian exports go to China, Mongolian mining exports are currently heavily dependent on the Chinese market.

#### *2.4.2.3. Relationship Between FDI and Political Stability of Mongolia is Negative but Insignificant*

The negative (t-value=-0.382) but statistically insignificant (p-value =0.709) effect of political unsteadiness related to FDI shows that government policy does not influence FDI inflows to the country. The political environment of a country is a major factor affecting the investment decisions of foreign investors. Searches of investors have showed that political or macroeconomic stability is one of its key concerns. The Mongolian Foreign Investment Law, established in 1993 and amended in 1998 and 2002, raised the country's image among multinational investors as one of the best favorable investment choices of Asia. However, political leadership of Mongolia has kept several crucial missteps, such as legislation directly opposing the interests of foreign investors and companies, those have drastically decreased recent FDI.

#### *2.4.2.4. Relationship Between FDI and Infrastructure Development of Mongolia is Positive but Insignificant*

FDI and Infrastructure are positively related (t-value=0.747) but insignificant (p-value =0.457). An expansive and high-quality infrastructure is an important determinant of FDI inflows. A country can further stimulate FDI inflows by expanding its infrastructure facilities. The infrastructure level of Mongolia is the rank 112 of 148 countries. This underdeveloped infrastructure raises transportation costs to the multinationals.

#### *2.4.2.5. Relationship Between FDI and Economic Stability of Mongolia is Positive but Insignificant*

The economic stability measured by inflation is positive (t-value=0.515) but insignificant (p-value =0.615) in determining the FDI inflows. When p-value of 0.615 and t-value of 0.515 were run though regression tests, it revealed a positive relationship with insignificant effect of economic stability on FDI into Mongolia.

#### *2.4.2.6. Panel Data of FDI Inflows From the Selected Developed Countries to Mongolia by Using Fixed Effects and Random Effects Models*

The regression analysis results presented in Table 2 show that the independent variable FDI is highly related with Mongolia's GDP. Such high correlation among the independent variables will induce the problem of multi-collinearity in the panel data estimation. The results of coefficients' sign and their significance levels of fixed and random effects are almost similar.

Both random effects and fixed effects models confirm the significance ($p < 0.05$) of Mongolia's market size (GDP). Both fixed effects (p=0.0495) and random effects (p=0.0503) models show a positive and significant relationship. The result shows that Mongolia's GDP is positively related and significant with FDI, whereas its trade openness is positively related but insignificant with FDI. The distance is also positively related but insignificant to FDI. The time dummy variables (dummy_t6 to dummy_t8)

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

are highly related, with $p < 0.05$, to FDI in both fixed and random effects models, with adjusted R-square values of 0.80 and 0.89, respectively. The present study has aimed at choosing fixed or random effects model as the best appropriate panel data model. For this, the Hausman test was used with the null hypothesis that preferred model is random effects compared to the alternative of fixed effects. The Hausman test p-value of 0.0492628, revealed that the fixed effects model is slightly more efficient than the random effects model.

## 3. SUMMARY AND CONCLUSION

Since the centrally planned economy until 1990, Mongolia has transitioned from communism to democracy, leaving from centrally planned to free market-oriented economy. Mongolia has taken considerable steps to establish vibrant economy with a booming economic growth. Through its openness to FDI, foreign investors have been main determinants in the process of Mongolia's economic transformation and growth. During the period of very high FDI inflows from 2011-2013, Mongolia's endogenous economic growth was one of the fastest among developing countries worldwide. The rapid development of mining sector and strong increase of output made more jobs, raised average wages, increased exports, transferred knowledge and skills into Mongolia, and accounted for a significant portion of total tax revenue.

Both study results showed that FDI is highly related to economic growth of Mongolia. The first model results revealed that FDI inflow is highly related ($p < 0.01$) with GDP, if other variables are held constant. Exports are positively related with FDI but insignificant. Political stability is negatively related but insignificant. Trade openness, infrastructure and inflation are positively related but insignificant with FDI. The second study results showed that FDI is highly related ($p < 0.05$) with Mongolia's GDP. FDI inflow is positively related and significant with Mongolia's market size. The 9 time dummies, 2005 to

Note: 1. The coefficient of variable is revealed first, followed by t-statistic in parentheses. 2. *, ** indicate significance levels of 5 and 1 percent, respectively. 3. (*) is denoted when t-value is almost equal to 2 and p-value to 0.05.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

2013, were used in the model. The result showed that 2010, 2011 and 2012 year's dummy variables are positively related and significant ($p < 0.05$) with FDI in the random and fixed effects models.

The Mongolian government needs to improve its infrastructure to attract further FDI into the mining industry, as demonstrated by Mongolia's low infrastructure ranking of 112$^{th}$ out of 148 countries. Further, the Mongolian government should revise its investment law, improve the investment environment and standard of services, strengthen the legal framework and maintain the economic and political stability.

# Chapter 45
# Outward Foreign Direct Investments:
## Experience of Polish Companies

**Anetta Kuna-Marszałek**
*University of Łódź, Poland*

**Agnieszka Kłysik-Uryszek**
*University of Łódź, Poland*

## ABSTRACT

*Dynamic changes that have taken place on Polish, European and global markets for the last two decades shifted significantly the conditions in which companies operate. Globalization, liberalization of capital flows, participation in the European Union not only increased competition on Polish market, but radically boosted the competitive potential of Polish firms. This, in turn resulted in growing interest in expanding the activity on international scale in the form of Outward Foreign Direct Investments (OFDI). Therefore, the aim of the chapter is to discuss the most important stimuli, which impact competitive potential of Polish companies and increase their interest in foreign activity. Moreover, theoretical background of company's internationalisation are presented, as well as the scale and structure of Polish OFDI and incentives provided by Polish institutions.*

## INTRODUCTION

Dynamic changes that have taken place in Poland during the last 25 years shifted significantly the conditions in which companies operate. Polish economy emerged from half a century of state control, industries were privatized, and reforms enabling market-based competition were introduced. Within a few years, Polish GDP began to rise significantly, operating conditions became more favourable for business, which resulted in the mushrooming of dynamically developing firms. Accession to the European Union (EU) in 2004 delineated a development path that enabled the country to catch up with the most advanced economies of Europe (Bogdan, Boniecki, Labaye, Marciniak, & Nowacki, 2015).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Recent two decades are marked with a clearly increasing potential of Polish enterprises, which is reflected not only in their increased activity in the internal market but, primarily, abroad. More and more often international expansion takes a form of outward foreign direct investments (OFDI), which (due to political and legal restrictions) practically did not exist before 1990. The Europe Agreement signed in 1994 and establishing an association between the European Communities and their Member States and Poland gave more freedom in the movement of capital. However, real investment boom took place only in the last decade.

The main research task of the chapter is to investigate the scale, structure, and directions of Poland's OFDI. Moreover, the authors present conditions, which increased the competitive opportunities of Polish companies and their interest in OFDI. The chapter consists of four major parts. Theoretical concepts, which explain internationalisation models for companies, are reviewed in the Background. The second part outlines Polish transformation experiences since 1989 and the main directions of the political and economic changes during the last 25 years, which have influenced the development of entrepreneurship in Polish firms. The third one discusses the conditions that encouraged Polish firms to start their FDI activity as well as the main motives behind the process. The fourth part presents the picture of Polish OFDI, their scale, structure, sectorial patterns and directions in light of the current theories and existing research.

The study uses statistical data obtained from the Central Statistical Office of Poland (in Polish: Główny Urząd Statystyczny (GUS)). Although data available from the National Bank of Poland ((in Polish: Narodowy Bank Polski (NBP)) cover a longer research period, data from GUS enable a more detailed analysis of the phenomenon in question.

## BACKGROUND

The process of internationalisation of enterprises is defined in various ways by scholars and academics. Mostly, the term "internationalisation" is connected with the expansion of enterprises to foreign markets, which is closely linked to progressing globalisation, including liberalisation of trade and capital flows and technological progress. It depends, inter alia, on the motivation or propensity of economic operators to go international and results from the engagement of their own resources or getting involved in various forms of cooperation with foreign partners. Thus, Wind, Douglas, and Perlmutter (1973) stress that internationalisation is a process where the specific conduct of enterprises is connected with subsequent stages in the evolution of international operations. Johanson and Vahlne (1977), Johanson and Mattson (1993), and Calof and Beamish (1995) understand internationalisation as a process of increasing international involvement and the adjustment of a company's operations to the specificity of the international environment.

Internationalisation is discussed from different angles, e.g., the theory of organisation, strategic management, international management, foreign trade, or regional development. Nowadays, definitions also take into account the relevance of R&D activities undertaken abroad. The approach is visible in Hollensen (2011, p. 41), who claims that one may speak of internationalisation when a company expands its production, sales, R&D, and other activities to foreign markets.

The literature most frequently highlights the evolutionary nature of internationalisation, although it is not always progressive or gradual (Jones & Coviello, 2005). The path of company internationalisation is firmly linked with the development of the industry in which the company operates (Andersson, 2004)

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

and often depends on network ties (Sharma & Blomstermo, 2003) or resources and capabilities of the organisation (Sapienza, Autio, George, & Zahra, 2006).

In order to demonstrate the specificity of multinational enterprises many theoretical concepts have been used, such as classical, neoclassical and modern theories of international trade, or the FDI theories. Among the most important group of internationalisation theories, the models of stage internationalisation (e.g., the Uppsala model), early internationalisation theories (unconventional, accelerated internationalisation models) and network theories should be emphasized. Most of them identify key determinants of the engagement of companies with the foreign markets, justify the advisability of international expansion and highlight its major effects. Below the authors present only selected, the most relevant theoretical concepts and examples of empirical studies connected with firm's internationalisation.

Authors start with FDI theories. The multitude and diversity of theoretical concepts have resulted in their multiple classifications: 1) macroeconomic theories (Kojima's (1973) theory of relative shift in the cost of labour and capital, and Dunning's (1973) theory of investment position in international markets); 2) microeconomic theories (theory of oligopolistic reaction of enterprises by Knickerbocker (1973), Hymer's (1960) theory of ownership advantage, Buckley and Casson's (1976) internalisation theory); 3) mixed theories (Rugman (1980) or the eclectic theory of international production of Dunning (1979, 1980), the so called OLI paradigm[1]).

Some attention should be drawn also to the reasons behind FDI. Dunning divided them into four groups: market seeking, resource seeking, efficiency seeking, and strategic asset seeking (Dunning, 2000). In later studies (Dunning, 2003, 2004, 2006) he also stressed the importance of the political framework and business environment, i.e., institutions. It is worth mentioning that most of the determinants he identified are universal for countries or regions, although some of them, such as privatization policy, are more important to developing or transition economies.

Dunning and Lundan (2008) point to possible FDI motivation outside of the above described categories: 1) escape investment – made to avoid restrictive legislation or macroeconomic policies in the home country; 2) support investment – made with the intention of supporting the operations of a given enterprise, and 3) passive investment i.e., those which do not meet the criteria of the FDI definition.

In the internationalisation literature, the expansion of an enterprise to foreign markets is often explained in the context of subsequent phases of its internationalisation. Among the models that describe sequential entry into foreign markets, the Uppsala model is one of the most frequently emphasized. It is one of the earliest and most popular concepts, and the one which assumes an enterprise's gradually increasing involvement in a foreign market (Johanson & Wiedersheim-Paul, 1975; Johanson & Vahlne, 1977).

The weaknesses of the Uppsala model (Reid, 1983; O'Grady & Lane, 1996; Forsgren, 1989; Whitelock, 2002) and the changing circumstances of business operations in international markets resulted in development of the concepts of unconventional internationalisation. They challenge the sequential and cumulative nature of internationalisation by highlighting a possibility to skip some of its stages (leapfrogging) and that of pursuing simultaneous operations in many foreign markets. Firms may simultaneously enter many markets under various internationalisation arrangements (Sharma & Blomstermo, 2003). When making their choices they reflect a great deal of flexibility (Rialp, Rialp, & Knight, 2005) and easily adapt to customers' needs and the requirements of the competition. In the internationalisation literature, such enterprises are referred to as born global, global/early start-ups. They can offer unique and highly specialised products/services and use original know-how and knowledge. In some technology-intensive sectors, like electronics or ICT, products have specific characteristics (e.g., scalability), which

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

may facilitate rapid internationalisation of enterprises (Cannone & Ughetto, 2014). The literature on models and paths of unconventional internationalisation is abundant (Gabrielsson & Gabrielsson, 2011; Cannone & Ughetto, 2014; Monferrer, Blesa, & Ripollés, 2015). This strand of research continues developing dynamically.

Another group of models trying to explain enterprise internationalisation is the so-called network approach. Business networks are often defined as a system of two or more connections between market participants who interact with each other and develop mutual inter-dependencies (Anderson, Håkansson, & Johanson, 1994), which evolve according to the changes in the economic environment (Johanson & Vahlne, 2009, p. 1414).

The literature highlights the relevance of networks in the internationalisation of enterprises, in particular to born global firms and to small and medium sized enterprises (Johanson & Vahlne, 2009; Kontinen & Ojala, 2011, 2012). Empirical studies confirm the theory demonstrating that firms, be they in developed or emerging markets, use networks to identify or exploit the possibilities to expand to foreign markets. Network is also used for the accomplishment of internal goals (Ciravegna, 2011; Kontinen & Ojala, 2011).

Studies of Polish foreign investment are relatively scarce. The broadest studies were conducted by Karaszewski (2013), Umiński (2010), Witek-Hajduk (2010), Jarosiński (2013), Buczkowski, Kłysik-Uryszek, Kuna-Marszałek, and Świerkocki (in press). These studies have led to similar conclusions: Polish enterprises most frequently choose a stage path of international expansion but most of them are not very advanced in the process. The dominant motivation is a wish to gain new markets resulting from the gradual saturation of the domestic market and the conviction that the quality of offered products is high (especially with respect to the price-quality ratio). Expansion directions are dominated by the markets of neighbouring countries, not only due to their geographical but also cultural proximity. The most frequently mentioned models which describe the internationalisation path of Polish enterprises are the Uppsala model (Kłysik-Uryszek & Kuna-Marszałek, 2015), but also the early internationalisation models (born global). Expansion through the development of network relationships was not particularly popular with Polish enterprises, which may result from the low degree of their internationalisation and little experience in the process (Kłysik-Uryszek & Kuna-Marszałek, in press). In fact, Polish entrepreneurs are still not very aware of the opportunities offered by becoming part of an international division of labour (also within cooperation networks and capital linkages).

Aside from the strand of studies focused on the general condition of the internationalisation of Polish enterprises, the authors also need to note writings on selected aspects of internationalisation, e.g., the role of cluster initiatives in the internationalisation of enterprises (Gorynia & Jankowska, 2007), early internationalisation of small and medium-sized enterprises (Daszkiewicz, 2004), impact of internationalisation upon the choice of marketing strategy in enterprises (Pietrasieński, 2004).

Most of the above-mentioned studies, however, concern internationalisation in a broader context (all stages, starting with exporting) rather than only direct investments made by Polish enterprises. Thus, the current study seems to fill, at least to certain extent, the existing gap.

## MAIN FOCUS OF THE CHAPTER

### The Experiences of Polish Transformation: Impact on Entrepreneurship Development

Before 1989, Poland as well as other communist countries in the Central and Eastern Europe (CEE) had been a centrally planned economy. The state administration activities at various levels and enterprises (mainly state-owned) had been strictly controlled. The reconstruction of market system in Poland after fifty years of central planning was difficult, exhausting, and time consuming. Poland underwent macroeconomic reforms, which were introduced the earliest and the fastest among the post-communist states. At the beginning, they consisted in implementing a tight monetary policy and market-economy rules, necessary in view of the total macroeconomic imbalance at the outset of transformation. New legal system had to be built from scratch.

In the 1990s, the so-called "Balcerowicz Plan" or more formally "The Economic Transformation Program" was introduced with the support of the International Monetary Fund. Numerous actions had to be undertaken, and the so-called "shock therapy" started[2]. Market prices were liberalized from state control, domestic market was opened up for foreign trade, and trade requirements were simplified. Public finance reform was launched and full convertibility of the Polish zloty (PLN) was introduced. Poland remodelled the important social-safety net (e.g., pension scheme, social insurance, education) and introduced a program of privatization of state-owned enterprises. Besides, a series of legal changes was introduced which led to the emergence of a financial and capital market sector, relevant mostly due to the role it played in the creation of a viable stock market.

The first outcomes of social and economic reforms were linked to negative phenomena, such as hyperinflation (in 1989 inflation reached some 900%), devaluation of the Polish zloty, multi-fold increase in interest rates on loans, drastic drop in production, and deterioration in living standards. The policy pursued at that time led to the reduction of social functions of the state, which was reflected by their partial commercialization and privatisation. It resulted not only from the fiscal pressures, but also from the dominant conviction of politicians regarding the public sector inefficiency and the necessity to reduce its scope. Moreover, privatisation adversely affected the labour market by increasing the unemployment from 3.4% in 1990 to 16.5% in 1994 (Główny Urząd Statystyczny, 2015). Over the years 2002-2004, the unemployment rate ranged between 19.0% and 20.0%. Amongst other serious issues, a permanently negative balance of trade was the problem. While in 1990 Poland recorded a trade surplus of $4.8 billion, since 1991, it experienced an acute trade deficit.

Systemic changes were of fundamental importance to entrepreneurs. In a centrally planned economy, the private sector was tolerated and marginalised by the dominant state sector. After 1989, everyone could start a business, and many Poles took advantage of this opportunity. That became feasible following amendments made to regulations and creating a climate conducive to the enhancement of the entrepreneurial spirit. Many new provisions entered into force that regulated economic activity, e.g., the commercial law, tax code, and the banking law. After fifty years of the centralised economy, private sector has finally been catching up with its developments.

Micro and small enterprises, practically right from the outset of the transformation until to date, have represented the vast majority of firms in Poland. Micro firms are the most numerous; almost 95% of enterprises employ less than 10 workers. However, within the last two decades the share of the smallest firms decreased while the share of medium-sized companies rose. The number of large companies

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

is shrinking as old post-communist giants have been privatised, commercialised, closed down or went bankrupt, and their assets have been introduced into the private sector. Only a handful of them are still in operation in some specific sectors in mining, fuel, energy, and defence industries. According to Bąkiewicz (2012), private sector in Poland evolves towards the structure typical of mature economies.

Entrepreneurship development was facilitated by political decisions on the accession to the EU structures. After several years of intense diplomatic and political summitry, accession negotiations were completed, and Poland and nine other countries formally joined the EU in 2004. Accession created new challenges and quality for economic transformation in Poland and had its impact upon the enterprise sector. Polish exports to the EU have literally soared from the moment of accession, especially to the countries in geographic proximity.

With the benefit of hindsight, it can be seen that free movement of goods has been a well-taken opportunity by Polish firms. Within ten years following the accession, they exported to the EU goods worth almost PLN 3.5 billion. This is twice the value of Poland's GDP (Ministry of Foreign Affairs of the Republic of Poland, 2014). Over the period 2004-2013 Polish exports to the EU increased almost threefold compared to 2003, while imports grew significantly slowly. The only exception was 2009 when trade turnover with the EU decreased because of the crisis. Poland experienced an export boom and an increase in productivity: number of exporting firms grew twice as fast as the total number of companies. As a result, in 2013 Polish companies earned one fifth of their revenues from export. It is also worth stressing that within a relatively short period of time Poland has become one of the leading European producers and exporters in key industrial sectors (such as automotive industry, electronic and home appliances sectors, or furniture sector). Besides, Poland has also become an important service provider in the EU market.

Dynamic growth of sectors of industry controlled by foreign capital is another interesting outcome of the transformation in Poland. At present, Poland is one of the countries with the highest share of foreign capital in the economy. Using the synthetic measure encompassing basic economic parameters and outcomes, in 2012 its share could be estimated at 47% in industrial manufacturing and 23% in the remaining industries. In the financial sector, the engagement of foreign capital is even higher (Cieślik, 2015). The cumulated value of FDI in Poland reaches almost 50% of GDP. Over the last several years, including the times of crisis and economic downturn, Poland (from among the countries of CEE) was one of the most preferred destinations for foreign investors.

Transformation of Polish economy was a long lasting and complicated process. After 25 years, many economists consider it is still not completed. Continuation of reforms started in the 1990s brought generally positive results, which provided growing competitiveness and sustainable base for further economic improvements. GDP growth was maintained, and over the years 2002-2014 Poland often outperformed other countries in the region (Eurostat, 2015). Real GDP has been increasing cumulatively by 19% since 2008, which, according to the report of the European Commission (2015), has been an unparalleled performance among all the EU member states. Poland's GDP per capita in 1995 represented 43% of the EU average, in 2000 – 48%, in 2013 – 67%. It means Poland is catching up, in terms of wealth, with the Western EU countries.

In the first years of the EU membership, Poland experienced investment and consumption boom, which, in turn, resulted in structural changes. The major ones include: increase in the share of services in the GDP with simultaneous drop in the share of agriculture, increase in the efficiency of the economy as a result of technological progress and intensified competitiveness in the internal market, increases in the production levels of medium- and highly processed goods, and an increased share in global trade

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Ministry of Foreign Affairs of the Republic of Poland, 2014). Effects of these changes are visible in annual competitiveness rankings, in which Poland slowly but systematically improves its position. For example, between 2004-2015, Poland's location in the Global Competitiveness Index ranking improved from 60 to 43 (Schwab, 2015).

Macroeconomic stabilization and economic liberalisation have also brought positive effects in the microeconomic sphere. Polish private sector became efficient and competitive. Its output increased along with its production capacity; more and more enterprises embark on the path of internationalisation. That is also true of small and medium-sized enterprises.

However, despite many positive changes in the Polish economy it exhibits certain cyclical and permanent problems, e.g., increasing public debt, high unemployment, increased gap between rural and municipal areas, and relatively low wages. At present, wages in Poland are far behind the EU average. Recommendations included in the reports of international institutions point to the need of structural reforms connected with the fiscal policy and changes with respect to the labour market. Attention is also drawn to the need to increase R&D outlays and to improve support schemes and mechanisms addressed to small and medium-sized enterprises.

## Sources of International Competitiveness and Investments Motives of Polish Companies

The first decade of the 21st century witnessed a significant change in the share of Poland in international flows of long-term capital. Even though Poland remains a net importer of FDI and is perceived as an attractive investment location, export of capital has increased seriously. 25 years after transition and a decade after joining the EU, Polish economy enters a stage of active internationalisation reflected in FDI[3]. Increasing international activity of Polish companies seems a natural consequence of economic development.

However, increased scope of international expansion of companies is influenced by several factors. Firstly, globalisation and liberalisation of capital flows, which considerably change business environment in Poland. Nowadays it is much easier to relocate production in a search for new, better conditions for business activity. On top of that, differences in prices of production factors between neighboring countries instigate specialisation and trigger OFDI. Poland's integration with the EU provides additional encouragement for firms to expand their activity abroad. Due to the EU membership Poland's investors are perceived as reliable partners providing world-class products, especially when investing in the eastern markets, where they have competitive advantage in products and services.

Secondly, economic development and structural changes in the economy over past 25 years, technological progress, increasing competition, and capital accumulation shift competitive advantages of Polish firms. Dominant labour and resource-intensive industries have been partly replaced by technologically advanced manufacturing. These changes improve market position of firms and their competitiveness, therefore, in accordance with the OLI paradigm (Dunning, 2000), facilitate effective internationalisation.

Thirdly, increasing openness of Polish economy already for over two decades has intensified the inflow of FDI to Poland. Hence, Polish companies have been competing on the domestic market with strong multinational companies for years, and the successful ones are fully prepared to compete also on foreign markets. When a new competitor enters the domestic market, a part of the market share is always lost to the new entrant. Seeking new growth opportunities abroad comes as a natural consequence. Thus, opening the market to FDI mobilises the strongest local companies to work out new ownership advan-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

tages, which help them operating effectively also at international level. Their marketing, organisational and often technological capabilities become substantial. However, technological advantages of Polish firms should not be interpreted as absolute domination over all actors on the market. Strong position in an industry suffices. Poland enjoys long-lasting, strong comparative advantages in labour-intensive industries, therefore in traditional sectors companies perform very well internationally. Few Polish companies get involved in international competition in modern hi-tech sectors.

Location factors are subsequent incentives for Polish companies. For industrial and trade investments they choose mostly neighbouring countries. That is in line with the Uppsala model conclusions (Kłysik-Uryszek & Kuna-Marszałek, 2014). The model suggests that in the initial stages of internationalisation, investors opt mostly for markets close to their home location. The reason is not just geographical proximity but mainly the psychic distance defined as social and cultural proximity. It facilitates "adaptation" of a company in a new location, understanding market mechanisms, business environment and interpersonal relations, which are the most important in economic activity. Many Polish entrepreneurs combine knowledge and experience, acquired in the course of 25 years of transformation, and they are able to work in a less stable and supportive institutional environment. They show relatively high flexibility due to the smaller size and shorter decision-making chains, so they are able to respond promptly to changing market conditions and to adapt their products to the current market situation. Consequently, they have clear advantage in less developed countries, which are still undergoing economic transformation, over the competitors from Western countries (Petru & Walewski, 2012). Moreover, Russia and Ukraine offer a huge market potential for Polish ventures with relatively cheap labour and growing demand. That seems extremely important, as Polish firms which embark on international expansion are guided mostly by market and resource-seeking (cost) motives. Empirical studies (Karaszewski et al., 2012; Stępniak & Zabłocka, 2009; Petru & Walewski, 2012) indicate "market seeking"[4] as a main motivation for Polish companies. It should be considered a good sign as it means that Polish products are already attractive for international markets, and companies are able to compete effectively.

Domination of market-related motives does not mean Polish companies are not guided by more "advanced" motivation. On the contrary, they seek efficiency and strategic assets although these motives are characteristics of more experienced investors (e.g., for multinational and innovative high-tech companies of the born global type). Polish entrepreneurs try to improve profitability and global efficiency seeking favourable tax arrangements or business environment on foreign markets. Large portion of those investment ventures are located in the countries offering favourable regulatory and tax systems, which significantly reduce fiscal burden. Specific attention should be paid to a few young innovative companies looking for knowledge and other strategic assets on international markets, which invest in global IT centres. Software Company Mobica which is about to open its office in San Jose, in the Silicon Valley, USA is one among the latest examples of such firms.

Finally, increased engagement in outward FDI arises from the operations of the foreign-owned branches and subsidiaries of multinational companies located in Poland. As they are perceived as Polish residents, their investments are reported in the statistics as Polish OFDI. That is misleading as the investment has got nothing to do with competitive advantages of Polish entities but results from ownership advantages of the multinationals. Hence, it may be independent of economic development and current economic situation in the country. International expansion of global corporations via their subsidiary companies located in different countries is a common phenomenon. For example, in Austria a substantial part of OFDI is made of investment by international capital groups rather than domestic companies with local

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

capital (Gorynia, Nowak, & Wolniak, 2007), and the majority of investment by U.S. corporations in Europe takes place via their subsidiaries in the Netherlands.

As for the effects of internationalisation, many Polish companies have pointed out that thanks to OFDI they could maintain or even increase sales, what often would not be possible without entering new markets and creating new production capacity. They also achieved higher stability by becoming less dependent on the situation at domestic market and got wider access to raw materials. OFDI has been the way to diversify the market risk, related to the demand for company's products and services, and related to the security of supply chains (Buczkowski, 2013). The main challenges and barriers faced by investors are cultural differences, corruption, organizational and administrative burdens in the host country, language barriers, distribution problems at local market, lack of qualified workers, and high operating costs (Petru & Walewski, 2012).

## The Picture of Polish OFDI: Scale, Structure, and Directions

Despite intense economic transformations, uninterrupted growth and economic development, Polish OFDI are a relatively new phenomenon. Poland's accession to the EU apparently marked the turning point. Before that moment, the cumulated OFDI value represented only 1% of GDP. Since 2004 investments have soared up to almost 12% of GDP in 2012 (Figure 1).

According to information included in the balance of payments, the total value of Polish OFDI was $55.2 billion (PLN 166.2 billion) in 2013 but the record-breaking year was 2012 – $57.4 billion (PLN 180 billion). These values include all FDI flows between residents and non-residents in all sectors of the economy. Unfortunately, data from the balance of payments statistics are little detailed with respect to the effects of the involvement of Polish entrepreneurs abroad. That is why the authors based their analyses on GUS data. It enabled them to provide the number of investors, foreign affiliates, employment, revenue, and trade. However, GUS data do not include the investments of the financial sector, which account for a substantial portion of all Polish investments. That is why the authors were not able to compare the values from Figure 1 with further presented data. On top of that, GUS data come from the statements submitted by enterprises, hence the revenues and sales are quoted only in Polish zloty. Another drawback is the time scope of available GUS data. Due to the relatively limited scale of OFDI regular questionnaire based studies have been conducted since 2008 and comparable data have been available since 2009. Nevertheless, despite such a short research period certain relevant tendencies in the scale, structure and geographical directions of Polish OFDIs may be observed.

In spite of the difficulties caused by the global economic crisis, over the period 2008-2013, Polish enterprises significantly increased their direct capital engagement in the foreign markets. In 2008, 1,106 operators declared having foreign affiliates, in 2013 their number increased to 1,588 (Table 2). The year of 2012 was less favourable for the expansion of Polish foreign investors as their population shrank to 1,437. Nevertheless, the number of foreign affiliates was regularly increasing from 2,541 in 2008 to 3,366 in 2013 (Figure 2).

The share of industrial manufacturing operators oscillated around 30-35%, construction –10-13%, and trade – 21-26%. Companies involved in professional, scientific and technical activities (mainly operations by headquarters, special purpose companies and management consulting) represented 8-9% (Table 1). In the industrial sector manufacturers of metal products, food (both food processing and beverages), rubber and plastic products as well as machinery and equipment were the most internationally active. Many foreign affiliates were owned by several producers connected with producers of coke and refined

petroleum products[5] (these are mainly one or two big investors, classified among the biggest Polish companies – ORLEN S.A. and KGHM S.A.).

Investors most frequently established independent companies abroad. That business arrangement was identified for 86% of all foreign affiliates. They were mostly subsidiaries with 100% share of investor's capital, and, less frequently, they were related companies with the investor's majority shareholding. Only every tenth entity was established as a branch and every thirtieth as a plant.

Over the period covered by the study, 80% of all investing enterprises were members of capital groups, which is indicative of their stronger market position. Considering the substantial share of foreign investors in Poland, it seems surprising that only slightly more than 1/3 of enterprises engaged in FDI were members of foreign capital groups (with the dominant company based outside of Poland). Other entities declared membership of groups with Polish companies as dominant actors.

It must also be stressed that investors not always pursue the same economic activity abroad as they do domestically (Table 2 and Table 3). Activities identical with those of the parent company were declared by less than 60% of operators with over 40% performing other activities. The latter were mostly trade and professional, scientific and technical services (which most often means delocalisation of headquarters, establishing special purpose affiliates or advisory entities – in order to reduce the tax burden).

At this point, it is worth remembering that according to the studies, Polish enterprises are at initial stages of active internationalisation. That is confirmed, inter alia, by the structure of foreign affiliates related to industry. In 2009 45%, and in 2013 as many as 55% of them were involved in services and more than 2/3 out of them dealt with trade, focusing on support to exports. Business support entities (management, administration) also enjoyed a big share.

Source: Authors' calculations based on Główny Urząd Statystyczny (2015)

Over the period covered by the study, employment generated by Polish entrepreneurs abroad was increasing systematically from almost 130 thousand people in 2009 to 150 thousand in 2012, and then dropped by over 7% to fewer than 140 thousand in 2013. Employment increased in both manufacturing and trade. Drop was mainly due to the reduction of the employment in other sectors of the economy (Table 4). Out of industrial investors, producers of coke and refined petroleum products, food, metal products, and furniture created the biggest number of jobs abroad. Over the entire examined period, average size of employment in foreign affiliates connected with Polish investors was 40-50 people.

The revenues generated by foreign entities increased over the same period from PLN 107 billion to almost PLN 150.7 billion (Table 5). Its biggest part came from entities owned by industrial investors (their share accounted for 60% of the total revenue in 2009, almost 73% in 2011, and 67% in 2013), mainly manufacturers of coke and refined petroleum products. The latter achieved total revenue from foreign operations exceeding PLN 72 billion in 2011, which represented almost 3/4 of the revenue generated by industrial investors and more than a half (53%) of the total revenue generated by all Polish FDI.

To complete the analysis of Polish investors' operations abroad the attention should be drawn to affiliates' exports and imports. They may measure the level of competitiveness of a given enterprise and give information about how the investment was used as a platform for further international expansion. The share of intra-group trade in revenue may measure the degree of vertical integration within a capital group, the scale of using network production linkages and an attempt to improve the overall performance of the corporation.

Over the period 2009-2011, exports of foreign affiliates increased from PLN 25 billion to PLN 43 billion (Table 6), which accounted for almost 25-30% of the total revenue (Table 5). 4/5 of that was generated by affiliates of industrial companies, and here the export-to-revenue ratio was the highest. Nevertheless, it needs to be stressed that generally low share of export sales in total revenue is indicative of investors' intentions, who decided to make FDI mainly to win the markets, not to improve the efficiency or seek possibilities to reduce the costs of production due to the effect of globalisation.

The tendency observed in industry is even clearer for affiliates related to investors dealing with trade, which export only 13-15% of their output. In the remaining sections of economic activities the index was even lower (in construction it did not exceed 8%).

The scale of vertical linkages in foreign trade of the analysed operators gradually increased. On average, 25-35% of exports targeted parent companies or other related entities within a capital group. In affiliates of manufacturing companies, the percentage was a bit lower, but it also increased over the analysed period. The biggest vertical export was recorded by construction companies and affiliates of operators involved in professional, scientific, and technical activities. As for the latter, the authors may associate it with the provision of services to related companies within a capital group by affiliates based in countries offering more favourable legal and tax arrangements[6].

From the viewpoint of investors, an increased share of vertical trade may be considered a positive change. Strengthening vertical integration of the value chain may evidence the active seeking of opportunities to reduce costs, purposeful allocation of factors to locations offering transnational benefits, and improvement of the global competitiveness of the corporation. However, from the point of view of the Polish economy, the assessment is not so unambiguous. Substantial imports from foreign affiliates may substitute domestic production and reduce employment in the parent company.

Detailed outcomes could be examined by including the structure of trade flows. Import to Poland of final goods manufactured in foreign affiliates produces the effects different from import of materials and semi-finished products or investment goods. Unfortunately, the available data do not enable such an analysis.

*Table 6. Exports by foreign affiliates total and to related companies (vertical export) by investor's NACE sections*

Much higher index of vertical linkages can be identified for imports by foreign affiliates. In the period covered by the study, 80-90% of foreign purchases originated from parent companies and other related entities. The highest indices were recorded in manufacturing (for foreign affiliates of manufacturers of pharmaceuticals, metal products and electrical devices it was close to 100%). Taking account of the generally increasing value of imports by foreign affiliates (Table 7), the phenomenon should be considered as positive for the Polish economy as it stimulates domestic production (irrespectively of the fact whether they import intermediate or investment goods).

Polish enterprises have invested their capital in almost 100 countries, however, a detailed analysis of the geographical breakdown of their investments clearly indicates that European markets, in particular those in neighboring countries, were especially attractive to Polish enterprises. Almost 85% of all foreign affiliates are based in Europe (and 88-90% of affiliates owned by manufacturing companies) while almost 63% in the EU countries. Over a half of foreign affiliates of Polish companies (and slightly more than 60% of manufacturing companies) were located in the immediate neighborhood (Germany, the Czech Republic, Slovakia, Ukraine, Belarus, Lithuania, and Russia) (Table 8). Neighboring non-EU countries were more interesting to industrial companies than other EU member states which do not share borders with Poland. Considering the fact that investors were mainly interested in seeking markets in the host countries, it may confirm the thesis that Polish enterprises follow the internationalisation strategy in line with the assumptions of the Uppsala stage model.

The majority of foreign affiliates are located in Germany. Their number increased from 372 in 2009 to 469 in 2013. Further down the list there are Ukraine (however the number of entities dropped there), the Czech Republic, Russia, Romania, Cyprus, Slovakia, Lithuania, and Hungary. At the end of the top-ten list, there is the Great Britain with 87 affiliates in 2013.

On average 1/3 of all ventures were undertaken by manufacturing companies but in some countries their share very much diverged from the average. Manufacturers willingly located their affiliates (not necessarily production plants but trade entities as well) in Germany, Ukraine, the Czech Republic, and Russia, where they accounted for 40% of all affiliates owned by Polish investors. In Belgium affiliates of industrial companies represented almost 52% of all businesses, in which Polish capital was involved, and in China – 50% (out of which 1/4 were metal products manufacturers and 1/5 manufacturers of machinery and equipment). Cyprus, Malta, Luxembourg, and the Netherlands turned out to be the least attractive for manufacturers, as investments in these countries did not exceed several percent of all foreign investments by Polish enterprises. Small countries offer attractive legal and tax solutions mostly to service providers (in particular in finance and business process outsourcing).

Source: Authors' calculations based on Główny Urząd Statystyczny (2015)

It is also worth drawing attention to geographical differentiation of entities according to their principal line of business. Manufacturing entities (i.e. production plants) dominate in less developed countries, which offer cheap labour, e.g., Belarus (almost 100%), Romania (75-80%) or China (almost 100%). In Russia, Germany, and Ukraine 60-70% affiliates of Polish manufacturing companies were involved in manufacturing (the rest were mainly trade oriented). In small countries neighboring Poland, the proportions were reversed. In Lithuania, Slovakia, Hungary, and the Czech Republic the share of manufacturing affiliates did not exceed 40% of all subsidiaries established by Polish industrial investors.

Types of pursued activities closely relate to the demand for labour, which is definitely the highest in manufacturing and trade. In 2013, Polish investors created the highest number of jobs in Germany, Russia, Ukraine, and the Czech Republic. Relatively many jobs were also created in Belarus and Slovakia, i.e., in countries where these activities dominate. Labor intense activities were settled in China and Kazakhstan in 2012: (in the former) more than 1,600 people were employed in 45 Polish entities and (in the latter) more than 2,000 employees worked for 33 Polish entities. Cyprus, Malta, Luxembourg, and Switzerland are targeted by special purpose entities[7], which benefit from the tax optimisation strategy in the parent company and/or finance-related investment. These activities do not require big plants and their employment is minor, 1-2 people per affiliate.

As for the income of foreign entities owned by Polish investors, its total value was constantly increasing throughout the period between 2009-2013 from almost PLN 108 billion to PLN 151 billion. The highest revenue was earned in German and Czech markets (Table 9). Affiliates in these countries generated 40% of the total revenue earned by Polish entities abroad. Moreover, the concentration rate increased from 38% in 2009 to 45% in 2011 and 43% in 2013. Russia came third but the revenue earned there was almost three times lower than in the Czech Republic. High dynamics of revenue increases in the affiliates in Russia, since 2009 the market has significantly "caught up" with the top runners.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

When analysing the revenue of foreign affiliates, exports and share of exports in the revenue should be taken into account. In the examined period export increased at greater rate than the revenue, which resulted in higher export-to-revenue ratio, which, however, did not exceed the threshold of 30%. It proofs that the FDI was predominantly motivated by market seeking reasons. The best examples are the German and Russian markets where the ratio accounted for less than 10%. Slightly higher share of exports in the revenue was recorded by Czech affiliates (with practically all exports from the Czech Republic generated by affiliates of oil manufacturers and processing enterprises, i.e., related with PKN Orlen). Interesting developments can be observed in Cyprus and Malta, i.e., in the host countries for special purpose investments (for instance entities which enable parent companies to avoid or optimize their tax burden). These investments generate revenue mostly from selling services or legal rights to affiliated companies; therefore, the export-to-revenue ratio is outstandingly high. Exports were also relatively high for affiliates of manufacturing enterprises in Scandinavian countries (Norway, Sweden, and Denmark) and in Serbia. Nevertheless, the total revenue from sales in these countries was low, so high ratio may result from strategies pursued by individual entities.

