The web can possibly make psychological interventions more effective, more precise, and more affordable. Internet-delivered treatment gives off an impression of being as viable as face to face therapy for treating anxiety disorder and depression and can be conveyed at a lower cost. However, utilization of this innovation is in the beginning periods. A high need is to exhibit the viability of this approach, especially contrasted with standard face-to-face, "manualized" interventions that have been appeared to be dominant for common psychological disorders. multiple studies have demonstrated that both the mode of therapies have no comparable statistical differences. Moreover, more research is needed to further evaluate the effectiveness of internet-based e-psychotherapy. If it can be proved that Internet-based treatment is effective, it could be a very promising line of treatment, reaching people who otherwise would not receive treatment. Despite the fact that exploration in numerous aspects of internet-delivered therapy is required, the Internet is probably going to assume a logically imperative role in giving emotional psychological assessment and interventions to patients. Consequently, the psychologist should choose how they will fuse such programs into their practices.

Chapter 61
Psychotherapeutic Interventions in Emotional and Behavioural Problems with Adolescents

Mahesh A. Tripathi
Sweekaar Rehabilitation Institute for Handicapped, India

Godishala Sridevi
Osmania University, India

ABSTRACT

Children undergo a variety of interrelated changes in their adolescence and at times most children exhibits difficult behaviours. The problem becomes more severe in adopted children because such status of adoption affects various aspects of the developing personality. Feeling of rejection in early childhood generates a tendency of insecurity and fear in these children and to overcome from these beliefs they adopt aggressive behaviour. Psychotherapy with adolescents is different in a number of substantive ways from adults, because an adolescent is a person who is no longer a child but is not yet an adult. They are special population for whom psychotherapeutic intervention needs to be customized considering the emotional and behavioural exigencies. Identification and changing unhealthy thoughts and behaviours is the central idea of CBT and is becoming the treatment of choice for children and adolescents. The chapter deals with application of CBT in adolescent.

INTRODUCTION

The origin of the term psychotherapy dates back to 1891, and first appeared in the paper entitled '*Hypnotism, suggestion, psychotherapy'* by Hippolyte Bernheim. Then it was discussed in psychoanalytical approach as a talking cure. In 20th century psychotherapy grew manifold and various form of psychotherapy emerged. Across time, many professionals and writers have defined psychotherapy in their own words. However, the most accepted definition of psychotherapy was given by Wolberg, (1995) who defined psychotherapy "a psychological treatment of emotional problems in which a trained person

deliberately establishes a professional relationship with the patient in order to: (a) remove or modify or retard existing symptoms; (b) mediate disturbed patterns of behavior; (c) promote positive personality growth and development". In simple term we can say that psychotherapy is a meet between a clinician and an individual taking place in a trustful environment, and clinician talks through the patient's concerns with the goal of bringing about changes in his thoughts, feelings, and behaviours. It is essential to clarify what not qualifies as psychotherapy. The interventions that use biological means of producing change, such as medication, diet, exercise, and psychosurgery are not psychotherapy. Other intervention such as tuitions and counselling aiming to enhance academic performance and achievement are also excluded. Engagement in leisure time activities such as chatting with friends and relatives, sports activities, or other individual or group activities like dancing, singing; and merely spending time with one's spouse or significant other are also omitted from the standard definitions of psychotherapy, though each of these can be a part of intervention for therapeutic benefit in improving.

TYPES OF THERAPIES

Wolberg, (1995) in his book "The techniques of psychotherapy" discussed psychotherapies in three major categories: Supportive Psychotherapies, Re-educative Psychotherapies and Reconstructive psychotherapies. According to him all psychoanalytical and psychodynamic therapies comes under re-constructive therapy and all time framed, short form, aiming on symptomatology comes under re-educative psychotherapies. While, techniques that are sympathetic in nature and provide hope, and sympathy and are basically uses as an adjunctive therapy are supportive therapies.

Every schools of psychology have different view toward mental illness and their management. Theoretical development of each school was based on particular target group and specific problems. Hence each school have their own understanding for casual and maintaining factors of all type of psychological problems. Therefore, founders and developers of different schools have generated and adopted a little unique way of management. Therapies developed on the theories of these schools are different in nature and we can divide them as follows.

1. Psychoanalysis and Psychodynamic psychotherapies,
2. Humanistic psychotherapy,
3. Gestalt psychotherapy,
4. Existential psychotherapy,
5. Cognitive behaviour therapy,
6. Transactional therapy,
7. Family therapy,
8. Reality therapy.

APPROACHES OF THERAPIES

Psychotherapeutic need of every client differs from another client and Therapists too employ different approaches as per the need. Approaches differ from anything between a few sessions to a number of years of intensive contact between client and therapist. Professionals select a type of psychotherapy for

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

a variety of reasons, including its empirical effectiveness. There are three broad categorical approaches toward all type of psychotherapies. In this, the oldest psychodynamic psychotherapy tends towards a pessimistic view of the human condition whereas a humanistic and integrative approach is essentially optimistic in nature and procedures. Psychodynamic model of psychotherapy give more emphasis on conflict and attempts to resolve it.

Humanistic and integrative psychotherapy includes many different schools of psychotherapy in which there is not one accepted theoretical approach. Most of these have a unique theoretical and methodological approach to psychotherapy. There are some general principles that can be found to lie in all schools related to this group or form of approach. The basic idea of this form of psychotherapy is as being intrinsically involved in facilitating the client's development of their potential. A recent development in this form of psychotherapy is the emergence of integrative psychotherapy. Safran and Messer (1997) have identified three most popular forms currently in practice.

1. **Technical Eclecticism:** Approach in which the therapist selects some core ingredients from different therapies that share common features, with aim to develop more efficacious treatment. (Norcross & Grencavage, 1989).
2. **Common Principles:** In this approach some common factors are identified from variety of psychotherapeutic approaches and are brought together. (Nuttall, 2002) argues that one such 'common principle' is the primacy of the therapeutic relationship as a factor for change. Therefore, an integrative interventionist utilizing this approach is giving more attention to develop the therapeutic relationship.
3. **Theoretical Integration:** Integration is described as "two or more therapies are integrated in the hope that the result will be better than the constituent therapies alone" (Norcross, 2005). In this approach therapist constructs his own theory of psychotherapy that draws on other approaches.

The third major approach was identified as Cognitive and behavioral therapy (CBT). Identification and changing unhealthy thoughts and behaviors is the central idea of CBT. Mainly used in a one-to-one setting, CBT is symptom-based, and in a collaborative effort client and therapist both decide the outcome from the therapy and measures its success as therapy progress. Homework and willingness to engage in activities between sessions is the main ingredient of CBT approach.

PSYCHOTHERAPIES FOR ADOLESCENTS WITH EMOTIONAL BEHAVIOURAL PROBLEMS

Psychotherapy with adolescents is different in a number of substantive ways from adults, because an adolescent is a person who is no longer a child but is not yet an adult. Children undergo variety of interrelated changes in these years. The physical changes are associated with puberty, cognitive changes are likely to be intellectual, social changes appear in increased peer-focused orientation, and educational move from elementary to secondary education (Moshman, 2005). In this period of development, most children are prone to exhibit difficult behaviour such as temper tantrums or occasional aggressive outbursts, but this behaviour becomes problematic when it is persistent. The problem could become more severe in special cases like adopted children, who spent their early childhood in and orphanages. The child who is placed with adoptive parents at or soon after birth misses the mutual and deeply satisfying mother

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and child relationship (Clothier, 1943). The belief of "I'm no good: because my parents gave me away, because I was no good and I am going to prove them right" is common in adoptive children (Schechter, 1960). There are various emotional and psychodynamic issues behind this recurrent behavioural and personality pattern that are specifically linked to adoption. Studies support that extreme provocative, aggressive, antisocial, and delinquent conducts are much more consistently among adoptees than their non-adopted counterparts (Kirshner, & Nagel, 1988). Large percentage of adopted children eventually comes to psychiatric or other professional attention because of emotional, educational or social problems (Toussieng, 1962). The most common behavior problems among these adopted children are externalized behavior problems indicative of children diagnosed as having "conduct disorders," who are acting out anti-socially in response to a number of internal negative feelings such as anger, powerlessness, low self-esteem, fear, and anxiety (Smith & Howard, 1991). Rejected children are more physically aggressive and more disruptive and used more verbal threats than other children (Coie, 1990; Newcomb, Bukowski., & Pattee, 1993) when confronted with social problems, conduct disordered children generate fewer solutions than children who do not have conduct disorder. There are also long term consequences for such children as they grow into adulthood, as about 80% of youths who demonstrate severe acting-out are likely to meet criteria for some type of psychiatric disorder in the future (Kazdin, 2004). It is also reported that girls significantly have more number of problems and lower self-esteem then boys (Harper & Marshall, 1991). Moreover, fathers play a much important role in the life of girls, who feels rejected by their fathers often have more adjustment and personality problems (Fish & Biller, 1993). Cognitive behaviour therapy (CBT) usually targets the attitudes and beliefs underlying such type of behaviours. Behavioural problems in children may be affected by both family and child factors, and problems may occur during interactions with parents. Individual intervention strategies are more desirable and effective in adolescent groups. There is some evidence that CBT interventions for adolescents administered in groups may make conduct problems worse (Fonagy et al., 2002). A meta-analysis based on 50 studies incorporating 1640 subject reveals that CBT recipient was better than 76% of untreated subjects in term of anger reduction (Beck & Fernandez, 1998). Cognitive behaviour and skills based approaches are the most widely studied and empirically validated treatments for anger and aggression in youth. Commonly used therapeutic techniques include affective education, relaxation training, and cognitive restructuring, problem solving skills, social skill training, and conflict resolution. These techniques tailored to the individual child and or families need and can foster the development of more adaptive and pro-social behaviour (Blake & Hamrin, 2007). A study revealed that CBT has improved the self-confidence and self-esteem of adolescent and effectively worked in adolescents with depressive and anxiety features (Tripathi & Sridevi, 2014).

It is important to note that anger outburst, aggression difficulties in regulating negative emotions are significant psychological problems of adolescent. Anger and aggression can be understood as a part of other psychological disorder such as conduct disorder, anxiety disorder or as an independent problem maintained by contingencies in the environment. They facilitate negative emotions and impact in interpersonal relationships. Therefore, it is necessary to adapt a little different psychotherapeutic approach in order to assist adolescents in managing such changes. It is also important to adopt a contextual and developmental perspective for describing, understanding, and treating adolescents. Usually, a difficulty in relating with other people and circumstances brings adolescents to psychotherapy, irrespective of the etiological factors of their problems. When specific type of treatment or intervention, especially meant for the adolescents uses psychological constructs and mechanisms it is known as 'adolescent psychotherapy'. Different therapists have developed their own strategies to work with children and adolescents.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Like, Kazdin, (2002) described self-instructional program including cognitive problem-solving skills to help adolescents in building competencies to deal with anger and aggression. Social skill training (SST) proposed by Bandura (1977) is another approach to deal with adolescents' problems. This include behavioral and social skills training, which involves accurate interpretation of social cues from others, self-instruction/self-regulation training. Other strategies involve the use of self-talk, self-reinforcement in response to appropriate social behaviors, social problem-solving skills. SST also includes the reduction of inappropriate, inhibiting or competing social behaviors that interfere with appropriate social interactions. SST is an essential component of therapeutic program designed for emotional and behavior disorders.

CBT FOR ADOLESCENT

CBTs include a variety of cognitive and behavioural techniques that target on symptom reduction and changes through identification and modification of dysfunctional thoughts, cognitive errors and interpersonal skill building. It is derived from learning theories and gradually moved on to incorporating the mediational role of cognitions in the perpetuation of emotional disorders. All CBTs have some common features consists a comprehensive cognitive and behavioural assessment of thoughts, emotions and behaviours. The core ingredients of cognitive therapies are negative automatic thoughts, cognitive errors or distortions and schema and CB therapist works on these components simultaneously. However, CBT in its conventional form for adults may or may not be indicative for adolescents. There is a need to adopt evidence-based therapies in order to make interventions scientific and effective. Evidence-based interventions are practices that are based on empirical research studies and interventions have been demonstrated to be superior to no treatment or alternative interventions for people with specific diagnoses (Sudhir, 2015).

An integrative approach to psychotherapy may often be a necessity due to the unique demands of working with children and adolescents (Coonerty, 1993). Through integration of different perspectives, both in conceptualizing and responding to child or adolescent difficulties, therapists may ensure a better fit between the interventions and the individual's specific needs. Child and adolescent cognitive styles and self-concepts are still developing, so interventions must be tailored to match these emerging abilities. Furthermore, because children are more contextually dependent than adults (Fitz Patrick, 1993), effective treatments often focus on creating a developmentally appropriate environment and modifying patterns of reinforcement, in addition to improving self-regulatory skills. For example, clinicians could respond to a child's problem behaviours by helping parents implement appropriate sleep routines to address inadequate sleep, as well as helping the child learn to better modulate his or her feelings. Integrative approaches allow clinicians to address interpersonal challenges while also addressing external realities. CBT is becoming the treatment of choice for children and adolescents because it is flexible and includes a variety of behavioural and cognitive strategies that the therapist can choose and apply during the progress of therapy.

STRUCTURE OF CBT SESSIONS

- Review of mood state and recent events,
- Setting agenda,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Review of homework,
- Working on targets, like defining problems, identifying & challenging negative thoughts,
- Establishment of home practice (Homework) based on work during the session,
- Feedback and planning for the next appointment.

Literature

CBT is a well-established therapeutic approach for adult as well young people and there are various studies to support the effectiveness in adolescent's behavior and emotional problems. In a meta-analysis of all psychological treatments for depression in child and adolescence CBT was found to be more effective (Weisz et al., 2006). The treatment effects were described as modest compared with outcomes for other disorders, such as anxiety. Watanabe et al., (2007) conducted a further meta-analysis of psychotherapies used a different methodology, including intention-to-treat analyses, and took a clinical perspective on outcomes and found that psychotherapies, especially CBT, which had the largest body of evidence, and interpersonal therapy (IPT) were more effective than no treatment, waiting list or attention placebo at post-treatment in youths. Effectiveness was greatest for 12–18-year-olds. A meta-analysis of child and adolescent psychotherapy outcome research indicates positive and highly significant effect. These effects were more positive for behavioural than for non-behavioural treatments, and samples of adolescent girls showed better outcomes than other Age and Gender groups. Results supported the specificity of treatment effects: Outcomes were stronger for the particular problems targeted in treatment than for problems not targeted (Weisz, Weiss, Han, Granger., & Morton, 1995). Though there is a strong empirical support for CBT in dealing with various disorders of all age groups. Most of the studies has been conducted on adolescent are targeting on externalizing behaviour, especially substance abuse, risk sex behaviour, and aggression but most of the studies are carried out in orphanage or institutions. Only few studies are available on adopted adolescents emotional and behaviour problem whose early life was belonged to an orphanage. There is no such study available in Indian context where cultural attributes are very prominent and adaptation is still not so popular, accepted and children or families both are facing different type of difficulties after adaptation. Therefore, there is strong need to find out some effective treatment strategy to address the issues related to anger and interpersonal conflict. Our aim is to find out a better comprehensive intervention plan to deal with such problems.

Case Study of CBT in an Adopted Adolescent

The authors worked with a case of an adopted adolescent, on whom CBT was employed. Miss "A", 14 yrs old girl, studying in IXth grade, belongs to nuclear family, from Hyderabad, India. She was adopted from a Government Orphanage home at the age of 2 yrs 6 months. She was dropped at orphanage when she was 15 days old. Initially she used to sit alone and remained aloof but gradually, she started interacting with family members. She was short tempered and impulsive since her childhood and she used to break her toys and her belongings whenever she became angry or frustrated. She was admitted in the play school at the age of 2 and ½ years and she loved to go to school and used to participate in all activities. She was an average student since her childhood and no disciplinary complaints from school about her. She maintained a good and healthy relationship with classmates and teachers and had good number of friends in school from both genders. She was a Gymnastic player at national level and practised till 8th standard but discontinued as her father did not want to continue it. She participated in a science exhibi-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

tion during current academic session and was appreciated by the school. According to school authorities she was a well-disciplined, regular, obedient student and always respected the teachers and staffs. She was very much kind towards poor people and beggars since her childhood as she used to bring extra pencils, erasers and sharpeners to donate among needy children. She also used to give her pocket money to beggars and poor children.

As per history, patient A's mother' nature was calm, quiet and sensitive while father had very low emotional tolerance and he used to become aggressive for simple reasons and used abusive language at that time. However, he was a responsible person to his family and always fulfilled the demands as far as possible. But he used to scold 'A' whenever she did any mistake and mentioned that she was an orphan child. While both parents were suffering from some health conditions, Miss A was sympathetic towards mother only as whenever mother felt sick she used to take care of her and always seems worry. She made three attempts to harm her mother in past 8 months, first time she bought acid bottle, second time pushed her, and last time she mixed excessive sleeping pills in her food. After each attempt she felt guilt and accepted her fault (all attempts were on planning phase and before execution of act she was caught by family). She gave the explanation to her mother for such behaviours that she wanted to throw her out from home and send her to other people as she is an orphan child.

Child was diagnosed as "Other mixed disorder of conduct and emotion" as per ICD-10 classification and CBT techniques were used in intervention program. Pre- post research design was used to study the efficacy of Cognitive Behaviour Therapy. She was assessed using Human Figure Drawing Test (HFDT) (Mitchel, Rechard., & Roland,1993). Bender-Gestalt Test (BGT-II) (Brannigan, & Decker, 2003), Malin's Intelligence Scale for Indian Children (MISIC), (Malin,1971). Rorschach's Test, Strength and Difficulties Questionnaire (SDQ-Self report) (Goodman, 1997) and Beck Depression Inventory (BDI-II) (Beck, Ward, Mendelson, Mock., & Erbaugh, 1961). BDI-II and SDQ was administered for pre-post assessment of the intervention.

INTERVENTION

Procedure and Therapeutic Process

Therapist targeted emotional and behaviour problems with integrated therapeutic approach. Intervention was done in two sessions in a week, each session for 55 minutes and total 24 sessions within 12 weeks were planned. Component of intervention comprised with psycho-education, relaxation therapy, anger management, cognitive restructuring, activity scheduling, role playing, social skill training, positive self -statement, and yoga.

Therapeutic Formulation

Miss "A" showed affective, cognitive, and behavioural features consistent with a diagnosis of other mixed disorder of conduct and emotion, increased since last 3 years. In addition, she shows a variety of emotional problems with fluctuation since early childhood. Predisposing factors for her emotional disorder included orphan and institutionalized in infant age. Perpetuating factors were father's aggressive nature and mother's over-concern on her studies. She has deep feeling of inferiority and father's critical approach toward her provoking to negative thoughts. Her anxious and irritable state was maintained

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

by her self- criticizing style of thought, and the fact that she and her parents have developed a style of interacting that is either critical or over involved. These maintaining factors occurred within a family situation. There were a number of important protective factors in this case which suggested that could be a positive outcome. These included her average overall level of academic ability and problem solving skills; ability to make and maintain friendships and effective behaviour with relatives; at times she cared for both parents.

Initial Sessions

In the initial session informal conversation including sharing of likes, dislikes, interests and hobbies were carried out to develop rapport with the client. After successfully establishing rapport she was psycho-educated about the nature, course, prognosis and management program. Psycho-education was also given to the mother to gain her support in psychotherapeutic process as psycho-education to the family members improves social functioning and adolescent-parent relationships and it provides great satisfaction with treatment (Stanford et al., 2006). She was educated about the functions of anger and about her personal anger patterns.

Initially clinical interview technique was used for assessing cognition, emotion and behaviour in which client was asked to describe the thoughts, feelings and actions. It has been argued that much important cognition is not accessible to self-monitoring and that individual's reports concerning their own cognitions are often no more accurate (Nisbett & Wilson, 1977). She was asked to maintain a self-monitoring record (thought sheet) and demonstration was given to her by hypothetical examples. It was a three column DTR chart in which she has to write stimulus situation, emotional response, and cognition that helps as a database for discussion of therapeutic principles and goals (Freeman et al., 1990). Through interview, thought sheet (dairy), and with the help of Socratic questioning, following triggering events were identified-

- Mother's excessive concern towards study.
- Father's shouting and criticizing attitude.

Middle Sessions

These sessions were purely cognitive in which underlying cognitive errors or beliefs were indentified with the help of thought challenging and Socratic questioning. She has belief that, her parents do not love her as she is not their biological child and they leave her. Initially thought challenging was used by examining the evidence such as she was asked to explain that how she came to know that her parents do not love her? She described some incidents where she felt that father was humiliating her and mother also support him. She was also elaborated the situations which made her to feel the same. The logical disputing was also used to change her irrational belief with some examples such as biological parents are more demanding and authoritarian. It was also noticed that her mother and maternal family has accepted her very well and she remained happy with them but father and few members of paternal family were used to criticize her. Initially she tried a lot to defend her beliefs but when other meanings of interactions were introduced, she started to accept that, maybe I was wrong. After convincing the patient that her underlying beliefs were maladaptive by providing lot of examples and she was suggested to write sentences which consisting positive and motivating words, for (e.g., My parents and friends likes me,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

as they take care of me, "I am also the part of society and there are so many children like me, I am in better place than other orphan children" and 'I have to take care of my parents).

The next target was to make her understand about the determents of the anger and distinguish anger from aggression. She was explained regarding expectation and appraisals which are linked with anger arousal. Particular attention was paid to inordinately high expectations of others behaviours and to the appraisal of the events as personal affronts or ego threats. This was done to increase her cognitive flexibility. Therefore, started intervening for skill acquisition in which first target was to create ability to "not take things personally", and the behavioural strategies were introduced such as self- instructions in the form of coping and self-statements were designed for specific provocative events (Bellack & Hersen, 1989). E.g (translated) – "when angry, my father can say anything, but my father cares for me, and that's why he scolds me". After setting set of instructions she was asked to start repeating the self-instructions out loud. With practice she learned to use the instructions and eventually instruction become automatic. Behaviour change can be brought about by changing the instructions that Patient give themselves, away from maladaptive and upsetting thoughts to more adaptive self-talk (Meichenbaum, 1977).

Two sessions were planned with parents to involve them in therapy process mainly the father because he did not believe in psychotherapy but after seeing some improvement he willingly came for the session. Initially his point of view was listened carefully. Therefore, He was psycho-educated about the maintaining factors. Therapist explained him the procedure of therapy and he was happy with the progress. Finally, he asked that in what way he can support in the therapy and he was advised to avoid criticizing or comparing with others and to spend quality of time with her. Mother was very much co-operative and ready to follow each and every instruction she was instructed to appreciate and appraise her, whenever she controls her temper. She was also advised to hug the child to make her calm whenever she becomes frustrated. Relationship between the adolescents and their fathers is particularly important for therapy prognosis and one has to consider the respective relations with both parents for therapy prognosis. Interest and readiness of parents (mothers as well as fathers) for a close cooperation are higher than generally expected (Mattejat & Remschmidt, 1997).

In these sessions relaxation technique was introduced and rationale behind this technique was discussed in detail. She was taught to relax muscles (e g, arms, face, jaw, tongue, neck, shoulders, trunk, and lower limbs) one by one. In first session all the procedure regarding relaxation was taught by demonstration. She was instructed to sit on the chair comfortably, close eyes and try to concentrate on breathing and asked to follow the instructions. (Ex- Clench the right fist, feeling tension in the fist and forearm, clinch the left fist, feeling the tension in the fist and forearm, bend the elbows and tensed the biceps keeping the hands relaxed, straighten the arm and tensed the triceps leaving the lower arms supported by the chair with the hands relaxed and so on). Initially she was not able to concentrate and used to open her eyes in between but later she started doing well and immediate after each session her subjective feeling was recorded on 10-point scale. After third session she rated 6 on 10-point scale. She was advised to follow the procedure by her own and also asked to practice it two to three time at home and she went fluent in next few sessions.

Meanwhile, she was targeted on communication skills as it was found through interview and thought dairy that she had a problem in interaction with parents. The role play technique was introduced and initially, she was asked to play her father's role and demonstrated how to control and divert the situation. Some communication strategies were taught to handle her mother that starts the conversation with mother after reaching home before she asks. Role playing is a very common strategy to assess and train clients in social skills training (Bellack & Hersen, 1989).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

To improve her mental well-being and positive attitude toward self, she was introduced to yoga techniques in which five Asna's including Padmasna, Sarvangasna, Pashchimottasna, Bhujang asna and "Om chanting. Yoga was introduced for arousal reduction as it is personally suited program (Bellack & Hersen, 1989). In fact, later mother was also advised to join the client in yoga session.

Terminal Sessions

In these sessions homework dairy was checked and self-rating and evaluation of therapy was obtained. Activity scheduling was done to bring her in more active and worthy life which was done on the basis of her previous routine such as early morning yoga, spend time with parents, fix time for homework and other studies, playing outdoor game (Badminton), weekly visit to grandparents or outing, etc. All scheduling was done with her concern which helps in reducing an apparently overwhelming mass of tasks (Hawton, 1989). Post therapeutic assessment was carried out with BDI-II, and SDQ. In the terminal session she was encouraged to maintain the improvements and advised to follow up once in a month for three months and reported the progress. Parents reported that her behaviour was significantly improving and she was doing well in academics as well as at home. She has started to maintain herself calm at home and used to help her mother and prepares favourite food for her father on holidays. She is developed to be clam when her father shouts on her. She practiced yoga regularly with her mother. Overall an integrated approach had good prognostic effect on the client.

IMPLICATIONS FOR CBT OUTCOME RESEARCH

Parental Involvement in therapeutic process with adolescents becomes an important for many of the behavioral and emotional problems. Research evidence suggests that parent involvement is likely to improve treatment outcome in anxious children and adolescents (Albano & Kendall, 2002; Barrett, Dadds., & Rapee,1996). Parents can be involved as a co- therapist, as collaborators or as a consultant who provide important assistance during therapeutic process. Parents are also instructed to provide positive reinforcements during the course of therapy and their active involvement in the therapeutic plan will vary depending upon degree of impairment, co-morbidity, age, and gender. Conflict resolution skills and handling negative self talk affect regulation skills such as learning to relax or use social problem-solving skills that are used in the management of problems related to anger (Novaco, 1979).

CONCLUSION

Integrated psychotherapeutic approach will improve the self-confidence, feeling of security and improving self-esteem, self-respect, confidence and emotional well –being of an adopted adolescent with emotional and behavioural problems. Yoga could be effective in improving emotional well- being and anger management techniques helps to control the emotions in adolescents. Parental involvement in therapy with adolescents is much needed. Findings of the case study mentioned in the chapter are difficult to generalize, however, the case was unique in nature and finding a group for such type of problems is a difficult task. CBT techniques with yoga can be applied with techniques such as stress inoculation and anger management in adolescents.

FUTURE RESEARCH DIRECTION

The assumption that a single form of therapy can be generically applied to a broad range of adolescent problems has been laid to rest. Similarly, the assumption that all forms of therapy are equally effective has not been supported. A range of adolescent disorders and a number of widely practiced forms of therapy have not been adequately evaluated. Although anxiety, depressive, and conduct disorders make up the bulk of adolescent referrals, there are a number of clinical problems in adolescents that need to be evaluated and evidence based managements for them.

KEY TERMS AND DEFINITIONS

Adolescent: In the process of developing from a child to an adult.

Adoption: The action or fact of adopting or being adopted.

Aggression: Feelings of anger or antipathy resulting in hostile or violent behaviour; readiness to attack or confront.

Cognitive Behaviour Therapy: A type of psychotherapy in which negative patterns of thought about the self and the others or world are challenged in order to alter unwanted behaviour patterns or mood.

Integrated Psychotherapy: An openness for various ways of integrating diverse theories and techniques.

Intervention: The action or process of intervening.

Sessions: A fixed time for therapy.

Chapter 62
Play Therapy for Children With Neurodevelopmental Disorders

Gaurav Thapliyal
Sweekar Academy of Rehabilitation Sciences, India

Sushma Kotnala
Pyare Foundation, India

ABSTRACT

A play is referred to the language of children through which they express and communicate their feelings, thoughts, and behavior in a playful way. Play therapy enables children to gain an understanding of themselves and the world around them and helps them to overcome behavioral, emotional, social, and various other issues through play activities. The chapter majorly focuses on the effectiveness of play therapy in different neurodevelopmental disorders. Recent trends and studies suggested that play therapy is one of the most favored therapeutic approaches used in the children with various neurodevelopmental disorders.

INTRODUCTION

Human life begins from childhood to adulthood. From the first day of life, everyone has their own temperament, perception and meaning to strive for survival which we call as "individual differences". Childhood is the initial stage of the circle of development. It is the utmost factor to be followed appropriately for achieving all the developmental milestones successfully. If this stage of childhood does not function properly, it may lead to the psychological, social, emotional and behavioral issues.

Presently, increased numbers of children have been diagnosed with neurodevelopmental disorders such as intellectual disability, autism spectrum disorder, attention deficit hyperactivity disorder (ADHD), and specific learning disorders. There are many therapeutic practices that help in the management of these disorders; one of them is play therapy. The most prominent activity, in which children mostly involve, is playing. Through playing children are availed with valuable cognitive, emotional, and interpersonal

learning opportunities. For children playing is the way to express their significant emotions, feelings and behavioral pattern of life. By the process of play therapy, children work on their own emotional and psychological problems in their own way. It is a natural expression of play where the therapist provides a secure and comfortable environment for children to express their feelings, thoughts, and behaviors within the acceptable limits. The present chapter focuses the use of play therapy and its effective application among children with neurodevelopmental disorders.

DEFINITIONS OF PLAY AND PLAY THERAPY

Play provides a developmentally responsive means for expressing thoughts and feelings, exploring relationships, make sense of experiences, disclosing wishes, and developing coping strategies. (Landreth, 2002)

"For children, play is the natural, spontaneous, and comfortable medium through which children express themselves" (Axline, 1947).

Play therapy is a developmentally-sensitive intervention to help the children with significant emotional problems. It:

is a well thought-out, philosophically conceived, developmentally-based, and research-supported method of helping children cope with and overcome the problems they experience in the process of living their lives. (Landreth, 1996)

Play Therapy is defined as:

the systematic use of a theoretical model to establish an interpersonal process wherein trained play therapists use the therapeutic powers of play to help clients prevent or resolve psychosocial difficulties and achieve optimal growth and development. (Association for Play Therapy, 2011)

HISTORICAL DEVELOPMENT

The famous Greek philosopher Plato (429-347 B.C) stated that "You can discover more about a person in an hour of play than in a year of conservation". The effective use of play as an intervention with childhood problems was initiated by Freud (1909) who published his work with the classical case of "Little Hans," a five-year-old boy with phobia. During his treatment, it was based on the father's notes about Hans' play that Freud advised the father to resolve his son's underlying conflicts and fear. It was the first recorded case of "Little Hans" in which a child's difficulty was understood in the terms of emotional problems. Hug-Hellmuth (1921) was the pioneer therapist who provided play materials in the therapy with children to promote their self-expression. Hug-Hellmuth discouraged psychoanalysis of children below six years of age and opined it to be potentially dangerous. Hug-Hellmuth introduced play as an intervention in child therapy. Klein (1955) started using play to analyses children under the age of six years. Klein believed that a child's play was served same as that of free association used among adults for their underlying conflicts. Freud (1946) applied the basic principles of psychoanalysis to children in therapy. Freud described that the children's play may be a conscious repetition of their day-to-day life

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

activities. On the other hand, Klein used play as a medium for the verbalized free association to work with children. Levy (1938) developed a structured play approach known as "release therapy". It helped children in recreating their feelings and thoughts or any other experiences towards a specific traumatic situation through play. Levy described that when a child feels comfortable, gets support, and security, along with appropriate play materials then the child may be able to play out a previous traumatic event over and over until the child will be able to let go of his/her fear, anxiety and other emotions related to those traumatic situations or events.

Axline (1947) was the most well-known personality in the field of play therapy. Axline developed a concept of non-directive play therapy to work with children and also revealed the value of the relationship between the therapist and the child via play, which allows the child to feel safe so that the process of growth may occur. Through establishing the rapport with the child in play therapy, the therapist will be able to balance his/her emotional maturity and could easily develop varied emotional expression and exploration of the various levels of the emotional process. Axline (1969) created eight basic principles as a help to guide the child-centered play therapist: (1) the therapist should develop a trusting and affectionate relationship with the child; (2) the therapist must accept the child the way he or she is; (3) the therapist should be lenient enough for the child to experience freedom in expressing his or her emotions completely; (4) the therapist should recognize the feelings and reflect them back to the child in a genuine manner; (5) the therapist must truly believe that the child is able to solve his or her own problems; (6) the therapist must refrain from directing any actions, speech, or play for the child; (7) the therapist should have patience throughout the gradual therapeutic process, and; (8) the therapist should be the one to create limitations necessary to anchor the relationship in the world of reality.

Rogers (1951) developed "client-centered therapy". Basically, it was the foundation for "child-centered play therapy". Carl Rogers emphasized deeply the relationships between the child and the play therapist based on trust and acceptance. It was a new perspective on emotional and psychological difficulties and the altered process within the therapy. Solomon (1938) developed an "active play therapy" in which a procedure was used with acting out and making children impulsive. It is a technique of abreaction that may occur through the safe play and also a supportive relationship. A child can play out difficult feelings and experiences, and thereby avoid acting them out through socially inappropriate behaviors.

In the year of 1982, Schaefer and O'Connor established the Association for Play Therapy (APT) who showed a major advancement in the field of play therapy. Later, the concepts of play therapy were applied and extended into many other various situations and ways such as in different clinical settings and among a diverse population. According to Landreth (1991), the different objectives of child-centered play therapy were to help children with various problems:

- To develop the positive self-concept.
- Become more self-directing.
- Become more self-accepting.
- Become more self-reliant.
- Experience a feeling of control.
- Become sensitive to the process of coping.
- Become more trustworthy.
- Develop an internal source of evaluation.

RATIONALE FOR PLAY THERAPY

The rationale of play therapy is to act as the symbolic language of self-expression in the children with maladjustment. Normally, adults communicate their emotions and thought process through verbal language. It is a process which transforms personal experiences into abstract skills. Children do not have that specific skill to perform complex operations until eleven years of age (Piaget, 1962). Children express their emotions and experiences through play (Ginott, 1960). Jernberg (1979) suggested the technique of touch to reconnect and provide a secure relationship between parents and the child. The parents were taught to respond empathically and to understand the nonverbal communication of the child through a playful approach.

Packman and Bratton (2003) found an activity-based intervention for children with learning disability. They described this specialized treatment to be very effective on those children who exhibited problem behavior at home and school. These kinds of interventions often involve the use of the symbolic expression which helps adolescents to develop their expression and exploration. It also allows children to have a safe distance between themselves and reality (Bratton & Ferebee 1999; Malchiodi, 2005). Harvey (2006) has developed a concept of "dynamic family play therapy". Basically, it is an action-oriented therapeutic process in which family members are involved in therapy sessions. Parents are instructed to display their creativity and help them adapt to traumatic situations. There are various techniques used to rely on the strength of the parent-child relationships as a significant factor in the healing process. Schaefer (2003) promoted and suggested play therapy for adolescents to encourage the use of language and benefits of play across the lifetime. The major goal of play therapy with adolescents was to help them feel more secure, comfortable and talk willingly about their feelings and experiences (Gallo-Lopez & Rubin, 2012).

GOALS OF PLAY THERAPY

Though there are various types of psychotherapies, the basic goals of play therapy are to decrease and modify maladaptive behaviors and also to help improve the adaptive ones. Some major goals of play therapy include:

- Improving communication pattern with verbal expression.
- Enhancing problem-solving and coping skills.
- Improving mood and affect.
- Improving impulse control.
- Developing underlying conflict.
- Developing self-awareness.
- Improving self-confidence.
- Developing greater self-esteem.
- Developing the more positive self-concept.
- Improving social skills.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

FORMS OF PLAY THERAPY

In different types of play therapies, some basic concepts were originated from the past and several most influential forms of therapies that are existing in the current scenario.

Psychoanalytic Play Therapy

Freud (1928) published comprehensively about how they incorporated play as a therapy into the psychoanalytic approach. As free association technique was used in adult clients, they substituted the natural tendency of the children to play together with free association. They described that the process of play uncovered the underlying problems or conflicts of children. In support to the therapy, the study done by Clausen, Ruff, Wiederhold, and Heineman (2012) applied the treatment for foster children who received psychodynamic play therapy over three years. Researchers found significant improvements with regard to reduction in anxiety, aggressive behavior, depression, interpersonal issues and problems related to school.

Structured Play Therapy

Structured play therapy is the exact opposite of non-structured approaches because the functions of play therapy is considered to be within the confined limits which are organized by various play materials provided in various play situations. Levy (1938) described structured therapy as a directive approach where the therapist provides security, support and other materials required to recreate stressfully or deal with any traumatic events of the child so that the child may cognitively understand the negative emotions and feelings associated with those adverse situations.

Adlerian Play Therapy

Adlerian play therapy is the most flexible approach which is based on the human needs regarding feeling the sense of "belongingness". The goal of the therapy is to meet the individual needs of the child as well as to give a sense of control and mastery to the participant. Taylor and Bratton (2014) applied Adlerian play therapy in their study with a four-year-old boy who was experiencing bereavement after the loss of his mother. After the treatment sessions, the authors found significant changes, as well as, an increased in his feelings of belonging.

The responsibility of the therapist is not only to explore children's lifestyle but also to gain knowledge about their emotions, behavior, relationships and perceptions towards self and others. The therapist should also conceptualize the thought pattern, behavior and feelings of the child's parents because it will be beneficial for him to understand the underlying factors of parents with regard to their in the relationship with children (Schaefer, 2003). Many play therapists include even parents or caregivers to train them on the methods to communicate with the child in a constructive way.

Client-Centered Play Therapy

Axline (1947) discussed that client-centered play therapy emphasizes the therapist's role including the qualities of genuineness, unconditional positive regard and empathic understanding towards the children. In the therapy, the therapist provides an acceptance, support and secure feeling instead of focusing on

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the problems of children. Axline indicated that therapist ought not to be in hurry of the problems of the child. The primary goal of client-centered play therapy is self-directed growth and change in the child. Moustakas (1959) indicated that this process develops the exploration of feelings and culminates in the child's an increased sense of self-worth. Ray, Armstrong, Balkin, and Jayne (2015) conducted a systematic review and meta-analytical study on 23 children who received child-centered play therapy in school. The conclusion of the study revealed that play therapy generated statistically significant outcomes in the children with internalizing problems, disruptive behavior, and academic problems.

Cognitive Behavioral Play Therapy (CBPT)

Knell (1993) developed the concept of cognitive behavioral play therapy in which cognitive and behavioral interventions are incorporated into a play therapy paradigm. Knell described six steps of CBPT:

- CBPT focuses on all the children through play in therapy.
- It incorporates children's imaginations, thinking, fantasies and environment in therapy sessions.
- It provides various techniques to improve appropriate behavior and positive thinking.
- It is a directive and goal-directed approach and not open-ended.
- It involves demonstrated techniques into therapy such as modeling.
- It involves an empirical examination of treatment into therapy.

Hall, Kaduson, and Schaefer (2002) used 15 techniques of cognitive behavioral play therapy with the children of age range between 4 to 12 years diagnosed with ADHD. After the completion of the therapy, children showed the significant reduction in the symptoms of hyperactivity and attentional problems.

Filial Play Therapy

Guerney (1964) developed filial therapy. It became the most popular therapy in the field of play therapy. This technique was unique as it allowed parents to implement play therapy sessions at home. The basic concept of this therapy was to make the parents and caregivers get involved in play therapy sessions. In the sessions, parents were the primary participants so that the lack of family intimacy, knowledge and the emotional conditions of the child can be eliminated. Furthermore, Schaefer (2003) described that if the parents understand the problem and psychological state of the child, they need not seek any psychological help from any professional play therapist. They will involve in the therapy sessions on their own as a primary play therapist with the child.

TECHNIQUES OF PLAY THERAPY

The Feeling Word Game

The Feeling Word Game allows children to express and connect their emotions and feelings in a non-fearful and non-threatening way. It is very difficult for children to express their emotions verbally because sometimes they do not connect themselves with emotion-provoking situations. When they are involved in play activities, they talk and express their feelings via play.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The therapist narrates a story regarding himself including both positive and negative feelings. At the end of the story, therapist place poker chips in front of the child for every appropriate feeling. It shows that everyone can have more than one feeling at the same time. Then therapist tells another story which is completely non-threatening to the child including both positive and negative feelings. Now, the child receives a tin of feelings and is instructed to put down what he may feel under those situations. After that, child narrates another story to the therapist to put down his feelings in the tin of feelings. It continues until major issues are discussed.

Application

The specific technique is effective to the children with conduct problems, ADHD and anxiety issues.

The Pick-Up-Sticks Game

The Pick-Up-Sticks Game was developed by Barbara McDowell (see Kaduson & Schaefer, 1997, pp. 145–149) for the purpose of improving affective expression in children. It is a technique designed for the children to express their emotions and pair various affective states related to the environmental conditions. To use the technique, children must know color-feeling pairs which mean Color- Your- Life.

Therapist starts with reviewing color-feelings pairs by playing Color-Your-Life. It may be discussed verbally also. Then the therapist describes the use of Pick-Up-Sticks in therapy sessions. Now, either the therapist or the child holds sticks in his fist and drop it on the table. Basically, they have to remove one stick without moving any other sticks. The game ends up when one of the players move other sticks accidently. Every time the stick is removed, the child must tell about a time when he had a feeling associated with the color of the stick. Once the therapist gets his turn, the therapist gives the response, tailored to the particular need of the child. This technique evaluates and interprets the color of the sticks chosen and avoided by the children and the overall affect during the play session.

Application

This technique is used among children individually or by making them into or in a small group. The child must have adequate verbal skills and knowledge about color-feeling pairs. This therapeutic strategy is more successful with children who are competitive because they have a particular desire to win that force them to choose the particular Pick-Up-Sticks which they normally avoid.

The Mad Game

The Mad Game is designed by Patricia Davidson (see Kaduson & Schaefer, 1997, pp. 224–225) to provide awareness to the children with anger suggesting that anger is a primary emotion which is easily acceptable. During the session, therapist divides blocks between himself and the child. Then, he instructs the child to put each block on the top of the previous one once the turn comes. Every time they have to express any incidence which makes them angry. All events are acceptable either it is silly or serious. Once all blocks are stacked then the child would be instructed to mention one last event which made him seriously angry. At last, the child has to make a mad face and knock down all the blocks.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Application

This technique can be used to show the slightly altered emotions rather than anger such as fear, anxiety and sadness.

Relaxation Training: Bubble Breaths

Bubble breaths technique is a very effective relaxation technique which involves teaching children deep and controlled breathing to make them aware regarding their body and mind connections. The therapist will take the child into a specific room where the child blows bubbles. The child and the therapist can pop those bubbles before they fall. After that, the therapist instructs the child to blow only one big bubble. Now, the therapist tells the child to take a deep breath from the stomach and exhale in very slow manner. Here, the therapist discusses with the child that whenever he gets angry, his brain demands more air and lungs cannot provide it. When they breathe slowly then the brain will not demand more air and heart and lungs will work slowly in a far better way. If they get angry and take a deep bubble breath they can prevent their anger easily.

Application

It is very simple, non-expansive and non-threatening technique, especially for those children with anger and anxiety.

Using a Puppet to Create a Symbolic Client

The use of puppets has a precious role in play therapy. All children attribute their emotions onto puppets. There are various children who are extremely anxious, fearful and withdrawn towards involving in therapies. But puppet is very useful as a symbolic technique so as to engage these kinds of children into therapy. The therapist observes anxiety and fear of the child and shows him a puppet. Then he remarks the puppet as anxious and fearful. Therapist discuss with the child to make the puppet comfortable. Actually, the therapist is achieving three major goals:

- Show empathy to child's emotions.
- Involving in the child's participation in the therapy.
- Establishing rapport with the child.

Application

The age range of children to adopt this technique is, between 4 and 8 years and is especially applicable to those children who are anxious and withdrawn regarding the therapy.

The Spy and the Sneak

The Spy and the sneak technique were developed to change the adverse and the negative interactions among family members in a positives way. Once it is transformed, it increases the enjoyment among

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

each other. Parents start observing positive and adaptive qualities of their children and give positive reinforcement towards their adaptive behavior. It gives an insight to the children as well, that they are getting more attention from the parents in an adaptive manner.

The therapist discusses with the child about a sneaky positive behavior that makes the parents surprised. The therapist guides the child to be a "sneak" and the parents are the "spy" who will find out what the sneak has done. He has to do brainstorming for the child to do at least three to four behavior related to the treatment goals. In the further sessions, parents will be informed about the role of the spy and will be invited to the session. They have to jot down all the good behaviors of their child for a week at home. Both the parents and the child are instructed not to discuss the findings with each other. Finally, the therapist will set a discussion regarding how the parents and the child feel about the child's engagement in positive activities. The child also gets pleasure to receive the positive attention followed by surprising the parents more.

Application

It is an excellent technique to be used among families experiencing negative interactions. After few therapeutic sessions, therapist switches the roles of parents and the child with each the sneak.

PLAY THERAPY IN NEURODEVELOPMENTAL DISORDERS

Various evidence-based studies have assessed the effectiveness of play therapy among different populations. Only very few experimentally designed studies were done. Some of them were in the form of case studies while others were anecdotal reports. Gall et al. (1996) described that case studies are the weakest method to measure the outcome of the treatment due to its lack of internal and external validity. All the experimental studies have been mostly preferred with various case studies since it has increased the validity of the studies that controlled their effects by confounding variables. In this section, controlled studies showed the effectiveness of play therapy, especially, all those studies that investigated the effectiveness of play therapy with children.

Intellectual Developmental Disorder

Morrison and Newcomer (1975) did a study to measure the effectiveness of directive and non-directive play therapy for children with mental retardation. The study concluded that no evidence revealed more effectiveness regarding directive and non-directive play therapy. Swan and Ray (2014) did a study related to CCPT on the children with intellectual disabilities who were showing the symptoms of irritable behavior and hyperactivity. The study showed the reduction in irritable behavior and hyperactivity after following the treatment. After three weeks, despite the treatment sessions, all the improvements were maintained by the children with intellectual disability.

Kachalaki and Faghirpour (2015) conducted a study on "The effect of play therapy in the development of cognitive skills, social and motor educable mentally retarded students". The research findings suggested that play therapy indicated improvements in the concept of mental development such as "length, weight, volume, appropriate eye-hand coordination, social development, academic achievement and motor developmental skills among educable children who were already diagnosed with intellectual

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

developmental disorder. Jacob and Brinda (2017) did a study on "The effect of non-directive play therapy on development among mentally challenged children in selected institutions of Coimbatore". The major findings of the study showed that non-directive play therapy has a significant effect on the development of mentally challenged children.

Autism Spectrum Disorder

Kenny and Winick (2000) utilized the techniques of directive play therapy in the treatment of children with autism. The treatment showed significant changes in the children with Autism. Josefi and Ryan (2009) took 16 sessions of non-directed play therapy with 6 years old boy who was diagnosed with severe autism. After receiving all the sessions, he developed the ability to engage in pretend play, increased autonomy and showed improvement regarding the level of empathy. Parker and O'Brien (2011) discussed regarding a 7 years old boy diagnosed with ASD and showed a significant improvement after receiving sand play activity as part of play therapy in his/her school. Ware (2014) did a single case design study on play therapy for children with ASD. The study was to find out the impact of non-directive play therapy on social competence, empathy and self-regulation with the children who diagnosed with ASD. The results supported play therapy as an intervention that helps children to develop all these areas.

Attention Deficit Hyperactivity Disorder

Naderi et al (2010) conducted a study on "efficacy of play therapy on ADHD, Anxiety and Social Maturity in 8 to 12 years aged clientele of Ahwaz metropolitan counseling clinics". The results revealed that play therapy is an effective intervention for children who experience various problems such as ADHD, and anxiety. Barzegary and Zamini (2011) did a study to examine the effect of play therapy of 14 male participants with ADHD. The results found that play therapy was an effective method of treating children with ADHD. Robinson et al. (2017) conducted a study on "The effects of child-centered play therapy on the behavioral performance of three first grade students with ADHD". The findings suggested that CCPT was an effective intervention for the first-grade students with ADHD in school settings.

Learning Disorders

Blanco and Ray (2011) revealed in their study that children who received Client Centered Play Therapy (CCPT) as an experimental group showed significant improvement in their academic performances as compared to the children with the control group. Khaledi et al. (2014) did a study on "The positive impact of play therapy on writing performance of students with dysgraphia". Results revealed that play therapy had a positive impact on the students with dysgraphia who had spelling difficulties. Sarpoulaki and Kolahi (2016) did a study to evaluate the efficacy of play therapy on children with spelling disorders and aggressive behavior. The result found that after using play therapy there was a significant reduction in aggressive behavior. They also noted an improvement in spelling disorder among the subjects. Esmaili, Shafaroodi, and Zardkhaneh (2017) conducted a study on:

Effect of play-based therapy on the meta-cognitive and behavioral aspect of executive functions, a randomized, controlled, clinical trial on the students with learning disabilities.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The result concluded that play-based therapy is highly effective on meta-cognitive and behavioral aspects of executive functioning among the subjects.

PLAY THERAPY IN OTHER CHILDHOOD DISORDERS

Play therapy is the best therapeutic technique which provides opportunities to the children to express their underlying conflicts or various other problems in a better way. In India, the prevalence rate of substance abuse is very high which lead to domestic violence, family crises, conflicts in interpersonal relationships and major psychiatric illnesses. Substance abuse or multiple addictions cause violence at home. Mostly, parents are the primary suspects in children with physical abuse. Once it is cleared, the child has to be removed from his home for security and safety. There are thousands of children who can get benefits from the long-term treatment of play therapy. It includes all kind of children such as children with sexual abuse (Hill, 2006), violent abuse (Chazan & Cohen, 2010), traumatic events (Webb, 2011), and children who lost their loved ones (Rakesh & Srinath, 2010).

Most of the time in an extreme case, children and adolescents experience unresolved anxiety, fear and sudden traumatic events that may not exhibit any negative behavioral changes; however, they develop aggressive, rebellious and withdrawn behavior which may lead to severe psychological problems in their life (Schaefer, 2010). In addition, children with grief reaction experience differently than an adult individual. They display their pain and the reaction of grief in "short bursts" which is opposite to prolonged period of time due to their short attention span (Landreth, 1996). It may affect their temperament, family dynamics as well as other resources even more if they do not receive any psychological help or treatment. (Collins & Collins, 2005). Schaefer (2003) described that children who experience grief must participate in filial therapy until they bereaved both the parents. However, it is a must for the parents or caregivers to observe initial sessions of play therapy and then to receive specific training for further treatment process (Schafer, 2010).

Various research studies have shown that after receiving play therapy, children who have been abused in any way such as sexually, emotionally, physically and neglectfully has come up with stability and positive effects in their lives (White & Allers, 1994). These studies also found a strong correlation between faster and effective healing progress from the use of play as a therapy either by a trained play therapist or parents. A research study conducted on 26 children with sexual abused showed improvement in their coping skills and behavior after receiving 10 sessions of play therapy (Blankenship & Lawver, 2008). Although, 10 sessions were not well enough to generate the appropriate outcome of the study. Due to that researcher monitored the study for a longer period of time. After that, approximately one-third of all the children showed significant improvement with regard to the reception of play therapy.

Flahive and Ray (2007) discussed that those samples, who received sand tray/play therapy in their study, showed significant differences in the problem of externalizing & internalizing disorders as compared with a control group. Ray, Schottelkorb, and Tsai (2007) conducted a study on the children, exhibiting symptoms of ADHD. After receiving play therapy, there was a positive impact on the overall symptoms such as internalizing and externalizing problems, depression, anxiety, self-concept, and treatment compliance.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

IMPLICATIONS OF PLAY THERAPY

Play therapy is a non-threatening and effective treatment for the children with emotional and behavioral problems. Basically, it is an issue for the adults who use their energies to change the maladaptive behavior of their children and deal with their emotional problems. Therefore, play therapy is a very effective intervention to provide help to those children with various problems.

Play therapy is also very effective across all settings, age, race, gender as well as clinical and non-clinical populations. It is extremely useful in a school setting with all age groups. There is an implication in Indian scenario where it applies for different children belonging to diverse socio-economic backgrounds. Even the involvement of the parents is very common in both Indian as well as western studies. It is also found that the role of the parents in therapy sessions showed a significant treatment outcome. To give proper training to parents regarding how to help the child while play at home is worthwhile.

Various research studies suggested that play therapy may take approximately 30 sessions to indicate the improvement and overall functioning of the children. The understanding views of all trained play therapists are crucial towards their small and young clients who receive therapy sessions with its full effects. This approach prevents all the future problems which may develop in children across their life-span.