## SOLUTIONS AND RECOMMENDATIONS

Overall performance of Polish companies abroad in the form of OFDI proves the rising competitiveness of Polish economy on the international scale. The analysis show that – regardless some theoretical considerations (which point out that OFDI may deteriorate the welfare in the home economy[8]) – foreign activities of Polish companies effectively stimulate domestic output and protect jobs. Therefore, to strengthen the performance of companies abroad and to help them to overpass to more advanced forms of internationalisation, some set of support tools should be introduced. Currently the system of incentives offered to

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

companies in Poland is mostly focused on facilitation of export activities and information and promotion services. Support directed to OFDI is usually just the development of the tools offered to exporters. Only in recent years due to the availability of the EU funds, some financial incentives especially for foreign investors have been implemented. However, many entrepreneurs are critical about the effectiveness of activities of public institutions and claim they have little business background and limited knowledge of economic reality. Therefore the authors should hope that in the years to come support offered to investors will evolve to match real needs of business people and to facilitate FDI decisions to Polish firms.

## FUTURE RESEARCH DIRECTIONS

Due to the limited scale of Polish FDI, the subject has not been so far vastly researched in economic literature. Recent years have witnessed an increase in scientific publications in this area. However, it seems that still there are areas, which need to be analyzed more deeply.

Hence, it seems justified focusing future research directions on strategies implemented by Polish investors in the third markets, in particular in the context of network approach or born globals. Besides, the evaluation of the sources of competitive advantage of Polish enterprises and the impact of OFDI upon the parent company also seem interesting fields of analysis. Detailed analyses are also required to assess and measure the influence of Polish OFDI on the economy of the home country (region) by evaluating the scale and effects of technology and knowledge transfer to other firms in the same sector and to find out how the development and internationalisation of these enterprises have mobilised the economy. Better understanding of the above mentioned issues would facilitate the tasks of local and national authorities and business environment institutions connected with the development of effective schemes designed to support the internationalisation of enterprises in line with the interest of the entire economy. While the impact of OFDI upon the competitive advantage of the parent enterprises or the home countries is often examined for developed economies, these subjects are extremely rarely addressed in the context of developing countries or emerging economies.

## CONCLUSION

The above analysis of foreign direct investment by Polish enterprises has helped the authors to draw some main conclusions:

1. Polish OFDI may be considered as a natural effect of economic growth of the economy following the systemic transformation. For years, Polish enterprises have been exposed to fierce competition of multinational enterprises on home market, so they have systematically reinforced their position. The economy experienced dynamic transformation from a centrally planned system to a free market economy.
2. Polish enterprises most often follow a stage path of international expansion (according to Uppsala model) but most of them are not too much advanced in the process. Expansion through the development of network links was not very popular among Polish enterprises, which may result from their little internationalisation and experience in the process. Still Polish entrepreneurs are little aware

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the opportunities that opened up to those who are engaged in international division of labour (also within cooperation networks and capital links).
3. Internationalisation is predominantly driven by market seeking motives as the domestic market is getting saturated and quality products offered by Polish companies are good enough. Polish investors tend to establish a trade representative office abroad rather than production plants.
4. Neighbouring countries are major recipients of Poland's OFDI not only due to their geographic but also cultural proximity.

International expansion of Polish investors does not threat their domestic production. High index of vertical linkages on the side of imports both to manufacturing units and to trade subsidiaries induces domestic production.

## KEY TERMS AND DEFINITIONS

**Economic Development:** Quantitative and qualitative changes in the structure of the economy leading to the GDP and total welfare growth. It involves advancement of technology, human and social capital formation and competitiveness increase.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Economic Transformation:** Change of an economic system, in particular shifting from a centrally-planned to a market economy, based on a functioning free market, competition, and private business.

**FDI Incentives:** A range of different support tools offered by public or private institutions during the process of internationalisation. May take a form of financial or advisory support as well as the promotion and marketing on foreign markets.

**FDI:** Foreign direct investment (outward – OFDI; inward – IFDI), the most advanced form of internationalisation of companies; FDI are undertaken to exercise a long-term capital supervision over an entity located abroad (branches or subsidiaries). Investors may create independent economic enterprises from scratch (greenfield investments) or take control over an already existing company (acquisitions and mergers).

**Internationalisation of Enterprises:** Process, through which a firm moves from operating in a domestic marketplace to international markets.

**OLI Paradigm:** The major FDI theory, which was presented by Dunning. It combines micro and macroeconomic approaches and synthesises many works devoted to this kind of internationalisation. The OLI (Ownership, Location, Internalization) theory explains that the FDI decision is a result of meeting three conditions: a firm enjoys ownership advantages (oligopolistic advantages); there are favourable location factors (host country advantages); the advantage of internalisation over market transactions.

**Uppsala Model:** The "stage model" presupposing that internationalisation is a slow and long-term process driven by experience and knowledge acquired by a company firstly on domestic market, than on the markets of countries in geographic proximity representing similar culture.

## ENDNOTES

1 The OLI paradigm has been supplemented and modified on numerous occasions by the author himself as well as by other researchers (Hill, Hwang, & Kim, 1990; Guisinger, 2001).

2 Shock therapy ("big-bang") is a radical and comprehensive economic program, in which macroeconomic stabilization, market liberalization, and fundamental institutional restructuring are quickly implemented (Balcerowicz, 1995; Wei, 1997).

3 Results of studies indicate that Polish economy is at the end of stage 2 or at the beginning of stage 3 both in the IDP J. H. Dunning model and in T. Ozawa model (Gorynia, Nowak, & Wolniak, 2009; Wysokińska, 2008).

4 Polish companies prioritized incentives for OFDI as follows: 1) access to the local market; 2) increase in sales and in global market share; 3) blocking competition; 4) imitation of what the competition is doing; 5) access to local brands, local technology and to global market; 6) weaker competition than in Poland; 7) product portfolio diversification; 8) lower cost of labor; 9) better business environment than in Poland; 10) optimization of supply chain (Petru & Walewski, 2012).

5 The sector does not have a numerous representation in the Polish economy but it is dominated by large, strong players with substantial ownership advantages, which have already been internationally active for many years (PKN Orlen, KGHM). Their investments are primarily linked with exploitation of natural resources in various parts of the world or with acquisition of foreign competitors and markets.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

[6] Increasingly more firms pay attention to the problem of tax optimisation, which may be reflected in locating business activities in countries that offer tax preferences (tax havens) although this is not the priority reason followed by Polish investors in their expansion abroad.

[7] At this point, it is worth remembering that manufacturers, when establishing their affiliates abroad in these countries, usually pursue non-manufacturing operations there. It improves their overall effectiveness and optimises taxes. An example may be the case of LPP S.A., a company which opened its subsidiary in Cyprus to transfer ownership rights to owned trademarks (apparel brands) there. In Cyprus, managing trademarks is covered by a reduced, preferential tax rate, thus what LPP has done may be considered an efficient element of tax optimisation strategy.

[8] Theoretically, it may happen due to the outflow of capital, which – despite the increase in the remuneration of capital owners – may reduce the production capacity of a country significantly. Besides, as know-how and technology are transferred abroad also employment may shrink together with the income of labour force.

# Chapter 46
# Chinese FDI Activity in Europe:
## Trends, Impacts, and Challenges

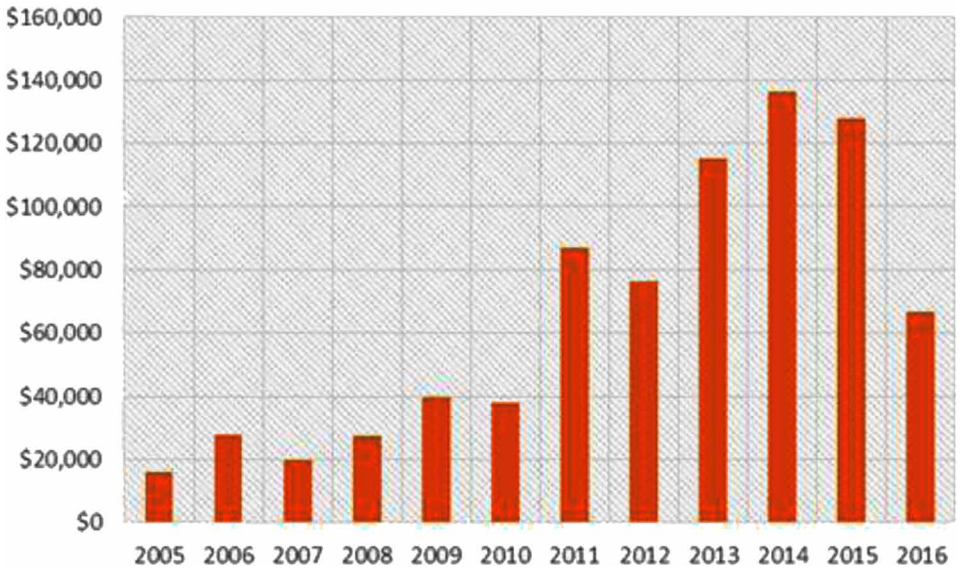
## ABSTRACT

*Today, China has become one of the major exporters of capital in Europe. It is expected that China's liberal policy and growth model will soon make China a major provider of cross-border investment. This process is expected to have significant impact on host European countries of Chinese investment. Europe needs to change its policies and position itself strategically to not only reap the benefits of this massive influx of Chinese investment but also minimize potential risks that European countries face due to their historical linkages with China for trade and investment. The objective of this chapter is to review Chinese FDI in Europe to identify its impact on Europe's economy and suggest some measures for European economies to optimize the benefits of Chinese FDI for their national competitiveness and economic growth.*

## INTRODUCTION

China's outbound foreign direct investment (ODI) may exceeded inbound foreign direct investment (FDI) for the first time in 2014, making China a net exporter of FDI. This is surprising given the country's stage of development as well as its relatively low share of global ODI stocks. Figure 1 shows the trend of Chinese ODI by July 2016.



It appears that a very significant portion of Chinese ODI is focused on developed world. Out of top twenty recipients of Chinese ODI, eleven were developed countries. Figure 2 shows the top recipients of Chinese FDI. It seems that focus of Chinese ODI is not the region but the sector-wise strategic priorities. Within the same region, the amount of Chinese ODI in various countries varied significantly. One good example is middle-east region where Qatar received the least amount of Chinese ODI. The Figure 3 shows the countries that received the least amount of Chinese FDI.

*(Figures are in Millions of US dollar)*

The increasing influx of Chinese FDI continues to impact European economies. The amount of Chinese FDI in Europe has exceeded $100 billion per annum and quickly shifting its focus towards more advanced European economies. Some of the most attractive sectors for Chinese investors include energy, transport, real-estate and technology. Both private and state-owned enterprises of China are actively making significant investments in Europe. Germany ranks no. 2 in the list of Chinese FDI recipients with total Chinese investment of €6.9 billion by the end of the year 2014 (UNCTAD, 2015). The advanced manufacturing capabilities of the more developed European economies are the major focus of the Chinese investors. The total Chinese investment in automotive and industrial equipment sectors of Germany alone accounts for more than two-third of the Chinese investment in Germany. With time, Chinese investment portfolio has diversified to include IT, finance, and consumer products sectors. In more developed European economies, the focus of Chinese investment is small-to-medium sized takeovers.

The objective of this chapter is to provide a comprehensive analysis of the outward direct investments by Chinese companies in the Europe region. After introduction, section 2 provides a discussion of the existing landscape of Chinese FDI in Europe. Section 3 discusses how new Chinese FDI would impact European economies and possible responses of European economies towards this FDI. Section 4 would discuss various concerns of stakeholders with respect to emergence of China as a new major FDI provider for Europe. Section 5 provides implications and recommendation for European policymakers for maximizing the benefits while addressing concerns discussed in section 4. Concluding remarks are provided in section 6.

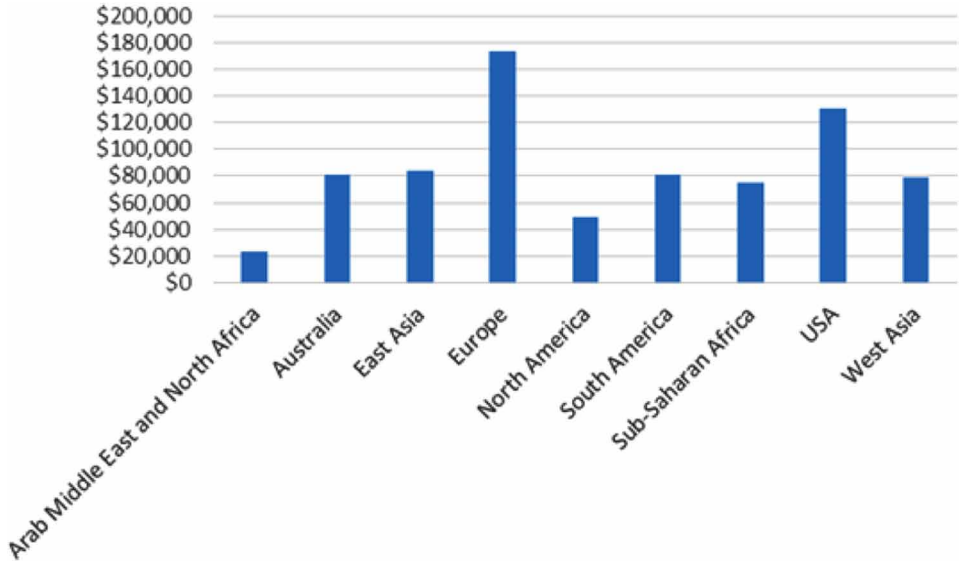
## EXISTING LANDSCAPE OF CHINESE FDI IN EUROPE

During the last decade, Chinese FDI has focused on European nations especially the Southern and Eastern European nations(Le Corre, 2016). Figure 4 shows distribution of Chinese FDI.

Majority of Chinese investment (more than 50%) was made in advanced European economies (such as UK and Germany). Eastern European economies are attracting Chinese capital in manufacturing, agriculture and infrastructure and accounts for 8% of total Chinese investment value (Hanemann & Huotari, 2015).



Chinese investors appear interested in a more diverse mix of industries. Energy is the number one sector where €13 billion of Chinese investment has been made. This trend appears to be uniform in Chinese global ODI and Chinese ODI in Europe. Figure 5 and 6 shows the sector-wise distribution of Chinese ODI in the World and in the Europe respectively.

The other important recipients of Chinese investments include automotive, machinery and information technology. In service sector, Chinese investment is focused on transportation, biotech, and finance. The two other important sectors growing rapidly are agriculture, finance, and real estate (Evans, 2016).

## IMPACTS OF CHINESE FDI ON EUROPEAN ECONOMIES

Chinese investment in Europe is growing fast. However, it is still unclear how this new FDI will impact European economies and how European economies should respond. All EU member nations follow the principle of openness when it comes to FDI. Under this principle, each member state provides each foreign investor fair and equal treatment (European Commission, 2014; Hanemann & Huotari, 2015). Chinese FDI opens up a unique opportunity to reap the associated benefits. However, Europe needs

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

careful evaluation of various risks associated with Chinese FDI that can arise due to some particular characteristics of Chinese economy. The following section discusses the potential benefits and associated risks of Chinese FDI for Europe.

## Urgently Needed Massive New Source of Global Investment

Chinese FDI has brought EU member nations an increased level of investment and projected to become the single largest flow of capital in the years to come (Arnett, 2014). It is expected that the current pace of Chinese FDI will sustain in the future to come due to recent changes taking place in China. These changes have brought more favorable policies towards ODI (Hanemann & Huotari, 2015). As a result, Chinese economy is becoming an efficient economy driven by market forces and innovations. The changes taking place in Chinese marketplace are pressuring Chinese firms to establish their offshore presence (Skeldon, 2011). China has implemented a series of policies (e.g. the deregulating controls over outbound investment and making state companies more competitive internationally) to further support firms' internationalization. Private Chinese companies are taking benefit of the new Chinese economy and actively making huge investments overseas. Chinese companies are expected to become a key driver of FDI activities in Europe. New Chinese institutional investors are increasingly using outbound investment to diversify their investment portfolio. It is expected that China will become one of the world's biggest cross-border investors by the end of this decade, with global offshore assets tripling from $6.4 trillion now to nearly $20 trillion by 2020 (Anderlini, 2015). This timing of increased Chinese FDI coincides with the time when FDI inflows to Europe are decreasing. These depressed levels of FDI, especially in smaller economies, have dampened growth prospects (World Bank, 2016). FDI that can help grow economy (by creating jobs and providing much needed cash to important cash-strapped parts of the economy) is a pressing need of Europe (Das, 2014). FDI, being a less volatile and non-cyclical capital flow, can help different sector of Europe's economy to develop and stabilize (Quak, 2008).

## Expanding Market Access and Linkages

FDI can also help expand market access and link markets of host countries with overseas markets and to the world economy. This expansion of market access and connection to the world economy can help companies in host countries to integrate their production and supply chain networks with the global supply chain networks (Hanemann & Huotari, 2015). This is especially useful for smaller European companies that do not have the knowledge and skills to tap into the Chinese markets. With FDI, the local firms can have a Chinese partner with share in their equity. It appears that Chinese investors are more interested in buying a dominant share in the companies where they are investing. This trend is more visible in Europe. Figure 7 and 8 shows the equity stake acquired by Chinese investors worldwide and in Europe respectively.

This can provide better opportunities for companies in host economies to gain access to and fully understand Chinese markets. With this knowledge, these companies can reap benefits of huge export opportunities to the massive Chinese market. One example of such linkage is the case of Putzmeister's strategic merger with Sany. Putzmeister was a German firm that used this merger to expand into Chinese markets. (Markets, 2016).

### Specialization and Innovation

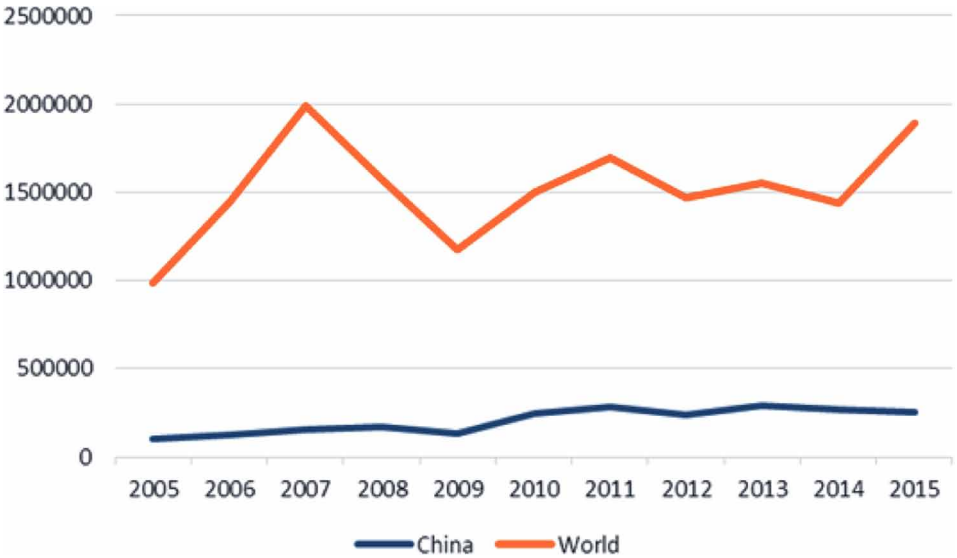
Companies in host economies can use FDI to increase their knowledge and build capacity to innovate in order become more productive (Erdal & Göçer, 2015). This can happen in many ways. Foreign companies can provide advanced level training to local workforce, contribute in local expenditure on R&D activities, and bring advanced technologies to the host countries. Chinese firms are making headways in many industries by continuously bringing innovations. With such strong emphasis on R&D, these firms are investing significant amounts of money in local research and development in Europe. The Chinese firm Huawei made standalone investment to set up more than twenty research and development facilities across Europe (McKinseyChina, 2015). Two other Chinese firms, Sany and CSR, topped the list of large R&D spenders in Europe. Chinese firms have the ability to innovate in many areas and have proven ability to bring new standards, models, and innovative approaches in business (Steinfeld, 2015; Hanemann & Huotari, 2015).

## CHINESE FDI: MAJOR CONCERNS AND THEIR REMEDIES

For Europe, Chinese FDI is a unique opportunity to increase future capital flows and benefits associated with this increased flow of capital.While many Chinese-backed projects in Europe didn't produce the desired results on economy, it is early to say that Chinese investments are more likely to not achieve their desired objectives. There are, however, many concerns of host countries related to China's economy, political system, and world standing that warrant a reassessment of risks associated with Chinese investment. These concerns include macroeconomic volatility; asymmetry in market access; subsidies; technology transfer; national security; and a regulatory race to the bottom (Hanemann & Huotari, 2015).

### Macroeconomic Volatility

From investment point of view, macroeconomic volatility refers to instable investment levels and large changes in asset prices. It is a long held concern that FDI can bring macroeconomic volatility and result in instable economic conditions and decreased economic growth. This volatility can produce highly volatile investment flows. Such volatility can be detrimental for smaller economies where large amount of foreign money is invested in extractive sectors (such as oil and gas) are more vulnerable against such volatility. China is the world's second largest economy that is providing very large amounts of capital outflows. Being an emerging economy, China is in the process of internal and external financial and economic reforms that are expected to bring major swings and volatility in coming years and the recent boom and bust cycle of Chinese investments in global extractive sectors is one clear example of this phenomenon (Pigato & Tang, 2015; Hanemann & Huotari, 2015). Clearly, the countries with high levels of Chinese FDI will be more exposed to potential risk of boom and bust cycles.



A comparison of inward FDI in EU across all sectors show that Chinese inward FDI stock is still a small portion of the total inward FDI stock in Europe (See Figure 9).

The economic diversity that exist within EU and the non-reliance of EU on highly cyclical sectors (such as natural resources extraction) means that the concerns of macroeconomic volatility may not be that high as of now. However, the recent increase in OFDI from financial companies in EU is expected to reach very high levels in coming years. The focus of this outward FDI so far is limited to few indus-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 9. Comparison of Inward FDI to Europe*
*Source: (OECD, 2016)*
*(Figures are in Millions of US dollar)*

tries (such as real estate). However, this outward FDI can result in increase in asset prices across Europe (Rhodium Group, 2015) and situation would become serious if there is an increase in non-FDI capital flows (such as bank lending and portfolio investments) in Europe. EU, especially smaller EU economies, needs monitoring of Chinese investment to identify any potential macroeconomic volatility. Identification of these macroeconomic volatilities is important because they can quickly spill over to affect all economies in EU. It is also important given that China is becoming one of the major FDI providers in EU. The EU data of inward data on capital flows should be made more transparent because United States has already implemented a system called Treasury International Capital (TIC) that provides US government information on foreign nationals' holdings of US government securities (Morrison & Labonte, 2013).

## Asymmetric Market Access

Another major concern related to FDI is the distortion of market access in the favor of companies whose origin is the country making large investments in a country. This asymmetry in market access is not just fair but also leads to distorted and politically influenced allocation of foreign investment between two countries. Historically, bilateral agreements between the countries or multilateral and regional agreements have been commonly been used to address these concerns related to market access. One example of regional agreement is General Agreement on Trade in Services (GATS). These agreements guaranteed a certain degree of reciprocity in openness (WTO, 2016). Recently, emerging economies, especially China, have become significant exporters of capital. As such, the concerns over market access have once again gained focus of attention, especially in Europe. Since, 1980, foreign investment is the most important economic reform China has been using for generating opportunities of growth, innovation and employment. In contrary, China doesn't offer the similar level of openness to FDI. In terms of formal restrictions to FDI, China is considered one of the least open countries among the G20 economies and

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

informal discrimination against foreign companies is commonplace (Anderlini, 2015). The China might be justified in doing so because of its position as a major capital exporter in the world and extended access of Chinese firms to the most advanced markets of the world. In contrast, EU countries abide by the openness principle when dealing with inward and outward flow of capital. This principle provides fair and equal treatment of all FDI providers including China. The extensive investment by Chinese companies in European markets is evidence of the practice of this principle in EU. However, European companies do enjoy the similar treatment in China and face tough market barriers in China especially in advanced manufacturing and services sectors where they have competitive advantage (European Union, 2014). For more developed EU economies, such as Germany, this situation is highly undesirable because German firms have huge stakes in currently restricted sectors of Chinese economy(Vetter, 2014). It is early to say if that current imbalance can result in systemic market distortions in near future. However, it does create an environment where this strong sense of unfairness can make it difficult for governments of EU countries to make a strong case for greater investment integration with China. The governments of EU countries will have to ensure that European companies are provided a level playing field in China to strongly defend the principle of market openness that Europe has been practicing for a long time. China realizes the gravity of the situation and importance of FDI in its greater agenda of economic reforms. In early 2015, China decided to formally abolish the current restrictions and implement a modern FDI regime that would provide expanded investment opportunities for foreign countries (Davies, 2013; Hanemann & Huotari, 2015). However, the uncertainties are still there.There is no defined timeline for implementation and the unclear scope of this policy leaves plenty of room for potential informal discrimination. EU countries cannot just wait and see rather take active role in finalizing and implementation of this modern FDI regime in China. EU can seek to negotiate bilateral investment agreements (BIAs) with China under Lisbon Treaty of 2008. These agreements can providethe necessary rights for European companies to receive fair and equal treatment in Chinese markets. Such as initiative can be a big step to facilitate the implementation of broader FDI reforms in China. These agreements can also help develop new standards of openness. Three major global economies (United States, European Union, and China) provides 60% of GDP and more than two-third of global outbound FDI (UNCTAD, 2015). EU should start a dialogue with China for a multilateral investment agreement in a bid to set new global standards for openness of cross-border flow of capital and regulatory practices to safeguard national interests of EU countries. EU countries can also play important role to achieve greater symmetry in market access with China. That would help align interests of individual member countries with European interests and large EU member states (e.g. Germany) can use their influence to force China expedite implementation of its new FDI regime. EU member countries have many tools that could be used for that purpose including competition policy, disclosure requirements, public procurement etc..

## Subsidies and Non-Commercial Advantages

Subsidies and other non-commercial advantages can arise from unfair competition in global FDI arena and lead to distortion in global markets. These disadvantages can limit the abilities to compete in the absence of any preferential access to resources. These concerns have gained importance in EU since the rise of emerging economic economies as the major sources of FDI. Many global Chinese firms, both state-owned and private firms, are supported by China's local and federal governments. These companies and receive extra benefits not available to other Chinese firms. In 2015, out of EUR 46 billion Chinese investment worldwide, EUR 31 billion investment was made by state-owned Chinese compa-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

nies (UNCTAD, 2015).In contrast, EU rules do not allow European firms to receive any aid from state. At the same time, these firms compete with Chinese firms that get privileged access to many facilities from their local/federal governments. However, recently we see some signs that show shift in China's policy of preferential treatment of Chinese firms (Hanemann & Huotari, 2015). The recently announced Chinese structural reform program aimed to transform Chinese economy a market-driven economy. For EU, it is important that Chinese government should be supported to implement this exhaustive program of structural reforms. At the same time, EU should demand that China should make rapid progress on priority basis to implement this reform agenda. Since long, Europe has been modernizing its own state companies. Modernization of state companies is also on the agenda of Chinese structural reforms. Europe can also share its experience with China. It is still unclear how long it will take for successful implementation for these structural reforms in China. The situation is risky and there exists strong conflicts of interest of large powerful stakeholders in China. EU policymakers need a careful analysis to come up with a strategy to how best help Chinese government in supporting investment by Chinese state-owned companies under new rules. At the same time, Chinese government needs to ensure that types and scope of government support for specific investments should be clear.

## Technology Transfer and Value-Added Economic Activities

Technology and other value-added economic activities can move out of host economies to the country providing FDI. For Europe, the emergence of China as the single most FDI provider has raised this concerns for a variety of reasons. First, China is an emerging economy and technology excellence is one core objective of this FDI. The strong industrial policies of China has a strong R&D focus (45). Many European firms enjoy leadership positions in their respective sectors and Chinese FDI is one way to get access to this knowledge and technology. Most Chinese investment in technology-related sectors is less than 5 years old and such a short track-record is not enough to support the hypothesis that the objective of Chinese investment in these sectors is transfer of technology from EU to China (Hanemann & Huotari, 2015). On a positive note, it is encouraging that Chinese companies have now changed their thinking and switching to gain access to technology by following an open and market-based mechanism. This indicates that China has made innovation and technology as one key element of its growth model. Chinese firm investing in European technology firms are increasing their R&D presence and strengthening the local workforce. Looking at the evidence available it appears that the thinking of Chinese investors about global R&D is no different from other investors in this sector. EU should develop policies that attract this large influx of Chinese investment in global R&D field. Both EU and its member states should develop strategies as to how this massive Chinese investment can be used to develop the national and regional innovation capacity and accelerate collaboration of European and Chinese firms. To better understand the probable negative impacts of technology seeking Chinese FDI, EU needs to carefully evaluate such investments in medium to long term. In particular, EU should assess, the trends of technology seeking Chinese FDI in sectors where China has implemented strong industrial policies and provide government support to its firms.

## National Security Issues

Host countries may have some national security concerns when a country make inward FDI. One concern is that the by giving ownership of national assets to foreigners, the functioning of economy can

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

be affected. This is because such ownership can restrict access to those goods and services required for proper functioning of economy. Another concern is that foreigners can gain access to the channels of infiltration and surveillance into critical infrastructures (such as utilities). A foreign firm may transfer or deploy technology obtained from the host country in a way detrimental to the national interest of the host country. Most trade-cum investment agreements include a common condition is that there would be no security- related reviews and free capital flow would be guaranteed (Hanemann & Huotari, 2015).

With few exceptions, all major FDI providers in Europe were market economies with democratic political systems. China is the world's second largest economy and ranked among top five FDI providers in the world. China is an authoritarian regime with weak security ties with many of Chinese FDI recipient countries. Considering these facts, Chinese FDI presents new national security challenges for host countries in Europe (48). For Europe, screening Chinese investments is important to ascertain any risks to national security to EU countries. If considered necessary, mitigation measures should be taken and if that is not possible investments should be blocked. These screening mechanisms are a prerequisite to appropriately monitor and address national security threats. Most EU member countries already have appropriate and operational review processes but they vary from country to country (Hanemann & Huotari, 2015). Many countries still do not have investment reviews. For EU, Chinese FDI is a unique national security scenario and an overhaul of the fragmented security reviews in EU is needed to develop a more coordinated approach of security reviews. This overhaul is important for two reasons. Chinese European investments are now covering assets with both national and regional security implications (such as utilities). Second, the future Chinese investment in Europe is projected to increase to levels where a proper review of investment opportunities by small EU countries would be impossible. Three, EU needs close coordination with source countries to prevent the possible politicization of the investment opportunities. EU can use OECD's principles of investment reviews to develop best practices for screening investment opportunities for any national security threats. These best practices can help improve shared understandings of national security threats. Investment deals that could provide cross-border impact require more collaboration and exchange of information among EU countries. Another option to mitigate national security threats arising from investment opportunities is to make public basic information related to investment opportunities. This transparency is important given that over use of national security exceptions for approving inward investment have brought some significant security risks. Keeping in view these risks, many countries including China have developed national security screening frameworks.

## Deteriorating Standards and Work Practices

Another concern is that FDI, especially from emerging economies, can bring bad practices and deteriorate existing labor, environmental and other standards. This deterioration of standards and practices occur because the institutional and regulatory environment of emerging economies, in general, not well regulated. There are examples, such as the Chinese entrepreneurs' COSCO's operations in Italy and COVEC in Poland. EU needs to make sure that member states devise and enforce robust regulations to prevent the probable deterioration of work standards and practices due to FDI. Non-complying foreign companies should be subject to penalties and litigation. Doing so, EU can ensure that foreign firms, including Chinese firms, adopt work standards and practices of advanced more regulated economies regulatory. This would also ensure that EU member states would be able to subject non-complying firms to litigation.EU also needs to develop harmony in various standards (labor, environmental and other regulatory standards) of its member states.

## POLICY IMPLICATIONS/RECOMMENDATIONS

### Better Data

China is a unique case of FDI and at the same time creates unique opportunities for Europe because of the size, growth and complementarities of Chinese economy. At the same time, some specific concerns that are related to the nature of China's political and economic system create some unique challenges. These concerns need addressed so that Europe can maximize the benefits of Chinese FDI while addressing all the concerns discussed so far. Following are some recommendations in this regard. China has emerged as a huge and relatively opaque investor and the current available data of Chinese FDI is inadequate. To understand extent, direction and trends of global capital flows, EU needs develop its national statistical agencies by adequate resources to improve data collection. EU can seek help from organizations such as the IMF, OECD and UNCTAD that are well equipped and resourceful. These organizations can help EU in real-time analysis of capital flows and improve the transparency of FDI.

### Investment Promotion System

Many EU member states have rich and effective investment promotion systems in place. Since China is a unique case of FDI for Europe, it important that existing European investment promotion systems are reviewed to identify the unique requirements for these systems. EU needs to identify and remove China-specific regulatory restrictions. A major focus of these investment promotion systems should be on innovation-based industries and post-acquisition expansions of the firms.

### Principle of Investment Openness

For Europe, it is important to keep following principle of investment openness to gain more Chinese investment by providing Chinese investors fair and equitable treatment. Growing Chinese FDI may trigger populist backlashes but government in Europe must defend liberalization of investments. Some countries, such as Canada, have introduced stricter laws and regulations especially for Chinese FDI (Hanemann & Huotari, 2015). There have been examples of politicization of Chinese FDI. One example is the takeover of US oil company Unocal by China National Offshore Oil Corp (CNOOC) in 2005. The deal failed due to harsh political reaction in the US against selling a majority stake of a US Company to Chinese state-owned enterprise. It is important for EU nation states to devise mechanisms to avoid such politicization that could hurt the reputation of the host countries in the eyes of potential large investors.

### Structural Reforms

Europe-wide implementation of structural reforms is needed to kick-start economic growth and continue to attract the massive Chinese investment in future. Ongoing crisis in euro region, a slow economic recovery, and structural deficiencies are some impediments that are diminishing the attractiveness of Europe. Besides fire sale opportunities, such as in Greece, EU member states should create the institutional and commercial environment needed to ensure Chinese firms investing in local firms should utilize the local factors of production in way that provides long-term economic growth and competitiveness of both member states and EU.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

### New Strategies for Investment Promotion Efforts

To realize the full potential of future Chinese FDI, EU needs strategically position the investment promotion efforts. Due to lack of experience, many Chinese firms needs different type of local support. A different type of investment promotion strategy is needed to attract investment from these firms. EU member states can use elements (such as high-level political support, post FDI support, local incentives etc.) in their investment promotion strategies.

### Investment Approaches for New Areas

Strong European economies need to accommodate specific Chinese needs especially in research and development and other innovation- intensive activities. These economies can improve their efficiency further by using targeted outreach based on investment patterns. Close collaboration among government officials at various levels and Chamber of Commerce of host nation and China would also help.EU can also explore cross-border projects in Europe attract more Chinese FDI.

## CONCLUSION

The new wave of Chinese FDI, characterized by a policy of liberalization and growth, is helping China become a driving force in global cross-border investments. This situation require European governments to adjust their economic policies towards China in order not only reap the benefits of this new source of capital but also to minimize potential new risks peculiar to European economies now intimately linked up with China for trade and investment. This policy change will also require European countries to have greater coordination, collaboration, and cooperation within and among nation states. Running state of affairs as it is now will mean Europe miss exciting new opportunities arising from this new era of Chinese FDI and undermine European interest. This, in turn, could trigger populist backlash against Chinese FDI but EU countries should be prepared to defend the liberalization of investments and Europe's economic integration with China.

## KEY TERMS AND DEFINITIONS

**China:** It is a populous nation in East Asia whose vast landscape encompasses grassland, desert, mountains, lakes, rivers and more than 14,000km of coastline. The country is one of the highly emerging countries in the world chasing United States in its GDP and per capita income.

**Economic Development:** Economic development is the process and policies by which a nation improves the economic, political, and social well-being of its people.

**European Union:** The European Union is a politico-economic union of 28 member states that are located primarily in Europe.

**FDI:** Its full form is foreign direct investment. It is an investment made by a company or individual in one country in business interests in another country, in the form of either establishing business operations or acquiring business assets in the other country.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Global Integration:** Global integration can involve the processes of product standardization and technology development centralization.

**Global Markets:** A global market refers to the activity of buying or selling goods and services in all the countries of the world.

**Investments:** Investments are the action or process of investing money for profit.

# Chapter 47
# An Investigation of the Return Risk and Liquidity Measure for Chinese Open-Ended Funds

**Jingqi Zhang**
*International Business School, Xi'an Jiaotong-Liverpool University, Suzhou, China*

## ABSTRACT

*So far, the fund industry has become one of the four backbones of the Chinese financial system, together with the banking industry, the security industry and the insurance industry. In addition, open-ended fund shares are the mainstream of the fund industry, and the product characteristics and operational characteristics of open-ended funds will lead to an unavoidable risk of return with liquidity measure. Therefore, based on the theories of financial investment, this research profile the risk return and liquidity characteristics of three different open-ended funds in China, which are helpful to making rational investments. This article selects three different kinds of funds with the relevant data from 2012to 2017 from the Huaxia Fund Management Co. Ltd., for each fund, the authors report the beta, Sharp Ratio, Information ratio and illiquidity. These risk-return features are discussed in the context of the different asset classes that each fund has invested, thus eventually obtaining a fund which has smaller relative liquidity risk and higher return after comparing. Hence, the investor can make the rational investment from the analysis of empirical results.*

## 1. INTRODUCTION

China is a developing country with high saving rates, however, the low interest rates of banks are difficult to satisfy the requirements of investors for increasing values in loans and investments (Li, 2014). When it is compared with the foreign financial securities market, it has been discovered that the Chinese securities market has a shorter development history and the Chinese government treasury bonds have a higher safety, lower return and poorer liquidity. Moreover, open-ended funds can make up for the deficiencies of the above-mentioned investment methods, thus being popular among a number of investors

in Chinese financial market. With the popularization of open-ended funds, its research is becoming more and more intensive. The focused attention is gradually evaluated through the performance evaluation, which is extended to risk control. Because investors can redeem the fund, the open-ended funds will keep a certain ratio; however, the assets with the high liquidity usually have the lower return and less income of the funds. Besides, the decrease of fund return will lead to further redemption and higher liquidity risk. Therefore, the core issues for fund management lie in how to coordinate the contradiction between return and liquidity.

In terms of the theoretical significance, there are relatively more relevant analysis and research on the stock return and liquidity in the financial filed. However, the researches on the fund return and liquidity are much fewer than those of the stock. Firstly, the investigations of open-ended funds have a certain research significance in China. Secondly, a number of scholars have various researches on the liquidity risk or the risk return for the stocks and funds, while there are few researches about the impact of the combination of risk return and measure of liquidity on the open-ended funds. Therefore, this study has accuracy significance on the research and analysis of the investment for open-ended funds. In addition, this paper selects three funds for keeping ceteris paribus and avoiding other uncertain factors. The factors of risk return, and measure of liquidity being addressed in the research could make shareholders and corporations take different measures briefly. Furthermore, it is helpful for the researchers to grasp the evolution law from studying the liquidity measure and risk return of Chinese open-ended funds.

This paper focuses on the liquidity measure and risk return of three specific and special open-ended funds (Huaxia Market Selection Mixed Fund, Huaxia CSI 300 ETF Fund and Huaxia Suelly Fund) in the Chinese fund market. Moreover, the research objectives of this module are to explore the different factors (Sharp Ratio, Beta, Information Ratio) of risk return combing with liquidity measures which have different influences on the three Chinese open-ended funds and explain which fund is significant for investors to make a valuable investment. In particular, it will address the following research questions:

1. As for the three different kinds of funds, whether the stock fund-Huaxia CSI 300 ETF Fund has a higher Sharp Ratio, Information ratio and Beta than the hybrid funds and bond funds;
2. To some extents, whether a higher Sharp Ratio, Information ratio and Beta have positive influence for the risk return of each fund in the two periods or not;
3. Combing the liquidity measure and comparing with other two funds, whether the Huaxia CSI 300 ETF Fund is the rational investment fund for the investors or not.

After that, the analysis results of Beta from the regression and Sharp Ratio, Information ratio from the formulation will be used. Combing the measurement of liquidity (ILLIQ), the three funds will be ranked based on single-sort for each factor. It is required to assign a score of 3 to the best, 2 to the middle and 1 for the lowest, so as to rank the funds. Afterwards, we will do this separately for each of the four characteristics and simply add up all the scores and see which fund has the highest score. Finally, we will select a fund with a higher return and a lower risk which is more conducive to investment.

This paper proceeds as follow. Section 2 provides a lit review and description of the funds and data. We outline the methodology in Section 3. Results are discussed in Section 4. Section 5 concludes.

## 2. LITERATURE REVIEW AND DATA DESCRIPTION

### 2.1. Literature Review

In recent decades, the fund holders must be held in the hands of assets into capital at the same time with constant change and fluctuation of market price, which is very likely to result in loss of liquidity risk (Foran & Sullivan, 2014). The definition of liquidity is the time and cost which are related to the transition for the asset position in the cash and the vice versa (Brandon & Wang, 2013). Sathish & Srinivasan (2016) have stated if the Beta value is lower than 1, it means that the reactions of fund are lower than the market reacts. As to the standard deviation, a higher standard deviation stands for a higher risk while a lower standard deviation means a lower risk. Some scholars have interpreted the liquidity risk factors that have different influences on the open-ended funds. The betas are the liquidity risk factor, which has the significant and positive relationships with economy. Moreover, there are some economically significant alphas for the strategies of a number of hedge funds (Brandon & Wang, 2013). However, it has been demonstrated that there is a weaker influence of the liquidity risk for the non-equity hedge funds in this article. Therefore, this specific article has an obvious significance to explain the factors for liquidity risk which have stronger or weaker effect on these hedge funds through the empirical results. In addition, the six risk factors and the extended versions are evaluated in the performance of the optimal portfolios which are related to the different types of investors. Moreover, the value-weighted Standard & Poor's 500 index has been used as the benchmark factor for the excess return in the article, which is to be derived from the optimal portfolios and to compare the empirical results with the previously studies (Brandon & Wang, 2013). Although these studies explored a number of the fund portfolios and the excess return of the emerging markets which are related to equity market neutral, the influence of the liquidity risk is less strong on the strategies fund portfolios, indicating that the liquidity risk betas ($\beta$) are more insignificant and the alphas ($\alpha$) are the mostly significant. Therefore, the findings of the hedge funds may still be applied to the situation in the Chinese open-ended funds (Brandon & Wang, 2013).

Afterwards, if the liquidity risk declines below 5%, the redemption of the shares may be suspended temporarily. Moreover, similar findings have been found that there are some attractive classifications, which have a relationship with other assets with fewer risks and lower correlations; in addition, the NAV (net asset value) has been discounted over 20% through the market prices (Foran & Sullivan, 2014). Nevertheless, this article has clarified that the OPFs are preferred as the alternative investment on the real estate shares in German, which is a contrast with a number of other countries (Haß et al., 2012). Therefore, there are relatively scarce studies on the factors of liquidity risk that influence the open-ended funds. In terms of the other sections of these studies, the scholars have shown that the methodology used in analyzing is to recompute the return series for the result of free for the auto-correlation. Furthermore, the arbitrary autocorrelation structures could be detected, and the annual reappraisals will be handled (Foran & Sulliva, 2014). Additionally, Haß et al. (2012) have expressed the view that there is a positive skewness of OPFs which has been established through the empirical tests. In addition, the assumption of the normal distribution for the monthly returns have been rejected when the integrated sample is taken into account. Although there are a number of studies which have investigated the liquidity risk and open-ended funds, it seems that more researches should focus on the specific and particular kinds of the funds in different fund markets in various countries (Foran & Sulliva, 2014).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

However, O'Hara (2003), a well-known scholar, has pointed that price discovery and liquidity were two fundamental functions of financial market; also, good liquidity does not always exist in financial market and market liquidity suddenly disappears during the crises. Transaction expenses would increase significantly when the securities price decreased sharply and other responds leading to the failure of financial market emerged (Li, 2009). In 1952, Markowizt introduced the concepts of expectation and variance in statistics of portfolio research and used the variance of yield to measure the risk of securities investment for the first time. Because of its simplicity and wide application, the variance method has been widely accepted and applied by the theoretical circles and the financial industries (Li, 2009). Many scholars have tried to introduce liquidity cost into the model of value variance, so as to measure the liquidity risk with flat variance. Thus, the core of the theory from portfolio investment based on mean variance analysis is established on the modern financial theory (Li, 2009).

The liquidity discussed in this paper refers to the liquidity of the security and stock markets on the microeconomics level. Since Amihud (2002) has suggested a topic about asset pricing and sale spread, which was published in the Journal of Financial Economics, the author drives the market for the market investors and uses the different price in this paper. Then Lou& Shu (2016) have studied the Amihud (2002) measure's pricing from the new perspective of close link through the Amihud measure and trading volume. After that, they also used the return factors to examine whether the pricing of Amihud measure could explain its trading volume factor or not. The approach used in the paper has the same spirit with the approach being used for the SMB factor, for example, to examine whether the portfolio's abnormal returns could be attributed to the size factor or not (Lou & Shu, 2016). To solve the problem if high-frequency liquidity benchmarks can illustrate the pricing of the volume factor for the Amihud measure, Lou& Shu (2016) estimated Fama-MacBeth regressions of return on the constant Amihud measures, which are also the command for $\lambda$ and other liquidity factors. In addition, the research included the usual control variables such as size, book-to-market ratio and past returns, which control the momentum and short-term return reversion (Lou & Shu, 2016).

This research has less limitations. However, it is obviously necessary to include the factors of liquidity risk and the influence on the Chinese open-ended funds into the research. First of all, according to the particular characteristics and nature of the three funds and the different kinds of risk return factors for this research, the main three specific open-ended funds in the market may be influenced by the various risk return factors to different extends. Secondly, the significant or insignificant and stronger or weaker effects of the risk return on the three types Chinese open-ended funds which combined the specific measure of liquidity should be focused in this research.

## 2.2. Institutional Background and Data

This module selects three different open-ended funds from Huaxia Fund Management Co., Ltd. The company was founded in April 9th, 1998, which is one of the firstly established national fund management companies under the permission of the China Securities Regulatory Commission.

The company stands for a comprehensive and omnipotent fund management company. Its services cover a number of asset classes, industries and regions. Furthermore, it has constructed a diversified asset management platform based on public funds and institutional businesses. Huaxia Fund Management Co, Ltd. has been operated steadily and maintained the leading position in the industry with strong comprehensive strength. In terms of the public fund, Huaxia Fund Management Co, Ltd. has established a perfect product line. There are more than 110 kinds of public funds, so as to meet the various invest-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

ment demands of different investors. The main types of active management fund include 5 primary funds (currency funds, finance funds, bond funds, hybrid funds and stock funds) and other risk return assets. In the passive management, the company has built a complete product line, which contains the comprehensive coverage index, the weight stock index, small cap index, industry index and overseas market index. Furthermore, at the end of September 30th, 2017, the company has provided services for more than 40000 institutions and customers as well as more than 47 million public shareholders in China.

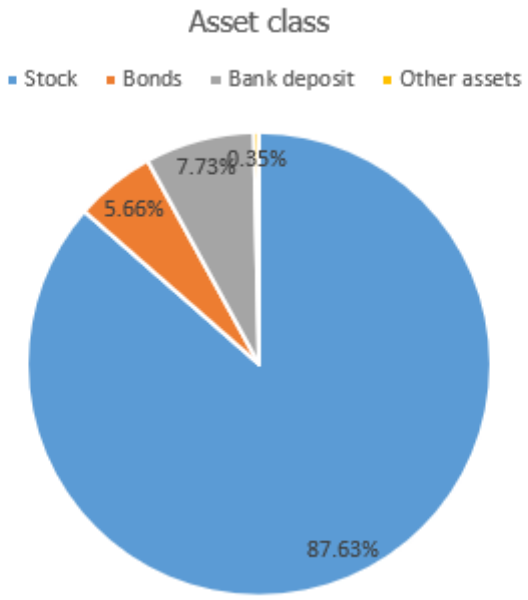
The open-ended fund is a kind of fund established by the fund sponsors and the fund units. Compared with the closed-ended funds, its total size of shares is not fixed. Additionally, the investors sell fund units or shares and could be a mode of operation of the fund investors' redemption. Yang & Hou (2016) have taken some advantages of management contracts with the obvious PPS information for closed-ended funds and studies, which has relationship with fund risk-taking behavior and fund PPS are correlative with the closed-ended fund industry. In contrast, ceteris paribus, the Huaxia Market Selection Mixed Fund is a hybrid fund in the open-ended funds; Huaxia CSI 300 ETF Fund represents the stock funds and Huaxia Suelly Fund stands for the bond funds in the open-ended funds. First of all, selecting the main three different kinds of Chinese open-ended funds in the WIND database from the same fund management company Huaxia Fund Management Co., Ltd.: Huaxia Market Selection Mixed Fund, Huaxia CSI 300 ETF Fund and Huaxia Suelly Fund. in which, Huaxia Market Selection Mixed Fund is a hybrid fund, Huaxia CSI 300 ETF Fund is a typical stock fund and Huaxia Suelly Fund is illustrated as the bond fund in the Chinese fund Market. Afterwards, the daily data from January 1st, 2012to September 30th, 2017 is used to do the empirical tests for the three funds, excluding days for which no number are quoted (weekends, legal holidays, etc.). Furthermore, the data is divided into two periods (2012-2014 is the first period, 2015-2017 is the second period). Then the average Beta, Sharp Ratio and Information ratio are calculated by doing the regression analysis of the three funds. Furthermore, the measure of liquidity risk (ILLIQ) is discussed in the empirical tests. The specific natures of the three funds are introduced in the following sections.

### 2.2.1. Investment Strategies

Therefore, it can be found that the investment strategies of the three funds have both similarities and differences. The same point of them is to gain the lower risk and higher return. However, as for the differences, Huaxia Market Selection Mixed Fund (000011) has been combined with some features of stock fund investment strategies for a long-term period, which is more complex than the other two funds. At the same time, Huaxia CSI 300 ETF takes the index information into consideration for the reaction of investment, which has shorter and more fluctuated strategies than the other two funds; Huaxia Sulley Fund has developed a long-term similar strategy, which is mainly based on bonds investment strategies. Table 1 shows the investment strategies of the three funds.

### 2.2.2. Asset Classes

Huaxia Market Selection Mixed Fund (Figure 1) (000011) is a leaning stock fund in the hybrid open-ended fund, which includes growth stocks, income stocks, mutual funds, bonds and other fixed income investment in the portfolio. The aim of hybrid fund is to allow investors to choose various funds through the diversification of investment without the need to purchase stock funds, bond funds and currency funds with different styles separately.

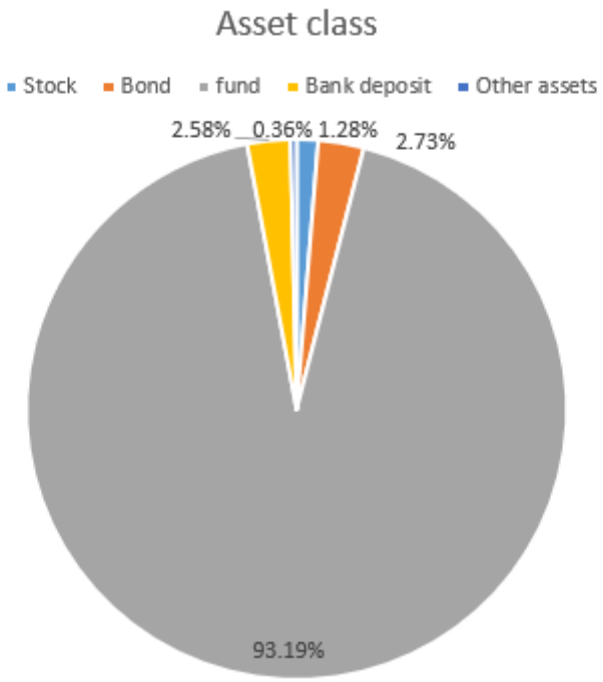


EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 1. Investment strategies of the three funds*

| Funds | Investment Strategies |
|---|---|
| Huaxia Market Selection Mixed Fund (000011) | The fixed proportion investment is used to pursuit of long-term value-added fund assets with the long-term smaller risk. In addition, the fund mainly adopts stock selection strategy "from bottom to top" according to the financial analysis and meticulous research of the listed companies. Then, it selected the well growth prospects and the market value was relatively undervalued of stock performance for the investment goals. The aim of this fund is to avoid the market risk and the risk borne by the fund. |
| Huaxia CSI 300 ETF Fund (000051) | The indexed investment is tried to be used to achieve the pursuit of benchmarking and the effective tracking of the index. In addition, it mainly purchases and redeems investment in ETF shares through exchange traded. The investors can also track the underlying index through buying underlying standard. The fund can also take part in trading, purchasing and redemption arbitrage of a moderate ETF fund share with the aim to increasing the return of the fund. |
| Huaxia Sulley Fund (000014) | The strategies to control of the premise of risk and achieve investment goals are mainly adopted, which contain debt allocation, long-term management strategy, yield curve strategy, buy back amplification strategy, credit bond investment strategy, SME private equity investment strategy, and other investment strategies. |

*Figure 1. Huaxia market selection mixed fund weights in various asset class*



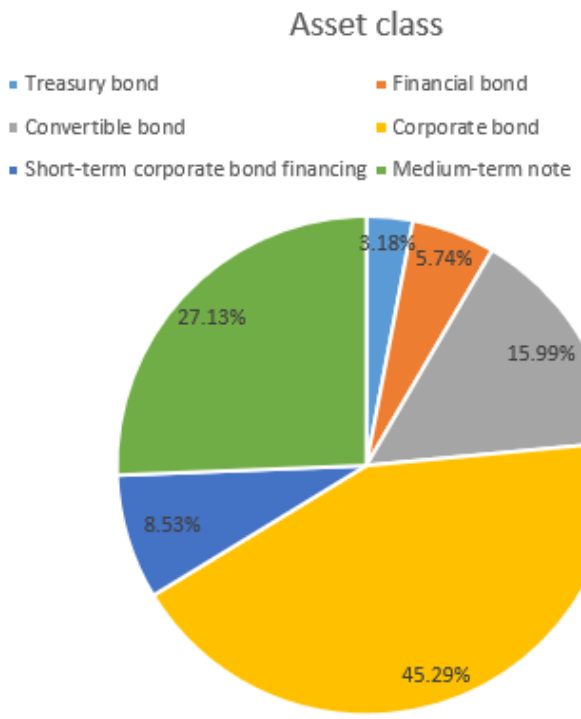
Additionally, it combines with the stock (87.63%), bonds (5.66%), bank deposit (7.73%) and other assets (0.35%), in which, the stock has the main portion in the asset class. It was issued to the public in Shanghai Stock Exchange in August, 2004in the amount of around 2 billion.

Huaxia CSI 300 ETF fund (000051) is an ETF fund in the stock open-ended fund (Figure 2). It combines with the stock (1.28%), bond (2.73%), fund (93.19%), bank deposit (2.58%), purchase of resale securities (0.14%) and other assets (0.22%). It was issued to the public in Shanghai Stock Exchange in 2009 in the amount of 25 billion.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 2. Huaxia CSI 300 ETF fund weights in various asset class*

Stock fund refers to the fund investment in the stock market. According to the subject of investment industry, it can be divided into various industry funds. In addition, ETF funds are commonly known as exchange traded funds (Exchange Traded, Funds, ETF). They belong to a kind of Listed Open-end Fund containing a variable exchange traded fund shares. Furthermore, it is a special fund which combines the advantages of both closed-ended funds and open-ended funds. Therefore, investors and the fund managers cannot only purchase or redeem the fund shares, but also can trade the ETF shares at market prices in the stock market as closed-ended funds.



Huaxia Suelly Fund (000014) is a bond open-ended fund, which combines with the treasury bond (3.18%), financial bond (5.74%), convertible bond (15.99%), corporate bond (45.29%), short-term corporate bond financing (8.58%) and medium-term note (27.13%) (Figure 3). It was issued to the public in Shanghai stock Exchange in 2013 with the total amount of 4 billion. The bond fund is an investment in the bond fund, it also forms a portfolio (fund bonds, financial bonds and other fixed income instruments) of bonds as the main investment targets. In addition, because of its relatively stable earnings, it is known as the "fixed benefit fund."

Hence, the asset classes of three different funds are four, five and six, respectively. Because Huaxia Market Selection Mixed Fund is a leaning-stock fund, the main investment stock portfolio will be introduced below in details. However, Huaxia CSI 300 ETF Fund is a stock fund, it has some percentages of ETF Index, which influences that the fund to a certain proportion. In terms of Huaxia Suelly, it has the most asset classes in the three funds, which contain corporate bond, convertible bond and financial bond etc.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 3. Huaxia Sulley fund weights in various asset class*

## 2.2.3. Portfolio Weight

Portfolio Weight is the fraction of the total investment in the portfolio for each individual investment in the portfolio. The detailed portfolio weight of each fund is stated in detail as follows.

Because the fund is a leaning-stock fund in the hybrid open-ended fund, which includes 41.69% stocks, 5.92% bonds, and some other financial assets. Furthermore, the investment institutions gradually become diversified with corporations and the policy bank bonds as the main investment institutions. Qingdao Haier, Midea Group and Wuliangye are the main three stock investment corporations for this fund; Agricultural Development Bank is the largest bond investment policy bank for the fund. Table 2 shows the portfolio weight of Huaxia market selection mixed fund.

Table 2 shows that Agricultural Development Bank and Qingdao Haier group occupy the largest percentages of holding bonds and the largest proportions of holding stocks for this fund. Furthermore, because Agricultural Development Bank is a Chinese policy bank and Qingdao Haier Group is a listed company ranked the top 500 in the world, the issuance bonds and stocks of these institutions are more stable and may have a better return. Therefore, the largest proportion of these institutions for the fund will have a certain impact on the risk and the return.

Since Huaxia CSI 300 ETF Fund is a stock fund, which contains ETF index and includes 0.28% stocks and some other financial assets (fund, bank deposit). In addition, its investment institutions are mainly corporations and commercial banks, in which, the PIN AN Insurance, Midea Group and SPDB are the main three institutions (Table 3).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 2. The portfolio weight of Huaxia market selection mixed fund*

| Bond and Stock | The Ratio of the Net Value |
|---|---|
| 15 Agricultural development bank 01 | 3.81% |
| 13 Agricultural development bank 06 | 1.27% |
| 17 China development bank 04 | 0.84% |
| Qingdao Haier | 6.05% |
| Midea Group | 5.12% |
| Wuliangye | 4.47% |
| Shanghai airport | 4.29% |
| Luzhou old cellar | 4.07% |
| CMBC | 4.05% |
| SAIC | 3.55% |
| KDX | 3.41% |
| CSCEC | 3.36% |
| OCT A | 3.32% |
| Total | 47.61% |

*Table 3. The portfolio weight of Huaxia CSI 300 ETF fund*

| Stock | The Ratio of the Net Value |
|---|---|
| Pin An Insurance | 0.05% |
| Midea Group | 0.04% |
| SPDB | 0.02% |
| Vanke A | 0.03% |
| PING AN Bank | 0.02% |
| CMCB | 0.02% |
| BOE A | 0.02% |
| Total | 0.28% |

Table 3 shows that Pin An Insurance is the largest proportion of holding stocks for this fund. Furthermore, because Pin An Insurance is Chinese policy bank and Qingdao Haier Group is a listed company ranked the top 500 in the world, the issuance stocks of this institution are more stable and may have a better return. Therefore, the largest proportion of these institutions for the fund will have a certain impact on the risk and the return (except other characteristics).

Since Huaxia Sulley Fund is a bond fund, which contains 33.91% bonds and some other financial assets (Table 4). In addition, its main investment institutions are corporate securities and bank securities, in which, the Jinyu Group, F referendum securities and Lianyungang securities are the main three investment institutions.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 4. The portfolio weight of Huaxia Sulley fund*

| Bonds | The Ratio of the Net Value |
|---|---|
| 16 Jinyu bonds 02 | 9.04% |
| 13 F referendum MTN1 | 5.62% |
| 17 Lianyungang CP001 | 5.36% |
| 15 Ex-im bank 09 | 4.28% |
| Vanke 3A1 | 0.07% |
| PR Far Eastern Group 5A | 1.41% |
| PR Jusi bonds A1 | 0.07% |
| Total | 33.91% |

Table 4 shows that Jinyu Group is the largest percentage of holding bonds for this fund. Furthermore, because Jinyu Group is a listed company ranked the top 500 in the world, the issuance bonds of this institutions are more stable and may have a better return. There are also other bonds of larger listed company for the holding bonds. Therefore, the largest proportion of these institutions for the fund will have a certain impact on the risk and the return.

Finally, the following is the detailed investment benchmarks of the three funds (Table 5).

Table 5 has shown that the benchmark of Huaxia Market Selection Mixed Fund (000011) has the relationship with the hybrid nature and can help the investors to make investment decisions. In addition, Huaxia CSI 300 ETF fund (000051) is the basic index in the Chinese stocks and funds market; Huaxia Suelly Fund (000014) is the less risky and stable rate in the financial market. These benchmarks separately have different effects on each fund.

## 3. EMPIRICAL METHODOLOGY

The broad methodology that will be used in the research is the empirical test. The methodology of this research will help readers understand the definitions of liquidity risk and open-ended funds easily. In addition, the aim of this research will be clarified through the methodology. The research will investigate whether risk return factors and liquidity measure have positive or negative influences on different kinds of Chinese open-ended funds. The detailed descriptions can be seen below.

*Table 5. The investment benchmark of three funds*

| Funds | Investment Benchmark |
|---|---|
| Huaxia Market Selection Mixed Fund (000011) | FTSE China A200 Index * 80% combine with FTSE China National Debt Index * 20%. |
| Huaxia CSI 300 ETF fund (000051) | Shanghai and Shenzhen 300 Index Yield * 95% + 1% (refers to the annual rate of return, the evaluation should be made by period conversion). |
| Huaxia Suelly Fund (000014) | One-year time deposit rate (tax after) + 1.2%. |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## 3.1. Regression Specification

The Linear Regression is the statistical technique which identifies the best-fitting line through a series of points. The specific equation is as follows:

$$(Ri - rf) = \alpha i + \beta i(RMkt - rf) + \varepsilon i$$

- $\alpha i$ is the intercept term of the regression;
- $\beta i(RMkt - rf)$ represents the sensitivity to market risk. When the market's return increases by 1%, the security's return increases by $\beta i$%;
- $\varepsilon i$ is the error term and represents the deviation from the best-fitting line. It is zero on average;
- $\gamma_f$ is the risk-free return which comes from the one-year deposit rate of the latest interest rate benchmark issued by The People's Bank of China in Chinese financial market, $\gamma_f = 1.5$ in 2017;
- RMkt is the market return which is the fund index in the Shanghai Stock Market.

The beta is the weighted average beta of the securities in the portfolio and acts as the measure of sensitivity to systematic risk. In addition, unlike volatility which measures total risk includes systematic risk and unsystematic risk, beta is a measure of only systematic risk. Since beta is the sensitivity to market risk of assets and the measure of excess returns, a higher value explores a higher risk and return. This research separately selects the covariances and the variances of the three funds. In addition, the period from 2012 to 2017 is divided into two stages. Additionally, the average six betas and the values of t-test are calculated respectively.

Furthermore, the most common test for the regression is the t-test which can be used to test a single restriction. Firstly, supposing the null hypothesis is $\beta_k = q$ for some given value q and considering the test statistic $t = (b_k - q)/se(b_k)$. Supposing the researcher wants to test the null hypothesis ($H_0$) that the true coefficient is $\beta_k = 0$, it will reject the null hypothesis if the absolute value of t(the ratio) is 'too large'(1.64 at 10%, 1.96 at 5% and 2.58 at 1% confidence level).Supposing it tests with 95% confidence, the researchers may reject the null hypothesis if the absolute value of t is larger than 1.96.

The ratio $t = (b_k - q)/se(b_k)$ is the t-value and is routinely supplied by any regression package with null hypothesis that $\beta_k = 0$. In addition, In case of being rejected, it is said that "bk differs significantly from zero" or "the corresponding x variable has a statistically significant impact on y" or simply "the ' variable is statistically significant." It is important to also look at the magnitude of beta (economic significance).

## 3.2. Measure of Liquidity (ILLIQ)

The Martin index measures the flow of the daily rate change to the ratio of the daily transaction. The trading volume and the pricing change are included in the measure of liquidity, which is related to the price impact. In terms of Amihud measure, the transaction cost dimension can probably be grasped by the difference of sale price; the dimension of the price impact can also be reflected. The measure is a better and low frequency indicator in the stock market. The specific equation is as follows:

$$ILLIQ = Rt/Vt$$

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Rt stands for the daily price change value of assets;
- Vt refers to the daily trading volume of assets.

From a certain point of view, these features indicate this measure. It means the bad characteristics for the fund return and the poor liquidity contributes to the risks in the securities market. This research separately selects the monthly trading volume and the monthly transaction price of the three funds, and the period from 2012 to 2017 is divided into two stages. Furthermore, the average six indexes of ILLIQ are calculated respectively.

## 3.3. Sharp Ratio

The purpose of Sharp Ratio is to calculate the amount of excess return for each portfolio to bear the total risk. The ratio is based on the concept of Capital Allocation Line (CAL), which is the most common measurement ratio in the market. In equilibrium, the capital asset prices have been adjusted, so that if the investors follow rational procedures (primarily diversification), they could achieve any desired point through a capital market line. This possibility also suggests both a plausible interpretation of the implication which contains all efficient combinations will be perfectly correlated and an interpretation for the relationship between expected return and the risk of investors assets (Sharpe, 1964).

The Sharp Ratio is applied when the assets of the portfolio are whole risky assets. Additionally, the index means that investors can get some extra returns when they take every risk. If the ratio is positive, the return of the fund is higher than the fluctuation risk; if the ratio is negative, the operation risk is greater than the return of the fund. As a result, each portfolio can be calculated with Sharp Ratio to estimate the return ratio on investment combing with multiple risk. The Sharpe theory has explored that investment should take the smaller risk for the larger return as much as possible in a scientific way, therefore, investors should become mature and try to avoid worth less risks. At the same time, when investors who lack investment experience and prefer to invest in portfolio, Sharp Ratio can be the professional index helping the investors to establish a suitable risk minimization portfolio. These portfolios can be measured by Sharp Ratio to estimate the proportion of risk and return. It is the measure the ratio of reward-to-volatility provided by a portfolio. The specific equation is as follows:

$$\text{Sharp Ratio} = \frac{PortfolioExcessReturn}{Portfolio\,Volitilaty} = \frac{E\left[Rp\right] - Rf}{SD\left(Rp\right)}$$

- E[Rp] is the excess return of each asset;
- Rf is the risk-free return which is the risk-free return which comes from the one-year deposit rate of the latest interest rate benchmark issued by The People's Bank of China in Chinese financial market, Rf = 1.5 in 2017;
- SD is the average standard deviation of each asset.

This research separately calculates the average excess return and average standard deviation of the three funds, and the period from 2012 to 2017 is divided into two stages. After that, the six average Sharp Ratios are calculated respectively through risk free rate and equation. This characteristic is related to the Sharp Ratio which will be discussed in detail as follows.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## 3.4. Information Ratio

The information ratio divides the alpha of the portfolio by the nonsystematic risk which could be eliminated by diversification. The calculation method is similar to the Sharp Ratio, while the factors of performance comparison are introduced. The equation which is in detailed as follows:

Information Ratio = $\alpha p / \sigma(ep)$

- $\alpha p$ is the Alpha for the portfolio;
- $\sigma(ep)$ is standard deviation for the portfolio.

Information ratio is the excess return corresponding to unit tracking error; the larger information ratio indicates the fund can get more excess returns at the same tracking error level. As for the measure of portfolio performance, the Sharp Ratio, Jansen index and Treynor index are known to investors for the risk measure. However, the Information Ratio is also known as "performance evaluation index" (Appraisal Ratio). In short, it is a measure of the funds and can get excess returns which used to measure the unsystematic risk per unit .The Sharp Ratio has the clear client point of view with the proportion of return, if the Sharp Ratio has the high proportion, it means the investors can decrease the absolute return for higher returns as long as the leverage and the risk is relatively small. However, the information ratio shows that the risk return has the relationship with a benchmark rather than cash due to active managers, so the significance of the information ratio is that it is one of important investment characteristic to the managers and investors.

This research separately selects the covariance and the variance of the three funds, and the period from 2012 to 2017 is divided into two stages. Furthermore, the average six Betas and the values of t-test are calculated respectively.

## 4. EMPIRICAL RESULTS AND LIMITATION

As the fund size increases, the investors are believed to have confidence on that obviously increasing fund and the corresponding fund return. And the factors have some negative and insignificant impacts the return, just as the liquidity and load fee (Rehman & Baloch, 2015). As for this research, this section analyzes the empirical results of data based on the characteristics and methodology which are described in the above parts. Moreover, the research assigns points to each ranking outcome and adds up all the points to see which fund has the highest point value (high means the score is 3, medium means the score is 2, small means the score is 1). After that, limitations on doing this research will be explored, with details listed in the following paragraph.

## 4.1. Beta and T-Test

First of all, the six $\beta$ values and the t-test values are observed from doing the regression of the three funds daily net value index in 2012-2014 and 2015-2017 two periods. The results in the table are in details as follows (Table 6).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 6. The beta of three funds*

| β | 2012-2014 | 2015-2017 |
|---|---|---|
| Huaxia Market Selection Mixed Fund (000011) | 0.75230226<br>(2.83) | -0.909148936<br>(-8.38) |
| Huaxia CSI 300 ETF Fund (000051) | 1.019293785<br>(1.11) | 1.069331307<br>(0.43) |
| Huaxia Sulley Fund (000014) | 0.0032080378<br>(13.72) | 0.0040075988<br>(12.48) |

As the above table indicates, according to the natures of the three different funds, except the β of Huaxia Market Selection Mixed Fund (000011) in the second stage is negative, all βs of these three funds are positive and different from each other. Huaxia CSI 300 ETF Fund (000051) has the highest β in the two periods and Huaxia Sulley Fund (000014) has the lowest β which is far from the other two funds. However, the β of Huaxia Market Selection Mixed Fund (000011) in 2012-2014 is medium among these three funds, which are different from the other two funds. Moreover, the β of Huaxia CSI ETF Fund (000051) is insignificant according to the t-test. The analysis and explanation of β and t-test values are indicated as follows in details.

In terms of the β value, because the asset class of Huaxia Market Selection Mixed Fund (000011) includes some percentages of stock and it is a leaning-stock fund in the hybrid funds, its β value is lower than that of the stock fund-Huaxia CSI ETF Fund (000051) and higher than that of the bond fund-Huaxia Sulley Fund (000014). Since the economic situation is relatively stable and the fund management corporation takes some different measures on this fund in 2015-2017, the β value of Huaxia Market Selection Mixed Fund (000011) has significant to do something with the risk return in the second stage. Besides, the t-test value of Huaxia CSI ETF Fund (000051) is lower than 1.96, reject the null hypothesis (except the reason for the smaller number of samples), β value may cannot explain something for the risk return of this fund. Then the β value of Huaxia CSI ETF Fund (000051) has not changed obviously in two stages because this fund is a stock fund of higher risk and higher return, which has been affected through some similar nature of the stock assets. The fund management corporation may have not taken some different measures on this fund in the two periods. As for the bond fund-Huaxia Sulley Fund (000014), the reason for its extremely lowβ value is because this fund is a bond fund, which has a relative stable asset class contains financial bond, convertible bond and the risk and the return is lower than the stock portfolio. Moreover, because the overall asset scale is smaller than the other two funds and the time of being issued is later than them. Additionally, the t-test value of β value is significant, which may have the significant explanation of the risk return for this fund and a better reference characteristic. The t-test value of β value for Huaxia Market Selection Mixed Fund (000011) in 2015-2017 is also significant.

Because β has something to do with the risk return, a higher β has a higher risk and a higher return while a lower β has a lower risk and a lower return. The stock fund-Huaxia CSI ETF Fund (000051) may have a higher risk and a higher return while there might be no more influence on the risk and return. The bond fund-Huaxia Sulley Fund (000014) may have the lowest risk and lowest return among these three funds. Huaxia Market Selection Mixed Fund (000011) may have the medial risk and return. Because β measure means the sensitivity for the risk, which is not a good value for this study, therefore, if the

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

value is higher, the score will be lower. Huaxia Sulley Fund (000014) is the most stable with 3 scores; the Huaxia Fixed Market Selection Fund (000011) is scored 2; Huaxia CSI ETF Fund (000051) is scored 1 combining with because of the significant β value.

## 4.2. Measure of Liquidity(ILLIQ)

Furthermore, the average six ILLIQ measures of three funds through the monthly pricing change and the monthly trading volume of each fund in 2012-2014 and 2015-2017 two periods are calculated. The average results are in details as shown in Table 7.

As Table 7 displays, according to the natures of three different funds, the whole six measures are positive in these three funds and different from each other. Huaxia Sulley Fund (000014) has the highest value in the two periods, and Huaxia CSI ETF Fund (000051) has the lowest value which is far from other funds. Therefore, the ILLIQ has something to do with the illiquidity. Because a higher ILLIQ brings about a higher risk while a lower ILLIQ results in a lower risk, the hybrid fund - Huaxia Market Selection Mixed Fund (000011) may have the medium risk; the bond fund Huaxia Sulley Fund (000014) may have the highest risk among the three funds; the stock fund Huaxia CSI ETF Fund (000051) may have the lowest risk.

The nature of bond fund- Huaxia Sulley Fund (000014) is a little different from the other two funds. Although the main asset class of this fund is steady bond, the small-sized publish scale and the later time of issuance may have some impact on the liquidity of this fund. The highest ILLIQ value among the three funds means that Huaxia Sulley Fund (000014) has the highest liquidity risk. In addition, the ILLIQ value of Huaxia CSI ETF Fund (000051) is the lowest in these three funds due to the proper management measures of fund manager, the largest issuance scale among the three funds and less uncertain shares of redemption. The medium ILLIQ value for Huaxia Market Selection Mixed Fund (000011) are caused by its nature of hybrid fund and the longest publish time among the three funds. Therefore, the ILLIQ means the illiquidity of the securities, which is not the good measure for the liquidity and risk return. If a higher value will lead to a lower score. Huaxia Sulley Fund (000014) is the highest with 1 score; Huaxia Market Selection Mixed Fund (000011) is scored 2 in the middle; Huaxia CSI ETF Fund (000051) is scored 3 with the lowest ILLIQ value.

## 4.3. Sharp Ratio

In addition, the average SR (Sharp Ratio) of three funds through the average excess return and average standard deviation of each fund in 2012-2014 and 2015-2017 two periods will be calculated. The average results are indicated in detail as shown in Table 8.

*Table 7. The ILLIQ of three funds*

| ILLIQ (Sharp Ratio) | 2012-2014 | 2015-2017 |
|---|---|---|
| Huaxia Market Selection Mixed Fund (000011) | 4.1309056 | 3.91219653 |
| Huaxia CSI ETF Fund (000051) | 2.020012267 | 2.036302133 |
| Huaxia Sulley Fund (000014) | 6.151964367 | 5.1226521 |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 8. The sharp ratio of three funds*

| SR (Sharp Ratio) | 2012-2014 | 2015-2017 |
|---|---|---|
| Huaxia Market Selection Mixed Fund (000011) | 0.900706215 | 1.749422492 |
| Huaxia CSI 300 ETF Fund (000051) | 0.473347518 | -1.567335375 |
| Huaxia Sulley Fund (000014) | 1.94471111 | 2.36271825 |

Table 8 shows that the Sharp Ratios of the three funds are different in the two periods. Huaxia Market Selection Mixed Fund (000011) still has the medium value in the three funds; Huaxia Sulley Fund (000014) has the largest and significant value in the two stages; Huaxia CSI 300 ETF Fund (000051) has the lowest ratio of the three funds and the negative value in 2015-2017 period. Moreover, if the Sharp Ratio is higher, the volatility of the investment return will become smaller. Huaxia Sulley Fund (000014) is the most stable and has the smallest volatility in the three funds. However, Huaxia CSI 300 ETF Fund (000051) has the greatest volatility of them and Huaxia Market Selection Mixed Fund (000011) has the medium volatility in the three funds. As for the reasons of higher, lower and negative Sharp Ratios, it can be seen and summed up as below.

Sharp Ratio means the ability to resist fall of each fund and it is estimated by using the regenerated sample, the risk-free rate and the conservative yield rate. With the negative value, it means that Huaxia CSI 300 ETF Fund (000051) has a significant and poor ability to resist fall and higher risk in 2015-2017 because it has the nature and fluctuate investment strategy of the ETF index fund in the stock fund. Moreover, since Huaxia Sulley Fund (000014) is a bond fund, which contains stable, less risky and rather safe bonds in the asset class, it has the smallest Sharp Ratio with smaller standard deviation and has not been changed significantly in the three funds. As a contrast of this fund, the holding stock price for Huaxia CSI 300 ETF Fund (000051) has obvious greater volatility than the other two funds and the asset class includes the higher risk stocks and liquidity index assets. That's why the Sharp Ratio of this fund has the significant change with the relatively great standard deviation and has the negative value in the second period. Because Huaxia Market Selection Mixed Fund (000011) is a leaning-stock in the hybrid funds and the manager of this fund holds a long-term and moderate investment strategy, the Sharp Ratio of this fund is medium with the obvious change in the two periods with the same reason (the change of manage measure for this fund in 2015-2017 period) in the section of beta analysis.

Hence, the Sharp Ratio means the relationship with the excess return of the securities, which is the better characteristic for measuring risk return. If the value is higher, the score will also be higher accordingly. Huaxia Sulley Fund (000014) is the highest with 3 scores and the Huaxia Market Selection Mixed Fund (000011) is also scored 2 as the medium, Huaxia CSI ETF Fund (000051) is scored 1 with the lowest Sharp Ratio in these three funds.

## 4.4. Information Ratio

Finally, observing the six Information Ratio value from doing the three funds daily net value index in 2012-2014 and 2015-2017 two periods; the results in the figure are in detail as shown in Table 9.