INDICATIONS OF PLAY THERAPY

Play therapy has been used as a major psychotherapeutic technique to treat disorders among children with:

- Specific phobia
- Panic disorders
- Generalized anxiety disorders
- Obsessive-compulsive disorder
- Depression
- Post-traumatic stress disorder
- Separation anxiety disorder
- Selective mutism
- Autism spectrum disorders
- ADHD
- Enuresis
- Sleep problems
- Learning disorders
- Conduct disorders

CONTRAINDICATIONS OF PLAY THERAPY

There are very few disorders to which play therapy cannot be applied. They include:

- Chronic illnesses
- Burn victims

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Children with deaf
- Children with physically challenged
- Dissociation
- Schizophrenia

FUTURE RESEARCH DIRECTIONS

In the field of play therapy, the future research needs to take into consideration the following factors:

- Play therapy still works on the small number of participants which cannot be generalized to a normal population. Sample size must be large for future studies.
- Mostly, studies do not report work experience of the therapist in this field. Various studies also do not show any standardized protocol, even though all the procedures of play therapy provide clear guidelines and clarity.
- There are significant research studies which reveal the design of therapy versus absence of treatment but still, researchers are not able to provide clarity about play therapy being the most effective intervention. It must be compared with other therapeutic treatment with children.
- Different studies focused on specific play therapy treatment among specific populations. The most important question is that whether the interventions facilitate play and it ought to be empirically researched. There are few research guidelines regarding how to facilitate play but of those only very few are based on empirical works.

CONCLUSION

Play therapy is a universal, dynamic and upcoming field in the ground of psychotherapy. From the earlier period, play therapy has been used as a most effective psychotherapeutic treatment for different psychiatric disorders. The present chapter mainly focused on the efficacy of play therapy as an intervention in the children with neurodevelopmental disorders. Through various evidence-based research studies, it is found that play therapy is an intervention which may be significant to reduce symptoms of disorders and improve adaptive behavior. The conclusion of the chapter revealed the effectiveness of play therapy in various neurodevelopmental disorders.

KEY TERMS AND DEFINITIONS

Bubble Breaths: It is a technique of relaxation which involves teaching children deep and controlled breathing to make them aware regarding their body and mind connections.

Feeling Word Game: It allows children to express and connect their emotions and feelings in a non-fearful and non-threatening way.

Mad Game: It is designed to provide awareness to the children with anger suggesting that anger is a primary emotion which is easily acceptable.

Neurodevelopmental Disorders: It is a group of disorders that occur during the developmental period and affects all the developmental aspects of the child such as communication, cognition, social, etc.

Non-Directive Play Therapy: It is a psychological intervention method used to help children communicate their inner experiences through the use of toys and play.

Play: It is a physical or mental activity that engages the individual either for enjoyment or recreation.

Play Therapy: It is a form of psychological intervention where the play is used as a medium to help children to express or communicate their feelings.

ABSTRACT

This chapter review some of the principal personal and situational factors established through recent international research that contribute to explain the phenomenon of cyber-victimization and cyber-aggression among adolescents, as well as its relations with socio-demographic variables (age, sex, grade level). Personal factors, like emotions, motives, normative beliefs, and moral disengagement were discussed jointly with situational factors, as the role of peers, friends, school and family environments, in addition to the possible interactions of these variables on cyber-bullying. The chapter ends with a discussion of future directions about the research on this phenomenon, namely in what concern educational programs that can use digital technology to help adolescents, schools and families to deal with cyber-bullying.

INTRODUCTION

In the last decade cyberbullying has been the focus of attention of several researchers that emphasize the transcultural and transnational nature of the phenomenon (e.g., Kowalski, Giummetti, Schroeder, & Lattanner, 2014; Menesini, Smith, & Zukauskiene, 2010; Paladino, Menesini, Nocentini, Luik, Naruskov, Ucanok, … & Sheithauer, 2017) as well as its association with the proliferation of digital technologies use among children and youth (e.g., Livingstone, Haddon, Gorzig, & Olafsson, 2011; Twyman, Saylor, Taylor, & Comeaux, 2010).

Several studies (Beran & Li, 2007; Li, 2007; Ortega, Calmaestra, & Mora-Merchan, 2008; Ortega, Elipe, Mora-Merchan, Calmaestra, & Vega, 2009) suggested that cyberbullying is not a new type of bullying, but it's rather a new manifestation of bullying through digital means. Cyberbullying has been generally defined as repeated aggressive and intentional actions (as was bullying) but with the use of electronic devices (e.g., cell phones and computers) and associated programs (e.g., e-mail, social networks, and other Internet tools), by means of sending messages and/or creating websites that insult, denigrate, threaten, or harass others in some way (Amado, Freire, Matos, Vieira, & Pessoa, 2012; Amado, Matos, & Pessoa, 2009; Li, 2007; Kowalski, Limber, & Agaston, 2008; Martins, Veiga Simão, Freire, Caetano, & Matos, 2016; Smith, 2009; Willard, 2005). So it consists of an indirect form of bullying and frequently represents continuations of face-to-face bullying situations that amplify the roles played on face-to-face bullying or change those roles (Caetano, Amado, Martins, Veiga-Simão, Freire, & Pessoa, 2017; Kowalski, Giummetti, Schroeder, & Lattanner, 2014; Ortega, Calmaestra, & Mora-Merchan, 2008; Ortega, Elipe, Mora-Merchan, Calmaestra, & Vega, 2009; Twyman et al., 2010). Paladino et al. (2017) in study aimed to examine the role of different criteria in the perceived severity of cyberbullying incidents, and the differences between four countries (Estonia, Turley, Germany and Italy) found that the criteria used by adolescents are the same across the four countries, and include imbalance of power, intentionality, repetition and anonymity. However, the specific level of severity associated with each factor differs from country to country.

In contrast with other types of bullying, cyberbullying does not tend to decrease with age or grade level; generally it is found a pattern of increase from elementary to secondary education, and this tendency can also be found in college and university students (Francisco, Veiga Simão, Ferreira, Martins, 2015; Kowalski et al., 2014; Souza, Veiga Simão, Ferreira, & Ferreira, 2017; Walker, Sockman, & Koehn, 2011).

The enormous amount of research done in the last decade about cyberbullying allowed to identify several variables that are associated either with cyber-aggression as well as cyber-victimization and these variables can be grouped in three types: socio-demographic (sex, grade level, age); personal (emotions, motives, moral beliefs, moral disengagement); and situational variables (role of peers and friends, family education and support, school climate) (Kowalski et al., 2014).

SOCIO-DEMOGRAPHIC AND PERSONAL FACTORS ASSOCIATED WITH CYBER-VICTIMISATION AND CYBER-AGGRESSION

In what concerns the prevalence of cyberbullying, the studies reveal some diversity from country to country and from school to school. For example, Li (2010) and Bartlett (2015) indicate values of 30% of adolescents that had been victimized. In a meta-analysis study on cyberbullying research conducted by Kowalski et al. (2014) it was estimated a prevalence of approximately 10% to 40% for cyber-victimization.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

A more recent literature review conducted by Aboujaoude, Savage, Starcevic, and Salame (2015) revealed that most cyber-victimization rates have ranged between 20% and 40%. Several authors (Matos, Vieira, Amado, Pessoa, & Martins, 2018; Smith, 2015) pointed out that this diversity reflects not just differences in the behavior itself but also some variations in the methodology used in the different studies, namely the definition of cyberbullying adopted.

In the exploratory study carried out in a private school (Freire, Alves, Breia, Conceição & Fragoso, 2013) in the frame of the research project "Cyberbullying – A diagnosis of the situation in Portugal", with participation of 87 students of the 8th grade (44 males and 43 females, aged 13 to 14 years), from middle-class / high-middle-class with diverse nationalities, almost 20% considered themselves victims of cyberbullying, and the most said they were observers, particularly of the victims. Only less than half of the students reported feelings of well-being in this school, with 17% explicitly expressing feelings of malaise (discrimination, fear, humiliation, exclusion and indifference), which they justified through the difficulty of living with the difference, namely cultural differences, in which predominate tensions linked to different national and cultural identities. These results alerted for better understanding of the relation between school climate and cyber-bullying.

In what concern the large sample used in the frame of the "Cyberbullying– A diagnosis of the situation in Portugal" project, with 3525 pupils from 6th, 8th, and 11th grades (mean age 13.6 years; 47,9% males and 52,1% females) from 23 middle schools and high schools located in Portugal, results showed that 7.6% (267) of the participants admitted to be cyber-victims sometimes and 2.6% (90) of these participants admitted to be cyber-victims at least once a month in the previous year. The percentage of cyber- aggressors was 3.9% (138 participants), with 1.5% (51) admitting to be involved in cyberbullying as aggressors at least once a month in the previous year (Martins et al., 2016; Matos et al., 2018). Websites were the most frequent medium used to cyber-bully, whilst sending insulting and harmful messages was the most frequently reported type of behavior. This study also aimed to understand the strategies used by students to deal with cyber-bullying. The strategies most frequently cited by the participants were technological strategies (e.g., changing passwords, blocking the bully), data that are in line with other studies (Parris et al., 2012). Active strategies like talking to the bully and becoming more careful were also reported by high percentages of students. Social strategies were cited by varying percentages of victims (Matos et al., 2018), although these are recommended as effective strategies in the literature (McGuckin et al., 2013).

Matos et al. (2018) also examined if victims knew the identity of those who cyber-bullied them and whether or not they are colleagues. Contrary to the spread idea that cyberbullying is mainly anonym (Ortega et al., 2008; Smith, 2009) this study reveals that just 26,8% of the victims stated they didn't know who was the bully, while 39,3% of the victims identify the aggressors as a classmate and 33,8% stated they knew they were not classmates.

In general studies revealed that boys are usually more involved in physical bullying but when sex are compared in terms of cyberbullying practices these differences don't emerge with the same consistence and this trend is not always found (Barlett & Coyne, 2014; Vieira et al., 2018).

Barlett and Coyne (2014) in a meta-analyses study about sex differences in cyberbullying found that males are usually more involved in cyber-aggression than females but this was not a big difference and it was moderated by age in the sense that females were more likely to report cyber-aggression during early adolescence and males were more likely to be cyber-aggressors during late adolescence. The authors consider that the interactive effect of sex and age could suggest the fact that cyberbullying is an indirect form of bullying, although not in a conclusive way (Barlett & Coyne, 2014).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In the project "Cyberbullying – A diagnosis of the situation in Portugal", rates of victimization were higher for females as well as for students in the 11th grade when compared to 6th grade and 8th grade. A two-way Anova on victimization frequency scores showed no significant interaction between sex and school grade. Regarding cyber-aggression, the interaction between sex and school grade was statistically significant, suggesting that that incidences of cyberbullying others are more frequent among boys in the 11th grade (Matos et al., 2018; Pessoa, Matos, Amado, Freire, & Caetano, 2017). As in other studies (Olweus, 2012; Ortega et al., 2009), data of the study cited above showed that, in both sexes, the tendency to become a cyber-perpetrator correlated positively with cyber victimization, revealing that some of adolescents played both roles (Matos et al., 2018; Vieira et al., 2016).

Motives most frequently mentioned for experiencing and engaging in cyber-aggression by girls, in the above cited study, were the breakdown of friendships and social rejection by peers and they were more able than boys to disclose the motives and emotions involved in cyber-acts. Taking gender socialization values and norms and the characteristics of this stage of development into consideration, we found that the motives for cyberbullying perceived by both groups of victims and the aggressors revealed two common sex differences, reflecting what tends to be valued more by girls than boys in their relationships with peers: the breakdown of emotional ties in friendships and fears of social rejection by others. These findings are consistent with the characteristics of relationships established by adolescent females with their same-sex peers, which tend to foster self-disclosure with their friends more than boys and display emotionally deeper interactions with them. Adolescent boys, who practise cyber-aggression, reported they do it because they were upset with the victim, as a justification of their behaviour, more than girls (Vieira et al., 2016).

The cited research also analysed the emotions associated with the experiences of cyber-aggressor or cyber-victim and data reveal that those experiences are different accordingly with the role played in cyber-bullying. So, cyber-victims feel more frequently the emotions of sadness, anger with will of revenge, and fear and cyber-aggressors feel more frequently happiness, indifference and relieve. It was also found that there were significant differences between the emotions experienced by cyber-victims and those that cyber-aggressors attribute to them, revealing that they have difficulties in understanding the impact of their behaviour on victims. Contrarily with what usually happened in studies in face-to-face bullying, guilty was not frequent in cyber-victims. In some of the schools it was also noticed the presence of emotions related to impotence and feelings of lack of support in cyber-victims and some feelings of guilty in cyber-aggressors, revealing the importance that moral ambience of schools could have on these behaviours (Caetano, Freire, Veiga-Simão, Martins, & Pessoa, 2016). These data are congruent with those from other studies (e.g. König, Golwitzer, & Steffegen, 2010; Li, 2010; Ortega et al., 2009; Ortega et al., 2012) that also found that negative emotions of sadness, anger with will of revenge, and fear were more experienced by cyber-victims and that positive emotions like satisfaction, relive, pleasure, amusement, and lack of empathy for victims were frequent in cyber-aggressors, even when adolescents play both roles, as cyber-aggressor and cyber-victim (with revenge mediating the transition of the role of cyber-victim to cyber-aggressor for some of the adolescents).

Ak, Özdemir and Kuzucu (2015) in a study about the mediating role of anger in cyberbullying with undergraduate Turkish students found that cyber-victimization had both direct effects on cyber-aggression and indirect effects mediated by anger-in (emotion of anger experienced inward). More recently, Görzig (2016) also report that suicidal ideation is associated with nasty web exposure and that this incident had a bigger impact if the adolescents were being targeted as cyber-victims.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In what concern motives attribute to display cyber-aggression, in the study cited above there were divergences in the perceptions of cyber-aggressors and cyber-victims. The most frequent motives reported by cyber-aggressors were pleasure, amusing, escape to boring, affiliation with groups, friendship rupture, and revenge in reaction to previous aggression. Cyber-victims perceive as the most frequent motives of cyber-aggressors envy, jealousy, lack of respect, immaturity, and a need to exercise power of cyber-aggressors over others (Caetano et al., 2017; Li, 2010). As noted above motives were different for both sexes: girls use more affiliation motives and boys use more hedonistic motives (Caetano et al., 2017; Vieira, et al., 2016). Motives were also related with age, with younger adolescents reporting more reactive motives as affiliation and envy, while the oldest ones reported more proactive motives, as amusing and enjoyment. These results are congruent with other studies that found that the youngest ones used more reactive motives for bullying (Caetano et al., 2017; Salmivalli & Niemenen, 2002). Other studies also report that cyber-victims can also experience stress and suicidal ideation (Gôrzig, 2015; Kowalski et al., 2014; Ortega et al., 2012).

Motives and emotions related with cyberbullying seem to be coherent, in the sense that enjoyment and amusing emotions were associated with hedonistic motives and emotions of revenge were associated with reactive motives as friendship rupture and reaction to previous aggressions (Caetano et al, 2017). These data seem to fit some theoretical suggestions about aggression that propose to divide it in reactive aggression and proactive aggression in face-to-face situations, accordingly to its nature and actuation. So amusement and hedonistic motives can be associated with proactive cyber-aggression and friendship rupture and revenge can be associated with reactive cyber-aggression, suggesting that the two types of aggression found in face–to-face situations are also valid in cyberspace (Caetano et al, 2016; Poulin & Boivin, 2000; Salmivalli & Niemenen, 2002).

Peluchette, Karl, Wood and Williams (2015) in a study with American and Australian young adults, about the risky social network behaviors that could contribute to cyber-victimization, concluded that extroversion, openness, and self-disclosure in social networks, as facebook, could be predictors of cyber-victimization, results that suggest some lines of action in order to help adolescents to learn about how to protect themselves on social networks.

In the meta-analysis study referred above about cyber-bullying, Kowalski et al. (2014) concluded that the strongest associations with cyberbullying perpetration were normative beliefs about aggression and moral disengagement, and the strongest associations with cyber-victimization were stress and suicidal ideation. Perren and Gutzwiller-Heltenfinger (2012) in a study with Suisse adolescents found that: bullying was highly predictable of cyberbullying; moral disengagement justifications were more predictive of bullying compared to cyber-bullying; and moral emotions, as reduced feelings of guilt and lack of remorse, predicted both bullying and cyber-bullying. The authors concluded that moral standards and moral affect are important to understand individual differences in involvement in bullying and cyberbullying conducts.

SITUATIONAL FACTORS ASSOCIATED WITH CYBER-VICTIMISATION AND CYBER-AGGRESSION

In reference to situational factors, the results of several authors' research suggest that group of peers; family; and school variables can be associated with cyberbullying phenomenon. Variables as parental support, parental monitoring, school ethos, and pressure of the peer group influence both cyber-aggression

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and cyber-victimization (Hinduja, & Patchin, 2013; Kowalski et al., 2014; Martins et al, 2016; Veiga Simão, Ferreira, Freire, Caetano, Martins, & Vieira, 2017). In the meta-analyses research of Kowalski et al. (2014), the strongest associations with situational variables were related with school and family and suggested that school variables that were inversely linked to engagement in cyberbullying included positive school climate and school safety. Regarding family variables, it seems that less frequent cyber-victimization is associated with parental discussion about online behavior and that cyber-bullies had weaker emotional bonds with their parents and less frequent monitoring of online activities (Kowalski et al., 2014).

Specifically concerning relationships between cyber-bullying, family and peers Fanti, Demetriou and Hawa (2012) posited that Cyprus peers aged 11 to 14 influenced cyberbullying involvement, but parent support significantly decreased the probability of involvement in such conducts. The authors concluded that their results highlight the role of parents in protection against cyber-bullying, because adolescences that reported more family support also had fewer incidents of cyber-aggression and cyber-victimization a year later (Fanti et al., 2012). Hinduja and Patchin (2013) revealed that American adolescent' peers influenced cyberbullying but the expectation of punishment for such conducts from adults reduced the likelihood of involvement. According to Hinduja and Patchin (2013), cyberbullying offences are associated with the perceptions teenagers have of their peers' similar behavior, as well as the probability of adults' reprimands. What is more, respondents who were less likely to participate in cyberbullying believed that significant adults in their life would punish them.

Sasson and Mesch (2014, 2017) in a study with 495 Israelis adolescents try to understand how peers' norms and family mediation (active guidance, restrictive supervision and non-intervention) could influence involvement in cyberbullying. The results showed that restrictive parent supervision and active guidance could be effective in minimizing several on-line risks, however peers injunctive' norms about on-line activities seem to had a stronger influence on on-line risky behaviors when compared to parent mediation, confirming the idea that in adolescence the peer group has more influence on adolescent's behaviors than parents. The results also suggested that the likelihood of being bullied on the Internet is associated with both risky behavior online and the norms prevalent within the adolescent peer group, and that just restrictive parental supervision had a significant effect on behaviors. The authors conclude that adolescents that exhibit on-line risky behaviors are older boys with frequent use of platforms that facilitate communication with strangers, came from families with little cohesion and parents that don't supervise their internet use, and simultaneously are connected with peers that give support to those behaviors (Sasson & Mesch, 2014; 2017).

Wegge, Vendebosch, Eggermont, and Pabian (2016) conduct a longitudinal study, with Belgian early adolescents, to assess the reciprocal effects of cyberbullyingand traditional bullying on social status, assessed with two measures: sociometric popularity and perceived popularity. The authors evidenced that cyberbullying perpetration predicted perceived popularity over time but not sociometric status, although traditional bullying was not associated with subsequent popularity, neither with sociometric status. However perceived popularity didn't precede cyber-bulling perpetration. The authors conclude that cyberbullying can function as a tool to eventually change the hierarchy of perceived popularity at school and may explain why this behavior increases in the secondary. These data suggested that schools must deal and prevent this phenomena because even it doesn't happen inside the schools its antecedents and specially its consequences often occur in schools (Weege et al., 2016).

The role of peers has been also evidenced in studies (Ferreira, Veiga Simão, Ferreira, Souza, & Francisco, 2016; Olenik-Shemesh, Heiman, & Segal, 2015) that focus specially on the actions that bystanders

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

display when they face cyber-bullying. Olenik et al. (2015) in a study with Israelis adolescents identified passive bystanders and active bystanders and noticed that just 36% of the bystanders of cyberbullying offered direct help to the cyber-victims. The authors identified the active bystanders as being more often older girls, having socio-emotional support from significant others and experiencing lower levels of loneliness, when compared to the passive bystanders.

Li (2010) in a study with Canadian children and adolescents found that victims often don't tell anybody because they were afraid of an escalation of the problem and also noticed that most of bystanders didn't do nothing about it, because they think nobody would do nothing, teachers included, and also because they were afraid of being cyberbullied.

Ferreira et al. (2016) in a study comparing Portuguese and Brazilian college studies tried to assess if the fact of being an active bystander of cyberbullying that intervene could influence the probability of becoming a victim or an aggressor later. The results showed that being a passive bystander of cyberbullying (with no intervention) predisposes more to be a victim or an aggressor of cyberbullying later, especially in the Brazilian sample were students also noticed more incidents of cyberbullying than the Portuguese. Bystander active intervention seems to be less associated with future active involvement in cyberbullying, as a victim or an aggressor.

In what concern the study cited above about cyberbullying in Portugal ("Cyberbullying– A diagnosis of the situation in Portugal"), the study had also as main objectives to examine the relation between family and school environments and cyberbullying conducts (as cyber-aggressor or as cyber-victim). After a hierarchical regression analysis it was evidenced that school climate was more predictive of conducts of cyber-victimization and family dimensions were more predictive of cyber-aggression. Although both variables have an effect on both behaviors, adolescent's perceptions of bad family environment were more associated to cyber-aggression and perceptions of bad school environment were more associated with cyber-victimization. When considering just the various family dimensions, assessed in the study, it was also evidenced that both perceptions of family support and family rules were situational factors that could protect against cyberbullying. Results showed that lack of family support was more predictive for cyber-victimization and lack of family rules together with lack of family support was more predictive for cyber-aggression or of the simultaneous condition (both cyber-victim and cyber-aggressor). These data suggested that schools can have a role in preventing these behaviors, investing in media education, and promoting safe and healthy environments that could prevent cyberbullying. Also parents that promote rules to use Internet, through dialogue with adolescents, under a warm and supportive relationship seem to provide a protection factor against cyberbullying (Martins et al., 2016).

The above-cited study intended also to explore how the perception of school climate could influence the reporting of episodes of cyberbullying by adolescents to teachers and school staff. Results showed that even though cyber-victims reported cyber-victimization more to friends and parents, those who told teachers about their experience, tended to report more positive perceptions of their school climate. Sex and age did not play a significant role in the relationship between cyber-victimization and perceived school climate. These data evidenced the important role of school because it focused on whether adolescent cyber-victims' perceived school climate was related to whom they turned to report the incident. Specifically, this study was able to provide an understanding of how these adolescents perceived their school climate and how teachers played an important role in these perceptions, when adolescents experiencing cyber-victimization need their help (Veiga Simão et al., 2017). Climate university campus seems also to affect the practices of cyberbullying of Portuguese and Brazilian college students, with more incidence in the Brazilian sample (Sousa et al, 2017).

FUTURE RESEARCH DIRECTIONS

The results from research on cyberbullying that were synthesized in this chapter show the complexity of the phenomenon, its interactive nature and the challenges that researchers face when it comes to find a consensual definition and suitable way to measure cyber-victimization and cyber-aggression behaviors. The difficulties became ever greater if we think about what distinguishes those who were born in the age of technology – digital natives – and older generations, that are now considered digital immigrants (Prensky, 2001).

Livingstone et al. (2011), in a study with 25 000 adolescents about usage of Internet in several European countries, emphasize that one third of the families of these adolescents knew less about digital devices and Internet than their sons and daughters. Nguyên and Mark (2014) noticed, in a research about parents and educators perspectives about digital devices and Internet, that they have different knowledge about how adolescents use those devices, with parents having more difficulties keeping up to date the progress of technology and its use by their adolescents.

The complex and evolving world of digital technologies and Internet seem to require more effort in developing programs and manuals to parents and teachers in view to understand and deal with the phenomenon of cyber-bullying, as well as to the exposure to nasty themes on the Internet and diverse risky behaviors associated with it. In future it should be important to know better what knowledge parents have of what their sons and daughters do with mobiles devices and Internet and how they deal with on-line risky behaviors from their adolescents.

Although cyberbullying does not necessarily happen at school, because many adolescents have access to the Internet at home and other spaces (Festl, 2016; Livingstone et al., 2011), several studies (Twyman et al., 2010; Veiga Simão et al., 2017; Weege et al., 2016) highlight that school variables (as for example the fact that good school climate is important to deal with cyber-victimization) play a role in cyber-bullying. Furthermore, since cyberbullying can be a continuation of bullying at school, as various studies have already indicated (Olweus, 2012; Ortega et al., 2009, 2012; Twyman et al., 2010), the teachers are of special importance in aiding these students to deal with this phenomenon and prevent cyber-bullying. Also more studies about the bystander behavior when facing cyberbullying incidents, especially about their motives to intervene or not, could better clarify the role of peers in the interruption or escalate of cyberbullying behavior.

Some manuals (e.g., Jäger, 2010; Jäger, Stelter, Amado, Matos, & Pessoa, 2012) have been developed to help parents and teachers to deal with cyberbullying incidents, but these could be not enough. Educational programs could be designed to embrace a whole community approach, including schools, families and peers. These three domains are the main sources of efficacy information for children and adolescents and therefore, should be considered as part of the focus for effective intervention programmes (Paul, Smith, & Blumberg, 2012). Programmes could be developed and preview software to include in digital devices to help adolescents to detect, be alert and block nasty messages. Educational games with themes that include bullying and cyberbullying could also be developed in view to attract adolescents to use for educational purposes the same devices they use in a diary and routine base.

Cyberbullying specifically represents a phenomenon of social interaction (Souza et al., 2017) and studying the intentional and conscious use of language to harm others online offers prospects of an enriched psychological understanding of the cyberbullying phenomenon. We believe that the examining of adolescents' written expressions in incidents of cyberbullying and their perceived management of this language could be better identified by future innovative technological resources in online platforms.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

So for future research, greater use should be made of qualitative research strategies to listen and read to what adolescent, boys and girls, say about matters that researchers are still unaware of and therefore cannot apprehend using quantitative instruments. Cross-cultural issues may also play an important role in language usage, so future studies should include adolescent participants from several countries.

Although often been practiced in private rooms cyberbullying seems to be highly influenced by peers, family and school climates and the contribution and interaction of these factors should be considered in future research.

ACKNOWLEDGMENT

This study was conducted in the frame of the project "Cyberbullying – a diagnosis of the situation in Portugal," financed by The Foundation for Science and Technology (program PTDC/CPE-CED/108563/2008) in a partnership with the University of Coimbra and the University of Lisbon, coordinated by professor João Amado.

Chapter 64
Psychotherapy and Christianity: Methods and Challenges

Jeremy Lim
HELP University, Malaysia

Ke Hui Chuah
HELP University, Malaysia

ABSTRACT

Christianity is counted as one of the biggest religious groups in the world, numbering at over 2 billion individuals who identify themselves with this religion. As of the 2010 census, the Department of Statistics Malaysia Official Portal reported that an estimated 9.2% of the population in Malaysia identified themselves as Christians. In numerical terms, this equates to approximately 3 million individuals spread out all over the Malaysian peninsular as well as Sabah and Sarawak who consider themselves part of the Christian church. This chapter intends to do four things: 1) provide a brief history of the church and Christianity, 2) acquaint the reader with basic Christian beliefs, 3) provide insight into the methods and challenges of working with the population in Malaysia drawing from both local as well as international literature, and 4) provide the implications of the methods and challenges of working with the Christian population.

INTRODUCTION

He answered, "'Love the Lord your God with all your heart and with all your soul and with all your strength and with all your mind'; and, 'Love your neighbor as yourself.'" - Luke 10:27, NIV

Worldwide, Christianity (including Protestants, Roman Catholics, and others) is counted as one of the biggest religious groups in the world, numbering at over 2,000,000,000 individuals who identify themselves with this religion (BBC, 2011). As of the 2010 census, the Department of Statistics Malaysia Official Portal (2010) reported that there is an estimated 9.2% of the population in Malaysia identified themselves as Christians. In numerical terms, this equates to approximately 3,000,000 individuals spread

out all over the Malaysian peninsular as well as Sabah and Sarawak who consider themselves part of the Christian church. This essay intends to do 4 things: 1) provide a brief history of the church and Christianity, 2) acquaint the reader with basic Christian beliefs, 3) provide insight into the methods and challenges of working with the population in Malaysia drawing from both local as well as international literature, and 4) provide the implications of the methods and challenges of working with the Christian Protestant population.

BRIEF HISTORY OF THE CHURCH

For many people, Christianity is synonymous from its founder from whom the name derives from – Jesus Christ. The following contains a short exposition on both the story of Jesus Christ and the history of the church as a means to provide the reader a basis for which to approach clients. This approach is presented from a Protestant point of view.

The Bible, Christianity's holy book, teaches that Jesus Christ (which means Yeshua the Messiah i.e. the Savior) was born in Bethlehem, Israel, to a virgin called Mary. Christians believe that Mary was pregnant not by human or physical means but by direct divine action through the Holy Spirit (BBC, 2009a). Jesus himself represented the fulfillment of prophecies of other parts of the Bible and was believed to have been born over 2000 years ago (approximately 4-7 BC) (BBC, 2009a; Robinson, 2008). The Bible covers Jesus' early life in brief and Jesus' public influence in detail in the books of Matthew, Mark, Luke, and John, reputed eyewitness accounts of Jesus' life (BBC, 2009a). During this period in the public sphere, Jesus gathered many followers, foremost of whom were the 12 disciples who later went on to lead the early church (BBC, 2009a). The climax of Jesus' story is when the religious leaders, critical of Jesus and believing him to proclaim falsehoods, apprehended and crucified Jesus (crucifixion is an ancient Roman means of execution, where the condemned is nailed to a cross and left to hang until he/she suffocates) (BBC, 2009a). However, the Bible teaches that three days after Jesus' death by crucifixion, Jesus was raised to life again by the power of God whereupon he was taken up to heaven a few days later after having spent time with many eyewitnesses (BBC, 2009a).

Jesus' ascension to heaven marked the beginning of the church where Jesus' disciples and followers spread His message throughout the Roman Empire (BBC, 2011). This was also when the term Christians (literally, Christ-followers) began to be used to refer to Christ's followers (Acts 11:26, New International Version). This early movement faced many troubles such as condemnation, torture, and execution by Roman emperors such as Nero, Domitian, and Diocletian who believed the religion to be heretical (BBC, 2009a). However, Christianity became more accepted under the rule of Constantine whose efforts resulted in the codification of Christian doctrine (BBC, 2009a). Over the centuries, various divides such as the Great Schism in 1054 and the Protestant reformation resulted in different ways of understanding Christianity (e.g. the Roman-Catholics versus the Protestants versus the Orthodox church) (Encyclopedia Britannica, 2017).

The verse from the Bible at the opening of this chapter is Jesus' summary of the teachings of the Bible which have been handed down throughout the centuries. Differences in doctrine and interpretation of teachings have also resulted in the various denominations today (e.g. the Methodists, the Anglicans, the Presbyterians, the Baptists, the Jehovah Witnesses, etc). However, it is beyond the scope of this chapter to cover the differences between denominations in detail and interested readers would do well to consult other sources. Regardless, most Christian denominations today believing these commands are thus

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

motivated to be able to better the lives of others. While some efforts in the distant past were extremely misguided (e.g. the Great Crusades), in the present day, the Christian church's main efforts outside of the church are in helping those who need assistance wherever they can in different capacities (e.g. building schools and hospitals, working among the poor and needy, caring for the outcasts in society) (Velarde, 2009). Unfortunately, efforts in the mental health field have been slower as various disorders were seen as spiritual issues and religion itself seemed to be vilified by early mental health practitioners (CT Editors, 2018). However, today, there is more understanding and acceptance of differences between spiritual and mental disorders and the Catholic church has even included a catechism which states that before an exorcism is performed, it must be ascertained that it is not a psychological illness causing a certain behaviour (Catholic Church, n.d.; CT Editors, 2018).

In Malaysia, Christianity first landed on these shores via the arrival of the Portuguese as early as early as the 1500s, the Dutch in the 1600s, and subsequently the British which brought Roman Catholicism into the country (Roxborogh, 1989). Through the subsequent years of various colonial attempts, World War Two, as well as Malaysia's independence, the churches in Malaysia continued to expand resulting in a growing Christian movement especially among those from Sabah and Sarawak (Roxborogh, 1989). Today, the churches in Malaysia face various challenges including continuing to integrate into a multi-ethnic and multireligious society (Roxborogh, 1989).

Individual Christian denominations in Malaysia generally subscribe to a higher council (e.g. the National Evangelical Christian Fellowship) (Christian Federation of Malaysia, 2018). These federations and councils come together under the banner off the Christian Federation of Malaysia which unites the Catholic Bishops' Conference of Malaysia, the Council of Churches Malaysia (i.e. Anglicans, Lutherans, Methodists, Orthodox, Presbyterians and others), and the abovementioned National Evangelical Christian Fellowship (i.e Assemblies of God, Baptists, Brethrens, independent and free churches, and others) thus accounting for the majority of Christians in Malaysia (See Christian Federation of Malaysia, 2018 for the full list). Other churches include the Mormon Church (i.e. the Church of Jesus Christ of Latter-day Saints) and the Jehovah's Witnesses. It is important to note that evangelical parties (i.e. mainstream denominations) may not consider either of these two denominations as fully "Christian" as they subscribe to teachings that do not conform to the traditionally espoused doctrines of the church (McDermott, 2016). Interested readers can consult other sources for a more in-depth exposition.

In terms of mental health related work, there exist seminaries and higher learning institutions that provide courses related to the mental health field such as pastoral counselling (e.g. the Alpha Omega International College) or a variety of certificate and diploma level Christian counselling courses at places such as Seminari Teoloji Malaysia, Bible College Malaysia, and others. Christian counsellors and therapists in Malaysia also have the option of connecting with others through the National Association of Christian Counsellors which was founded in 2011 and aims to provide ethical mental health services to the Christian community (National Association of Christian Counsellors, 2018).

The Basics: Tenets of the Faith

To begin the work of therapy with Christians, it would be of great use to examine some basic Christian beliefs in order to begin understanding how Christians make sense of their faith and its relation to the world. For Christians who identify as Protestants (any mainstream Christian denominations such as Methodists, Baptists, and so on), the basic Christian beliefs can be summed up in five Solas. A Sola is a Latin word meaning "alone". The five Solas are as follows:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Sola Scriptura. The meaning of this phrase is "Scripture alone" and points to the belief that the Bible alone is the highest authority as the word of God. This phrase does not mean that truth is only found in the Bible but the Bible informs Christians about God's message and all other truth should be interpreted in light of the Bible (Holcomb, n.d.).
- Sola Fide. This phrase means "faith alone", and points to the belief that Christians are saved and justified as righteous in God's eyes only by their faith in Jesus Christ, his divinity, and his message (Holcomb, n.d.). This phrase reminds Christians that this salvation is not a result of any righteous or "good" actions that the individual may undertake or do. Essentially, this phrase states that one cannot "earn" one's salvation through good works.
- Sola Gratia. This particular phrase means "grace alone". Christians believe that they possibly match God's perfection and holiness and it is only through His grace alone that they are offered the opportunity for salvation, not our own goodness and regardless of our sin (Holcomb, n.d.).
- Solus Christus. This phrase means "Christ alone" and points to the belief that Jesus Christ is the revelation and incarnation of God in the flesh and only His death could redeem Christians from their sin (Holcomb, n.d.).
- Soli Deo Gloria. Meaning "to the glory of God alone", this belief helps the Christian put him or herself into the proper perspective, that all glory belongs to God alone and that God's glory is the primary motivator and purpose for the life of the Christian. However, this also reminds Christians that God is good, and that His purpose for the Christian is the enjoyment and improvement of life for themselves and others (not necessarily physical or material improvement) (Holcomb, n.d.).

These five phrases sum up some of the core Christian beliefs about God and His purposes for humanity as Christians believe is revealed in the Bible. Another often used method of expressing the basic doctrines of Christianity were codified in the creeds spoken in churches around the world as a reminder and proclamation of what the church and each Christian believes. One of the oldest declarations of the basics of Christian faith is the Apostles' Creed which is usually given as:

I believe in God the Father Almighty, Maker of heaven and earth, And in Jesus Christ his only Son our Lord, Who was conceived by the Holy Ghost, Born of the Virgin Mary, Suffered under Pontius Pilate, Was crucified, dead, and buried. He descended into hell; The third day He rose again from the dead; He ascended into heaven, And sitteth on the right hand of God the Father Almighty; From thence he shall come to judge the quick and the dead. I believe in the Holy Ghost; The Holy catholic Church, the Communion of Saints; The Forgiveness of sins; The Resurrection of the body, And the Life everlasting. Amen. (Billy Graham Evangelistic Association, 2004).

Some key points to note are that the beliefs espoused in this creed are ecumenical, key doctrines of the Christian faith that cut across all denominations and traditions (Tang, 2004). Another is that the term "catholic" (note the small "c") in this creed means universal and does not refer to the Roman Catholic church as a group (Billy Graham Evangelistic Association, 2004). Creeds were used as answers to perceived false teachings of that time and were used to present a summary of key teachings (Tang, 2004). Most creeds (including this one; others include the Roman Creed and the Nicene Creed) covers the basics of salvation, the understanding of God, the divinity and physical incarnation of Jesus, the crucifixion and resurrection of Christ, and the doctrine of grace (Tang, 2004).

A further elaboration of basic Christian beliefs include but are not limited to:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Monotheism; A belief in one God but present in three forms, elements, or aspects (the Trinity): the Father, the Son (Jesus Christ), and the Holy Spirit (BBC, 2009b).
- God's love: Christians believe that God is a personal God and loves all humanity unconditionally (BBC, 2009b). However, to receive salvation, the individual who desires must obey certain conditions as stipulated in the Bible (BBC, 2009b).
- Jesus' teachings can be summarized into two commands which Jesus himself proclaimed: Love God with all of oneself and, the second, love one's neighbour as one loves one's self (BBC, 2009b). This provides a point of entry for the therapist to discuss self-care in the Christian context.
- Christians believe in life after physical death, the spirit as eternal, and most believe in some conception of heaven and hell (BBC, 2009b).
- Prayer is the method of communication with God. Christians believe that the Bible gave a model of prayer from Jesus in the New Testament and are told to address God as Father (BBC, 2009b). Prayers can be both rituals or spontaneous (BBC, 2009b). Some groups believe that prayers should be directed through other individuals such as saints or Mary, the mother of Jesus (BBC, 2009b). Some groups believe in "praying in tongues", a form of prayer where the person praying utters sounds that do not appear to resemble any known language as empowered by the Holy Spirit (Got Questions.org, 2017).
- Baptism (i.e. the submerging and reemergence of the person's body) in water, whether as an infant or an adult (depending on the group) as an outward symbol of commitment to Christ and His teachings (BBC, 2009b).
- Communion or the Eucharist: A Greek word meaning thanksgiving, Christians believe that the Communion meal, consisting of bread and wine, are an emulation of the last meal (the Last Supper) of Christ before His crucifixion who commanded His disciples to continue the tradition in memory of Him (BBC, 2009b). Disagreement has arisen in between different denominations due to different understanding and interpretation of Christ's teaching on the Communion (BBC, 2009b).
- A personal relationship with God: Christians believe that God is active and in communication with the church as a whole and individual believers (Piper, 2008). God speaks to Christians through the Bible, through the Holy Spirit, through other believers, and through circumstances (Piper, 2008).

While these summarize most of the basic doctrines of Christian faith, it is also worth noting that there exist differences between different groups of Christians (e.g. Protestant versus Catholics) and between denominations (e.g. Methodist versus Baptist). Thus, it would be a worthwhile exercise for the therapist to explore the specific interpretations and beliefs of the Christian client's belief system while keeping in mind these basics to better grasp the religious and spiritual context of the client. Readers interested to delve into the differences between such denominations are encouraged to consult other definitive sources.

The Lay of the Land: Christians and Psychotherapy

It is undeniable that psychotherapies have been shown to be effective in treating relational and emotional issues but yet remain as one of the most controversial discussions in the church in this day and age (Christian Research Institute, 2009). Bob and Gretchen Passantino from the apologetics discipleship organization, *Answers In Action* illustrated that some members of the Christian community perceives psychology as a rival religion that challenges their Christian faith (Christian Research Institute, 2009).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Christians were found to be more likely to attribute spiritual causes to psychological disorders (Choi, 2013) and amongst the difficulties of working with Christians, one of the main concerns was the idea that therapists were against religious establishments (Beck, 1997). However, in the 1960s and 1970s, there was a growing understanding that the usual spiritual methods in the church were not effective at treating relationship and emotionally-related issues (Esau, 1998). This coupled with the fact that psychotherapists are more likely to identify as "spiritual but not religious" (Post & Wade, 2009) all potentially contributed to the rift between Christianity and psychotherapy.

Some other debates surrounding the controversies of Psychology in the Christian community include the different views of Psychology vs. Christianity in topics such as personal suffering, self-love, and the sufficiency of recovery through biblical scriptures and Psychology being a "worldly wisdom":

- Personal suffering.

Barnes (2014) argued that modern psychology strived to remove all forms of personal suffering whether through the removal of guilt, or self-esteem improvements; while the Christian doctrine contended that personal suffering served the purpose of drawing Christians closer to God, builds character, and that Jesus Christ also suffered for a purpose (Philippians 3:10, Hebrews 5:8-9, 1 Peter 5:10, New International Version). Such Christians might not desire to eliminate personal life suffering but to learn how to live with it and adapt accordingly. For the therapist working with such a client, this means that being aware of such a mentality could change the approach that the therapist takes with his or her client e.g. working with them to accept their suffering instead of striving to remove it completely.

- Self-love.

Barnes (2014) also argued that some modern psychology approaches were intended to help an individual begin to develop love and acceptance of himself or herself to recover from self-destructive behaviours; whereas, the Bible teaches that Christians should learn to deny themselves, turn away from making themselves the most important person in their lives, and follow Jesus (Matthew 16:24-25). Biblical teachings also condemned the mentality of being a lover of oneself (2 Timothy 3:1-2). However, closer examination appears to reveal that the self-love espoused by Psychology has been taken out of context and equated to narcissism and the Scriptures themselves have been taken out of context by the arguments above. The first Scripture appeared to revolve more around the theme of learning to place God first before oneself; while the second Scripture seemed to put forth the proposition to focus more upon being mindful of not falling into self-absorption rather than condemning self-love.

- Sufficiency of recovery through biblical scriptures and Psychology being a "worldly wisdom".

Cole (1993) explained that the Bible provided warnings about succumbing to worldly wisdom as it opposed God's wisdom (Psalm 1:1-2; Isa. 55:8-11; Jer. 2:13; 1 Cor. 1:18-2:16, New International Version). He also argued that instead of depending on psychology which is a form of worldly wisdom, Christians should be depending solely on God and the scripture for wisdom and support in the trials and difficulties of life (Psalms 19:7-11; 32:6-11; 33:6-22; 119). Furthermore, Cole (1993) also proposed that as Christians learn to depend on God and the scriptures as their source of healing and strength, the glory of recovery goes to God as the only true God; whereas, if Christians rely on secular psychology for

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

healing, it would contribute to psychology receiving said glory. This in turn goes against the Christian teaching of God being the all-sufficient One who understands our deepest needs and is able to meet them.

However, despite the controversies surrounding Psychology for the Christian community, Bob and Gretchen Passantino also acknowledged that amongst the Christian community, psychotherapy has indeed became enormously popular and sought after (Christian Research Institute, 2009). They explained that many Christians have often focused their attention on criticising psychotherapy and urge other Christians to go back to the Word of God as a form of solutions to their struggles and problems, but argued that although such approach has its merit, it is also an inaccurate generalisation (Christian Research Institute, 2009). Instead, they believe that the limitations of current practice and the lack of emphasis on biblical counselling was a far more critical concern to the endeavours and efforts of the church and is the main cause of Christians who are suffering from mental disorders or emotional struggles turning away from biblical scripture to psychotherapy as a form of healing (Christian Research Institute, 2009). This is illustrated in their article where stories were reported about certain churches who refused to embrace "the repentant alcoholic, the parent with the troubled teen, or those emotionally bruised by sinful behaviour", churches who fail to support, nurture, and fulfil a church's responsibilities and obligation towards the their community, whether Christian or not. The Passantinos also contended that when these hurting Christians do not feel nurtured, protected, admonished, and matured by the Church, they will look elsewhere for help and in this case, they found healing through more secular psychotherapy instead (Christian Research Institute, 2009).

Jones and Butman (2011) suggested that in order to provide optimal assistance to the recovery journey of hurting individuals, it is vital to have an explicit and comprehensive understanding of human behaviour through psychology. However, they also argued in their analysis of psychotherapy theories that different theories and/or models have their own compatibilities and incompatibilities with Christian and biblical faith alongside with its strength and weaknesses, insights and inconsistencies. So where exactly does psychotherapy and its associated theories stand in the Christian community and vice versa? This chapter posits that while biblical Scripture does govern the fundamental practices and beliefs of Christians, "Scripture does not provide all that we need in order to understand human beings fully", which is similar to Jones and Butman's (2011) perspectives. Therefore, it would be of great importance for Christian psychologists and counsellors to remain flexible and explore an integration of their Christian belief with the evidence based psychological findings, theories, and models to provide psychotherapy that could be most effective in assisting individuals struggling with mental health and/or life struggles. In fact, Jones and Butman (2011) also contended that neither is there one definitive model that exists nor would such a perfect model ever exist, thereby supporting the suggestion that integrated models would be the most efficient way of conceptualizing this apparent dichotomy.

IMPLICATIONS AND RECOMMENDATIONS

In discussing how Christians view psychotherapy, it cannot be denied that as more awareness is created, the need to work effectively with this population continues to increase. The effective multicultural therapist would begin to examine how a client's faith could be turned into support or even direct intervention in order to better assist a client instead of simply brushing this valuable resource aside. Thus, it would also be helpful to examine practical steps that therapists can take to begin to work more effectively with Christian (and other similarly religious) clients.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Post and Wade (2009) in a review paper describe the methods of clinicians who were deemed to work effectively with spiritual and/or religious clients. They describe these clinicians as approaching clients with an openness and appreciation of different religious and/or spiritual traditions and were also cautious not to place their own religious values on clients (Post & Wade, 2009). To facilitate greater spiritual and religious self-awareness and become more aware of their values, therapists were recommended to generate a spiritual autobiography as a means of self-reflection (Wiggins, 2008, as cited in Post & Wade, 2009). This openness was supported by a proposition by Esau (1998) that therapists who were effective at working with Christians must be willing to explore the client's religious life and be aware of their own potential for countertransference. To facilitate such exploration with clients, Post and Wade (2009) recommend an explicit statement or discussion facilitation outlining therapists' openness and commitment to explore such issues with their clients. Post and Wade (2009) also recommend that while understanding the basic tenets of religion was helpful, what was more important was therapists' attitude and openness towards understanding and exploring the client's religion. Furthermore, as illustrated earlier in the essay, Jones and Butman (2011) also stepped forth and suggested for therapists and counselors who are working with the Christian community to familiarise oneself with the Christian teaching and constructively integrate these teaching with the fundamental psychological findings.

Other important points to note for therapists included being acquainted with non-mainstream religious traditions as they had a great likelihood of assigning psychopathology to non-mainstream traditions (O'Connor & Vandenberg, 2005) and assessing religious commitment as a correlate with client willingness to share about religious or spiritual issues (Walker, Worthington, Gartner, Gorsuch, & Hanshew, 2011). Therapists should also be aware that despite being open to discussing religious issues, clients may not want therapists to view their religion as part of their presenting problem (Walker, Worthington, Gartner, Gorsuch, & Hanshew, 2011). Highly religious clients may experience difficulty discussing their faith with secular therapists as they might be uncertain about the therapists' reactions (Cragun & Friedlander, 2012). As already espoused above, secular therapists who were open and allowed clients the autonomy to decide when and how much to share facilitated more positive psychotherapeutic experiences for their clients (Cragun & Friedlander, 2012). In contrast, religious clients with secular therapists who articulated opposing religious perspectives or even avoided discussing spiritual and/or religious issues experienced greater negative psychotherapeutic experiences (Cragun & Friedlander, 2012).

On top of that, highly religious clients may expect and request spiritual integration in their psychotherapy process (i.e. discussing Scripture or praying with them) (Walker, Worthington, Gartner, Gorsuch, & Hanshew, 2011). This was found to be the case among Orthodox Christians where there was an emphasis placed on using faith, prayer, meditation, teachings from the Bible, and Christian counselling in the therapeutic process (Gass, 1984). This was further supported among conservative Christian adults who stated a preference for both explicitly Christian and secular therapists to engage with them using a greater emphasis on religiously oriented interventions (Bellaire & Young, 2005). However, therapists should be careful not to assume and take caution in assessing a client's needs and desires for more religiously-oriented intervention techniques and should make it a practice to obtain informed consent before attempting any interventions (Post & Wade, 2009). In cases with client agreement, there is some research to show that religious or spiritual interventions were more effective for these clients than more secular interventions and that despite therapists' own religious commitment, effectiveness was mediated more by correlation with clients' own religious commitment (Post & Wade, 2009).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

At the end of the day, there is a place for both biblical counselling and more secular psychotherapies especially when working with a Christian client. A person may draw strength, hope and even healing from biblical scriptures or biblical counselling, while psychotherapy could come in handy to facilitate the Christian client to re-evaluate dysfunctional, irrational, and/or unhealthy beliefs that perpetuates the Christian client's mental struggles. Nonetheless, as with all therapy, it is also crucial for the therapist to be flexible when working with different individuals. As this chapter has illustrated some of the different controversies of psychology to Christians, and discussed some of the limitations of solely biblical counselling, an integration of psychology with a client's Christian beliefs could help achieve a balance and a mode of recovery that would be more optimal for Christians who are wary about secular psychotherapies. In conclusion, the effective multicultural therapist should consider both the person's faith as well as the modality of application, in this case, for the Christian community.

Chapter 65
Ethics in Play Therapy Consultation and Supervision

Jeffrey S. Ashby

Laura Wood
Georgia State University, USA

Sarah Kiperman
Georgia State University, USA

ABSTRACT

Ethics in play therapy consultation and supervision can be complex because of the "layered" nature of the relationships involved in each of these indirect services. In this chapter, we discuss the differential obligations the play therapy consultant or supervisor owes to the consulate/supervisee and the client. The ethical constructs of informed consent, competence, confidentiality, and dual relationships are discussed in relationship to the consultee/supervisee and the client. While the obligations are similar in these indirect services, there are also different obligations in each of these areas.

ETHICS IN PLAY THERAPY SUPERVISION AND CONSULTATION

Do the right thing. - Spike Lee

Ethics is ultimately doing the right thing. This can be straightforward in clinical practice and may be a relatively easy path to find. Our codes (e.g., American Counseling Association [ACA, 2014], American Psychological Association [APA, 2010]) and practice guidelines (e.g., Association of Play Therapy [APT, 2012]) give guidance that help us practice ethically, such as providing services within the boundaries of our competence and protecting client confidentiality. The codes (ACA, 2014) also recommend incorporating Kitchner's (1984) five ethical principles into all aspects of practice: autonomy (fostering a client's independence and right to control the direction of his/her life), nonmaleficence (not cause

harm to others), beneficence (doing good unto others and promote human welfare), justice (fairness and equal treatment), and fidelity (commitment to demonstrate faithfulness and loyalty to the professional relationship at hand). The additional principle, veracity (dealing truthfully with clients) is also provided in the code of ethics (ACA, 2014).

Ethics in play therapy, however, is complicated by an obligation not limited to the child, but to additional stakeholders such as parents/guardians, teachers, and other professionals. Navigating these relationships often requires professionals to seek consultation or supervision. While a number of resources offer guidance in play therapy ethics (e.g., APT, 2012; Ashby & Clark, 2015), delineate conceptual differences among supervision and consultation (e.g., Knoff, 1988), discuss ethics as they relate to consultation (e.g., Doughtery, 1992; Newman, 1993) and supervision, (e.g., Herlihy, Gray, & McCollum, 2002; Ladany, Lehrman-Waterman, Molinaro, & Wolgast, 1999), limited information is available on how these topics function together. Many professionals question 'when should I seek consultation', 'does this require supervision', or 'what are my obligations as a supervisor or consultant?'. This chapter aims to address these questions and discuss the ethics of these indirect play therapy services with additional stakeholders in consultation and supervision.