As the figure showed, the Information ratio has the different results of three funds in the two periods. In addition, Huaxia Market Selection Mixed Fund (000011)has the higher value in the three funds and Huaxia Sulley Fund (000014) has the low and significant negative value in the two stages while Huaxia

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 9. The information ratio of three funds*

| IR (Information Ratio) | 2012-2014 | 2015-2017 |
|---|---|---|
| Huaxia Market Selection Mixed Fund (000011) | 0.148677686 | 0.187470238 |
| Huaxia CSI 300 ETF Fund (000051) | 0.067561983 | 0.074826915 |
| Huaxia Sulley Fund (000014) | -0.060022989 | -0.154657738 |

CSI 300 ETF Fund (000051) has the medium ratio of three funds and the negative value in 2015-2017. Moreover, if the information ratio is large, the excess return of the fund will become higher; Huaxia Market Selection Mixed Fund (000011)may have the higher excess return in the three funds and Huaxia Sulley Fund (000014)may have lower excess return in the three funds. The detailed reasons of higher, lower and negative information ratio can be seen below.

There is a problem of information ratio. If the value is negative, the fund manager of this fund may not be able to make the largest excess returns with the relatively smaller excess risk. Therefore, the fund manager of Huaxia Sulley Fund (000014) may take some improper management measures to this fund, which add the smallest published scale and the latest issuance time through these funds. The information ratio of this fund is the smallest in the three funds and has no obvious change in the two periods. Additionally, the information ratio of Huaxia Market Selection Mixed Fund (000011) is the highest in the three funds and also has no obvious change due to the nature of this fund, the proper management measures of fund manager in the two periods and the measure of excess returns. The information ratio of Huaxia CSI 300 ETF Fund (000051) is the medium value in these funds and almost has no changes in 2012-2014 and 2015-2017 periods, which have some reasons that are not steady investment strategy as the Huaxia Market Selection Mixed Fund (000011).

Hence, the information ratio refers to the relationship with the Sharp Ratio of the securities, which is the better characteristic for the measure of risk return. If the value is higher, the score will also be higher. Huaxia Market Selection Mixed Fund (000011) is the highest with 3 scores; the Huaxia CSI ETF Fund (000051) is scored 2 as the medium; Huaxia Sulley Fund (000014) is scored 1 with the negative information ratio in these three funds.

## 4.5. Estimation and Limitation

From the analysis above, there are some estimation and limitation of this research, which will be explored in detail as follows.

### 4.5.1. Estimation

Considering all the characteristics and measures above, as indicated in Table 10, Huaxia Market Selection Mixed Fund (000011) has the highest scores (9) in the three funds. In addition, Huaxia CSI 300 ETF Fund (000051) has the lowest scores (8) in these funds while Huaxia Sulley Fund (000014) has the medium scores (7) in them. In terms of the rational investment for three funds, the investors are sug-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 10. The summary scores of three funds*

| Funds | Beta | ILLIQ | Sharp Ratio | Information Ratio | Total Score |
|---|---|---|---|---|---|
| Huaxia Market Selection Mixed Fund (000011) | 2 | 2 | 2 | 3 | 9 |
| Huaxia CSI 300 ETF Fund (000051) | 1 | 3 | 1 | 2 | 7 |
| Huaxia Sulley Fund (000014) | 3 | 1 | 3 | 1 | 8 |

gested to combine the risk return theory with the risk-aversion theory of funds. The development of the theoretical relationship between risk and expected return are built on two economic theories: portfolio theory and capital market theory. Table 10 shows the summary of the three funds.

Portfolio theory deals with the selection of portfolios to maximize expected returns consistent with individually acceptable levels of risk. It covers how do investors under assumed conditions select the assets to be included in a portfolio. However, the failure to quantify these important measures made constructing a portfolio of assets highly subjective and provided no insight into the return investors should expect. In terms of the capital market theory, it deals with the effects of investor decisions on security prices and shows the relationship existing between security returns and risk. If investors construct portfolios as indicated by portfolio theory, the portfolio theory and capital market theory yield a framework to specify and measure investment risk then develop an equilibrium relationship between risk and expected return. With regards to the risk-aversion theory, the attitude of different people toward risk is different. Some people may have interest in the stimulation while others might be more willing to be stable. The investors are divided with three types: risk-preference, risk-neutral and risk-aversion types. As the theorem of Arrow shows that if an investor becomes less risk-averse with higher wealth in terms of absolute risk aversion, he/she will invest more in the risky asset. In case of having the same return, they prefer to the assets with low risk and are interested in assets with high expected return for the assets with similar risk. Contrary to the risk-aversion, the risk-preference investors usually think the benefit of the volatility is better than the stability and seek the risk. The risk neutral investors usually do not avoid risks and pursue risks. Regardless of the risk conditions, they just consider the size of expected returns for the assets.

First of all, the conservative investors of fund who are risk-aversion may prefer to Huaxia Market Selection Mixed Fund (000011) and Huaxia Sulley Fund (000014) as the rational investment portfolio, which have fewer risks and more stable returns. After that, neutral investors of fund who are risk-neutral may have the interest in these three funds as the rational investment portfolio, which have relatively fewer risks and more returns in the three funds. As for aggressive investors of fund who are risk-preference may prefer to Huaxia Market Selection Mixed Fund (000011) and Huaxia CSI 300 ETF Fund (000051) as the rational investment portfolio, which has the highest risks and most returns in the three funds.

### 4.5.2. Limitation

This study takes into the comprehensive consideration of the data choosing and estimation analysis as much as possible. However, there are still some limitations. First of all, as for the selection of the data, the coverage may not contain all types of funds, such as currency funds, leaning-bond funds in hybrid funds. Therefore, the empirical results only depend on the selected data. Secondly, there are only data

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

of three funds in this research while it has no methodology to do more models and analysis due to the data restriction. Thirdly, the published time (2013) of Huaxia Sulley Fund (000014) is later than other funds, which may have some negative influence on the data select.

In addition, the characteristics of risk return, and measures of liquidity are not entirely selected in this research, such as Alpha, turnover rate and some other measures. Except the regression specification, there are no more models and analysis methodology in this module, such as the Capital Asset Pricing Model and Fama French three factors Model. Also, some characteristics need to be further explored by the analysis of data.

Therefore, if this research considers these limitations, it may have more specific and accurate results, so as to draw more suitable and rational investment suggestions for the investors.

### 4.5.3. Future Research Directions

Chang (2014) presented the "Business Intelligence as a Service" to demonstrate how financial analysis can be conducted in real time. If our financial analysis can be performed in real-time, it can effectively enhance the functionality of our financial services. Maintaining a high security and privacy is also important to ensure all data can be protected from large-scale hacking (Chang and Ramachandran, 2016). Additionally, having all our services and data presented in analytics can allow decision-makers and users to understand the implications and meanings of their services (Chang, 2017). What's more, how to prevent tax avoidance and tax invasion has become increasingly more important. Newman et al (2018) introduced ways to measure tax avoidance and invasion. In this way, it can enable our proposed recommendation to become more robust since we can detect any suspicious and criminal activity. In summary, all these will be relevant to the future trends, so that our future work can be developed on top of the combination of these three areas.

## 5. CONCLUSION

In the first place, as for the research questions and hypothesis for this module, the stock fund-Huaxia CSI 300 ETF Fund (000011) has the higher Sharp Ratio and Beta than the hybrid fund-Huaxia Market Selection Mixed Fund (000011) and bond fund-Huaxia Sulley Fund (000014), while this fund has no higher information ratio through these funds. To some extents, higher Sharp Ratio and Information ratio have positive influence on the risk returns of each fund in the two periods while higher Beta has negative effect on the risk return for these funds. After analyzing the three funds in this research, the conservative investors of fund who are risk-aversion may prefer to Huaxia Market Selection Mixed Fund (000011) and Huaxia Sulley Fund (000014) as the rational investment portfolio; neutral investors of fund who are risk-neutral may have the interest in the three funds as the rational investment portfolio. The aggressive investors of fund who are risk-preference may prefer to Huaxia Market Selection Mixed Fund (000011) and Huaxia CSI 300 ETF Fund (000051) as the rational investment portfolio.

Furthermore, the data of this research comes from the Chinese fund market and the Chinese fund management company, which can be used for the reference with the development of Chinese fund market and the rational choice with higher income and lower risk of investors and investment institutions.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Compared with the whole financial market in the world, the western fund market and financial market have different situations with the Chinese market, which are affected through a series of factors. However, the financial market follows the same economics theory in various areas, such as the capital market line model, the regression and t-test theory etc. Therefore, this research also has reference for the western financial market and fund market to some extent.

# Chapter 48
# Trade and Economic Integration in BRICS:
## Towards Multi-Polarity

**Akhilesh Chandra Prabhakar**
*Lovely Professional University, India*

## ABSTRACT

*This chapter examines the existing pattern in the area of trade and economic integration among the BRICS countries which was tended to be neglected and to which there have been few original or significant contributions until now. The research results indicate the presence of the long-run sustainable equilibrium relationship between Foreign Direct Investment (FDI), trade and economic growth. It is thus important that policymakers have to remove obstacles to FDI inflows and improve the respective absorptive capacity of national economies in order to maximize positive growth effects. This study also discusses how China performed well through attracting FDI inflows and maintained trade balance.*

## INTRODUCTION

The balance of economic power from the West (which dominated during the last four-five centuries) has been dramatically shifting to the East since 2007 when major capitalist developed countries including the USA faced economic recession. As an emerging regional block, BRICS (Brazil, Russia, India, China, and South Africa) plays a significant role through acquiring technological capacity, internalizing capability to exploit resources, and developing infrastructure. The gap between demand and supply is reducing through improving production capacity and distribution networks with the principles of collective self-reliance at the South-South level. BRICS countries have increased their trade, financial and technical cooperation and established distinct ways and means of economic cooperation, especially through south-south cooperation with three continents, namely Africa, Latin America, and Asia. BRICS countries are striving for more economic and political influence, thereby challenging western-dominating "global economic order", which has maintained currency supremacy of US dollar and Euro through international financial agencies like the World Bank and the International Monetary Fund (IMF) since the Second World War.

Russia hosted the seventh BRICS summit on July 9–10, 2015, in Ufa, the capital of the Republic of Bashkortostan, gathering the heads of state of the five countries.

Expanding investment cooperation and exploring a strategy for multilateral economic cooperation were the centerpieces of Russia's 2015 agenda in the framework of BRICS. At the 2014 Fortaleza summit, BRICS countries decided to establish the New Development Bank (NDB) and the Contingency Reserve Agreement (CRA). The CRA is especially relevant for addressing the shrinking foreign reserves of Russia.

BRICS has an enormous potential of consumer market, large middle-class, abundant supply of natural resources, well-developed financial parameters, good communication and networks, sound legal system, and modern infrastructure supporting an efficient distribution of goods and services among member states and other developing countries (Vijayakumar, Sridharan, & Chandra Sekhara Rao, 2010).

In terms of combined GDP, BRICS economies put together are already larger than the USA and the European Union (Naude, Szirmai, & Lavopa, 2013). BRICS economies are stable with high growth rates, economic potential and demographic development, and intensified economic cooperation linkages with other developing countries not only with regard to trade and financial flows but also as emerging donors. Europe and the USA were drivers of economic and trade growth in the 19th and 20th centuries, respectively (Sajal, 2013).

BRICS encompasses over 25% of the world's land coverage with 43% of the world's population; holds a combined GDP (PPP) of $24,000 billion (which increased more than three times in the last fifteen years). Over the past ten years, BRICS countries increased their share of global gross domestic product from 18% to 28%. BRICS' share in global exports is also expected to grow from 12.4% to 20.1% in 2014. BRICS countries hold $3.93 trillion of foreign reserves, which is over one-third of the global reserves. The overall BRICS focus of development cooperation lies on regional integration and technical assistance with various regional groups in Latin America, Association of Southeast Asian Nations (ASEAN), Asia-Pacific region in Asia, and in African countries. From a purely demographic point of view, India and China have the highest economic prospects due to their huge population and sufficient capital accumulation, which favor and support the BRICS agendas.

However, trade and the current foreign direct investments (FDI) inflow into BRICS are extremely complex. They are subjects to various factors related to the competitive environment. This study intends to examine the patterns of trade, economic growth, as well as the major determinant factors of FDI inflow-outflow. Currently, domestic investment ratios are around 40% and 30% of GDP in China and India, respectively. Investment ratios of Brazil, Russia, and South Africa account to 20-23% of GDP.

The central premise of this study is to investigate FDI and trade both between BRICS countries and internationally, and to assess their combined impact on economic growth within BRICS. There are several studies contributing to the economic literature on the subject. The existing literature includes a number of surveys, case studies, and some empirical studies, which formulate cross-sectional analysis and discover a set of explanatory variables that determine FDI, trade and growth of BRICS. However, some earlier studies investigated the relationship between FDI, trade, and economic growth for transition economies and developing economies as well as for groups like ASEAN and the European Union. Nevertheless, the available research literature pertaining to BRICS countries is still limited. In this context, author's study intends to examine the role of FDI flows and trade in BRICS's economic growth by employing long recent data. Author hopes, that this actual study will contribute largely to the literature on incoming FDI, trade and economic growth in BRICS, and can be extended to other countries as well.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## BACKGROUND

BRICS' significance in terms of trade flows has risen sharply in recent years since the economic crisis. Outward investments are concentrated in the sectors where the home economy has relatively well-developed capabilities. Outward investments are also important for the further development of those capabilities. FDI represent a major source for capital-intensive projects from multinational companies (MNC) worldwide. Due to the global economic recession since 2007 developing countries like Mexico, Indonesia, Nigeria, and Turkey (called MINT), India, China, Asia-Pacific countries, and other East and Southeast regions became the most competitive hosts of foreign capital. Empirical studies regarding the link between FDI, trade, and economic growth in BRICS are not sufficient.

In addition, financial services and pharmaceutical cases underline that there are important complementarities in key sectors supporting capability development and internationalization of firms when BRICS countries are both home and host economies (Gelb, 2014). The study of Ho, Ahmad, and Dahan (2013) also analyzed that trade between BRICS countries and the rest of the world has grown expressively with China and Brazil being the world's quickest rising economies. As international consumption and international production shifted to emerging economies (BRIC), MNCs are increasingly investing in these countries. In order to utilize this trend of FDI it is important to look back and consider the status of India's FDI attracting position among other BRICS countries (Mathipurani & Rachel, 2014). This study is likely to contribute to the literature on BRICS. This study used a technique for analytical and empirical study in depth on the commodity trade and FDI, and focused on other variables too. The author used graphs and tables to explain the data accordingly. The data used in this study are taken from the World Development indicators 2014 (World Bank, n.d.).

## MAIN FOCUS OF THE CHAPTER

### Global FDI and Trade in BRICS

Incoming FDI worldwide increased by 11% and accounted $1.46 trillion in 2013. FDI inflows to developing countries reached $759 billion, accounting for 52% of the total volume of FDI (United Nations Conference on Trade and Development, n.d.). Developed countries, however, were "trapped in a historically low share" (39%) for the second consecutive year. Global inflows of FDI progressively rose to $1.6 trillion and $1.8 trillion in 2014 and 2015, respectively. Inflows of FDI into developed economies increased by 12% and reached $576 billion, with such investments into the EU growing, while inflows to the USA continued their decrease. The USA received $159 billion of FDI inflows in 2013.

BRICS now accounts for over one fifth of global inward FDI with 22% (21% in 2012). Continued inflows of FDI testify a long-term confidence in the BRICS economies among foreign investors, which provides those countries with a measure of insulation from the global credit crunch. However, global FDI surged by a projected 10.94% from $557.58 billion in 2012 to $618.62 billion in 2013. China was the highest ranked country internationally with $64.1 billion worth of FDI announced in 2013.

Western Europe was the top source for FDI in 2013. It accounted for 34.94% of all announced outward FDI in 2013 and experienced a 10.38% increase in 2012. Estimated capital investment from North America increased by 9.57% in 2013, and the region maintained a global market share of about 20%.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

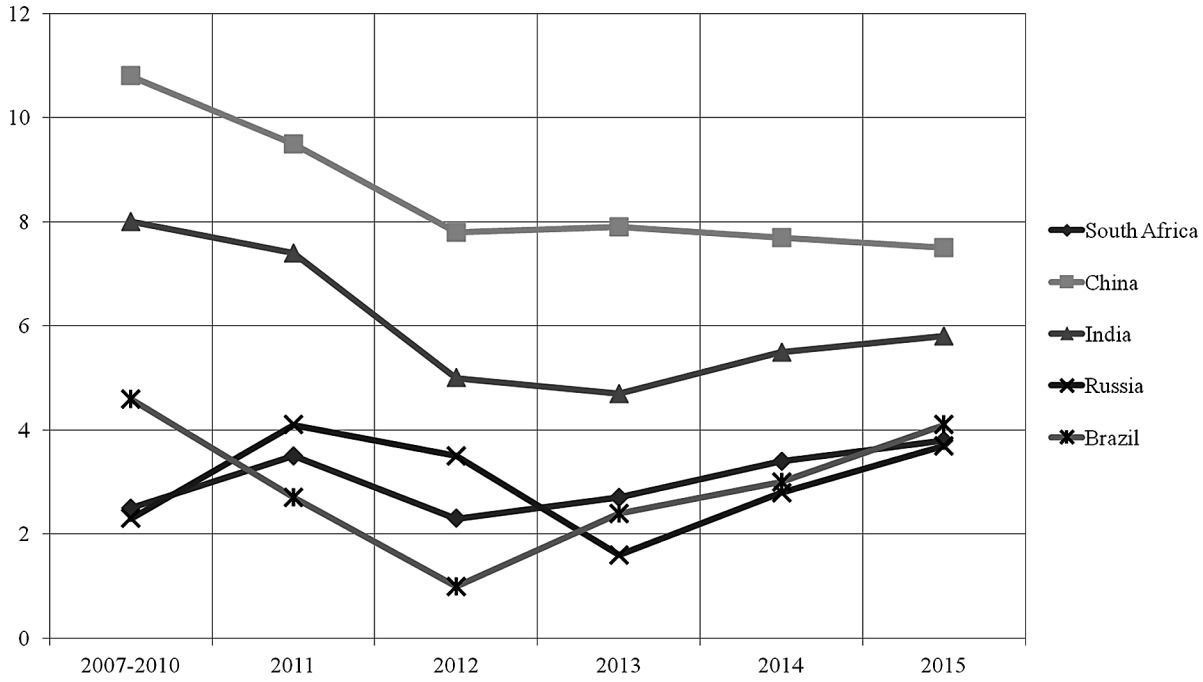
There was a decline in the number of outward FDI projects coming from the region of North America (2,951 in 2013 compared to 3,287 in 2012) (Financial Times, n.d.).

Business services, coal, oil, natural gas, communications, renewable energy, and real estate were the top sectors of capital investments in 2013, accounting for 47.26% of FDI worldwide. Out of them, real estate was the only one sector, which experienced a decline by 27.03%, down to $46.74 billion. FDI activity in construction grew with hotels and tourism increasing by 36.3%, up to $18.98 billion in 2013 and building and construction materials increasing by 88.39%, up to $9.69 billion. In 2013, FDI markets recorded 762 investments in the communication sector totaling $61.59 billion. This represents an increase by 82.2% in 2012 and the highest ever capital investment since 2003 (Financial Times, n.d.).

## Intra-BRICS Trade and FDI

Intra-trade of BRICS countries accounted to $230 billion in 2013. It reached $300 billion in 2014 from only $27.3 billion in 2002. It is expected that intra-trade within BRICS will exceed $500 billion in 2015. BRICS' aggregated share in international trade is currently 18%. It is predicted that BRICS may account for 41% of the world's market capitalization by 2030. South Africa outperformed other BRICS countries, with FDI inflows rising by 126%. Inflows to China are about $127 billion – including both financial and non-financial sectors. China is ranked second in the world on the volume of inward FDI, closing the gap with the USA to some $32 billion. Almost 70% of the China's incoming FDI go to manufacturing sectors (automotive, consumer durables, garments, microelectronics, and telecommunications), solidifying China's status of the world's manufacture platform. Chinese foreign investments excited incoming FDI in financial services, real estate, construction, and other non-manufacturing sectors. FDI to Brazil – the largest recipient of FDI in Latin America – accounted $63 billion in 2013, which was the 7th position among the top-20 host economies in 2013. Brazilian biofuel industry, which has become the world's leader amid growing demand for renewable energy products, is also garnering significant attention from foreign investors. Figure 1 shows the economic performance of BRICS countries in terms of GDP.

## Growth Slowdown in the BRICS



In many large developing countries, including BRICS, economic growth has weakened considerably over the past two years and is now well below the pre-crisis level. In 2013, weighted GDP growth in BRICS was 5.6%, down from an annual average of about 8% during the period 2000-2008. India and South Africa recorded trade deficits and lack of competitive advantages, while China and Brazil, and to a lesser extend Russia, have large trade surpluses and obvious comparative advantages. Further, according to UNCTAD statistics online reports, before the economic crisis, Russian export followed by those of Brazil and China has significantly exceeded import flows. As a result, in this first period, total trade of countries showed the uneven development within the BRICS group.

In 1997, aggregated share of BRICS countries in world trade in goods was 6%. Since 2004, the five states have maintained relatively stable growth (between 20-30%). The analysis of data from the period 2001-2007 reflects the characteristics and national trade level of BRICS countries. In these years, the five countries experienced high growth trend, especially in living standards (India), meaning a strong development momentum. In addition, the author finds that the growth rate of trade maintained a high level until 2008 when the economic crisis started. As an example, the growth of China and India compared to other countries was faster, followed by that of Russia, South Africa, and Brazil. The explanation for

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 1. BRICS economic performance in terms of GDP (in %)*
*Source: Author's own development based on World Bank (n.d.)*

China′s case consists in the early process of gradual reforms and introduction of the "openness" policy in 1978 compared to Russia (1991) and Brazil (1994). BRICS states are increasingly dependent on foreign trade. According to the World Bank experts, in regards to their dependence on foreign trade BRICS countries may be mentioned in the following order: China, South Africa, Russia, India, and Brazil (China being the less dependent) (World Bank, n.d.). Regarding imports, the leading importer is South Africa, followed by China, India, Russia, and Brazil. Consequently, large commercial dependence leads to the irrational domestic production, consumption and structure of foreign trade, affecting GDP because of trade volatility (case of South Africa).

## Impact of Foreign Direct Investment

Multinational companies (MNC) shifted from highly industrialized countries to such emerging markets as Brazil, China, and India (4,000 MNCs). However, on the other hand, private corporations from these emerging countries (China, India, and Russia) operate abroad. For example, over 700 Chinese corporations operate in Africa. Moreover, subsidiaries in BRICS evolve in parallel with expansion of the whole group and its increasing importance on the global market. Therefore, the author states that expansion abroad is an opportunity to acquire existing capacities in case of MNCs that operate on a developed market (see the data in Table 1 and Table 2).

FDI inflows in BRICS can be identified by two groups of countries, some focusing on manufacture (China and Brazil) and energy (Russia), while the others – on services (India, with emphasis on communication and information, and Russia). China and India are followed by Russia, Brazil, and South Africa. India, for example, attracted huge investments starting from the beginning of the 21st century

Source: Financial Times, n.d.

due to major reforms on opening the economy towards the world market. Both India and China have two competitive advantages which are cheap labour costs and low country risks. Increase of FDI flow in China is mostly due to the large domestic market and close international trade ties with OECD (Organisation for Economic Co-operation and Development) countries. Regarding investments abroad, in case of China they are considered as the tools of access to technologies and natural resources. In these circumstances, the author considers that before the financial crisis of 2008 rapid growth of BRICS countries accounted a major share of global economic growth. However, the world economic crisis has affected BRICS members, though to a lesser extent, than it hit some of the developed countries. Both import and export volumes fell in Russia (by 65%), Brazil (52%), China (41%), South Africa (32%), and India (23%). However, compared to the G-7, the impact of the crisis on BRICS countries in terms of trade was not dramatic (Popa & Carp, 2013). Compared to other emerging countries, China continued its upward trend (with 8%/year). Thus, the author believes that China is an engine of global economic growth, alleviating somewhat the regress of the rich world.

## China-Russia Economic Corridor for De-Dollarization

On May 21, 2014, Russia entered into a $400 billion agreement with China on supplying gas over the next thirty years. The significant feature of the deal is that the payment will be made not in US dollars. This substitution of other currencies for the reserve currency, which in today's world is essentially presented by the US dollar, is what the Russians call "de-dollarization". Therefore, "de-dollarization" can become a prelude to a new conjuncture entailing severe crisis and destabilization in the capitalist world, and leading to a loss of the USA's hegemony. Figure 2 and Figure 3 portray the trends in GDP growth rates and world output and trade respectively.

## Evolution of International Trade of Emerging Economies

Statistic data from international organizations show an increase of trade of emerging economies from one year to another. China is the leading exporter and importer among BRICS countries. However, it recorded large trade deficit because of which services continued to have a small share in trade. The same feature is true for Russia and Brazil. In case of India, services accounted for approximately 37% of total national export (goods plus services) and 24% of total national import. These are higher values than those recorded by the USA (Popa & Carp, 2013). Due to a poor basic infrastructure and lower investment, India's share in world's export in 2013 was only 1.7%, while China had 11%. Three factors determine industrial patterns of FDI inflows in BRICS, namely development directions, availability of resources, and business environment. For this reason, the author considers that in Brazil, Russia, and India the tertiary sector attracted FDI the most among other sectors of economy in recent years, the primary sector – only a few millions of dollars, while the results of the secondary sector were somewhere in the middle. China's secondary sector was and remains dominant in terms of attracting foreign capital, what cannot be said about the primary and tertiary sectors. Compared with other BRICS members, Russia does not attract many FDI. A number of barriers, such as administrative ones, infrastructure issues, and enforcement of intellectual property rights are the major obstructions to FDI inflows to Russia.

However, studies have shown a relationship between GDP and FDI inflows in BRICS states that can be approximated to a linear equation with a positive slope (Nandi, 2012). Further, despite certain domestic obstacles, economies of Brazil, Russia, India, China, and South Africa seem to form the world's largest economic group on increasing attraction of FDI flows and their rapid development in the mid-twentieth century. They now continue their efforts in the 21st century. All macroeconomic indicators show that the five members continued their upward trend of yesteryear (it is true, in lower percentages). In this context, the possibility for China to become as large as the USA by 2027 and even exceed it by 2050 became a heated and controversial subject of debate among researchers.

## BRICS-Africa Cooperation

Growing economic linkages of Africa with BRICS go through three key channels: trade, investment, and development assistance. Africa's trade with BRICS has grown faster than with any other region in the world. Foreign trade turnover between BRICS and African countries doubled to $340 billion in 2012 in comparison with 2007. It is projected to reach $500 billion in 2015 (United Nations Economic Commission for Africa, 2013). BRICS countries are now becoming a larger feature on the global and African market. Their economic, political, and strategic position in global affairs is a manifestation of the potential of South-South Cooperation.

Africa's resource endowments create opportunities to leverage Africa-BRICS cooperation for embarking on an industrial strategy to maximize backward and forward processing linkages with the commodity sectors. Such linkages potentially offer major benefits for commodity producing countries, among which is a decent employment. Cooperation of African countries with BRICS can capitalize and develop such sectors as agriculture and manufacturing, which could boost growth and give employment through these linkages, as well as other channels. Success of BRICS is to promote inclusive growth, employment and structural transformation, which will lead to reduction of poverty and inequality in Africa.

The largest FDI come to Africa from BRICS (until 2002 their FDI inflows were dwarfed by those from the Western countries). FDI flows to Africa from India, China, and Brazil rose from 18% of the total

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

volume of FDI in 1995-1999 to 21% in 2000-2008 to meet the requirements of Africa for infrastructure development. BRICS' financial aid was forwarded to Africa through project aid (mainly to improve infrastructure, complementing aid, concessionary loans and credits, as well as grants).

## SOLUTIONS AND RECOMMENDATIONS

Based on the findings of the current study, "South" can achieve the goal of "Bandung Consensus" through regional integration, and support each other at all levels: investment, technological transfer, trade and economic cooperation, etc. Moreover, BRICS policy makers need to formulate appropriate and effective policy in order to encourage FDI, expand trade volume and further stimulate economic growth.

## FUTURE RESEARCH DIRECTIONS

For future research it is suggested that cross-country analysis, long period data, and more sophisticated econometric techniques, covering the main determinants of FDI, investment, trade, technical and production cooperation will certainly give more robust results and largely help policy makers in the context of BRICS.

## CONCLUSION

Global economic recession and instability gave an opportunity to forge new mutually beneficial partnerships in the fields of economic, trade, energy security, and technology. It will ultimately act as an engine of economic growth and socio-economic development among the developing countries. The quest for exploration of the newer paradigm led to the birth of an idea called BRICS. It is about the tremendous force of solidarity, which can help to overcome even the biggest challenges confronting the world. It has potential to bridge the technological gap in order to improve capability; ensure equal distribution of resources, opportunities and freedom; abolish foreign currency domination (like dollar and euro) and imperialist military domination, which would ultimately achieve the goal of self-reliance. With the influential and remarkable progress through promoting local currency (for de-dollarization), regional foreign direct investment, and regional trade, BRICS economies have emerged and took a new space in the 21st century.

Russia hosted the seventh BRICS summit July 9-10, 2015, in Ufa, the capital of the Republic of Bashkortostan, gathering the heads of state of the five countries. Expanding investment cooperation and exploring a strategy for multilateral economic cooperation were the centerpieces of Russia's 2015 agenda in the framework of BRICS. At the crossroads of Asia and Europe, BRICS decided to launch various projects of the Silk World Order of trade and integration. It is no coincidence, however, that the Seventh BRICS and Fifteenth Shanghai Cooperation Organisation (SCO) summits were combined into a single big international summit, to use the opportunity to initiate the integration process of the Silk World Order. One informal session at Ufa did not include the members of the BRICS and the SCO only, but also the members of the Eurasian Economic Union (EAEU). Armenia attended the joint BRICS and SCO summit in Bashkortostan, since all the other members of the Eurasian Economic Union are

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

either full SCO members or, like Belarus, SCO dialogue partners. Azerbaijan and Turkmenistan also participated in informal meeting of the BRICS, SCO, and EEU. The BRICS-SCO-EEU talks were "a sign that Russia is aiming for political block-building".

The Eurasian and global convergences in Ufa used the links that already existed. China's New Silk Road and the Russian-led Eurasian Economic Union launched a roadmap to fuse together in Bashkortostan as the pivotal axis of rotation in the Eurasian space. While the New Silk Road and the EEU came together in Ufa, BRICS initiated together a development map while the SCO also outlined its expansion plans for new full members. The applications of India, Iran, and Pakistan for full membership were discussed. Moreover, Egypt and several other countries applied to join the SCO in some context. Ufa is being used to stamp out a roadmap for the "Eurasian Century" and a Silk World Order that goes beyond Eurasia, which includes everything from a transcontinental mega railroad network connecting the Iberian Peninsula to the South China Sea and to what was dubbed as the "modern city of the Eurasian continent" in Belarus.

The Chinese are busy building trade infrastructure and transport networks. In Belarus, the Chinese build the first "modern city of the Eurasian continent" in the forests next to the Minsk National Airport as part of what Bloomberg calls "a manufacturing springboard between the European Union and Russia". Upon completion, the new export-oriented city in Belarus, which is being built on the route of the European highway that links Berlin, Warsaw, Minsk, and Moscow, will be the largest manufacturing and industrial park in Europe.

This research has found a scope of new prosperous emerging, other developing and transitional economies, with the commercial exchanges, through foreign direct investments with technical cooperation, and trade as an engine of sustainable economic growth of the world economy, which ultimately creates a "new world economic order". The institutionalized grouping known as BRICS (or BRICSA according to some experts) includes three different continents namely: Asia, Latin America, and Africa, linked with each other in many ways. In trade in goods, taking into account the export structure, it can be distinguished by two complementary groups. On the one hand, China and India, whose exports are dominated by manufactured goods. On the other hand, Russia and Brazil, which focus on commodity exports surpassing those of manufactured goods, raw materials, and oil and gas supply (especially by Russia). In terms of exports trend, Brazil and India are less interested in export of their products, while China and Russia are predisposed to export.

China's economic cooperation with India is continuously growing with the target of increasing annual trade scale to $150 billion, and the total amount of China's outward investment up to $30 billion in next five years to come. India and China today constitute almost 35% of the world's population, their bilateral trade volume increased from less than $3 billion to nearly $70 billion. Two emerging powerhouses set a target of increasing their annual bilateral trade volume to $100 billion by 2015, as they are seeking to step up trade and investment engagement. It is concluded that overall FDI inflows and trade have positive impacts on the economic growth of BRICS.

## KEY TERMS AND DEFINITIONS

**BRICS Development Bank:** It is operated by BRICS (Brazil, Russia, India, China, and South Africa) as an alternative to the international financial organizations such as the World Bank and the International Monetary Fund, which are dominated by Western countries. The objective of the bank is to mobilize resources for infrastructure and sustainable development projects in BRICS and other emerging economies and developing countries.

**De-Dollarization:** Since Bretton Woods Conference, all trade including oil and natural gas around the world has been bought and sold in US dollar. It has been a massive advantage for the USA and disadvantages for the rest of the world. Recently, BRICS nations such as Brazil, Russia, India, China, and South Africa have initiated to change the current unipolar world order through de-dollarization process.

**Economic Development Cooperation:** Among groups of countries and between the nations economic, financial, educational, scientific and technological, and trade ties based on the common objectives and goals.

**Foreign Direct Investments:** They are involved in any country to fulfill the desires of capital, technology, business organizational skills, and management. It is generally controlled by the powerful MNCs for the purpose of maximization of their profits under comparative advantage conditions.

**Infrastructure Development:** Generally, infrastructure refers to the large-scale public systems, services, and facilities of a country or region that are necessary for economic activity. The sector tends to be separated into two broad subsets – economic and social. Economic infrastructure includes highways, water and sewerage facilities, and energy distribution and telecommunication networks whereas social infrastructure encompasses schools, universities, hospitals, public housing, and prisons.

**New World Order:** The term is used to refer to a worldwide conspiracy being orchestrated by an extremely powerful and influential group of genetically related individuals.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**Regional Integration:** An arrangement for enhancing cooperation through regional rules and institutions entered into force by states of the same region.

**Silk Road Project:** The Silk Road is a series of trade routes between China and the region of Mediterranean Sea.

**Trade:** Any country or firm involved in trade to fulfill the requirements of foreign currency to correct balance of payments and to gain profits under comparative advantage conditions when firm/country has abundant resources and able to produce goods and commodities at its cheapest.

## ABSTRACT

*Energy is the source of development of the mankind and an indispensable input for economic growth. Currently, most of the energy consumed in the world is composed of fossil fuels which are not environmentally friendly and reliable since their prices are volatile and their supply compels importing countries dependent on energy exporting countries. Thus, a good remedy to reduce fossil fuel dependency is to utilize more renewable energy resources. Renewable resources can be replenished quickly, are almost infinite and would lead a country to sustainable development. The Republic of Turkey is a net importer of energy. The diversification of energy sources and supply security is of great importance for it. Thus, the objective of this study is to analyze the relationship between renewable energy production and economic growth in Turkey by using Johansen Cointegration Test, Vector Error Correction Model (VECM), Granger Causality Test and the Augmented Dickey-Fuller Test (ADF). Consequently, both long run and short run a casualty running from GDP growth to renewable energy production is determined in the study.*

## 1. INTRODUCTION

The volume of energy consumption and its combination is fundamental for the economic development and social wellbeing of a country. However, today the energy consumption pattern in the world is mostly not sustainable and environmentally friendly owing to its hydrocarbon inception. Amounting hydrocarbon energy usage in modern life, increasing volume of population and pollution are considerable issues today. Also, the prices of fossil fuses are variable and not dependable in global markets and they are depleting continuously. Therefore, one could state that hydrocarbon sources are not sustainable and secure. Yet, sustainability of energy is the key to economic and industrial development. Sustainability of energy could be defined as secure, continuous and dependable form of energy which is conducive to environmental protection and economic growth (Öztürk, Yüksel, 2016; Zeb et al., 2014).

The amount of hydrocarbon sources is diminishing and their prices are volatile. This complicates the obtainment of sustainability which can be provided with continuous economic development with energy efficiency, also benefitting the environment positively too. The issue of using green energy and green economy has been gaining increasing importance along with global warming and greenhouse effect. Furthermore, transforming the hydrocarbon fueled economic system to a green one and securing green efficiency are requisites to sustainable development. The reduction in CO2 emission and saving financial resources by the utilization of green energy would boost the economic and industrial structures of a country. Therefore, the composition of fuel resources and securing a balance between fossil and renewable sources is of great importance for the wellbeing of a society, economic improvement and sustainability (Zeb et al., 2014; Chang et al., 2015; Öztürk, Yüksel, 2016). Furthermore, the aim of this study is to investigate the energy issues, energy and renewable energy production and economic growth nexus within the Turkish case depending on credible national and international sources and data.

## 2. ENERGY ISSUES, RENEWABLE ENERGY AND SUSTAINABILITY

21st century is the age of continuous development of countries and a period of great breakthrough with respect to economic developments, technological improvements and differentiating realities for the mankind. Within this development process, energy is the indispensable factor to sustain the improvement continuum of nations. Especially, fossil fuels have been the prominent form of energy for decades all over the world as to provide for the necessities of people, development of industries and sustainability of state policies. Yet, the pervasive spread of the wide energy consumption activities all over the globe has brought about significant concerns. First, the fossil fuel sources are not infinite in the world. Second problem related to the depletion of fossil fuels is the increasing volume of greenhouse gases which cause global warming. Third, the utilization of fossil fuels may bring about resources dependency (Sebri, Ben-Salha: 2014; Shahbaz et al., 2015).

These important problems mentioned above requires the search for a remedy which is the utilization of renewable energy sources (RESs). If managed and used suitably, RESs could be the future of energy for the mankind. Renewable energy is the continuously regenerating form of energy supplied from solar, wind, hydro, geothermal, tide, wave, biomass and waste. Conventional sources of fuel are finite, not dependable, have negative effects on environment and not sustainable. On the contrary to this from of fossil fuels, RESs are clean, safe, not contaminating and inexhaustible. That's why, it should be just natural that the usage of the RESs is fast developing in the world in order to ensure sustainable

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

development, energy security and economic improvement. Therefore, one could state that the share of the RESs within the overall energy consumption has been increasing due to environmental, economic and security issues. Moreover, the sustainability and security of energy sources emerge as a substantial subject not for developing, but also for the developed countries, since, energy is the primary source of economic and country development (Sebri, Ben-Salha: 2014; Shahbaz et al., 2015; Halkos, Tzeremes, 2013; Biresselioğlu, 2012).

One of the considerable issues in the 21st century is to meet the needs of billions of people, especially with respect to energy concern and at the same time challenge the surging problems brought by conventional forms of fuels such as greenhouse effect and depletion of fossil fuels. Therefore, it is a significant matter to switch from fossil fuels to RESs in an efficient manner, since, RES are cost affective, easy to replenish and environmentally friendly. As a matter of fact, energy is the fundamental factor to enhance economic development and social welfare in a country. The more secure and plentiful energy sources a country has, the more prosperity it will enjoy. Also, within the process of modernization, countries become dependent on energy consumption. Coupling with that, the uninterrupted and adequate procurement of energy would improve the production volume and business efficiency and profitability in a country, leading to economic development too. Within this regard, the utilization of RESs would benefit a country with sustainable and green energy that is conducive to both economic and environmental development. Moreover, the expanding impact of globalization and increasing volume of international commerce would facilitate the spread of the usage of RESs by transferring efficient and green technologies among companies and countries, thereby influencing the policymakers in various states (Shahbaz et al., 2015; Sebri, Ben-Salha: 2014; Biresselioğlu, 2012; Erdal, 2015; Öcal, Aslan, 2013).