In this chapter, we attempt to help the reader understand the layered ethical obligations inherent to indirect play therapy services. Keeping in mind the ultimate responsibility to the child client, the chapter will address the ethical obligations to attain informed consent, practice within the boundaries of one's competence, protect confidentiality, and manage potential dual relationships with the consultee/supervisee, the child client, and the client's parents/guardians. These familiar issues can take on greater complexity in the layered application of play therapy consultation/supervision. The goal of this chapter is to help clarify the differential obligations we hold so that we can ultimately do the right thing.

WHO'S WHO? THE ROLES INVOLVED IN INDIRECT PLAY THERAPY SERVICES

Understanding the ethical and legal obligations in play therapy consultation and supervision can be complicated, in large part because these indirect play therapy services are made up of a tripartite relationship among at least three parties: the indirect play therapy service provider (e.g., supervisor, consultant), the direct play therapy service provider (e.g., supervisee, consultee), and the client (e.g., child and their family, system). Because of the layered nature endemic to indirect services (e.g., supervisor, supervisee, supervisee's client) there are varied and various parties to whom the play therapist supervisor or consultant owes an ethical duty. In addition, with regard to ethical obligations, it may be helpful to treat supervision and consultation as discrete areas of specialization with differential ethical obligations (Thomas, 2010).

In play therapy supervision, the play therapist supervisor owes a direct ethical obligation to the supervisee and an indirect ethical obligation to the supervisee's clients (ACA, 2014). The play therapist supervisor is ethically obligated to meet a reasonable standard of care in providing supervision (Russell-Chapin & Chapin, 2011). The supervisor may take on a number of roles in supervision including teaching, mentoring, evaluating, and providing guidance and direction. The supervisor is ethically obligated to provide a reasonable standard of care. That standard of care is consistent with the ethical obligations in direct service to clients (e.g., informed consent, competence, confidentiality, dual relationships). In addition to the ethical obligation the play therapy supervisor has to the supervisee, the supervisor also has an ethical obligation to the supervisee's clients (Knapp & VandeCreek, 1997). Play therapists generally seek play therapy supervision when they cannot practice competently without supervision (e.g., are

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

not yet licensed, are practicing in a new area). The supervisor takes responsibility for the supervisees' practice with clients in these relationships, meaning play therapy supervisors are responsible for their actions as supervisors, their supervisee's treatment of clients and ensuring the client receives a reasonable standard of care.

Consultation, like supervision, includes at least three parties: the consultant, the consultee, and the consultee's dependent, client, or client system (Remley & Herlihy, 2016). The role of a play therapy consultant differs from a supervisor in various ways, which accounts for their different ethical obligations to both the consultee and the party who is the focus of the consultation (e.g., client, client system, student, dependent child). While play therapy supervision generally takes place between two clinicians (supervisor and supervisee), a play therapist might provide consultation with several entities including, but not limited to, another play therapist or licensed clinician, parents, teachers, and or/other school personnel. While there are similarities between supervision and consultation, the ethical obligation the play therapist consultant owes to the consultee and the child or system that is the focus of the consultation differs from the obligations in supervision. In consultation, the play therapist consultant is ethically obligated to provide a reasonable standard of care to the consultee (e.g., competence, confidentiality).

The role of consultant is similar to the role of supervisor in that both roles may include teaching, mentoring, and providing guidance and direction. However, consultation is nonhierarchical and the roles of consultant and consultee share coordinate status (Sandoval, 2014). The role of consultant does not typically include evaluation, and the guidance and direction offered by the consultant may be considered and ultimately rejected by the consultee. In the case of a play therapist seeking play therapy consultation, the consultee is generally understood to be practicing within the bounds of competence and is seeking additional information, guidance, expertise, and/or perspective on a case or cases. While the consultant does owe an ethical obligation to the party for whom the consultee has sought consultation, the consultant is not typically viewed as responsible for the actions of the consultee in providing services or intervening with the child or system that is the focus of the consultation (Jacob, Decker, & Timmerman Lugg, 2016). As a result, the consultant typically does not have the role of evaluator and is not viewed as responsible for the consultee's actions with children or systems.

Understanding the similarities and distinctions between the roles of play therapist supervisor and play therapist consultant can aid in differentiating distinct ethical obligations owed in these rather complex, layered relationships. As we consider the application of the ethical constructs of informed consent, competence, confidentiality, and dual relationships, it will be important to acknowledge that they are fairly interdependent.

INFORMED CONSENT IN PLAY THERAPY SUPERVISION AND CONSULTATION

The ACA code of ethics (ACA, 2014, p. 20) defines informed consent as "a process of information sharing associated with possible actions clients may choose to take, aimed at assisting clients in acquiring a full appreciation and understanding of the facts and implications of a given action or actions." Ultimately, informed consent refers to clients acknowledging their comprehensive awareness of the services they receive. In play therapy, service providers (the supervisee/consultee) are responsible for providing their clients with access to adequate information so they are informed consumers (Beahrs & Gutheil, 2001). The goal of informed consent is to prevent situations where clients would not have consented to a provided service had they known information prior to beginning treatment. Traditional informed consent practice

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

includes three important components to ensure this goal is met: (1) *capacity*, (2) *comprehension*, and (3) *voluntariness* (Dekraai, Sales, & Hall, 1998). C*apacity* refers to a client's ability to make rational decisions. *Comprehension* ensures clients have all of the information that they need in a comprehensible form. V*oluntariness* refers to the client giving consent willingly, without coercion and their ability to withdraw from service at any time. These three components apply to informed consent in indirect service and should always be considered in evaluating the consent of clients, supervisees, and consultees

Informed Consent for Indirect Service Providers and the Clients of Their Consultees/Supervisees

Informed consent in traditional settings is typically enacted between supervisees/consultees and their clients. Ashby & Clark (2015) offer an overview of the appropriate topics to cover in informed consent with a client and a play therapist. They also highlight that informed consent is typically sought from the parents or guardians of the child client, with developmentally appropriate assent gathered from the child. However, when direct service providers seek supervision and/or consultation, additional information may need to be shared for clients to be able to give truly informed consent. For clients to demonstrate full understanding and comprehension of services, they must be made aware that by consenting to treatment, they are doing so with the understanding that other professionals (e.g., indirect service providers) will be involved in their case through supervision or consultation.

Direct service providers who have sought supervision need to make sure that their clients understand the nature and implications of the supervisory relationship. For instance, informed consent with the client should include the information that the play therapist can only provide competent care under the supervision of another professional and, without that supervision, would not be competent to provide a direct clinical service (Bernard & Goodyear, 1998). In addition, informed consent should clarify that the play therapist will be systematically sharing the client's confidential information with the supervisor and that the supervisor, just like the treating clinician, has an ethical mandate to keep client information confidential except in special circumstances (e.g., legally mandated to disclose). Because supervisors are vicariously responsible for all of the actions of their supervisees (Goodyear & Rodolfa, 2012), supervisors have the responsibility to make sure that their supervisees have gathered appropriate informed consent from clients.

As previously noted, the practice of consultation differs somewhat from the indirect service of supervision. Consistent with this distinction, informed consent in the practice of consultation is somewhat different than the process in supervision. When a direct service provider seeks consultation, the direct service provider fully anticipates providing competent care to clients but is typically seeking to be as expert as possible (Kurpius & Fuqua, 1993). In addition, while the play therapist consultee may disclose confidential information about a client, the information is typically not adequate to make the client identifiable. As a result, it may be a best practice for play therapists to acknowledge (in informed consent with clients) that they regularly consult with other professionals about cases to provide the best possible care. Play therapists might also clarify that consultation will only occur with qualified professionals and confidentiality will be guarded.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Informed Consent for Indirect Service Providers and Their Consultees/Supervisees

When play therapists are providing indirect services, informed consent between a play therapist and the supervisee or consultee can help frame the service provided and the expectation of each party (Jacob et al., 2016). In consultation, formal documentation of informed consent may not be necessary given the equal relationship and demonstrated competence of the consultee. The formal nature of supervision calls for a signed informed consent according to the Ethical Standards for Counseling Supervisors from the Association for Counselor Education, and Supervision (1993). This consent may include several of the issues typically addressed in informed consent for treatment including anticipated length of service, limits to privacy, any fees, risks and benefits, and storage of records (Thomas, 2007). Informed consent in supervision is designed to prevent supervisees from saying they would not have consented to receiving supervision had they been more aware prior to entering the supervisory relationship (Beahrs & Gutheil, 2001).

It is expected that supervisees and consultees should have the capacity for judgement and decision making for informed consent (Dekraai, Sales, & Hall, 1998). Though, in the case of both supervision and consultation, supervisors and consultants should assess for capacity. If supervisees or consultees are impaired to the degree that they lack capacity for decision making (e.g., whether or not to engage in indirect services with a play therapist supervisor/consultant) then informed consent cannot be obtained and supervision/consultation should not occur. This lack of capacity might well imply impairment on the part of the supervisee/consultee that could bring harm to clients and, consequently, the play therapist supervisor/consultant might need to take action (e.g., report to a clinic director or ethics board). Indirect service providers may want to consider whether the supervisee/consultee presents as using substances, with impairment of memory or thought process, or with an altered state of consciousness, all of which would undermine the capacity of the person to give consent and to provide competent care for clients.

The second component of informed consent, comprehension, is required in both supervision and consultation informed consent. While comprehension in consultation is often informally accounted for, comprehension should be explicitly addressed and documented in supervision, so the supervisee has a clear understanding of all aspects of supervision (McCarthy et al., 1995). McCarthy and colleagues (1995) and Thomas (2007) provided a list of issues to address in informed consent among supervisors and supervisees. Some examples of information Thomas (2007) suggests including are a supervisor's credentials, the time commitment and documentation of supervision, supervisor's responsibilities, confidentiality limits, financial interests, benefits and risks associated with supervision, and evaluation methods. This list gives a general overview of the kinds of information that can help potential supervisees make an informed decision about entering into a supervisory relationship. Comprehension in informed consent for consultation includes some of the same components as supervision, but may also be more limited (Jacob et al., 2016). Potential consultees should have comprehension of the consultant's areas of competence and expertise before consenting to consultation.

Voluntariness in informed consent assumes that consultees and supervisees have willingly consented to their received services (Corey, Haynes, Moulton, & Muratori, 2010). In consultation, the intentional act of choosing the consultant can imply the enactment of voluntariness, as the consultee usually actively initiated the consultation. In supervision, signing an informed consent form provides formal documentation that the supervisee voluntarily agrees to enter the supervision experience. However, supervision often happens in the context of a formal training experience and as a result, supervisees are often obligated

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

to have supervision since it is required for progress in an academic training program or in the pursuit of certification or licensure. The implication in supervision is that one can always choose not to pursue a particular training program and adequate information about the requirements of supervision must be made clear before a trainee begins the program.

Withdrawing from supervision or consultation involves consultees and supervisees acknowledging the benefits of the service on which they will miss out (e.g., a second opinion in consultation or formally documented hours of supervision). While consultees can willingly terminate their consultation, continue practicing, and seek help from another professional, supervisees should stop seeing the clients for whom they sought supervision until they have access to a qualified supervisor.

COMPETENCE IN PLAY THERAPY CONSULTATION AND SUPERVISION

Fairburn and Cooper (2011) defined competence as "the extent to which a therapist has the knowledge and skill required to deliver a treatment to the standard needed for it to achieve its expected effects" (p. 375). The ethical mandate of competence suggests that practitioners should only use the skills they know how to use. The directive for competence is made clear in several ethical codes. For example, ACA states, "Counselors practice only within the boundaries of their competence, based on their education, training, supervised experience, state and national professional credentials, and appropriate professional experience" (2014, C.2.a, p. 8).

There are various aspects to consider when accounting for competency. Licensure or certification as a counselor or mental health professional presents as a broad acknowledgement of the skills one has as a competent service provider. However, determining individual areas of competence are typically left to the discretion of the practitioner. Pope and Vasquez (2010) propose that formal academic training, professional training, and supervised experience may be the best standard for the establishment and defense of the boundaries of competence. In delivering indirect play therapy services, practitioners have to consider whether they are competent in their skillset as a play therapist to work with the client of the supervisee or consultant as well as in their skills as a consultant or supervisor.

Competence in Treating the Clients of the Supervisees and Consultees

It is important to be competent in play therapy skills as indirect service provision assumes the supervisor and consultant are competent in areas and for clients for which they provide consultation and supervision. Competence for play therapists spans knowing *about* particular treatments, populations, and presenting problems and knowing *how* to deliver these services to clients from diverse backgrounds in specific settings (Ashby & Clark, 2015). Practitioners should have documented formal instruction, training, and supervised experiences in the areas in order to be considered competent. Questions practitioners may ask in evaluating whether they are competent to supervise or consult on a case include: (1) am I competent in working with children; (2) am I competent to conduct play therapy; (3) am I competent to address the presenting concern; (4) am I competent in working with diverse clients; and (5) do I have adequate training and supervision to provide care to this client.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

1 and 2: Am I Competent in Working with Children and Conducting Play Therapy?

Play therapy is generally considered a "limited-domain intervention" (Barber, Sharpless, Klostermann, & McCarthy, 2007), which requires specialization in order to practice. The practice of play therapy assumes a competence in child therapy. Exhibiting competence in working with children can be achieved via academic course training in child development and child psychopathology, as well as in supervised experience working with child clients. Competence in the specialty area of play therapy may be established most easily through formal training and supervised experience. One way to demonstrate competence as a play therapist is to become a Registered Play Therapist (RPT). The APT (2015) notes that becoming a RPT does not infer one's achieved knowledge or competency, but it conveys certain education and training requirements have been met within the area of play therapy. Beyond training, one should be able to competently conceptualize a case within a theoretical framework, build a relationship, evoke change with certain activities or practices, and terminate treatment when necessary in order to be a competent play therapist.

3: Am I Competent to Address the Presenting Concern?

Addressing the presenting concerns of a client must be within one's competence, as treating a condition with inappropriate methods could lead to a worsened condition. While specialized trainings are required to gain competence in addressing certain presenting concerns such as these, general training, supervision, and consultation may be sufficient for competency in other areas (e.g., children coping with divorce or loss of a parent). Play therapists may regularly consult on cases to assure competence and should seek supervision or refer when they are confronted with cases outside the boundaries of their competence (Sweeney, 2001).

4: Am I Competent in Working with Diverse Clients?

Play therapists work with diverse clients in every session. While we may assume competence applies to clients who are culturally different from ourselves (e.g., different race/ethnicity, nationality, religious background) we must challenge ourselves to have awareness for the client's comprehensive culture (O'Connor, 2005). It is inevitable that clients' cultures will differ from our own, especially as we work with children – a culture in and of itself! In addition, clients can present with different values, languages, religions, ethnicities, and experiences. We are ethically obligated (ACA, 2014) to practice in a culturally competent manner (i.e., the continued effort of practitioners to exhibit effective work within the cultural context of the client [Campinha-Bacote, 2002]). Cultural competence involves having an awareness of one's own culture and biases and understanding the cultural experience of the client. To exhibit competence, practitioners should seek to educate themselves with supervision, training, coursework, and ongoing self-reflection (Gil, 2005).

5: Do I Have Adequate Training and Supervision to Provide Care to This Client?

Because play therapist supervisors and consultants should only provide this indirect service in areas where they are competent, they should consistently ask themselves if they have enough training and supervision to provide direct service to the client with adequate care. A good way to account for this is

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

to assess the amount of documented training and supervision hours that specifically relate to the area of competency being assessed.

Competence in the Practice of Consultation and Supervision

Play therapist must also be competent in providing supervision or supervision in order to ethically provide indirect service to clients and systems (Pope & Vasquez, 2010). Indirect service providers are typically viewed as experts when assuming the role of supervisor or consultant. In supervision, the indirect service provider takes on the role of expert as the person receiving supervision is working outside the boundaries of their competence. In this situation, play therapist supervisees work under a competent play therapist (the supervisor) to develop their competencies and the supervisor assumes responsibility for the client being seen by the supervisee. Consultants are viewed as competent play therapists who can trouble-shoot scenarios, consider different options, test hypotheses, and ask relevant questions. The consulting relationship is often more informal than supervision and is a service provided to competent individuals (e.g., a practitioner, parent, teacher) in collaboration to yield effective ideas to benefit the client. While the indirect service provider is being approached in consultation due to their exhibited competence, the person seeking consultation is also viewed as competent and the client ultimately remains the primary responsibility of the consultee (Jacob et al., 2016).

Although the degree of responsibility and the expectations for competency differ for consultants versus supervisors, the areas of competency are similar for both. Beyond the questions of competency related to the specific client, helpful questions of competency to ask yourself when entering into the role of an indirect play therapy service provider include: (1) do I have adequate preparation and training in consultation or supervision methods and techniques; and (2) am I aware of and able to address the multicultural and diversity issues present across relationships.

1: Do I Have Adequate Preparation and Training in Consultation or Supervision Methods and Techniques?

Similar to competency related specifically to the client, indirect play therapy service providers must have training and experience with the methods and techniques associated with consultation or supervision. This may include graduate level course work, simulated supervision or consultation, supervised experiences of supervision or consultation (i.e., meta-supervision), and continuing education activities (APT, 2015; Newman, 2013). These trainings should be focused both on general supervision and consultation as well as specific play therapy consultation and supervision (APT, 2015). While competency cannot be defined by certification, APT does offer credentialing as a Registered Play Therapist-Supervisor (RPT-S) to demonstrate that a certain level of training has been met. The RPT-S certification requires additional hours of general clinical and play therapy experiences compared to the hours attained as an RPT, as well as specific supervisor training (APT, 2015).

2: Am I Aware of and Able to Address the Multicultural and Diversity Issues Present across Relationships?

The ACA Code of Ethics (2014) highlights the importance of being aware of and able to address any multicultural and diversity issues that may be present across relationships. Due to the indirect nature of

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

supervision and consultation, this includes the indirect play therapy service provider (i.e., supervisor or consultant), the direct service provider (i.e., supervisee or consultee), the client, and the general context (e.g., school, clinic, home). Robinson, Bradley, and Hendricks (2000) suggested a four-step process for developing multicultural supervision competence. The first step is to develop awareness of how cultural issues affect counseling processes. In the second step, supervisors identify how cultural dynamics have an impact on supervision relationships. The third step is characterized by an exploration of cultural limitations and contributions of counseling theories. Finally, in the fourth step, supervisors integrate multicultural issues into existing supervision models.

Ingraham (2000) provided a multicultural consultation framework specifically for schools that can be adapted and applied to consultation across settings as well as to the supervision relationship. The following five components are included in the Multicultural School Consultation (MSC) framework and have been adapted to apply to the provisions of indirect play therapy services:

1. **Indirect Service Provider Learning and Development:** Knowledge and skill in areas such as understanding one's own culture and the impact it has on others, understanding individual differences within cultures, understanding of rapport building across cultures
2. **Direct Service Provider Learning and Development:** Knowledge and skill in areas such as decreasing the use of a "color-blind" approach, improving confidence
3. **Cultural Variations in the Indirect Provider-Direct Provider-Client Constellation:** Considering the similarities and differences between the consultant, consultee, and client
4. **Contextual and Power Influences:** Knowledge and awareness of the cultural context of the system, disruptions to balance of power and the impact
5. **Hypothesized Methods for Supporting Direct Service Provider and Client Success:** Using multiple perspectives to frame the problem, modeling bridging between cultures, seeking feedback from others

By following the Robinson et al.'s (2000) model and the guidelines provided by Ingraham (2000), the indirect service provider can continue developing their competency when working within diverse settings with culturally diverse clients.

When assessing competence in indirect play therapy services, the play therapist may ask a number of questions. The potential indirect play therapy service provider might ask (1) "Am I competent in the practice of supervision or consultation?"; (2) "If I am generally competent in the practice of supervision/consultation, am I competent in the area in which I would be providing that service in this situation (e.g., problem focus area, client population, or system)?"; and (3) "If questioned, could I easily defend my competence in each of these areas through education, training, and supervised experience?"

CONFIDENTIALITY IN PLAY THERAPY CONSULTATION AND SUPERVISION

Sommers-Flanagan and Sommers-Flanagan (2015) noted that confidentiality is one of the most important ethical considerations in mental health practice and Slack and Wassenaar (1999) found that issues of confidentiality were among the most common ethical dilemmas reported by clinicians around the world. Confidentiality refers to the ethical and legal obligation of a mental health provider to protect private information shared by a client in a therapeutic setting (Sweeney, 2001). The importance of con-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

fidentiality is rooted in the need for a sense of trust between the client and the therapist as an essential grounding of any therapeutic relationship. As further emphasized by the ACA code of ethics (2014, pg. 4), "Trust is the cornerstone of the counseling relationship, and counselors have the responsibility to respect and safeguard the client's right to privacy and confidentiality." However, confidentiality is not as straightforward as simply promising to never repeat what has been discussed. There are instances when confidentiality may legally or ethically be breached, such as when the client gives permission or when it is mandated by law.

The issue of confidentiality is further complicated in the practice of play therapy (APT, 2012; Carmichael, 2006). Although the legal obligation of confidentiality is reserved for the individual that provides informed consent (typically the parent or legal guardian of the play therapy client), the importance of trust in the therapeutic relationship remains equally important between a therapist and a child client. Finding the balance between respecting the child's right to privacy with the legal right of the parent or guardian to remain informed can be challenging (Sweeney, 2001). Serving in the role of supervisor or consultant, the picture of confidentiality becomes even more complex as one considers the issues of confidentiality related to child clients as well as supervisees and consultees.

Honoring the Confidentiality of the Supervisees' and Consultants' Clients

The obligation of confidentiality for information disclosed by or about the child receiving play therapy is an important consideration of the indirect service provider. However, the specific boundaries of confidentiality differ somewhat depending on the role of either supervisor or consultant. According to ACA (2014), one of the primary roles of the supervisor is to "monitor the services provided by supervisees" (p. 12). This process of monitoring naturally involves access to the client information disclosed by the supervisee and there is little about the client that will remain confidential between a supervisor and supervisee. It is the responsibility of the supervisor to protect the privacy of the child beyond the supervisory relationship. This is done both by not sharing confidential information with others and ensuring that the supervisee is aware of the obligation of confidentiality (Borders & Brown, 2005).

The consultation relationship differs from the relationship of supervisor and supervisee, which affects the structure of confidentiality. According to ACA (2014), information shared in a consulting relationship is discussed for professional purposes only and should not reveal identifying information whenever possible. This may be more difficult in settings such as schools where descriptions of a student's behavior (e.g., a fight in the hallway that is public knowledge in the school) or a personal attribute important to the consultation (e.g., a physical attribute that is resulting in bullying) may reveal the identity of the child. As a consultant, one can limit the amount of identifying information requested by asking, "Why am I seeking this information?" If it is not to help the presenting professional concern, it should remain confidential.

In both supervision and consultation, the child and legal client (e.g., parent, guardian) must be informed that information may be shared with other professionals, including supervisors and consultants. Furthermore, they must be informed that there are limits to confidentiality beyond these relationships. The limits of confidentiality for client information are the same for the indirect service provider as they are for the direct service provider, including (a) the legal client (e.g., parent) gives permission for information to be disclosed to a third party; or (b) it is required or permitted by law (Fisher, 2013).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Permission

The parent or guardian has the right to give permission for information to be shared with others (Remley & Herlihy, 2016). One common reason a parent may give permission is so that pertinent information can be shared with other professionals, such as teachers, who may need to know how best to work with the child. In cases such as these, it is important to protect the privacy and autonomy of the child as much as possible by allowing the child to have a voice in what information is to be shared. Other instances when permission may be given to breach confidentiality include needing to inform insurance policies about diagnoses or progress and transferring records between therapists or school systems. Again, all parties should be informed about what information is to be disclosed and to whom.

Required or Permitted by Law

Indirect play therapy service providers are regarded as mandated reporters. Therefore, when we take the role of a supervisor or consultant, we are legally and ethically required to breach confidentiality when there is a threat of harm to the child or other individuals. The supervisor is likely to play a direct role and even model for the supervisee this process, especially if it is a new domain for the supervisee. As a consultant, the indirect play therapy service provider can still support the process of mandated reporting without needing to be aware of the child's identity. Both in consultation and supervision, the indirect play therapy service provider should work with the direct play therapy service provider to make a plan of how to breach confidentiality. It is recommended that the child and the parent or guardian be included in or informed of the process when appropriate (Taylor & Adelman, 1989).

Honoring the Confidentiality of the Consultee and Supervisee

Just as trust is the cornerstone of a therapeutic relationship between the child and the play therapist, the foundation of trust is essential to the professional relationship between the indirect and direct service providers (Corey et al., 2010). Therefore, when we discuss confidentiality as an indirect play therapy provider, it is important to recognize the need to protect the privacy of the direct service provider in order to create a safe and supportive environment. It is not uncommon for supervisees and consultees to divulge personal information that arises for them as they work with clients. Care should be taken to ensure that both sides are clear about the guarantees and limits of confidentiality before the delivery of an indirect service. The limits of confidentiality in a supervisory or consultation relationship are similar to those in direct therapeutic relationships, including when permission has been given by the direct service provider and when it is ethically or legally required or permitted to breach confidentiality.

Permission

There may be instances where an indirect service provider is given permission to share information related to the direct service provider discussed during the supervision or consultation. For example, supervisees typically give consent for their supervisors to share evaluation information with other entities (e.g., state licensure boards, university practicum instructors). This consent is often required before supervision is undertaken and as Cobia and Boes (2000) note, should be explicitly outlined in the informed consent between supervisor and supervisee. In both supervision and consultation, the supervisee or consultee

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

may also give permission for the indirect service provider to disclose information for the purposes of recommendations for jobs or further training opportunities. In each case, consent for the disclosures should be clearly documented.

Required or Permitted by Law

As a mental health professional, the indirect play therapy service provider remains a mandated reporter. If there is any reason to believe that the direct service provider is engaging in harmful behavior towards the client, such as physical abuse, it is legally mandated that the behavior be reported immediately to the appropriate authorities. In many cases though, the boundary of harmful behavior is not as clear as physical abuse. For example, imagine a consultation situation in which the direct service provider is working with a child who he/she is not professionally competent to serve. Through consultation, it becomes clear to you as a consultant that the professional is practicing outside the boundaries of his/her competence. In situations such as these, where you believe the professional has violated their ethical obligations but it has not as of yet caused or threatened to cause substantial harm, ACA (2014) recommends first attempting to resolve the issue informally by approaching the colleague about your concerns. In this case, it would not be your ethical or legal obligation to immediately breach confidentiality. While these two situations demonstrate instances where the indirect play therapy service provider should and should not immediately breach confidentiality, it can often be less clear cut what it means to cause "substantial harm" (ACA, 2014). In those situations, it is often helpful to consult with other professionals without needing to reveal identifying information.

When assessing confidentiality in indirect play therapy services, the play therapist may ask a number of questions. The play therapy consultant or supervisor might ask, "Am I keeping information about the consultee or supervisee private and confidential?" "If I am disclosing information about the consultee or supervisee, do I have permission (e.g., signed release for disclosure of evaluation information from a supervisee to a licensure board) or am I ethically required to do so (e.g., with a seriously impaired consultee with whom I have not been able to resolve the situation informally)?" Because the play therapist providing indirect services has an ethical obligation to the consultee or supervisee and the client, the play therapy consultant or supervisor might also ask, "Am I keeping information about the client private and confidential?" "If I am disclosing information about the client, do I have permission (e.g., signed release for disclosure to teachers or systems) or am I ethically required to do so (e.g., as a mandatory reporter)?"

DUAL RELATIONSHIPS IN PLAY THERAPY CONSULTATION AND SUPERVISION

A dual role is generally understood as when a mental health service provider has a professional role with a person along with another role or relationship with the same person or a with a person closely associated with the person (Moleski & Kiselica, 2005). "This may involve assuming more than one professional role (such as instructor and therapist) or blending professional and non-professional relationships (such as a counselor and friend or counselor and business partner)" (Corey, Corey, & Callanan, 1998, p. 225).

The ACA code of ethics (2014) frames the discussion of dual relationships as "Managing and Maintaining Boundaries and Professional Relationships". The question becomes how far can boundaries be ethically extended? The answer differs depending on the type of indirect serviceprovided (consultation vs. supervision). The answer also depends on the other party in the potential dual relationship (the con-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

sultee/supervisee or the client of the consultee/supervisee). Again, the layered nature of indirect service provision adds complexity to decision-making when navigating potential dual relationships and ethical extensions of boundaries.

Managing Boundaries with Consultees' and Supervisees' Clients

Play therapists providing these indirect services must also manage boundaries with the clients on whose behalf indirect services are sought. For the clients of supervisees, the management of boundaries is very similar to the process used in navigating the boundaries between a counselor and a client. Because the supervisor is vicariously responsible for the client, the relationship to the client of the supervisee is similar to that of the counselor. In evaluating whether to engage in a dual relationship with the client of a supervisee, the recommendations of Younggren and Gottlieb (2004) seem instructive. The authors suggest that, before engaging in a dual relationship with a client, the professional ask and answer several questions. These include: Is entering into a relationship in addition to the professional one necessary, or should I avoid it? Can this relationship potentially cause harm to the client? If harm seems unlikely, would the additional relationship prove beneficial? Is there a risk that the dual relationship could disrupt the therapeutic relationship? Can I evaluate this matter objectively? The answers to these questions, in consultation with another professional, can aid in managing boundaries in an ethical manner.

Managing boundaries with clients of consultees may also be an ethical challenge. However, the consultant may not know the identity of the client. The ACA (2014) code notes that in consulting with colleagues, clinicians "disclose information only to the extent necessary to achieve the purposes of consultation." The indirect service provider engaging in this type of consultation would not have a dual role with the client, because the client was not identified to the consultant. Other forms of consultation (e.g., parent consultation, teacher consultation) offer additional challenge such as the client being typically identifiable and, as a result, the boundaries with the client should be managed. Nevertheless, the ethical boundaries with a consultation client may be different from the ethical boundaries with a supervision client. When the type of consultation client may differ significantly (e.g., the child of a parent with whom you are consulting but who you are, or are not, treating in play therapy, the student of a teacher with whom you are consulting but who you are, or are not, treating in play therapy, an administrator with whom you are consulting about a system), there are few rules that can be universally applied. Play therapists consultants may consider the proximity of the client of the consultee to the play therapist consultant, and apply Younggren and Gottlieb's (2004) method of evaluation. The answers to their questions may differ depending on the proximity of the consultant to the client (e.g., consulting with a teacher about a student who is not being treated by the play therapist but who attends the same school as the children of the play therapist).

Managing Boundaries with Consultees and Supervisees

Because the roles of supervisor and consultant are distinct, the management of boundaries differs for the play therapist providing these different indirect services. The role of supervisor is a professional role that typically involves some form of evaluation (e.g., letter of recommendation, licensure evaluation form, academic grade). As a result, the role of supervisor is likely incompatible with traditionally social roles (e.g., friend, family member) because the social role has the capacity to undermine the objectivity and effectiveness of the supervision (e.g., it's hard to give my friend or family member a less than stellar

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

evaluation) (ACA, 2014). However, unlike the traditional counselor-client relationship, the supervisor-supervisee relationship is typically time-limited and is unlikely to be resumed at a future date. Since a therapy client might return for therapy at another time, it may be unwise to begin a personal relationship with the client after initial termination of therapy since that personal relationship with the client would preclude the counselor from seeing the client in future (Pritchett & Fall, 2001). Unlike counseling relationships, supervision relationships are not typically resumed in future but are limited to a particular case or cases, pre-licensure period, or academic term. In contrast to work with counseling clients, supervisees often develop into colleagues with whom the past supervisor would welcome a personal or business relationship. Nevertheless, the ACA code of ethics (2014) emphasizes the evaluation and gatekeeping roles of supervisors and warns against supervising any individual "with whom they have an inability to be objective" (p. 13).

Managing boundaries as a consultant is somewhat less straightforward. The role of consultant does not typically involve evaluation (Jacob et al., 2016). As a result, an existing social relationship with a consultee (e.g., friend, family member) may be less likely to undermine the objectivity and effectiveness of the consultation. In addition, professionals often seek consultation from other professionals who they know personally (e.g., through similar professional involvement, business arrangements). Some aspect of a personal relationship may be the basis for consultation (e.g., knowing the person has an area of expertise and a style that appeals to the potential consultee).

Managing boundaries and potential dual relationships in indirect services can be particularly challenging and call for higher ordered thinking on the part of the indirect service provider. Understanding the role of the provider (consultant vs. supervisor) and, if consultation is being provided, the type of consultation, can inform the decision-making process.

CONCLUSION

In ethics, the primary goal is to "*do the right thing"* (Spike Lee). This chapter has provided a brief overview of four important ethical issues relevant to the indirect play therapy services of supervision and comprehension: informed consent, competence, confidentiality, and dual/multiple relationships. The application of these issues in play therapy supervision and consultation is complex and the above discussion is not a comprehensive list of the ethical issues relevant to these indirect services. The goal was to guide the reader in understanding how these issues apply when the ethical obligation of the play therapist is to both the supervisee or consultee and to the client of the supervisee or consultee.

As Sweeney (2001) has noted, ethical actions are "more than a professional mandate", they are "an extension of the play therapist's commitment to children" (p. 75). While it is not possible to address all ethical dilemmas that indirect service providers may experience, this chapter discusses topics that require heightened ethical awareness. Honoring the values of informed consent, competence, confidentiality, and dual relationships can help the play therapy consultants and supervisees fulfill their commitment to improving the lives of children.

Chapter 66
Psychological Well-Being, Self-Concept, and Couple Relations in University Students

Lucía Herrera Torres
University of Granada, Spain

Laila Mohamed Mohand
University of Granada, Spain

Sergio Cepero Espinosa
University of Granada, Spain

ABSTRACT

The aim of this chapter is to analyze the psychological well-being of university students, their self-concept and certain behaviours and attitudes of violence in couple relationships by gender and cultural group (European vs. Amazigh) as well as to determine the relationship amongst the three constructs evaluated. For it, 100 university students of the University Campus of Melilla, Spain, participated in the research. The Psychological Well-Being Scale (PWBS), the Test of Self-Concept Form 5 (AF-5), and the Dating Violence Questionnaire (DVQ) were the instruments used for the data collection. Main results showed differences by gender on the Degree of distress experienced by the presence of violent behaviours and attitudes in couple relationships, the Academic/Professional Self-concept and Self-Esteem. Regarding cultural group, differences were showed on the Couple Relationships Scale of PWBS. In addition, different correlations were found. Finally, the need to address the elements analyzed at the university context is discussed.

INTRODUCTION

Concern about the quality of teaching in Higher Education necessarily involves analyzing the different variables that can facilitate or hinder the process of teaching and learning with university students. Their psychological well-being is an element that is necessary to address (Salavona, Martinez, Bresó,

DOI: 10.4018/978-1-7998-3432-8.ch066

Copyright © 2021, IGI Global. Copying or distributing in print or electronic forms without written permission of IGI Global is prohibited.

Llorens, & Grau, 2005). In this sense, the scientific literature highlights the need to analyze and promote the psychological well-being of university students (Audin, Davy, & Barkham, 2003; Cooke, Bewick, Barkham, Bradley, & Audin, 2006; Howell, 2009; Ruthig, Haynes, Perry, & Chipperfield, 2007).

Also, the association between psychological well-being, self-concept and performance in the university context is a reality that has to be addressed by institutions of Higher Education (Stupnisky, Perry, Renaud, & Hladkyj, 2013).

Moreover, within university classrooms, affective or partner relationships among university students also take place, allowing the existence of beliefs and tolerant attitudes towards violence against women in the dating relationship (Ferrer, Bosch, Ramis, Torres, & Navarro, 2006) as well as violence in young partners (González & Santana, 2001; Strauss, 2004).

The aim of this work is to analyze the relationship between university students' psychological well-being, self-concept and certain negative behaviors and attitudes in young couple relationships. To do this, the following specific objectives were established:

- To analyze the frequency and degree of discomfort with the appearance of certain negative behaviors and attitudes experienced by dating couples, as well as the psychological well-being and self-concept of university students according to gender and cultural group.
- To establish if there is a relationship amongst these negative behaviors and attitudes in dating relationships, the psychological well-being and self-concept of students.

BACKGROUND

The University Context

Higher Education is immersed in a process of change and adjustment, derived from the European convergence process (Jacobs & van der Ploeg, 2006; Justice et al., 2006). It is characterized by complexity, the multitude of situations, functions, contexts and agents involved, which makes it different from other educational stages (O'Neill, Moore, & McMullin, 2005; Tomusk, 2006). In addition, the requirements arising from the quality assurance in Higher Education must be added (Ardi, Hidayatno, & Zagloel, 2012; Lodge & Bonsanquet, 2014; Singh, 2010; Turner, 2012; Zineldin, Akdag, & Vasicheva, 2011), which is a highly competitive and stressful setting (Barkhuizen, Rothmann, & van de Vijver, 2014; Krieg, 2013).

However, the two main protagonists are university teachers and students. It is therefore necessary to address different psychological variables, related both to teachers (Klassen, Tze, Betts, & Gordon, 2011) and students (Richardson et al., 2012), which can affect the adjustment and quality of the teaching, and learning process.

Regarding teachers, their initial training is diverse and, usually, they do not receive specific training to address the different challenges in Higher Education institutions (Hawes & Donoso, 2003; Shulman, 2004). In this sense, university teachers have to develop many different areas of work: teaching, research, management, transfer of knowledge, etc., that make their professional identity a very complex issue (Clarke, Hyde, & Drennan, 2013). Therefore, it is common for university teachers to experience stress and burnout (Tytherleigh, Webb, Cooper, & Ricketts, 2005; Yusoff & Khan, 2013).

With regard to students, the performance and academic adaptation of these is related to their level of satisfaction (Denson, Loveday, & Dalton, 2010; Duke & Weeks, 2010) as well as different variables

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

such as social support, self-esteem and stress (Friedlander, Reid, Shupak, & Cribbie, 2007). Thus, it is necessary to pay special attention to stress and emotional exhaustion at Higher Education (Gonzalez & Landero, 2007).

The burnout or "burnout syndrome" is composed of three dimensions: fatigue or emotional exhaustion, depersonalization and low personal accomplishment (Maslach, Schaufeli, & Leiter, 2001). In the academic context, students with academic burnout are characterized by a lack of interest in their study, low motivation and fatigue before the learning task (Lee et al., 2010). External and internal causes are included in the etiological factors of academic burnout (Zhang, Gan, & Cham, 2007). In the first one, excessive number of activities related to learning is identified while the latter are usually set by certain individual traits, such as self-efficacy, self-concept, locus of control, self-esteem and anxiety trait (Jacobs & Dod, 2003; Silvar, 2001). Given the importance of this issue, there are many studies examining burnout and emotional exhaustion among university students (Heikkilä, Niemivirta, Nieminen, & Lonka, 2011; Lian, Sun Ji, Li, & Peng, 2014; Shih, 2015).

Based on what has been mentioned above, in the following sections different researches focused on the psychological well-being, self-concept and relationships in college students are described.

Psychological Well-Being

Well-being has been studied from the Psychology field and specifically its development lies within Positive Psychology. Traditionally, Psychology has shown a clear clinical guidance focused on research of psychological disorders and their possible intervention. However, currently it shows a growing interest to understand the positive side of human beings and the development of their potential, providing knowledge and strategies to achieve personal growth and higher well-being balance (Wong, 2011). As advocated by the pioneers of Humanistic Psychology, and as postulated from the new trend called Positive Psychology, Psychology plays an important role in helping to develop human potential.

Positive Psychology is conceived as the scientific study of optimal human functioning and its general objective is to discover and promote those factors that allow growth to individuals and communities. Therefore, Seligman and Csikszentmihalyi (2000) argue that positive psychology is interested in searching for human excellence through enhancing the qualities and the sources of strength of human beings (Kobau et al., 2011; Molony & Henwood, 2010).

Wellbeing can be obtained through two routes: the hedonic route, that is, the experience of positive emotional states of mind and the satisfaction of desires; and eudaimonic route, the presence of meaning and development of the potentialities of everyone (Peterson & Seligman, 2004; Ryan, Huta, & Deci, 2008; Ryff, 2014).

- The hedonic route refers to the subjective well-being, that is, pleasure, positive affect compared to negative, emotional balance, positive emotions, net affection and life satisfaction. Life satisfaction (overall assessment of life) and happiness (assessment of more immediate aspects) are included on this route (Keyes, Shmotking, & Ryff, 2002). Subjective Well Being depends on external conditions and is linked to the environment.
- The eudaimonic route or psychological well-being is more focused on the virtues, self-actualization, psychological growth, goals and psychological needs and strengths. Therefore, it focuses on the positive performance of the individual, in the development of the true potentialities of everyone (Ryff & Singer, 2008).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Thus, the level of wellbeing of students, both subjective and psychological (Keyes, Shmotking et al., 2002; Ryff & Singer, 2008), will determine their functioning and adjustment to the university setting.

Health and wellbeing of university students are related to academic performance (El Ansari & Stock, 2010). Psychological well-being is related in college students to optimism and positive values towards health (Burris, Brechting, Salsman, & Carlson, 2009). Proactive coping is a partial mediator of social support in the positive affection of university students and, in turn, positive affection is associated with better psychological functioning (Greenglass, & Fiksenbaum, 2009).

Thus, a relationship between well-being and achievement-related functioning has been identified (Howell, 2009). In this way, Salavona et al. (2005) find a positive relationship between psychological well-being of college students and academic achievement, academic self-efficacy beliefs, the engagement (energy and dedication) and satisfaction with the studies. However, the relationship is negative with burnout (exhaustion, cynicism and lack of effectiveness in the studies), showing a greater propensity in this case to dropout.

Moreover, during the first year at the university a high level of stress and anxiety is experienced (Ruthig et al., 2007). Thus, the psychological well-being gets affected especially at the beginning of university studies (Bewick, Koutsopoulou, Miles, Slaa, & Barkham, 2010) and can lead to the appearance of psychological stress in the first academic year (Verger et al., 2009). Among the risk factors for psychological well-being of the students are, for example, high anxiety before exams, low self-efficacy and certain personality traits, such as shyness, excessive perfectionism or the tendency to loneliness (Tosevski, Milovancevic, & Gajic, 2010).

Related to the above, the use of university counseling services is important (Cooke et al., 2006). Universities must offer students counseling services, which have to develop specific programs tailored to the needs and characteristics of their students. In this regard, Audin et al. (2003) developed a program focused on the psychological well-being of college students and their satisfaction. To do this, they involved departments, students and university staff. Students were advised on matters relating to academic Departments, university support services and university managers. This study shows the need for a change at the university to generate greater satisfaction and psychological well-being in college students.

Similarly, psychological well-being is related to self-concept and performance (Stupnisky et al., 2013). Therefore, in the following section the self-concept construct will be addressed.

Self-Concept

Self-concept is a psychological construct that refers to the perception or image that each one has of himself or herself (Viljaranta, Tolvanen, Aunola, & Nurmi, 2014). Self-concept is formed by self-schemes related to different contexts: academic/professional, social, emotional (called self-esteem), family and physical (Garcia & Musitu, 2001).

In this way, Richardson, Abraham, and Bond (2012), highlight through a meta-analysis study, five areas that relate to the academic success of university students: personality traits, motivational factors, strategies of self-regulated learning, approaches to student learning and, finally, psychosocial contextual influences. Among the motivational factors, numerous studies suggest a close relationship between academic self-concept and university academic results (Awad, 2007; Choi, 2005; Cokley, 2000; Gerardi, 2005; Thomas & Gadbois, 2007). Academic self-concept of students strongly influences their academic self-efficacy beliefs (Marsh & Martin, 2011), so that predicts (and mediates) the affective-motivational type of variables (Ferla, Valcke & Cai, 2009).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Within self-concept, scientific literature indicates the importance of self-esteem at university level as it relates to performance and academic adjustment (Aspelmeir, Love, McGill, Elliot, & Pierce, 2012; Friedlander Reid, Shupak, & Cribbie, 2007; Rosli et al., 2012). From this perspective, Herrera, Mohamed and Cepero (2016) found a positive correlation between self-esteem and satisfaction with studies, though negative with emotional exhaustion in university students.

In addition, self-esteem at the university level is linked to professional future. Thus, Salmera-Aro and Nurmi (2007) found that self-esteem during university studies related to career a decade later. Students with high self-esteem had permanent jobs, better wages, a high level of engagement (commitment and involvement) at work, greater satisfaction with it and low levels of burnout, at a point ten years later.

Couple Relations

Universities also make it possible to meet other people, the establishment of social relationships as well as couple relationships. The academic and interpersonal stress which is experienced in institutions of Higher Education can lead to dating violence (e.g., psychological aggression, physical assault, and sexual coercion) (Mason & Smithey, 2012).

In recent decades both at national and international level, policies have been implemented which are geared towards combating gender violence. Their primary objective is focused on gender equality (Fontanil et al., 2005; Labrador, Fernandez-Velasco, & Rincon, 2010; World Health Organization, 2005). In Spain, the introduction of the Organic Law 1/2004 of December 28th on comprehensive protection measures against gender violence as well as the Organic Law 3/2007 of March 22nd for Effective Equality between Women and Men, have been accompanied by the development of administrative policies to raise awareness, prevent and detect problems of this nature.

Thus, there are various investigations that have focused on this topic in recent years (Expósito & Herrera, 2009; Harrison & Abrishami, 2004; Marcus, 2007; Ruiz, Exposito, & Bonache, 2010; Sugarman & Hotaling, 1989). However, studies and publications related to intimate partner violence in young people are still insufficient (Halpern, Oslak, Young, Martin, & Kupper, 2001; Jones & Gardner, 2002; Kaestle & Halpern, 2005; Rodriguez-Franco, López- Cepero, & Rodriguez-Diaz, 2009).

METHOD

Participants

This research has been conducted with university students from the Autonomous city of Melilla (Spain). It is a Spanish city that is geographically located in the northeast of Africa, opposite the coast of Almeria, Granada and Malaga. Its area is about 12 km^2. The official census data indicates that its population now exceeds 80000 inhabitants. In this city it can be seen the coexistence of four communities or cultural groups: European, Amazigh, Hebrew and Hindu. In particular, there have been some studies on gender violence centered on the Berber origin or Amazigh population (Mohamed, Seijo, & Novo, 2012).

The study involved 100 volunteer university students from the Faculty of Education and Humanities of the University of Granada (University Campus of Melilla, Spain). The type of sampling used was therefore not probabilistic.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

By gender, 19 were men and 81 women with an average age of 20.14 years ($SD = 2.67$). Academically, 63 students were enrolled in the degree in Early Childhood Education and 37 in the Degree in Primary Education. 59 students were studying first year, 23 second year and 18 third year.

In addition, 68.0% of students were from European cultural origin while 32.0% were from Amazigh cultural background (also called Berber and whose geographical location is located in the Riff region of Morocco).

Instruments

Next the three instruments used for data collection are described:

- **Dating Violence Questionnaire (DVQ):** Designed by Rodriguez-Franco, Antuña, Rodriguez-Diaz, Herrero, and Nieves (2007). It consists of 42 items in which different negative behaviors and attitudes are introduced that may interfere with the dating relationship. To do this, it asks participants to indicate the frequency of occurrence of these behaviors through a *Likert* scale of five points where 1 = Never and 5 = almost always. Secondly, it asks participants to indicate the degree of discomfort that has been experienced for such behaviors and attitudes that have taken place or would be experienced in the theoretical assumption that they occurred, through a standard *Likert* scale of five-point, where 1 = Not at all and 5 = Very much.

The DVQ has been validated in Spanish, Mexican and Argentinean students (Rodríguez-Franco et al., 2010), as well as in American (Fabelo, & López-Cepero, 2012) and Italian youths (Presaghi, Manca, Rodríguez-Franco, & Curcio, 2015).

The reliability of the questionnaire, found in the study by Rodríguez-Franco, Antuña, Lopez-Cepero, Rodriguez, & Bringas (2012), is .926. In the present study the reliability of the questionnaire has been estimated by *Cronbach's alpha* statistic, obtaining a value of .955. Specifically, for the *Frequency of occurrence of negative behaviors and attitudes in dating relationships* the internal consistency was of $\alpha = .960$ and the *Degree of discomfort experienced* was $\alpha = .986$.

- **Psychological Well-Being Scale (PWBS):** The PWBS (Sánchez-Cánovas, 2007) consists of four subscales: Subjective Psychological Well-Being, Material Well-Being, Labour Well-Being and Couple Relationships. The first and last subscales have been used for the purpose of this research.

The Scale of Subjective Psychological Well-Being consists of 30 items related to feelings that have been experienced throughout life (for example, I am optimistic, I feel young, etc.). Subjects have to answer according to a *Likert* scale of five points, where 1 = Never and 5 = Always. Meanwhile, the Couple Relationships Scale has 15 items that refer to personal attitudes regarding sexuality and relationships (for example, I am happy with my partner or I attend to the sexual desire of my partner). In this case, it was also answered on a five point scale where 1 = strongly disagree and 5 = strongly agree. The reliability of the *Subjective Psychological Well-Being Scale* is high ($\alpha = .928$) and the *Couple Relationships Scale* ($\alpha = .868$).

In the same way as for the previous questionnaire, reliability in this research for both scales was calculated, obtaining a value of $\alpha = .941$ for the Subjective Psychological Well-Being Scale and $\alpha = .833$ for the Couple Relationships Scale.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Self-Concept Questionnaire, Form 5 (AF-5), of García and Musitu (2001):** This consists of 30 items that assess the subject's self-concept in the Social, Academic/professional, Emotional or Self-esteem, Family and Physical contexts. The subject has to answer according to an attributive scale of 1 to 99 depending on how the item will fit to the subject's assessment. Esnaola, Rodriguez, and Goñi (2011), when analyzing the psychometric properties of this test indicate that its total reliability is $\alpha = .74$. The index of internal consistency, *Cronbach's alpha* calculated for this study yielded a value of $\alpha = .760$.

Procedure

For Data Collection

During the first half of November, measuring tools were administered collectively by classrooms, in two sessions of 30 minutes each. In the first session they completed the PWBS and AF-5 and in the second the DVQ. At the beginning of each session students were informed that this was a research project in which their participation was voluntary, anonymous, without any link with the subject in which their course of study was passed and that their involvement would help us to know more of their experiences and feelings in relation to the object of study.

For Statistical Data Analysis

Firstly, the distribution of data was analyzed to determine whether it fulfilled the requirement of normality according with Gaussian distribution in order to decide the type of statistical tests (parametric and nonparametric) that were more appropriate to develop. To achieve this, the *Kolmogorov-Smirnov* test was used for total scores on different subscales of the three measuring instruments (see Table 1).

Since values for some cases were statistically significant ($p < .001$, $p < .01$), the null hypothesis for the normally distributed data was rejected.

The homogeneity of variance or homoscedasticity was also analyzed. For it, *Levene*'s test was used for the independent variables gender and cultural group (see Table 2). Results by means the *t-test* for independent variables showed that the homogeneity of variance was not achieved in all cases.

According to that described above, the use of nonparametric tests was indicated. In this regard, the nonparametric tests used were the *Mann-Whitney U* test for analysis based on gender and cultural group variables, and the correlation analysis of *Spearman*, to find the possible relationship between the different dependent variables.

RESULTS

This section describes the results obtained in response to the research objectives. In first place violence in couple relationships, psychological well-being and self-concept of university students attending the independent variable gender are analyzed. Next, an analysis is set according to the cultural group. Finally, a correlation analysis to determine the possible relationship between the different constructs evaluated is performed.

Results by Gender

Table 3 shows the results of statistical analysis, through the nonparametric *Mann-Whitney U* test, in each of the constructs evaluated as well as the dimensions that comprise them depending on the gender variable.

The results revealed differences by gender in the *Degree of discomfort* experienced in the presence of negative behaviors and attitudes in couple relationships, $U = 362.000$, $W = 552.000$, $Z = 3{,}583$, $p = .000$, so women showed a greater degree of discomfort than men. Similarly, differences in the *Academic/ Professional Self-concept* were found, $U = 516\,500$, $W = 706\,500$, $Z = -2{,}223$, $p = .026$, in which women also scored higher, as well as the *Emotional Self-concept,* $U = 430{,}000$, $W = 3751.000$, $Z = -2983$, $p = 0.003$, although in this case women scored lower than men.

Results by Cultural Group

The same analysis was carried out but considering the students cultural group (see Table 4).

Only statistically significant differences were obtained in the *Couple Relationships Scale* according to the cultural group, $U = 730.000$, $W = 1258{,}000$, $Z = -2{,}648$, $p = .008$, with students of Amazigh cultural background showing a lower score compared to those of European origin.

Results of the Correlation Analysis

Finally, a Spearman correlation analysis was carried out in order to determine whether there was a relationship between negative behaviors and attitudes in couple relationships, psychological well-being and self-concept of students (see Table 5).

First, the Frequency of occurrence of negative behaviors and attitudes in the couple relationship was related significantly and negatively with the Degree of discomfort experienced, Rho = -.480, p = .000, Couple Relationships Scale, Rho = -.364, p = .000, and Family Self-concept, Rho = -.349, p = .000. On the other hand, the Degree of discomfort experienced correlated positively with the Couple Relationships Scale, Rho = .254, p = .011, and negatively with Physical Self-Concept, Rho = -.196, p =. 049.

		Female	47.82		

*** $p < .001$, ** $p < .01$, * $p < .05$

The Psychological Well-Being Scale was related to the Couple Relationships Scale, Rho = .308, p = .002. Similarly, it was related with all subscales of AF-5, that is, Academic/Professional Self-Concept, Rho = .344, p = .000; Social, Rho = .437, p = .000; Emotional, Rho = .255, p = .010; Family, Rho = .254, p = .011; and Physical, Rho = .438, p = .000.

In addition, the Couple Relationships Scale related to the Academic/Professional Self-Concept, Rho = .208, p = .038; Social, Rho = .225, p = .025; and Family, Rho = .215, p = .032.

Academic/Professional Self-Concept was related to the Social, Rho = .305, p = .002, Family, Rho = .205, p = .041; and Physical, Rho = .337, p = .001.

Finally, Social Self-concept related to the Emotional, Rho = .197, p = .048; Family, Rho = .367, p = .000; and Physical, Rho = .455, p = .000.

CONCLUSION

Firstly, according to the initial aims, gender differences in the constructs Negative behaviors and attitudes in dating relationships as well as Self-concept are obtained. Specifically, with reference to violence between dating couples, women are expressing a greater degree of discomfort than men related to violence, real or hypothetical, within their relationships. These data may be due to the constant advertising campaigns

** $p < .01$

that are being made in the media as a measure to prevent and eradicate gender violence, although the importance of incorporating this subject within university contents of studies cannot be ignored (Ferrer et al., 2006), especially when the participants of this study will be dedicated to the education of children of primary and early childhood education (Diaz-Aguado, 2005).

As for Self-concept, significant differences in relation to gender have been found, which coincides with different researches (Padilla, Garcia, & Suarez, 2010). In fact, women get higher scores in the Academic/Professional Self-concept (Pastor, Balaguer, & Benavides, 2002), whereas men score higher on Self-Esteem (Amezcua & Pichardo, 2000).

Secondly, differences depending on the cultural group in the construct Psychological Well-Being are found. Such differences are not in the dimension Subjective Psychological Well-Being, which is consistent with previous studies showing similar results in different cultures (Disabato, Goodman, Kahsdan, Short, & Jarden, 2016). In particular, it is in the dimension Couple Relationships where European students get higher scores than Amazigh. This result may be due to the type of education that has been acquired in the family, because in the Amazigh culture issues related to couples and feelings are considered a taboo, especially for women, so they are taught they should not discuss them with anyone (Mohamed et al., 2012).

Thirdly, the results of correlational analyzes show a negative relationship between the frequency of occurrence of gender violence behaviors by the partner which is generally low, and the degree of discomfort caused by them, which is usually higher, and the dimension of Couple relationship of *PWBS*,

		p			.002	.000	.000	.010	.011	.000
	Couple Relationships	*Rho*				.208*	.225*	.150	.215*	.174
		p				.038	.025	.136	.032	.084
Self-Concept	Academic/professional	*Rho*					.305**	-.116	.205*	.337**
		p					.002	.249	.041	.001
	Social	*Rho*						.197*	.367***	.455***
		p						.048	.000	.000
	Self-esteem	*Rho*							.162	-.037
		p							.107	.714
	Family	*Rho*								.148
		p								.143

*** $p < .001$, ** $p < .01$, * $p < .05$

which may reflect that the lower the frequency of occurrence of these behaviors is, the greater the well-being experienced in the couple relationship (Proulx, Helms, & Buehler, 2007). The relationship is also negative with the Family Self-concept, that is, students with higher family self-concept show a lower frequency of gender violence behaviors. In this case, the influence of the family and, specifically, family education may serve as a protector against the possible occurrence of gender violence.

Moreover, the degree of discomfort experienced against the real or hypothetical presence of couple violence is related positively with the dimension Couple Relationship of *PWBS* and negatively with the Physical Self-concept. Probably, this fact is due because those students whose physical self-image is greater do not see themselves experiencing an episode of gender violence.

It stresses that the dimension Subjective Psychological Well-Being correlates positively with both the other dimension of *PWBS*, Couple Relationship, as with the five dimensions of Self-concept. Similarly, the second dimension of *PWBS* correlates with different dimensions of Self-concept. These results corroborate those from other studies, which highlights the association between Psychological Well-Being and Self-concept (King, Extremera, & Pena, 2011; Rodríguez-Fernández Droguett, & Revuelta, 2012; Stupnisky et al., 2013).

Finally, the Academic/professional Self-concept correlates with the Social, Familial and Physical dimensions of self-concept. In the same way, Social Self-concept is related to Self-esteem, Family and Physical Self-concept. As already described above, the Academic Self-concept is strongly linked to self-efficacy beliefs and academic success (Awad, 2007; Marsh & Martin, 2011; Thomas & Gadbois, 2007). In addition, in this situation mediate affective-motivational variables (Aspelmeir et al., 2012; Ferla et al., 2009). Therefore, it highlights the need to address issues related to social identity, internalization of social context and groups that comprise it given that for university students are relevant both a sense of belonging to different groups in those who move as social support perceived by them (Haslam, Jetten, Postmes, & Haslam, 2009).

FUTURE RESEARCH DIRECTIONS

One of the goals in Higher Education is to encourage a quality process of teaching and learning. In order to achieve this goal it is necessary to consider the factors that may facilitate or hinder this process (Audin et al., 2003; Cooke et al., 2006). The results obtained on this research show the need to implement programs that address the attitudes and behaviors related to health as it relates to academic achievement in institutions of Higher Education (El Ansari & Stock, 2010). These programs have to meet the personality characteristics and values associated with the psychological health of university students (Burris et al., 2009). Access to the university and beginning a new program of studies in itself can be a time of anxiety for students, so it is important to ensure that they receive the necessary support throughout their studies so they can successfully complete their course, which will allow a more pleasant transition throughout university and, ultimately, into the labor market (Bewick et al., 2010).

The development of successful coping behaviors will likely reduce stress and allow students to develop problem-solving strategies, while psychological balance and well-being will remain. In short, university counseling services have to address issues of psychological health of students and carry out campaigns of active dissemination (Tosevski et al., 2010) so that the functions of advice and guidance are met for the personal, academic and professional development of students. This implies a teamwork which involves not only counseling services but also the entire university community (departments,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Dean's offices, administrators, etc.). University quality cannot be limited only to making reports but especially to the satisfaction and well-being of its members. Therefore, it must continue advancing both in terms of research and change of the organizational structure of the university.

Moreover, although this study was conducted in a relatively small sample of university students, it is worthwhile to continue doing research in this direction, mainly to analyze in greater depth the differences according to gender and cultural group.

Finally, the present study has been developed with training students whose career goal is to work as teachers. In these future teachers it is necessary to deepen into different variables that can affect their professional work as, for example, their cognitive and emotional empathy (Herrera, Buitrago, & Avila, 2016).

ACKNOWLEDGMENT

This research was co-financed by the Vice-Rectorate for Research and Transfer of Knowledge of the Granada University, Spain (Program 20, Target-Based Funding. 2015-17 Contract Program) and the Research Group DEDiCA (Development, Education, Diversity, and Culture: Interdisciplinary Analysis -Ref. HUM-742), within the framework of the Andalusian Plan for Research, Development and Innovation of the Regional Government of Andalusia, Spain.

KEY TERMS AND DEFINITIONS

Construct: Theoretical construction, concept formulated to be used in Science (e.g., intelligence and personality).

Couple Relation: Bound between two people characterized by mutual love and deep reciprocal feelings.

Cultural Group: A group of people sharing the same knowledge, beliefs, arts, values, laws, customs, habits and skills.

Dating Violence: Behaviors and/or attitudes within couple relationships, which cause or intend to cause damage of various kinds (physical, psychological, sexual ...) to the other member.

Gender: Set of behaviors and attitudes learned that each culture associates with being male or female, developing in each culture a certain ideal of masculinity and femininity.

Psychological Well-Being: Construct or broad concept that integrates social, psychological and subjective dimensions and healthy behaviors that allows the individual to function positively.

Self-Concept: Beliefs about one-self. Set of characteristics (physical, intellectual, emotional, social, etc.) that make up the image that an individual has of himself or herself.

Chapter 67
Cognitive Remediation Therapy in Chronic Schizophrenia

Susmita Halder
Amity University, India

Akash Mahato
Amity University, India

ABSTRACT

Cognitive impairments are now recognized as one of the most ubiquitous features of schizophrenia. Cognitive deficits appear to play a large role in how patients with schizophrenia function in their everyday lives. The role of cognitive deficits in schizophrenia may be gauged by the fact that even when patients with schizophrenia are relatively free of psychotic symptoms, many still have extraordinary difficulty with communication, motivation, self-care, and establishing and maintaining relationships with others. Patients with schizophrenia are often additionally treated with supportive psychotherapy, behavioral management, or social skills training as required. However, the efficacy of these adjunct therapies could be limited in presence of marked cognitive deficits. Thus it becomes crucial to have specific intervention for the underlying cognitive deficits that appear detrimental to improvement of functioning of patients with schizophrenia. The present chapter focuses on cognitive training based intervention program for schizophrenia patients and its efficacy.

INTRODUCTION

Schizophrenia is a major psychiatric disorder characterized by a disruption in affective, cognitive and social domains, which results in compromised ability to adapt to a changing environment and to function adequately in the community. It is a hypothetical construct that clinicians and scientists have developed in an attempt to capture a complex reality (Morey, 1991). As a diagnostic construct, it is inferred from behaviour of a client or the symptoms reported by him. The complexity of the illness is such that even psychiatric experts concede on hypothetical construct nature of the diagnostic categories in schizophrenia (Wong, 2014).

The deterioration in cognitive and behavioural functions has been implicit in initial conceptualization of the illness to an extent that Kraeplin (1919) described the illness as an irreversible and deteriorating condition like dementia (Goldman, Axlerod, & Taylor, 1996). Cognitive impairments are now recognized as one of the most ubiquitous features of schizophrenia. It is suggested that these impairments are very apparent and detectable before the onset of symptoms that meet diagnostic criteria for schizophrenia. The severity of these impairments may vary from moderate to severe even at the time of the first break of the symptoms and they tend to persist throughout the course of the illness (Bowie & Harvey, 2005). Meta-analytical studies provide substantial evidences that these cognitive impairments are present significantly at early stage of the illness even in drug naive patients; thus they are not resulting from other symptoms or antipsychotic treatment (Bergman, Cervenka, Flyckt, Edman, & Farde, 2014). The recognition that cognitive dysfunction is a central feature of schizophrenia has elevated its importance for both research and treatment. One of the main incentives for understanding the signature of cognitive impairment in schizophrenia is the strong relationship between cognitive performance and functional skills and functional outcome.

Despite the widespread prevalence of cognitive impairment in schizophrenia, there is considerable controversy as to whether the deficits reflect a generalized and a global neuropsychological impairment. The presence of diffuse cognitive impairment has been documented in patients with schizophrenia across a range of cognitive measures (Hoff et al. 1999; Mohamed, Paulsen, O'Leary, Arndt, & Andreasen,1999; Saykin et al., 1994). Although there appears to be a group of patients who are impaired only minimally, most patients are characterized as having at least some impairment across a number of domains.

SPECIFIC NEUROPSYCHOLOGICAL DEFICITS IN SCHIZOPHRENIA

Several studies identify selective impairments of a greater magnitude against a background of global impairment. Specifically, the cognitive deficits appear to be larger in areas of attention, memory and executive function.

- **Attention:** Schizophrenia is characterized by deficits in attention (Bleuler, 1911; Kraepelin, 1919; Shakow, 1962) and it has been claimed that these attention deficits are related to dysfunctional brain systems that underlie the pathophysiology of the disease (Robbins, 1990; Norman et al., 1997). Attention skills are disrupted by a wide variety of causes and attention is a critical underlying component of many cognitive functions. Without intact attention skills; many other skills, including learning, communication, and problem-solving become difficult or impossible. Furthermore, attention deficits can be mistaken for memory deficits when memory functions are in fact intact.
- **Memory:** Memory impairment is one of the most common cognitive problems in schizophrenia patients (Gourovitch & Goldberg, 1996). This type of impairment is usually long- term, debilitating and difficult to treat (Chen& McKenna, 1996). In last many years, an increasing amount of research has investigated memory deficits in schizophrenia. Schizophrenia patients have been found to be impaired on their ability to recall, recognize, and learn both visual and verbal materials (Gold, Carpenter, Randolph, Goldberg, & Weinberger, 1997; Tamlyn et al., 1992; Paulsen et al., 1995). These findings have been postulated to result from neuropathological abnormalities in the temporal- hippocampal area (Goldman et al., 1996). Consistent with learning theory, three

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

phases of learning are implemented in memory training: acquisition, application, and adaptation. Each phase imposes different demands on the learner and requires adjustment in instructional strategies.

- **Executive Function:** Executive functions include the capacity to formulate goals, plan and organize goal- directed behavior, carry out goal directed behavior fully and effectively, and monitor and self- correct one's behavior needed. Disturbances in executive functions have been structurally related to the prefrontal lobes, neuropsychological to defective performance in tests of problem- solving abilities, and functionally to disability in maintaining a complex behavior sequence without help. Schizophrenics have varying grades of impairment of executive processes, which result in difficulties during extended and multifaceted interpersonal interactions. Carter and Barch (2000) relate the neural basis of executive functions to the dorsolateral prefrontal cortex and anterior cingulated cortex, and show that functional imaging studies identified disturbances in other areas as well, particularly the temporolimbic region. Disturbances in higher cognitive functions may have an engaging relationship to the functional hypofrontality observed among these patients during positron emission tomography (PET) and functional MRI studies. Luria (1973) have referred to the loss of meaningful, directed behaviour resulting from frontal lobe lesions, in the absence of marked disturbances in motor activity or sensitivity, agnosis or praxis as a construct in rehabilitation.

EFFECT ON REAL-WORLD FUNCTIONING

Cognitive deficits appear to play a large role in how patients with schizophrenia function in their everyday lives. Impaired cognition can harm patient compliance to treatment regimens and reduce motivation to engage in a therapeutic alliance (Olfson et al., 2000). Cognitive deficits may be the most vital factor in predicting real-world functioning in patients with schizophrenia, such as availing public transport and doing financial transactions in shops or bank. In a study, geriatric patients who were able to live in the community in comparison to institutionalized patients were found not differing from them on most measures, including the severity of their positive symptoms; however, their cognitive functioning was dramatically better than the institutionalized patients, suggesting that a patient's level of cognitive functioning might be the most important determinant of real-world outcomes (Harvey & Keefe, 1997). Similarly, Green (1996) tried to determine which, if any, neurocognitive deficits restrict the functioning of schizophrenic patients in the outside world. He reviewed studies that have evaluated neurocognitive measures as predictors and correlates of functional outcome for schizophrenic patients. The review included seventeen studies that evaluated specific neurocognitive correlates of community functioning, social problem solving, and psychosocial skill acquisition. Results suggested that despite wide variation among studies in the selection of neurocognitive measures, some consistencies emerged. The most consistent finding was that verbal memory was associated with all types of functional outcome. Vigilance was related to social problem solving and skill acquisition. Negative symptoms were associated with social problem solving but not skill acquisition. Notably, psychotic symptoms were not significantly associated with outcome measures in any of the studies reviewed. Verbal memory and vigilance appear to be necessary for adequate functional outcome. Deficiencies in these areas may prevent patients from attaining optimal adaptation and hence act as neurocognitive rate-limiting factors.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Addington and Addington (2000) examined the relationships between neurocognitive and social functioning in 80 schizophrenia outpatients. They found social functioning as assessed by the Social Functioning Scale was unrelated to neurocognitive functioning. However, poor cognitive flexibility was associated with low scores on the Quality of Life Scale and the Assessment of Interpersonal Problem-Solving Skills (AIPSS). Verbal ability and verbal memory were also significantly associated with the AIPSS. Visual-spatial ability and vigilance were associated with the sending skills subscale of the AIPSS. In this study, which used a wide range of neurocognitive tests and measures of community functioning and social problem solving, results support earlier research that suggests an association between certain aspects of neurocognitive functioning and social functioning. Perhaps one of the most challenging aspects of treating patients with schizophrenia is coping with the severe cognitive deficits that accompany the disease. These deficits are evident in nearly all individuals diagnosed with schizophrenia (Keefe & Harvey, 2012) and their impact on the employment, social relationships and living status of patients is devastating. Cognitive deficits impair motivation and insight about one's illness and treatment as well as negatively affecting the therapeutic alliance.

Diminished attention disrupts the ability of a patient to follow a conversation, comply with medication instructions, complete a course of therapy and hold a job. Poor memory has many consequences harming social functioning, employment and quality of life. Patients with schizophrenia also tend to have greater trouble with tasks that require executive functions in that they have impaired ability to shift from one set of rules to another. This difficulty, also known as a perseveration, makes the process of adapting to change very difficult. It is evident that each of these cognitive deficits may pose a problem during non-pharmacological form of therapy. For example, patients with poor verbal memory will find it difficult to benefit from cognitive-behavioral therapy techniques if they cannot easily remember them. A physician's awareness of these deficiencies will help patients receive the best possible treatment.

COGNITIVE REMEDIATION THERAPY

While Cognitive Remediation Therapy and Cognitive Rehabilitation Therapy sound very similar, there are certain differences. Cognitive rehabilitation is a form of intervention in which a series of procedures are applied by a trained practitioner to retain or alleviate problems due to deficits in underlying cognitive functions (Sohlberg & Mateer, 1989). While, cognitive remediation is a teaching process that targets areas of neuropsychological functioning involved in learning and basic day-to-day functioning. It itself is a behavioural training based rehabilitative exercise aiming to improve attention, memory, language, executive functions and social cognition. It is an art and science of restoring these mental processes and teaching compensatory strategies. Overall, any cognitive rehabilitation procedure must be based on solid, scientific knowledge of brain- behaviour relationships and designed to meet specifically defined treatment goals.

TYPES OF COGNITIVE REHABILITATION THERAPY (CRT)

- **Stimulation Therapy:** It is based on the assumption that cognitive functions will improve by stimulating the cognitive system. The therapy usually includes paper-and-pencil exercises or computer training that stimulates one or more mental skills. Presumably, by using these skills, a

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

person's cognition will improve and the improvement will transfer to his or her activities of daily living.

- **Process Training:** Process training is similar to stimulation training, but process training focuses on specific areas of cognition. For example, Bracy's (1986) process approach to CRT emphasizes assessment and treatment of specific cognitive defects, such as poor visual scanning or visual neglect.
- **Attention-Concentration Training:** It is designed to improve a person's ability to focus attention, to maintain vigilance, to resist distraction, and to perform mental manipulations quickly and efficiently. It is one of the most widely researched areas of CRT and the researcher has produced commercially available training programs with proven efficacy (Sohlberg & Mateer, 1987).
- **Strategy Training:** As the name suggests, strategy training imparts specific strategies to a deal with situations which a person finds difficult to handle, e.g. remembering information, or skill to continue on a particular task like conversation. These kinds of trainings have been used on patients with traumatic brain injury (Richardson, 1992).
- **Nutrient and Drug Treatment:** It operates on the premise that various substances can affect cognition by correcting chemical imbalance. For example, memory deficits secondary to long term alcohol abuse can often be arrested with thiamine treatments (Elovic, 2000). This type of CRT is relatively new although the results are promising.
- **Prosthetic-Orthotic Devices:** External aids are sometimes referred to as prosthetic-orthotic devices. Their purpose is to obviate a cognitive problem rather than to retrain a defective process. Using an external aid is often the most efficient and expedient way to treat certain cognitive deficits. For example, training a person with a poor memory to use a tape recorder can improve his or her functional memory immediately but it may not have any effect on the underlying physiological cause of the deficit. Although the prosthetic devices do not rectify a person's memory deficit, the devices are especially effective and efficacious methods of treatment.
- **Domain-Specific Training:** These techniques emphasize training a person with simulated life experiences or within a specific functional domain. For example, Schacter and Glisky (1986) described the use of computer simulation to train a person to perform data entry.
- **Indirect Training:** This is based on the idea that although CRT methods like those previously discussed may be the most direct ways to improve cognitive problems, other indirect methods may also be effective (Herrmann & Parente, 1994; Yesavage, Rose, & Spiegel, 1982). For example, teaching a person to adhere to better sleeping and eating habits can improve cognitive function. Training a person to use a variety of external aids can result in a productive and satisfying daily routine (Herrmann & Petro, 1991; Naugle, Prevy, Naugle, & Delaney, 1988). Even the teaching of certain social skills can give some people more control over their everyday living situations so that they can make better use of their reduced cognitive functioning (Best, 1992; McEvoy, 1992).

In recent times, researchers introduce a model of cognition that provides a theoretical backdrop for an eclectic approach to cognitive rehabilitation. This approach is rooted in the theoretical assumption that cognition and the rehabilitation of cognitive functions are influenced by many different factors including a person's physiological state, perceptual skills, emotional status, motivation, and social skills. Changing these factors can improve the person's cognitive functioning as much as any learned compensatory strategies. A combination of environmental changes and cognitive rehabilitation produces the greatest improvement in a person's cognitive functioning (Ben- Yishay & Diller, 1981; Gianutos, 1980). More-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

over, this multimodal model provides a blueprint for a holistic approach to cognitive rehabilitation that is grounded in basic and clinical research (Herrmann, Plude, Yoder, & Mullin, 1999; McEvoy & Moon, 1988).

- **Cognitive Remediation:** A behavioural intervention designed to improve cognition in people who have suffered a decline in neuropsychological functioning. The application of cognitive remediation for people with schizophrenia has become increasingly popular. Over the past several years, two models of cognitive rehabilitation are in practice, viz. Cognitive remediation and Cognitive adaptation:
  - **Cognitive Remediation:** In this model cognitive deficits are treated directly through repeated practice and acquisition of compensatory strategies on cognitive exercises designed to engage under functioning brain systems.
  - **Cognitive Adaptation:** In this adaptive model, neurocognitive deficits are addressed through modification of patient's environment to allow patients to bypass their deficits (Kurtz, 2003).

Cognitive remediation packages are usually customized as per the cognitive deficits of the patient. Cognitive training studies in schizophrenia have followed two approaches:

1. In laboratory setting improving individual test; and
2. In clinical setting: paper pencil task along with variety tasks.

NEUROPSYCHOLOGICAL MEASURES IN COGNITIVE REMEDIATION

It could be a big question that which cognitive domains to be included in remediation training programme. Cognitive remediation programmes are more specific and conventionally have targeted on attention, memory, language and executive functions. This is in line with the evident literature on cognitive impairment in schizophrenia, making it a characteristics feature of the illness. Impairments of attention, learning, memory, and executive function have been reliably identified in the context of preserved verbal knowledge (Gold et al., 1997; Heinrichs & Zakzanis, 1998; Saykin, Gur, Gur, & Mozley, 1991). Decline in attention, memory are the common manifestation of cognitive impairment in schizophrenia, which is increasingly recognized as a core symptom of the disorder. It is evident in almost all people who carry the diagnosis. Deficits in the following areas have been consistently highlighted against a background of diffuse impairment: *Attention processes*: slowed cognitive speed. *Memory:* immediate and delayed recall, learning and verbal memory. *Executive functioning*: sequencing, organisation, planning, and flexibility. On the contrary, language, motor and visuo-spatial functions are less consistently impaired. As neuropsychological assessments are integral part of cognitive remediation programmes; the following guidelines for maximally valid neuropsychological assessment has been hypothesized while dealing with clients with severe disabilities like in schizophrenia.

1. Neuropsychological assessment should occur in real world settings.
2. Assessments should be made repeatedly over time.
3. Neuropsychological assessment measures should include the following:
   a. Supervisor ratings of patient's performance and attitudes.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

b. Objective ratings of the work environment.

THE COGNITIVE REMEDIATION PACKAGE

We discuss a remediation package (Halder, 2011) in detail that was done in clinical setting customized for and used on five chronic schizophrenia patients showing evidence of impaired attention, memory and executive functions. It was conducted in a tertiary care psychiatric hospital setting, rather than in laboratory set up, so several external distractions were there, but on the other hand it acted as real life simulation. The programme was structured combining psychoeducation without disturbing other daily schedule of the subjects.

Before selecting any test for administration, it was ensured that:*(a) the test could be easily administered on chronic schizophrenia patients,(b) even patient with impaired cognitive functioning could show some measurable performance on the tests and (c) practice on these tests in diverse set-up should be possible.*

Considering evidence based literature as discussed before, the researcher focussed on intervening on attention, memory and executive functions only.

- **Target for Intervention:** The package was designed so as to:
  - Improve attention, memory and executive function of the patients.
  - Modify the clinical symptoms of the patients.
  - Improve overall daily functioning of the patients.

The package was developed keeping in view, easy availability of the materials used, ease of method, so that it could be easily conducted by trained person in diverse setups and with patients of different background even with minimal educational background. The remediation therapy package basically investigated the efficacy of cognitive remediation program of neuropsychological deficits, in terms of attention, memory, and executive functioning of hospitalized, chronic schizophrenic patients. The overall effects from baseline to the 3-month follow-up were investigated.

- **Therapeutic Package:** The package broadly consisted of:
  - Psychoeducation.
  - **Cognitive Training:** Attention module, Memory module, Executive functions.

Psychoeducation

Psychoeducation refers to the dissemination of information about psychosis and skills of self-management. It has generally been targeted either at neuroleptic medication compliance and/or improving understanding and insights into psychotic illness itself (Goldman & Quinn, 1988). Early studies on psychoeducation on schizophrenia demonstrate that patients can acquire information and skills, but they still beg the question as to whether such information and skills internalize such that these are seen as relevant to the individual and his or her own situations. Keeping this view in mind, the intervention program started with a brief session of psychoeducation to both the groups. It specially helps to prepare the patient for actual therapy. It basically aimed to:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. Provide information to patients regarding signs and symptoms of schizophrenia;
2. Knowledge and importance of medication and its side effects; and
3. Inform the patients about the cognitive difficulties in simple language that were going to be dealt with the aim to improve that functioning.

The patients were explained briefly about the cognitive problems in schizophrenia. The idea was to improve compliance and effort on part of the patients. Patients were explained how deficits in cognitive functions led to gross deficit in their daily activities, like attending things, remembering (dates, events, work), or organizing. Along with Psychoeducation, the group was continued with group meeting which included

- **Social Interaction:** Interacting with other patients and staff nurses.
- **Recreation:** Participation in activities like singing, games.
- **Involvement in Pre-Vocational Work Assignment:** Engagement in light work like helping the ward staff, carrying water and food from the mess, cleaning etc.

Cognitive Training Programme

The cognitive training program consisted of 30 hours (average) individual training divided into 20 minute sessions. The sessions were done six days a week and lasted for three months. The program consisted of three modules: Attention, Memory, and Executive function apart from psychoeducation.

Training Programme Flow Chart

Brief Education about the cognitive training
↓
Introduce a new task and establish a rationale for the task
↓
Discuss Steps of the task
↓
Demonstration of the task
↓
Practicing the task
↓
Giving feedback and correct mistakes if any
↓
Assignment of Homework
↓
Review of work from previous session.
↓
Assessment

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Introducing a new task:

- The cognitive training program consisted of a series of exercises that were hierarchically ordered according to increasing cognitive complexity.
- The program progressed from training the sample on basic and simple stimuli to training on more complex stimuli.
- The training programme encompassed training on reasoning skills, training on attention, memory and executive functioning, which were deemed as basic skills for intervention.
- The training exercises were always presented in the same predetermined order, though tailored according to the need of the patient.
- Considering the educational and Sociodemographic background of the subjects, remediation training tasks were formulated as such that they were simple yet effective and feasible to follow at home under supervision. The tasks as per intervention areas are detailed in Table 1.

Table 1. The attention, memory and executive functions training module

Intervention Area	Specific Target Area	Task
Attention	• Sustained Attention • Selective Attention • Scanning Ability	• Joining Beads • Grouping of cards • Letter Cancellation • Joining dots • Reading newspaper
Memory	• Verbal Learning • Immediate Memory • Delayed Memory • Recall • Recognition	• Remembering Objects • Picture Recognition • Learning Word list • Story Telling
Executive Function		• Category Matching • Correcting the order • Daily Schedule and 'to do list' • Planning Daily Routine • Problem solving • Extensive training on WCST

- **Sessions:** Given that treatment intensity appears to be a salient factor in any cognitive remediation programme, every effort should be made both to provide treatment regularly and to ensure that clients go to sessions. And that was the reason why patient were intervened for three months.
- **No. of Sessions:** The subjects attended at least 10 but typically more than 25 sessions, which involved doing the packaged exercises designed to improve cognitive skills.
- A reminder was given to subjects in each session:
    - To attend each and every session – the more you attend and participate, the more skills you learn.
    - Bring your notebook and do the task what you are asked to do in free time after the session.
    - In event of any problem or difficulty, consult.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Procedure

- Detail and structured interview of the patient, and information from the ward staff were collected in the process of selecting and screening the patients.
- Semi-structured Performa was prepared for collecting data related to socio-demographic detail, clinical variables, and their social functioning.
- Standardized tools were also used for rating patient's psychopathology, handedness, and overall functioning.
- Direct behavioural observation method was also emphasized for the patient in actual or simulated interpersonal situation. Direct observation was done while patient interacted with the therapist, other patients, ward staffs, and other people.
- In addition, two raters (Clinical Psychologists) were engaged, who were unaware about the nature of the study. So the raters could do their rating impartially and in this way, tried to maintain objectivity and prevent rater biasness.

As patients differ widely in pre-morbid cognitive abilities, duration of illness, symptoms and pattern of neuropsychological deficits, the effects of individual differences on sensitivity to remediation procedure could be immense. For this, patient ideally should be screened for significant neurocognitive impairment prior to treatment with these remediation procedures. Thus, the clinical status, psychopathology level, disability and neuropsychological measures of the subjects were assessed thrice; once at the baseline, next post intervention, and lastly at follow up. Before introducing any new task, subjects were explained in simple words the rationale behind it and the impairment of the skills (in daily life) to motivate the patient to involve in that task.

- **Drop Out of Patients:** Out of the total sample two subjects dropped out of the intervention program, as one patient was discharged from the hospital before completion of the study, while one was dropped for increased severity of symptoms.

Treatment Factors Involved

There was no attempt to control the type of medications subjects were getting in the previous study. This was kept in unison to most of the similar treatment efficacy studies done earlier, which did not control this variable, although post hoc analysis of tracked data about medication use suggests that patients taking atypical anti psychotics were more likely to improve in cognitive remediation than those on conventional anti psychotics. In fact, only few remediation studies e.g. Wykes et al. (2007) have reported the type of medication during these training procedures. However, all psychotic medications administered to patients during the study were noted down. Type and doses of antipsychotic medications were determined at the initial assessment. Usually cognitive exercises targeted at specific neurocognitive deficits provide incremental benefit for specific aspects of neurocognition. The intervention program along with psychoeducation improve overall clinical and psychosocial functioning. In the study (Halder, 2011) patients assigned to cognitive remediation demonstrated significantly greater improvements in overall cognitive performance. There are also non-specific effects of participation in the cognitive remediation program, such as improved motivation or sense of self-confidence, which are another potential contributor to improved work outcomes. A greater understanding of the relationship between

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

improved cognitive functioning and better psychosocial functioning in areas such as work is needed to identify appropriate cognitive targets for treatment. This in turn may reinforce motivation and improve a sense of self-mastery, which in itself could contribute to better cognitive performance. Apart from control interventions that systematically teach skills; simply engaging the patient in some active manner may also improve cognitive functioning in patients with schizophrenia. However, more work is needed to evaluate the effects of different types of control groups on cognitive performance in schizophrenia and to identify the common and unique features of active control programs and cognitive remediation programs, based on theories of how each program works.

IMPLICATIONS

One potential implication of these findings is that while neurocognitive deficits and negative symptoms of schizophrenia place large restrictions on patients social and daily work life; any type of sustained, goal-directed cognitive activity in the presence of supportive clinicians, regardless of its content, has the potential to improve neuropsychological function significantly in this patient population. Consistent with this viewpoint, a small but growing number of studies suggest that structured behavioural rehabilitation improves neurocognitive skills in patients with schizophrenia in the absence of any specific cognitive training (Spaulding et al., 1999; Spaulding, Reed, Sullivan, Richardson, & Weiler, 1999; Silverstein & Wilkness, 2004). This possibility also emphasizes the significance of reports showing an advantage of cognitive remediation for a variety of outcome measures, even when cognitive remediation interventions are compared with control interventions that involve considerable non-specific stimulation such as work therapy or supported employment programs (Bell, Bryson, Greig, Corcoran, & Wexler, 2001; McGurk, Mueser, & Pascaris, 2005).

GENERALIZATION

An important issue is the generalizability of the improvement. Literature suggests that performance on the training task can often be improved (Green, Satz, Ganzell, & Vaclav, 1992) but it is doubtful whether these effects generalize meaningfully (Bellack, Blanchard, Murphy, & Podell, 1996). Findings of the previous study discussed (Halder, 2011) suggests that improvement in cognitive function also has effects on social, and daily functions, but overall improvement is not maintained. It also indicates that longer duration of intervention program may lead to more sustained and generalized effect.

Among few methodologically adequate studies, like Wykes, Reeder, Corner, Williams and Everitt (1999); Medalia, Revheim, and Casey (2000; 2001) have investigated the effects of an intensive cognitive rehabilitation programme. The intervention was targeted at deficits of executive functions, based on procedural learning and the principles of errorless learning, targeted reinforcement and massed practice. It consisted of individual daily sessions of 1 hour for up to 3 months. The control therapy was occupational therapy, matched for length of treatment and therapist contact. Seventeen patients received the cognitive treatment and 16 received occupational therapy. Some improvement in cognition followed both therapies, but the cognitive intervention was superior to the occupational therapy with regard to tests of cognitive flexibility and memory. There were no systematic changes in symptoms or social functioning in either group, with one exception: patients in the cognitive treatment showed a significant increase in

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

self-esteem. The study by Medalia et al. (2000, 2001) applied computer-aided training programmes to remediate memory and problem-solving deficits. The subjects failed to apply the mnemonic strategies that they learned successfully within training tasks to other general measures of memory and learning. In contrast, the problem-solving group showed a significant improvement on the outcome measure that assessed problem-solving skills required for independent living, an effect that was not present in the other two groups. The authors concluded that patients with schizophrenia are responsive to problem-solving training techniques.

Reviewing the available set of studies, it is clear that some measures of executive function, attention, and memory can be remediated with extra instructions, repeated practice, or reinforcement or both, but not conclusive about social, daily functions and other areas of disability. Recent researches are targeting those areas of neuropsychological deficit that are particularly responsible for the profound social dysfunction evident in schizophrenia. Different neuropsychological deficits may not contribute to social dysfunction equally. There has been increasing attention to the relationship between specific neuropsychological dysfunction and community outcomes, social problem solving and social skills acquisition over the past several years (Green, 1996).

CONCLUSION

Patients with chronic schizophrenia are impaired in a range of neurocognitive domain, and this is evident in terms of both statistical and clinical significance. The neurocognitive deficits can be improved by continuous cognitive training, along with psychoeducation. There is also strong relation between cognitive functioning and clinical symptoms and social outcome, and that too improve with cognitive intervention program. There is a need of proper standard cognitive remediation package, which should be rich in methods but may not be computerized. Focus on functional deficits is a much neglected area in which further research is urgently needed and cognitive remediation in schizophrenia should be aimed at improving not just specific cognitive deficits, but also the functional deficits that arise from them.

The overall impression of this chapter confirm the notion and suggests that individuals with schizophrenia have cognitive deficit and can learn and perform the skills with proper intervention. The skills taught in remediation programme can be retained without substantial degradation over a considerable period of time, showing the effectiveness of the comprehensive cognitive remediation program along with psychoeducation. The intervention programme also indicated in improvement of clinical symptoms and social functioning of chronic schizophrenia patients. The cognitive remediation programme discussed in the chapter included only three major areas: *attention, memory and executive functions*. Future remediation programmes may be drafted targeting the overall neuropsychological functioning in a comprehensive way. Along with neuropsychological functions, more stress may be put on social and vocational functioning and a combined rehabilitation package should be made in future. A proper, detail manual of cognitive remediation program can be made. The package for cognitive remediation can be standardized in different population and the duration of the remediation programme can be increased.

KEY TERMS AND DEFINITIONS

Cognitive Remediation: A behavioural training based rehabilitation treatment, focussing to improve attention, memory, language and executive functions in persons having these impairments.

Neurocognitive Impairment: The impairment of cognitive functions of a person following a neurological illness, mental illness, drug use or brain injury. Most common cognitive domains are attention, memory and executive functions.

Schizophrenia: Schizophrenia is a psychiatric illness characterized by abnormalities in thought, perception, language and speech. The symptoms are manifested variably in combination of hallucinations, delusions, impaired reality contact and abnormal behaviour.

Chapter 68
The Power and Compassion of Rational Emotive Behavior Therapy (REBT)

Debbie Joffe Ellis
Columbia University, USA

ABSTRACT

This chapter demonstrates the effectiveness of Rational Emotive Behavior Therapy (REBT) for enabling people to enhance their lives and create greater happiness. It is the pioneering approach developed by Albert Ellis PhD, the late husband of the author, that heralded in the cognitive revolution in psychotherapy, and which influenced approaches that followed it such as Cognitive Behavior Therapy, Positive Psychology and more. It is a holistic approach that reminds us of the inseparable interplay of thoughts, emotions and behaviors, and in addition to being an evidence based therapy, it can also be a way of life for those who choose to apply it as such. By practicing its principles which encourage us to create healthy emotions in response to adverse situations, we are also guided to experience and express unconditional acceptance of ourselves, others, and life, and to practice daily gratitude. In so doing we can feel compassion and empathy for those who suffer, including ourselves, experience greater joy and minimize emotional suffering in our lives.

INTRODUCTION

Countless people are hungry, starving at times, to feel greater joy and happiness in their lives. There has been turbulence and challenge in societies of almost every culture and era as far as can be told, and many would suggest that contemporary society contends with confusion, crisis, violence, brutality and other such joy-zapping conditions.

Sadly, too few individuals seem to be aware that each one of us has the power to create our own emotional destinies – despite and including any challenges in home life, societal unrest and global disharmony. Many might want to suffer less emotional angst and pain, and intellectually know that happi-

ness and other positive emotions are good for the mind, body and soul – but they lack a knowledge of the "how-to's" for getting there: Such tools are required for creating and maintaining healthy emotional states. Additionally, it is not sufficient to simply know the tools, but to apply them in order to create and maintain beneficial change. Furthermore, many people may not realize that what can significantly contribute to a feeling of greater happiness more of the time, is not only the satisfaction of fulfilling their individual wants and needs, but also the expression and experience of feeling empathy and kindness towards others, and performing related actions which demonstrate such care.

The tenets and practices of Rational Emotive Behavior Therapy (REBT) are dedicated to helping people learn ways to create greater happiness. REBT encourages people to adopt attitudes and actions of self-care and self-acceptance and vigorously urges people to adopt attitudes of kindness and empathy for the sake of helping others. Doing so can become an additional means to an ends of achieving the goal of greater happiness. In other words, though helping and caring for others is ideally done for the sake and well-being of those in need-- a lovely by-product can be greater happiness within the individuals carrying out those deeds.

I feel with deep conviction, based on my personal experience, my experience as a professor and as a therapist working with a variety of clients over the years of my professional life so far, and based on solid scientific evidence and research (Ellis & Whiteley, 1979) – that the approach of Rational Emotive Behavior Therapy (REBT) may be one of the most effective, evidence based approaches to enable the maximization of joy and happiness in life, and to minimize emotional misery. It provides a healthy and stabilizing philosophy of life along with tools for achieving a life of more happiness and minimal misery.

REBT is arguably the most holistic of psychotherapeutic approaches, reminding us of the inseparable interplay between our thinking, our emotions and our behavior. At the heart of its philosophical core is an emphasis on the importance of unconditional acceptance, gratitude, kindness, empathy, and the encouragement to perform and express caring actions and attitudes towards ourselves, towards others and towards the world in general.

Some main premises of REBT include, (i) that essentially most humans, in the absence of emotional disturbance and mental illness, act in life-enhancing ways; (ii) that the goal of most humans is to feel greater happiness throughout their lives; (iii) that acting with kindness and experiencing empathy contributes to greater happiness; (iv) that experiencing daily gratitude distracts one from focusing too much on negative thoughts, creates tranquility, and may be followed by uplifting experiences of awe and wonder. A significant and growing body of scientific research supports the positive and healthy impact of experiencing gratitude, wonder and awe (Wood & Chopra, 2015; Mills, Redwine, & Chopra, 2015; Doraiswamy & Oz, 2015).

This chapter presents a brief account of certain experiences of REBT's founder, Albert Ellis that contributed to the development of his REBT theory. It expounds upon the basic elements of the scientific evidence-based, rational, no-nonsense - yet also humanistic, compassionate, humorous (at appropriate times!) and philosophical -approach of REBT, the basics of REBT Psychotherapy, and describes the contribution and benefit of the REBT aspect of Unconditional Acceptance and gratitude for increasing human happiness, kindness and empathy.

Albert Ellis PhD, my late and brilliant husband, was the genius who created REBT, and, in-so-doing, heralded in the cognitive revolution in psychotherapy. In the years following his ground-breaking work other cognitive approaches were developed that were influenced by REBT (Ellis, 2001b). They include Cognitive Therapy (CT), Cognitive Behavior Therapy (CBT), Dialectical Behavior Therapy (DBT), Acceptance and Commitment Theory (ACT) and Positive Psychology. Dr. Aaron Beck (CT founder) and

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Dr. Martin Seligman (Positive Psychology founder) often give credit to Ellis for his influence on their work and theories. Ellis embraced empirical knowledge, a sound and consistent philosophy, action, and psycho-education, and was a pioneer of the self-help movement. Hundreds of studies, and their time-tested value observed through years of practice, validate the major theoretical hypotheses of REBT (Ellis & Whiteley, 1979), and since many REBT techniques are found within CBT, they are also validated through CBT's large body of research. Ellis greatly hoped that more research on the specific aspects of REBT, particularly on its substantive effectiveness, efficacy and elegance, would and will be done.

In his final decade of life, Ellis and I worked together in every aspect of the work, which included, training professionals in the helping professions, providing weekly Friday Night Workshops for members of the general public, giving individual and group therapy sessions, writing, researching, and presenting through various modes of media on a variety of topics, which included providing methods for applying REBT to creating healthy emotional lives. I continue to teach and practice REBT at Columbia University and have been invited to present at other universities and to professional groups. I write about REBT in relation to various aspects of daily life and to topical contemporary and topical issues, I give presentations to the general public about it and I have a private therapy practice.

Just as my late husband experienced in his decades of work, time and time again I observe the powerful impact on the lives of people I teach or counsel of applying and incorporating REBT principles into their lives. Very importantly – I do my best to practice what I preach, for REBT is not only an evidence-based scientific therapeutic approach, it is also a way of life for those of us who choose to adopt it as such. The result for many of us who do so, is greater happiness, tranquility, emotional stability through the most challenging of times, and, consequently, the enjoyment of better sleep, health and well-being.

HISTORY AND DEVELOPMENT OF REBT

Much about REBT is unique, including its development. It incorporates the wisdom, tools and techniques which were created through the innovative brilliance of Albert Ellis. Albert Ellis was not shy about offering praise, respect and credit where they were due, and he acknowledged the influence that some others, of the past and among his contemporaries, had had on his work. The people, philosophies and practices that he acknowledged as being influential in his work included Gautama Buddha, Zen Buddhists, certain Hindu Yoga practices, Greek and Roman philosophers, and the Stoic philosophy including the works of Epicurus, Epictetus, and Marcus Aurelius. Aspects of the ancient Hebrew and Christian philosophies – despite Ellis's position taken for most of his life as a "probabilistic atheist" – were also influential. He also was inspired by writings of the general semanticist Alfred Korzybski, and those of philosophers including Bertrand Russell, Paul Dubois and Emile Coue (the latter two used persuasive forms of psychotherapy). He enjoyed the works of Alexander Herzberg and the works of existential philosophers of his times, such as Kierkegaard', Heidegger, Sartre and Tillich. During the time Ellis was trained in and practicing liberal psychoanalysis, he considered himself more of an existential analyst. Influences at that time included Erich Fromm, Karen Horney, Harry Stack Sullivan, and Alfred Adler. However it was largely the visionary nature and genius of Albert Ellis that was at the core of his creation of his revolutionary REBT approach.

When studying psychology in the 1940's, psychoanalysis was the approach that was taught at Columbia University Teachers College, the university from which Ellis attained his Masters and PhD. Ellis increasingly found the psychoanalysis he was using with his clients to be too passive, inefficient, and

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

lacking in educational and behavioral elements. He became more active-directive with his clients and abandoned psychoanalysis in 1953, developing the approach now known as REBT. (It was first called Rational Therapy (RT), then Rational Emotive Therapy (RET) in the early 1960's (Ellis, 1962), and in 1993 became known as Rational Emotive Behavior Therapy). It was recognized as being a most humanistic approach (Ellis, 1973) and brought profound changes to the practice of psychotherapy. It was fitting that in 1971 Ellis was named 'Humanist of the Year' by the prestigious American Humanist Association.

One aspect that makes the development of REBT unique is that many of the tenets and techniques were born from the insights and practices that Ellis came up with in order to cope with various adversities that he faced in his own life from infancy onwards. He was his own experimental subject so to speak, and having experienced profound success in minimizing his emotional pain as a result of applying such practices to himself, he did research to supplement his experience and knowledge. He continued to practice the techniques and healthy ways of thinking, wrote and lectured about these principles and practices in a manner that both the lay person and academic could embrace and understand – and in so doing, contributed to millions of people changing their lives for the better. His direct experience and understanding of the debilitating impact of emotional pain, and his deep caring about the well-being of others, inspired his dedication to helping as many people as possible, throughout his lifetime and beyond, to learn how to reduce and even prevent emotional disturbance.

What follows in this section is a brief account of just a few of the early experiences and major adversities that Ellis faced from his childhood onward, from which a good number of the tenets of REBT were born. Readers can learn more about them and others by reading his autobiography (Ellis, 2010).

From infancy and throughout his childhood, Ellis experienced various illnesses including nephritis and stomach problems, often having to spend a stretch of months in the hospital. His family rarely visited him, and he felt deeply sad. He could not bear such sadness, so he read books from the children's hospital library, spoke to fellow patients and their visitors, fell in love with his pretty nurses and used his imagination to think about what he would do when he grew up. He also invented games that he and the other children in his ward could play after lights were out. These actions helped him focus on things other than his sadness and the neglect of his parents. These were fine examples of the effectiveness of *cognitive distraction* – which became, and is, an oft used technique of REBT.

Cognitive distraction can be a helpful short term strategy, when one is choosing to remove emotions and attitudes of extreme anger, hatred and bitterness. While it does not remove the root cause of those emotions, it does provide respite from the heat of them, can bring temporary calm, and can allow individuals to behave in more productive ways as a result. From a position of emotional stability, they can then choose to examine their irrational ideas, and work towards developing greater understanding, empathy and forgiveness for the wrong-doers in their lives.

When Ellis was a teenage youth leader of a radical political group, he had a severe phobia of public speaking and never dared to give a speech until he read the early work of John B. Watson. He noted Watson's success in using in-vivo desensitization with young children to help them overcome their intense fears of animals. He forced himself, very uncomfortably, to speak often in public – and within weeks got over his phobia and discomfort to such a degree that he came to enjoy public speaking greatly and proved to be a most effective public speaker. He would often say in workshops and lectures when recalling that time: "I completely got over my phobia, and now you can't keep me away from the public speaking platform!"

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In a similar manner, Ellis tackled his social anxiety and fear of talking to women, his other major paralyzing phobia: using in-vivo desensitization. He challenged himself to generate conversation with at least 100 women on park benches in the Bronx Botanical Gardens for the full month of August. Although he only made one date, and she didn't show up, he completely overcame his fear of approaching women!

In-vivo desensitization became and remains one of the frequently-used techniques of REBT. An example of this approach is to address uncomfortable situations by forcing ourselves to approach and communicate with certain people with whom there is disharmony or for whom we harbor negative thoughts and unhealthy feelings. We would do so while keeping in mind our intention of attaining the goal of increasing tolerance and understanding. (This is not to be attempted with people who act in violent and physically abusive ways).

When Ellis was a young man of around 24, Karyl, the young woman he was dating and with whom he was madly in love with, expressed on-and off-again devotion to him and did not reciprocate his feelings of undying love and commitment towards her! One night she wanted to end their relationship, and he felt devastated. Walking around the nearby Bronx Botanical Garden's lake after leaving her home, he realized that in fact it was not her rejection that was creating his despondency, but his thoughts about the rejection. He realized that he was telling himself that she 'should' love him as much as he loved her, that it was awful that she was so fickle in her behavior towards him, that his life without her would have no meaning, and other such irrational ideas. He started to question and dispute these beliefs and, at that moment, identified one of the core aspects of REBT – it is not an event but our thoughts about it that create our emotions. He realized that there was no evidence that life was fair or that Karyl should act toward him as he did toward her. He realized that though it was undesirable and unpleasant that she did not reciprocate his expressions of love – it was in fact not awful or the end of his world, it was simply disappointing and very sad. And he realized that even if his life would be deprived of certain things, if Karyl was not part of it, there was no way his life would be meaningless unless he kept telling himself that. He reminded himself of other things that brought him meaning and fulfillment that did not involve Karyl – such as his reading, writing, music, and helping other people. Such reflections not only reduced his despondency, but they also allowed him to feel greater acceptance of Karyl and her whimsical ways – which further brought him calm and greater equilibrium.

His actions of recognizing his irrational demands, unhelpful perspectives and expectations, and of disputing them in order to create healthy and realistic attitudes and perspectives became a core part of REBT theory and practice.

Throughout his later adult years and until the time of his death, Ellis practiced what he preached during times of adversity and during some brutal situations. These included health challenges and, in his final years, a shocking situation in his very own Institute, after which he worked outside of the institution (Ellis, 2010; Ellis & Ellis, 2011). The situation was widely reported in newspapers and magazines, and many readers reported back to him and this author their shock and disbelief about the injustice of the situation. Ellis was, and remained until the end of his life, a model of his REBT approach, and an inspiration – demonstrating that it is possible to unconditionally accept those who act in ways you despise. He was quoted in the *New York Magazine* and elsewhere when asked about the situation at the Institute: "I hate what they are doing, but I don't hate them" (Ellis, 2010).

THE BASICS OF THE REBT APPROACH

Rational Emotive Behavior Therapy strives to help people achieve lasting change, and in so doing, educates them about the process. REBT discourages clients from developing any unhealthy reliance on the therapist. It encourages self-effort and the resulting experience of greater empowerment so that clients can rightly claim to take responsibility for, and create their emotions. As indicated earlier, REBT can be more than simply an effective evidence-based therapeutic approach. It is also a healthy philosophy and a positive way of life and living (Ellis & Harper, 1997; Ellis & Ellis, 2011).

A basic goal of REBT is to help as many people as possible suffer less emotional misery and more joy in their lives. The ten essential elements of the REBT approach are briefly described:

1. REBT points out that it is not events or circumstances that create people's resultant emotional experiences and reactions, but what they tell themselves about the events and circumstances. It asserts that when individuals think in healthy and rational ways in response to adverse or unfortunate circumstances, they create healthy and often life-enhancing emotions. When they think in irrational ways in response to adversity, they create debilitating and unhealthy emotions (Ellis & Ellis, 2011).
2. REBT takes a holistic view of people's lives and tendencies. It reminds people that their thoughts, feelings, and behaviors are interconnected. The healthier their thinking, the more likely it is that their consequent emotions and resultant actions will enhance their experience of life (Ellis & Ellis, 2011).
3. REBT asserts that with awareness, people have choice. In other words, they can choose to experience greater happiness and contentment, or to remain unhappy and miserable. People can choose to monitor their thinking, to recognize when they are thinking in irrational ways, and then to dispute and replace such beliefs (Ellis & Ellis, 2011).
4. REBT clearly distinguishes the differences between rational and irrational thinking. Rational Thinking is based on empirical reality; it creates appropriate and healthy emotions and behaviors; it includes preferences rather than demands; it encourages flexibility; it encourages healthy perspectives; it prescribes high frustration tolerance, unconditional acceptance, and the non-damning of self, others, and life. It encourages people to rate behaviors - not their essential selves; it removes the Tyranny of the "Shoulds" and "Musts." On the other hand, *Irrational Thinking* creates debilitating and unhealthy negative emotions and behaviors; it includes rigid and dogmatic demands; it leads to low frustration tolerance; it includes absolutistic attitudes and overgeneralizing; it exaggerates facts, and includes "awfulizing" and "catastrophizing" (Ellis & Ellis, 2011). It leads to damnation of self/others and life when things don't go the ways demanded that they *should* go; it rates the *worth* of self/others/life. Three core Irrational Beliefs that REBT identifies, from which countless others stem, are: (1) I must always do well and be loved and approved of by others; (2) You must treat me well and act the way I think you should; and (3) Life should be fair and just (Ellis & Ellis, 2011).
5. REBT clearly distinguishes between Healthy and Unhealthy Negative Emotions. Negative in this context does not mean bad, but means unpleasant, painful or unenjoyable. REBT asserts that when people think in irrational ways in response to not getting what they want, or to getting what they don't want, they are likely to create one or more of the self-defeating and Unhealthy Negative Emotions which include anxiety, depression, rage, guilt, shame, and jealousy. When they think in

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

rational ways, in response to the same circumstances, they are likely to create Healthy Negative Emotions (non-debilitating, and often motivating or enriching), such as concern, sadness and grief, healthy anger, and regret (Ellis & Ellis, 2011). REBT reminds us that healthy negative emotions are enriching and beneficial during adverse times, and it encourages us to strive to create those instead of fancifully and irrationally thinking that we should not be feeling them, and should be happy all the time.