Soaring prices of oil, increasing volume of energy demand and hazardous impact of hydrocarbon fuels instigated the significance of RESs more. RESs can be replenished quickly and decline the negative effect of fossil fuels. Besides the positive impact of green energy on environment, RESs also pave the way to secure and sustainable energy consumption by declining the dependency on the energy sources of other countries. RESs can supply uninterrupted flow of energy to support economic wellbeing. Therefore, with the development of new green energy technologies and increasing intensity of their usage on the global scale, the attention will be focused on the better utilization of secure green energy. However, renewable energy also brings some costs to be on the disposal. These costs could be called as the technological and financial barriers to the development of RESs. Many of the RESs such as solar, wind and wave are intermittent. Therefore, it is necessary to store and postpone consumption. If the demand for RESs increase suddenly, it would not be easy to supply the related amount quickly. The initial investment of establishment and maintenance costs of RESs could be expensive with respect to use hydrocarbon energy. Also, in addition to initial investment costs, the establishment cost of infrastructure and superstructure to connect the RESs to the existing energy grid could be burdensome, coupling with that the research and development process (R&D) of RESs is expensive too. Moreover, the governmental policies and regulations shall be in favor of the development and the usage of RESs as well (Bayülgen, 2013; Fackrell, 2013; Erdal, 2015; Öcal, Aslan, 2013; Bhattacharya et al., 2016).

The utilization of renewable energy is indispensable to strike a balance between green energy and fossil fuels, ensure economic growth and sustainability for the future security of a country. Sustainability is to meet the needs of current generation without harming the future generations. Sustainability is a slight balance between economic growth and environmental protection as well as closely related to resource depletion, environmental and ecological preservation and wellbeing of society. The ways to produce energy and its side effects are significant indicators of how sustainable development is achieved. The

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

population of the world has been rising at an increasing rate as well as new technologies and industrial breakthrough are required to satisfy the needs and expectations of rising global human needs. Resulting from this reality, the energy consumption is increasing to find permanent solutions for the necessities of the mankind. On the one hand, humanity has been utilizing hydrocarbon sources to fulfill the expectations of human population, on the other hand, the increasing volume of the utilization of fossil sources negatively contribute to environmental degradation and greenhouse effect. Energy is the first and foremost significant input in economic development. However, securing continuous energy flow by RESs is equally important to ensure future sustainability of a country (Öztürk, Yüksel, 2016; Zeb et al., 2014; Chang et al., 2015; Erdal, 2015; Öcal, Aslan, 2013).

## 3. ENERGY AND RENEWABLE ENERGY ISSUES ON TURKEY

The demand for energy has been increasing in the world resulting from economic and technological developments. Energy is also a priority issue for the Republic of Turkey. A huge surge in the energy demand has prompted Turkey to become dependent on foreign sources of supply. Turkey, with its fast increasing population and growing economy is quite dynamic. However, the volume of the production of energy is limited in Turkey. Turkey has poor hydrocarbon sources and it has got to import the necessary amount of hydrocarbon energy sources from other countries. However, it has got significant amount of renewable sources as hydraulic, solar, geothermal, wind and biomass. The optimal mixture of a fossil and renewable energy structure would lead the Republic of Turkey to a sustainable future of economic growth (Benli, 2013; Biresselioğlu, 2012; Melikoğlu, 2013).

Turkey is at the convergence of Europe and Asia, converging two continents and many energy routes. It has a population of about 78 million people with a growing economy. Therefore, energy supply is critical for a country such as Turkey and the satisfaction of energy demand is rather challenging with its scarce hydrocarbon energy sources. Turkey utilizes oil, natural gas, hard coal and lignite as hydrocarbon resources and imports a considerable volume of them. Yet, it has substantial RESs. Turkey has been importing about 75% of its energy necessity from other countries and this makes it dependent on foreign sources as well as negatively impacts on its energy security and sustainability. Moreover, the renewable energy potential of Turkey is good enough to decrease its dependency on foreign energy sources. Turkey is attempting to utilize its hydraulic, wind and solar power as much as possible and its geothermal energy potential is projected to be used much profoundly in the forthcoming years (Öztürk, Yüksel, 2016; Toklu, 2013; Bayülgen, 2013; Kaya, Kılıç, 2012; Şekercioğlu, Yılmaz, 2012; Süzer, 2013).

Turkey has been going through an economic transformation for more than a decade and its energy necessity has been increasing accordingly. It is one of the 20 largest economies in the world and this is an indication that the increase in its energy demand is going to surge in theforthcoming decades too. The energy need of the Republic of Turkey is rising at 6-8% each year and in order to respond to its ever increasing energy need, it has got to make aboaraut 120 billion USDs of investment until 2023 which is the centennial of the Republic. The Republic of Turkey also projects to become one of the ten largest economies in the next decade. This objective reinforces it to implement substantial economic breakthrough and require much more energy. However, Turkey is not bestowed with abundant fossil fuel sources and is supposed to import about 75% of its energy requirement from neighboring and other countries. Taking into account this reality, it becomes indispensable to utilize its renewable energy sources in order to

cover the huge gap (Bilgin, 2015; Fackrell, 2013; Kaya, Kılıç, 2012; Toklu, 2013; Benli, 2013; Richert, 2015; Melikoğlu, 2013).

The energy strategy of Turkey is set by the Ministry of Energy and Natural Resources (MENR). This strategy has energy supply security, environmental protection and utilization of national sources as pillars. Main objectives of the Turkish energy strategy are (Biresselioğlu, 2012; Ekşi, 2010):

- Ensuring diversity in energy by prioritizing indigenous sources,
- Increasing the volume of RESs within the total amount of energy consumption,
- Improving the energy efficiency along with declining costs,
- Liberalization of the energy market and enhancing the investment environment,

- Assuring diversity with respect to oil and natural gas as to avoid possible interruptions in their supply,
- Making Turkey an energy hub by utilizing its geographic disposition along with regional cooperation,
- Minimization of the adverse environmental effects of current energy sources,

- Improving the contribution of green energy sources to the economy,
- Enhancing the efficiency of energy management of natural resources,
- Pioneering the development of contemporary energy technologies and green energy.

The increasing rate of industrialization and urbanization also increased the demand for more energy in Turkey. In order to accommodate the energy necessity, the role of imported resources is very important. However, importation of large resources come with considerable amount of bills and importation does not guarantee permanent, reliable and inexpensive sustainable solutions. Transforming the Turkish economy from an agricultural to an industrial one and rapid urbanization have required to increase the energy supply. This is a common trend in every developing country. As the volume of consumption of the fossil fuels ascend in total energy consumption and as it becomes difficult to respond to energy necessity by domestic hydrocarbon energy sources, the utilization of RESs becomes more important. Also, the usage of hydrocarbon energy in the rapid industrialization and urbanization has caused massive emission of C02 and create environmental problems. Moreover, the hydrocarbon energy is exhausting quickly and its availability raises as a question mark. Detrimental impacts of fossil fuels on environment and greenhouse effect as well as fluctuating prices and unreliable energy supply make renewable energy highly attractive not only for Turkey but for other countries too. Turkey never had sufficient energy sources. This made it to make long term energy agreements with other countries especially with Russia and Iran. These agreements are take-or-pay contracts meaning that surplus, non-consumed portion of the agreement must still be paid, bringing a huge burden to Turkish tax payers and economy. Turkey does not only have to diversify its energy sources, but it has also got to secure its supply. Currently, dependable supply of resources can be defined as an optimal mixture of fossil and renewable energy. Electricity is produced in coal-powered and natural gas-powered power plants in Turkey. A sudden interruption in any of these sources would have catastrophic consequences. The optimal alternative to avoid such events to focus on indigenous energy sources, especially renewable ones. This would diminish dependency to import fuel too. Transition from fossil fuel powered industry to renewable energy powered industry is another issue to be considered too (Biresselioğlu, 2012; Ekşi, 2010; Bilgin, 2015; Richert, 2015; Öztürk, Yüksel, 2016; Kaya, Çakmak, 2012; Süzer, 2013).

The increase of the energy demand of Turkey does not only raises the question of resource diversification, but also ensuring its sustainability and security with RESs. Energy security is to assure adequate amount of energy sources at affordable prices and whenever needed. This is a priority for Turkey. It is to become a major player in its region and beyond. The Turkish energy strategy is aimed at striking an optimal balance among oil, natural gas, coal and renewable energy sources. Turkey's amounting energy need is certainly a significant topic. However, it is clear that it cannot be met by domestic production and has got to be either met by importation or utilizing its renewable sources more. However, a shift from extensive hydrocarbon energies sources to RESs is not quick and easy. Renewable energy technologies are expensive and must be accommodated with the existing grid. But, if one considers Turkey's dependency on neighboring countries with respect to oil and natural gas importation and the negative impact of this on the economy, the better utilization of RESs emerges as an optimal option (Bilgin, 2015; Toklu, 2013; Benli, 2013; Şekercioğlu, Yılmaz, 2012).

Energy is an essential element of economic development and social wellbeing of Turkey. However, as one can see in Tables 1 and 2 that the main production of Turley's energy necessity is still and will be based on fossil resources. However, being relied on fossil fuels is a threatening factor to the energy security and sustainability of Turkey. Fossil fuels are conventional forms of energy and easier to have access. Yet, renewable energy sources, even though they are replenished, regenerate over time and infinite, are gaining importance gradually. As one can infer from Tables 2 and 3, Turkey is a net importer of fossil fuels since it does not have sufficient amount of them. Moreover, the energy strategy of the Republic of Turkey is based on uninterrupted energy and secure energy supply along with environmentally friendly sources which decrease the CO2 emission. Also, as the importation of energy increases, Turkey will have to spend more hard currencies on foreign sources of energy which it can difficultly acquire. When Tables 2 and 3 are analyzed, it is clear that the domestic production of energy does not meet the consumption. Therefore, the difference must be met with importation. Yet, importing a considerable part of energy necessity of Turkey is not conducive to its economic growth, social wellbeing and national policies on sustainability. Therefore, the acquirement and utilization of renewable energy resources emerge as a remedy and priority in order to alleviate the dependency of Turkey on foreign sources of energy and sustain its economic growth with domestic RESs.

## 4. RENEWABLE ENERGY PRODUCTION & ECONOMIC GROWTH NEXUS IN THE REPUBLIC OF TURKEY

The Republic of Turkey is rapidly developing and is also a part of G20 group. It aspires to become one of the largest 10 economies in the forthcoming decade. This indicates that the Turkish economy grows at a convenient rate and in a competitive pattern. Economic growth is a developmental sign for a country, but, economic growth has always been coupled with rising amount of energy consumption. Yet, Turkey is not self-sufficient in terms of energy. Its fossil fuel reserve is not adequate enough to respond to its energy necessity. Therefore, Turkey is a net importer of energy from neighboring countries in order to provide for a considerable volume of its energy need. Moreover, fossil fuels are not environmentally friendly and their prices are volatile (Melikoğlu, 2013; Chang et al., 2015; Bhattacharya et al., 2016).

There is a significant correlation between renewable energy production/consumption and economic growth. Energy is one of the indispensable inputs of production. It is abundant in some countries and scarce in some other. The countries with large energy sources are bestowed and the other ones with

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

scarce energy sources are supposed to search for solutions for energy scarcity and diversify scarce energy resources as to accommodate energy security and ensure sustainability. Another important factor in the energy security and sustainability is the mixture of energy sources. Striking a right balance between hydrocarbon and renewable energy is of great importance for the self-sufficiency of a country. Consuming mostly hydrocarbon fuels is dangerous for environment and if a country is dependent on foreign sources this would be also harmful to economic growth with respect to spending national reserves on foreign sources of energy which also causes an increase in balance of payments too. Yet, an optimal solution to this concern is to consume more indigenous RESs which are conducive to environmental protection and sustainable economic growth. Therefore, the more RESs a country utilizes, the more it could improve its economic growth potential. Furthermore, energy production and consumption are substantial issues for a country which impact on its future with respect to economic growth and sustainability (Chang et al., 2015; Melikoğlu, 2013; Ocal, Aslan, 2013; Bhattacharya et al., 2016).

Akpolat and Altıntaş (2013) investigated the relationship between cointegration and causality in the long run for Turkey's energy consumption and real GDP for the period of 1961-2010. The results of Johansen Cointegration Test and VECM Model determined the cointegration in the long-term with bilateral causality. Akkemik and Göksal (2012) examined Granger causality between energy consumption and GDP by using panel data on 79 countries for the period of 1980-2007. The results indicated that seven-tenths of the countries exhibit bi-directional Granger causality, two-tenths exhibit no Granger causality and one-tenth exhibit unidirectional Granger causality. Ciarreta and Zarraga (2010) analyzed linear and nonlinear causality between electricity consumption and economic growth in Spain for the period 1971-2005 by using Granger causality test and the results showed that there is a unidirectional linear causality running from real GDP growth to electricity consumption and no evidence for nonlinear Granger causality. Eggoh et al. (2011) examined the relationship between energy consumption and economic growth for 21 African countries for the period of 1976-2006 by using panel data with cointegration and causality tests. The results indicated that there is a long-run equilibrium among energy consumption, real GDP growth, labor and capital. Lee and Chang (2007) investigated co-integration and causal relationship between energy consumption and real GDP for 16 Asian countries during the period of 1971-2002 by using panel unit root, heterogeneous panel cointegration and panel-based error correction models. The results supported a positive long-run cointegration between real GDP growth and energy consumption, no short-run causality and a long-run unidirectional causality from energy consumption to economic growth. Masih and Masih (1996) examined the cointegration relationship between total energy consumption and real income of six Asian countries (India, Pakistan, Malaysia, Singapore, Indonesia and the Philippines) by using Granger causality test. The results pointed out that there is cointegration only for India, Pakistan and Indonesia. Mehrara (2007) investigated the causal relationship between the per capita energy consumption and per capita GDP with panel data on selected oil exporting countries by using panel unit-root tests and panel cointegration analysis. The results showed that there is a unidirectional causality from economic growth to energy consumption for the oil exporting countries. Narayan and Popp (2012) analyzed the long-run relationship between energy consumption and real GDP for 93 countries. It evidenced that energy consumption has a negative causal effect on real GDP growth. Pirlogea and Cicea (2012) examined the relationship between energy consumption and economic growth in a comparative analysis for Spain, Romania and European Union for the period of 1990-2010. In the long run, for both counties and the European Union, there is a correlation between economic growth and energy consumption. But, in the short-run, there is only a relationship for Romania and Spain. Soytaş and Sarı (2003) analyzed the causality relationship of energy consumption and GDP growth between

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

the G7 countries and some emerging market countries. The study showed a bi-directional causality in Argentina. The causality runs from GDP growth to energy consumption in Italy and Korea as well as runs from energy consumption to GDP growth in Turkey, France, Germany and Japan. Stern (2000) investigated the causal relationship of GDP growth and energy consumption in the USA for the post-war period by using cointegration analyses. The results indicated that there is a cointegration between energy consumption and GDP growth. Yang (2000) examined the causal relationship between energy consumption and real GDP growth for the period of 1954-1997. The results showed at the existence of causality between energy consumption and real GDP growth. Altınay and Karagöl (2004) examined a series of unit root and causality tests to detect the causality between the GDP and energy consumption in Turkey by using Granger causality method for the period of 1950-2000. The result indicated no relationship between energy consumption and GDP growth. Aqeel and Butt (2001) analyzed the relationship between energy consumption, economic growth and employment in Pakistan by using Granger test. The results showed that energy consumption and employment were positively affected by economic growth. Chang et al. (2015) researched the causal relationship between renewable energy consumption and economic growth among G7 countries. The empirical results determined the existence of a bi-directional causal relationship economic growth and renewable energy; but, when individual results for each country are considered, the neutrality hypothesis is valid for Canada, Italy and the USA; yet, for France and the UK, there is a unidirectional causality running from GDP to renewable energy and the opposite is true for Germany and Japan. Bhattacharya et al. (2016) investigated the impacts of renewable energy consumption – economic growth nexus of significant renewable energy consuming countries in the world. They used the Renewable Energy Country Attractiveness Index to determine top 38 countries for this study. By utilizing panel estimation methods, the authors determined cross-sectional dependence and heterogeneity across the related countries. Their findings suggest that renewable energy consumption has a considerable positive affect on the economic growth for 57% of selected countries. Shahbaz et al. (2015) aimed to examine the correlation between renewable energy consumption and economic growth. The results of the study indicated that the entire variables in the study are cointegrated. This shows a long run relationship among the variables. Also, the causality analysis shows the feedback impact between economic growth and renewable energy consumption. Halkos, Tzeremes (2013) investigated the relationship between renewable energy consumption and economic efficiency. The results of the study indicate that renewable energy consumption has favorable impacts on the economic efficiency. Öcal, Aslan (2013) examined the renewable energy consumption – economic growth causality for Turkey. While this study's ARDL approach indicated no positive effect of renewable energy consumption on economic growth, Toda-Yamomoto causality tests indicated a unidirectional causality running from economic growth to renewable energy consumption.

## 5. DATA AND METHODOLOGY

This study is aimed at determining the relationship between renewable energy production and economic growth in Turkey for the period of 1975-2014 by using annual time series data. The data on the GDP series was acquired from the database of the Turkish Statistical Institute. Data on renewable energy production was obtained from Ministry of Energy and Natural Resources of the Republic of Turkey and World Energy Council websites. The logarithmic values of the variables are used. The variables are;

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

LNGDP: GDP growth (economic growth)
LNRENEWABLE: Renewable energy production (solar, wind, wave, biomass, geothermal, hydraulic)

In this study, the relationship between renewable energy production and economic growth in Turkey is analyzed by using Johansen Cointegration Test, Vector Error Correction Model (VECM) and Granger Causality Test. Before applying the cointegration test, the stationary and integration degrees of the series are determined by the Augmented Dickey-Fuller Test (ADF).

## 6. EMPIRICAL FINDINGS

The ADF test is applied to test whether the time series used in the study are stationary or not. It is important to determine the appropriate lag length in VAR systems. During the analysis, the optimum lag length is determined by the Schwarz Information Criterion (SIC). To explain the unit root of variables, an ADF test is applied (Dickey and Fuller, 1981). The results are shown at Table 4. The critical values were generated by Eviews7 econometric program and based on MacKinnon values. The values that are given in parenthesis designate the lag lengths.

The results indicate the presence of unit roots in both series. The null hypothesis shows that the series which are non-stationary is not rejected at the levels of these variables. However, when the first differences of the variables are considered, the null hypothesis is rejected in favor of alternative hypothesis, which states that the series are stationary. Thus, their first difference is determined to be stationary and hence the series are integrated for order one, I(1).

After the analysis of the time series characteristics of variables, the next step is to analyze whether there is a long-term correlation among the variables or not. The long-term correlation is analyzed with Johansen Cointegration Test. The optimum lag lengths are determined using the Schwarz Information Criterion (SIC). The proper lag length in VAR is 2. The Johansen cointegration test is applied for these series and the results of this test is denoted in Table 5 and 6.

The results of the Johansen cointegration test, which is presented in Table 5 and 6, provide evidence for the existence of a cointegration equation at 5% significance level, implying that the two variables (LNGDP and LNRENEWABLE) are cointegrated. Thus, the results of test imply a long run relationship

*Table 4. ADF Test Results*

| Variables | ADF Test Statistics | P-Probability | Constant, Trend | Test Results |
|---|---|---|---|---|
| LNGDP | -3.441670 (1) | 0.0608 | Constant + Trend | Unit root exists: Non-stationary |
| LNRENEWABLE | -2.576704 (0) | 0.1063 | Constant | Unit root exists: Non-stationary |
| DLNGDP | -6.657281 (0) | 0.0000 | Constant | Unit root doesn't exist: Stationary |
| DLNRENEWABLE | -10.55171 (0) | 0.0000 | None | Unit root doesn't exist: Stationary |

D refers to first difference, Note: If p-value is greater than 0,05 as a result of the ADF test, we decide that 'it has a unit root'; otherwise, we decide that 'it does not have a unit root'.

between GDP growth and the renewable energy production in Turkey. With respect to the selected variables, results of the cointegration test can be concluded as the long run equilibrium between variables, which is;

LNGDP = 0.916424 LNRENEWABLE (normalize according to LNGDP)
(t-values) (16.94564)
LNRENEWABLE = 1.091198 LNGDP (normalize according to LNRENEWABLE)
(t-values) (11.0205)

The results indicate that there is a long run equilibrium relationship between the two variables, and this may indicate that the long run bi-directional causal relationship exists between GDP growth and renewable energy production.

The empirical results of the estimated vector error correction models are presented in Table 7.

The error correction term (ECT (-1)) represents the long run impact of one variable on the other while the changes of the lagged independent variable delineates the short run causal impact. Vector error correction results in Table 7 shows that in equation (1), the error correction term has correct sign and it is statistically significant at 5% level. This provides evidence on long run impact from GDP growth to renewable energy production. The short run examining the statistical significance of the values given in these columns can identify dynamics of the error correction processes. The optimum lag lengths for autoregressive terms in equations (1) and (2) were identified using the Schwarz information criterion. The results show that in the short run one-way directional causality runs from GDP growth to renewable energy production. All these results confirm that, beside of long term, there is a significant short term relationship as well between GDP growth and renewable energy production.

In Table 8, Granger causality test results are presented. As it is obvious from the table, there is a significant Granger causality from GDP growth to renewable energy production, but the reverse is not significant. This result is consistent with the result of VECM model.

## 7. CONCLUSION

This study investigates the relationship between renewable energy production and economic growth by using annually time series data for the Turkish economy over the period 1975-2014. By utilizing the VAR methodology, the existence of causality between renewable energy and economic growth is analyzed for Turkey.

This study applies time series econometric tools such as unit root test, Johansen cointegration, and vector error correction model and Granger causality to investigate the dynamic relationship among the variables. The results of ADF test show that all the variables are stationary in the first difference. The Johansen cointegration modeling techniques have revealed that there is a long run relationship between renewable energy production and GDP growth in Turkey. Vector error correction analysis and Granger causality tests confirm a unidirectional causality running from GDP growth to renewable energy production in Turkey. There is also evidence for long run and short run causality running from GDP growth to renewable energy production in Turkey in this paper.

The renewable energy production which will increase with economic growth can provide a remedy for Turkey to meet is own energy needs. Thus, Turkey can become a country which is less dependent on foreign energy with the utilization of RESs. The positive effect of economic growth on renewable energy production reveals once again the importance of sustainable green growth for the Turkish economy.

## ABSTRACT

*This article describes how telecommunication has a strategic role in national development, which requires a large amount of funding in Indonesia, in spite of the limited financial support from the government. The dynamics of telecommunication law has provided a clear direction, from monopoly to healthy competition. It is important for foreign investment to be an option that needs to be harmonized with the applicable law of telecommunication. Four main constructs have been identified as important issues to be discussed are Social Welfare (SW); Global Village (GV); Foreign Direct Investiment (FDI); and Law Telecomunication (LT). In conclusion, two quality actions are proposed to accelerate fair accesibility through law of telecommunication in global village setting. The first quality action is to accelerate SW through fair accessibility in GV setting and FDI. The second quality action is to accelerate SW through fair accessibility based on FDI and LT.*

## 1. DYNAMICS OF TELECOMMUNICATION AND TECHNOLOGY IN A GLOBAL VILLAGE SETTING

Fast moving of technology in telecommunication includes internet have been significantly change the way of global society to interact each other. Boardless soil, language, cultural, nation and etc seem connected into one big village with the same pupose to survive within limited natural resources existed. Then to accommodate such phenomena, the term 'global village' (GV) then has entered the language as a recent reference (Densi, 2012).

In addition, the present reformation of telecommunication sector is conducted by almost all countries with an increasing acceleration and considering GV as both advantages and disadvantages impact that occurred. As to be admitted that the success of the reformation is still hard to be predicted. One of successful indicator of the reformation for nation's wide is the achievement of social welfare (SW). Distribution of fair and transparent SW's initiation seems significantly important to be considered. Theferefore, accessibility of telecommunication is needed to aim to the social welfare's (SW) achievement.

Furthermore, seems global telecommunication sector will be dominated more by private actors therefore its market will be more competitive and open for any operator. There is a demand for a fair, credible, and transparent regulation which caused a limitation on the government's role only as a regulator, and no longer as a telecommunication operator. In this respect, three phenomena – privatization, monopoly disentanglement, and establishment of independent regulation body – are the foundation of global telecommunication sector (World Telecommunication Development Report, 2002). Research conducted in developing countries indicated that the advance of telecommunication technology is always linear with the increase of a country's Gross Domestic Product (GDP) (ITU, 2012). The telecommunications sector is an industry that has achieved a leading role in the economy during the last decades, due to its potential impact in terms of welfare and development. For instance, Roller and Waverman (2001) found evidence of significant positive effects of telecommunications development on the economic growth at national level. For this reason, one major focus policy makers are to sustain and foster the service diffusion (Bruno, et al., 2015).

In Indonesia, however, to achieve SW through fair accessibility telecomunication, a regulation is required to guarantee the emergence of justice. Including one of the initiations among foreign investments is in the field of telecommunication with the interest of Indonesian people. The foreign investment required in order that the advance of communication technology is owned by foreign investors, while at the same time improve the welfare of Indonesian people. Therefore, technology advancement has rightly be an instrument for Indonesia in addressing the number of poor population (the population whose monthly per capita expenditure is under Poverty Line) which was 28.59 million people in March 2015 (11.22 percent) of around 254.9 million people (Central Bureau of Statistics, 2015).

GV is close related to industrial sector with the advance of communication technology that is also provide positive impact in increasing workers' efficiency. In terms of technology sophistication, the advance of communication technology also provides positive impact for a company. The Deployment of Fiber to the X (FTTX) and Technological Advancement in Third Generation (3G) and upcoming Fourth Generation (4G) mobile telecommunications have given birth to many new broadband, multimedia, and cloud computing services in the telecommunications services industrry (TSI). Many companies, such as in Taiwan, are increasing the use of this services for business management and are demanding highly customized services that suit their business workflow (Chen et al., 2015). Owing to the increasing popularity and the high efficiency of TSI, the competitiveness of the companies has strengthened and improved.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

As GV much affected to the advance of technology information, the technology is also significantly influence productivity and the level of industrial progress. The impact of ICT on labour productivity reveals in a company, an industry and a country level. The development of ICT results in the increase of labour productivity both in the sector producing ICT and in the sector using ICT (Mačiulytė et al., 2014). ICT development need to consider the GV setting by providing a possibility to improve the systems. The system of company includes management processes, ensures a more efficient mechanism of market distribution, stimulates the development of network economy, influences social and cultural changes within a society. In addition, ICT development in correlation with GV has a positive impact on SW development perspectives which, in turn, results in productivity growth of individual companies, as well as industries, and national or country groups.

## 2. RESEARCH DESIGN

The method of the research focuses on empirical research, which is built on the approach of telecommunication law in Indonesia. Empirical research is a research based on the data obtained in the field. The data is secondary data which is collected by bibliographical study. Analyzes and systematizes data shall be conducted to discover a conclusion as an answer to the prevailing problem.

In addition, a quality based approach is also used to analyze of each construct being used. The approach is based on mapping the construct into similar characteristic then identify each construct's relationship into others (Rika Fatimah, 2012). Four main constructs have been identified as important issues to be discussed are Social Welfare (SW); Global Village (GV); Foreign Direct Investiment (FDI); and Telecomunication Law (TL).

## 3. INDONESIA OVERVIEW: TELECOMMUNICATION AND WELFARE OF INDONESIAN PEOPLE

The role of telecommunication currently is very strategic, particularly in triggering many countries, including Indonesian government to pay special attention to improve this sector. In a global economy characterized by rapid technology change, massive trade liberalisation and increasing information needs, the telecoms sector is deemed as a crucial one that provide a basis for competitive advantage, relating to other businesses and the overal economic development (Roller & Waverman, 2001). The efficient delivery of of telecoms services generates direct benefits through reducing transaction costs and indirect benefit through improving marketing information and accelerating the diffusion of knowledge, which can subsequently enhance national productivity (Grenstein & Spiller, 1995). As such, the telecoms sector reforms have been a priority for many governments and international development agencies, (Li, 2011).

Indonesia reacted to this competition by its various policies, in its attempt to adapt this industry with global demand. Globalization era has demanded a change in the development of telecommunication industry that was once restricted and monopolistic into a more open one, by adoption of the basic principle antimonopolist, minimalization of nation role, relinquishment to market mechanism, and reduction of trade barriers, both tariff and nontariff barriers. Adoption of the principles have generated change in the development of telecommunication sector in Indonesia, as seen in various regulations stipulated by the government in regulating this industry.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Mason's analysis predicted that the ratio of telecommunication industry penetration in Indonesia will reach 158% in the end of 2019, which is an increase from 325 million in 2013 into 411 million in 2019 (Singhania et al., 2014). A survey conducted by Milward-Brown in 2014 also indicated that Indonesian people are ranked as number one users of smartphone in the world, with the average usage time of 181 minutes a day (Milward-Brown, 2014). However, the development of telecommunication industry in Indonesia is unseparable from a number of prior dynamics. Similar to what happens in another country, structural and underlying changes has occurred in the operation of telecommunication in Indonesia, which is in line with deregulation in this field marked by the increasing level of private sector involvement in telecommunication business in many countries (Supriadi, 1996).

Telecommunication means also experienced impressive developments from year to year, both the quantitative ones (power of reach, accessibility, and capacity) and the qualitative ones (technological sophistication, efficiency, and service quality). In line with those are the increasing expectations and demands of users of telecommunication service, with regard to its capacity, quality, and kinds of it that are provided by telecommunication operator or other private sectors. In the last few years, people's needs relatively shift from quantitative matter to a more qualitative one. On the other hand, the fact that telecommunication industry becomes one of the most prestigious industry in global era means that every country, including Indonesia, must be ready in free trade, where other countries' industries will compete in capturing telecommunication market in Indonesia. In this regard, Indonesia has anticipated by building telecommunication network with a wider scope and more diverse services (Indonesian Telecommunications Policy, 1999).

The future challenge in global telecommunication industry will be more severe and complex. In response to that, the direction of national telecommunication development policy in the future must first reflect the historical trajectory of the process of telecommunication industry development policy. Therefore, the first part of this paper will discuss the dynamics of telecommunication law in Indonesia from the era of pre-globalization to post-globalization. In the second part, to promote national telecommunication sector, harmonization of telecommunication law and investment law will be discussed in the framework of global order perspective, particularly to create a environment of healthy investment and competition.

## 4. QUALITY ACTION 1: ACCELERATING SOCIETY WELFARE (SW) THROUGH FAIR ACCESSIBILITY

Quality is fulfilling customer's need, want and/or expectation. Having the quality approach into action may lead to more structured way of accelerating society welfare (SW) in fulfillment of society's need, want and/or expectation (Rita Fatimah & Jemain, 2012). In principal, SW is a significance solution to determine how best one action can comprehensively impact. However, in practice, seems what is plan is a diffetent matters to what is in action. As SW movement is mostly intangible and wide spread to the society, therefore need to make sure that what have been done in action of SW is including the element of fair accessibility.

### 4.1. Social Welfare (SW) for Fair Accessibility in Global Village (GV) Setting

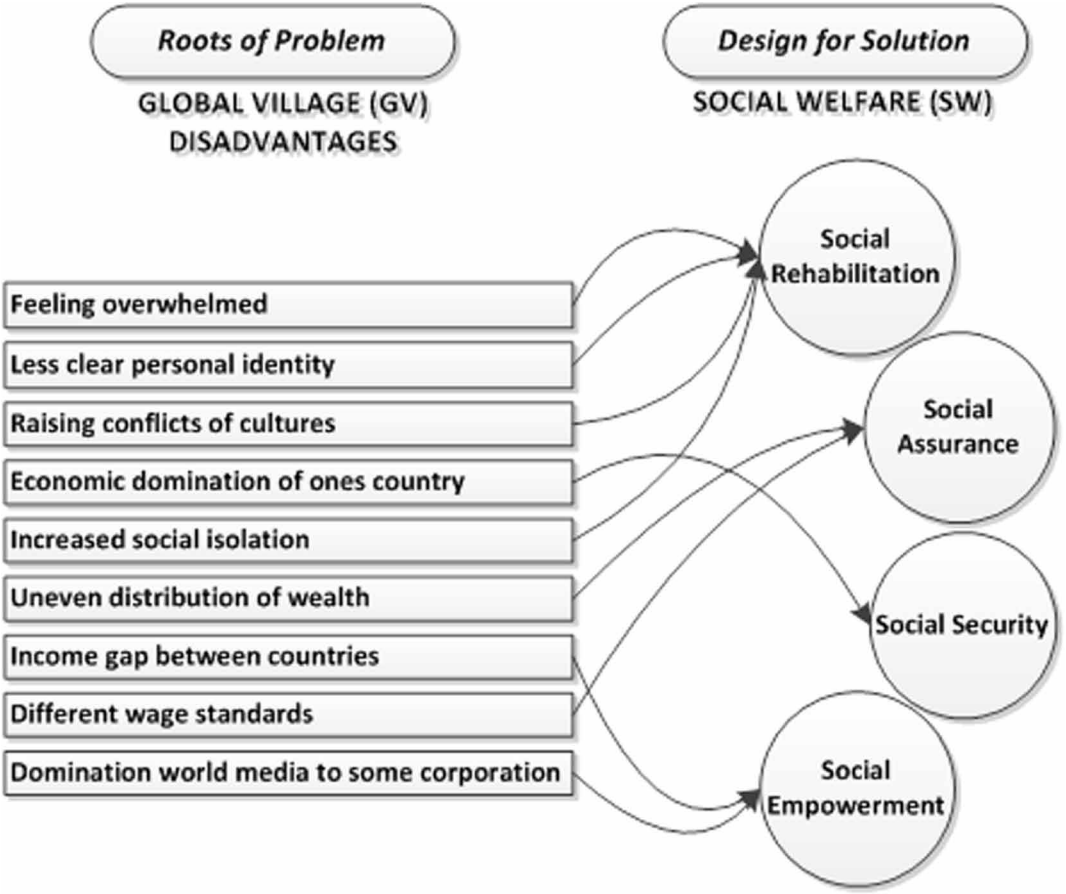
Social Welfare (SW) is not only about economic development but also close related to fair accessibility to sources. Increasing interest in the economics literature with regard to fairness (Fehr & Schmidt,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

1999). Less care to other fairness to access sources than what can own access may significantly implicate within Global Village (GV). Fair accessibility is one the essential need, for nowadays, that government and organization should put their concerned to improve their quality of society. GV increases worldwide technology, within fast information movement, effective communication and consumption of popular products. In addition, GV links cultures and international relations on a variety of levels; economics, politically, socially, etc (Danesi, 2012 & Amirkhanyan, 2011). In conclusion, one of the important impacts of GV is how the society may achieve better social welfare (SW).

However, not only advantages can be direvied from GV's impact but also disadvantages which can refer as root of problems. Various disadvantages occur caused by GV. Nevertheless, GV's disadvantages can be identified into the nine (9) GV society root of problems. First, action to shift to global communication within internet setting may lead many people feeling overwhelmed and second less personal identity revealed (Dixon, 2009). Overwhelmed indicate over reaction and response to one's issues as in real probably less than happened. In addition, in global communication, seems less in real personal identity. As result, the response is overrated as one way to quests for identity in GV.

Third, the rising of cultures conflict, fragmentation and domination culture that lead hybrid cultures were issues that citizen concern with by the evolution of global village (Dixon, 2009). In addition, the fourth disadvantages are negative impacts of dominant culture around the world by those with more economic power. In other words, the cultural standard will be controlled by economic dominant countries. Furthermore, fifth, internets providing social isolation in many interactions level even the kinds of relationships that people encourage offline, while relationship between increased connectivity and increased social isolation seems paradoxical (Biggs, 2000). Next, the sixth disadvantages of GV is uneven distribution of wealth, where the develop countries will be increase twice along with the developing world (Amirkhayan, 2011).



Furthermore, seventh, income gap between developed and developing countries seems continuing wider. As impact to the income gap shall follow by the different wage standards for developing countries. The standards which is explained by the following fact that the technology worker may get more value for his work in a developed country than a worker in a developing country thus there are in the later many dynamic, industrious and enterprising people who are well educated and ready to work with rigor (Amirkhayan, 2011). The last but not least disadvantages of GV, ninth, there is also another aspect of disadvantage of globalization in media sphere. The threat that control of world media by a handful of corporations will limit cultural expression.

The GV society root of problems, the nine disadvantages of GV, may refer to SW's design for solution approach. Welfare is the fulfillment of the conditions of material, spiritual, social and citizens in order to live a decent and able to develop them, so that they can perform their social function. In Indonesia, under Act 11 of 2009, the implementation of SW is the effort directed, integrated, and sustained by the government, local government, and the community in the form of social services in order to meet the basic needs of every citizen (Lakitasari, 2016). The basic needs can be fulfilled accordingly through four main solution approach are (1) Social Rehabilitation; (2) Social Assurance, (3) Social Security, and (4) Social Empowerment. Social Rehabilitation is how to improve SW into the life of every citizen while Social Assurance is all efforts aimed at preventing and addressing the risk of shocks and social vulnerability. Social Security is an institutional scheme to ensure that all people in order to meet the basic needs of a decent life. Social empowerment is all efforts aimed at making citizens who experience social problems have power, so as to meet their basic needs.

*Figure 1. The Nine Disadvantages of Global Village (GV) as GV Society Root of Problems and Social Welfare's Design for Solution Approach*

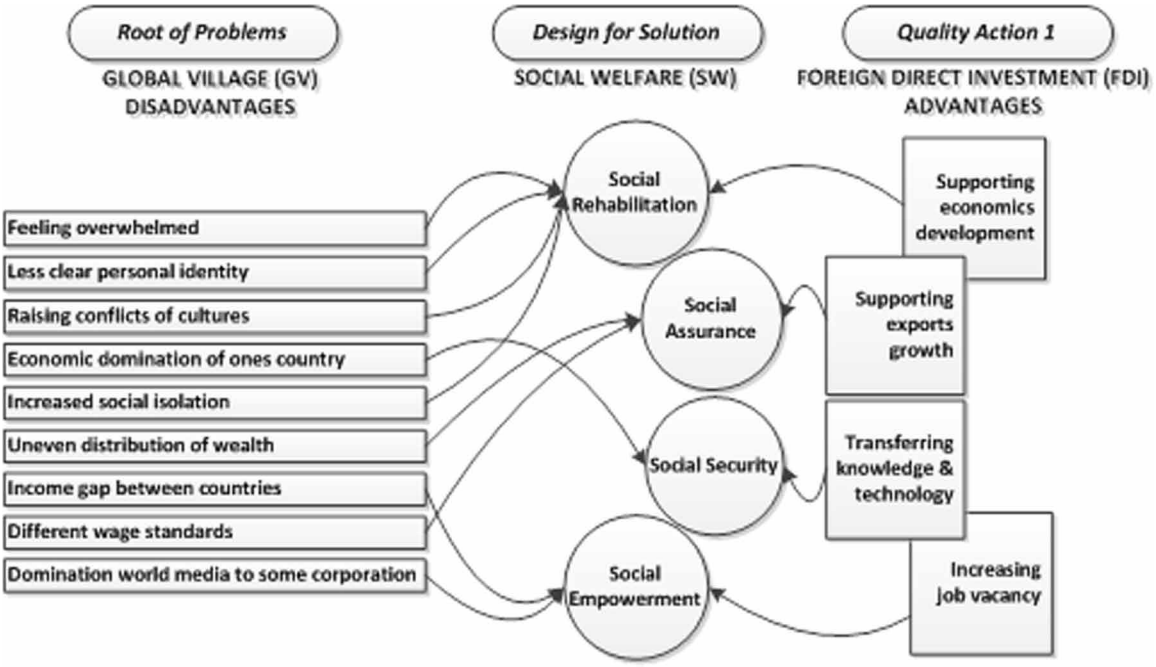
Having said the GV society root of problems which refer to GV's disadvantages and SW as solution approach is as proposed in Figure 1.