6. Whilst attending to cognition and behavior, REBT focuses on the emotional element of therapy and wellbeing (its "E"!).
7. REBT reminds people that maintaining therapeutic and other gains requires ongoing work and practice. Homework is an essential part of REBT and can be selected from a variety of REBT Cognitive, Emotive and Behavioral techniques (Ellis & Ellis, 2011).
8. REBT strongly emphasizes the importance of the practices of three forms of Unconditional Acceptance – namely: Unconditional Self-Acceptance (USA); Unconditional Other Acceptance (UOA); and Unconditional Life Acceptance (ULA). USA means determinedly accepting and respecting one's self worth and totality, whether or not one performs well and gains the approval of others. UOA reminds people to make an effort to accept others by remembering that each person is fallible and flawed, and to adopt attitudes of humility and compassion. Finally ULA encourages people to accept life with both its good and its unjust and harsh aspects – changing what can be changed and gracefully accepting that which cannot be changed at the present time. More than other cognitive approaches, REBT emphasizes the benefit of unconditional acceptance and vigorously encourages us to adopt it more of the time. It is a significant contributor to experiencing greater and lasting happiness, kindness and compassion (Ellis, 2005a; Ellis & Ellis, 2011). More is written about this later in this chapter.
9. REBT strives to address a person's philosophy of life and living. This is referred to in REBT as the elegant approach, which focuses on precisely identifying and changing a person's underlying debilitating or destructive beliefs and demands rather than focusing solely on symptom change. In considering similarities and differences between REBT and CT (cognitive therapy), Beck and Padesky agreed with Ellis that REBT is the more philosophically based psychotherapy of the two (Ellis, 2003; Padesky & Beck, 2003; Ellis, 2005b).
10. REBT urges therapists to practice what they preach. When they do so they may display an added component of greater authenticity, which can allow stronger empathy and rapport in the client-therapist relationship and they act as credible models of the approach. Through their ongoing effort at applying REBT to themselves to keep themselves stable, steady and calm during challenging times in their own lives, they are able to remain focused and effective during sessions (Ellis, D.J. 2015).

THE REBT PSYCHOTHERAPY PROCESS

In order to facilitate lasting change, along with the understanding and application of the essential REBT elements, the consideration and application of certain change mechanisms is required.

An initial part of the REBT psychotherapy process is the clarification of therapeutic goals. This includes the identification of the specific self-defeating emotions and behaviors that will be worked on in therapy. REBT is a multi-modal approach and aims to create change in the thinking, emotions,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and actions of the client. REBT is also concerned with relapse prevention. Relapse prevention methods include regular self-monitoring, the application of disputing methods, and the practice of unconditional self-acceptance including any relapses. Finally, as aforementioned, homework is an ongoing part of the therapeutic process.

The REBT therapist encourages and motivates clients to persist at making an effort to achieve their goals. The effective REBT therapist models UOA when there are relapses, continues to warmly acknowledge progress the client makes on his or her therapeutic journey, and encourages ongoing forward movement.

In REBT psychotherapy, the therapist also makes an effort to develop rapport with the client. A common misconception about REBT is that it asserts that rapport and the demonstration of empathy are not essential in the therapeutic process. REBT encourages therapists to prevent the client from predominantly depending on the therapist to "make them feel better." Instead, REBT assists clients to work on removing any excessive and inappropriate need to feel accepted by the therapist. REBT encourages clients to take responsibility for their emotions and teaches the methods for doing so. However, that does not preclude therapists from establishing a strong rapport and offering empathy when they offer their clients the tools and help them construct positive change.

A possible reason for the misconception referred to above was the judgment about the vigorous style and manner of Albert Ellis when he conducted his demonstrations and sessions. His direct approach, his no-nonsense style, and his frequent use of colorful language, led some people to wrongly infer that his style was the only recommended REBT style. It also led to the inaccurate assumption that his manner prevented rapport and demonstrated an absence of empathy. There is no doubt that his manner was not everyone's "cup of tea" (as is said down under!), however for countless numbers of clients, his authenticity and "tough love" at times enhanced the rapport and contributed to their successful therapeutic outcomes. Ellis did not suggest that others copy his style and manner. The effective REBT practitioners apply the tenets, theory, methods, and philosophy of REBT – but in their own unique way, style and manner.

The REBT therapist listens well, and is sensitive to and accepting of the multi-cultural components of their client (i.e. race, ethnicity, gender, age, religion, sexual orientation). In so doing they can be better equipped to establish rapport by understanding their client's unique cultural elements and by choosing respectful ways of communicating that are less likely to be dismissed or misinterpreted.

REBT psychotherapy is largely psycho-educational and in addition to print and video material on REBT, the REBT therapist will also suggest materials associated with other theoretical approaches if they seem helpful. The effective therapist also stays abreast of current news and inspiring stories, as well as the popular books and movies that support themes being worked on in therapy that can be recommended to clients.

A strong part of the change process is the willingness the client has to be mindful, to reflect on his/her thinking, and to take appropriate actions. Awareness is a key element in the change process. Clients are often encouraged to learn and practice forms of meditation and relaxation. This level of awareness helps clients to maintain realistic goals and expectations regarding the change process.

REBT in the form of brief therapy is sufficient for some people, but for those with deeper issues and disturbances, longer term REBT therapy is needed. Those clients who require brief therapy can experience significant changes within five to 12 sessions (Ellis & Ellis, 2011). Achieving productive results through brief therapy depends on the ability and willingness of the clients to take responsibility for constructing their emotional well-being, learning the tenets of REBT and applying them on a frequent and regular basis.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Clients with severe emotional disturbances, greater endogenous disturbances, co-occurring conditions, or poor learning skills can also benefit from longer term REBT therapy (Ellis, 2001a). Whilst a course of individual therapy is recommended, over time some clients may benefit from both individual and group therapy. As progress continues, they may solely attend group therapy as a means of beneficial reinforcement and the enhancement and maintenance of their therapeutic gains. Such clients are welcomed to return for individual sessions if or when they may benefit from direct one-on-one refresher sessions, particularly if they have experienced any relapses.

REBT has been applied to a variety of specific conditions such as perfectionism, obsessive compulsive disorder, borderline personality disorder, addiction, the treatment of people with co-occurring problems, severe emotional disturbances, self-defeating behaviors, and other issues (Ellis & Ellis, 2011; Ellis, 2001a).

REBT reminds us that to maximize and fuel effective action for change, simply thinking rational thoughts in a mild manner may not be enough. Ellis urged the inclusion of an emotive element to enhance the effectiveness and efficiency of healthy thinking for promoting effective action: namely, the inclusion of "a forceful, energetic and determined element" and asserted that more vigorous and dramatic thinking "goes one step further to include the determination to act and the actual action that backs up this kind of change-oriented cognition" (Ellis, 1979, p.95). This could explain why Ellis was often so bold, vigorous, intense and dramatic in his delivery of lectures and training. He wanted to help people dispute change and replace irrational debilitating beliefs.

REBT is holistic, recognizing the interconnected nature of various processes within and without, and asserts that people have a choice about the beliefs, actions and emotions they create.

UNCONDITIONAL ACCEPTANCE AND GRATITUDE

Unconditional Acceptance of self, others and life may be essential towards the experience of authentic happiness, the willingness to adopt an attitude of kindness, gratitude and the ability to experience genuine compassion for oneself and empathy for others. This is why REBT vigorously and "heartfully" encourages people to make the effort to experience and express more of these ways of being more often.

REBT asserts that the worth of an individual cannot be scientifically or empirically measured, and that it is simply a given. It recognizes the benefit of rating people's traits and behaviors as positive or negative, helpful or unhelpful, healthy or destructive, successful or failing, the importance of NOT rating them***selves,*** and of not considering that they are worthless because of any failures or mistakes they have made. Ellis would often say, in conversations and presentations, that people have worth simply because they are "alive and kicking," and that failing at things did not mean they were failures, but simply that they were people who failed-at something or things. He recognized that when many people evaluate themselves they are rating their traits and actions as inadequate, and then overgeneralize so that their entire being or personhood is seen as inferior or worthless. Ellis used to say that people rate their whole self instead of merely rating what they do, thereby creating what Alfred Adler called inferiority feelings (Adler, 1929). Ellis taught that people with such feelings can easily and automatically put themselves down, and then can also overgeneralize and globally condemn others (rather than just their behavior) who they are judging as bad or wrong - thereby creating rage and hatred.

REBT encourages people to guard against conditional self-acceptance, feelings of inferiority, and related needs to compensate (Ellis, 2005a). This is accomplished by making on-going efforts to acquire greater unconditional self-acceptance despite any failings or deficiencies of one's particular traits, skills

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

or talents, as well as to make ongoing and diligent efforts to experience greater unconditional other acceptance. This would minimize feelings of hostility and resentment towards others despite their different views and/or wrong-doings and maximize the ability to adopt an attitude of unconditional life acceptance when brutal situations occur in the world. Doing so takes ongoing effort and application, repetition, and more repetition. A one-off realization, reminder or infrequent epiphany, are usually insufficient for allowing these attitudes to take root and to become habitual ways of thinking and feeling over time.

The three elements of unconditional acceptance that are core parts of REBT - Unconditional Self-Acceptance (USA), Unconditional Other Acceptance (UOA) and Unconditional Life Acceptance (ULA) have frequently been controversial. In many debates and symposia over the years, Albert Ellis and the author of this chapter, Debbie Joffe Ellis, have been challenged on those aspects of REBT, and criticized. In particular, UOA has been the most controversial of the three. Many have said that to suggest that people adopt such attitudes towards perpetrators of brutal acts and behaviors is unrealistic. Some say it is impossible. The number of individuals who have successfully achieved UOA contradicts such opinions of the nay-sayers, as do the people one regularly can read about in news stories and elsewhere who have chosen to forgive those who have acted in evil ways against them or their loved ones. Such evidence contradicts the views of skeptics who believe that forgiveness and UOA are unrealistic pursuits in the face of brutal events. REBT reminds us that it IS possible to feel UOA more substantially, more of the time, particularly when bad things happen, and strongly encourages people to do the following:

1. Think about the circumstances which led to the person behaving in appalling ways, and be willing to consider that if any one of us had experienced those or similar circumstances, there is a high probability that we might have acted in very similar ways. If any one of us had some combination of similar brain chemistry, similar upbringing where bad behavior was modeled for us by people around us - leading to similar beliefs that fueled the cruel actions that had consequently been carried out – might not any one of us have been candidates for committing similar horrific acts?

   Such contemplation does not for one moment imply that one had better drop any care about the matter nor be less keen to seek justice where necessary. It does, however, make it possible to create a sense of compassion and forgiveness while doing so. For many of us this can take great effort. It is effort well worth it. For the result is an absence of hatred, resentment, rage and other such life-zapping emotions.

   REBT helps guide individuals as they seek to adopt greater happiness and healthier emotions. In developing understanding, compassion and forgiveness, a soul-nourishing attitude can often arise – that of gratitude, such as feeling grateful that we do not suffer from the afflictions that led to the horrific behavior carried out by an evil-doing perpetrator. We can feel immense gratitude that we survived any unpleasant or brutal circumstances and that we are alive and have opportunities each day, each moment, to strive to be more aware, more kind to others and to ourselves. Therein, we can focus on, relish and cherish the many wondrous things in life – despite and including the difficult events around us.
2. Remember each day to think about and appreciate our lives and everything for which we are grateful. As mentioned earlier, research is proving the positive impact on the health of adopting the attitude of gratitude (Ellis, D.J., 2015). Cardiologists and other medical practitioners are recognizing the fact that a number of articles from highly scientific research journals, including the *Journal of the American Medical Association* (JAMA) demonstrate the benefits of gratitude, meditation, and other life-enhancing attitudes and actions.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

3. Consider that we are organic creatures, part of nature, and like any part of the natural world and universe, we are subject to predictable and unpredictable flaws and fallibilities. For some people who love nature, seeing bumps and scars and parasites on a lovely and ancient banyan tree, for instance, would hardly evoke criticism. In all probability the whole tree – along with its gnarls, bumps and flaws – would evoke wonder and awe. In REBT lingo, the person admiring the tree could be said to have unconditional other acceptance of it – marveling at its existence and unique characteristics. No judgment. Perhaps they might observe and acknowledge some unhealthy or damaged parts of that tree that may or may not be able to be healed or fixed. Perhaps there would be actions taken to remedy some condition in the trunk or branches that was detrimental, and again – this would come from care and not criticism or negative judgment about the tree.
   If an individual can quite easily adopt such an attitude and perception about the tree with its flaws, then if they are willing to make effort – they could work to develop such an attitude, namely unconditional self-acceptance, towards themselves, their lives, and their capabilities along with any flaws and fallibilities.

The greater an individual works on minimizing and creating an absence of damnation of self, others and life, the greater his/her potential to experience joy and happiness more of the time. If we choose to work on achieving these feats of joy and happiness – it can take ongoing effort, and it is a choice. Not only do we experience more uplifting emotions, but we act as models for others who can observe our healthy states and perhaps feel inspired or motivated to work more towards increasing such stability and equanimity in their own lives.

CONCLUSION

Life moves swiftly by. Along with its challenges it can contain experiences of elevating joy and moments of awe and wonder, when we choose to think in healthy ways and adopt healthy and realistic perspectives. REBT reminds us to remember life's fleeting nature and to choose to create and cherish opportunities to be kind and compassionate to others and towards ourselves. In so doing, societies and global communities can become infused with greater tolerance and well-being. REBT vigorously encourages individuals, clients and therapists to mindfully utilize, embody and express courage, cognition, compassion, creativity, kindness and care - and to fuel them with action. Let us hope that, in so doing, greater and increasing numbers of individuals' will more passionately embrace life, mindfully cherish their moments, minimize suffering and maximize joy!

Chapter 69
Engaging Communities through an Art Program at a Domestic Violence Shelter

Elzbieta T. Kazmierczak
University of Illinois at Urbana-Champaign, USA

ABSTRACT

This chapter is a case study, written from the perspective of a visual artist, designer, and educator, reflecting on a five-year volunteer initiative of developing, leading, and funding an art program at a domestic violence shelter for battered women and adolescent girls who experienced sexual violence. One purpose of this chapter is to provide information about establishing art programs that can be sustained by the institutions in which they are introduced. This chapter discusses the following aspects: 1) breaking the ice and establishing rapport; 2) training and supervising staff and student volunteers; 3) fund-raising, grant writing, and seeking support both within and outside the agency; 4) partnering with organizations or community groups to set up art exhibitions; 5) partnering with artists and writers to print and distribute an educational publication; and 6) developing research with vulnerable populations serviced by the agency.

INTRODUCTION

This case study presents a thick description (Geertz, 1973, pp. 9–10) of my experience of establishing and leading an art program at a domestic violence (DV) shelter that provides services to battered women and their children as well as to adolescent girls who have experienced sexual violence. Although this chapter focuses on a grassroots agency in the rural Midwest, many of the lessons presented will be applicable to a broad range of communities and institutional partnerships. To that end, this chapter offers a narrative of the people and events of this five-year journey, focusing on the following aspects: how it proceeded, what problems were faced, where the principal sources of support came from, and

what insights were gained. For readers who are thinking about including art in their civic engagement endeavors, these considerations will give a sense of what to expect, what the reasonable goals are, what the organizational problems are, and how to negotiate or overcome them.

This chapter describes the essential steps and strategies I took for initiating and developing an expressive art program to complement individual and group counseling, case management, and life-skills development provided within a residential environment of an emergency shelter for battered women and their children as well as to complement non-residential short-term trauma intervention with sexually violated youth. The objectives of such a program were to facilitate the empowerment of survivors of domestic and sexual violence through art-based methods and to develop an educational outreach strategy, which included advocacy against gender-based violence. In order to accomplish these programmatic goals, essential aspects had to be addressed, ranging from the development of a treatment plan, the training and supervision of staff and student volunteers, and fund-raising and grant writing, to publishing, website development, and group art exhibitions, including a touring art collection.

Incorporating a new program into an existing and tightly functioning organizational structure can pose a challenge that can trigger resistance at a number of levels; recognition of this fact cannot be overemphasized. The new program can be construed as irrelevant or threatening to the status quo instead of being embraced as an asset. An investment of time, energy, and money that is needed to build a program can fuel the resistance, especially when the decision makers are not familiar with art methods, materials, and outcomes and lack the tools for judging the value of such a program. All of these can be difficult to accommodate in an overstretched organization, in which the providers are overworked and often experience secondary traumatic stress or compassion fatigue. The stress-induced reactions may include avoidance of the trauma stories or "feelings of horror, guilt, rage, grief, detachment, or dread, and may possibly lead to burnout and countertransference" (Simpson & Starkey, 2006, p. 1). Hence, this chapter addresses the vulnerabilities of a new program introduced with an objective to being sustained by an agency. The chapter emphasizes the critical importance of building collaborations, fostering participation, and gaining and maintaining support of staff, when there is little or no initial support from the management of an organization.

This case study shows how the development of initiatives like this program can achieve success (a) by starting small, working with a few staff members and against the disbelief that art activities can be an effective therapeutic modality; (b) by making the program visible; and (c) by building a consensus on the unique contributions of the program not only as a powerful method for healing and recovery but also as the clients' favorite program.

In addition to describing strategies for establishing an art program, this chapter introduces a theoretical and ethical framework of the Art for Empowerment (A4E) program, as it relates to the hosting agency's mission statement. Hence, this chapter will equip readers with both the strategies helpful in developing similar programs and a system of assumptions, principles, and relationships posited to guide the practice. It includes examples of artwork and recommends specific problem-solving strategies. Although artists, educators, or public service leaders might introduce and initiate an art program at a social service agency, they are outsiders, and their initiatives can be sustained only for as long as they remain involved, running a risk that the agency might not commit itself to investing in the program. This chapter describes the lessons I learned from guiding a particular midwestern agency toward developing a sense of ownership of the initiative and sustaining it without further involvement of the outsiders who put the idea in motion.

An important principle that this chapter addresses is the necessity of understanding the specific cognitive and emotional needs and characteristics of the populations that are to benefit from the new program.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Although such familiarity is essential to the effectiveness of an art program, it does not guarantee it. Because of the dual nature of the services provided by the agency described in this chapter—that is, as a DV shelter and also as a place where rape survivors are counseled—it presents the lessons learned from addressing the programming needs of battered women who experienced chronic abuse in their intimate relationships and of adolescent girls who were sexually violated. Each group reacted to art activities differently and often required customized workshops.

The uniqueness, novelty, and many of the challenges presented in this chapter relate to the fact that it deals with a program functioning inside a residential environment of an emergency shelter for battered women. Studies of such programs are absent from art education literature. Unlike other social service institutions, DV shelters and agencies servicing survivors of sexual violence require completion of the specialized training in crisis intervention as a prerequisite to the direct engagement with their clients. This significant commitment of time can be seen by many as a major obstacle to facilitating art workshops for these populations, but the lessons presented here can be easily and immediately applied by social workers and domestic violence counselors who do not have to jump through the hoops of such training to initiate and sustain an art program at their place of employment. These lessons also apply to working with survivors in other institutional settings that do not require such training.

That is not to say that art programs inside DV shelters are the only form of art programming available to individuals exposed to domestic violence. Numerous programs and initiatives have been in existence for children, teens, and adults experiencing domestic violence, street violence, and other forms of trauma-inducing experiences in school and community settings, especially in urban areas (Cohen-Evron, 2005; Gude, 2000; Heise, 2014). Stokrocki, Sutton Andrews, and Saemundsdottir (2004) have studied the role of art in the lives of battered women who were homeless and lived at a shelter for the homeless. Art education turns from the apolitical approach to art (Bersson, 1986), catching up with contemporary art practices, which blend the boundaries between art, social process, and social activism. Art educators who recognize the necessity of expanding the traditional model of art education beyond the fine art-based and discipline-based have paved the way for others. Hence, there is growing literature on art programs initiated and/or facilitated by art educators outside the shelter environment. The push for understanding educational processes, including art education, as emancipatory forces for oppressed, colonized, and marginalized groups and for exploited ecosystems makes art-based programs and interventions more relevant than ever. Desai and Chalmers note that "giving increased attention to contemporary art practices opens new possibilities for art educational practice in schools." (2007, p. 7). The movement toward the culturally-based and localized rather than the universalist and formalist approach to art education has given rise to the recognition of the importance of personalization of students' connection to art objects and processes (Bastos, 2002; Feldman, 2002) and to critical, culture-based theoretical frameworks and practices (Freedman, 2000).

In spite of institutional constraints, risk of retaliation and the loss of jobs for encouraging emancipatory practices (Garber, 2004), socially-minded educators and art educators feel responsible for fostering in students a sense of possibility and empowerment to produce knowledge and contribute to the shaping of their lives, communities, and culture. They do so, for instance, by grounding the teaching in the local arts community (Bastos, 2002) and by deconstructing how ideologies underlying visual culture foster violence, racism, and varied forms of discrimination, including gender-based violence (Ament, 1998; Garber, 2004; Keifer-Boyd, 2003). Socially minded art educators reach outside the traditional classroom walls in this era of AIDS, violence, war, post-colonialism, and environmental crisis. They work with at-risk youth, underserved communities, minority students, traumatized individuals and groups,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

youth exposed to violence, the abused, and the homeless, to name a few from among the many forms of art-based community engagement in the United States and internationally (Gomez, 2012; Heise, 2014; InSul, 2009; Marshall, 2014; Orr, 2002; Stokrocki, Sutton Andrews & Saemundsdottir, 2004; Wexler, 2004; Wyrick, 1993).

After 9/11, confronting the painful reality of war, trauma, and violence can no longer be avoided. Socially-minded art educators recognize the need for transforming art classrooms in schools and communities into places for fostering non-violence, peace, and healing, where students can safely use art-based modalities to express anger, pain, grief, loss and raise self-awareness to develop a critical understanding of their positioning in life as gendered, sexed, ethnic, and class-bound selves embedded in the sociopolitical systems of inequality (Ament, 1998; Cohen-Evron, 2005; Congdon, Delgado-Trunk & López, 1999; Gomez, 2012; Kay & Arnold, 2014; Keifer-Boyd, 2003; Lampela, 1996). Service learning, community-based projects, and community-based programs have become important components in the education of pre-service teachers and art educators, as evidenced by the topics of master theses and doctoral dissertations such as this doctoral study presenting an exhibition titled "Window of Hope: Come and Share the View," featuring works created by female survivors of domestic violence living in a public housing facility for the homeless in Columbus, Ohio (InSul, 2009).

The growing recognition that art can diminish, prevent, and transform the devastating effects of trauma has elicited the interest in art as self-expression, art as therapy, and art as empowerment. A number of conceptual frameworks and understandings of how the creative process, art interventions, and art curricula can accomplish the buffering, preventative, medicinal, and transformative effect on trauma-affected individuals and groups have been utilized by art educators and therapists. Models of practices based on the notion of resilience have been well researched and regarded. Educators and art therapists favoring this conceptualization have committed their practice to fostering and encouraging resilience as the goal of art activities (Gerity, 2010; Heise, 2014). Other art educators emphasize the cathartic and healing effect of self-expression and the peacemaking effect of beauty, creativity, and originality (Marshall, 2014). Some focus on the power of the art-making process to transcend dehumanizing experiences, such as domestic violence (InSul, 2009), whereas others, such as feminist-oriented art educators have written about the catalytic and mobilizing effect of group sharing of self-expressive works (Kay & Arnold, 2014). Some educators emphasize a community-building effect of the collective painting of murals celebrating local communities, as reported by a retired art educator Beth Burkhauser (personal communication, March 23, 2016) who has facilitated such initiatives.

Those varied models of the healing, protective and restorative power of art have in common an emphasis on connecting art to students' lives and to the society at large, and they use art methods as a means for empowerment. They see the educator's role as that of creating a safe environment for students' expression of anger, emotional pain, anxieties, loss, grief, and confusion. Art facilitators listen empathetically, encourage self-reflection, foster non-violent communication, and affirm students' stories without asking students to retell or relive traumatic experiences. Art educators are mindful that they have not been trained as therapists and thus refrain from asking students to explicitly depict traumatic situations, which could impose an emotional burden on students. In spite of such precautions, teachers often notice that students' works spontaneously manifest their emotional struggles and traumatic experiences and observe that as a result of such retelling, students regain a sense of control and purpose in life (Heise, 2014; Marshall, 2014).

PREPAREDNESS, TRAINING, AND THE AGENCY

Personal Objectives

I am a visual artist, graphic designer, and academic searching for opportunities to make a positive difference in the world through art and creativity. I believed that to achieve this goal, I had to go beyond the boundaries of academic routines, and seek connection with a community. Community is the realm in which things happen, real-life decisions are made, and actions are taken. It is a natural laboratory of experiential learning and human-centered research and a locus of meaningful knowledge. Unlike in controlled laboratory experiments, where one can lose a sense of connection between the production of knowledge and real-life applications, the community is a place where inspiration for research can be found, real social impact of one's actions can be felt, and wisdom can be gained. After working mostly with men in the design field, I wanted to work with women and feel the synergy of a group effort toward a common goal where the decisions would be achieved through shared willingness to find solutions.

Three aspects of my personal and professional life came together and guided my decision to collaborate with an agency serving battered women and victims of sexual violence. First, as I underwent counseling and therapy to cope with troubles in my personal life, I came to terms with my history of domestic violence and sexual assault. Second, I have been making drawings for therapeutic and self-reflective purposes for as long as I have been interested in visual arts, so I understood the medicinal and transformative effects of self-expressive art making on troubled minds and hearts. Third, I enjoyed working with not-for-profit organizations. If only I could make art and touch, inspire, and guide other women toward empowerment, my mission could be accomplished.

Training in Crisis Intervention

Advocacy and engagement involving direct contact with the victims of domestic and/or sexual violence cannot be carried out casually. Such engagements require at least 40 hours of specialized training in crisis intervention with either the victims of domestic violence or victims of sexual assault. It may take as many as 68 hours of training if it pertains to both populations. To qualify for training, potential volunteers respond to a series of prescreening questions at a meeting with a volunteer recruiter at an agency of their interest. The goal is to determine what, why, and how the potential trainee seeks to contribute to the agency and the well-being of the women and children served by the agency. In order to work with both survivors of domestic violence and survivors of sexual violence, I had to complete the training pertaining to both populations.

While this mandatory training can pose a major barrier against involvement with these populations and may restrict access to research opportunities in the residential setting of a DV shelter or a social service agency servicing victims of sexual violence, it provides the trainees with a unique opportunity for learning directly from counselors working with the victims and from the survivors themselves. The myths and truths about such difficult-to-access, vulnerable populations are examined during the training. The trainees learn about the effects of domestic and sexual violence on the victims' mental, physical, and cognitive health and about the dynamics of domestic and sexual violence as sociocultural and political phenomena in personal, local, and national contexts. In other words, the trainees learn the true answers to the questions "Why doesn't she just leave?" and "Why doesn't she get over the rape?"

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

It is not surprising that approaching vulnerable populations, including victims of violence, requires preparation so that one does not cause harm unintentionally by acting in ignorance or under misperceptions. Even though the vulnerability is not a permanent attribute but one associated with where the survivors are in their life situations and the healing process, it is imperative to understand the complex dynamics of those situations. The goal is to lower a risk factor of emotional harm.

Survivors of domestic or sexual violence who have overcome their own issues and seek to put to work the knowledge and wisdom they have gained from their healing and recovery make ideal candidates for such involvement (Tedeschi & Calhoun, 2004). The fact that a volunteer is a survivor herself may be particularly useful in developing a rapport with other survivors who are in the process of reclaiming their lives from abuse and violence. It does not guarantee success, but it warms the initial contact and helps to break the ice. The survivors at a DV shelter who have been approached by an "outsider" can relax into the knowing that "she is one of us and knows what we are talking about." Whether or not educators, artists, or public service leaders seeking engagement in the residential setting of the shelter have been victims of violence themselves, it is fundamental that rapport be based on absolute respect for the individuals who are coping with a major crisis in their lives.

Training in Using Art with Survivors of Domestic Violence

A Window Between Worlds (AWBW) is a not-for-profit agency located in Venice, California. It provides training in the use of art with trauma survivors, including battered women and children and survivors of combat trauma. The two- or three-day training programs focus on the methods of using trauma-informed art-based interventions. Unlike the crisis intervention training offered by the shelter, it is optional and not free of charge. I attended the AWBW training and found it immensely informative and beneficial, primarily because it discussed group management strategies and examined typical scenarios of participants' behaviors that often occur during art sessions. Trainees are guaranteed continuous access to the AWBW's educational resources for as long as they facilitate structured, trauma-informed art sessions at a DV shelter in the United States or at an agency working with veterans suffering from the effects of combat trauma. The resources include a wide range of art workshops that were developed by art facilitators working with survivors; funding for art supplies and exhibitions; advice on managing difficult situations; and other forms of support.

Grant Writing Skills

While the various training discussed so far took place prior to my involvement with the social service agency, I also attended workshops on grant writing for institutions and individuals during my involvement. The local university and institutions in the community offered these workshops. The need for competency in grant writing emerged as the art program was underway and it became clear that funding was critical to develop and sustain the program. That is not to say that such training is necessary to succeed in general but that it helped me to navigate the grant writing challenge. As a non-native English speaker, I felt empowered by acquiring the language and linguistic conventions often used in grant writing narratives and by understanding the dynamics of the funder-grantee relationship.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The Agency: Populations Served and the Approach

To preserve the anonymity of those involved in this narrative, I will not use actual names and locations. I approached a DV center in the rural Midwest, hoping that it did not have an art program, and it would be open to the idea of using art in counseling to complement individual and group counseling, case management, life-skills development program and parenting classes the center offers to battered women and their children living in the shelter. I soon discovered that the agency services not only battered women and their children but also adolescent victims of sexual violence, and it indeed did not have an art program. This grassroots organization was one of the first DV centers established in the country and has been providing free-of-charge, confidential services since the 1970s. It serves a geographic region that is isolated from the cultural offerings of cities and has a high poverty rate among the predominantly white population. Other notable groups served by the agency include African American survivors (25%) and Hispanic or Latina women and children (2%). The latter group often needs help to communicate in English. With an operating budget of more than $1.5 million, the agency provides services through the combined efforts of about 30 paid professional staff, degree-seeking interns, and trained volunteers. On average, 36% of the adult survivors of violence receiving services are between the ages of 18 and 29 years, nearly 50% are between 30 and 49 years, and 13% are over 49 years old. In an average year, the center provides safe shelter and comprehensive services to 850 adult victims of domestic violence and 145 children, not including services provided to victims of sexual violence.

The defining characteristic of the agency is that it is pro-choice in all aspects of women's personal, social, family, educational, economic, and legal rights. It follows a feminist and client-centered counseling approach, which emphasizes supporting women in making their own decisions about their lives by providing them with information about their options and choices. These principles predetermined the philosophy of the art program, defining how the art-making sessions were conducted and what the role of the facilitators and expectations from the participants would be. Different agencies providing services to victims of violence adhere to different approaches. I felt fortunate that this agency operates according to the principles that resonate with my own deeply held beliefs and values regarding critical pedagogy. Critical pedagogy is the pedagogy of emancipation, empowerment, and social justice "with an explicit aim toward establishment of a more harmonious and peaceful world" (Darder, 2015, p. 6).

The agency fosters a feminist orientation in counseling, primarily because its founding mothers were activists of the women's movement associated with the second wave of feminism of the 1960s through the 1980s. These women activists fought for social equality regardless of sex through social, political, and grassroots means and for antidiscrimination laws, including the Equal Rights Amendment to the Constitution to guarantee social equality for women and others. Their efforts led, for instance, to the U.S. Congress passing Title IX of the Education Amendments of 1972, which "required all educational institutions receiving federal funds to eliminate discrimination against women and girls" (Fraser, 2001, p. 49). Women-only organizations were created, including the National Organization for Women in 1966, as well as informal "consciousness-raising" groups for women empowerment (Fraser, 2001; Rampton, 2008). Inevitably, the beliefs and goals of the founding mothers and the social-political climate of the period shaped the organizational philosophy and mission of this grassroots agency.

THEORETICAL FRAMEWORK

Art for Empowerment Program: The Feminist-Based Methodology

The present tense used in this section of the chapter serves to indicate that the Art for Empowerment (A4E) framework is not exclusive to trauma-informed methods presented in this chapter, but has been further developed and is currently used with non-clinical populations.

The pro-choice imperative and the tenets of feminist counseling have given the impetus to the naming of and the methodology of the art program discussed in this chapter. Importantly, the notion of empowerment refers to the increase of autonomy and self-determination in individuals and communities. It is defined as "holding a positive attitude toward one's own self-efficacy, mastery of environment, and the possibility and ability to influence the outside world, along with taking individual or collective action to fight against oppression and discrimination" (Song, 2012, p. 1115). As such, it corresponds to the mission of the agency: ending violence against women through women's empowerment.

The goal of the naming has been to emphasize the sought-after positive outcome of the creative process without making references to therapy, medicine, interventions, or treatments. In alignment with the feminist approach, the A4E framework does not associate the survivors and their situation, beliefs, and worldviews with pathology. Linking art with medical terminology, which is fixated on detecting what is wrong with a person, would invite the narratives of victim blaming. It is common for battered women to be accused of perpetuating violence by not leaving the pathological domestic situation. Clinical models of domestic violence search for psychological factors in the individuals that cause violence, conceiving wife abuse as an aberrant behavior of some men with poor impulse control or psychopathology (Bograd, 1998; Joyce, 1997).

The most important contribution of the feminist approach to the understanding of domestic violence is that it connects psychological analyses with understandings of the social context of gender inequality. Rather than see domestic violence as a result of the pathology or aberrant behavior of the few, this approach conceives gender-based violence as a method for usurping and maintaining power and control over women as a social group. Recognition that social structural factors and gender-based power relations perpetuate gender-based violence helps in understanding the overwhelming prevalence of domestic violence in the United States and globally (Bograd, 1988; Whalen, 1996; Worell & Remer, 1992). More than 1 in 3 women (35.6%) and more than 1 in 4 men (28.5%) in the United States have experienced rape, physical violence, and/or stalking by an intimate partner in their lifetime and about 1 in 4 women (24.3%) and 1 in 7 men (13.8%) have been victims of severe physical violence by an intimate partner in their lifetime, as reported by the National Center for Injury Prevention and Control (2010). Considering that about 1 in 3 (35%) of women worldwide have experienced either physical and/or sexual intimate partner violence or non-partner sexual violence in their lifetime the prevalence of violence against women in all of its manifestations is a major global health problem and a violation of human rights, as reported by the World Health Organization (2016).

Feminist counseling conceives psychological stress as a response to societal oppression and problems in living conditions or coping strategies. It refuses to conceptualize distress as caused by pathological cognitions or behaviors. Unlike traditional, mainstream counseling that focuses on an individual in isolation, feminist counseling is relational and situates women's distress in the broader context of family dynamics, gender relations, and social-political systems of power relations and institutions (Ballou & Gabalac, 1985; McLeod, 1994). This is a strength-based and strength-building method for developing

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

self-awareness and critical consciousness raising, because it does not dwell on traumatic memories and insists that survivors shift their attention to identifying and visualizing the assets and skills they used to survive (Saleebey, 2009). Combining the relational interpretations of abuse with an emphasis on women's strengths help to ameliorate the self-blame and guilt and the sense of powerlessness that survivors harbor as they enter counseling.

An important aspect of the A4E framework is the absolute respect for individual women's experiences and the refusal to pathologize these experiences. Hence, women's understandings of their experiences are the points of departure for group discussions. To this end, survivors' art products are viewed as positive outcomes of artistic activity and as the tangible accounts of the survivors' efforts to reflect upon and reevaluate their situations and heal themselves. It is important to keep in mind that the pro-choice and person-centered approach means that domestic violence counselors and A4E facilitators "follow the survivor." Survivors are provided with information about their options, but it is up to them to decide what to do with that information. Survivors are "shown the path" and supported in making their own decisions, no matter what those decisions might be. Returning to the batterer is a valid and supported option, if the survivor decides that is the best option in her situation at the time. The reality of leaving abusive partnerships is grim. One indicator of the difficulty of deciding to break the partnership, disrupt the family, and leave the abusing partner or spouse is that, on average, it takes seven attempts to leave before the survivor actually leaves for good (Robinson, 2013). Moreover, leaving an abuser puts women in danger of being killed: "Of the total domestic violence homicides, about 75% of the victims were killed as they attempted to leave the relationship or after the relationship had ended" (Domestic Abuse Shelter, 2015).

The Three-Step Process

Group art sessions are staged around creative activities that include varied media and techniques, such as drawing, painting, collaging, sculpting, or assembling. At the beginning of art sessions, participants are provided with prompts that focus the creative activity on a particular theme that is relevant to the survivors' experiences. Most often the prompts cover the themes of healthy relationships, before-and-after, coping, gender, body image, reactions to stress, dreams, and life as a journey. The goal of the A4E methodology is to encourage survivors to speak their truths unapologetically and to hear themselves communicating those truths to others in a safe and respectful environment. This aspect reflects the account of feminist practice derived from person-centered counseling "Encouraging women to trust themselves, to become more assertive and to be able to acknowledge and express anger are other central themes in feminist work" (Walker, 1990, p. 75). In the A4E practice, it means that survivors are invited to use the creative process to bring the traumas, memories, and beliefs into the open and view them in the safety of the art group. The creative process does not merely relieve pain or alleviate a problem without addressing the underlying causes. Under the right conditions it can be utilized as a modality for self-help. To this end, we (the A4E facilitators) intuitively adopted a three-step process of (a) creating the work, (b) reflecting upon one's own creative product, and (c) communicating these reflections to others.

The three-step approach and assumptions that drive it are best understood through conceptualizations found in expressive art therapy literature (Betensky, 1973, 1995; McNiff, 1998). The three-step method rests on the assumptions that the creation and reflection upon the created work can generate self-discovery and that communicating the insights to others can advance self-discovery by generating more insights. Ideally, each step adds up, and collectively they can stimulate new understandings of

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

one's own condition and the desire to transform and overcome the limitations of that condition. The create-reflect-communicate method is based on the premise that some insights can be gained only at the intersection of these processes.

The A4E framework is eclectic in that it combines common-sense ideas and workshops taken from expressive art therapy with cognitive-behavioral therapy, person-centered counseling, and a structured trauma intervention model that relies on three steps: re-exposure to traumatic memories through drawing, developing a trauma narrative, and cognitive reframing (Steele & Kuban, 2012). The latter is a model of intervention developed by the National Institute for Trauma and Loss in Children (TLC), supported by research demonstrating a significant reduction of trauma-specific reactions (Steele & Raider, 2009). Cognitive reframing involves the altering of trauma narratives in order to make them manageable. The initial narrative "This experience has ruined my life and leaves me no choices" (Steele & Kuban, 2012, p. 165) often changes into "I survived this experience; I'll survive others and rebuild my life." Self-initiated voicing of the trauma narratives in front of other survivors who also had similar experiences helps normalize feelings associated with traumatic experiences. Cognitive reframing helps individuals transition from seeing themselves as powerless victims to seeing themselves as survivors, which is associated with a sense of some control over life events. It is a passage toward empowerment.

In the A4E framework, creation and reflection are expected of the participants, whereas the sharing of insights and reflections with others is optional. Following the pro-choice approach, all the interpretations are made by the survivors themselves rather than by the facilitators of the art sessions. Facilitators' involvement at the reflection stage runs a risk of influencing and overshadowing the reflections made by the survivors. Because of the unequal power relations between the facilitators, who are in a leadership position, and participants, who by virtue of being participants listen to the facilitators, participants are inclined to consider facilitators' interpretations as more important or valid than their own. However, survivors may abstain from sharing their works and reflections with the group. Giving participants the choice of whether or not to discuss their works in front of the group communicates an important message to the survivors of abuse: they are free to make their own decisions, and those decisions are respected. It is one way to foster empowerment. Having options counteracts the fact that in abusive relationships, survivors are deprived of the freedom to choose. The abusive partners control most of the decisions in the relationship by using varied methods of coercion and oppression, such as psychological, physical, and economic, to name a few.

Art as Healing

The A4E methodology adopts many ideas about the connections between art and healing from the expressive arts literature, which regards the creative process as a treatment in its own right. The approach of the British pioneer in art therapy Edward Adamson is particularly relevant to feminist counseling and the pro-choice ethics. Adamson articulates an egalitarian position, which I call the "ethics of empowerment." It is aligned with the fundamental principle of feminist counseling that every woman has the capacity to help and heal herself, just as she is the one who carries the weight of the journey toward the change and the healing. No one can help or empower a survivor unless she is ready to make the first step and has the perseverance to carry on. Similarly, Adamson believes that healing properties of the creative process can be experienced by anyone because the creative process fulfills the creative impulse that all humans have. Adamson refuses to interpret patients' works, believing that to foster the self-healing and medicinal effect of expressive art is to award the patients "the dignity of helping to cure themselves"

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and to let "Nature's healing powers . . . restore balance and harmony to the troubled mind" (Adamson, 1990, pp. 2, 5). In this approach, the art facilitator's role is to provide a safe space in which participants can heal themselves by engaging in the creative process. The respect for each survivor and recognition of her right to self-determination and creative expression of her individuality guide the dynamics of the art group at the DV center.

Using drawing, painting, collaging, or sculpting as a therapeutic modality to complement traditional talk therapy is based on the distinction between verbal and nonverbal means of expression. Nonverbal modalities are valued in therapy on the premise that some content, such as embodied feelings and unconscious beliefs, can be evoked and better expressed through images than with language alone (Hogan & Pink, 2012; Kazmierczak, 2006). Hence, the expressive art process is utilized not only as a way for connecting with the preverbal dimension of the self but also as means for stimulating the externalization of somatic and sensory experiences, memories, and the psychological content that otherwise may remain unexpressed (Oster & Gould Crone, 2004; Siegesmund, 2013; Waller & Dalley, 1992). "For those who have been battered, talking is often impossible due to sensory memories of trauma and depression, withdrawal, and shock associated with violent episodes" (Malchiodi & Miller, 2012, p. 336).

Drawings and paintings, for example, are regarded as a point of access to the emotional realities of individuals by displaying concrete markers of the inner self. Importantly, expressive works encode not all but most salient aspects of personality, including important themes, social dynamics, and attitudes toward the self and others (Groth-Marnat, 1990). Including nonverbal modality in domestic violence counseling can eliminate possible sources of bias by reducing variables like language skills development, verbal skills, communication disabilities, and sensitivity to performing under pressure. Language skills, verbal skills, trauma, and stress play a dominant role in counseling at DV shelters; traumatized and silenced women, girls, and children, many of whom are immigrants, can effectively communicate complex ideas through images, whereas they experience difficulties in expressing themselves in English.

Interpreting and Sharing as Community Building

Feminist counseling recognizes the individual as a locus of knowledge, especially the knowledge about herself. In alignment with this principle, A4E facilitators do not interpret the works created by survivors. By abstaining from interpretation, facilitators avoid running the risk of projecting their values and personalities onto the survivors' works. Experimental studies have indicated that even though the makers of expressive works imbue the works with meanings, interpreters are not passive recipients of those meanings but rather cocreators. Personality characteristics, theoretical affiliations, and experiences can affect how expressive works are diagnosed and interpreted. For instance, experimental studies of personality factors in relation to psycho-diagnostic skills found positive associations between high levels of hostility and anxiety in clinicians and high frequency with which they saw these personality characteristics in the drawings (Hammer & Piotrowski, 1997; Mintz Emmons, 1955). My own dissertation study showed that interpreters who experienced intimate partner abuse as victims saw indicators of abuse in an overwhelming majority of self-expressive drawings created by undergraduate students, even though most of those drawings were created by the non-abused (Kazmierczak, 2015).

By not getting involved in the interpretation of survivors' works, A4E facilitators also avoid potentially imposing their theoretical orientations and learned theories of diagnostic meaning, which can as much obscure the meanings delivered by the survivors as enhance them. Differences appear among clinicians' attitudes to interpretation, depending on the their training: a psychoanalyst looks for deep, unconscious

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

motives, while a cognitively oriented clinician looks for indicators of personal coping strategies embedded in the works. Again, the A4E facilitators' role is to create a safe, nonjudgmental space that is conducive to self-reflection through art making and group interactions.

The goal of reflection in the three-step process is to enable survivors to formulate and "own" the meanings of their works. The meanings are theirs to discover in the works and to share with others. While facilitators do not comment on the meanings of the works, survivors participating in the art sessions are encouraged to comment on each other's works. The objective of the communication phase in the three-step process is that these conversations present opportunities for survivors to hear themselves speaking their minds in front of others and to be heard. An important aspect of the group interactions is building a sense of community, trust, and belonging among the survivors. At DV shelters, the residents not only share bedrooms, cooking responsibilities, cleaning, laundry, and other chores but also discover that they share life experiences that are not limited to abuse. They offer each other advice based on their experiences, and more often than not the advice is well received. Survivors enter the shelter, feeling isolated, alone, and misunderstood. Participating in shared activities and communicating with each other help to take the edge off those feelings and make them manageable. Again, self-disclosure is valued as a normalizing process. Individual survivors realize that their loneliness, concerns, fears, and anxieties about what has happened and is happening to them have also been experienced by many others. During art sessions, as participants contribute to each other's reflections about the works and share their own experiences, they develop communal wisdom. As a collective, they build a body of shared knowledge that has practical and immediate applications. It is an elating and empowering experience for individual survivors in the group.

A4E facilitators on the whole maintain a passive stance at this step. They may comment on aesthetic aspects of the works to boost survivors' confidence in their creativity, but otherwise facilitators create a nonjudgmental environment by listening empathetically, showing understanding, acceptance, and concern. By doing so, they create a forum for group interactions, which they monitor. Whenever inappropriate comments are made, abusive language is used, or hurtful criticisms are uttered, facilitators use those instances as teachable moments to introduce and model by example the principles of non-violent communication. Because of the abuse, survivors often have poor communication skills and lack experience with non-threatening and mutually supportive relationships. Participation in group activities, including art sessions, is one way to foster experiential learning of life skills that the survivors can utilize as they rebuild their lives outside the abuse and violence.

Self as a Process

In the ethics of empowerment, meanings and reflections voiced by survivors about their works are recognized as temporal and malleable rather than as fixed and stable. They are concrete manifestations of transient states of mind, beliefs, and emotions. The meanings reveal aspects of survivors' inner worlds, marking the steps of their mental journey toward self-healing. As survivors' understandings of themselves and their situations change, their expressive works convey new meanings and insights. The insights are revised and updated as new events take place and new understandings of the self evolve. Change, self-healing, and recovery imply that the inner states are in flux, and the inner changes occur at their own pace, depending on an individual survivor's personality, severity of abuse, and other circumstances.

In the safety of the DV center, survivors are provided with conditions fostering their empowerment. Survivors undergo individual and group counseling, which equips them with the tools to understand that

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

they have been victims of abuse and that they are neither responsible nor to be blamed for the abuse. They are provided with information relevant to securing their safety and acquire skills necessary to rebuilding their lives: healthy coping skills, life skills, money management skills, parenting skills, and orientation to family law, to name a few.

Challenge of Facilitation

It can be difficult for A4E facilitators to resist the urge to get actively involved in the group interactions, interpret the works created by the participants, and urge them to act "smart." But the facilitators are not supposed to "teach" or urge anyone, or recommend how survivors are to act, especially when it involves criticism of the survivor's decisions. Facilitators facilitate by presenting alternatives and creating an atmosphere of safety and acceptance that is conducive to creativity, reflection, and open communication. The A4E facilitator's job is not to administer an intervention but to help survivors realize what lies within and ahead of them and to help them get in touch with their inner worlds without activating the panic reaction of the drama, danger, and pain they lived through daily.

The A4E workshops have been designed so that to guide the participants toward self-expression of their individuality and connect with their inner resources through visualization, reflection, and communication. Facilitators are responsible for creating a space in which participants could empower themselves through the creative process. The participants do so in their own ways, at their own pace, and in their own styles. There has been the astonishing diversity of expressions and the creativity manifested in the survivors' works, many of which display childlike simplicity, directness of expression, and aesthetic grace (see Figure 1).

BREAKING THE ICE AND ESTABLISHING RAPPORT

Building a Community of Supporters

I approached the agency cold, proposing an art program to help survivors of domestic violence understand their situation and envision the future through creative means. Even though I volunteered my services, my initial reception at the agency was mixed at varied levels: counselors, management, and survivors. Some counselors were keenly interested in my proposal while others were skeptical, and the management had no interest in supporting the initiative at that time. I worked closely with the senior volunteer recruiter, a respected and accomplished staff member who believed in the idea and gave me entry.

To ensure the survivors' safety and well-being, the counselors who were interested in art did not want to introduce new methods without "testing" them first on themselves. To that end, for two and a half months, I led evening art sessions every other week for the counselors who welcomed the idea of an art program at the shelter and who supported the idea of an art program and were interested in incorporating art making into their counseling routines. Some of the participants were occasionally using art media in individual counseling but lacked ideas for workshops and confidence in their skills to facilitate them. Others had not used art but wanted to bring it into their practice to complement talk therapy. The training was conducted with two goals in mind: (a) to demonstrate how art sessions can be facilitated at the shelter and (b) to equip the counselors with experiential knowledge of how expressive art making can lead to better self-awareness, cognitive reframing, and self-empowerment. Above all, the overarch-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

ing goal of the training was to build a community of committed supporters of the initiative. Certainly, without the collective support from within the agency, setting up a new program would not be possible.

There were no lectures, no assigned readings, no slide presentations. Instead, participants were immersed in the intensive, hands-on experience with the trauma-informed themes, media, and three-step process. The workshops for the counselors were conducted as if they were taking place with the survivors at the shelter. The instructional goal was to provide the counselors with a model experience, on the basis of which they could develop their own styles of facilitation and utilize their counseling competencies. The counselors worked through the topics that were pertinent to their emotional and cognitive needs. These overworked professionals at the understaffed agency suffered from secondary trauma and unknowingly ached for an opportunity to channel their emotions, get in touch with their inner worlds, and restore their inner strength and resilience.

Art at the Domestic Violence Shelter

As soon as all the interested counselors were trained and ready to facilitate, we approached the administrators of the agency with a plan to introduce the program at the shelter. We experienced both passive and active resistance and disbelief. Neither the shelter Coordinator, nor the Director of the center had prior experience with art as a therapeutic modality. Not surprisingly, they could not support the idea that might interfere with the existing programs or have deleterious effects on mental health of the residents. They viewed art making as a hobby, rather than a valid counseling method. They also considered art making too "touchy-feely" to inspire lasting changes in emotions, coping strategies, and worldviews. Moreover, grants that funded the existing programs had no provisions for art therapy or art-based activities for adult residents. The funds for art-based counseling and art activities were available only for children's programs.

Instead of giving up, the A4E supporters, decided to self-organize, collect the funds for art supplies, and gain the support from the bottom up: starting with the clients. The counselors have incorporated art in individual counseling, but they had no time to facilitate an art group outside their work hours. A young and adventurous counselor who was totally committed to making the program a reality, helped me facilitate late-evening art sessions at the shelter every other week. This counselor, whom I shall call Ann, devoted her after-work hours to volunteer with me. We met in the evenings because that was the only time when the residents had no scheduled activities and could devote two-hours to art.

Small posters and handouts detailing the four-and-a-half-month schedule were distributed at the shelter and among the clients receiving counseling services on a walk-in basis. Thanks to Ann's unconditional commitment and support, the program prevailed. It took over a year of holding art sessions in a semi-underground manner, until the program was fully accepted by the management and other counselors thanks to the clients who reported to the administration that art sessions were helping them recover. With the executive decision that art activities were a valid therapeutic modality, attendance at the art sessions was made mandatory for all shelter residents and the biweekly meetings were held in the mornings, interchangeably with parenting classes. At that time, the A4E-trained counselors were given permission to get involved.

The Collective Curriculum and Empowerment

Ann's approach to utilizing art methods in counseling was transformed over the time of our collaboration. It shifted from intimidation to confidence and flexibility with the format, media, and the curriculum. Ann's transition from a novice to an expert illustrates how self-empowerment can be gained in a new area of competency through persistence, repetition, and reflexive practice. Others who regularly incorporated art in their group counseling sessions underwent the same process of self-empowerment. They moved from rigid reliance on lesson plans for each activity to flexibility with the topics, media, and types of activities. At times, they facilitated the workshops without prompts or lesson plans, even though on the whole they preferred to have them handy.

An initial curriculum for a four-and-a-half-month period was developed collectively. All trained counselors contributed to its development by including topics that they believed were most relevant in domestic violence counseling. The media used were also a collective decision, so that everyone could facilitate activities that were executed in their preferred media. Favorite activities included working with watercolors, Super Sculpey, and oil pastels; collaging; making dream catchers; painting on bottles; and box making, to name a few. Many ideas for the activities were inspired by lesson plans, which were supplied by AWBW. Our goal for the collective decision-making was that everyone was vested in carrying the curriculum. Over time, we developed different curricula for different seasons: spring, summer, and fall. The approach proved effective and had a lasting effect on some facilitators. For instance, when Ann worked at a DV center in a different state, she organized and facilitated an art group there as well, using the curricula. One counselor customized the curricula and used them with elderly clients at another social service agency. Each workshop held at the shelter was co-facilitated by one counselor who was trained in A4E methods and by me. During an average semester, the program was staffed by two or three counselors who worked with me on a rotational basis. The goal was to keep their time commitment to art facilitation low because it competed with the time they could devote to the heavy case load that each carried.

Art with Adolescent Survivors of Sexual Violence

The agency provided services not only to domestic violence survivors but also to adolescent survivors of sexual violence. The dual function provided an opportunity to develop art curricula for two populations. Several months after the introduction of the art program at the shelter, a new sexual assault counselor was hired. I shall call her Becky. Influenced by her mother, who was a painter, Becky was immediately open to utilizing expressive art methods with adolescent survivors of sexual violence and had experience in a variety of art media and techniques. Becky also had many ideas for engaging art activities, which she developed for fun and learning with her children at home. Adolescents immediately embraced art activities and were eager to experiment with the media, the themes, and the creative process. The program was demonstrably successful, because it resulted in an adolescent support group, which did not exist before the art methods were incorporated. The girls were excited to make art and wanted to learn new techniques, even though the workshops often dealt with painful or difficult topics. Soon after the program was initiated, the second counselor joined in. The workshops for adolescents, then, were staffed by two counselors who both regularly co-facilitated the workshops with me.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Art as a Challenge

In retrospect, the initial resistance and lack of support are not really surprising. It is naive to assume that everyone loves art without realizing that art process and art materials can be intimidating for anyone without prior experience with art. Having to make something creative can generate anxiety and self-conscious feelings about one's lack of creativity or drawing skills. The adult survivors doubted their ability to make anything creative, until they discovered that they can. Moreover, the adults did not know how to relax and enjoy themselves because they had responsibilities but no time for self-care.

It has to be noted that facilitating art workshops is demanding, as it requires commitment of extra time and energy for preparations and cleanup in addition to the actual facilitation with the clients: up to 45 minutes for the creation of art samples and the setup and about 15 minutes for the cleanup.

CONTINUOUS TRAINING PROGRAM

To the end of sustaining the program from within the agency and building allies of the program, we, Ann and I, developed a training program for the employees. The initial set of three training sessions took a total of four hours, during which participants were immersed in hands-on workshops, delivered during time slots that were designated for weekly staff meetings. Each module lasted one hour and 20 minutes. It consisted of sampling of topics that were popular among the survivors participating in the A4E program, and demonstrations of how to conduct them. Counselors who were seriously interested in trying out the art methods with their clients in individual or group settings, received one-on-one tutoring and individualized assistance. On average, it took helping the counselor to prepare and facilitate two group sessions until the counselor would overcome her fear of art and feel comfortable enough to conduct the workshops on her own. All interested counselors were provided with a handbook of workshops, which included enough workshops to cover four and a half months of weekly meetings.

Demand for training sessions grew as word got out that counselors would learn how to use art with difficult or resistant clients, how to use art to initiate counseling sessions, and how art activities could help focus a counseling session. Counselors seeking to incorporate art in individual and group counseling with their clients and volunteers who were interested in helping with art sessions for the shelter residents participated in individual or group training sessions. The demand for repetitive training sessions was specific to this agency and was necessitated by high personnel turnover, which was caused by the burnout often seen among counselors who work with the trauma of others (Simpson & Starkey, 2006). The volunteers who were undergraduate students earning credit hours for their work with the program were trained at the beginning of a semester. The introductory training sessions lasted three hours, followed by experiential learning through apprenticeship. The learning-through-experience process culminated in an opportunity to facilitate the workshop at the end of a semester. Volunteers who stayed with the program for a year or longer had more opportunities for facilitation. Those volunteers who were involved in the A4E program for a longer time were interested in gaining hands-on experience in preparation for graduate schools in art therapy.

Repetitive trainings are not needed in agencies that are adequately funded and staffed, have strong organizational coherence, and are open to non-verbal modalities in counseling. For example, I reached out to an organization providing residential treatment and counseling to adolescents and adults who have problems with drug and alcohol abuse. In contrast to the DV center, this organization's management

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

immediately expressed an interest in utilizing art in counseling. I was hired to develop and conduct a structured two-day training for all counselors and therapists working at the agency at the time. Over time, the counseling team developed their own facilitation styles, workshops, and curriculum.

FUNDING: ASSURING THE SURVIVAL OF THE PROGRAM

Considering that there was no grant money for the art programming for adults, the A4E program had to be fully self-sufficient. The initial challenge was related to the fact that even if we could identify a grant that would support art programming for adults at a social service agency, no grant funds were available for a program without a track record. Hence, we sought and received art supplies from local art retailers, art teachers, and the art department at the local university. We also organized a fund-raising event at Ann's house, asking for art supplies or money for the program in return for food and entertainment. Through this event, we raised enough money to buy supplies, which complemented the supplies we received through the calls for supplies in the community. The art program used anything that could be appropriated as art supplies: old magazines, leftover craft materials, found objects, and office supplies. Such resources enabled the program to operate over a year, establishing the program's track record and thus making it eligible for foundation funding.

Our strategy—that through the unofficial sessions at the shelter the program would gain momentum, overcome resistance, and achieve acceptance at the administrative level—proved successful, even though it was not the preferred strategy. We were setting a bad precedent: introducing a program that did not require funding or institutional support. It is not a recipe for longevity when an agency that pays no price for its passivity and shows no commitment to an initiative nonetheless carries the program serving its target population. To sustain the program, the agency had to commit to it and take fiscal responsibility for it. By doing so, the agency could fully take credit for offering it.

Once the art program was institutionally established and mandated as a treatment program, it qualified for institutional funding as part of the agency's operations. Here, however, there was another challenge in fund-raising: obtaining funding outside the agency's traditional charitable channels. Again, none of the grants supporting the center included spending for art activities for adult survivors. Moreover, this underfunded and understaffed agency was unable to take on an additional budgetary responsibility, that is, to identify new sources of funding and apply for support for the art program.

This situation prompted me to exercise resourcefulness and structure leveraging sequences to seek and receive funding from the donors who were focused on the community arts and humanities rather than on mainstream social services. Over the years, the program was supported by local, statewide, and national funding agencies. Sponsors have different requirements for what is suitable for funding. Humanities councils typically do not support art making, although they support its interpretation. Art agencies usually do not support causes for social justice or antiviolence movements, but they do support promotion of art in underserved populations and for the strengthening of the connection between art and ordinary people's lives. They also support bringing arts to communities.

Hence, each application highlighted aspects of the initiatives related to the art program that matched the funding objectives of a given sponsor. It has to be emphasized that arts organizations played a vital role in the success of the A4E program. They funded in part specific initiatives and one-time projects but not long-term operational expenses. Arts councils supported survivors' art exhibitions and outreach initiatives, including an online gallery. The state humanities council funded in part a publication educating

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

about the value of arts in the well-being of women and communities. We sought and received funding for the antiviolence aspect of the educational outreach from the Puffin Foundation of New Jersey, which supports projects combining art and social causes.

AWBW was instrumental in supporting the program's operating expenses. As explained earlier, the AWBW's mission is to support art programs for survivors of trauma, including trauma of domestic violence and combat trauma. Thus, after a year of providing regular workshops at the shelter, the A4E program was eligible for the AWBW's funding. After two years, the program had developed a positive track record with AWBW so that it qualified for additional grants, which supported survivors' art exhibitions.

All the applications were institutional. The center served as the art program's fiscal agent, but in all respects, we—the art facilitators—were responsible for the fulfillment of the grants' requirements. The Director of the center graciously supported and signed the applications. Although applying for grants is a lengthy process, I learned a great deal from that experience because it forced me to make explicit the content of the initiatives and why they are important to the community.

To gain support from patrons of the agency, we persisted in regularly including announcements about A4E and its initiatives and successes in the agency's newsletter. The announcements were illustrated by photos from the art openings and by examples of art created by the survivors. The announcements never failed to quote survivors commenting on the positive impact of the program on their healing, recovery, and lives. The goal was to let patrons of the agency know that the program existed and that it positively contributed to the survivors' empowerment. This strategy proved effective as the agency started to receive donations that were exclusively designated to the art program. Active and retired art teachers and artists in the area supported the program through their donations. As a result, a separate art account was established to maintain fiscal transparency and accountability. Slowly but surely the program was establishing its credibility and grew stronger thanks to the solidarity and the support of the arts organizations and local art communities.

EDUCATING THROUGH TRANSFORMATIVE ART EXHIBITIONS

Annual art exhibitions of survivors' art were organized at varied locations locally and statewide. Sharing with the community the transformational works created by survivors of violence not only then, but in general, is important in many ways: it increases public awareness of gender-based violence, increases awareness of the presence of an art program at a social service agency, educates about the healing power of art, destigmatizes survivors, and bolsters the survivors' self-esteem by public exhibitions of their works. Moreover, exhibitions help the center and other agencies exhibiting survivors' works to develop a positive public image quite different from the one social service agencies traditionally have been associated with. Instead of focusing on dark societal secrets of violence and abuse, exhibitions make a positive contribution to the communities through art. Exhibitions also reach quite different populations from those usually served by social service agencies.

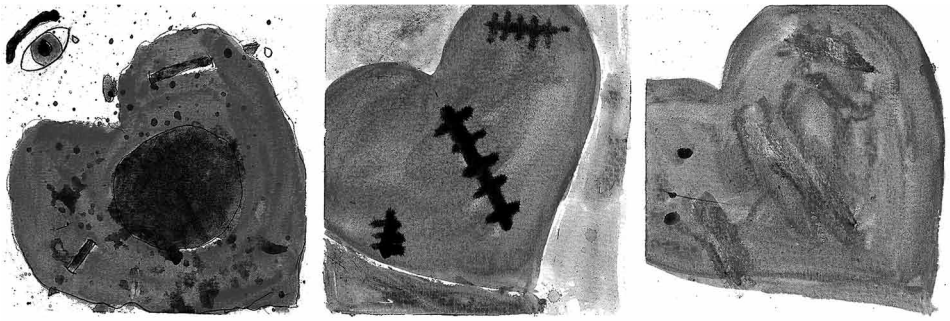
The survivors whose works are on display serve as champions for other survivors, many of whom are unable to speak for themselves. Seeing the works in the open gives great hope to others and boosts self-esteem. We have learned that best for the survivors are locations not too distant from the agency that provides the services, so that the survivors can attend the openings and see how their works are displayed. We also learned from the survivors that they feel validated and honored. While exhibitions farther away from the social service agency have no survivors in attendance, they are important for public relations

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and the visibility of the agency. Exhibitions provide the link between the agency and the community. They display art *by* the community members and art *for* the community members and situate art *in* the community. Each aspect points toward a different impact the works can potentially have on viewers.

The artworks manifest the universal power of art making across language barriers, age, and education. An important educational aspect of exhibiting self-expressive and transformational works is that statements about the emotional transformations that occurred during their creation supplement the works. Figure 1 is an example of one such work by an 18-year-old survivor of sexual violence. The artworks and the statements depict and describe emotional states and cognitions emerging during the process of recovery, ranging from anger, depression, and resignation to self-acceptance, hopefulness, and strength. The emotions are indicative of stages in the recovery process, which for many leads to a survivor's ability to have a normal life and healthy relationships with intimate partners.

Figure 1. Yesterday–Today–Tomorrow, created by an 18-year-old survivor of sexual violence



YESTERDAY: My heart was full of hate and unforgiveness. I thought I would never recover.
Our world is full of love and hate.

TODAY: I'm healing. My rips and tears are sewn together. I will heal with pride.

TOMORROW: I still have scars but the pain and the hate are gone. My heart forgives. I'm full of love.

2007, WATERCOLOR

Our exhibitions featured color laser prints of the originals that were executed in a variety of media, ranging from watercolor, drawing, ink, and painting to collage and sculpture. The originals were returned to the survivors, as reminders of their passage to recovery. Over the years of exhibiting, the A4E program gathered enough funds to uniformly frame all the works (15 x 21 inches). Figure 2 shows three informational panels and the framing of the works. The curatorial goal was to present the work in the best possible light to demonstrate that there is a lot of creativity in ordinary people. Such exhibitions send message to the community that anyone can be creative. Informational posters and educational take-home materials about the role of art in healing from domestic or sexual violence and how to identify warning signs of abusive relationships accompanied the exhibitions. Exhibitions require considerable resources and funding for scanning and image preparation, mounting, framing, packing and transporting, and contacting and cultivating venues. But, once prepared, exhibitions become a permanent resource by documenting the work of the organization and the survivors' journey.

PARTNERING WITH ARTISTS, WRITERS, AND EDITORS

Educational Outreach Through a Publication

Exhibitions have short life spans, and they are limited to audiences of gallery goers. We wanted to create something of value that had lasting power and could reach women throughout the state and beyond. Thus, an edited and self-published educational book and an online gallery of survivors' art have been created.

The book results from a collaboration of at least 33 individuals—artists, writers, humanists, therapists, and editors—to communicate with the larger community issues of violence against women and the transformational power of creativity. It has been designed to be concise and high quality: offset-printed in full color on archival paper to ensure longevity. The book focuses on art as a source of self-knowledge and transformation in the lives of women artists and survivors of trauma and violence. It shows larger cultural and social contexts for understanding violence against women and the role of creativity in the search for meaningful lives.

The publication features visual works; commentaries of artists and survivors; and essays on such topics as the experiential nature of the creative process, quilting as a means of communication, aesthetics, healing, and the impact of trauma on women's self-worth. Copies of the book that were funded by grants were distributed free of charge to shelters, social services agencies, libraries, colleges, art organizations, and galleries that were oriented toward social justice issues.

Partnering with an Editorial Community

I functioned as the editor of the publication in collaboration with an assistant editor; we both capitalized on years of experience in preparing our own manuscripts for scholarly publications. We made the basic selections of materials to be included, working on the materials over the course of nine months. However, ensuring the quality of such an editorial enterprise begged for professional editors. Here again, there was a need for engagement of community members. This time, editorial professionals had to be found and engaged to make this project a reality: a copy editor, a proofreader, and a design and production manager at a large academic press with whom discussions helped develop a clear vision of the project with the reader in mind.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

RESEARCH WITH VULNERABLE POPULATIONS

Doing research with survivors of domestic violence and/or sexual violence means doing research with vulnerable populations. Approaching vulnerable populations requires knowledge and sensitivity so that harm is not unintentionally caused by acting in ignorance or under misperceptions. Even though the vulnerability is not a permanent attribute but one that is associated with where women and children are in their life situations and the healing process, it is imperative to understand the dynamics and complexity of those situations. The intent is to lower a potential risk factor of emotional harm.

It is essential not to associate survivors of domestic and/or sexual violence with a permanent state of victimization and powerlessness. Conceiving of survivors as strong and resilient women and children who are at a phase of life that makes them vulnerable is the ethical imperative. This view of vulnerable populations reduces the risk of revictimizing the survivors. It is important to make this distinction because it is too easy to blame the victims for withstanding the abuse and to perceive them as weak and pitiful. One has to remember that the desire to make changes and ensure safety for their children's lives brought the women and their children to the shelter in the first place. These are the women in transition, women making sense of the trauma they experienced from the hands of partners who were supposed to foster loving and supportive relationships, partners with whom the women were committed to building lives—whereas their partners were committed to destroying them.

SOLUTIONS AND RECOMMENDATIONS

Art for Empowerment Outside Domestic Violence

Methodology of A4E is not exclusive to applications pertaining to domestic violence and/or sexual violence. The framework and the methods can be used with other populations. If feminism and gender inequities are not a preferred lens, empowerment-based, resilience-based, strength-based, person-centered, and solution-focused models of counseling can be emphasized instead. I have taught two different six-week courses at a community college. The first was focused on creativity in general counseling, and the second pertained to stress management. Counselors, art educators, teachers, special education teachers, mental health professionals, health professionals, social workers, psychologists, and artists took these courses, many of whom received professional development credits for completing them.

Again, the primary responsibility of an A4E facilitator is to create a safe space for the participants' self-reflection, self-expression, and self-empowerment through visual art making and respectful and supportive group interactions. All of these help to build a sense of community and belonging through the shared practice of art making. Whether A4E sessions take place at a DV shelter, at a local cultural center, or at a church, sharing art making and reflections with others can help to develop social skills and confidence. The beauty of the works and wisdom of the meanings they convey can help to reconnect with one's inner resources and assets, and foster the sense of empowerment.

Workshops and Curriculum

The following guidelines will help you facilitate expressive art workshops:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. Be familiar with and understand the likes, characteristics, and needs of the group for whom your program/workshop has been designated. If you learn about the population from a textbook or an expert, meet at least two individuals from that group to ground your learning.
2. Feel at ease with art materials and how to use them in public. You do not have to be trained in art or know how to draw or paint realistically to be an effective facilitator. However, you must have prior experience with the specific project you plan to facilitate if you want to know what you are doing when you stand in front of the group. As a general rule, prepare examples of the projects you will ask your group to make. Going through the process yourself will give you an understanding of the technique and the subject matter that only hands-on experience can generate.
3. Be prepared to have a curriculum consisting of workshops tailored to address the unique needs and interests of your group. Know where to access more workshops to ensure that you will not recycle the same ones. Offering a variety of workshops will keep your group interested and engaged. Make sure to diversify: follow emotionally challenging themes dealing with the dark side of the human condition with emotionally light and entertaining workshops; diversify projects in terms of media, sizes and techniques—for example, drawing, painting, collage, prose writing, sewing, quilting, bead making, jewelry making, journaling, and poetry. When working with youth, consider technology-based projects, including photography and video. At one workshop make butterflies or dream catchers; at another use found objects. Interchange seriousness with silliness and individual art making with team creating. Group projects help develop social competencies. Art therapists recommend starting the curriculum with representations of a safe place. Going back in one's mind to that place of safety when feeling anxious, especially after dealing with emotionally difficult topics, will ground and disarm the edgy emotions. When you ask the group to draw "a monster in me," make sure that the next session deals with light and positive feelings. For example, ask the group to paint a "personal needs flower" or ask the group to make a mosaic that will show how participants can "put themselves back together."
4. At the beginning of a session, individually greet every person entering the room and thank her or him for coming in. This will make the participants feel that they matter. At the end of a session, praise the group members for having the courage to create, to share, and to heal themselves.
5. Do not jump in with your interpretations of participants' work. Refrain from offering solutions to participants' dilemmas. Instead, encourage members of the group to comment on other's work in a non-judgmental way. Listen attentively and empathetically and be affirming. The goal is to ensure that participants can make interpretations for themselves and decide how they want to approach a problem. Positive cognitive reframing often takes place during that process. When participants are in charge of the creative process, they are more likely to feel empowered to make their own decisions and to recognize their strengths and assets; they become aware of how strong they are and of "how many of the answers they already know" (Ernst & Goodison, 1988, p. 27). For example, invite the participants to draw, paint, create a collage, or make an assemblage by starting with a statement "I am strong because…"
6. If you organize educational art exhibitions make their content and purpose self-explanatory and transparent to viewers. For instance, include informational panels describing the role of art in healing and warning signs of an abusive relationship, if you work with survivors of domestic violence.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Sustainability

1. If your goal is sustainability of the program, get as many people involved as necessary to cover the strategic functions, such as organizing art supplies, cleaning up after the workshops, grant writing, bookkeeping, exhibition preparation, securing venues for exhibitions, and the like. Avoid doing everything alone. Delegate. Give others opportunities to gain a sense of accomplishment and pride.
2. Equip the agency and individuals working there with the knowledge and tools for sustaining the program without your involvement: provide the training, share the resources, and encourage collective decision-making. Give support and advice at the beginning, but limit your engagement so that others can be proud of what they have accomplished and can sustain the initiative from within.
3. You will need at least one person you can trust from the agency to be your informant and unconditional supporter. When you feel like giving up, that individual will keep you going. When you feel insecure or uncertain about your methods or the choice of topics, that person will provide a realistic assessment of the situation.

Record Keeping

Once the program is in operation, do the following:

1. Archive what you, others, and the program have done and accomplished.
2. Systematically count and record numbers of participants attending each session.
3. Keep a record of what workshops have been offered: media, format, and themes. Take notes about how the workshops were received, whether anything noteworthy happened during each workshop, and how participants reacted to it and evaluated it.

Utilizing Resources

1. Use resources that communities have to offer: arts organizations, granting organizations, libraries, civic centers, and more. Organizations that helped me develop varied aspects of the Art for Empowerment program included state and regional arts councils; the state humanities council; Puffin Foundation of New Jersey, which supports art initiatives of social significance; and AWBW, which plays an essential role in the training and funding of programs for victims of violence and military trauma. It is worth noting that there are expanded opportunities for funding arts with veterans through, for instance, the National Endowment for the Arts (NEA). Recently, Congress specifically supported the NEA's increased work with military service members and the arts in fiscal year 2016. Moreover, there are new funding possibilities, as the Every Student Succeeds Act, signed into law on December 10, 2015, includes the arts alongside math and language arts in its definition of a "well-rounded education." That "ensures that arts education programs and teachers are eligible to receive federal funds through provisions such as Title I, which supports disadvantaged students, and Title II, which supports teachers" (Americans for the Arts, 2015).
2. Be prepared to do grant writing for the agency, if you want to have your initiative funded. It is likely that no one in your situation knows art as well as you do, so it is up to you to make a connection between the arts and the goals of the organization or community in which you are active. My experience taught me that grassroots, not-for-profit organizations have no manpower to apply for

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

grants for initiatives that may fall outside or stretch their original mission statements. Be prepared to make connections with new funders to demonstrate that art initiatives can be sustained, but do so as the agency is fiscally responsible for the funds devoted to the art-based initiatives.

CONCLUSION

This chapter has presented a case study on integrating arts into an organization providing services to survivors of domestic and sexual violence. It has introduced an empirically based method, Art for Empowerment, that was developed in response to the unfolding needs at a particular agency, where an expressive art program was focused on fostering self-reflection, self-healing, and self-empowerment of the participants of the program. This chapter has outlined the methodology and assumptions behind the A4E framework, which is not exclusive to the events that took place at the agency discussed in this chapter. Importantly, the methodology created through the practice at the DV shelter has been further developed and can be used with many other populations.

KEY TERMS AND DEFINITIONS

A Window Between Worlds (AWBW): A not-for-profit organization in Venice, California. AWBW provides specialized training and resources pertaining to using art as a healing tool for survivors of domestic violence and trauma.

Art for Empowerment: A strength-based and solution-focused conceptual framework and methodology for using visual arts to foster self-reflection, self-healing and self-empowerment. It has been empirically developed by this author through community engagements.

Feminist Counseling: An approach to therapy, which is attuned to the needs and problems of women. It focuses on contextual (societal, cultural, and political) causes of problems and stress and helps the clients recognize their own inner resources, strengths, and responsibility for making a change.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Survivors of Domestic Violence and/or Sexual Violence: Individuals of any gender or sexual orientation who reclaimed their lives after having been abused or violated physically, emotionally, sexually, or experienced other forms of violation of their personhood.

Warning Signs of an Abusive Relationship: Patterns of coercive behaviors in which a partner or partners focus on gaining power and control over the other partner or partners. It can involve: physical violence or the threat of physical violence, psychological/emotional abuse, intimidation, isolation, economic manipulation, jealousy, name-calling, possessiveness, and so on.

This research was previously published in the Handbook of Research on the Facilitation of Civic Engagement through Community Art edited by Bryna Bobick and Leigh Nanney Hersey; pages 339-366, copyright year 2017 by Information Science Reference (an imprint of IGI Global).

ABSTRACT

In the past few years, web documents, blogs, and reviews have played an important role in many fields as organizations always aim to find consumer or public opinions about their products and services. On the other hand, individual consumers also seek the opinions or emotions of existing users of a certain product before purchasing it. This method is currently one of the most vital methods for adapting the organizations' plans. In this article, the authors provide a survey for different techniques and approaches for emotion analysis from the text. They also demonstrate the techniques and the methods that have been proposed by different researchers with criticizing many of these methods according to the applied approach and the accuracy level.

INTRODUCTION

The fields of opinion mining (Mohsen, Hassan, & Idrees, 2016; Mohsen, Hassan, & Idrees, 2016) and emotion analysis (Othman, Hassan, Moawad, & Idrees, 2018; Othman, Hassan, Moawad, & Idrees, 2016) have had a deep focus recently as their impact have been strongly proved in the different fields of business including the educational field (Idrees & Hassan, 2018; Khedr, Kholeif, & Hessen, March

DOI: 10.4018/978-1-7998-3432-8.ch070

Copyright © 2021, IGI Global. Copying or distributing in print or electronic forms without written permission of IGI Global is prohibited.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

2015; Khedr & Idrees, 2017; Khedr, Kholeif, & Hessen, April 2015; Khedr & Idrees, 2017), the agricultural field (Hassan, Dahab, Bahnassy, Idrees, & Gamal, 2015; Hassan, Dahab, Bahnasy, Idrees, & Gamal, 2014), health field (Hazman & Idrees, 2015), and the business intelligence field (Badawy, Abd El-Aziz, Idress, Hefny, & Hossam, 2016; Helmy, Khedr, Kolief, & Haggag, 2019; Idrees, 2015; Khedr, Abdel-Fattah, & Nagm-Aldeen, 2015). The success of processing large volume of text data that express the opinion is not a trivial task. Processing this information needs complicated analysis to find positive or negative opinions and emotions about a special topic or a product. This section introduces the main definitions related to this field.

Natural language processing is one of the computer science domains which target is to process and understand the people language (Dahab, Idrees, Hassan, & Rafea, 2010). This process is performed through determining the text from documents, then parsing the text automatically by applying determined steps to find their meaning. First step which is considered the main step and has a high impact on the results' accuracy is "input preprocessing". Input preprocessing means preparing the input text for the understanding step (El Seddawy, Sultan, & Khedr, 2013; Mostafa, Khedr, & Abdo, 2017), this preparation includes the following tasks:

1. **Tokenization:** Considers parsing text and split text into a sequence of sentences and then splitting the sentence into a sequence of tokens. Some tasks which are performed in this step is removing punctuations and white spaces. The output of this step is a set of tokens;
2. **Filtration:** It is mainly related to the removal of stop words such as (the, an, a, etc.) that will not affect the meaning of the text;
3. **Lemmatization:** Considers converting the token to its original form like (walks, walked) to (walk);
4. **Stemming:** Considers replacing the token to its stem such as replace the token "interesting" to be "interest";
5. **Part of speech "POS" tagging:** Considers determining and tagging each word with its type, either it is a verb, noun, adverb, adjective, etc.

Opinion Mining

Opinion as stated in (Liu, Sentiment Analysis and Opinion Mining, 2012) is a personal belief or judgment of a person or a group of persons about a specific subject or entity. Turney and Littman (Turney & Litiman, 2003) argued that an opinion is the result of the emotion or interpretation of facts which may be presented by a discussion. Moreover, different people can present different opinions for the similar subject or entity. On the other hand, Sentiment analysis or opinion mining is the area of performing analyses to the person's document discussing an entity or a product and its attributes (Wiebe, Bruce, & O'Hara, 1999). It aims at determining a set of parameters and then detecting the sentiment of the writer towards the defined entity. Item classification has different successful approaches (Khedr, Idrees, & Elseddawy, 2016), in this research, we focus on the text classification approaches.

Sentiment analysis has different levels, a sentiment is either positive or negative or a deeper level representing the emotion of the writer which may be sad, happy, angry, etc.

According to (Liu, Sentiment Analysis and Opinion Mining, 2012), the main levels in opinion mining are as follows:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. **Document level analysis (Padmaja & Fatima, 2013):** This level considers classifying the whole document for the sentiment level. This level assumes that the whole document focuses on a single subject;
2. **Sentence level analysis (Wiebe, Bruce, & O'Hara, 1999):** This level considers each sentence in the document as an individual component and perform the sentiment analysis for each sentence;
3. **Entity and aspect level analysis (Hu & Liu, 2004):** This level is also called feature level, it directly considers extracting the main subject features and the person's opinion for these features. as an example, the document "HTC mobile quality is good, but its battery is too short" includes two aspects (quality and battery) describing one entity (HTC mobile).

Looking to opinion mining as a process, it is composed of determined phases, the following discuss these steps with considering the previously mentioned example:

1. **Entity extraction and Entity categorization:** In this phase, the entity extracted is "HTC mobile";
2. **Aspect extraction:** In this phase, the extracted aspect is "good";
3. **Opinion holder extraction and standardization:** This phase considers extracting the person who provided the opinion;
4. **Time extraction and standardization:** This phase considers extracting the time in which the opinion is provided;
5. **Aspect sentiment classification:** This phase is the main target which considers the detecting the required classification according to the determined level, for example, either it is positive or negative;
6. **Opinion quintuple generation:** This is a final phase which create the opinion sentence vector (E, A, H, T, S).

Emotion Analysis

Emotions are the person's subjective feelings and thoughts (Shixia & Huamin, 2010) mostly reached by a direct experience although it could be acquired indirectly. Examples of these feelings could be: happy, pride, joy, sorrow, fear, envy, or anger. Emotional responses could also include physiological reactions (Chaudhuri, 2006) such as heart rate changes, blood pressure, sweating, and so on, which directly affect human actions and facial expressions. Researchers have focused on a subset of emotions according to their research, for example, Liu in (Liu, 2011), considered that person has six primary emotions: love, joy, surprise, anger, sadness, and fear, however, other researchers have not followed the same set, in (Boa, et al., 2012), emotions list included sad, happy, and like. Opinion mining and emotion mining have a natural correlation, for example the positive opinion includes happy, joy, or like and negative opinion includes sad, depressed, or angry.

The following sections discuss the emotion mining using different directions, section II discusses emotion mining by applying information retrieval techniques while section III focuses on Lexicon based techniques which is based on the intelligent methods for building Lexicons, and section IV considers machine learning techniques.

Information Retrieval Techniques

Information retrieval refers to the recovery of specified information from a group of unstructured text documents (Khedr, Kadry, & Walid, 2015). In the field of opinion mining and emotion mining, information retrieval techniques are applied targeting to the retrieve the tokens that represent the emotions in the text. According to (Sharma & Patel, 2013), Information retrieval techniques are categorized to two models, they are: Boolean models and vector space models. Figure 1 demonstrates the hierarchy of models categorization which are discussed in the following subsections, while Table 1 illustrates a brief comparison between vector space models according to determined criteria including the accuracy level in retrieving the emotions and the applied domain with highlighting the reference and the used dataset nature in the research.

Figure 1. Techniques and sub techniques for information retrieval techniques

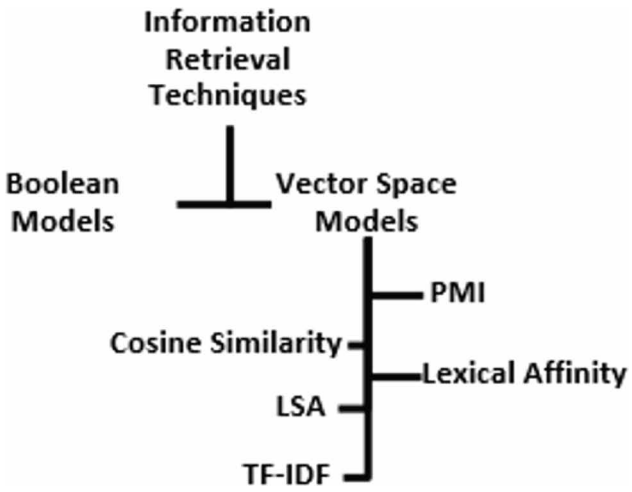

Table 1. Information retrieval techniques

Model	Paper, Year	Dataset	Accuracy	Domain	Emotions Used
Cosine Similarity	(Gohary, Sultan, Hana, & Dosoky, 2013)	Children Stories	65%	General	Joy, fear, sadness, anger, disgust, surprise
	(Martinazzo, Dosciatti, & Paraiso, 2012)	Tweets news	70%	Portuguese language	Joy, fear, sadness, anger, disgust, surprise
	(Agrawal & An, 2012)	Tweets	86%	General	Happy, sadness, anger, fear, surprise, disgust
PMI	(Agrawal & An, 2012)	Wikipedia, eBooks	58%, 50%	General	Happy, Sad, Anger, Fear, Surprise, Disgust, Neutral
	(Polisetty, Polisetty, & Rao, 2014)	Movie reviews	Unknown	General	anger, disgust, fear, joy, sadness, surprise, Emoticons
LSA	(Wang & Zheng, 2013)	ISEAR	Avg. 39.4%	General	Anger, disgust, fear, guilt, joy, sadness, shame
TF-IDF	(Patil & Patil, 2013)	ISEAR	71.64%	General	Anger, Disgust, fear, joy, sad

Boolean Models

Boolean models apply search approach which aims to find the required tokens in a specified text document. For example, a user query "cats and dogs" can be answered by retrieving all documents that contain these two words. Simply, Boolean models depend on the operators (and, or, not). Following this concept, the main operation of the previous query is "and."

Vector Space Models

Vector space models follows an algebraic approach which is applied by different models, each with its own perspective as discussed in the following subsections. The main steps can be briefly stated as follows:

- Build the Opinion quintuple generation vector for all extracted emotion terms;
- Apply a weighting technique;
- Apply a similarity measure which parameters is the user query and the extracted terms with respect to the term weight.

Cosine Similarity

Cosine similarity is calculated by applying Equation (1) (Khedr, Idrees, Hegazy, & El-Shewy, 2017):

$$Similarity\left(A,B\right) = \frac{A \times B}{\left|A\right| \times \left|B\right|} = \frac{\sum_{i=1}^{n} A_i \times B_i}{\sqrt{\sum_{i=1}^{n} A_i^2} \times \sqrt{\sum_{i=1}^{n} B_i^2}} \quad (1)$$

where A, B are the documents vectors.

Gohary, Sultan, Hana and Dosoky followed the cosine similarity model for extracting the Arabic text emotions in (Gohary, Sultan, Hana, & Dosoky, 2013) which was applied the on Arabic children stories. The research also aimed at constructing an emotion lexicon using the same dataset, therefore, the dataset was divided into two parts, the first part is used for manual building to the emotion lexicon, while the second part was used for applying the proposed approach for emotion mining to prove its applicability. The research focused on a determined set of emotions which is {Joy, fear, sadness, anger, disgust, and surprise}. The research approach was to annotate each sentence in the document with the determined emotion, then the emotion for the whole document is determined using the weighting technique for all detected sentences' emotions. The research by Gohary and his colleagues reached a precision equal 65% which is an average score. Earlier, another research is conducted by Martinazzo, Dosciatti and Paraiso in (Martinazzo, Dosciatti, & Paraiso, 2012) is conducted which had higher contribution and reached an accuracy equal 70%. The research focused on Brazilian text and followed the required pre-processing steps with respect to the language nature. The research also built a manual emotion lexicon which included the token and associated emotion, then the document matrix was built and finally the cosine similarity measure was applied. Although the research by Martinazzo and his colleagues was promising, however, the accuracy level was also average, more work in the same year has been conducted by other researchers such as in (Agrawal & An, 2012) which reached an F-measure equal 86%. This accuracy was reached

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

by using the WordNet (Miller, 1995) as a lexical database source and a corpus of statements with its associated emotion, then these sources were used for emotion mining.

Point-Wise Mutual Information (PMI) Similarity Measure

PMI measures the impact of one token to the other which formulates the whole sentence meaning. Mutual information is explained in (Khedr & El Seddawy, 2015) as follows.

Considering there are two words x, y:

- P(x, y) is the probability that the two words can be found together in the same context;
- P(x) is the probability that x is found individually;
- P(y) is the probability that y is found individually;
- Then the joint distribution of x and y in a given dataset or documents is measured as in Equation (2):

$$I\left(x,y\right) = \log_2 \frac{p\left(x,y\right)}{p\left(x\right)p\left(y\right)} \tag{2}$$

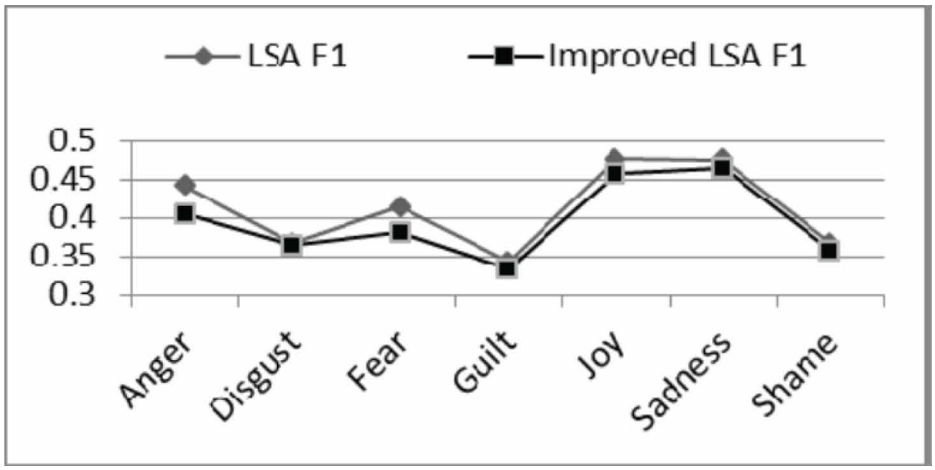
In the same research of Agrawal and An (Agrawal & An, 2012), an algorithm was proposed using unsupervised context-based learning for emotions detection at the sentence level. PMI similarity is applied in one of the steps by measuring the relation between words in the documents such as (looks, beautiful). The results were 52.5% for WIKIPEDIA dataset when the text is un-stemmed and 58.08% for stemmed text. Another experiment using GUTENBERG dataset reached an accuracy equal 54.76% for un-stemmed text and 55.34% for stemmed text. Another research is conducted by Polisetty and his colleagues in (Polisetty, Polisetty, & Rao, 2014), the research proposed an approach for Emoticons analysis for movie reviews. Emoticons are the emotions that are represented by faces' reaction. The sentences in the movies dataset was classified to six basic emotions (anger, disgust, fear, joy, sadness and surprise). The research followed the same approach by using a *lexicon* of words, however, this lexicon had an additional feature by providing a relation between the six categories of emotions with emoticons using these words. PMI was then applied after the exhaustive preprocessing step that included all required tasks. The main contribution of the research by Agrawal and An (2012) is the size of dataet which provides more confident in the proposed approach.

Latent Semantic Analysis (LSA)

LSA (Landauer & Dumais, 1997) aims at analyzing the relations between the documents and extracts the most important terms that represent the documents context. This model is based on building the terms' matrix for the documents, the matrix includes a column for each term and a row for each document. The term frequency in each document is calculated and assigned to the term/document cell. Then, singular value decomposition (SVD) method is applied on the matrix, and finally, the similarity is measured for all documents. Wang and Zheng applied and improved LSA model in (Wang & Zheng, 2013) by using LSA for emotions classification using VSM model targeting to increase the accuracy level. The research succeeded to reach a raise of 4% than the normal accuracy level as illustrated in Figure 2.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. LSA compared with Improved LSA results



Lexical Affinity

Lexical Affinity considers the measurement of the relations between words by determining how the subjects and objects of a sentence compose a definite meaning. This measurement basically depends on uncertainties and probabilities such as Bayesian networks (Dahab, Idrees, Hassan, & Rafea, 2010). In (Lu, Hong, & Cruz-Lara, 2006) Lexical Affinity was applied for sentence level emotion detection. The research applied semantic labeling for the words in the text targeting to identify if the word is adjective, verb, or objective. Then they a web mining engine such as Google is used to identify the definitions of the labeled words. These identifications were the main key for building the relations between these words. Finally, detecting emotions was achieved by detecting the relation between the tokens with different labels. The overall meaning of the sentence is also considered as it may affect the detected emotion.

Tf-idf (Probabilistic)

Tf-idf (Hassan & Idrees, Sampling Technique Selection Framework for Knowledge Discovery, 2010), (Khedr & El Seddawy, 2015) is a weighting measure represented in Equation (3). Tf-idf is determined by defining the relative frequency of tokens in a specific corpus document (tf) with a comparison to the inverse of the term frequency in the whole corpus (idf). Tf equation is represented in Equation (3) while idf equation is represented in Equation (4). Finally, TF/IDF is computed by multiplying TF with IDF as represented in Equation (5) (Mohsen, Hassan, & Idrees, 2016; Mohsen, Hassan, & Idrees, 2016):

$$tf\left(t,d\right) = 0.5 + \frac{0.5 * f\left(t,d\right)}{\max\left\{f\left(w,d\right) : wd\right\}} \tag{3}$$

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

$$idf\left(t,D\right)=\log_2\frac{N}{\left|\left\{d\ \ D:t\ \ d\right\}\right|} \tag{4}$$

$$Tf-idf\left(t,d,D\right)=tf\left(t,d\right)\times idf\left(t,D\right) \tag{5}$$

The research in (Patil & Patil, 2013) presented a method for emotions' classification in a news headlines dataset. After the preprocessing phase which included filtering, tokenization, stemming and pruning, training set was determined and Tf-Idf (El Azab, Idrees, Mahmoud, & Hefny, 2016) was computed for the tokens in the training set. Tf-idf was calculated for the documents' terms and SVM is applied to classify the words representing the emotions and their emotion category. The classification process is then applied to the testing set and the method proved to reach an accuracy level of 71.64%.

Lexicon Based Techniques

Although some of the previous discussed research have used a lexicon, however, they were a supportive component to the main approach to build the emotions' corpus in addition to the manual process to build these lexicons. Lexicon based techniques mainly aims at supporting emotion mining field by building an emotions' lexicon for various types of emotions, this lexicon is then used for emotion mining in the targeted documents. Different techniques are proposed for building the emotions' lexicon, they are Concept net, Lexical Chain, Corpus Based, and Dictionary Based. Table 2 presents a brief comparison among these techniques while the following subsections discuss each technique.

Table 2. Lexicon based techniques

Technique	Paper, Year	Dataset	Accuracy	Domain	Emotions Used
Concept Net	(Ezhilarasi & Minu, 2012)	WordNet	unknown	General	_
Lexical chain	(Kumar & Suresh, 2012)	Wiki news articles	86%	General	happiness, sadness, anger, fear, disgust and surprise
Corpus based	(Lei, Raob, Li, Quan, & Wenyin, 2013)	BBC News	63.57%	General	Touching, empathy, boredom, anger, amusement, sadness, surprise, warmness
	(Gohary, Sultan, Hana, & Dosoky, 2013)	Children Stories	65%	General	Joy, fear, sadness, anger, disgust, surprise
Dictionary based	(Tokuhisa, Inui, & Matsumoto, 2008)	EP corpus	Unknown	Dialogue systems	happiness, pleasantness, relief, fear, sadness, disappointment, unpleasantness, loneliness, anxiety, and anger

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Concept Net

Using this technique, the text is analyzed for extracting the main domain concepts targeting to build the concept net. Concept net represents the concepts with their relationships with highlighting the relationship between the concepts and the related topic. Ezhilarasi and Minu in (R.Ezhilarasi & Minu, 2012), built an emotion ontology network for classifying the text documents according to emotion classes. The main idea can be summarized as identifying the tokens which is expected to represent the emotions and confirm these expectations using WordNet (Miller, 1995). Confirmed emotions terms are then used for building the ontology net for further document classification.

Lexical Chain

Lexical chain technique (Turney & Litiman, 2003) is based on natural language processing paradigm. Lexical chain builds a linguistic ontology net by detecting the relation between sentences in the corpus according to the terms' similarity which exist in these sentences. Lexical chain considers a number of criteria including the length of the sentence namely the chain length, the number of the term occurrence in the chain. The classification is then determined by determining the product of the homogeneity index and the chain length. Kumar and Suresh (Kumar & Suresh, 2012), considered detecting six basic emotions (happiness, sadness, anger, fear, disgust and surprise) in their research, their proposed approach reached an accuracy of 86%. In this research, the lexical chains are constructed in a terms' semantic relations basis and the chains score is calculated, and finally, high scores chains are highlighted to represent the emotions of the document.

Corpus Based

Corpus based techniques aims at building an emotion corpus which can be used later for emotion mining tasks. Lei and his colleagues presented a lexicon-based system in (Lei, Raob, Li, Quan, & Wenyin, 2013) which targeted to classify the documents based on their emotions and reached an accuracy of 59.11%. The main idea of the research was based on extracting the main words representing each emotion by the user from a set of documents and build a lexicon of words representing the emotions. The emotions set included (Touching, empathy, boredom, anger, amusement, sadness, surprise, warmness). Another research in (Gohary, Sultan, Hana, & Dosoky, 2013), focused on the automatic detection of emotions in Arabic text based on the sentence level which reached an f-measure score equal 65%. The proposed approach was based on a moderate sized Arabic lexicon which was used to annotate Arabic children stories dataset terms. The corpus consisted of 100 documents with 2,514 sentences. The sentence classification was measured according to the kappa statistics value, a value equal 1 represents a total agreement while a value equal 0 represents a total disagreement. The average value of Kappa in this research was 0.46 which represented that moderate agreement. The Lexicon was built for the six emotion categories (Joy, fear, sadness, anger, disgust, surprise) from annotated sentences and directly from English emotions lexicon.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Dictionary Based

Dictionary based technique aims to classify the emotion represented in a token based on the definition of this word in dictionaries such as WordNet (Miller, 1995) and their hierarchies. Tokuhisa, Inui and Matsumoto presented a research in (Tokuhisa, Inui, & Matsumoto, 2008) which reached an accuracy of 84.6%. The research aimed at documents' classification according to the emotions of these documents following their sematic meaning. The proposed research targeted the dialog chatting system for extracting emotions' terms, then this step was then followed by connecting these results with the context of human computer dialog and assign massive examples of emotion-provoking events that can be extracted from the Web by determining their accuracy level with determining the accuracy threshold. These examples are then used to build a semantic content-based model for fine-grained emotion classification. The model also considered the quantity and accuracy of emotion-provoking examples to be collected and Emotion-provoking corpus for extracting data. Moreover, in (Boa et al., 2012), a high-quality moderate sized emotion lexicon is manually created using Mechanical Turk and WordNet Affect (Strapparava & Mihalcea, 2007; Idrees, Ibrahim, & El Seddawy, 2018); the lexicon is built based on questioners distributed to the subscribers of Mechanical Turk.

Machine Learning Techniques

Machine learning is an Artificial Intelligence (AI) paradigm that aims at learning computers without being programmed manually (Sayed, Salem, & Khder, 2019). Main focuses of machine learning are the development of computer programs that can self-learn automatically to grow and change when being exposed to new data. Different machine learning algorithms are applied in data mining, pattern recognition and some computational theories. It is divided into 3 main categories (Supervised, Unsupervised and Semi-Supervised). A brief comparison is demonstrated in Table 3 for different research considering this area while the following subsections discusses some of the research for each category.

Supervised Learning

Supervised learning is a machine learning task aims at deducing a model from supervised training data (Idrees & Hassan, 2018), then prove the applicability of this model using testing dataset. Some of supervised learning approaches are discussed in the following subsections.

Support Vector Machine (SVM)

SVM is a discriminative classifier that aims at separating the training examples by a determined separator such as spaces, then it constructs a hyper plane or a set of hyper planes in a high- or infinite-dimensional space which then can be used for classification, regression, or other tasks. In (Inkpen, keshtkar, & Ghazi, 2009), a Text Affect dataset was used (Strapparava & Mihalcea, 2007) and SVM was applied over a segment equal 1250 headlines from the dataset which produced an accuracy of 48%. Another annotated corpus was also used in which SVM is applied on 2090 sentences and produced an accuracy of 65.45%. Moreover, Binal, Wu, and Potdar in (Binal, Wu, & Potdar, 2009), targeted to detect the emotions during E-learning as it affects the learning experience. They proposed a conceptual framework that can extract, analyze, and predict the emotion of learners to assist the lecturer for decision support by applying the

Table 3. Machine learning techniques

Technique	Sub Technique	Paper, Year	Dataset	Accuracy	Domain	Emotions Used
Supervised	Support vector machine	(Inkpen, Keshtkar, & Ghazi, 2009)	Newspapers headlines	48%,	General	Happiness, sadness, anger, disgust, surprise, fear, no emotion
			annotated blog corpus	65.45%		
		(Binal, Wu, & Potdar, 2009)	Student reviews	NO	E-learning	Negative (sad, confused, frustrated), positive (happy, engaged, excited), neutral
		(Haji, Chen, & Vidyasagar, 2010)	Blogs	96.4%.	General	sadness, happiness, anger, fear, disgust and surprise
		(Patil & Patil, 2013)	ISEAR dataset	71.64%	General	Anger, disgust, fear, joy, sad
	Naïve BAYES	(Boa, et al., 2012)	online news collection	53.67%	General	Touched, empathy, boredom, anger, amusement, sadness, surprise, warmness
		(Donglei, Zhikai, Yulan, & Deyu, 2019)	News dataset	43.072%	General	Touching, Anger, Amusement, Sadness, Shock and Curiosity
	Deep Learning	(Ankush, et al., 2019)	News dataset	71.43%	General	Anger, Happy and sad
Unsupervised	Graph based	(Sugandh, Mulye, & Wadhai, 2011)	_	_	General	anger, fear, happiness, sadness

natural language steps using GATE tool (tokenization, sentence, splitter, POS tagger). These steps allowed the proposed framework to detect the students' emotions towards the subject. The student could experience either positive (happy, engaged, excited), negative (sad, confused, frustrated) or neutral emotional experience. Another research in (Haji, Chen, & Vidyasagar, 2010) have used the GATE tool, with detecting and annotating emotions' terms in the corpus. The resulted words are considered as input features to the support vector machine for training. The system proved the success by an accuracy of 96.4%. Moreover, in (Patil & Patil, 2013) a proposed approach which joined SVM with tf-idf for emotions' classification and reached an accuracy of 71.64%. Moreover, in (Balabantaray, Mohammad, & Sharma, 2012) support vector machines are also applied and reached an accuracy of 73.24%. Other research applied SVM in different fields such as in (El Azab, Idrees, Mahmoud, & Hefny, 2016; Idrees & Taie, 2016; Khedr, Kholeif, & Saad, 2017). Finally, recent research such as (Nida, Kirmani, Mohd, Muttoo, & Mohd, 2019) proposed a method that applied support vector machine approach with the support of an emotions' terms' dictionary. The emotions were Joy, fear, sadness, anger, disgust, surprise. The research used different datasets that were collected from news headlines and were classified among 3 corpuses. An accuracy of 59.71% was achieved for corpus 1, 63.24% for corpus 2 and 67.86% for corpus 3.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Naïve Bayes

Naïve Bayes (El Azab, Idrees, Mahmoud, & Hefny, 2016; Khedr, El Seddawy, & Idrees, 2014) is based on a statistical theory called Bayes. So it is probabilistic classifier that is trained much efficiently in a supervised learning settings. A system was presented in (Boa, et al., 2012) which consisted of two components targeting to extract the emotions from social network. First component is the emotion terms model which used naïve Bayes to determine the emotions within documents and words. Second component is LDA topic model which uses LDA to classify the topic from documents (Othman, Hassan, Moawad, & Idrees, 2016). The two components are working coherently for documents classification according to their associated emotions with respect to the topic and the relation between these documents. This system reached an accuracy of 53.6%. Moreover, Donnglei and his colleagues constructed a model (Donglei, Zhikai, Yulan, & Deyu, 2019) that uses Bayesian networks in order to detect hidden topics about emotions. They assume that words within the same sentence carry similar emotions and reached an accuracy of 43.072% for their target.