## 4.2. Foreign Direct Investment (FDI) to Accelerate Social Welfare (SW)

Foreign Direct Investment (FDI) has positive effect on Social Wlefare (SW). FDI impact can be seen as quality action to achieve SW through for at least in four way. First, FDI impact through economic development or economic growth in particular host countries through multiple channels, namely the construction of a new plant which meant increased output or GDP, the total export and employment (Lipsey et. al., 2011). Second, FDI export growth also can be seen as quality action to achieve SW by incerasing the foreign exchange reserves further expand recipient countries to repay foreign debt and imports.

Apart of economic development and export growth, increasing employment opportunities is the third FDI as quality action to achieve SW. FDI shall had positive effects on the domestic economy through the demand side. Increasing employment opportunities shall inline to increase the ability of public spending and further increase the demand in the domestic market. The last quality action under FDI is the role

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use



of FDI as transfer of technology and other knowledge resources. By the FDI, the production processes and services will be adopting of SOP in state financiers certainly more advanced than Indonesia as a recipient country.

As discussed, FDI shall refer as quality action to acheive SW then able to function as proposed design for solution for GV root of problems is as proposed in Figure 2.

## 5. OBSTACLE AND APPEAL FOR FOREIGN INVESTORS IN TELECOMMUNICATION SECTOR IN INDONESIA

Common obstacles faced by foreign investors in telecommunication sector in Indonesia are as follows: Common obstacles faced by foreign investors in telecommunication sector in Indonesia are as follows. First, investor will see whether or not the law is enforced based on the principle of good governance, with enforcement of law supremacy as one of its main principles. Therefore, it is important to note that in order to promote Indonesia as one of the destination countries for competitive investment compared to other countries, there must be legal certainty for the investors. Frequently complained problem by the investors is not on the law, but on the implementation of the law. As also stated by Mochtar Kusumaatmadja, the problem in Indonesia which is often complained about is legal certainty, unclear and also contradictory laws and implementation of court decision (Kusumaatmadja, 1998).

*Figure 2. Quality Action 1: Accelerating Society Welfare (SW) through Fair Accessibility in Global Village (GV) Setting and Foreign Direct Investment (FDI)*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Second, is a good USO policy of a country will prevent digital devide between urban and rural regions or low-income region. Other problem is universal service obligation (USO) or the obligation for operator to provide telecommunication service in regions that are not profitable economically, because the procurement cost is expensive in rural and remote areas and for those with low income who cannot afford telecommunication service (ITU, 2002). And third is by mobile telecommunication system, spectrum of radio frequency is the core media as the medium used in telecommunication operating. Therefore, the management of radio frequency spectrum includes planning in usage, arrangement, licensing, and operational supervision which requires definite, transparent, and fair legal support and its utilization has to focus on the interest of people in general. The regulation of radio frequency spectrum management, in line with the need and progress of telecommunication development, telecommunication operating will be more mobile in the future (ITU, 2002).

In spite of the obstacles, investment in Indonesia tends to increase. The data from well-known economics newspaper in England, *The Economist*, stated that in 2015, Indonesia ranked the 2nd after China as the destination for world investment. Data from Capital Investment Coordinating Board (BKPM) showed that the realization of Foreign Investment (*Penanaman Modal Asing*/PMA) and Domestic Investment (*Penanaman Modal Dalam Negeri*/PMDN) in the first semester of 2015 showed an increase compared to the same period in previous year. The number of workforce employed was also significant, of about 685,000 people.

The 2nd quarter in 2015, particularly for foreign investment, BKPM data showed a quite significant change (refer to Table 1). Transportation, warehouse, and telecommunication industry moved to top rank with a $2.1 million investment. Compared to previous quarter, this industrial sector was only ranked 10 with $282 million investment. This is also strongly related to the relatively huge potential of telecommunication in Indonesia. There are at least five appealing factors for foreign investement in Indonesia. Those include, the increasing number of internet users into 23% (year 2013-present year was 71.2 million people, 2014 was 98.1 million people) and of device sales. The third factor is the huge population. The fourth one is stable political condition, and the fifth one is licensing simplification. Further description is in Table 3 in the Appendix.

*Table 1. Data on Foreign Direct Investment (FDI) in Indonesia, 2nd Quarter, 2015*

| | **2015 ($ million)** | |
|---|---|---|
| | **Q1** | **Q2** |
| **Description of FDI** | | |
| Mining | 1.135 | 1.045 |
| Metal, Engine, and Electronic Industry | 765 | 609 |
| Food Crop and Plantation Industry | 598 | |
| Food Industry | 533 | |
| Transportation Equipment | 582 | |
| Mineral Energy Industry | | 456 |

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The performance of infrastructure industries, such as energy, telecommunications, and transport are important determinants for the level of the economy large (refer to Table 1). In this context, the performance of the telecommunications industry – including the internet – takes a central role as economic and social activities are increasingly electronically mediated and transacted online (Lemstra, at. al., 2015). Generally, some of the problems can be resolved by construction and modernization of various telecommunication infrastructures. But a huge amount of capital is required to realize it, and this is the problem for Indonesia. This is where Indonesia needs foreign investors to take part in advancing telecommunication in Indonesia.

In addition to that, the government, through its 10th economical policy plan in 2016, conducted a change of share composition to foreign investment in the revision of negative list of investment (*Daftar Negatif Investasi*/DNI). This change also include DNI change in telecommunication sector. The government established an examination institution for telecommunication device from DNI. Foreign investment is open for 65% for three business fields, and it increased into 67%, such as telecommunication network operator that is integrated with telecommunication service, etc.

Therefore, the regulation on the role of private sector in domestic competition must also be regulated to prevent private sector from controlling domestic market and creating new monopoly. The finding that competition has a positive impact on investment by state-owned incumbents and a negative impact on investment by private incumbents should not be misinterpreted. In particular, it should not be inferred that telecommunications incumbents should be renationalized or that competition between private operators is not desirable. Indeed, the negative relationship between competition and investment by private incumbents does not imply that competition does not foster investment at the industry level because both the incumbents and the entrants may invest (Lestage, et. al., 2013). However, competition may not always encourage investment. When the market is dominated by a private incumbent, it may even slow down the deployment of next generation networks. In this case, pro-competitive regulation could be usefully supplemented by more direct public incentives for investment or even by government leadership.

Hence, it has to be underlined here that the existing regulation must also provide opportunities for foreign investors to continue gain benefits from Indonesian market. This is important considering that they need fund to fulfill their obligation to provide telecommunication services in remote areas in Indonesia. Multinational Enterprises (MNEs) engaging in FDI need advantages allowing them to offset the liability of foreignness in host countries (Hillemann et al., 2016). This liability of foreignness gives rise to additional operational costs related to economic, institutional, and cultural differences between home and host countries.

## 6. EXPLORING TELECOMMUNICATION LAW IN INDONESIA

Legal certainty for foreign investors, combined with potentials in Indonesia is the key for Indonesia to face the challenge of telecommunication business in global era. On one hand, Indonesia must be able to be a good host. On the other hand, to develop telecommunication, Indonesia must be able to encourage foreign investment to continue improving. Hence, harmonization of investment law and telecommunication law must be able to provide legal certainty for foreign investors in investing their capital in Indonesia, also to balance it by continue protecting national interest. The harmonization between FDI and Telecomunication Law shall refer as the next quality action to achieve Social Welfare (SW).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## 6.1. Telecommunication Law in Pre-Globalization Era

Fundamenttaly, the dynamics of telecommunication in Indonesia can be analyzed from various regulations starting from pre-globalization era and globalization era. In the pre-globalization era, telecommunication regulation tended to legitimate monopoly practice by the government. This can be seen in Act No. 5 of 1964 on Telecommunication and Act No. 3 of 1989 on Telecommunication. Entering globalization era, particularly in the order international telecommunication business, superpower countries in telecommunication signed WTO Agreement on Basic Telecommunication, (Mačiulytė-Šniukienė et al., 2014).

The purpose of the agreement was to liberalize the market of basic telecommunication service. However, not all telecommunication markets in other countries are open for a free market. In Japan, the last mile access line market, which is the landline for from telephone offices to homes of offices, is dominated by the formerly state-owned monopoly Nippon Telegraph and Telephone (NTT) (Nakamura, 2015). Although cable TV companies have their own broadband network infrastructures as a last mile access line, their market share is small in Japan, as is the case with that of mobile broadband internet access services.

## 6.2. Exploring Telecommunication Law in Indonesia: Globalization Era

Indonesia responded global demand in liberalizing its telecommunication market by stipulating Act No. 36 of 1999 on Telecommunication. Afterwards, telecommunication regulation in Indonesia attempted to adopt principles in the business of international telecommunication, such as antimonopoly, transparency, and being open to free market. The complete description can be seen in Table 4 in the Appendix.

Examined from the aspect of telecommunication regulation, since the stipulation of Act No. 36 of 1999 on Telecommunication, it can be concluded that there is a progress in telecommunication sector in Indonesia. The change from monopoly to competition era has created a competitive business environment for big, medium, and small business actor. In comparison of public and private ownership, there is a signifant number of empirical studies examining whether the private companies operate more efficiently than the goverment-owned corporations. The result conclude that the private companies are more efficient and more profitable than the public-owned companies and thus provide better services to the people, in spite of the lack of sufficent data (Karamanis, at. al., 2015).

The development of telecommunication in Indonesia is proven by the data of Ministry of Telecommunication and Informatics, in which in 2014 the number of users in mobile telecommunication in Indonesia was 310 million people, more than the population of Indonesian people (254.9 million people). The number of Base Transceiver Station spreaded in Indonesia is 183,000, which consists of 110,000 2G BTS and 60,000 3G BTS, and the rest is 4G BTS (Kemenkominfo, 2014). The transition from monopolistic era to competition era have promoted advance in telecommunication field in Indonesia, through a competition among telecommunication operator. Indonesia's NRI value experienced a 0.2 point increase and was at the 64th position in 2014, or a 12 position rise from the previous year. NRI Networked Readiness Index (NRI) value is an index indicating the level of a country's readiness to apply and implement ICT consistently, sistematically, and in a structured way to increase economical development, which is published by World Economic Forum (The Global Information Technology Report, 2014).

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## 7. QUALITY ACTION 2: ACCELERATING SOCIETY WELFARE (SW) THROUGH FAIR ACCESSIBILITY BASED ON FOREIGN DIRECT INVESTMENT (FDI) & TELECOMUNICATION LAW (TL)

The development of telecommunication sector in Indonesia experiences problems as well. The data from Ministry of Communication and Informatics (Kemenkominfo) shows that it is not equally experienced in all parts of Indonesia (refer to Table 2). In addition to infrastructure construction, foreign investment also provides other benefits for advancing Indonesia. FDI is a crucial factor in international economic integration. FDI creates direct, stable and long-lasting links between economies. It promotes the transfer of new technology and know-how between countries, and provides the host economy to promote its products more widely in international markets (Tülüce, at. al., 2014). FDI is also an extra funding source for investment and, under the right policy environment; it can be an important channel for development of SMEs. Increased FDI inflows to a country cancreate several positive economic effects. Among others, FDI canaffect labour and capital markets, trade patterns and economic growth. It is well known from the theory of host country effects of FDI that in order for FDI to occur, the multinational enterprise (MNE) must have some firm specific advantages compared to the enterprises in the host economy.

Nowadays, internet has a crucial role for a country in global economy competition. In this regard, internet speed in a country is also one of the indicators of ICT development in every country. It is related to the condition of broadband network in the country. In Indonesia, the speed of internet access in 2014 is under 2.4 Mbps. Although it experienced an increase compared to the same period last year, the number is still under the average of internet speed in ASEAN countries, which was 3.6 Mbps in 2014 (Kemenkominfo, 2014).

However, inviting foreign investors in a national telecommunication competition also requires discretion. Indonesia must reflect on the case of the selling of Indosat shares. Almost all Indosat shares, which are capital in the limited liability company, are controlled by foreign parties. The controlled capital indicates an ownership by individual or legal entity of a company. It is worth to be noted that whoever control information, he/she will control everything. This is the negative effect of a regulation which provides unlimited opportunity to foreign parties.

In GATT-WTO agreement, particularly the one related to investment trade which is called Trade-Related Investment Measure (TRIMs), it is specified that every country who sign TRIMs agreement must not differentiate domestic and foreign capitals. Investment Law of GATT-WTO participant countries must not also differentiate both kinds of capital. Further, quoting the opinion of Bergsman and Shen, David Woodword (Woodword and Geneva, 1996), stated that:

*Table 2. Indicator of Access to and Use of Information & Communication Technology (ICT) in Households in 2014*

| | (%) | | | |
|---|---|---|---|---|
| **ICT** | **Java** | **Sumatera** | **Maluku & Papua** | **Sulawesi** |
| Computer | 30.42 | 28.57 | 16.07 | 20.70 |
| Internet | 28.28 | 26.24 | 14.20 | 17.05 |

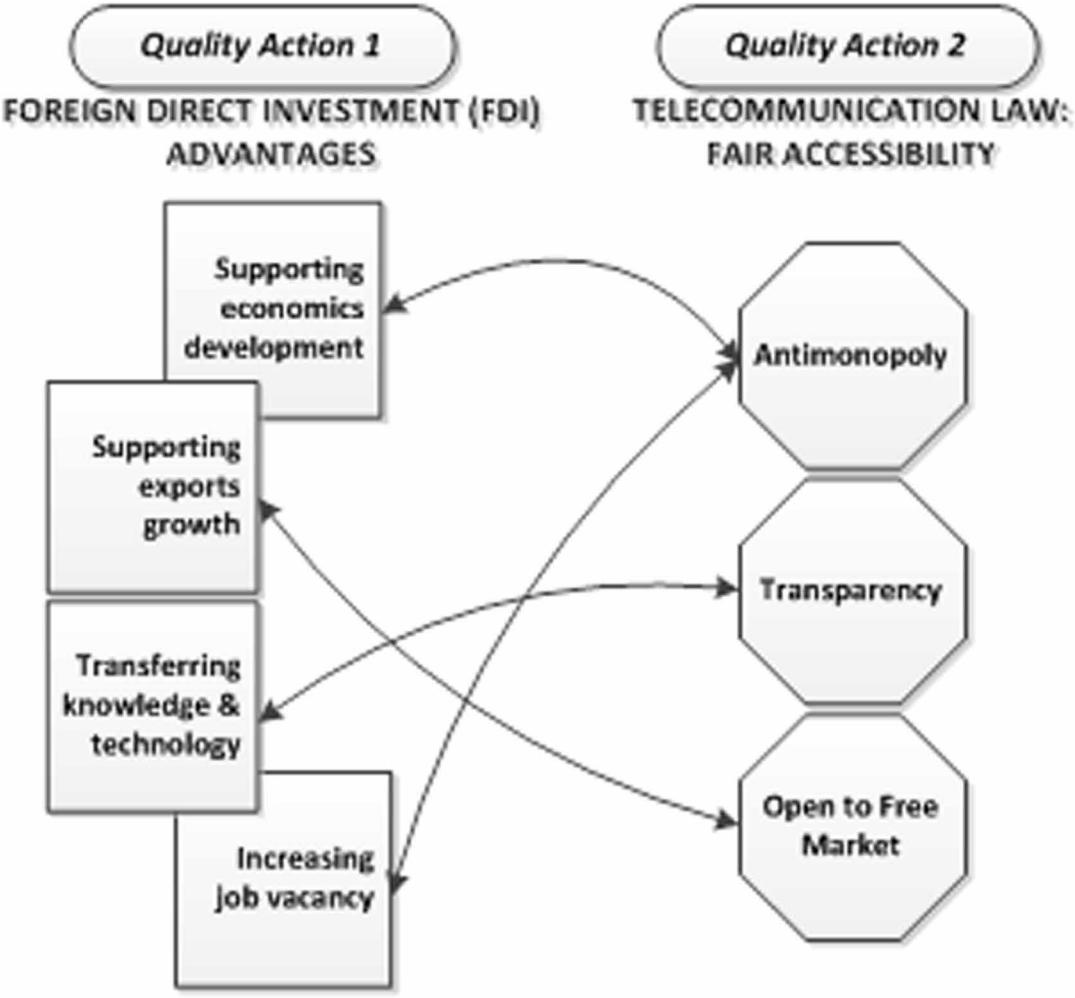
Source: Ministry of Communication and Informatics (Kemenkominfo, 2014)

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*...that low labour cost are no longer sufficient to attach FDI, as investors are interested, primarily in productivity, and only in sites where can produce to international standars of quality and price. Among the specific factors they identify as necessary to promote FDI are: 1) a stable macroeconomic environtment (including and appropriately valued exchange rate); 2) rapid, sustained economy growth and strong consistent growth in demand for consumer goods and service; 3) sustained trade reform (and nonbureaucratic cutoms procedures) and domestic liberalization; 4) adequate legal protection for investors, including wellfunctioning legal systems; 5) general education, industrial skill training and managerial discipline; 6) access to quality supplies of parts, components, and supporting services, with upstream and downstream linkages, and 7) conditions that facilitate just-in-time delivery.*

By examining the ideas, it is important for a country to attract investors to be able to create a conducive investment environment and to have legal certainty, including in the investment for telecommunication industry. Considering that, it is required to change the way in managing investment from a passive one into a proactive one. Government and parties that are related to investment management must have perception alignment that the presence of investor is crucial in driving the development of national economy. The presence of foreign investors is intended not only for the interests of government and business actors, but also for those of people in general.

In order to obtain a more interesting environment of capital investment, the laws and regulation on capital investment must be formulated thoroughly, undividedly, and must provide legal certainty. Its effective implementation also play an important role. One of the obstacles in investment environment is on the inappropriateness of regulation implementation in capital investment, causing apprehension and uncertainty for capital investor (Sumantoro, 1984). Regulation of telecommunications sector plays a crucial role in the political and economic agenda for both industrial and developing countries. The regulatory efforts of more developing countries in order to attract investments and enhance the level of effective competition in the industry are hindered by the absence of a sound legal framework, the weak level of regulation and the extended state interventionism, (Paleologos, at. al., 2013).



Based on that, the regulation on investment is considered important to be revised in order to be adapted with the development of investment law that is agreed to by various countries, that is realized in numerous international agreements, both in bilateral agreement (Bilateral Investment Treaties) and multilateral agreement (Multilateral Investment Treaties). However, the problem is in law enforcement. Apparently, this is the main issue in attracting investment to this country, whether judicial process as the last resort in law enforcement is conducted fairly. Therefore, although investment law is already revised, there is no guarantee that investors will come unexpectedly.

In conclusion, the need to accommodate movement of fair accessibility accordingly to FDI under Telecomunication Law (TL) shall be refer as the next quality action to achieve Social Welfare (SW) (refer to Figure 3). Indonesia already responded global demand in liberalizing its telecommunication market by stipulating Act No. 36 of 1999 on Telecommunication. Afterwards, telecommunication regulation in Indonesia attempted to adopt principles in the business of international telecommunication, such as antimonopoly, transparency, and being open to free market.

*Figure 3. Quality Action 2: Accelerating Society Welfare through Fair Accessibility Based on Foreign Direct Investment (FDI) & Telecomunication Law (TL)*

## 8. CONCLUSION

From the exploration of historical trajectory of telecommunication regulation in Indonesia, it can be concluded that the change of nature of telecommunication business from monopolistic to competition in the global era has been proved to bring positive impact in the development of telecommunication in Indonesia. Competition in telecommunication business in Indonesia has created a competitive business environment for big, medium, and small business actors, which directly influence national economy. However, the satisfying progress also means problem. As a matter of fact, telecommunication sector is not equally distributed in Indonesia up to the present moment.

One of the ways to address the problem in developing telecommunication in Indonesia is by Foreign Direct Investment (FDI). Indonesia has a lot of potentials which functions as the appeals to attract investment. However, Indonesia has to harmonize telecommunication law and investment law, particularly to promote acceleration and connectivity of telecommunication in all parts of Indonesia. On the other hand,

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

this arrangement is also important to protect national interest, while also preventing foreign dominance in telecommunication market in Indonesia.

In conclusion, two quality actions are proposed to accelerate fair accesibility through law of telecommunication in global village setting. The first quality action is to accelerate Society Welfare (SW) through fair accessibility in Global Village (GV) setting and FDI. In other words, FDI shall refer as quality action to acheive SW then able to function as proposed design for solution for GV root of problems. Second quality action is to accelerate SW through fair accessibility based on FDI and Telecomunication Law. Meaning that the need to accommodate movement of fair accessibility accordingly to FDI under Telecommunication Law shall be refer as the next quality action to achieve SW.

## ACKNOWLEDGMENT

This paper is presented in Workshop and Coaching on Writing Publication in International Journal (WCWPIJ), FH UNDIP-Batch 1, 2016, Indonesia. Therefore, the authors express their gratitude to ThinkSmart Scholar (TS Scholar) for the event and the valuable inputs during the preparation and improvement processes of this article.

# APPENDIX

*Table 3. Potential of Internet Users*

| No | Factor | Description |
|---|---|---|
| 1. | Constantly increasing number of internet users. | The published 2014 survey of the Association of Indonesian Internet Service Operator (Asosiasi Penyelenggara Jasa Internet Indonesia/APJII) shows that the increase of internet users in Indonesia was quite significant, of about 23% (from 71.2 million people in 2013 into 88.1 million people in 2014). The increase in number is followed by increase in penetration – users per the number of population – from 28.6 percent in 2013 into 34.9 percent in 2014. Meaning, the enthusiasm of Indonesian people to use internet is getting higher. |
| 2 | Constantly increasing sales of gadget | Data from VNI Forecast Cisco in 2011 showed that there were 250 million purchases of various cell phones and tablet computers in Indonesia. According to Cisco research, in only one year, the number of cell phone owners in Indonesia increased of 50 million, into 300 million users. This increase is expected to develop until 2017 into 370 million users of cell phone and tablet computer. |
| 3 | Huge population | The number of population of 254.9 million people is a proof that Indonesian market is huge. |
| 4 | Stable political condition | Political condition in Indonesia is considered stable and safe, particularly when it is related to other Southeast Asian countries such as Malaysia or Thailand. |
| 5 | Licensing simplification through PTSP | The government has simplified investment licensing in the country by implementing One Stop Integrated Service (Pelayanan Terpadu Satu Pintu/PTSP). This is conducted to address the complicated licensing in Indonesia, including the overlapping regulation bureaucracy. |

*Table 4. Dynamics of telecommunication law in Indonesia*

| Telecommunication Regulation | Description | Outcome |
|---|---|---|
| **Pre-Globalization Era** | | |
| Act No. 5 of 1964 on Telecommunication | 1. Division of duties in telecommunication into three parts<br>a) Regulation function (Government)<br>b) Operational function (State-owned Enterprises/BUMN, in this case Perumtel and PT Indosat)<br>c) Coordination function: Telecommunication Board<br>2. There are only two companies in operational function, namely telecommunication operator for domestic public, which is Perumtel (present PT (Persero) Telkom), and telecommunication operator for foreign public, which is Liability Company (*Perusahaan Perseroan*/Persero) PT Indosat. | 1. Rise of monopoly practice<br>2. The society do not have much to choose from various telecommunication business operators<br>3. No competition, causing the lack of competition and breakthrough |
| Act No. 3 of 1989 on Telecommunication (Transition Era) | Start to regulate people's involvement in certain limits | Rise of new entrepreneurs in telecommunication. |

## ABSTRACT

*This chapter presents the results of an empirical investigation on stock trading activity in the context of restatement announcements. The aim is to explore whether sophisticated investors may anticipate accounting restatements, and which factors lead their trading strategies. The empirical analysis shows that sophisticated investors sell before and buy after the announcement. Moreover sophisticated investors trade more when information asymmetry and event-related risk are higher, and do not care about stock's recent performance. In contrast, unsophisticated investors do not follow a particular trading strategy before or after the announcement, stay away from trading when the information gap (risk) is too wide (high), but trade more on stock with positive past performance. Results suggest that sophisticated investors are able to anticipate restatements and exploit their information advantage to speculate.*

## INTRODUCTION

The Financial Accounting Standards Board (FASB) defines a restatement as a revision of a previously issued financial statement to correct a material error. Restatements have gathered a considerable interest from researchers, regulators and investors due to the significant impact they have on issuers' value. A consistent portion of research investigates market reaction to accounting restatements. Several studies

document large negative reaction with a loss in equity value of 10 percent, or even higher (Hribar & Jenkins, 2004; Palmrose, Richardson, & Scholz, 2004). Part of this reaction is due to revisions in firm's expected performance and part to a reduction in management capabilities and financial statements reliability (Badertscher, Hribar, & Jenkins, 2011). A recent strand of the literature focuses on the relation between information flow among investors and the market response to restatement announcements. Hribar et al. (2010) show that institutional investors tend to quit from restatement companies one quarter before the announcement. Badertscher et al. (2011) demonstrate that insider trading and company's share repurchase before a restatement announcements have a signaling effect for investors.

This chapter aims to extend this literature by investigating the difference between sophisticated and unsophisticated investors trading strategies in the context of restatement announcement. Previous studies adopt ownership data to discriminate investors. Differently, we adopt a microstructure approach and classify investors based on their trading behaviors. This allows us to document the trading strategies implemented by each investor's type on a daily basis.

This chapter explores four hypotheses about the difference between sophisticated and unsophisticated trading. The first hypothesis is that sophisticated investors are able to anticipate accounting restatement and sell before the event's disclosure. By comparing abnormal buy and sell trading volumes, it emerges that sophisticated investors tend to sell until the day before the announcement, whereas unsophisticated investors do not change their strategy in the same period. The second hypothesis is that, given that the information advantage rests on the side of sophisticated investors, they trade more when information asymmetry is higher. The results show a positive impact of information asymmetry on sophisticated investors trading volume. On the contrary, such an impact is negative for unsophisticated investors. The third hypothesis is that sophisticated investors trade more when the risk related to the impact of the announcement on the stock price is higher. Results are coherent with the expectations and show that an increase in uncertainty has a positive impact of sophisticated investors trading. Unsophisticated investors, instead, tend to stay away from too risky stocks. The fourth and last hypothesis is that sophisticated investors do not consider stock's recent performance in their decision process, while unsophisticated do. Results show no impact of stock performance on sophisticated strategy and a positive effect on both buy and sell volumes of unsophisticated investors.

## LITERATURE REVIEW AND HYPOTHESES

Recent accounting scandals have raised both regulators and financial community interest on accounting restatements. Unsurprisingly, the literature in this field has grown significantly in the last decade (Hribar & Jenkins, 2004; Badertscher et al., 2011).

Existing studies agree on negative consequences of restatements and deeply investigated their causes and consequences. Using a relatively small sample (73 US restating companies from 1976 to 1985), Kinney and McDaniel (1989) showed that restating companies present lower returns and higher leverage; subsequently lots of effort has been dedicated to measure the market reaction and to identify event's features which could amplify or mitigate such an impact. Change in equity value is typically quantified in terms of abnormal returns in order to avoid the influence of market trend; previous studies show that restating companies lose about 10 percent of their market value within two days following a restate-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

ment announcement (Dechow, Sloan, & Sweeney, 1996; GAO, 2003; Wilson, 2008; Kravet & Shevlin, 2010; Burks, 2011). Furthermore, some characteristics of restatements may exacerbate such a negative reaction. If a restatement:

1. Involves multiple and core account revisions (e.g.: revenues and cost of sales),
2. Has large impact on net income,
3. Is deemed fraudulent, or
4. Is auditor-initiated, the loss in market value can be as high as 20 percent (Anderson & Yohn, 2002; Palmrose et al., 2004; Hennes, Leone, & Miller, 2008).

A second branch of the literature investigates the relation between corporate governance and restatements. Companies could adopt adequate measures in order to prevent restatements to occur or repeat over time. Aier, Comprix, Gunlock and Lee (2005) show that CFO financial expertise is negatively associated with restatements. Carcello, Neal, Palmrose and Scholz (2011) find the same effect for audit committee independence and expertise. Adopting more conservative financial reporting strategy may represent a wise option as well, however Moore and Pfeiffer (2004) report that restating firms do not appear to change their strategy after a restatement. Finally, top executives and audit committee members may decide to not engage in 'arguable' accounting practices in order to avoid possible reputational damages. Restatements turn to be very costly for them in terms of compensation, reputation and job loss (Srinivasan, 2005; Desai, Hogan, & Wilkins, 2006; Cheng & Farber, 2008; D. Collins, Masli, Reitenga, & Sanchez, 2009).

Overall, previous studies suggest that part of the market reaction is due to revisions in expected future earnings and financial statement reliability, and part is due to the increase in uncertainty about management credibility (Badertscher et al., 2011).

Financial studies investigate the difference between informed and uniformed investors. Two types of investors are assumed to be informed: insiders, since they possess private information, and institutional investors, since they are reasonably supposed to be more sophisticated and have more resources to spend in information mining. In this chapter, we refer to informed investors as sophisticated investors; on the opposite, we refer to uninformed investors as unsophisticated investors.

Beneish (1999), Li and Zhang (2006), Agrawal and Cooper (2008), and Badertscher et al. (2011) provide evidence of insiders' strategic trading before restatement announcements. Drake, Myers, Scholz and Sharp (2015) provide evidence of abnormal short selling behavior surrounding, but not before, restatement announcements. Despite the large number of studies investigating the informational advantage of institutional investors (D. W. Collins, Gong, & Hribar, 2003; Ke & Petroni, 2004; Ke & Ramalingegowda, 2005; Ke, Petroni, & Yu, 2008), to the extent of our knowledge, only one paper (Hribar et al., 2010) which investigates institutional investors' behavior in relation to restatement announcements. Hribar et al. (2010) argue that institutional investors act as they partially anticipate potential accounting irregularities. Institutional investors adjust their holdings downward prior to the restatement announcements and their information advantage is mainly due to their higher ability in information processing. However, it is plausible that not all sophisticated investors decide to quit so long time in advance. Some of them might not be able so get alerts so early or might simply decide to monitor the situation if the irregularities are not likely to be disclosed.

This chapter addresses this gap in the literature by deepening in sophisticated investors' behavior and by analyzing their daily trading behaviors in the context of restatement announcements.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Accounting restatements are complex information, and investors should not be able to anticipate it. Either managers or third parties (e.g. external auditors, SEC) might discover irregularities and this makes the information timing unpredictable. Even if they were company-initiated, managers would be unwilling to share this information with outsiders. Consequently, investors' reaction to such events mostly relies on their ability (and speed) in processing information. It is possible that part of sophisticated investors fails to detect signals of a forthcoming restatement as early as predicted by Hribar et al. (2010), or they might decide to wait until the restatement is about to be announced. If this happens, abnormal trading activity coming from sophisticated investors should arise right before the announcement. This discussion leads to the first research hypothesis.

**H1:** Sophisticated investors sell before a restatement announcement, while unsophisticated do not.

If H1 is true, then sophisticated and sophisticated investors carry on different trading strategies, which are based on the information available. Sophisticated investors typically have higher information quality (Barron, Byard, & Kim, 2002; Barron, Harris, & Stanford, 2005; Bushee & Goodman, 2007; Hribar et al., 2010). This means that information asymmetry rests on their side. On the other hand, unsophisticated investors can adapt their trading strategies only after the information disclosure. Therefore sophisticated (unsophisticated) investors might (might not) be willing to trade in case of high information asymmetry. This leads to the second research hypothesis.

**H2:** Sophisticated (unsophisticated) investors trade more (less) before restatement announcements because of the increase in information asymmetry.

Unsophisticated investors typically have stricter wealth constraints compared than sophisticated investor. Consequently, unsophisticated investors are more reluctant to face risk compared with sophisticated investors (Hirshleifer, 2001; Kaniel, Liu, Saar, & Titman, 2012). When announcing a restatement, managers typically are not able to provide reliable estimation about the impact that the restatement is going to have on net income. The market appears to impose less severe losses to firms which are able to provide information about the effect of restatement quickly (Hirschey, Smith, & Wilson, 2015; BenYoussef & Khan, 2016). However, a restatement triggers a long and complex process and managers need time to assess the real impact. This situation causes an increase in information uncertainty and risk for investors. This discussion leads us to the third research hypothesis.

**H3:** Sophisticated (unsophisticated) investors trade more (less) when information uncertainty is higher.

Another important factor, which is likely to influence traders' buying and selling decisions, is stock's recent performance. As Grinblatt and Keloharju (2001) note, "*the impact of past returns on the buy versus sell decision is complicated by equilibrium constraints*"; furthermore, existing studies (Odean, 1998; Choe, Kho, & Stulz, 1999; Grinblatt & Keloharju, 2000) report some heterogeneity among countries. As we know from the literature present above, sophisticated investors are able to better process complex information (such as restatement) and have less wealth constraint compared to unsophisticated investors. Therefore they should be able to make better forecast of restatement consequences and decide to buy, hold or sell a stock regardless stock's past performance. This leads us to the fourth research hypothesis.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

**H4:** Past stock returns have lower impact on buy/sell decision of sophisticated than unsophisticated investors.

## METHODOLOGY AND EMPIRICAL RESULTS

### Data

This paper focuses on accounting restatement announcements, which are typical non-recurring and unscheduled events. There is no specific period of time when they are more likely to be disclosed. Both annual and interim reports can be affected by errors, and these errors can be discovered even long time after the original filling. With such characteristics, accounting restatement are extremely interesting from a research point of view because of their significant impact and heterogeneity, but also time-consuming from a data collection perspective. Most of the existing studies rely on a database compiled by the U.S. Government Accountability Office (GAO), which is public available. Such a database covers (in two subsequent issues) a 10-year period starting from January 1997 and provides company name, disclosure date and causes for each restatement. However, it starts to become out of the date, since regulatory and technological innovations might have modified the speed and magnitude of investors' reaction to restatement announcements. To the extent of our knowledge the only database, which goes beyond the period covered by GAO, is Audit Analytics, but it has some event overlap issues (Karpoff, Koester, Lee, & Martin, 2012). Being aware of the potential biases these two sources might introduce, we replicated the GAO methodology and built our dataset from scratch. We adopted the Power Search tool as provided by Lexis-Nexis Academic and searched for the following keywords: "restate", "restatement", "restates", "restated" or "restating" within fifty words of "financial statement" or "earnings" and variations such as "adjust", "amend" and "revise" within fifty words of "financial statement" or 'earnings". Our search included all English news and SEC filings in order to find the date when the information firstly became public. We collected all the documents announcing a restatement from 1st January 2007 to 31st December 2013. The initial sample included 6,500 events. Table 1 summarizes the number of events collected for each year.

*Table 1. Events by year*

| Year | No. of Events |
|---|---|
| 2007 | 1,367 |
| 2008 | 949 |
| 2009 | 762 |
| 2010 | 858 |
| 2011 | 855 |
| 2012 | 856 |
| 2013 | 853 |
| **No. of events** | **6,500** |

This table reports the number of events for each year as detected in Lexis-Nexis Academic database. The search was performed using the Power Search tool with the following keywords: "restate", "restatement", "restates", "restated", "restating", "adjust", "amend" or "revise" within fifty words of "financial statement" or "earnings".

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

From the initial sample we selected companies listed on New York Stock Exchange, NASDAQ and Amex. We deleted 142 events due to clerical errors or omissions and further 3,857 events because of market data availability. For the remaining 2,501 we retrieved trades and quotes data, as well as changes in shares outstanding, from Thomson Reuters Tickhistory Database (TRTH). In order to be included in the final sample we require companies to have market data available for at least 60 trading days before and after the announcement, and at least 50 percent of the non-zero daily trading volume in the estimation period (-60;-21). This was necessary to avoid companies delisted right after the restatement and illiquid stocks. These restrictions led us to delete further 1,499 events. Finally, we deleted 478 events because of overlapping. In other words if a company had multiple restatement announcements within 61 trading days we kept the only the first one. Table 2 summarizes all the filters applied. The final sample consists of 524 restatements occurred to 455 firms.

In order to identify trades involving sophisticated and unsophisticated investors, we classified all transactions as follows. A trade was assigned to sophisticated investors if its volume was higher than 10,000 shares or its market value was higher than 200,000 dollars[1]. Previous studies show that trading size is highly effective in separating institutional and individual investors activities (LaPlante & Muscarella, 1997; C. Lee & Radhakrishna, 2000). We also classified transaction as buyer or seller-initiated according to Lee and Ready's (1991) algorithm paying attention to combining trades which occurred at the same time-stamp in order to avoid biases due to order fragmentation.

To detect differences in sophisticated and unsophisticated investors' behavior, we considered the daily trading volume of each investor type. There is a wide literature which shows that trading volume is more effective than stock price in separating sophisticated and unsophisticated investors' trades (Bamber, Barron, & Stevens, 2011). We adopted log turnover as a measure for trading volume. Raw turnover is defined as the trading volume divided by outstanding shares. Turnover has a major benefit, it corrects for the number of outstanding shares; therefore it provides a cleaner interpretation of the results compared to absolute volume (i.e. number of shares traded). However, the distribution of raw turnover is highly skewed and this might bias statistical tests and regression coefficient estimators. See Table 3 for summary statistics. Skewness and kurtosis show a clear divergence from normality so we applied a log transformation in order to normalize the distribution (Chae, 2005). Table 3 shows that, after applying the logarithm, our measure of trading volume is very close to normality.

*Table 2. Data sets and applied filters*

| | **No. of restatement** |
|---|---|
| Events from Lexis-Nexis | 6,500 |
| Filter for restatement due to errors or omissions | (142) |
| Filter for market and data availability on TRTH | (3,857) |
| Filter for number of trading days | (1,499) |
| Filter for overlapping | (478) |
| **Final sample** | 524 |
| **No. of firms** | 455 |

This table summarizes the sampling process. The restatement announced by US companies between 2007 and 2013 were extracted from the Lexis-Nexis database. Stocks in the final sample has to be listed in NYSE, NASDAQ or AMEX, have market data available for a 121-day period centered on the annoucnement day (-60;+60) and this time interval must not overlap with other restatements or corporate events for the same company.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 3. Turnover descriptive statistics*

| Sample | Mean | SD | Kurtosis | Skewness |
|---|---|---|---|---|
| | **Daily Turnover (%)** | | | |
| Sophisticated-Buy | 0.122 | 0.060 | 8.571 | 2.635 |
| Unsophisticated-Buy | 1.373 | 0.272 | 0.178 | 0.957 |
| Sophisticated-Sel | 0.140 | 0.164 | 47.208 | 6.540 |
| Unsophisticated-Sell | 1.379 | 0.295 | 2.492 | 1.637 |
| Full sample | 3.439 | 0.692 | 0.562 | 1.119 |
| | **Log Daily Turnover** | | | |
| Sophisticated-Buy | -2.933 | 0.152 | -0.447 | -0.143 |
| Unsophisticated-Buy | -6.449 | 0.044 | -0.545 | 0.221 |
| Sophisticated-Sel | -2.939 | 0.128 | 0.557 | -0.322 |
| Unsophisticated-Sell | -6.432 | 0.044 | -0.325 | 0.326 |
| Full sample | -5.515 | 0.045 | -0.433 | 0.311 |

This table reports the summary statistics of daily turnover for a 41-day period centered on the announcement day (-20;+20). The summary statistics include mean, standard deviation, skewness and kurtosis. The daily turnover is defined as daily trading volume divided by outstanding shares.

Unless otherwise noted, any following reference to volume, trading volume and turnover refers to log turnover as defined in Equation (1). Equation (2) shows how we estimated the abnormal trading volume, which is the difference between the trading volume of stock *i* in day *t* minus the median value $\left(\widetilde{LogTurnover_i}\right)$ of trading volume in the estimation period for the same stock[2].

$$LogTurnover = log\left(\frac{TradingVolume_{i,t}}{Outstanding_{i,t}}\right) \tag{1}$$

$$AbnormalTurnover\left(\varepsilon_{i,t}\right) = LogTurnover_{i,t} - \widetilde{LogTurnover_i} \tag{2}$$

Figure 1 provides a graphical representation of the change in trading volume from day -20 to day +20. Chae (2005) shows that abnormal trading volume increases prior to unscheduled announcement. A restatement represents a typical unscheduled announcement thus we expect to find a similar pattern in our data. The graph shows the expected increase in trading volume. Interestingly, Chae (2005) find a similar trend before merger and acquisition (M&A) announcements. M&As are usually anticipated by rumors (Aspris, Foley, & Frino, 2014; Siganos & Papa, 2015), therefore the similarity in volume pattern with restatements might be a signal of a possible investors' anticipation.

Palmrose et al. (2004), among others, provide evidence of negative market reaction to restatement announcements. Figure 2 plots the cumulative abnormal stock returns for a 21-day period starting 10 days before the restatement announcement (day 0). The time series shows a clear downward trend, which is coherent with previous studies.

## Univariate Analysis

Using the variables described above, we report the cross-sectional average abnormal turnover for all four subsamples from day -7 to +7 in Table 4. This table shows that the abnormal volume due to sophisticated investors is significantly larger than the abnormal volume generated by unsophisticated investors, and that the difference between the two groups is statistically significant.

We also analyze the difference in net selling activity between sophisticated and unsophisticated investors. Based on the assumption that more informed traders would leave companies before the announcement, we estimated investors' net activity on the sell side, i.e. the difference the difference between abnormal sell and abnormal buy volumes (Hribar et al., 2010). Figure 3 provides a graphical representation of the cross sectional abnormal net selling activity for each investor type. When the line is above (below) zero, investors are net seller (buyer). The graph shows that sophisticated investors tend to be net buyers from day -7 to day -4 and net sellers from day -3 to day -1. On the other hand, unsophisticated investors' activity is quite constant over time. Looking also at the change in stock price, sophisticated investors show a clear speculative behavior since they sell just before the price drop suggesting that they are able to anticipate the announcement. These results lead us to accept H1.

*Table 4. Daily abnormal turnover around the restatement announcement*

This table reports the cross sectional daily abnormal turnover for a 15-day period centered on the announcement day (-7;+7) and for each investor and trade types. Abnormal turnover is reported as the difference between log turnover and the median value of log turnover estimated from 60 to 21 day before the announcement, where turnover is trading volume divided by shares outstanding. ***, ** and * denote that the *t*- statistics are significant at one, five or ten percent level respectively.

## Multivariate Analysis

This paragraph presents the regression analysis implemented in order to test the hypotheses H2-H4. The aim is to show whether sophisticated and unsophisticated investors rely on different factors in shaping their trading strategies.

In building the regression model we followed Chae (2005). We run the regression on four subsamples i.e. sophisticated-buy, sophisticated-sell, unsophisticated-buy and unsophisticated-sell. Differences in significance and magnitude of the regression coefficients across subsamples lead us to our results.

Equation 3 presents the regression model.

$$\varepsilon_{i,s} = \beta_0 + \beta_1 InfoAsym_i + \beta_2 Risk_i + \beta_3 PrcChg_i + \beta Year_{i,s} + \epsilon_{i,s} \quad (3)$$

The notation $\varepsilon_{i,s}$ is the cumulative abnormal trading volume for stock *i* in subsample *s* over a 5-day period centered on the announcement day (-2;+2); $InfoAsym_i$ is a proxy for information asymmetry before the announcement (-60;-20); $Risk_i$ is a proxy for event-related risk; $PrcChg_i$ represents the difference between average absolute return of stock *i* and average absolute value-weighted market index return[3] from day -10 day to day -3. $Year_{i,t}$ are dummy variables to check for year fix effect.

The bid-ask spread, calculated as the difference between ask and bid prices divided by the quoted midpoint, is our proxy for information asymmetry. Copeland and Galai (1983), Glosten and Milgrom (1985) and Venkatesh and Chiang (1986), among others, show that market makers widen their bid-ask spreads when information asymmetry arises in order to protect themselves from trading with informed traders. Since high bid-ask spread is associated with higher information asymmetry, and being informa-

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion asymmetry on the side of sophisticated investors, we expect to find a positive (negative) relation between sophisticated (unsophisticated) buy and sell activities (H2).

Choosing a proxy for event-related risk is a bit more complex since the literature does not provide a generally recognized measure. Following Chae (2005), we adopted the absolute price change on the announcement day, which, in spite of possible endogeneity problems, provides a clear idea of the surprise and the direct impact caused by the announcements. As noted above, sophisticated investors have access to higher quality information and are able to process complex information quickly; moreover they have less severe wealth constraints and can face riskier trading strategies compared to unsophisticated investors. This means that sophisticated investors might decide to trade more when the risk is higher in order to seek higher profit. On the other hand, unsophisticated investors need to be more careful about what they buy or sell because of their limited resources and information disadvantage. Following H3, we expect to find a positive (negative) relation between sophisticated (unsophisticated) trading volume and risk.

*PrcChg* is a measure of stock performance compared to the market index. Since sophisticated investors typically have high analytics skills, they could decide to not follow stock's past performance in designing their strategies. Unsophisticated investors usually do not have many resources dedicated to performance forecasting, so in defining their strategies they can rely only on past performance. Agreeing with these considerations, H4 implies that recent stock performance does not have any impact on sophisticated investors trading behavior, while it is positively related with unsophisticated trading.

In order to check for possible multicollinearity problems caused by strong correlations between the variables included in the regression model, we performed a correlation analysis. Table 5 reports the Pearson correlation coefficients[4] among variables in Equation (3). A strong positive correlation exists only between buy and sell trading volumes of the two types of investors signaling that unsophisticated investors tend to follow sophisticated investors' activity. Interestingly, the coefficients between information asymmetry, risk and stock performance and volumes have all the same sign. This means that there is no single factor, which causes the differences in investors' behavior.

*Table 5. Correlation matrix*

This table reports the Pearson correlation coefficients among variables in our final sample. *CAVBS* and *CAVSS* are the cumulative abnormal volume over a 5-day period centered on the Announcement day (-2,+2) for buy and sell of sophisticated investors. *CAVBU* and *CAVSU* are the cumulative abnormal volume over a 5-day period centered on the Announcement day (-2, +2) for buy and sell of unsophisticated investors. *InfoAsy* is the average percentage bid-ask spread from day -60 to day -20. *Risk* is the absolute price change in the event day. *PrcChg* is the difference between the average absolute return of the stock and the average absolute value-weighted market index return from day -10 to day -3. ***, ** and * denote that the correlation coefficients are statistically significant at one, five or ten percent respectively.

Table 6 summarizes the results of the OLS regression. Results show that information asymmetry has positive impact on both buy (Panel A) and sell (Panel B) volumes of sophisticated investors. In other words, they trade more when information asymmetry is higher. The sell-side coefficient is larger then the buy-side one, suggesting that sophisticated investors tend to be net seller when information asymmetry arises. On the other hand, Panel B and Panel D show that higher level of information asymmetry induces unsophisticated investors to trade less on both buy and sell sides. A restatement announcement triggers a downward price revision, therefore this evidence leads us to conclude that sophisticated investors exploit their information advantage to avoid losses and therefore to accept H2.

Looking at the proxy for risk, Table 6 shows that unsophisticated investors buy and sell less when the risk increases. On the opposite side, risk triggers an increase in sophisticated investors' trading. There is a well-known positive link between risk and returns, thus it is plausible that sophisticated investors attempt to speculate from the turmoil restatement-induced. This evidence leads us to accept H3.

The results of the regression analysis also show that recent stock performance does not have a significant impact on sophisticated investors trading. However, its effect turns to be positive and significant for unsophisticated investors. The evidence suggests that unsophisticated investors trade more in stocks with positive past performance. These results lead us accept H4.

This table reports the results of regressing cumulative abnormal trading volume on proxies for information asymmetry, risk and stock's recent performance for each combination of investor and trade type. The dependent variable in Panel A is the cumulative abnormal buying volume for sophisticated investors from day -2 to day +2. The dependent variable in Panel B is the cumulative abnormal buying volume for unsophisticated investors from day -2 to day +2. The dependent variable in Panel C is the cumulative abnormal selling volume for sophisticated investors from day -2 to day +2. The dependent variable in Panel D is the cumulative abnormal selling volume for unsophisticated investors from day -2 to day +2. *InfoAsy* is the average percentage bid-ask spread for each stock from day -60 to day -20. *Risk* is the absolute price change in the event day. *PrcChg* is the difference between the average absolute return of the stock and the average absolute value-weighted market index return from day -10 to day -3. The t-statistics of regression coefficients are given in parentheses below their corresponding figures.

## Robustness Test

In our analysis we adopt the bid-ask spread as a proxy for information asymmetry. However, it embeds two components, namely adverse selection and transaction costs (Glosten & Harris, 1988; Huang & Stoll, 1997). This means that the positive relations between trading volumes and information asymmetry described above might be driven by a change in transaction costs instead of in information asymmetry. In order to test the robustness of our results, we run the regression model presented in Equation (3) using the probability of information-based trading (PIN) as proxy for information asymmetry (Easley, Kiefer, & O'Hara, 1997; Easley, Hvidkjaer, & O'hara, 2002) Table 7 reports the results of the OLS regression.

Signs and significance of the regression coefficients are all confirmed, except for the significance of the new proxy for Panel B and Panel D. However, it does not affect our main conclusions. We can conclude that our results are robust to different information asymmetry measures.

## FUTURE RESEARCH DIRECTIONS

Our results are coherent with evidence on insider and informed trading around company events in general and provide further evidence in this field. However, some interesting questions are still open.

*Table 7. Robustness test*

This table reports the results of regressing cumulative abnormal trading volume on proxies for information asymmetry, risk and stock's recent performance for each combination of investor and trade type. The dependent variable in Panel A is the cumulative abnormal buying volume for sophisticated investors from day -2 to day +2. The dependent variable in Panel B is the cumulative abnormal buying volume for unsophisticated investors from day -2 to day +2. The dependent variable in Panel C is the cumulative abnormal selling volume for sophisticated investors from day -2 to day +2. The dependent variable in Panel D is the cumulative abnormal selling volume for unsophisticated investors from day -2 to day +2. *PIN* is the average probability of information-based trading for each stock from day -60 to day -20. *Risk* is the absolute price change in the event day. *PrcChg* is the difference between the average absolute return of the stock and the average absolute value-weighted market index return from day -10 to day -3. Y20XX are dummies for single year of the announcement date. The *t*-statistics of regression coefficients are given in parentheses below their corresponding figures.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

First, why do sophisticated investors start buying at the event day? Collecting the time of the announcements might be painful, but an intraday analysis might provide new valuable insights.

Second, is there any difference in market response if the announcements are released during trading or non-trading hours? For example, if a restatement were announced during the weekend, both sophisticated and unsophisticated investors would have time to evaluate possible consequences and define appropriate trading strategies.

Third, does information advantage of sophisticated investors rise from their analytical power or from other information sources? Studies investigating this dimension would provide significant contributions to the insider trading literature.

## CONCLUSION

This chapter provides empirical evidence on investors' response to restatement announcements. Using a dataset of 524 restatements announced by 455 US public companies from 2007 to 2013, the results show that sophisticated investors may anticipate restatement announcements and trade in advance of sophisticated investors in order to avoid losses. Sophisticated investors increase their abnormal buying activity until four days before the announcement, and then they implement an intensive selling activity until one day before the announcement. On the other side unsophisticated investors do not appear to follow any particular strategy before restatement announcements suggesting that they are not able to predict them.

The results also show that some specific determinants influence buy and sell choices of sophisticated and unsophisticated investors in matters relating to restatement announcements. First of all, information asymmetry makes sophisticated (unsophisticated) investors trade more (less). Information advantage rests on the side of sophisticated investors so they speculate on it as long as they can. Stock's risk also encourages sophisticated trading. From higher risk they can gain higher profit. Finally, our results show that sophisticated investors are not influenced by recent stock returns; indeed they typically have high analytics skills so they can rely on better predictions about companies' future performance to define their trading strategy. On the other hand, unsophisticated investors are positively and significantly influenced by recent performance.

Overall our results suggests that unsophisticated investors mostly rely on accounting and other public information in deciding their trading strategies while sophisticated investors integrate accounting information with other sources which allow them to better predict firm's future performance and detect the non-reliability of accounting information. Furthermore, the negative stock price reaction, which follows a restatement announcement, is partly due to the revision of accounting information and partly to a decrease in trust in management capabilities and in the accounting information they provide.

## ACKNOWLEDGMENT

The research work described in this chapter was supported by the Irish Centre for Cloud Computing and Commerce, an Irish national Technology Centre funded by Enterprise Ireland and the Irish Industrial Development Authority, and by the European Capital Market CRC.

## ENDNOTES

1 These parameters are coherent with the classification of block trades for NYSE, NASDAQ and Amex.

2 See Bamber et al. (2011) for reasons for choosing median, instead of mean, value as measure for normal trading volume.

3 Since stocks in our sample are listed in different markets, each stock has been associated with its respective market index.

4 An absolute value of the coefficient lower than 0.3 (higher than 0.7) denotes a weak (strong) correlation.

# Chapter 52
# Foreign Direct Investment in China:
## Its Impact on Economic Growth (Revisited)

**Agya Atabani Adi**
*Federal University Wukari, Nigeria*

**James A. Rossi**
*University of Greenwich, UK*

## ABSTRACT

*In accounting for the gaps in the literature between the period 2011 and 2016, more recent literature – particularly empirical related studies on the topic have been consulted to consolidate on the paper "Foreign Direct Investment in China: Its Sectoral and Aggregate Impact on Economic Growth". As highlighted by Wei (2013), it is important to recognize and acknowledge that the relationship between FDI and employment is affected by many variables, such as growth of the national population, increased exports, and growth of the domestic economy. Furthermore, as illustrated by Iamsiraroj and Doucouliagos (2015), whilst positive and negative effects may be demonstrated in relation to economic growth, in some countries, no effects can be deduced as regards the relationship between economic growth and FDI in certain other countries. This chapter also aims to accentuate the need for greater focus on environmental issues - as well as poverty alleviation - than is currently the case within the sphere and framework of Carroll's pyramid of Corporate Social Responsibility.*

## INTRODUCTION

As well as the consideration of other objectives which will be introduced towards the end of this section, this chapter is aimed at highlighting why corporate governance mechanisms such as audits are assuming an ever increasing role in mitigating information gaps resulting from lack of investor confidence and growing mistrust, as well as the mitigation of information asymmetries and uncertainties which have the potential to generate shocks, panics and turmoils in financial markets.

According to Agrawal and Khan (2011:71,72):

*FDI is an important factor in the globalization process as it intensifies the interaction between states, regions and firms. Growing international flows of portfolio and direct investment, international trade are all parts of this process. Globalization offers an unprecedented opportunity for developing countries to achieve faster economic growth through trade and investment. In the period 1970s, international trade grew more rapidly than FDI, and thus international trade was by far than most other important international economic activities. This situation changed dramatically in the middle of the 1980s, when world FDI started to increase sharply. In this period, the world FDI has increased its importance by transferring technologies and establishing marketing and procuring networks for efficient production and sales internationally (Shujiro Urata, 1998). The large increase in the volume of FDI during the past two decades provides a strong incentive for research on this phenomenon.*

*After the global financial crisis, the status and importance of Asian economies have increased a lot because of their more than expected resilience to financial crisis. Asian economies are expanding rapidly and their growing clout can be felt from the fact that out of top 5 economies of the world (in terms of GDP by PPP) 3 are Asian. Asia, with the exception of Japan, South Korea, Hong Kong and Singapore, is currently undergoing rapid growth and industrialization spearheaded by China and India - the two fastest growing major economies in the world.*

However, recent global trends, reports and developments reveal a slowing down in the pace of growth – as well as anticipated growth in the emerging economies – and notably, China. Whilst many factors are contributory to such developments, it is also vital to consider corporate governance related aspects which may have contributed to the quality of financial reporting and the reliability of financial reporting instruments and financial data in China.

It is recently acknowledged that the level of accuracy of financial data constitutes a huge matter of concern for financial investors in global markets and this has also been evidenced by the recent volatility in leading global financial markets.

Whilst the value relevance of accounting information and data in capital markets of selected jurisdictions constitutes the focus of investigation and analysis in another publication (Ojo, 2016), this chapter will briefly consider the importance of accounting information for investors – as well as Foreign Direct Investment in many emerging economies.

This chapter also aims to analyze and consolidate on the findings of Adi and Ogbole (2013) in relation to their paper "Foreign Direct Investment in China: Its Sectoral and Aggregate Impact on Economic Growth".

Since the results from their studies are based on data analysis which spans a period of 2005 to 2010, this chapter also aims to mitigate the gaps in the literature by way of reference and consultation to more recent research on the topic. The chapter will also illustrate why environmental concerns and poverty alleviation still constitute vital areas in need of redress and greater focus within the framework of Carroll's pyramid of Corporate Social Responsibility.

## MAIN FOCUS OF THE CHAPTER

### Background to the Study: Theoretical and Empirical Review

Whilst many studies on the topic and in the literature highlight the positive effects of economic growth on Foreign Direct Investment, there are also controversial and refuting results which dispute the validity that economic growth has positive effects for Foreign Direct Investment.

Iamsiraroj and Doucouliagos (2015) highlight and demonstrate that "there is a robust positive correlation between growth and FDI" – however further studies are also cited as having reached controversial conclusions.

As well as incorporating meta-regression analysis into their study, they applied it to 946 estimates from 140 empirical studies.

Furthermore, they highlight the fact that the positive effects between growth and FDI are more visible – even if slightly, with developing countries than is the case with other countries.

According to Iamsiraroj and Doucouliagos (2015),

*Studies which demonstrate positive correlation between growth and FDI, "empirical studies which find that economic growth is an incentive for FDI inflows" include those carried out by Al Nasser 2010; Jiménez 2011; Kandil 2011; Mohamed & Sidiropoulos 2010). They also add that (pages 5 and 6):*

*There are several reasons why foreign investors might prefer faster growing markets. For example, cost efficiency of production and the realization of economies of scale and scope in production are closely linked with market size (Blonigen et al. 2007; Filippaios et al. 2003; Greenaway et al. 2007; Vernon 1966; Wang & Swain 1995). Other things equal, a growing market can be attractive to FDI because of the likelihood that a larger market will enable a more efficient scale of production through the realization of economies of scale (Agosin & Machado, 2007; Carstensen & Toubal, 2004). That is, growth is a measure and signal of market demand and market demand attracts FDI.*

The importance of favorable prospects for market growth as a means of facilitating long-term commitment by foreign investors, is also highlighted.

Other studies which accentuate a negative correlation, that is negative effects of economic growth on FDI, are as follows (Iamsiraroj & Doucouliagos (2015:7):

*Studies by Buchanan et al. (2012), Jensen (2003), and Wint and Williams (2002) – which all find a significantly negative impact of economic growth in attracting FDI in developing countries.*

One explanation for such empirical results, according to Iamsiraroj and Doucouliagos (2015) is that it is a measurement artifact.

More importantly, it is demonstrated that whilst positive and negative effects may be demonstrated in relation to economic growth, in some countries, no effects can be deduced as regards the relationship between economic growth and Foreign Direct Investment. Iamsiraroj and Doucouliagos (2015) add, with reference to (Akinlo, 2004), that "in Africa, extractive FDI is located in several mineral-rich countries, where market size and growth rate are not the key motivation for FDI" (Akinlo, 2004) – and that consequently, in such cases, economic growth and FDI will be unrelated.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to the OECD (2000:3):

*Because of its size, China's "open door policy" launched twenty years ago constitutes a unique and vast laboratory for the study of major structural changes in China and the world economy. It also provides an opportunity to test the benefits and the shortcomings of the economic policies which have been followed by the Chinese authorities and identify the improvements that could be brought about to increase the economic positive fall-outs of Chinese economic reforms.*

In its study, the OECD (2000:4) also remarks that:

*Despite shortcomings in available data, the synthesis note clearly shows that FDI has brought substantial and definite changes in China's external and internal economic structure. In fact the findings of the study are amazingly consistent with economic theory and existing economic literature. They confirm the complexity and diversity of China's economic situation and the broad ramifications of Chinese economic reforms.*

Zhang (n.d.) also uses data from over a period of 1992 to 2004 to analyze the impact of FDI inflows on China's income growth. His results appeared to illustrate that "positive growth effects seems to rise over time in coastal than inland areas." He also adds that FDI seemed to contribute to China's economic growth through direct effects, such as facilitating productivity and promoting imports, and positive externality effects – such as facilitating transition and diffusing technology (page 13). He concludes that the effects of foreign invested enterprises on the Chinese economy appeared to increase with FDI inflows between the period of 1992 and 2004, and that such effects appeared to be more prominent in coastal areas than in the inland region (page 13).

In attempting to answer the question revolving round the core research streams that have evolved around the phenomenon of FDI to China (Fetscherin, Voss, & Gugler: 236), Fetscherin, Voss, and Gugler, amongst other criteria and factors, employ:

*An interdisciplinary historiographic bibliometric citation analysis to reveal patterns in the analyses of research about FDI to China (Garfield,1963; Small,1974; Moedetal.,1985) and relate their findings to the four main streams of research in international business as identified by Dunning and Lundan (2008a). These are: (1) the motives and determinants of FDI; (2) 'inside' the multinational enterprise (MNE); (3) the impact of MNE activities; and (4) policy implications for the host country.*

In their opinion, they consequently expand on work by Peng, Lu, Shenkar, and Wang (2001), Li and Tsui (2002) and Quer, Claver, and Rienda (2007) by analyzing a very large sample of literature on FDI to China in an objectified manner and in close relationship to the foundations of international business research, rather than management studies (see Fetscherin, Voss, & Gugler: 236).

In comparing the pace of growth between India and China, Agrawal and Khan (2011:72) remark:

*India and China have experienced rapid economic growth in recent years. The growth, in part, is attributed to the adoption of liberal trade policies by each country in 1990's, and the consequent surge in the flows of foreign capital to both these countries. China and India, as the two largest developing countries in the world, have been both enjoying fast economic growth since the 1990s. China seems to*

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

*be performing better. In 1975, China was at par with India in GDP, yet 33% lower in its GDP per capita ($146 versus $220). But over the years China developed more rapidly than India and surpassed India in terms of GDP per capita in 1984.*

*What's more phenomenal, however, is the difference in their FDI performance. China has been able to attract more FDI than India, both in terms of net inflow and as % of GDP, from the beginning. Over the past decade, China has established itself as the top recipient of foreign direct investment (FDI) among developing countries. The World Prospectus Survey 2010-2012, released by the United Nations Conference on Trade and Development (UNCTAD), showed that China has once again retained title of the world's most important FDI destination.*

They also highlight the significance of "knowing what the effect of FDI on their growth is". Having considered the controversial results relating to the positive and negative effects of economic growth on FDI, it is interesting to discover that their findings and results revealed the following (see Agrawal & Khan, 2011:76):

- Confirmation that FDI promotes economic growth, and further provides an estimate that 1% increase in FDI would result in 0.07% increase in GDP of China and 0.02% increase in GDP of India.
- That China's growth is more affected by FDI than India's growth and FDI is not as much significant as other variables to predict growth.
- The study also provides possible reasons behind China's great show of FDI and the lessons India should learn from China for better utilization of FDI.
- That majority of the foreign investors prefer China over India for investment opportunities as China has a bigger market size than India, offers easy accessibility to export market, government incentives, developed infrastructure, cost-effectiveness, and macro-economic climate – even though India on the other hand has talented management system, rule of law, transparent system of work, cultural affinity and regulatory environment.

In investigating the impact of FDI on employment in China, Wei (2013), highlights the importance of recognizing and acknowledging that the relationship between FDI and employment is affected by many variables, such as growth of the national population, increased exports, and growth of the domestic economy. As a result these variables were taken into consideration for the study, and then data analysis was also undertaken to determine whether FDI was helpful in the creation of more job opportunities for the Chinese economy in general, the magnitude of this impact, and the impact of FDI on employment in China's primary, secondary, and tertiary sectors (see Wei, 2013:7).

In order to determine the relationship between FDI and employment in China's overall economy, 8 predictor variables are used by Wei (see page 20), namely: FDI, total wages, consumption, government spending, investment, net exports, interest rates for deposits, and interest rates for loans – further, the data employed spanned over the period 1985 to 2011. The overall results of the study indicated the following (Wei, 2013: 52, 53):

- FDI did not reveal a significant relationship with employment - however, taking the autoregressive error structure into consideration, the interest rates for loans has a stronger effect on employment.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The FDI used in the primary sector has a significant positive effect on employment and that for the secondary sector, the effect of FDI on employment is not significant, while GDP has a large positive effect on employment.
- It was also recommended that the Chinese government could choose to expand the four components of GDP for the secondary sector (see page 52).
- That for the tertiary sector, the effect of total wages is not significant, while FDI has a negative effect on employment and GDP has a positive effect on employment, with FDI's negative effect bigger than GDP's positive effect.

The differentiation of stock markets in China is also acknowledged to be necessary and essential to the determination of value relevance of accounting information in such markets. In distinguishing the A share only firms and the AB share firms, it is added that "these two types of companies also differ in monitoring function performed by independent auditors and that although A-share companies are mostly audited by domestic CPAs, AB-share companies normally hire international accounting firms (the now big Four) to audit their IAS-based financial statements in addition to domestic auditors responsible for Chinese GAAP statements (see page 13).

Chen, Chen and Su also add that "since auditors play an important role in the quality of financial reporting and international CPA firms are of better perceived reputation, they believe that the double monitoring performed by international and domestic auditors in AB[1] companies is another factor contributing to higher quality financial reporting and therefore more relevant accounting information in the market (Chen, Chen & Su, 1999:13)." Further, they are of the opinion that:

*whilst A-share companies only follow Chinese GAAP in preparing financial statements, companies that also issue B-share to foreign investors are required to publish both Chinese GAAP-based and IAS-based financial reports. In addition, AB-share companies are also required to disclose the break-down details of the reconciliation discrepancy. Since IAS-based financial statements are, on average, less subject to managers' manipulations (Chen et al.1999), the magnitude of the reconciliation discrepancy is likely to be interpreted by investors as an indication of the quality of Chinese GAAP-based financial statements (Chen, Chen & Su, 1999:13).*

Value relevance of accounting information is hence not only determined by whether the market is an A share only company or firm, or whether it is an AB share company, but also based on the level of stock liquidity operating across the market. In this respect, Chen at al (2001:7) also emphasize the importance of distinguishing between institutional[2] and individual holdings – and that "although individual and institutional holdings constitute a company's total tradable shares as in other stock markets, individual investors generate most of the trading volume in the Chinese market."

Value relevance of accounting information is hence a very important issue – not just from the perspective of Foreign Direct Investment and the reliability and relevance of financial and accounting information for investors – whether institutional of individual, but also in matters of Corporate Social Responsibility and financial reporting. This being of crucial importance given the need to enhance the quality and presentation of financial information, the need for comparability and consistency as a means of enhancing the relevance and reliability of financial information. This issue of reconciliation discrepancy hence constitutes a matter in need of urgent redress in capital markets.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Consequently the Enron case in the United States also revealed the flaws in the interpretation of GAAP. In the case (see page 26),[3] it was highlighted that "Enron's accounting was misleading to users and that specifically, the accounting risks for Enron were too high to be considered acceptable or presented fairly. To make them acceptable, adjustments would have been necessary to the reported estimates. Accounting risks should have been reduced to an acceptable level (as suggested by ISA 540) so that the reported numbers were more reliable."

## RESEARCH METHODOLOGY

According to Adi and Ogbole (2013:24), In spite of positive benefits of FDI, many scholars have argued that it exerts some negative effect on economic growth in some sectors of the economy, and hence they decided to empirically investigate this latter argument using time series data drawn from three sectors of the Chinese economy (1995 to 2010), namely; primary (natural resources); secondary (manufacturing) and tertiary (service).

- The Douglas' production function forms the theoretical model/framework on which the econometric model used in their study is based. The production function assumes two factor inputs as follows:
  Y= A f (KαLβ) where Y is the total output of the economy;
  L is the Labour utilized in production process;
  K is the capital. A is the technology/total factor productivity.

Their model specification is as follows:

**Model specification**

$$\text{Log } Yt = \beta 0 + \beta 1 \log Capt + \beta 2 \log Labt + \mu t \ldots\ldots. \quad (1)$$

where Log Yt is the log of real GDP; log Capt is the log of Capital stock at time t; and β2log Labt is the log of Labour used at time t.

They used the augmented Cob-Douglas' production function (a modified form of equation 1), with FDI included as one of the factor inputs by splitting capital into FDI and domestic investment (Dinv.) Equation (1) is thus modified as (see Adi & Ogbole, 2013:26):

$$\text{Log } Yt = \beta 0 + \beta 1 \log Dinvt + \beta 2 \log FDIt + \beta 3 \log Labt + \mu t \ldots\ldots. \quad (2)$$

LogDinvt is the log of domestic investment at time t
LogFDIt is the log of Foreign Direct Investment at time t
LogLabt is the Labour used at time t.

As well as re-iterating their de-aggregation of economic activity as with the case of Clark (1940) and Fisher (1939), into primary, secondary and tertiary sectors and control domestic investment and labour

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

in order to determine the effect of FDI on each of these sectors (see Adi & Ogbole page 27), they also modify equation (2) as follows:

$$\text{Log } Yt = \gamma 0 + \gamma 1 \text{logFDItpri} + \gamma\ 2\text{logFDItsec} + \gamma\ 3\text{logFDItter} + \mu t \ldots\ldots. \quad (3)$$

where: Log Yt = log of Real GDP; logFDItpri = log of FDI in primary industry; FDItsec = log of FDI in secondary industry; FDItter = log of FDI in tertiary; $\gamma 1$, $\gamma 2$ and $\gamma 3$ = elasticity in primary, secondary and tertiary industries respectively; $\gamma 0$ = Intercept; $\mu t$ = Disturbance term (Error term) (which includes other explanatory variables such as domestic investment, fixed capital investment, Educational level, Government policy, labor, technology etc.); and t = Data collected at time t.

## Data Description

Other statistics used are as follows (see page 27):

*Annual Time series data (from annual FDI utilized in 21 sectors of China's economy) was used but grouped into the national industrial classification in China (primary, secondary and tertiary). The data are in millions of US Dollars. The traditional approach of homogeneity of FDI was assumed and hence the quality of FDI was not ascertained. Domestic capital formation was used as proxy for domestic investment and number of employed persons per 10,000 persons as proxy for labor.*

## RECOMMENDATIONS AND FUTURE DIRECTIONS

Recommendations cited in their study include:

1. FDI attracting economic policies with greater attention to the secondary and tertiary sectors of the economy;
2. FDI attracting economic policies should pay more emphasis on the secondary sector at the early stage of such policies as this sector exerts growth enhancing spillover effects on other sectors and industries is the economy;
3. Economic policies that de-emphasize FDI into the primary sector as this may exert negative influence on economics growth;
4. Human resource capacity building economic policies that would take advantage of technology transfers and managerial skills acquisition occasioned by such FDI, more so that some corporations technically deprive the host economies ready access to their advance technologies.

Based on their findings, the following were recommended:

1. FDI attracting macroeconomic policies should be formulated to attract FDI as it spurs economic growth, at least the aggregate level.
2. Though FDI should be attracted to both the secondary and tertiary sectors, to spur economic growth, yet emphasis should be on the secondary sector (at the early stage of FDI policy) as it has spillover effect on other industries in the economy through it wider array of economic linkages;

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. FDI inflow into the primary sector should not be encouraged due to its negative growth effect on the industry;
4. Government policy should adequately focus on human resource development through transfers of advanced technological know-how, superior managerial and marketing skills from the foreign corporations.

To the above recommendations, the following considerations must also be mentioned as being in need of redress. When should economic policies and economic objectives take subordinate roles to the implementation of regulations, standards which are aimed at compelling compliance with environmental standards, rules and regulations? As demonstrated by recent global events and falling oil and gas prices, the impact of such a slump in prices, economically, may be more apparent in oil exporting countries than oil importing countries – however, environmental repercussions of continued consumption of oil and gas – in huge quantities, particularly encouraged and fueled by prevailing low prices, and evidenced by higher carbon emissions, generate far reaching consequences which are not only measured monetarily, but also in terms of potential life threatening and toxic emissions.

## Environmental Issues and Their Relation with Corporate Social Responsibility and Foreign Direct Investment Continue to Constitute Areas Which Should be Focal Points and in Need of Attention

As highlighted by (Fetscherin, Voss, & Gugler: 243):

*Areas that currently underdeveloped and offer opportunities for international business scholars to explore come to light. It is proposed that the following themes need further attention, namely: FDI and environmental issues; FDI and corporate social responsibility; FDI and social impacts; FDI and institutional transformation in China; and FDI and the growth of the Chinese MNE. Inward FDI to developing countries is often accused for negatively impacting the host country by exploiting low environmental standards to shift polluting production processes from countries where these are prohibited (He, 2006; Cole & Elliott, 2005). Further, after relocating polluting facilities, MNEs could engage in institutional spillover and seek to secure an institutional environment that is favorable for them. China has a track record of environmental incidences and low practical environmental standards despite having a written book law (Ross, 1998).*

*The extent to which environmental regulation can be and has been shaped and exploited in China by MNEs is therefore an important research topic. In particular, MNEs seek to exploit their technological superiority while need to ensure that their product quality and standards are comparable globally. From this perspective MNEs should have a self-interest in supporting and enforcing strict environmental regulation. Environmental issues have gained new momentum with the advancement of greenhouse gas measurements and the global debate on climate change.*

As already highlighted in the volume, and with particular regards to the chapters on poverty alleviation and according to World Bank reports (World Bank, 2002:63), private investment in Sustainable Forest Management (SFM) is not only attracting a lot of attention because of the magnitude of funds

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

being invested and diverted towards this industry and sector, but also because of the opportunities it provides for developing countries.

Private sector actors and contributors who have been identified to have an influence on the forest sector, include (Toppinen et al, 2014: 65):

- Large multinational companies
- Local companies of varying sizes
- Individual private investors (such as conservation investments by philanthropists)
- Community or cooperative enterprises which implement sustainable forest management; and
- Small scale forest owners

Further, as regards accountability and corporate governance measures in this sector, focus is considered to continually "shifting towards placing more emphasis on environmental and social sustainability of the industry", not only because of opportunities being provided for emerging economies such as Brazil, Russia, India and China, but also because of the scale and opportunities for investments in such countries, the current challenges being encountered by investors, as well as limited research on MNE's foreign investment in China.

## CONCLUSION

As a means of accounting for the gaps in the literature between the period 2011 and 2016, further more recent literature – and particularly empirical related studies on the topic have been consulted. As highlighted by Wei (2013), it is important to recognize and acknowledge that the relationship between FDI and employment is affected by many variables, such as growth of the national population, increased exports, and growth of the domestic economy.

More importantly, it has recently been demonstrated by Iamsiraroj and Doucouliagos (2015) that whilst positive and negative effects may be illlustrated in relation to economic growth, with respect to certain countries, no effects can be deduced as regards the relationship between economic growth and Foreign Direct Investment – with regards to other countries.

When should economic policies and economic objectives take subordinate roles to the implementation of regulations, standards which are aimed at compelling compliance with environmental standards, rules and regulations? Perhaps the need to implement and effectively enforce auditing and regulatory standards will serve as a necessary and compelling impetus and trigger which will pave the way for the implementation and enforcement of environmental standards. As demonstrated by recent global events, economic objectives and policies may be compelled to take subordinate positions where a matters of national interest are at stake, and where certain economic policies and practices serve as a deterrent to foreign investors whose interests are better served by greater demonstration of transparency and financial reporting within the corporate process.

## ENDNOTES

1 They argue that the mere existence of the dual-GAAP reporting system in AB companies, along with the disclosure of the reconciliation discrepancy, is a sufficient motivational factor which makes it more likely for AB-share companies to produce higher quality accounting information than A share companies with a one-GAAP reporting system. Also see Chen et al (2001:8).

2 Institutional shareholders in China and distinguished from institutional shareholders from the West. In this regard Chen et al add that "While institutional shareholders in China may hold a large percentage of company's stock, their ability to trade is severely restricted by the government policy and trading rules in China. The institution-held shares can only be transferred to other institutions with approvals from the government. The transfer price is based on negotiations rather than the market price. Consequently, a higher percentage of individual holdings may indicate a more active market, and it is through an active market that stock prices have the potential to fully reflect public information including accounting information." See Chen et al, 2001:7

## ABSTRACT

*Online stock trading (OST) is a growing phenomenon across countries, yet there is a sparse literature focusing on the negative utilities (risks) that causing the low adoption. Drawing from perceived risk theory, this article attempts to fill the gap by identifying the influential risk factors that impede the acceptance of OST in a developing country, Pakistan. The study also applies the Hofstede cultural theory to ascertain the effects of cultural moderators on investors' usage behavior (UB). Based on structured questionnaire, 443 valid responses were received from current and potential investors. The model was tested using structural equation modeling through Smart-PLS. The results validate a negative and significant relationship between risk dimensions and investors' behavioral intentions (BI) to use OST. Especially time, financial, performance, privacy and opportunity cost risks are found having a negative impact on investors' BI. Moreover, the study finds that cultural dimensions, collectivism, and uncertainty avoidance, moderate the relationship between BI and UB.*

## 1. INTRODUCTION

Today, the Internet proliferation has radically changed the operations of brokerage houses and has enabled them to provide online services to their clients for performing seamless transactions irrespective of time and location (Ramayah, Rouibah, Gopi, & Rangel, 2009). Internet stock trading is the provision of online access by the brokerage houses to their client to execute buy or sell stock orders on the brokerage's Internet-based proprietary trading platforms (Carlos Roca, José García, & José de la Vega, 2009). High liquidity of financial assets, low transactions fees, faster transactions, better information transparency are the direct advantages whereas checking stock quotations, receiving real-time market news, performing transactions from anywhere and anytime are the indirect benefits that investors can gain from online stock trading (Guiso & Sodini, 2013; Lee-Partridge & Ho, 2003). The provision of online services to clients is also advantageous for brokers as it increases revenue by reducing operational expenses (Yiu, Grant, & Edgar, 2007). Traditional settings require excess staff and physical offices for smooth business operations (Cheng, Lam, & Yeung, 2006).

Despite the multiple advantages, high-speed digital gadgets/computers, and Internet access, the online stock trading is still in its infancy (Tai & Ku, 2013). In this respect, scholars have identified different factors by using the dominant information technology models[1] that contribute to investors' decision regarding adoption of online stock trading. For instance, social factors, facilitating conditions, information quality, compatibility, complexity, relative advantages (Lee-Partridge & Ho, 2003) perceived security, perceived privacy, perceived trust, usefulness, ease of use (Carlos Roca et al., 2009) injunctive norms, descriptive norms (Ramayah et al., 2009). However, the literature reveals a limited focus on reflecting the inhibitors (perceived risks) of online stock trading. There are fewer studies that examined perceived risk in the context of online stock trading adoption (Lee, 2009b; Tai & Ku, 2013). These studies used perceived risk as a single construct or with some specific dimensions. The current literature on technology acceptance divides risk into various dimensions, for example financial, time, physical, privacy, psychological, opportunity cost risks etc. (Featherman & Pavlou, 2003; Kassim & Ramayah, 2015; Martins, Oliveira, & Popovič, 2014). Such dimensions are still unexplored in the context of online stock adoption, especially in developing countries. In this regard, the perceived risk theory (PRT), i.e., the users' behavioral perception of risks, can be appropriately used to explain the acceptance process. In addition to PRT, this study uses the cultural theory of Geert Hofstede (1980) for evaluating the moderation effects of cultural dimensions on the usage behavior of online stock trading adoption.