Deep Learning

Deep learning as discussed in (Yann, Yoshua, & Geoffrey, 2015) as it applies a computational model for data representation learning with respect to the abstraction level by applying a set of multiple processing layers. Another research in (Ankush, et al., 2019) proposed an approach to detect emotions from text using deep learning. The proposed approach focused on three emotions, they are: angry, sad and happy and reached an average f-measure of 59.68% for the happy emotion, 80.79% for the sad emotion, and 73.55% for the angry emotion.

Unsupervised Learning

Unsupervised learning deals with unlabeled data and not has to be evaluated. Also, there is no measuring for error because there is no in indicator for classifying. Sugandhi, Mulye, and Wadhai in (Sugandh, Mulye, & Wadhai, 2011) proposed a system which applied a graph-based method targeting to extracting tokens representing emotions from text. The emotion token was considered as a token, and all other basic tokens were related to the extracted nodes in a semantic basis. The research considered two levels of emotions, the first level included an emotion set of 4 items, they are: {anger, fear, happiness, sadness}, the second level included an emotion set of 22 items, they are: {aggressiveness, anger, avoidance, compassion, courage, excitement, fear, happiness, helplessness, humility, impatience, indifference, joy, optimism, pain, patience, pessimism, sadness, selfishness, surprise, unselfishness, vigilance}. Finally, the weight for each node was calculated according to its relations with other nodes in the tree.

Emotion Mining vs. Opinion Mining Challenges

There are many challenges in the field of opinion mining and emotion mining. First, the ability to detect both levels in the same text in different analysis levels (document, sentence, or term). Second, the ability to provide an explanation for the extracted opinion or emotion. Third, the ability to provide a weight representing the impact of the extracted opinion over the context according to the holder's knowledge. Fourth, the ability to apply multilingual approach for opinion mining and emotion mining.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Other challenges considered the ambiguity in the Positive or Negative sentiment words may have opposite orientation, for example "This Samsung mobile sucks" could mean a negative opinion about Samsung while another sentence with the same terms such as "This Samsung mobile is really sucks" could mean a positive opinion about Samsung. Moreover, the sentence may contain sentiment words which may not express any sentiment such as the example "Could you tell me which Samsung is good?". Sarcastic sentences are also challenging such as "What a great Samsung! It stopped working in two days". Finally, many sentences without sentiment words can imply opinions such as "This Samsung mobile consumes a lot of electricity" which represent a negative opinion about with no inclusion of any term representing this opinion.

CONCLUSION

This paper provided an overview on opinion mining and emotion mining and their basic definitions. The paper also discussed the main steps of the mining process included all phases. A review of the techniques for emotion mining in text have been presented and their relation with opinion mining. Finally, a comparison among different techniques has been discussed through some criteria such as datasets and error rates.

Chapter 71
Accessible Mobile Rehabilitation Games for Special User Groups

Sari Merilampi

Andrew Sirkka
Satakunta University of Applied Sciences, Finland

ABSTRACT

This chapter presents viewpoints of 104 users upon trials on four mobile games which combine cognitive stimulation and physical exercise in rehabilitation. The first game requires users to control by tilting a mobile phone embedded in a balance board; the second game can be controlled by tilting the tablet computer; the third game is a modified version of Trail Making Test A—a memory test that can be played by tapping figures on the screen of tablet computer; and the fourth game is an activation game with a special controller, dedicated for people with severe physical limitations. Users welcomed the use of games as self-rehabilitation tools that can be adjusted according to personal skills and limitations. The games not only gave them meaningful activities, but also saved time and efforts of professional care takers who might be unable to socialize frequently with clients.

INTRODUCTION

People with special needs are too often seen as a minor and marginalised group having no use or even interest for game technology. However, alongside with the ageing of populations and dwindling resources, modern user-friendly technology applications have shown huge capacity in intensifying care and rehabilitation services. Active ageing, self-supported care, and other aspects in quality of life would take an enormous step forward with deployment of user-friendly technologies (Leinonen, Koivisto, Sirkka, & Kiili, 2012; McCallum, 2012; Confalonieri, Guandalini, Da Lio, & De Cecco, 2012).

Having real possibilities to be mentally, physically and socially active is an important part of well-being in all ages. People with special needs, like cognitive or physical limitations, often feel unnecessarily disabled because of attitude and belief prevailing in the environment, including care professionals. To break the unnecessary impediments, new means and methods are required. Elements of entertainment and therapy content can be put together into mobile games, such as four games investigated in this study, to make games become tools for rehabilitation that is adoptable for anyone in need (Leinonen et al., 2012).

Several studies show that both physical exercise and game play have positive effects on people, including older adults or people with learning disabilities, who are combating serious depression or even Alzheimer's disease (e.g. Fairchild & Scogin, 2010; Geda et al., 2010; Spector et al., 2003; McCough et al., 2011; Merilampi, Sirkka, Leino, Koivisto, & Finn, 2014). Findings from scientific research studies show that, in general, playing video games can lead to changes in an individual pleasure, vigilance, dominance, and therefore improving the overall experience of well-being. In the case of older adults, simple and easy to play video games are well accepted, as the games were found to be able to create positive feelings and enjoyment (Khoo & Cheok, 2006; Koivisto, Merilampi, Kiili, Sirkka, & Salli, 2013; Sirkka, Merilampi, Koivisto, Leinonen, & Leino, 2012; Snowden et al., 2011). Even a few minutes of regular game playing exercise on daily basis can generate cognitive benefits, improving skills required to enhance performances like attention and concentration (Gao & Mandryk, 2012a). This knowledge has inspired the Well-being Enhancing Technology research group (WET-RG) to create games that combine physical movement with cognitive impetus, and then testing the games in several target groups.

In Finland, the WET-RG at Satakunta University of Applied Sciences focuses on generating gamification tools to activate and assist people with special needs. Instead of investing in design-for-all, WET-RG chose to design for somebody. This chapter presents findings of trails on four different cognitively stimulating mobile games, where the games were tested with different target groups. The chapter also discusses the subjective experiences of participants and the observations of staff related to these trials.

DESIGN PRINCIPLES OF THE GAMES

Four different games presented in this study are categorised based on the control method and the game display. The first game (Game#1) is controlled by tilting the mobile phone allocated in a balance board, and the visual of the game is displayed on a large television screen. The second (Game#2) and the third (Game#3) games are playable on a tablet computer, in which figures of the second game can be controlled by tilting the tablet; while figures on the third game can be manipulated by tapping the screen. The fourth game (Game#4) is playable by moving custom-made a hand controller and a head controller, in which the visual of this game can be showed either on a tablet computer screen or on a bigger screen.

Game#1 was tested with older adults and people with learning disabilities. Game#2 and #3 were tested by a group of older male participants with diagnosed memory impairment. Game #4 was tested in a rehabilitation centre with people with varying physical disabilities.

The target groups consisted of people with special needs, such as diagnosed memory impairment, older adults and people with learning or physical disabilities, therefore a special attention was paid on the game design. Due to the impaired perception and sensation skills in the target users, the following six accessibility principles were deployed in the game design: a) large target button elements, 2) simplified and only necessary graphics, 3) minimal amount of animation, 4) colours used conservatively with high contrast, 5) simple one-view display at the time, and 6) placing important information in the middle of

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the screen. (Díaz-Bossini & Moreno 2014.) Apart from the above-mentioned accessibility principles, game designers used obvious logics instead of showing additional introduction of how to play a game. This feature is especially important for people with learning disabilities, even when they are assisted by staff to start playing the game (Koivisto, Merilampi, & Sirkka, 2015)

Time pressure was also added to all games to assure achieving both goals in the game, entertainment and rehabilitation. Multiple short game playing sessions, with moderate-intensity on regular basis, have been proven more beneficial than less-frequent but longer play sessions (Gao & Mandryk, 2012a; Gao & Mandryk, 2012b).

In general, the games should correlate with the physical conditions of targeted users, as well as their skills to achieve the so-called "flow feeling". The games are designed to generate a positive effect in players, and are most engaging when they facilitate the flow experience. Csikszentmihalyi (1990) introduced the flow state through the study of people involved in activities such as rock climbing, playing music, chess and dancing. 'Flow' describes a state of complete absorption or engagement in an activity and refers to the optimal experience. During the optimal experience, a person is in a psychological state where he or she is so involved with the goal-driven activity that nothing else seems to matter. Activity which can produce such experiences is so pleasant, to the extent that a person may be willing to do something for its own sake, without being concerned about what to get out of it. Theoretically speaking, the flow state consists of nine dimensions, but immediate feedback, sense of control, loss of self-consciousness, clear goals and the challenge-skill balance dimension provide a meaningful approach with which to embody engaging elements into exergames used in activation (Kiili, 2005; Kiili, de Freitas, Arnab, & Lainema, 2012; Kiili & Perttula, 2013; Koivisto et al., 2013; Merilampi et al., 2014; Wilson et al., 2002).

The design of games depicted in this chapters emphasizes on accessibility factors. These games should require minimal amount of equipment to play. To make the games appealing enough to generate the "flow feeling", the gameplay should be activating, easy and fun while being a "serious game" that serves certain goals and purposes of rehabilitation. These requirements led the WET-RG to select components of game playing technology, like mobile phone, internet connection and television or tablet computer display.

Issues associated to the accessibility and usability play an important role on the gameplay when designing games for people with severe limitations (Bierre et al., 2005). A concept of 3D-printed controller jig was designed and used to make games accessible and entertaining despite of physical impairment. As a novel method, it does not limit the use of game playing hardware to those available in the market, instead it is truly designed for individual special needs.

Game#1 Chase-the-Square / Cheese

The concept of Game#1 is a mobile phone that embedded an acceleration sensor to control game characters on a wide television screen. By constantly reading the acceleration data, the phone communicates commands to a socket server via internet. The socket server determines the moves of game characters in the game run in the mediating computer.

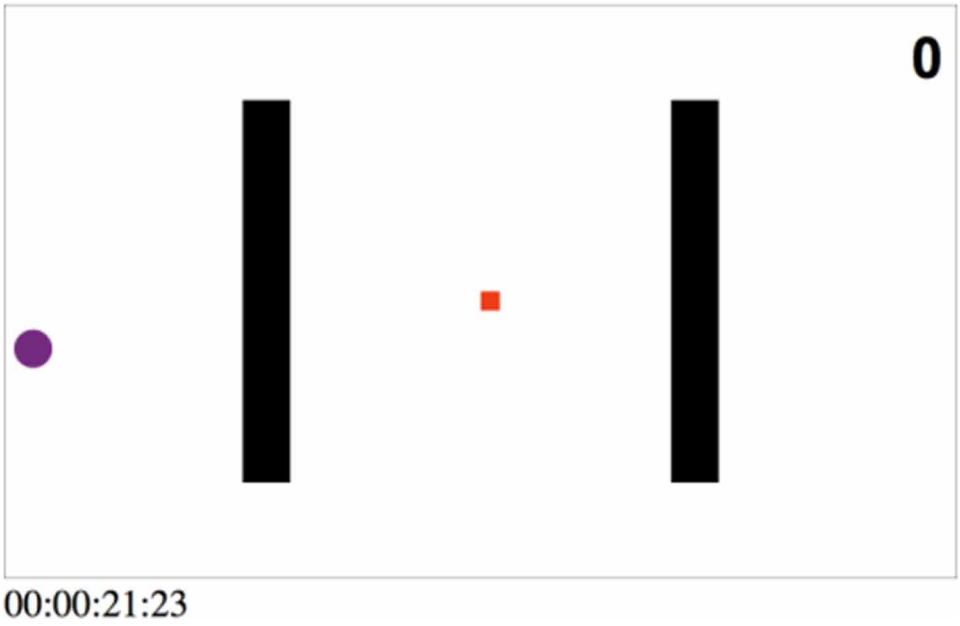
The choice of using the socket server solution was made to make multiplayer possible in the trials. Node.js was used as the socket server to attain the best possible interaction between the HTML5 game on a browser and mobile phones as game controllers. Game#1 was stored in the web, enabling any of mobile client to join a game session, and to use television browser as a game console.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Phonegap app was deployed in building the game controller application inside the phone due to its ability to access phone hardware easily, while allowing application construction to all major mobile phone platforms. Deploying this app prevented complication in connections caused by sleep mode of phone, which may close connection to the internet and terminate a playing session.

When playing Game#1a, players practice motor coordination of hands or feet by catching a red square with a purple ball. The game also involves cognitive stimulating as players must observe and react to positions where the next square appears. The game was tested in trials with older adults and adults with learning disabilities (see Sirkka et al., 2012), which justified why the design was kept visually clear and logically simple. Players must bypass two impenetrable obstacles in the game field, as shown in Figure 1.

Figure 1. Game#1a chase-the-square



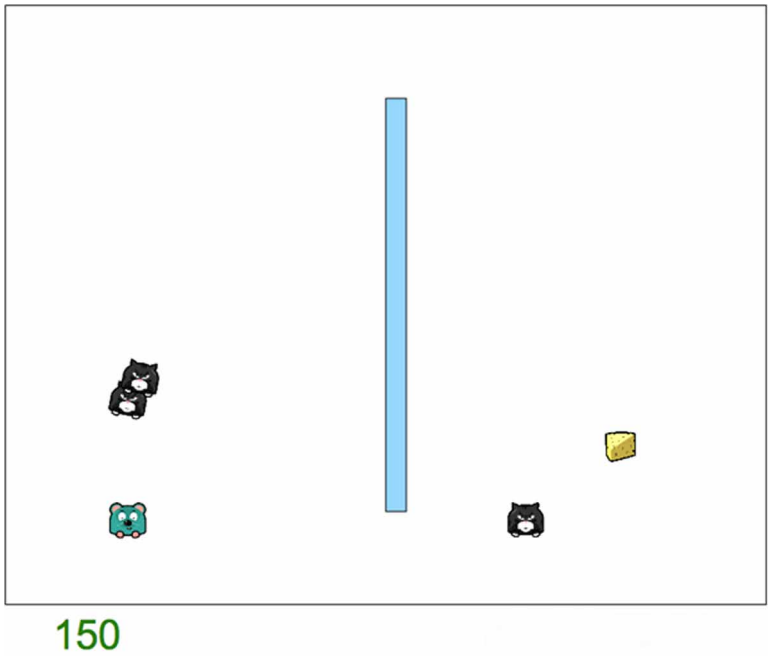
Players control the movement of the ball by tilting the mobile phone. The steeper the tilt, the faster the ball moves on the screen. Two different controlling modes were used: a) manually control by making wrist movement, or b) making foot movement to control the phone attached into a balance board. In both modes, players were seated during the game for safety reasons.

The square object and the ball objects in Game#1a were replaced by three mouse characters, a cat character and cheese chunks in the second trial with adults with learning disabilities (Game#1b). The modification was based on feedback given by the older adults from the first trial. This modification increased the difficulty level in the game by adding adversary component into the game (see Figure 2), making it cognitively more challenging.

Players played Game#1b using the balance-board control mode to collect as many cheese chunks as possible in one minute. The game starts with no opponents, but players must bypass the impenetrable obstacle. The game becomes more challenging after collecting five cheese chunks, as the first adversary, a cat character enters the game scene and starts chasing the mouse characters. Another cat appears after

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Design of game#1b, chase-the-cheese (balance board) and game#2 chase-the- cheese (tablet computer)



collecting ten cheese chunks, while the first cat moves faster, making it difficult to evade. The third cat appears after collecting 15 cheese chunks, while two existing cats moves faster in chasing the mouse. The game ends when the one-minute time is up or when any cat catches the mouse.

Game#2 Chase-the-Cheese on Tablet Computer

Games#2 and Game#3 are cognitively stimulating games designed through a collaboration with professionals specialised in memory disorders. The design of Game#1 was modified to generate a tablet computer version, which can simplify game playing events and data communication, affording direct communication between the tablet and the server using Near Field Communication or NFC identification facilities. The gameplay was identical to the Game#1b (Figure 3), but the phone controller was replaced by a tablet computer, eliminating the calibration of computer-internet-television screen requirement. The tablet computer version of Game#2 and Game#3 were tested in trials conducted with a group of older male participants with diagnosed memory disorder. The feedback given by participants of trials conducted in Game#1b, the animal characters helped players understand the logic of the game, making the game exciting as the level of difficulty increase gradually.

Game#3 Trail Tapping

Game#3 is a modified version of Trail Making Test A (TMT-A), which is commonly used in memory diagnostics. The standardised test distributes numbers 1 to 25 randomly over a sheet of paper. A test taker should draw a line connecting the numbers in ascending order as quickly as possible without lifting the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

pen from the paper. The time to draw the trail is measured. The test taker is allowed to correct possible errors which will increase the completion time reported in seconds—the longer the time, the greater the memory impairment ("Trail Making Test", n.d.; Tombaugh, 2004)

As shown in Figure 3, blue digits are randomly distributed over the screen and the test taker is instructed to tap on them in ascending order as quickly as possible. Correctly tapped digit turns translucent while an error turns red. The size and colour of numbers were made as visible as possible. The game may end in three conditions: when all digits are tapped in correct order, after making four errors, or when time runs out (240 seconds).

Important adjustment was made in trials on the difficulty level, in which a menu to select a desired difficulty level, ranging from 5 to 40 digits in five-digit intervals was added in the game design.

A game score registry system was built to trace personal progress. Each participant was provided with a personal NFC identification card to log in the game. When starting the game, a player touched the NFC reader in the tablet with their personal card. Based on identification, the game presented the latest personal records on the screen. The NFC technology registered data of each play event, enabling the analysis and the progress tracing of each player.

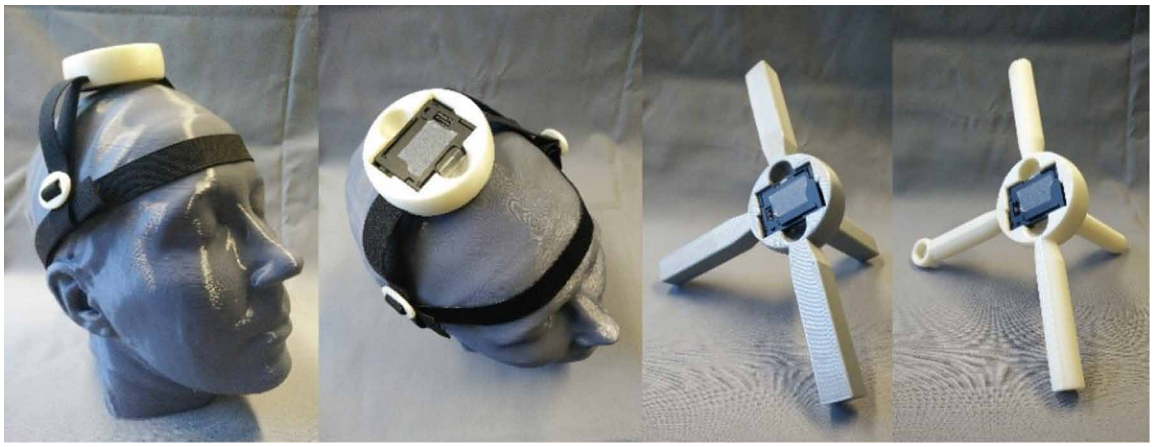
Figure 3. Game#3, tapping the trail

Game #4 Maze and Breakout With Modified Game Controllers

Game #4 was modified based on Game #1 in order to match the physical limitations of the most challenging clients in a rehabilitation centre. The client prompted the challenges related to the game controller. Special 3D-printed controllers were developed with the help of the rehabilitation personnel. Every game controller contains two parts, a sensor that contains External Texas Instruments CC2650 and a jig. The

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Game controllers attached on headband or easy-grip handle



jig could be placed on the head of a player or held in hand (Figure 4). The game controller sends gyroscope data through Bluetooth Low Energy (BLE). The data is interpreted in the game code to determine the direction and the speed of player's movement. Different shapes of handles were printed to be used based on individual player's gripping abilities. The handles can be fixed to the players body by using a belt in order to provide extra support and avoid dropping the controller due to compulsory movements. The sensor in the head controller could also be modified based on the player's needs.

The game was modified and divided into two different versions: a) a maze where a player character competes with a non-player character enemy in catching heart shape objects within a time; and b) a breakout game which is based on a 1970's arcade game, where a player character moves a paddle on the lower part of the game screen in order to break bricks on the upper part of the game screen using a ball that may bounce back on individual tiles after breaking them. The paddle moves only to the right or left, making the game easier to play using the head controller. The speed of the game was optimized for the both types of controllers, but it can be changed afterward according to specific needs.

Both versions of Game#4 were regarded as 'activation games' in this study, in which special game controllers were designed to motivate and intensify physical rehabilitation. Activation games can also generate tools for game modifications based on the user's functioning accessibility, personal likes, and rehabilitation needs on individualization and motivation. The logics in the games is based on the classic Breakout game and the heart collection Maze, which is easy for players to learn (Figure 5).

GAME INTERVENTIONS AND STRUCTURED INTERVIEWS

This chapter presents results of game interventions and structured interviews, in which data were collected in several trials with various target groups. The trials are explained here in more details.

Game#1a trials were organised in two different organisations in Finland for two weeks. The target group contained 34 participants (17 female & 16 male) who were over 70 years old, living in assisted living conditions. The average age of the participants was 85.9 years old. Game#1a was tested in non-recurring game events where participants may play the game as many times as they wished. Professional staff, researchers, and other game testers were observing these game events. Subjective experiences and

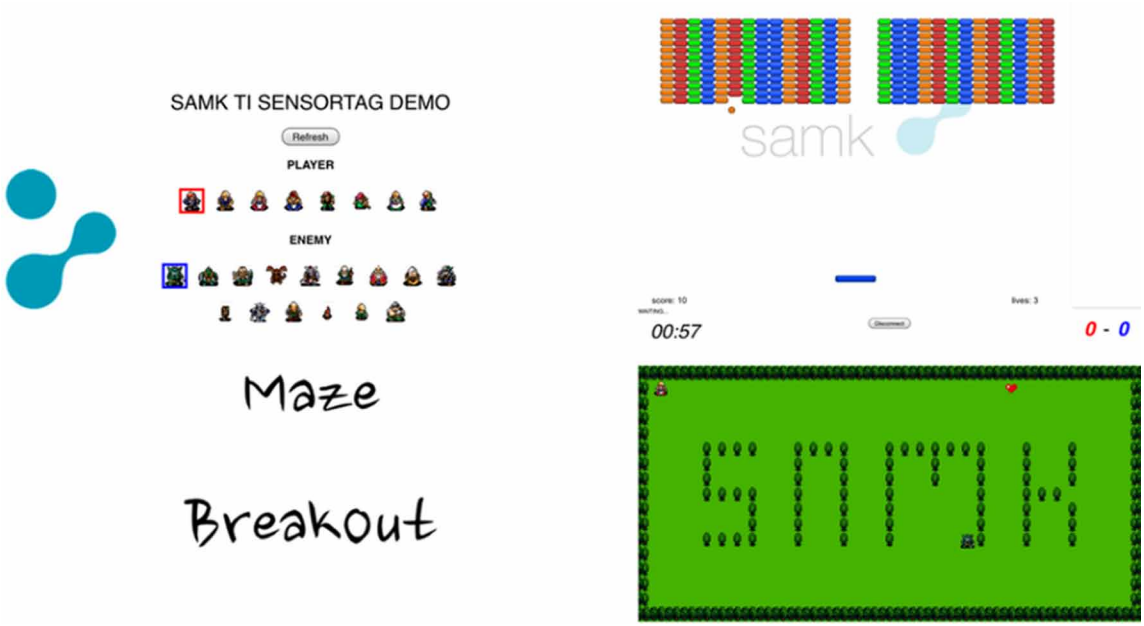
Figure 5. Two self-rehabilitation games created for people with physical disabilities. On the left main menu and on the right Breakout (upper figure) and Maze (lower figure) game screens.



perceptions, including commonly stated free comments over the trial, were collected immediately after each participant's play event through a structured interview. The data was analysed through a quantitative content analysis method, which involved calculating the frequency of responses in each theme.

Game#1b trial was targeted to adults with learning disabilities. A total number of 23 participants (N=23; male n=16, female n=7) aged between 21 and 60 years (average age 39 years) who worked in a sheltered working facility took part in this trial. Majority of the participants had no diagnosis apart from intellectual disability or mild learning disability. In particular, two participants were diagnosed with Asperger's Syndrome, one with Down's syndrome, one with cerebral palsy, one with Tourette's syndrome, and two with autistic features. Seven participants had difficulties in paying attention and nine had difficulties in coordination and perceptive skills. The subjective user experience analysis had been included as a part of a larger study conducted by Koivisto et al. (2013). The data was collected through thematic interviews by asking participants to assess and describe their subjective perceptions of the games and play settings. The qualitative results of the thematic interviews are presented in this chapter.

Trials associated to Games#2 and #3 were carried out in a three-month trial setting in a rehabilitation home for male war veterans. The trial aimed to measure possible impacts of cognitively stimulating mobile games on older people's cognitive skills when playing on regular basis. A group of nine Finnish male war veterans who stayed in the assisted living environment volunteered to participate in this trial. They were between 88 and 97 years old (average 90.1 years old). Although they were diagnosed with mild or medium level memory impairment, they were still cognitively active.

Data related to user experiences and usability issues were collected through structured interviews, immediately after the three-month game playing period. Each participant was interviewed privately to obtain authentic and subjective information related to their past experiences of the use of mobile games and devices, subjective experiences about the trial period and its impacts on their cognitive skills and

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

general well-being, subjective meanings set on game playing, and general comments on usability of the devices and games. Observations and comments of the care taking staff were incorporated in the data as reflection.

In addition to the Finnish trials, a cultural comparison pilot was performed in China for Game#2 and Game#3 to examine whether different culture would affect the game playing experience of elderly users or not. During the trials in China, the games were played in a semi-controlled environment in which care taking staff were assisting on request while the researchers were observing the players. Six Chinese participants who resided in an elderly home in Changzhou, China took part in the trial. The average age of these participants was 82 years. The number of participants was intentionally kept small since this study was supposed to be a preliminary trial. The study focused on qualitative findings, specifically to understand personal characteristics and cultural aspects, such as past game playing experiences, likes and dislikes, lifestyle, social manners and norms, history, environment. Participants volunteered themselves to join the trial. After playing those games, each participant was interviewed privately in order to obtain authentic and subjective information.

Trials associated to Game #4 was conducted in a rehabilitation centre for people with physical limitations. All 17 test takers were volunteers, having a variety of physical limitations. All of them played the game for the first time. The data was gathered by researcher through observations and follow-up interviews. A staff of the rehabilitation centre was present throughout the observation of trials. Authentic user experiences from this preliminary trial were presented in this chapter.

RESULTS AND DISCUSSION

User Experiences of Game#1: Older Adult Participants (N=34)

Experiences of participating in the game trials were divided into positive experiences and negative or indifferent experiences. Most participants (30 out of 34) found the game playing a positive experience. The experiences were described as fun (11 participants), interesting (7 participants), easy to play (4 participants), challenging (3 participants), rewarding (3 participants), and entertaining (1 participant). The game was reckoned as good for social activities and events (6 participants).

Most participants believed that the game provided rehabilitating and activating experience (32 out of 34). They considered the game can assist in motor coordination (11 participants), give sensible limb activation (8 participants) and activate brain (7 participants). People with impaired mobility thought the game playing experience was more rewarding and suitable as a rehabilitation method than able-bodied people who could participate in other physical exercises.

In contrast, three negative comments of personal conditions were collected: “game controlling created pain”, “my hands were shaking too much”, and “the game elements were hardly visible”.

User Experiences of Game#1: People With Learning Disabilities (N=23)

The majority (17 out of 23) of people with learning disability could play Game#1 independently. The need for assistance during game playing events was limited to verbal instructions, mental encouragement or minor physical support. Thanks to the recognisable characters, the participants can easily comprehend the game idea.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

All participants took the game positively and regarded the experience as event entertaining events while providing good leg exercise. 20 of the participants wanted to continue playing the game at home. They described the climate during the game playing events as comfortable (18 participants) or excited (5 participants). The excitement cumulated when the cat character appeared, increasing the level of difficulty. Part of the excitement came from having audience or experiencing something completely new. All participants felt capable to focus in the game playing. The event was social and loud, as participants were giving instructions and spurring other players.

Only few negative comments were stated: "The loud audience was distracting" (2 participants), "I could not imagine playing the game on my own" (3 participants), and "Playing game with legs was weird" (1 participant). Four of the participants found using the "balance board controller" challenging. Some participants commented about slipping or getting the board in the wrong position on the floor.

Improvements Made to the Concept of Game#1

The feedback obtained in the trials of Game#1 was used to improve Game #2 and Game#3. Five participants and one third of professional staff suggested to add difficulty levels into the game. Seven participants reckoned that higher level of challenges might discourage playing. Game elements should be coloured to make them more distinguishable.

Three participants in the group of adults with learning disabilities wanted some sound effects to be added into the game. Another improvement in the game was to increase the variety of animal figures or animations. Some older adults commented that the game was too difficult, even after modifying the original game and adapting more flexibly to the progress of individual players. Many players ended the game at the first cat's appearance on the screen. Multiple cheese chunks on the screen were also suggested to make scoring points easier.

User Experiences of Game#2 (N=9)

The war veterans were found engaged with the tablet computer version of Game#2 in the trial. Prior the three-month game playing period, all participants went through standardised Mini-Mental State Examination (MMSE) and TMT-A tests. When the results of pre- and post-trial were compared, only a couple of participants improved their cognitive test results. Therefore, no significant impact of game playing was detected in the trial. However, subjective experiences of participants upon the trial were outstandingly positive. Majority of participants found the regular game playing event activating, interesting, and entertaining as it provided suitable cognitive rehabilitation. Game playing events helped them to stay alert and active throughout the day time, which otherwise contained not many cognitive impulses or things to do. Apart from being mental stimuli, the game offered useful activity to train finger dexterity and attention skills. The game also played an important role as social activator, involving staff, visitors and family members to compete with each other and to share play experiences.

User Experiences of Game#3 (N=9)

The second game in the war veteran trial was a modified version of TMT-A test. The game followed the key idea of the standardised TMT-A test to connect numbers. Instead of drawing a connecting line, participants tapped numbers in correct order as quickly as possible. This modification was made to test

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

whether or not the omission of line drawing makes the test easier to complete. In this trial, tapping digits in correct order did not decrease the played time; what actually happened was rather on the contrary.

The TMT-A game had several difficulty levels. The participants were instructed to increase the difficulty level each week by adding five more digits on the screen. Participants played the game successfully until they reached the level of 25 digits on the screen, which became the ultimate top level in the trial. Only one participant in the test group attempted all the most difficult level (40 digits on screen) but the participant did not complete the level successfully (see Table 1).

Table 1. TMT-A game shots per difficulty levels

Difficulty Level	Played Game Shots in Total 729	Completed Shots	Success Rate
Level 5	23	12	52%
Level 10	263	235	89%
Level 15	167	161	96%
Level 20	139	111	80%
Level 25	62	44	71%
Level 30	65	50	81%
Level 35	5	3	60%
Level 40	5	0	0%

The overall play time of completed TMT-A game shots became shorter over the trial. The increased difficulty levels indicated that aging people were still able to learn and develop their skills in attention, reaction and dexterity with regular activities. Two most active participants decreased the count of error numbers over the total time spent on the trials (Table 2).

A majority of participants found the mobile games easy-to-play, interesting, and suitable for cognitive activation. The usability of tablet computers improved outstandingly when silicon covers were used to improve gripping of the tablet computer, especially for older people with dry skin.

The games on tablet computer were commented as being easy-to-use and light to handle. One worth mentioning comment was regarding the low touch sensitivity of tablet screens. The screen did not always react to the tapping of older adults, and this affected negatively on game results, causing false errors and increasing game playing time. The touch sensitivity was set to be as sensitive as possible upon triggers. Prior to the actual test, a touch event was triggered even when a player lifted a finger from the screen. One detected reason for the weak touch sensitivity issue was poor conductivity of electricity due to dryness of skin in fingertips of older adults. This was one drawback to the otherwise effective working of capacitive touch screens where function is based on the change in capacitance caused by an electrically conductive object such as human touch. For future trials with older adults, a touch pen or touch gloves should be used to increase touch sensitivity. Another option is to employ resistive touch screens which do not require any electrically conductive touching object.

User Experiences of the Cultural Comparison Pilot in China for Game #2 (N=6) and Game#3 (N=6)

In China, although the test group had prior experience of using mobile device, the participants were somewhat heterogenous to the use of technology. The games received a warm welcome by the participants and the staff involved in this trial, and the overall feedback collected from the trial was positive. The games concerned were seen as interesting, exciting, entertaining and evidently catching the interests of participants. Immediately after the first participant tried the first game, other participants turned from being skeptical to very excited, interested, and supportive.

Same usability issues prevailed in both countries, but the only recurring challenge was about the touch screen. Typically, the Chinese participants pushed the screen too hard. In addition, if the players were holding the tablet computer in their hands, the thumb of a holding hand constantly touched the screen, avoiding tapping action to be registered by the game. Dry skin in finger tips also prevented the tapping to be recognized as productive action, similar to the situation faced in Finland (Merilampi et al., 2017).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

User Experiences of Game#4 (N=17)

The test group (N=17) in the rehabilitation centre was satisfied with the visual elements of the games. Only two regarded the games being a bit hard to learn, and one commented that the game logic was difficult to understand. The time pressure feature divided the opinions in this test group. Seven test takers saw time pressure inspiring to play, while six had an opposite stand. Most participants (14 out of 17) expressed that the game was suitable for rehabilitation purposes. All game controller types received positive feedback, even though five test takers noted some momentary problems with the sensitivity of the controller sensor and the touch screen. In conclusion, the more severe the disability, the more motivating the game playing was. One possible explanation to this phenomenon might be: there were not many motivational games created and dedicated for this user group (Sirkka, Merilampi, Koivisto, Tommiska, & Saarinen, 2017).

Similarities in Subjective Experiences of Various User Groups

The games were well accepted by each test taker group, since they received mainly positive feedback and user experiences. The most important factor behind the positive user experience would be the right balancing of personal skills and gameplay, which is a well-known fact in game design (McGough et al., 2011; Mountain & Craig, 2012; Szturm, Betker, Moussavi, Desai, & Goodman, 2011). Success in mastering the gameplay and increase of game scores boosted the motivation, which in turn reported as a part of the positive experience. Other identified motivating elements were: the ability to experiment with something new and to play and control a game, especially to participants who were not used to play computer games.

Various user groups reported similar ideas for game improvement regarding the adjustability of difficulty levels. If the difficulty level and general gameplay could be adjusted to match individual player's health conditions and skills, the subjective user experiences would be more positive. This improvement could be realised by adjusting game tempo and difficulty setting (beginner, normal, and expert), in collaboration with users who require highly individualised characteristics. Levelling the game difficulty is a challenge for game developers, especially in maintaining fun of the game playing even at low difficulty levels.

The games used in this study were not specially designed for social activities. Nevertheless, the game events in all trials turned out to be active social events. Some participants enjoyed watching others play and giving mental support. Social aspects around the games extended to additional moments with a nurse or "having something common to do with my grandchild". Majority of players regarded the presence of audience as something positive, which indicated a wide acceptance of social games designed for people with special needs. Only Game#3 required more concentration and therefore it was played privately. The social aspect in this game was restricted to sharing the results and experiences with other players.

Divergences in Subjective Experiences of Various User Groups

Despite of many similarities across different target groups, some clearly defined target group centred requirements emerged in the study. People with learning disabilities were more heterogeneous than the groups of older adults (with a variety of ages and capabilities). Based on the feedback, adjustable difficulty levels, animations and sounds seem to be very important especially for the younger players.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

On the contrary, older adults (in Finland at least) disliked unnecessary elements in the game, and they were against expectations of the WET-RG. Simple game setting was not seen as being childish at all. The participants preferred simple logics and elements which clarify the mission of the game. This indicates that well-known concepts and characters can help people with special needs to grasp the idea in gameplay. Similarly, typical age-related impairments in senses should be notified when designing and adjusting games for older adults.

Although the user experiences of older adults in Finland and in China had great similarities, the feedback from the cultural comparison pilot study suggested possibility to increase motivation of participants to play by localizing the games for different countries and cultures.

The most significant differences when comparing the Finnish to the Chinese elderly people, is the game visualization. The Chinese loved colorful and rich graphics, voices, and animations. They suggested different progress visualizing approach, like showing game scores by collecting flowers instead of numbers. In addition to richer graphics, one concrete example was the hope of game localization using Chinese animals in the games. Researchers reported that Chinese participants were typically betting while playing, which was why the researchers may consider developing some sorts of "earning coins" feature in the game (Merilampi et al., 2017).

In China, the close relationship between the care taking personnel and the participants was evident in terms of holding hands, hugging, helping with the games by holding the tablet together, applauding, cheering and proving genuine support. In Finland, the nursing staff was supportive but the relationship with the participants was not as close as the scenario in China. The effect of the nursing staff support on game experience would be an interesting future research topic (Merilampi et al., 2017).

The competition status and players' scores displayed on screen appeared to motivate the older adults to play and achieve higher scores. The group of people with learning disabilities was less competitive, as they were focusing only on each player's own performance.

As to Game#3, the results of individual participants varied a lot even within one day. The game was also reckoned as rather boring to play in the long run. Even if the participants were facing higher difficulty levels of challenge, the game did not motivate them to keep on playing. It might be worthwhile to modify the game, making its design closer towards the original TMT-A that requires combining numbers by drawing lines.

Participants with physical limitations were mostly used to computer related technologies and assistive devices. However, the challenge in game playing was more about accessibility. By providing the accessible technology, this target group showed great interest for entertaining products. The target group was also very heterogenous when indicating a necessity of modifiable game design.

Although the user groups studied in this chapter had different characteristics and skills, the findings indicated that having a clear concept and purpose of the game were enough to be applicable for several user groups, even with slight modifications in graphics, controlling methods and difficulty level adjustments.

User Experiences on Rehabilitative Elements in Games

All user groups experienced the games as potential rehabilitation tools despite the differences in participants' health, cognitive and physical conditions. Some participants in all target groups had motor skill limitations, but in the case of Game#4, some had relatively more severe physical disabilities. The challenge related to physical limitations in game design was to find the ways to adapt the game control according to the player's abilities.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Mobile phone as game controller could easily be integrated in different kinds of assistive technology or training equipment, or attached on different parts of the body. The use of a balance board in game controlling broadened the user groups to people who were unable to use their hands. Participant who took part in the testing of the balance board games were seated during game for safety reasons.

Game#4 was tested using the special game controller to compensate uncontrollable body movements, and they were meant for physical workout. However, in the case of participants with severe physical limitations, the goal of Game#4 was changed to create moments of happiness and new contents to everyday living. The sensor was embedded into a balance board in the Game #4 as in the Game #1, which actually was tested in the rehabilitation centre with clients in wheelchairs. People who still could sit and use the legs for tilting the board, the concept provided entertaining leg workout. This maybe a direction to investigate in further trials.

For older adults with memory impairment, the rehabilitative element was more cognitive than physical. However, also tilting the tablet or playing with balance board by feet required some light exercise and practice.

To summarise the results, the motivational aspects required of a new self-rehabilitation tool is provided in game playing. Games can be adjusted and modified according to a user groups' or most importantly personal capabilities, interests or requirements. The results of trials indicate strongly that gamification has potential in rehabilitation. Therefore, the future challenge is to integrate a wider palette of therapeutic contents in such games to maintain and enhance functional capabilities (social, cognitive, physical). Also, novel technologies, such as virtual reality and robotics, are of key interest of the WET-RG to boost game playing experiences and accessibility of the games. Due to limitation in the trials discussed above, long-term research trials should be arranged to collect wider and measurable quantitative data, particularly about the impact of the games on different user groups. The results also show convincing evidence that long-term learning through games and activation through games. In addition, attitudes towards mobile applications are better while possible thresholds are lowered. In other words, elderly people may use mobile devices more easily.

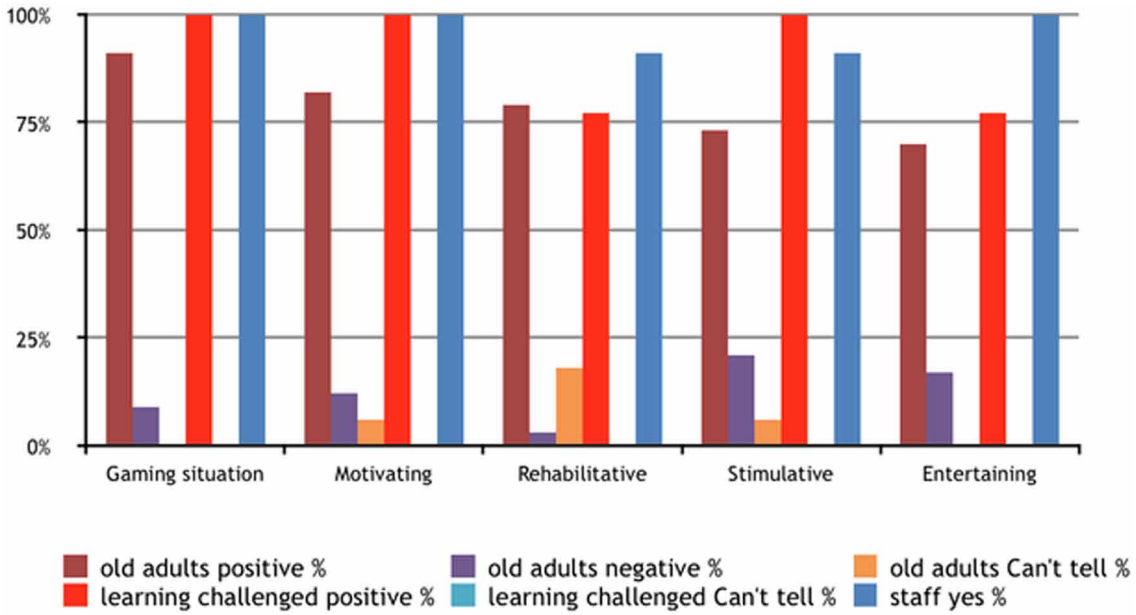
Figure 6 presents the overall feedback rate of various target groups (N=107, including nursing staff). Apart from the players participating in game trials, feedback was also gathered by interviewing the care taking staff. The staff interviews contained their assessment of therapeutic usability of the games as well as their observations both on the game playing situations and on their clients over and after the gameplay.

Even if the overall feedback was very positive, some challenges are still left for further development. The sensitivity issue of tablet screens appeared to be challenging especially among older adults, but the concept of care taking or rehabilitation seemed to be rather conservative. In the mindset of many people, having fun and exercising at the same time was seen as diminishing the value of professional rehabilitation. Even if there are loads of evidence available to confirm how good games would be tools in maintaining and improving cognitive and motor skills, there is still obvious caution in the public mindset, impeding the deployment of game playing initiative as part of the therapeutic pallet in long-term care taking.

From pure business point of view, there is also prejudice about the market of games for special user groups. There are not many games created, targeted and made available for special user groups. Yet, based on experiences of the WET-RG, there is a demand for these games. This could be an opportunity for game companies, since there is not much competition in the market. One possible solution is to convert commercial games into physical well-being games, creating an administrator view for nursing staff where they may adjust the gameplay so the games become more suitable for special user groups. Conventionally, the special user groups might be marginal target groups, whom are probably seen as very

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Summary of the feedback gathered from various target groups (N=107)



challenging and requiring too much work for a too small market. However, if the games are designed to be modular, extra requirements set by more challenging target groups would not mean that much of extra work. Perhaps, minor modifications would be needed to transform otherwise ready games. This chapters presents examples of those needed modifications. In most cases, different graphics or controlling methods will do the trick, whereas the game logic and most aspects of the game can remain the same.

Design for Somebody (DfS) is a design philosophy used by the WET-RG. The goal of this philosophy is to provide solutions to live in optimum capacity despite of limitations in functioning. DfS serves especially small target groups with highly specific needs as a "bottom-up" philosophy (from small to all). Modular design with replaceable "modules" is the key in individualised modification, utilising a generic solution base which is designed for the big crowds and added only with required specific modules. A person, referring to an individual or a very narrow target group, is at the centre in the DfS development process. A thorough and deep user needs analysis is performed by a multidisciplinary team, including the end-user. In addition, the development process requires creativity, technology know-how, understanding of service systems, business, and regulations. The modularity of design is of key importance (Merilampi et al., 2017).

CONCLUSION

New technology provides cost-effective, individualised, reasonable and mindful ways to activate and motivate people to be self-supportive, mobile and vigilant. In particular, long- term care taking facilities should encourage targeted users to maintain their cognitive, motor and social skills by deploying new and easy-to-use technology to provide meaningful things to do, individually and in groups.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

As seen in Figure 6, positive experiences make the difference in overall well-being. Easy- to-use technology is available and more and more evidence confirm that it is useful for and accepted by older people as well as people with special needs. In these trials, the games were welcomed as potential self-rehabilitation tools that can be adjusted according to personal skills and limitations. They also give meaningful activities to those in care saving time and efforts from professional carers who very often feel guilty of not being able to socialise with clients as much as needed and wanted.

KEY TERMS AND DEFINITIONS

Activation Game: Game which is meant for activation of physical, social, or cognitive activity.

Design for Somebody (DfS): A design philosophy that serves especially small target groups with highly specific needs as a "bottom-up" philosophy. Modular design and user engagement are corner stones of the philosophy.

Flow: A state of complete absorption or engagement in an activity, flow refers to the optimal experience.

Functional Ability: The ability to perform activities of daily living (includes physical, mental, social, and cognitive abilities).

Trail Making Test A (TMT-A): A standardized memory diagnostic test that distributes numbers 1 to 25 randomly over a sheet of paper, measuring the time spent by a test taker to draw a line that connects the numbers in ascending order as quickly as possible without lifting the pen from the paper.

Chapter 72
Deconstructing Racial Stigma in the Therapeutic Relationship

Katrina Y. Billingsley
South University – High Point, USA

Donté R. Corey
South University – High Point, USA

ABSTRACT

This chapter seeks to deconstruct racial stigma of mental illness held by counselors within the therapeutic relationship. The authors will provide counselors with practical tools that will help them work through their own prejudices, discriminations, and stereotypes about people of color and mental illness. This chapter will provide background information on stigma, specifically racial stigma, the process for incorporating theoretical variation in clinical work, and its importance. Additionally, the authors will explore best practices that will help counselors obtain the knowledge and skills needed to effectively work with a variety of clients who are racially and ethnically diverse.

INTRODUCTION

Unfortunately, stigma is not a new concept. In 1963, Erving Goffman's book *Stigma: Notes on the Management of Spoiled Identity* took a look at the stigma of character traits. The stigma of character traits as outlined by Goffman (1963) are the "blemishes of individual character perceived as weak will, domineering, or unnatural passions" possessing "treacherous and rigid beliefs", and favor "dishonesty". These characteristics are "being inferred from a known record of, for example, mental disorder, imprisonment, addiction, alcoholism, homosexuality, unemployment, suicidal attempts, and radical political behavior" (p.2). The stigma of mental illness is historically wide spread. Stigma for individuals struggling with mental illness robs them of what is perceived as a "quality life: good job, safe housing, satisfactory health care, and affiliation with a diverse group of people" (Corrigan and Watson, 2002, p. 16). Stigma related to mental illness exists in the workplace, in homes and within families, in the education systems and, most surprisingly, in the practice of therapy. Two types of stigma are prevalent in the literature,

public stigma and self-stigma. Public stigma "is the reaction that the general population has to people with mental illness" (Corrigan & Watson, 2002, p. 16). Public stigma includes discrimination, stereotypes and prejudices. Racial stigma emerged in the literature and will be explored to better understand its impact on clients of color in the therapeutic relationship within the United States.

Howarth (2006) references Goffman's view of stigma as being seen as a way to reduce the whole person to a "tainted, discounted one" (p.442). Racial stigma emerged as spotlighting what happens when stigma is applied to minority groups of people. Racial stigma is recognized in a variety of settings including the media, education and in the field of medicine. The authors suggest that racial stigma is also present in the therapeutic counseling relationship. Racial stigma "reduces the identity and the potential of those seen as *raced;* they are spoiled or blemished by the racist gaze" (Howarth, 2006, p.442). Howarth (2006) suggests that, "racial others" are individuals with skin that is brown and black who are seen as "less than, different from, unequal to the realizing, normatively white other" (p.442). Howarth (2006) also suggests that "race produces and sustains inequalities and is anchored in histories of prejudice, exclusion and poverty" (p.442). Howarth (2006) further explains that race, as stigma must be understood in order for it to be deconstructed. The authors suggest processing this understanding in order to help counselors become more aware and educated when working with individuals who are different; individuals who are also perceived as being so different that they are not considered normal. Additionally, race as stigma highlights how race reduces one's identity and potential. Howarth (2006) speaks to the fact that race is institutionalized and has historical implications. It is important to understand the impact and legacy negatively associated with race.

Education and awareness are critical to helping counselors engage whole-heartedly and authentically with clients who identify racially and ethnically different from the counselor. It is the intent of this chapter to provide practical ways to help counselors acknowledge and work through their own personal prejudices, discriminatory views and stereotypical behaviors related to racial and ethnic minorities with mental illness. The terms counselor and clinician will be used interchangeably as the terms differ according to therapeutic setting. This chapter highlights the theoretical orientation, Relational-Cultural Theory and will provide therapeutic applications that will help counselors engage clients in a harmless, productive and harmonious way. This chapter is designed to assist current counselors or clinicians in becoming efficient in working with people of color in therapy. In addition, this chapter serves as an additional training guide for counselors-in-training to be utilized in counseling programs.

BACKGROUND

Due to the various levels of stigma, individuals do not seek out the assistance they need to reduce their mental health symptoms leading to the public's prejudicial fear and negative perception (Corrigan and Rao, 2012). Challenges faced by those who have mental illness are diverse and may include the struggle to: understand their illness, gain insight into how the illness effects their lives, understand treatment options, deal with society and how this leads to stereotyping, prejudices and discrimination. Within the counseling setting, it is important to ensure that clinicians are prepared to work with any person seeking their clinical help. Historically, people of color and other marginalized groups have opted out of therapy. Black/African Americans have been prone to not engage in therapy for a variety of reasons including the cost, religious views and the stigma associated with counseling. Only about one quarter of African Americans seek mental health treatment compared to 40% of White Americans (NAMI). With this known

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

history, it is important that counselors are aware of their own stigmas towards Black/African Americans and other people of color (POC). The 2014 American Counseling Association (ACA) Code of Ethics, known as *the Code*, "serves as an ethical guide designed to assist members in constructing a course of action that best serves those utilizing counseling services and establishes expectations of conduct with a primary emphasis on the role of the professional counselor" (p.3).

Therapeutic Relationship

As stated above, clinicians should be mindful of ethical standards when working with clients. However, what makes a relationship therapeutic goes beyond ethical standards. Several theorists began defining a therapeutic relationship as a working alliance that includes unconditional positive regard, empathy, honesty, and acceptance. "Unconditional positive regard implies that clients are the best authority on their own experiences" (Sommers-Flanagan & Sommers-Flannagan, 2017, p. 222). "The authors also suggest that a therapist's judgments are always based on inadequate information because we have not lived our client's lives or their experiences, so we do not know their internal motives" (Sommers-Flanagan & Sommers-Flannagan, 2017, p. 222).

"For Carl Rogers, unconditional positive regard was based on the belief that consistent warmth, acceptance, and encouragement of clients enhanced clients' growth toward their potential" (Sommers-Flanagan & Sommers-Flannagan, 2017, p. 222). Another word that can be used in the place of unconditional positive regard is *respect.* Respect is universally understood. "According to quantitative and qualitative research and clinical anecdotes, it appears safe to say that clients from all minority groups respond better when they have unequivocal respect from members of the dominant culture" (Farber & Doolin, 2011). However, respect can be shown and perceived very differently depending on one's racial background and this is why multicultural awareness and competence is necessary.

Another important aspect of the traditional therapeutic relationship is empathy. Clinicians should not only be skilled listeners, they should be empathetic listeners. Rogers (1980) defined empathy as the counselor's sensitive ability and willingness to understand the client's thoughts, feelings, and struggles from the client's point of view. This is different from sympathy. The counselor should not treat the client in such a way that causes her/him to feel sorry for the client. Being empathetic requires the counselor to put her/himself in the client's shoes and imagine what it is like to experience the experience.

A relationship is not therapeutic without an element of a *working alliance*. In 1979, Bordin introduced a three-dimensional model referred to as the working alliance. The model consisted of goal consensus or agreement, collaborative engagement in mutual tasks, and development of a relational bond. Collaboration is key in the therapeutic relationship. Research shows that clients who have a collaborative bond with their clinicians presents with the most improvement.