Perceived risk dimensions are considered as key factors preventing customers' intentions regarding the adoption of information technology (Martins et al., 2014). Khedmatgozar and Shahnazi (2017) found that various risks are involved in online banking adoption, thereby, corporate clients in Iran prefer traditional banking method. Another study conducted Yang, Liu, Li, and Yu (2015) identified risk dimensions as main inhibitors of customers' mobile acceptance. Cultural dimensions have an influence on customers' adoption of IT. For example, Chen and Barnes (2007) reported that in contrast to Korea's online trade rate (54%), customers in Taiwan have lower trust on e-business, therefore, their online trade rate is only 20% (Lee, 2009b). The technology acceptance is profoundly dependent on users' cultural dimensions (Zhang, Weng, & Zhu, 2018). Using cultural theory, Baptista and Oliveira (2015) identified positive effects of the five cultural dimensions[2] on mobile banking usage behavior. Similarly, Khan, Hameed, and Khan (2017) found Individualism/Collectivism (I/C) and Uncertainty avoidance (UC) as significant moderators in online banking usage behavior. This study believes that the investors might be affected by their cultural values in the adoption of online stock trading.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

The study contributes to the extant literature in several ways. First of all, understating online stock trading (OST) is relatively overlooked area in electronic finance. Previous studies investigated the effect of perceived risk dimensions on internet banking, e-government and online shopping adoption and pointed out that risk dimensions negatively influence customers' intention for e-services adoption (Martins et al., 2014; C. Park & Jun, 2003; Xie et al., 2017). There are quite a few studies highlighting the adoption of OST and especially they focused on the positive factors that contribute to the customer adoption of OST. There is very little research on the negative utilities that impede the adoption of OST. This study, to the best of authors' knowledge, is the first one that closes the gap by investigating the impact of perceived risk dimensions on OST adoption in a developing country, Pakistan. This was also suggested by Yang et al. (2015) to examine the effect of perceived risk dimensions in a new context and new culture. Secondly, the study is new in evaluating the moderation effects of Hofstede cultural dimensions on investors' usage behavior. Past studies concluded that cultural dimensions/values have a moderating effect on users' adoption of technologies (Abbasi, Tarhini, Elyas, & Shah, 2015; Khan et al., 2017; Zhang et al., 2018). In this regard, this study is insightful that analyze the moderating impact of cultural dimension on investors' usage of OST, especially in a developing country, Pakistan.

## 2. LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

### 2.1. Studies on Online Stock Trading Adoption

There are few studies that examined the internet stock trading adoption in different contexts. Carlos Roca et al. (2009) investigated online stock trading in Spain by using perceived trust, security, privacy, and TAM. Their results revealed a positive and significant relationship of perceived usefulness (PU), perceived trust with behavioral intention, and perceived ease of use with PU, and perceived security with perceived trust. Lee (2009b) studied investors' intention to adopt online stock trading in Taiwan using TAM and TPB. The author found that PU, ease of use and perceived benefits positively affect investors' attitude towards intentions. Trust positively affect investors' attitude, perceived behavioral control and subjective norms (SN) towards intentions while perceived risk negatively affect investors' attitude and behavioral intention. Lee-Partridge and Ho (2003) investigated online stock trading adoption issue in Singapore. The authors pointed out the significant and positive effect of social factors and information system quality on investors' behavioral intention. Singh, Sandhu, and Kundu (2010) examined the internet stock trading adoption issue in India and found that demographic and attitude dimensions significantly affect internet stock trading adoption. Tai and Ku (2013) worked on mobile stock trading adoption with the help of the UTAUT and perceived risk. Their results showed performance expectancy (PU), effort expectancy (EE), and social influence as positive determinants while security risk, financial risk and functional risk as negative determinants of internet stock trading adoption. Bhattacherjee (2000) concentrated on the acceptance of e-services by using the theory of planned behavior. Collecting online data from 172 electronic brokerage users in the USA, the author studied the influences of SN (including both external and interpersonal influences) and determined SN as an important predictor of e-services. However, the study found a minimal impact of behavioral control on e-services acceptance. Ramayah et al. (2009) checked internet stock trading adoption in Malaysia on the basis of the decomposed TRA.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

They found that attitude and SN are positively affecting the stock trading adoption; PU and ease of use significantly influence attitude, while injunctive norm and descriptive norm significantly influence SN. Among the literature, there is little known as how the risks dimensions affect the online stock trading.

## 2.2. Perceived Risk Theory and Online Stock Trading Adoption

Since the 1960s, perceived risk theory (PRT) has been used in different studies of behavioral economics and after then a considerable research has ascertained the impact of risks on customers decisions (Lin, 2008). Perceived risk (PR) is generally defined as the likeliness of possible negative consequences or losses of using any product or service. Bauer (1967) defined PR as "a combination of uncertainty plus seriousness of outcome involved". According to Peter and Ryan (1976) "PR is the expectation of losses associated with the purchase and act as an inhibitor to purchase behavior". Generally, scholars defined perceived risk according to their own research contexts. For example, Forsythe and Shi (2003) defined perceived risk as "a buyer's subjective expectation of possible losses when making decisions about online shopping". In this study perceived risk is defined as investors' perceptions about the possible monetary and non-monetary losses or risks allied with the internet stock trading adoption. Roy, Balaji, Kesharwani, and Sekhon (2017) argued that customers consider new technology as having the problem of uncertainty like performance, reliability and market acceptance.

Scholars have shown that perceived risk consists of several dimensions in e-commerce context (Featherman & Pavlou, 2003; Martins et al., 2014). Keeping in view the risk as a multi-dimensional phenomenon, the authors investigate eight-dimensions of perceived risk in the context of online stock trading adoption in Pakistan. These dimensions are time, financial, security and privacy, social, performance, psychological, physical and opportunity cost risk, consistent with the work of (Kassim & Ramayah, 2015; Martins et al., 2014). The definition and importance of each risk dimension in terms of internet stock trading are highlighted as follows:

### 2.2.1. Time Risk

Time risk refers to the investors' concerns about wasting time due to the usage of the online stock trading platform (Featherman & Pavlou, 2003). Khedmatgozar and Shahnazi (2017) defined time risk as wasting time in searching securities, trading securities and learning online securities trading platform. It includes potentials investors concerns' like how much time is needed for learning the online securities trading system; how much time needs to be spent in searching good securities and how much time is spent in completing the transactions. Hoyer and MacInnis (1997) pointed out that consumers have to devote sufficient time for buying, using or disposing of a product or service. Several studies pointed out that time risk significantly affect IB adoption (Featherman & Pavlou, 2003; Lee, 2009a). Currás-Pérez, Ruiz-Mafé, and Sanz-Blas (2013) also identified the negative relationship of time risk with the usage of social sites. Keeping in line with previous studies, this study also expects that there will be a negative and significant relationship of time risk with behavioral intentions to use online stock trading in Pakistan. Therefore, we propose the following hypothesis:

**H1:** Time risk negatively influences investors' intention for online stock trading adoption.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

### 2.2.2. Financial Risk

Financial risk is defined as the investors' perception of possible monetary loss associated with the usage of internet stock trading adoption (Featherman & Pavlou, 2003). The online transfer of money between accounts in online stock trading may increase worries of investors that the accounts and passwords may be hacked/ stolen. Kuisma, Laukkanen, and Hiltunen (2007) affirmed that investors hesitate to perform online transactions or transfer money because they afraid of losing money. Khedmatgozar and Shahnazi (2017) clarified that financial risk refers to the investors' concerns about the possible financial loss caused by making mistake(s) in entering account number or amount of money. It is also because they have concerns in asking compensation from brokers in case of errors in transactions. Yang et al. (2015) found a strong negative relationship between financial risk with m-payment acceptance. Similarly, Featherman and Pavlou (2003) identified that financial risk effects e-services adoption negatively. In the context of Pakistan, this study hypothesizes that:

**H2:** Financial risk negatively influences investors' intention for online stock trading adoption.

### 2.2.3. Performance Risk

Performance risk refers to the investors' perception about the possible malfunctioning or not working as advertised of the online stock trading system and thus being unable to provide desired services (Featherman & Pavlou, 2003). Furthermore, sometimes the performance of online stock trading system may be unstable due to low internet speed or disconnections. Kuisma et al. (2007) conceded that sudden web server breakdown and disconnections during conducting online transactions may result in unexpected losses to the users/investors. The performance may depend upon digital devices such as mobile application, laptops, pads or personal computer, used for internet stock trading. For instance, Yang et al. (2015) documented that mobile phones screen size or processing capability reduce users' m-payment adoption and noted negative effects of performance risk on m-payment acceptance. Tan (2002) concluded that perceived performance significantly predict customers' intention while Liao, Lin, and Liu (2010) found so significant relationship of performance risk with intentions. In the context of Pakistan, the study posits that performance risk will negatively influence investors' intentions. Therefore, it is proposed:

**H3:** Performance risk negatively influences investors' intention for online stock trading adoption.

### 2.2.4. Privacy Risk

Privacy risk refers to the investors' perception about the possible exposure of their private information (Featherman & Pavlou, 2003). Privacy risk is a major barrier in the adoption of e-services (internet stocking) because users have to provide more private information such as biodata, phone numbers, account number etc. when they open an account with an online broker. Such information if fell into the wrong hands can be misused. The violations of one's private information include intentionally disclosing, selling personal data of a customer by the service provider without his/her knowledge or hackers may hack such information. According to Chen and Barnes (2007), lack of privacy and security has a significant

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

negative effect on customers' intention to use e-service. Yang et al. (2015) also identified negative effects of privacy risk on m-payments acceptance. Similarly, Featherman and Pavlou (2003) found significant effects of privacy risk on e-services adoption. So, the authors hypothesize that:

**H4:** Privacy risk negatively influences investors' intention for online stock trading adoption.

### 2.2.5. Social Risk

Social risk refers to the potential loss of status in one' social group as a result of adopting online stock trading (Featherman & Pavlou, 2003). Forsythe and Shi (2003) defined social risk as "a threat which creates a possible loss of self-image or prestige resulting from the purchase or use of certain products or services". It includes potentials investors' concerns of losing social status among family members/ friends/colleagues in cases of financial or privacy loss due to the usage of online stock trading. It is possible that a person's social status may be increased or decreased on the basis of how online stock trading adoption is viewed in the society. For example, Ali, Shafeeq, and Ali (2012) argued that majority of people in Pakistan don't consider stock investing to be religiously legitimate i.e., "halal". Yang et al. (2015) investigated the effects of social risk on m-payment acceptance, however, the authors did not find a negative relationship between social risk and m-payment. Currás-Pérez et al. (2013) examined social risk with social sites usage and validated a negative relationship. The current study hypothesizes that the social risk will have a negative impact on the investors in Pakistan to use online stocking. It is, therefore, posited:

**H5:** Social risk negatively influences investors' intention for online stock trading adoption.

### 2.2.6. Opportunity Cost Risk

Lu, Hsu, and Hsu (2005) defined opportunity cost risk as the possibility that the "the best alternative is not chosen" an investor may lose when a choice is made. In the context of stock trading adoption, the opportunity cost risk can be explained as adopting internet stock trading by losing the alternative traditional settings (phone-based stock trading) or investing savings in the stock market by losing best alternate investment opportunity (Kerins, Smith, & Smith, 2004). If a consumer takes a decision regarding the purchase of any product or adopting a service, his/her decision may be affected if several opportunities exist in the market. For example, Kassim and Ramayah (2015) argued that opportunity cost risk negatively influences the attitude of traditional banking customer towards internet banking adoption in Malaysia. Similarly, Lu et al. (2005) concluded a negative relationship between opportunity cost risk with online applications usage. Keeping in view the literature, this study proposes that:

**H6:** Opportunity cost risk negatively influences investors' intention for online stock trading adoption.

### 2.2.7. Physical Risk

Customers are always cautious about their physical health. In this context, Lu et al. (2005) defined physical risk as "the potential threat to an individual's safety, physical health, and wellbeing". According to Hoyer and MacInnis (1997) when an investor intends to adopt online stocking trading he/she has

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

to give sufficient time for buying and using the online stock trading platform. Kassim and Ramayah (2015) argued that using online services a consumer may lose data or his hard disk may be damaged, his eyesight may be affected or may fall in a headache and backache etc. Kassim and Ramayah (2015) investigated the physical risk, however, they did not find a negative relationship in the case of internet banking adoption. Lu et al. (2005) identified the effect of physical risk in online applications usage. Therefore, we hypothesize:

**H7:** Physical risk negatively influences investors' intention for online stock trading adoption.

### 2.2.8. Psychological Risk

Psychological risk refers to the investors' perception about the possible psychological frustration, pressure, or anxiety due to the use of online stock trading system (Lim, 2003). Compared with the traditional stock investment, online stock trading is a relatively complex service. Users may not operate it successfully and thus inducing a psychological pressure. Investors may face psychological pressure due to low internet speed or devices such as a mobile app or personal computer. For instance, Yang et al. (2015) found that mobile screen size or low processing capability may induce anxiety in investors if a transaction does not complete. Investors may succumb to psychological pressure such as disappointment and frustration if their personal information is misused (Forsythe & Shi, 2003). Currás-Pérez et al. (2013) identified psychological risk as the main driver of users' attitude towards social networking sites. Liao et al. (2010) admitted the significant role of psychological risk in the context of software. Yang et al. (2015) investigated psychological risk in the context of mobile payment acceptance and pointed out insignificant results. This study proposes that the psychological risk will have a negative effect on investors' intentions in Pakistan. Therefore, it is hypothesized:

**H8:** Psychological risk has a negative influence on investors' intention to adopt online stock trading.

## 2.3. Behavioral Intention

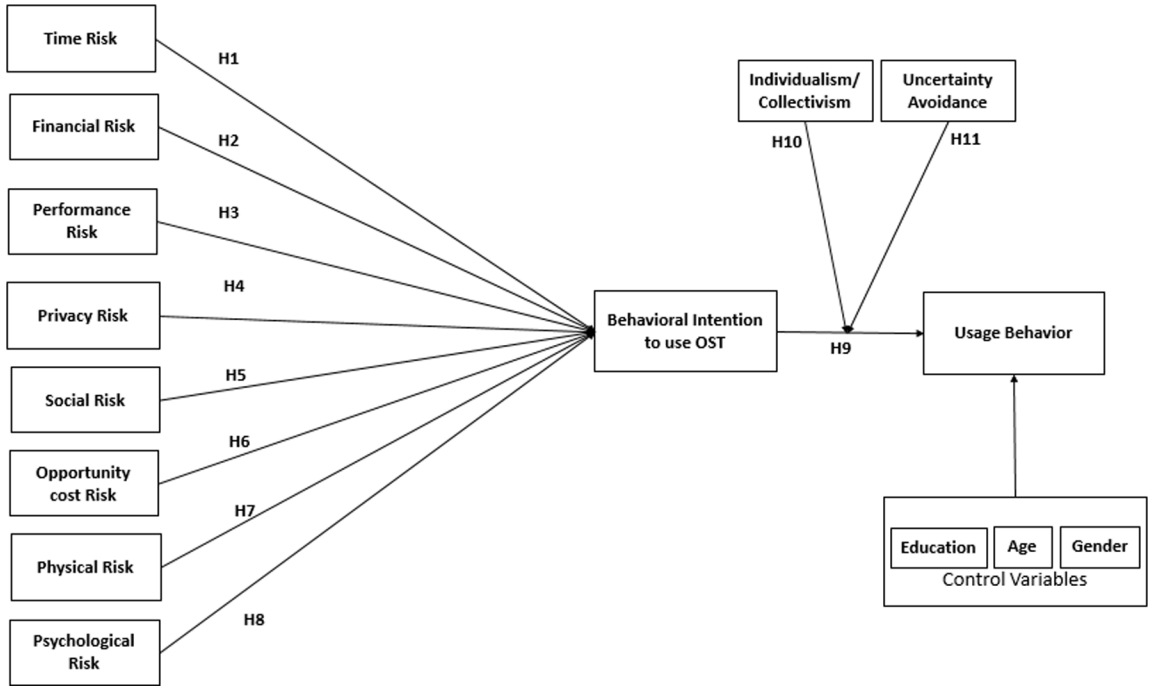
Behavioral intention (BI) leads to actual usage of information technology. Many past studies in the context of e-commerce/e-health have substantiated that actual usage of individuals is positively influenced by BI (Khan, Yu, Hameed, Khan, & Waheed, 2018; Yu, 2012). Venkatesh, Thong, and Xu (2012) reported that BI urge people' actual usage behavior. Same results that BI has a significant and positive impact on users' actual behavior are also confirmed by (Khan et al., 2017). Therefore, it is hypothesized that:

**H9:** Behavioral intentions have a positive effect on investors' actual usage behavior in online stock trading.

## 2.4. Cultural Moderators

Technology adoption is duly influenced by cultural differences; therefore, investors might be influenced by their cultural values (Srite & Karahanna, 2006). G Hofstede (2014) defined culture as "the way people think, feel and act". J. Park, Yang, and Lehto (2007) reported significant moderation effects of cultural values between BI and actual usage of mobile banking. This study followed Geert Hofstede (1980) culture model to investigate the moderation effects of cultural dimensions between BI and actual

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use



usage of online stock trading. In this regard, the Geert Hofstede (1980) model can be conveniently used at both the individual and organizational level. The other models of Hall (1989) and Trompenaars and Hampden-Turner (1998) are complex and used only at the organizational level (Abbasi et al., 2015). Out of the five cultural dimensions, this study investigates only two cultural dimensions (Individualism/collectivism and uncertainty avoidance) to understand the problem of low adoption of online stock trading in Pakistan. The reason behind the selection of the two dimensions is the high score of the selected dimensions on the Hofstede continuum.

Individualism/collectivism (I/C) shows how customers/investors adopt any technology and whether they are influenced by their society or they are independent in the decision. In an individualistic society, the investors will be independent in the adoption or rejection but in a collectivist society, they are influenced by voices of their peers, colleagues, friends, and others (G Hofstede, 2015). The I/C index explores the degree to which the individuals are associated in groups. The individualistic mode shows a loose tie with society, while a collectivist culture gives importance to the social and group pressures/opinions. The dimension of uncertainty avoidance expresses how people look and behave in uncertain situations, whether they embrace or avert the unexpected and unknown uncertainties. The authors hypothesize that;

**H10:** Individualism/collectivism moderates the relationship between behavioral intention and usage behavior in such a way that the relationship will be stronger among investors with collectivist values.

**H11:** Uncertainty avoidance moderates the relationship of behavioral intentions and usage behavior in such a way that the relationship will be weaker among investors with a higher level of uncertainty avoidance (see Figure 1).

## 3. RESEARCH METHODOLOGY

### 3.1. Sample and Procedure

Before starting the formal survey, first, we performed a focus group with three university professors and five experienced individuals in the field of internet stock trading. Upon their recommendations, we made some changes in the wordings and design of our questionnaire to make it more easy and understandable to the respondents. Following the method of Ramayah et al. (2009) and Alleyne and Broome (2011), the study collected data from two target groups: individuals who had internet stock trading experience and those students who were in final years of their Master and PhD studies from business schools of six universities[3] in the capital territory of Islamabad, Pakistan. As the students of business studies have knowledge of stock market and investment, therefore considering potential investors, we included them in the target population. Secondly, with the help of brokerage houses in Islamabad, we managed to collect data from experienced individuals. For this cross-sectional study, we gathered data through an adapted questionnaire in the second last quarter of 2017. First, the purpose of the study was clarified to the respondents and they were assured that the responses will be strictly kept confidential and will only be used for research purposes. The students and the investors took part in the survey voluntarily. They were motivated by giving them different small gifts and promised to get the copy of results when the paper is completed. Finally, a total of 470 responses were received of which the 27 were data-constrained and were excluded from onward analysis. Among the received responses, there was a participation of 210 experienced individuals while the remaining 233 responses were from non-experienced individuals/students. Table 1 shows demographic information of the respondents. The table shows that almost 58% of the participants were male, 50% of the respondents aged above 30 years and 73% of the participants have a master and above education.

*Table 1. Demographic Information*

| **Characteristics Number of Respondents (n = 443)** | | |
|---|---|---|
| Gender | Male | 252 |
| | Female | 191 |
| Age | ≤ 25.00 | 113 |
| | 26.00 - 27.00 | 76 |
| | 28- 30.00 | 83 |
| | 31- 35.00 | 93 |
| | ≥36.00 | 78 |
| Qualification | Bachelor | 119 |
| | Master | 163 |
| | M.Phil/MS | 121 |
| | Doctorate | 40 |
| Use experience | ≤ 3 Years | 85 |
| | 3-5 Years | 73 |
| | 5-8 Years | 39 |
| | 8 & above Years | 13 |

## 3.2. Measurement Development

We designed the survey questionnaire in two parts. The first part was designed to collect the basic information such as gender, age, level of education, and internet stock trading experience of the respondents. The second part was designed on the basis of constructs of perceived risk i.e. time, financial, performance, privacy, social, psychological, physical and opportunity cost risk. All items for constructs were borrowed from past literature and were slightly modified to suit the context of online stock trading adoption. For measuring perceived risk dimensions, the relevant constructs were borrowed from the study of Featherman and Pavlou (2003), Lu et al. (2005), Kassim and Ramayah (2015), having four items per construct. Four items were used for measuring dependent variable behavioral intention derived from Kim, Chan, and Gupta (2007), Venkatesh, Morris, Davis, and Davis (2003). The measures for cultural dimensions of Geert Hofstede (1980) were adopted from (Srite & Karahanna, 2006). Nominal scales were used in the first part and seven-point Likert scales, ranging from "disagree strongly" to "agree strongly" (1 = disagree strongly to 7 = agree strongly) were used for measuring constructs in the second part of the survey questionnaire.

Besides the main variables, the study controls for education, age, and gender to test the relationship and get the findings fairly. Empirical studies in the context of e-commerce have shown that behavioral intention is also influenced by age, gender, education, income an experience. For example, Koenig-Lewis, Palmer, and Moll (2010) reported a high adoption rate of internet banking among young Germans. Koksal (2016) found insignificant results of gender and education on mobile banking adoption. Du, Zhu, Lv, and Sun (2012) discovered that higher income people have a positive attitude towards accepting new technology. Pavlou (2003) mentioned that experience has a positive impact on future intentions. Therefore, keeping in view the possible impact of these variables, this study used age, gender, and education, as control variables to independently validate the model.

# 4. RESULTS AND ANALYSIS

## 4.1. Data Analysis

To examine the structural model, the researchers chose structural equation modeling (SEM) and analyzed through partial least squares (PLS) estimation. According to Hair, Black, Babin, Anderson, and Tatham (2006), PLS is a powerful technique, which is used to better combine the principal components analysis (CFA) and regression, and simultaneously to analyze the measurement model. In this study, we use the Smart-PLS 3.0 software to get the PLS estimation. Barnes (2011) suggested that smart-PLS is dealing with formative measures and moderating associations in the most effective way. Therefore, the study relied on the use of smart-PLS 3.0 software to conduct confirmatory factor analyses and get results of the structural model.

## 4.2. Common Method Bias

According to Podsakoff, MacKenzie, and Lee (2003) when all the data are gathered from one source and at the same time, the problem of common method bias (CMB) could influence the validity of the results. To test the CMB, Harman's single factor test was used. The result of the test shows that all the stated items can be classified into nine factors where the first factor explains 27.10% of the variance indicating that common method bias was not an issue in current research.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

## 4.3. Structural Model

Following Hair et al. (2006), The study measured the relationships in the model through CFA. More precisely, the measurement model was tested using content, convergent, and discriminant validities. Through an exhaustive review of the past literature and pilot testing, we managed to assess the content validity. Similarly, by getting the values of factor loadings, Cronbach's alpha, composite reliability, and average variance extracted (AVE), we assessed the convergent validity. The findings of the CFA indicate that all item loadings are greater than 0.60, except UA1. The recommended cutoff levels for Cronbach's alpha composite reliability and average variance extracted are 0.7, 0.7 and 0.5, respectively, fulfilling the standard rates (Flynn, Sakakibara, Schroeder, Bates, & Flynn, 1990; Fornell & Larcker, 1981; Hair, Anderson, Tatham, & William, 1998). Results in Table 2 indicate that composite reliability scores are greater than 0.7, and the AVE of all variables is greater than 0.7. Thus, the findings demonstrate good convergent validity.

*Table 2. Factor loadings, Cronbach's alpha, CR and AVE*

| Constructs | | Loadings | Cronbach's alpha | CR | AVE |
|---|---|---|---|---|---|
| Behavioral | BI1 | 0.873 | 0.868 | 0.919 | 0.72 |

| | UA4 | 0.744 | | | |

Table 3 shows the results of inter-construct correlations and discriminant validity. Discriminant validity represents whether the measures of a variable are different from other constructs. To examine the discriminant validity, we followed two approaches (Gefen & Straub, 2005). First, we evaluated discriminant validity by comparing the association between variables and the square root of the AVE of constructs. Table 3 demonstrates that the square roots of AVE are above the correlation between constructs, therefore showing good discriminant validity. Secondly, we analyzed the items in the item loadings and cross-loadings (see Table 5 in the Appendix) to construct the associations.

Results in Table 3 indicate that all the item loadings of the corresponding variables are above the cross-loading values of the other latent constructs, therefore indicating proper discriminant validity. We further analyzed the variance inflation factors (VIFs) and tolerance values of predictor variables to check whether multicollinearity was an issue. According to Mason and Perreault Jr (1991), the results of VIFs should be less than 10, while our results demonstrated that the VIF scores range between 1.06 to 2.60. Thus, multicollinearity does not exist in this research.

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

Note: N = 443. Diagonal elements are the square root of the average variance extracted of each construct. *P< .05, **P<.01

## 4.4. Hypotheses Testing

The relationships among the constructs were analyzed by examining the standardized paths. Following the previous research Henseler, Ringle, and Sinkovics (2009) path significance method were used with 2000 iterations of resampling (Chin, 1998). Table 4 summarizes the results of hypotheses testing. Psychological, social, and physical risks were found insignificant in the model while the rest of the hypotheses were supported by the data.

The findings in Table 4 demonstrates that Time risk (β=.275, $p$<.001), financial risk (β=.142, $p$<.001), performance risk (β=.268, $p$<.001), privacy risk (β=.122, $p$<.01) and opportunity cost risk (β=.293, $p$<.001) are statistically significant in exploring behavioral intention to use OST, therefore, supporting hypotheses H1, H2, H3, H4, and H6. On the other hand, the social risk, physical risk and psychological risk has no statistically significant influence on behavioral intention to use OST, thus H5, H7 and H8 were not confirmed. Figure 2 specifies that the model explains 60.4% variation in behavioral intention and 54.3% in usage behavior. In addition, the results depict that behavioral intentions has a positive impact on use behavior of OST, thus, confirming hypothesis H9.

## 4.5. Moderating Analysis

The study uses two cultural moderators i.e., individualism/collectivism (I/C) and uncertainty avoidance (UA) between behavioral intentions and usage behavior. Table 4 indicates the moderation results for I/C and UA. The results prove that the interaction effect of BI with IC (BI*CI→UB) is significant in predicting usage behavior of OST. Furthermore, the interaction effect of BI with UA (BI*UA→UB) is also significant that predict usage behavior of OST, therefore, our results confirm hypotheses H10 and H11.

# 5. DISCUSSION AND IMPLICATIONS

## 5.1. Discussion

Past studies reveal that different scholars have investigated information technology models (for example, the Technology Acceptance Model, Theory of Reasoned Action, Theory of Planned Behavior, Unified Theory of Acceptance, and Use of Technology), to ascertain positive utility factors that contribute to the adoption of online stock trading across countries. However, there is little known to uncover the negative factors that impede the adoption of online stock trading. Up to the best of authors' knowledge, there is a dearth of research work using perceived risk theory in the context of online stock trading adoption. Especially, there is no study measuring the effects of risk dimensions on the OST in developing country, Pakistan. Therefore, based on PRT we explored the risk factors influencing online stock trading adoption in Pakistan.

The most influential risk affecting investors' intention to use online stock trading is opportunity cost risk (β=.293, $p$<.001). This result supports the findings of Lu et al. (2005), Kassim and Ramayah (2015) and indicating two possibilities. First, as argued by prospect theory (Kahneman & Tversky, 1979), if traditional settings are still working, then people do not adopt a new risky method for conducting transactions. Thus, due to the various risks associated with e-services adoption, investors in Pakistan prefer traditional method (phone-based) of stock trading. Second, as mentioned by Kerins et al. (2004) investment decision may be affected in case of more investment opportunities in the market. Therefore, it may be possible that they have other best investment opportunities in the market which prevent them from internet stock trading adoption.

The second important inhibitor of internet stock trading is time risk (β=.275, $p$<.001) This result is in line with the previous studies of Featherman and Pavlou (2003) and Currás-Pérez et al. (2013). The finding reveals that investors in Pakistan have worries in terms of learning the online trading platform which might take a long time. Forsythe and Shi (2003) affirmed that online trading is complex than traditional trading methods and it needs sufficient time for learning. Similarly, Hoyer and MacInnis (1997) argued that a lot of time is spent in online stock trading. These concerns adversely affect investors' intentions to use internet stock trading.

Performance risk (β=.238, $p$<.001) is the third important risk that adversely affects investors' intentions to use internet stock trading. Same results were also confirmed by Khedmatgozar and Shahnazi (2017); Hanafizadeh and Khedmatgozar (2012). The results indicate that investors' concerns about the possible malfunctioning of the online stock trading system or low internet speed reduce their intentions to use online stock trading. In this respect, another possible concern of investors is that the service provider may not be able to provide them the advertised services, advantages and facilities, which adversely affect their intention to use internet stock trading.

Financial risk (β=.142, $p$<.001) is the fourth influential risk having a negative effect on investors' intention for internet stock trading usage. This conclusion is consistent with the findings of (Hanafizadeh & Khedmatgozar, 2012) and (Martins et al., 2014). Financial loss as a result of careless operations, fear of hacking of the online account(s), unable to claim compensation from brokerage houses in cases of errors in transactions and lack of legal support are some of the concerns that investors face in respect of financial risk. These concerns prevent them using internet stock trading for their investment purpose. The study also finds that privacy risk (β=.122, $p$<.01) has a significant negative influence on investors' intentions to opt for online stock adoption. The finding is in accordance with the results of Currás-Pérez

EBSCOhost - printed on 2/8/2023 11:07 PM via . All use subject to https://www.ebsco.com/terms-of-use

et al. (2013). The result indicates that investors' fear regarding the misuse of their private information by service providers or hackers, adversely affects their intention to use online stock trading.

Unexpectedly, we found insignificant results of three risk dimensions i.e. social risk, psychological risk and physical risk on investors' internet stock trading acceptance. Insignificant results about these risk dimensions have also been confirmed by Lee (2009a), Yang et al. (2015) and Kassim and Ramayah (2015) respectively. The insignificant results of social risk indicate that investors do not pay heed to the social pressure from family members, friends or/colleagues with regard to internet stock trading. There are two possible interpretations, one is that internet stock trading is common where the social group(s) has a favorable perception of it. Second, the decision of internet stock trading is not mandatory, rather it is voluntary. Venkatesh et al. (2003) argued that social norms significantly influence intentions in the context of mandatory-usage and has a low effect on intentions in the context of voluntary-usage. The insignificant results of psychological and physical risk show that investors have a favorable attitude towards internet stock trading. The investors do not think that internet stock trading will lead to any physical threat or psychological discomfort.

The moderating results reveal that collectivism affects the investors' usage of online stock trading in Pakistan. Investors living in Pakistan, tend to be influenced by the opinions of other investors, colleagues, friends, and others important. Consistent with the results of (Abbasi, 2011; Khan et al., 2017), the group pressures matter in the adoption of online stock trading in Pakistan as individuals are often get affected by his/her society. The high score of uncertainty avoidance does moderate the relationship between BI and usage behavior. The result is not in line with the projected hypothesis which may show the specific data characteristic. This counterintuitive result was also found by Baptista and Oliveira (2015) in the area of mobile banking.

## 5.2. Implications

### 5.2.1. Theoretical Implications

This paper contributes theoretically in several ways. First, this article contributes to the extant literature of internet stock trading by shedding light on the factors that impede the use of online stock trading adoption. Second, the findings of this paper further validate the negative and significant role of perceived risk dimensions in a new context i.e. internet stock trading adoption as suggested by Yang et al. (2015). Similarly, as argued by Lee (2009a) that the perceived risk dimensions are indirectly influenced by cultural differences, so these dimensions should be examined in different cultural contexts. Therefore, considering further validations in a new cultural context, we examined risk dimensions in Pakistan. The study extended the work of Tai and Ku (2013) by examining the impact of more risk dimensions on internet stock trading. The cultural dimensions are worth including in the technology acceptance studies. This study added the cultural dimensions to understand the online stock investing behavior of individual investors. This is a new evidence of the cultural moderators in the area of online stock trading and it will further stimulate the research to better investigate the cultural impacts in other technology acceptance studies. Theoretically, the study will pave the way for future researchers in using or extending the model in other contexts and technology groups.

### 5.2.2. Practical Implications

This research has many managerial implications. Regarding the significant and negative impact of risk dimensions on online stock trading acceptance, effective risk-reducing strategies may be formulated for promoting the adoption of online stocking among current and potentials investors. This research found that opportunity cost risk has the most significant impact on online stock trading adoption. This result implies that due to various risks associated with online stock trading, investors prefer the traditional method of stock trading. Thus, stock brokers and planners can focus on such factors which can be used for reducing the impact of various risks on technology acceptance. For example, Hanafizadeh and Khedmatgozar (2012) found that awareness negatively influences risk dimensions towards internet banking adoption. Awareness refers to the information of investors about the availability of online services, benefits and the procedure to open an account for using the online stock trading platform. Thus, this risk can be minimized by increasing awareness through advertisements, training, and literacy. Similarly, the recent finding of Xie et al. (2017) hold that perceived risk has a negative association with trust, indicating the importance of trust-building measures in online services. Therefore, this study suggests that the online stock brokers must develop trust-enhancing mechanisms such as guarantee statements, providing digital receipts of transactions, and/or increase familiarity with the online trading platform.

The possible solutions for investors' concerns regarding the second important inhibitor, time risk, includes preparation of appropriate guidelines for investors so that they can easily use the online stock trading platform (Khedmatgozar & Shahnazi, 2017). Hanafizadeh and Khedmatgozar (2012) suggested telephone calling centers for this purpose to facilitate the investors in real time. Yiu et al. (2007) stressed on advertisements of demonstration versions of online stock trading for learning the trading platform. Performance risk, the third inhibitor of online stock trading can be minimized by implementing traffic management systems (Khedmatgozar & Shahnazi, 2017), adopting of latest and user-friendly technology, hiring an active technical team, frequent and redundant data back systems to avoid data loss and by implementing multiple high-availability server clusters. This study, too, highlights the concentration of policymakers and web-designers to work out for improving investors' performance.

Reducing the financial risk, online stock brokers can keep investors informed about the guidelines and instructions for knowing their rights and responsibilities. Stockbrokers can reduce financial risk by providing improved services, a guarantee of satisfaction, digital receipts of transactions and money back guarantees to investors. Finally, the study found that privacy risk is another inhibitor of online stock trading. Bestavros (2000) recommended the following suggestions for decreasing privacy risk: keeping the investors informed about the regulatory materials that hold brokerage houses responsible for misuse or disclosing the private information of investors. In this regard, the right to information act and other digital rights can be strengthened for the sake of promoting online stock trading, including the protection of investors' private information in the policy of brokerage houses. Lee (2009a) also pointed the implementation of strong authentication systems and encryption to minimize chances of fraud and identity theft. In the context of Pakistan, the investors can be ensured of their privacy in the form of latest technology, government regulations and right information of the online stock trading.

## 6. LIMITATIONS AND FUTURE RESEARCH DIRECTIONS

In this study, based on perceived risk theory, we tested the impact of perceived risk components on investors' online stock adoption in the context of Pakistan. Although the study contributes to the extant literature in different ways, yet we acknowledge several limitations associated with the study. First, the findings of this study have generalization problem. The validity degree of risk components may vary according to the difference in culture and market conditions. The user must take care of the context and therefore, the validation of risk components in different national culture is a worthwhile opportunity for future researchers. Secondly, the study used a cross-sectional design, which could limit the findings and can be robustly validated by using longitudinal studies in future. Third, the study focused to test how risk perceptions affect online stock trading from individual investors' perspective, which could be alternatively researched in the context of organizations. Fourth, the model was composed of the risk factors which could be more strengthened by taking some other variables (predictors or moderators), like government support and social influence. Finally, the study did not examine the actual behavior in terms of frequency of use which can be covered in further studies.

## 7. CONCLUSION

Online stock trading provides multiple advantages to investors, but still, the adoption rate is unexpectedly low, especially in developing countries. In this respect, past scholars have increasingly applied various adoption models to explore the positive factors that influence investors' intentions to use online stock trading. However, perceived risk has received limited attention in the online stock trading literature. This study aimed to close the gap by using perceived risk theory to examine the risk dimensions inhibiting online stock trading adoption at individual investors' level in Pakistan. Moreover, this study measures the cultural effects on the investors' usage behavior which has been remained unaddressed in the previous literature.

More specifically, this study examined the effects of eight risk dimensions (i.e., time, financial, security and privacy, social, performance, psychological, physical and opportunity cost risk) upon investors' behavioral intentions to use online stock trading. We found that time, financial, privacy, performance, and opportunity cost risks have significant and negative effects on behavioral intentions to use online stock trading. Consistent with the previous empirical studies, the results of this study confirm the negative and significant role of perceived risk dimensions on behavioral intentions. The cultural dimensions, too, have a significant impact on the investors' usage behavior. The findings provide insights to help regulators/planners in developing risk-reducing strategies to enhance online stock trading by considering the risk and cultural factors.

# Chapter 54
# Outward Foreign Direct Investment in Emerging Economies:
## A Case of Turkey

**Ahmet Oğuz Demir**
*Istanbul Commerce University, Turkey*

**Muhammad Moiz**
*Istanbul Commerce University, Turkey*

## ABSTRACT

*Outward Foreign Direct Investment (OFDI) has been utilized by developed economies to enter developing markets for competitive advantages. However, recent boom in OFDI from emerging economies has prompted the question as to why these economies are investing abroad? A modest amount of literature exists regarding China and India, however, Turkey being an emerging economy has been largely untapped when it comes to determinants of OFDI. This study uses the Global Competitiveness Index (GCI) to find host and home country factors which have led to OFDI from Turkey to their top 10 investment destinations for the past 10 years. The host country factors found to be significantly correlated with Turkish OFDI are innovation (Netherlands and Russia), technological readiness (Russia and UK), labor market efficiency (Netherlands), infrastructure (Netherlands), domestic market size (Germany), and exports (UK). The home factors found to be significantly correlated with Turkish OFDI are infrastructure and domestic competition.*

## INTRODUCTION

Foreign Direct Investment (FDI) is an important factor for economic growth especially within developing economies. Generally the flow of FDI has been from developed towards developing economies, however in recent history there has been a shift in the outward foreign direct investment (OFDI). Emerging