Others have supported this view:

What remains in question is how clinicians can best foster a working alliance with culturally diverse clients. A good beginning is to provide clients with a clear statement of purpose individualized to specific cultural orientations. For example, with a client who has a collectivist orientation: "My goal is to provide the best help I can to you and your family" (Sommers-Flannagan & Sommers-Flannagan, 2017, p. 252).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Effective counseling is likely to occur when there is a working alliance and that alliance will not be developed without trust. That trust includes the therapist's ability to understand the client and his/her level of competence.

Others have reinforced this opinion:

Competence encompasses practicing from a theoretical evidence-based approach. Theory is the lens through which the counselor gains a perspective on the client, however theory is useless without a counselor. The clinician, however, comes with her or his own experience. Ideally, there should be a good fit between the clinician's own eyes or worldview and the theoretical lens she or he chooses (Sullivan, 2005, p. 283).

Racial Identity Models

When trying to deconstruct racial stigma in the therapeutic relationship, clinicians must be aware of the idea of racial identity development. A person's perception and worldview depends on her/his racial identity development. How a person understands her/himself and how one relates to others is also a part of racial identity development. Counselors should not only be aware of their development but should also be aware and understanding of clients' development.

In 1990, Sue and Sue proposed a seven-phase process that integrates many characteristics that explain White racial identity in their White Racial Identity Development Descriptive Model. The first phase is known as naiveté and occurs during early childhood (3-5 years). During this phase, individuals may notice differences but awareness of social meaning is absent or minimal. In the next phase, conformity, minimal awareness of self as a racial/cultural being and characteristics of the naiveté phase are maintained. For example, the individual believes that cultural differences are not important so as a result they "do not see color". In the dissonance phase, obliviousness breaks down when the person becomes aware of inconsistencies in their day-to-day experiences. For instance, the individual may have the belief that "all men are created equal" yet see POC being treated as second class citizens (Sue & Sue, 2016). Individuals become increasingly conscious of Whiteness and may experience dissonance, resulting in feelings of guilt, depression, helplessness or anxiety.

The fourth phase is known as resistance and immersion. In this stage, White individuals begin to realize what racism is all about and begins to question and challenge their own racism. For example, the individual's awareness of racism is enhanced as they see evidence in media, written materials, etc. In the fifth phase of introspection, individuals no longer deny being White, honestly confront their racism, understand the concept of White privilege, and feel increased comfort in relating to people of color. In the sixth phase of integrative awareness, the individual understands and appreciates self as a racial/cultural being while shifting focus from trying to change people of color to changing self and other White people.

The final phase is the commitment to antiracist action and is characterized by social action. When individuals get to this phase, they see things that they perceive as wrong and actively work to make them "right". This is done by objecting to racist jokes, trying to educate family, friends, and coworkers about racial issues and taking direct action to eradicate racism in schools, in the workplace, etc. As clinicians working with diverse clients, progression into the final phase is necessary to maintain the therapeutic relationship. In this phase, the clinician not only has an awareness and understanding of self, there is also an awareness and understanding of others' worldviews and sensitivity to racial issues that impact experience, growth and development.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In 1999, Sue and Sue developed the Racial/Cultural Identity Model. This five-stage model depicts identity development among minority groups. The first stage is the conformity stage which is marked by the desire to assimilate and acculturate and believing in White superiority and minority inferiority. A minority individual in this stage spends a large amount of time trying to "fit in" with the majority group. Unconscious and conscious desire to escape one's own racial heritage is presented in this stage. Physical and cultural characteristics identified with one's own racial/cultural group are perceived negatively, as something to be avoided, denied, or changed. Reports show that Asian women have undergone surgery to reshape their eyes to conform to White female standards of beauty may (but not in all cases) typify this dynamic (Sue & Sue, 2016).

The second stage, dissonance, is when the person of color experiences a breakdown of her/his denial system. Dominant-held views of minority strengths and weaknesses begin to be questioned and the individual begins to realize that attempts to assimilate or acculturate may not be fully allowed by the larger society. For example, a Latino adolescent boy tries to befriend a group of his White peers at school but is met with racial slurs. Individuals in this stage begin to become aware of racism, racial microaggressions and covert gestures of oppression. In resistance and immersion, the third stage, individuals begin to understand social-psychological forces associated with prejudice and discrimination. Members of the dominant group are viewed with suspicion and there is considerable anger and hostility directed toward White society.

Stage four is known as the introspection stage. The POC begins to spend more and more time and energy trying to sort out aspects of self-identity and begins to increasingly demand individual autonomy. For example, the individual spends a large amount of time trying to disconnect from White society instead of attempting to understand one's cultural heritage. In the final stage, integrative awareness, the individual develops an inner sense of security as conflicts between new and old identities are resolved. The individual begins to perceive himself or herself as an individual who is unique, a member of one's own racial-cultural group, a member of a larger society, and a member of the human race. At this stage, the POC finds comfort in being a part of all of these systems and takes pride in her/his diverse uniqueness.

Relational-Cultural Theory

Having a strong theoretical foundation is important in working with all clients. However, it is imperative when working with clients who differ from the counselor to be aware of their worldview and how those differences may impact their interaction with and care for the client. It is the belief of the authors that counselors should revisit their theoretical orientation as they prepare to engage in a therapeutic relationship with diverse clients. Relational Cultural Theory (RCT) is an alternative theory that has emerged as a framework for working with racially and ethnically different clients because it an act of social change and an emphasis on movement out of isolation (Jordan, 2009). Although RCT was initially developed to address the concerns of women it has advanced and is applicable to a more diverse population. RCT was developed to "better understand the importance of growth-fostering relationships in people's lives" seeking to "lessen the suffering caused by chronic disconnection and isolation whether at an individual or societal level, to increase the capacity for relational resilience, and to foster social justice" (Jordan, 2009, p.23). Maureen Walker (2002) suggests that the connections and disconnections in relationships are characterized in a context that has been "raced, engendered, sexualized, and stratified along dimensions of class, physical ability, religion, or whatever constructions carry ontological significance in the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

culture" (Jordan, 2008, p.23). As a good first step to ensuring one will openly engage in the counseling process, beginning with RCT is a way to become more introspective.

There are seven key components of RCT that will help counselors frame how and why utilizing a theoretical framework such as RCT can help nurture the therapeutic relationship in a more meaningful and developmental way. The key components according to Jordan (2002) include understanding that: people grow throughout the lifespan because of relationships in their lives; mature functioning occurs because of movement toward mutuality not when separation occurs; the differences between individuals and the elaborations of those who are in relationship together create growth for those involved. As counselors, being able to acknowledge the differences between oneself and one's clients can be used as a tool to foster growth for both parties. Additionally, mutual empathy and empowerment, along with authenticity are necessary for the development and prospering of healthy relationships. The relationship is not a one-way endeavor but takes both individuals to foster development. It will take courage for the counselor to go beyond what is the norm for them and reach out to create a therapeutic relationship that will help clients grow. Engaging in the tenets of RCT, requires counselors to live outside of their comfort zone and garner a relationship with someone who may hold many differences than they do. Committing to clients in such a way means committing to the process of establishing an authentic relationship.

MAIN FOCUS OF CHAPTER

Issues, Controversies and Problems

Being aware of and understanding why racial stigma may exist in the therapeutic relationship is a very significant part of assisting clients. However, knowledge and awareness is only the first step. Clinicians need to take an active role in deconstructing racial stigma in the therapeutic relationship. This is important for a few reasons. Firstly, minorities are not seeking out treatment for their mental health needs. Secondly, minorities that are getting treatment do not always feel safe, supported or understood by the public, and more importantly clinicians.

"Public stigma is the most prominent form observed and studied, as it represents the prejudice and discrimination directed at a group by the larger population" (Corrigan and Rao, 2012). Most times, public stigma develops due to how mental illness is portrayed in the media. People of color are already discriminated against because of the color of their skin and the assumptions that surround their racial identity. Thus when they are experiencing a mental illness, this adds to the negative perception that the public has about this population; racially and mentally.

Self-stigma has been a term coined to describe how an individual struggling with mental illness experiences self-hate, low self-esteem, and a lack of self-efficacy due to how they are perceived by others. This self-perception is detrimental and can cause counter-productivity within the person's life and the counseling process. Self-stigma can also cause additional pathologies such as depression and may lead to suicide attempts and suicide completion. As reported by the Office of Minority Mental Health (2016), suicide was the leading cause of death for American Indian/Alaska Native girls between the ages of 10 and 14 in 2014. Due to these varying levels of stigma, people of color are not receiving the assistance that they need to reduce their symptoms which causes an increase in the person's symptomology and the public's negative perception.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Although mental health professionals do not intentionally practice a level of stigma when working with clients, several discriminating factors play a role in the counselor-client relationship if the counselor is not self-aware. Certain cues can be very debilitating for an individual experiencing mental illness and can have a negative impact on the therapeutic relationship as well as future attempts for the client to seek help. Microaggressions and non-verbal communication signals can affect this therapeutic relationship.

"For effective therapy to occur, the therapist and client must be able to send and receive both verbal and nonverbal messages appropriately and accurately" (Sue & Sue, 2016, pp. 258). Clinicians are continuously observing and assessing their clients so that they do not miss anything of importance. The same way that counselors watch and observe clients, clients at times are also watching the counselor. Counselors must be aware of the types of messages that are being sent when nothing has been said. For some clients, any small gesture from the counselor, for example a head tilt, can be misinterpreted by a client. Nonverbal communication varies from culture to culture, so counselors need to be aware, culturally competent, culturally sensitive and aware while engaging with clients.

Some nonverbal behaviors are microaggressions. Microaggressions are "brief and commonplace daily verbal or behavioral indignities, whether intentional or unintentional, that communicate hostile, derogatory, or negative racial slights and insults that potentially have a harmful or unpleasant psychological impact on the target person or group" (Sue, Bucceri, Lin, Nadal, & Torino, 2007). One common example of a microaggression is clutching a purse tighter while passing by a young Black male on the sidewalk. This action signifies the notion that all Black men are dangerous and will steal purses when walking by others. Another example is asking an Asian American individual where they are from. This last example sends the message that the Asian American individual is not American even if he/she was born in the United States. Microaggressions can also be delivered environmentally through the physical surroundings of target groups, where they are made to feel unwelcome, isolated, unsafe, and alienated (Sue & Sue, 2016, pp. 179).

Based on the literature, although all forms of racism can be hurtful and traumatic, there are different levels of oppression. These different levels can be seen within three different types of microaggressions. The three different types of microaggressions are micro-assault, microinsult, and microinvalidation.

The term microassault refers to a blatant verbal, nonverbal, or environmental attack intended to convey discriminatory and biased sentiments" (Sue & Sue, 2016, pp. 179). Microassaults are overt and are intended to purposely violate and hurt a person or group of people. For example, calling a Latino individual a *spic* is highly offensive and derogatory.

"Microinsults are unintentional behaviors or verbal comments that convey rudeness or insensitivity or demean a person's racial heritage/identity, gender identity, religion, ability, or sexual orientation identity" (Sue & Sue, 2016, pp. 188). An example of a microinsult is assuming that an Latino male should be placed in remedial classes due to one failed test. This assumption would be solely based on his racial background and gender. Microinvalidations are verbal comments or behaviors that exclude, negate, or dismiss the psychological thoughts, feelings, or experiential reality of the target group (Sue & Sue, 2016, pp. 189). "Colorblindness" is an example of a microinvalidation.

Deconstructing racial stigma also includes counselor competence. Counselors have a responsibility to their clients to not only be competent but to be culturally competent. There are several ways a counselor can enhance competency. When counselors lack self-awareness, are not culturally competent, and lack exposure/experience they can unintentionally create racial stigma in the therapeutic relationship. Baruth and Manning (2003) state that it is often easier to rely on stereotypical beliefs about others than to learn about cultures and to get to know people on a first-hand basis. Stereotyping can result both from

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

a counselor's personal prejudices and biases as well as from a lack of factual information about cultures and individuals. "Just as a European American counselor might hold stereotypical perceptions about African-American, Asian-American, Hispanic American, and American Indian clients, a counselor from any of these cultural groups might hold stereotypical perceptions about European American clients" (Baruth & Manning, 2003).

Within counselor competence, there is also a need for theoretical approach variation. All clients are not created equally; meaning, counselors cannot treat all clients the same by using the same theoretical approaches for every client. A common issue that maintains stigma in mental health is counselors' lack of theoretical variation. It is an expectation that counselors learn a variety of approaches for all individuals and be able to utilize any of these approaches, when necessary. RCT therapy requires counselors to understand the vulnerabilities that many clients come with and foster a nurturing relationship that allows the therapeutic alliance to develop. Being empathetic and authentic allows clients to feel seen and heard. This level of acceptance fosters allows for growth within the therapeutic relationship.

Self-exploration is a main part of every counselor's educational program, however after one graduates the exploration should not stop. White counselors may be: unintentional racists; unaware of their biases, prejudices, and discriminatory behaviors; and using therapeutic approaches to multicultural populations that are likely to be more harmful (unintentionally) than helpful (Sue & Sue, 2016). "An important part of the solution to deconstructing racial stigma in clinical practice is that White clinicians need to examine the contexts of power and privilege that pervade every encounter with a client or colleague of color" (Lee, 2005, p. 96). A large part of understanding a client's worldview and life situation, is first understanding our own.

A current controversial misconception is that just because the counselor and client share the same racial background, means that the counselor can identify with the client. Race is only one part of an individual's world. Even if they have race or ethnicity in common, the client may experience comfort due to that commonality, however, this can affect the therapeutic relationship, negatively or positively. Building rapport with the client and showing genuine concern is key. Baruth and Manning (2003) stated that regardless of the client's native communication and cultural backgrounds, building rapport during counseling sessions depends significantly on communication between the counselor and client.

Lack of self-awareness and exploration, most times, comes with a lack of exposure/experience. Racial stigma can develop due to counselors not engaging in opportunities that will enhance their understanding of people of color. When new counselors enter into the world of counseling, they come with only the experiences that they had while in their graduate programs. This experience is limited and most times lacks culture.

A significant part of being culturally competent is being exposed to different cultures to enhance knowledge. According to the 2016 CACREP annual report, 61.12% of students graduating at the master's level are White. The likelihood that people of color seeking counseling services will be seen by someone who does not identify culturally as the client is very high. As stated earlier, identity development is the driving force of one's perception of self. Oftentimes, a counselor does not know where a client is regarding identity development. This lack of information can promote racial stigma due to the client feeling that the counselor does not understand her/him. Another part of cultural competence is understanding a client's acculturation level. For example, whether a 60-year-old Latino man has lived in the United States all his life or only a few years makes a difference when attempting to understand behaviors, values, and family dynamics.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

SOLUTIONS AND RECOMMENDATIONS

Counselors must engage in professional development that will challenge their positions of privilege and help them understand their position of power within the therapeutic relationship. It is important that practitioners deconstruct their stigma towards a particular group by becoming aware of differences that could set them apart from engaging at an authentically human level with a client. This process begins with re-education to set the tone of what can be the start of a culturally competent and sensitive counseling relationship.

To increase awareness and re-educate counselors should begin by becoming active in the profession. Being active in a professional organization will give counselors an additional layer of support and education they would not normally receive. Additionally, being involved in a professional organization will provide insight into new, cutting edge information. As apart of the larger network there are divisions or special interest groups that address specific interests and needs of counselors allowing individuals to connect with colleagues who have similar interests.

A counselor's approach to therapy and how they relate to the client is key in ensuring a successful therapeutic relationship. This is extremely important when engaging with people of color. As stated previously, counselors who are engaging in therapy should be aware of their theoretical orientation and have a toolbox in which to pull from. Each client, whether a POC or otherwise is different with varying needs, wants and desires. Thus, the counselor should be able to diversify their clinical approach to therapy to help the person before them. There are many therapies that can be utilized to address a variety of needs for clients.

One specific therapeutic approach the authors feel would enhance the counselor's skill level for working with persons of color is Relational Cultural Theory (RCT) therapy. RCT is an advanced treatment guided by one's desire "to lessen the experience of isolation, increase the capacity for self-empathy and empathy for others, and develop an appreciation for the power of context and limiting cultural/relational images" (Jordan, 2008, p.35). RCT therapy is most concerned with the attitudes and the quality of mutual engagement as opposed to the types of interventions and techniques used in the counseling process. Changing the clinical approach to focus on relationship building rather than fixing or correcting a client can produce a change in the life of the client that may not be quantifiable.

As with all treatment modalities, RCT therapy begins with an assessment by gathering the usual demographic information. However, with RCT therapy close attention is paid to significant past and current relationships. It is the intent of the counselor to ensure what the client's goals are for seeking assistance. RCT clinicians do not focus solely on the pain that brings clients into treatment but on their strengths and coping skills and how effective they have been. It is important for counselors to assess the resiliency of clients and to determine if they have a community in which the client feels they matter and/or belong. It is also important to assess whether or not a client can engage in constructive conflict. Engaging in constructive conflict will allow the client and counselor to pursue authentic dialogue and create a trusting relationship. It is important, also, to assess if the client can present their needs and views to others even if those views may conflict with the other person's perspective. Additionally, it is also important to understand how the client disengages from others when in conflict. The goals of assessment in RCT therapy are to "identify the sources and functions of the relational images, including controlling societal images, and coping strategies that have shaped the client's experience and to establish the basis for the therapeutic relationship" (Jordan, 2009, p. 37). Gathering such information allows the counselor to effectively meet the client's needs while engaging in the therapeutic process.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

It is also of much importance for the counselor to "develop an awareness of their own strategies of disconnection, including when they get activated and how they affect each particular therapy relationship" (p. 38). It is recommended that the counselor develop self-awareness. Being able to identify the signs of disconnection in therapy will help keep the therapeutic relationship authentic. Checking in with the client if the counselor feels a shift in the energy or tone is essential to creating an environment in which sensitivity and awareness are evident. Being sensitive and aware of what the counselor is feeling about their client or the therapeutic relationship will help to build against isolation and disempowering cultural forces. RCT therapy builds the client's desire for connection and is about building "networks and community" (Jordan, 2009, p. 41). RCT therapy emphasizes the utilization of empathy. Exhibiting empathy towards a person of color in the therapeutic relationship reflects that the counselor is authentically engaged and wholly present with the client.

Another recommendation for counselors that would help with becoming culturally aware is to engage in a service learning opportunity. Although service learning is a concept that is usually applicable to secondary education and undergraduate curriculum, the authors propose that utilizing service learning in the field of counseling will increase the awareness and education of counselors working with diverse clients. The incorporation of a service learning experience in the re-education of counselors would be helpful and beneficial to changing how a counselor engages with individuals who are persons of color. Service learning is known for incorporating a community service activity into the instruction of a particular discipline. Being able to apply theory in a real world setting would be beneficial in exposing counselors to a world they may not be familiar with. In return, counselors gain a valuable perspective that would help them engage empathetically with clients who are racially and ethnically different from them. Additionally, communities would gain much from the service provided. For example, if counselors enroll in continuing education courses on diversity this framework can be useful when a counselor engages in a service opportunity with a Black or African American church that is raising monies to support HIV/AIDS research. Immersion in this type of engagement creates a sense of community between the counselor and that population allowing the counselor to shift her paradigm on what she initially thought about Black Americans.

It is a recommendation of the authors that counselors become active and engaged in the larger community as change agents. By engaging in resistance against stigma and racist activities and posturing oneself as an anti-racist counselor is a powerful stance to take. This stance creates a safe zone within one's office space. Positioning oneself as anti-racist could create a steady flow of clients who would feel safe engaging with them in therapy. This position allows counselors to be collaborative with like-minded colleagues helping to de-stigmatize race in the therapeutic relationship.

As mentioned, counselors are required to have an appropriate level of self-awareness including but not limited to one's biases, cultural understanding and ethical standards when working in the mental health field. Exposure (contact) to diverse people and situations will enhance this self-awareness. Counselors should learn about people of color from sources within the group such as clients and colleagues. Purposeful experiences such as travel and venturing out of one's own community will allow counselors to not only learn about other cultures but will also allow them to experience their feelings regarding being around people of color.

Another way to be self-aware is to be mindful of types of communication being used and received in day-to-day living. Being aware of your own microaggressions and nonverbal communications that may be perceived as racially stigmatizing promotes change personally and professionally. Understanding communication of others that could be based on cultural style is also important. Owen, Jordan, Turner,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Davis, Hook and Leach's work (as cited in Sue & Sue, 2016) supports the idea that clients' perceptions of racial microaggressions are negatively associated with therapeutic alliance.

Certain types of nonverbal communication such as proxemics, kinesics, and paralanguage can also play a part in creating a therapeutic disconnection. Proxemics refers to perception and use of personal and interpersonal space (Sue & Sue, 2016). For example, a White counselor that is comfortable with close spacing could cause an Asian client to withdraw and feel awkward. Kinesics refers to body movements such as facial expressions and hand gestures. A Japanese smile may mean discomfort (Sue & Sue, 2016). Paralanguage is known as vocal cues including pauses and silences. A counselor could misinterpret a Black client as being angry when speaking loudly about something she or he is passionate about.

As cited earlier, self-awareness includes understanding where one is in their development of identity. Counselors may need to ask themselves, "What does my race mean to me?". This question should generate some exploration into cultural biases, values, beliefs, and the counselor's worldview. Baruth and Manning (2003) found that common barrier in counseling occurs when counselors only expect (perhaps unconsciously) clients to conform to the counselor's cultural standards and expectations. "For example, expecting African American women to emulate European American standards of beauty (or vice versa) has a demoralizing effect and can create racial stigma in the therapeutic relationship" (Baruth & Manning, 2003, pp. 59).

Counselors also need to be aware of what their race may mean to other people, especially their clients. Oftentimes, clients already look at their counselors as experts and the counselor's race can also be seen as powerful or even superior. Sue, Capodilupo and Holder (as cited in Sue & Sue, 2016) found that African Americans consistently report that intellectual inferiority is a common communication they receive from Whites in their everyday experiences. Counselors need to be aware of these perceptions and how they are affecting the therapeutic relationship.

Self-awareness can be developed through a variety of avenues and by several different ways. One way to develop self-awareness is through diversity training. It is imperative that all counselors participate in ongoing diversity training. It is a requirement for all licensed counselors to obtain continuing education units to maintain licensure. Diversity training should be a part of this continuing education experience. Not only will diversity training enhance counselor self-awareness but this experience will also increase counselors' understanding of various cultural groups and cultural evidence-based practices.

FUTURE RESEARCH DIRECTIONS

Forward thinking requires that counselors position themselves to continue to advance their own self-awareness and skills for working with people of color. This requires understanding one's own layers of identity as well as their client's multiple identities and how those roles are addressed in the counseling relationship. The term, intersectionality was coined by Kimberlee Crenshaw in 1989 although the issues it addresses have been around since slaves were freed. Intersectionality is when the overlapping of social identities along with their related system of oppression creates an environment for discrimination (Crenshaw, 2016). It is important to frame an understanding of what it means when individuals have multiple social identities and the impact those identities have on their lives. It is not only just about the identities they hold but also about the oppression associated with those identities. Initially, this concept was developed to address concerns faced by Black American women who were confronted with issues of racism and sexism and how the intersection impacted their lives. The judicial system set a prece-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

dence that would not allow lawsuits to be brought forth when the plaintiff suggested was being dually discriminated against. Essentially, these Black women had to choose a struggle – gender or race but not both. Just as discrimination against a woman because she is a woman and she is Black is a reality so is stigmatization in the counseling relationship.

However, intersectionality can be applied to any individual who has multiple identities that are the opposite of what society deems as normal, proper or the standard. For example, Asian American gay men have two intersecting identities – race and sexual orientation in which they can face stigma, social injustice and discrimination. Intersectionality is applicable to a variety of groups of people to include people of colors with identities such as LGBTQ and people of color who are not able-bodied, to name a few.

Counselors must understand not only the impact of race when working with a client who is an ethnic or racial minority but also be mindful of the intersectionality of their own multiple identities that cause injustice, oppression and additional stigma. It is also important for counselors to understand their own biases and stigmas related to these varying identities. It is not possible for individuals to separate one identity from another – it is their own identity and they are whole people. Additional research on intersectionality and counseling would help clarify its impact on clients and counselors.

CONCLUSION

Stigma continues to be an issue in our society. Individuals who struggle with mental illness are perceived and judged, at times, based on this mental illness, which leads to developing a negative outlook and self-stigmatization. Due to public stigmatization and self-stigmatization, people are not seeking counseling services or are not benefiting from the services that are being utilized. This stigmatization phenomenon is even more prevalent among people of color because they are not only being perceived by others negatively because of their mental illness, but also because of the color of their skin. Oftentimes, individuals come to counseling due to experiences of racism, discrimination and oppression. The therapeutic relationship is known to be a supportive alliance built on trust, empathy, and respect. Clients come to counseling hoping to find comfort in a safe place. Counselors must be the driving force in deconstructing racial stigma because counselors are the foundation of the therapeutic relationship.

As mentioned, identity development plays a part in understanding one's self as well as understanding others. Counselors must be aware of many aspects of themselves to appropriately serve clients and deconstruct stigma. Being aware includes being educated, competent, and sensitive to culture. Additionally, understanding how a person's race intersects with other identities that are held by the person is valuable because these factors make the person whole and counselors need to understand the wholeness of the individual.

The ACA *Code of Ethics* speaks to counselors' duties regarding multicultural competence, however these guidelines need to be taken a step further when practicing in the counseling field. Counselors must be purposeful in their cultural experiences. Gaining knowledge and competence includes exploring culture by exposing one's self to it. One aspect that is important for counselors to consider when experiencing cultural exposure is being aware of her/his behavior. Microaggressions and non-verbal communication are significant and can make or break the therapeutic relationship.

Lastly, working with people of color means that counselors must have a full clinical toolbox that includes various theoretical approaches and interventions. What works for one client may not work with another, thus being knowledgeable and purposeful when choosing appropriate culture-specific

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

interventions and theoretical approaches is key. The authors suggest RCT therapy because it is a holistic approach that considers the collectivistic nature that most minority groups value. As society continues to develop new roles and aspects of human nature, it is the responsibilities of mental health providers to keep up with this growth in a way that assists in the deconstruction of racial stigma. It is the ethical duty and responsibility of clinicians to appropriately respond to matters of diversity and stigmatization. In summary, this chapter has assisted in identifying practical approaches that counselors can use when deconstructing racial stigma in the therapeutic relationship.

Chapter 73
The Diversity Management for Employment of the Persons With Disabilities:
Evidence of Vocational Rehabilitation in the United States and Japan

Kai Seino

ABSTRACT

The purpose of this chapter is to discuss the latest knowledge of effective diversity management—from businesses and academia—with regard to the employment of persons with disabilities. From a broad perspective, this knowledge is found in the field of industrial-organizational psychology. From a more narrow perspective, and based on evidence from a substantial study, the knowledge of vocational rehabilitation has relevance for persons with disabilities. Vocational rehabilitation is the practice of providing employment supports that will build win-win relationships between employers and persons with disabilities. This chapter reviews recent findings documenting the effective employment and management of persons with disabilities, and summarizes effective actions and workplace considerations for the employment of persons with disabilities.

INTRODUCTION

This chapter focuses on diversity management in industries and organizations in the employment of people with disabilities in the United States (USA) and Japan. Diversity in the labor market has previously focused on race or gender. However, diversity now is "any and/or every dimension of attributes one may have" (Taniguchi, 2008, p. 69), and includes disabilities (within that dimension). Employment of individuals was previously an issue that fell under the welfare domain in both the USA and Japan. However, employment of people with disabilities is now becoming an industrial and/or organizational issue. Globally, the United Nation's Convention on the Rights of Persons with Disabilities in 2006, the nationwide promotion of Employment First in the USA, the amendment of the Disabled Persons Employment Quota System and the enforcement of the Comprehensive Support for Disabled Persons Act in Japan, have facilitated protection of the rights of people with disabilities in society and emphasizes a shift from welfare to employment.

This chapter has two objectives. The first is to contribute to the development of companies and society by introducing effective management of people with disabilities in the labor market. The second is to contribute to the promotion of attaining independence, social participation, rehabilitation, and right through the employment of people with disabilities. In order to achieve both these objectives simultaneously, research from the field of vocational rehabilitation focusing on employment support for people with disabilities is required. This is because vocational rehabilitation concentrates not only employment for the sake of social contribution by an employer, but is also an accumulation of studies, utilizing many methods, with the goal of constructing a "Win-Win relationship" between an employer and a person with disabilities.

However, there has been little cooperation (interaction) between the field of vocational rehabilitation research and the field of industrial/organizational research. Therefore, reporting the findings from vocational rehabilitation research in this chapter may also contribute to the promotion of industrial/organizational research. Based on this background, in this chapter, we report findings and examples of effective practices for organizations and industries hiring individuals with disabilities, from the field of vocational rehabilitation research. This chapter's objective is to clarify effective employment management for people with disabilities in the workplace, from both the USA and Japan; therefore, we identified the following research questions and keywords:

1. What is effective employment management for people with disabilities from the field of vocational rehabilitation research?
2. What are good examples of employment management of people with disabilities conducted by companies?

Additionally, the following three keywords were common in both USA and Japanese studies:

1. Evidence from vocational rehabilitation
2. Customized employment
3. Universal design

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Regarding the third keyword, "universal design," effective management with consideration of those with cognitive and physical function disabilities, is not only effective for affected individuals, but also for those who have experienced a change in their cognitive or physical abilities due to aging. Therefore, we included the keyword "universal design" to examine the possibility of a general application of employment management of people with disabilities. The content of this chapter not only contributes to increasing the understanding of people with disabilities from the point of view of company executives, human resources, managers, and government personnel, but also provides beneficial knowledge to researchers and students of industrial/organizational psychology.

BACKGROUND

Diversity is defined in the Oxford Advanced Learner's Dictionary as "a range of many people or things that are very different from each other," and "the quality or fact of including a range of many people or things" (p. 443). Although diversity has traditionally been defined as differences in gender, race, and age, the definition has since broadened. According to the United Nations High Commissioner for Refugees (UNHCR), diversity refers to "different values, attitudes, cultural perspectives, beliefs, ethnic background, nationality, sexual orientation, gender identity, ability, health, social status, skill, and other specific personal characteristics" (UNHCR, 2011), and Taniguchi (2008) defines diversity as "any and/or every dimension of attributes one may have" (p. 69).

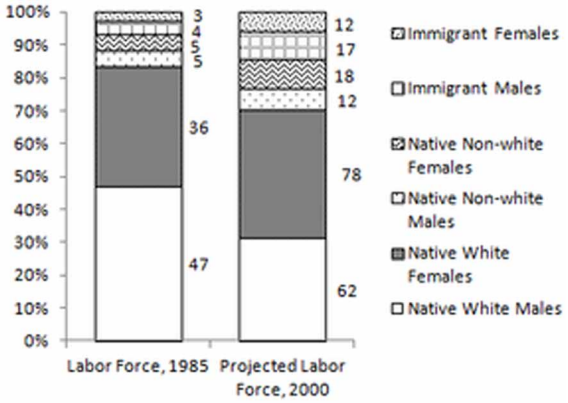
Biodiversity, a shortened version of the word biological diversity, was created by Walter Rosen, and is defined as "constructed of genetic diversity, human-derived diversity, and ecosystem diversity" (Simon, Reece, & Dickey, p. 476), and is essential to human life. Diversity in the sense of the modern meaning was used in Regents of the University of California v. Bakke, a landmark decision made by the Supreme Court of the United States. Allan Bakke, a white man, sued the University of California after having been rejected for admission to the Davis School of Medicine twice, despite testing higher than some minority students who had been admitted via the racial quotas set by the school. The Supreme Court ruled in favor of Bakke, ruling the quota unconstitutional, and that Bakke be admitted. However, Justice Lewis Powell, Jr. argued that although the racial quota did violate the Civil Rights Act, "the goal of achieving a diverse student body is sufficiently compelling to justify consideration of race in admissions decisions under some circumstances" (Cornell University Law School, n. d.).

Furthermore, in the USA the Genetic Information Nondiscrimination Act was established in 2008, banning discrimination based on genetic information in health insurance and employment fields. Diversity now does not only include the traditional demographical information (such as sex, age, and education) but also psychographic information such as personality traits, life style, and sexual orientation. Diversity drew attention in the USA after the publication of *Workforce 2000: Work and Workers for the 21st Century,* by Johnson and Packer (1987). It estimated the demographics of the workforce in the year 2000, and proposed that the workforce would be older, and have higher participation by women and minorities, resulting in the need for a shift in the employment environment to embrace the change (Figure 1).

The term "Diversity Management" was founded by Roosevelt Thomas (Roosevelt Thomas Consulting & Training, n. d.), who defined diversity as referring to "any collective mixture characterized by differences, similarities, and related tensions and complexities" ("Definitions of Diversity," n. d.) and introduced strategic categories to conduct diversity management:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Estimates made in Workforce 2000



1. Managing diverse talent
2. Managing all strategic mixtures
3. Managing relationships
4. Managing representation.

Diversity management in Japan drew attention after 2000 following the establishment of the Equal Employment Opportunity Law of 1986. Diversity management in Japan has focused largely on the employment of women. The Japanese Business Federation's (*Keidanren*, formerly *Nikkeiren*) Diversity Work Rule Collegium defined diversity management as "a strategy to maximize diverse personnel, to take in diverse attributes (such as sex, age, and nationalities), values, and ideas, without being held to previous standards or norms, and meet the changes of the business environment swiftly and flexibly for company growth and personal happiness" (Japanese Ministry of Education, Culture, Science and Technology, 2012).

In recent years, diversity management has finally begun expanding to facilitate the careers of people of all ages, including persons with disabilities (Keidanren, 2016). Negative aspects related to diversity management have also been reported. Ellison and Mullin (2014) compared working environments of men only, women only, and both over a span of eight years, and reported that although diversity enabled 41% more success, individuals were less happy. However, Cox and Blake (1991) supported diversity management's superiority in six fields, specifically, marketing, creativity, problem solving quality, organizational flexibility, cost, and attracting human resources. McMahon (2010) reported that work performance may also be influenced by work environment (i.e., whether or not work the environment is stable), and not just diversity management.

It is important to note that, in some diversity management policies, disability as a dimension of diversity is forgotten. For example, Ball and colleagues (2005) reported that of the top 100 companies on *Fortune Magazine's* 2003 list of the 500 most profitable companies in the nation, a total of 10 companies did not include disability in their diversity policies, despite referencing groups protected by civil rights laws. Numerous state laws in the USA, as well as the Americans with Disabilities Act (ADA) of 1990, as amended have designated persons with disabilities to these protected groups, and therefore should be

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

referenced. In reality, even as of 2016, in the diversity section of the Fortune 500 website, there is still only data with regard to gender and race, and persons with disabilities are not mentioned.

Furthermore, we should be aware that the collective group of persons with disabilities is different from other groups related to diversity. There is no "group norm," as they have difficulty having a sense of group membership, and disability in and of itself is very diverse (e.g., physical disability, mental disability, etc.). For example, two people with the same disability may exhibit different symptoms, and their degree of disability will most likely be different as well. Group membership is difficult, not only because disability itself is diverse, but also because some people may feel that the disability is the only element they have in common, and are therefore not members of the same group. In addition, Jones (2002) has pointed out that the desire to be part of a particular group is contingent on the group being viewed as positive. Therefore, group self-identification may be diminished, as discrimination against various disabilities still exit.

On a more fundamental note, the International Classification of Functioning, Disability, and Health (ICF) introduced a basic model of disability, the biopsychosocial model, which synthesizes the medical and social aspects of disability (ICF, 2002). In the medical aspect, the person with the disability requires treatment or intervention to better the individual. The social aspect proposes that society at large is in need of change, and demands environmental accommodation for the individual. Lederer and colleagues (2014) also identified disability in the workplace as "a relational concept resulting from the interaction of multiple dimensions that overlap and influence each other" (p. 259) at the individual, organizational, and societal levels.

Discrimination and prejudices must not be forgotten when discussing persons with disabilities. It may not be difficult to accommodate for a disability that is "visible," but many people have disabilities and/or symptoms that are not "visible" (e.g., mental disabilities). In recent years, the term "neurodiversity" has been created as a dimension of diversity to include individuals with no physical defect or impairment, but do need some accommodation and/or support (in the workplace). This includes individuals with autism and autism spectrum disorder (April 2016). Unfortunately, stereotypes of persons with disabilities not being able to work still exist. Fassinger (2008) stresses that small issues, or micro-inequities (e.g., not being promoted once), lead to bigger problems over time, becoming a cumulative disadvantage (e.g., becoming depressed after not being promoted several times) that needs to be resolved.

The use of a number of interventions, collectively called disability diversity training, is gradually increasin in an effort to reduce such prejudices and improve intergroup relations. However, there is still little empirical data validating the effectiveness of diversity training (Philips, Deiches, Morrison, Chan, & Bezyak, 2016; Horwitz & Horwitz, 2007), and perceptions that people hold prior to training may still persist. Specifically, Rynes and Rosen (1995) reported that only 33% (30% answered quite successful and 3% answered extremely successful) of participants of diversity training believed it would be successful in the long run. These issues will hopefully be addressed in the future.

EFFECTIVE EMPLOYMENT MANAGEMENT PRACTICES FOR PERSONS WITH DISABILITIES

Disability and Diversity Management in the United States

Attracting and maintaining a diverse workforce is critical in today's competitive labor market. We live in a global and interconnected world in which our workforce is becoming increasingly diverse and that poses both challenges and opportunities for employers. The idea is that having a more diverse workforce helps companies remain competitive. It also helps companies to become more reflective of the diverse communities and the customers they serve. Employers recognize and leverage diversity and inclusion in order to remain competitive and achieve better business results. This is part of building high-performing business organizations. Incorporating disability into companies' diversity and inclusion policies and practices helps employers improve their bottom line (U.S. Business Leadership Network (USBLN), 2012).

Large businesses develop a diversity and inclusion (D&I) strategy and dedicate staff positions to managing the D&I aspect of their business operations. Indeed, the area of "diversity and inclusion" is a relatively new focus for employers, and employers that have D&I personnel are challenged to create clear competencies that individuals in these positions must achieve (Lahiri, 2010). Lahiri discusses the emergence of the D&I practitioners over the last decade and that this has become an important part of companies' strategic global business growth. These practitioners are charged with creating universally designed workplaces that benefit all employees, including people with disabilities, and ultimately the employer.

There is evidence that employers are implementing disability-inclusive practices/policies but more must be done (Erickson, 2013, 2014; Linkow, Barrington, Bruyere, Figueroa, & Wright, 2013; USBLN, 2012; Young & Kan, 2015). Erickson (2013, 2014), for example, based on a survey of 675 HR professionals (23% response rate), identified a range of practices related to recruitment and hiring, accessibility and accommodations, and retention and advancement. More than half of the respondents reported that their organization included people with disabilities in their diversity and inclusion plans (58.8%), required sub-contractors to adhere to non-discrimination requirements (57.2%), and had relationships with community disability organizations (53.9%).

In terms of accessibility and accommodations, nearly three-quarters reported having a designated office or person to address accommodation questions (74.1%). Allowing employees to exceed the maximum medical leave duration as an accommodation (71.2%) and having a grievance procedure to address accommodations issues (65.7%) were the next most often reported practices. Having a return to work or disability management program for employees who are ill/injured or become disabled (76.4%), encouraging flexible work arrangements for all employees (such as flextime, part-time, telecommuting) (56.6%), and encouraging employees to confidentially disclose their disability (in staff surveys for example) (41.0%) were the top three retention and advancement practices reported by Human Resource (HR) professionals.

Erickson concluded that, beyond the most frequently reported practices/policies, a large proportion of employers had not implemented any or only a few of the practices/policies and that more needed to be done (see also Young & Kan, 2015). While the knowledge base on disability-inclusive practices/policies is increasing, little is known about their effectiveness in terms of improving employment outcomes of people with disabilities. Studies have mostly measured effectiveness in terms of perceived effectiveness by HR professionals and others knowledgeable about the practice/policy under investigation (e.g.,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Erickson, 2013, 2014; Young & Kan, 2015). Erickson, von Schrader, Bruyere, VanLooy, and Matteson (2014), for example, surveyed a total of 339 organizations about 10 disability-specific recruitment and hiring practices/policies. They found that nearly three-quarters had implemented at least one of the ten practices/policies but that there was no large-scale adoption across organizations.

Larger organizations (500+ employees), federal contractors, and non-profit organizations were significantly more likely to implement many of the listed practices/policies than their counterparts. Organizations with a history of hiring people with disabilities were significantly more likely to have each of the listed practices/policies in place compared to organizations without such histories or track records. Conversely, having these practices/policies in place increased the likelihood of organizations hiring people with disabilities. The practices/policies that had the greatest impact on the recruitment and hiring of people with disabilities included (in order): internships for people with disabilities, strong senior management commitment, explicit organizational goals regarding people with disabilities, actively recruiting people with disabilities, including people with disabilities in diversity and inclusion plans, considering people with disabilities' goals in management performance assessment, and relationships with community organizations (see also Young & Kan, 2015).

Measuring effectiveness of disability-inclusive practices/policies is challenging because of voluntary self-identification. The problem with measuring effectiveness is that self-identification is voluntary and that in the absence of disability data on job applicants and employees, employers do not know how they are doing (Young & Kan, 2015). This is particularly challenging for federal contractors. In 2013, the U.S. Department of Labor's Office of Federal Contract Compliance Program passed regulations that, effective March 2014, requires businesses that want to contract with the federal government to fill a total of 7% of their job positions with people with disabilities (U.S. Department of Labor, n. d.). Compliance with this so-called "utilization goal" depends on the self-identification of job applicants/employees and their comfort level.

Despite these challenges, research indicates that some employers are making an effort to track disability data and that they are in a better position to assess effectiveness of their practices/policies compared to their counterparts (e.g., Erickson, von Schrader, Bruyere, & VanLooy, 2014). Erickson et al. (2014), based on a survey of 675 employers about their data collection efforts, found that the majority of employers track general HR data, such as employee performance/productivity (93%), number of work-related injuries (91%) and lost work days (83%). As for disability-specific data, the top three types of data collected by employers were: information on accommodations (32%), number of job applicants hired (29%), and number of job applicants (23%).

Other data points on which employers were less likely to collect disability data included: employment and retention (18%), grievances (17%), compensation equity (14%), and turnover rate (11%). The researchers concluded that "employers are only now beginning to consider inclusion a disability measure among their recruitment, hiring, and retention HR analytics" (p. 12).

Research also indicates that strategies targeted at a particular diverse group of employees may be transferable to other diverse groups (Hall, Boeltzig, Hamner, Timmons, & Fesko, 2006; Timmons, Hall, Fesko, & Migliore, 2011; The National Center on Workforce and Disability/Adult (NCWD/Adult), 2008a, 2008b).

Timmons et al. (2011), for example, studied workplace strategies of U.S. companies seeking to recruit and retain older workers ages 50+. They found that the strategies these companies were using not only benefited older workers but also workers with disabilities. Results were based on interviews with 18 employers (their HR or diversity program representatives) in 13 U.S. states, as well as in-depth case

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

studies of 5 of the 18 companies. Transferable recruitment strategies included: employee referral, collaboration with community partners, recruitment from a volunteer pool, formal recruitment programs among businesses, and placement agencies focused on specific populations. Transferable retention strategies included: job flexibility, comprehensive benefits packages that go beyond standard health and pension components, professional growth and development opportunities, and other workplace accommodations, such as physical modifications.

DISCUSSION

Based on this work, the researchers identified characteristics of a universally designed workplace that benefits all employees. Originally developed to promote architectural access for people with disabilities, universal design refers to the "design of products and environments to be usable by all people, to the greatest extent possible, without the need for adaptation or specialization" (Definition by Roy L. Mace, The Center for Universal Design). Timmons et al. (2011) identified a total of six characteristics of a universally designed workplace: 1) creating an inclusive organizational culture, 2) flexible workplace policies and practices, 3) effective supervision and management, 4) a welcoming and accessible environment, 5) clear and consistent communication, and 6) recruiting, hiring, orienting, and maintaining a diverse workforce that maximizes each employee's performance. There is evidence that companies both in the USA (Linkow et al., 2013) and Japan (Hirano, Matsumoto, & Nose, 2004) are incorporating a focus on universal design into their operations. Future research should investigate these employer efforts and evaluate them in terms of their effectiveness in increasing workplace access for all.

A REVIEW OF EVIDENCE OF VOCATIONAL REHABILITATION IN JAPAN

Introduction and Background

In recent years, the number of individuals with disabilities working in companies in Japan has increased due to systems that assist people with disabilities and improvement of employment support services (Conference on community employment support, 2014). However, many problems have been highlighted regarding community employment support (Conference on the promotion of employment of people with disabilities though the cooperation of welfare, education, 2007). Low competitive employment rates (i.e., employment in companies and not welfare institutions) and low employment transition rates (i.e., ratio of transition from welfare education services to employment) for people with disabilities in welfare and education institutions have been reported (Ministry of Health, Labour, and Welfare, 2014).

Therefore, in order to facilitate the employment of people with disabilities and promote diversity in companies, more effective practices regarding transition from work preparation to employment, and accommodation of a long-term support system after obtaining employment is required from healthcare, welfare, and education related fields. Such a transition to employment from healthcare, welfare, and education fields requires effort from labor field supporters, who specialize in the understanding of labor markets and companies. More specifically, labor field supporters are staff members from the National

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Institute of Vocational Rehabilitation, the Public Employment Security Office, and employment support institutions. However, the effect of "employment support" in such related fields has yet to be organized, except for some Individual Placement and Support (IPS) approaches in mental health fields (Haruna & Tomei, 2012).

Based on the above, this section's objective is to organize known effective approaches of the broadly interpreted "employment support" practiced in Japan, from studies and research, as evidence of vocational rehabilitation, and provide background information of employment management for individuals with disabilities to companies and government organizations.

Method

Related literature in both English and Japanese were gathered and analyzed for this literature review. Specifically, for employment support in Japan, a full-text search was conducted on 17th June 2014 using the NDL-OPAC (National Diet Library) and CiNii (National Institute of Informatics) databases. Search terms are given in Table 1. Literature searches were also conducted using the academic journal "Vocational Rehabilitation" and proceedings of the conference on vocational rehabilitation research (Japan Organization for Employment of the Elderly, Persons with Disabilities and Job Seekers). Literature search was restricted to literature published after 2006. Only quantitative studies were selected after reviewing either abstract or full manuscript.

Table 1. Search terms

Field	Search Term Combination
Healthcare	(employment support or vocational rehabilitation) and (medical care or hospital or health)
Welfare	(employment support or vocational rehabilitation) and (welfare or employment transition or sustained employment)
Education	(disability or disability*) and (employment support or vocational rehabilitation or career education or career counseling) and (education or special needs)

*Although both words here are "disability," we used different characters in Japanese to expand search results.

Next, a hand search of the extracted literature and cited literature was conducted, and the approaches of employment support in each field were analyzed. In this review, we interpreted "employment support" broadly, and extracted approaches based on the hierarchy structure of individual characteristics on employment, proposed by Matsui (2004), that had an effect on employment. The hierarchy structures were "performance of duties," "performance of vocational life," "performance of daily life," and "management of disease/disorder."

Approaches of "Employment Support" in Each Field

The approaches extracted from literature were organized by the type of disability covered and by the level of evidence. Categorization of the level of evidence was based on that of the Agency for Health Care Policy and Research (AHCPR, 1993; see Table 2).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Levels of evidence and content

Ia	Meta-analysis
Ib	Randomized controlled trial
IIa	Well controlled study without randomization
IIb	Well-designed quasi-experimental study
III	Non-experimental descriptive studies (comparative studies, correlation studies)
IV	Expert committee opinion, and/or clinical experience of respected authorities

Furthermore, prospective studies with intervention were categorized as IIb, and cross-sectional studies with no intervention as III. Results are shown in Table 3. Each disability was counted, even when more than one type of disability was covered. With regards to the type of disability covered, mental disorders and higher brain dysfunction was most prevalent in the healthcare field, all disabilities and mental disorders in the welfare field, and all disabilities and intellectual disability was most prevalent in the education field. With regards to the level of evidence, studies of levels IIa, IIb, and III were most prevalent in the healthcare field, studies of levels IIb in the welfare field, and studies of levels III and IV were most prevalent in the education field. In general, many studies of levels IV and below, such as practical studies, were reported.

Table 3. Overview of approach of each field

Literature		**Field**			
		Healthcare	**Welfare**	**Education**	**Other**
Number of Literature		30	50	78	11
Number of approach		30	54	141	11
Disability	All disabilities	0	12	37	3
	Physical	3	2	12	0
	Intellectual	0	4	32	0
	Mental	16	14	0	3
	Higher brain dysfunction	9	2	0	3
	Developmental	2	6	13	1
	Intractable disease	1	1	1	0
	Co-occurring	0	0	2	0
	Unknown	1	14	30	1
	Other	-	-	17	-
Level of evidence	IIa	1	0	0	0
	IIb	2	2	0	0
	III	4	0	1	2
	IV	0	0	12	0
	Other (Practical study, etc.)	23	52	128	9

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4 shows the overview of studies that were categorized as level a or b, with clear intervention methods and effects. In the healthcare field, various approaches were conducted alongside drug treatment. As a result, improvement was seen in more fundamental elements to facilitate employment that were related to "management of disease/disorder," such cognitive functions and symptoms. In the welfare field, a more comprehensive employment support program was implemented. As a result, approach was associated with more practical elements such as "performance of duties" and "performance of work achievements" (specifically employment rates work duties).

Table 4. Summary of high evidence level research

Author	Participants	Study design	Intervention	Results
Sato et al (2014)	109 patients with schizophrenia spectrum disorder	Non-randomized controlled trial	Cognitive Rehabilitation: Training using computers (cognitive rehabilitation and supported employment group; 52 people, supported employment group; 57 people)	Verbal memory, psychiatric symptoms, interpersonal relationships, social functions, and cognitive functions significantly improved. However, the groups did not differ significantly in employment rate and wages earned.
Tashiro et al (2013)	12 patients with depression remission	One group pre-test, post-test	Integrated Return to work Support Program (IRSP): 30 subprograms such as Bright Light Therapy, Exercise Therapy, Cognitive Therapy, Behavioral Therapy, and Social Life Program Therapy was conducted for 6.5 hours every day.	Return to work/Employment rate was 100%, relapse/exacerbation rate was 0% 4-38 months after the program. Significant improvement was seen for depression assessment indexes (HAM-D17, BDI-II).
Tajima et al (2010)	55 people taking a leave of absence due to depression	One group pre-test, post-test	Group Cognitive Behavioral Therapy (GCBT) to return to work: Strengthen return to work readiness by learning the basis of CBT, was conducted 9 times, each time was 100 minutes a week.	Significant improvement was seen for dysphoria symptoms (BDI-II), nonfunctional cognition (DAS24-J), and self-esteem (SE).
Kitagwa et al (2011)	28 patients with depression	One group pre-test, post-test	Return to work Support Program: 12 weeks of Cognitive Rehabilitation, 12-16 weeks of Work Therapy, 12 weeks, 60 minutes a week of GCBT.	Cognitive function tests (such as WCST, TMT-A, and ALVT) significantly improved. Of 29 different patients, 21 returned to work within a year after finishing the program (72.4%), and 5 relapsed/exacerbated within a year after finishing the program (17.2%).
National Institute of Vocational Rehabilitation (2011)	90 patients with intractable diseases	Prospective study	Intractable disease model project: Coherent approach such as job preparation, employment, job adjustment sustaining employment, and career-building. Peer and/or advocate group counseling, employment seminars were also conducted.	Employment using Promotion of Employment of Persons with Disabilities Act was significantly greater. Work-related problems were significantly related to approaches.
	34 people with developmental disorders	Prospective study	Developmental disorder model project: Work support such as accompanying to work, on-the-job training, employment seminars.	General work-related problems were significantly related to various approaches.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Discussion

Regarding the method of employment support for the employment of people with disabilities, "employment support" in healthcare, welfare, and education fields was related to the expertise of each field. Furthermore, characteristics of disability covered by each field were also implicated. Concerning the level of evidence, some experimental design studies were found in healthcare and welfare fields. However, many studies were individual observations (such as practical/case studies) and were at the "building specialist consensus stage" (i.e., creating definitions). Studies examining the effect of employment support with higher levels of evidence are needed in the future.

As for the implications for employment management of people with disabilities, there were many studies (a total of four studies describing support for people with mental disorders in medical institutions) as evidence of support methods confirmed in this section. Further, the content of the support improved mental symptoms, cognitive functions, and other functions, through individual/group training and numerous other programs. All support in medical institutions was found in training or programs prior to employment/rehabilitation.

From the results of this review, support directly related to employment management of people with disabilities in organizations could not be found. However, many psychiatric diseases are chronic, and even those that are not chronic, still require some ongoing support. Therefore, medical treatment and/or support are still needed after obtaining a job in companies. Hence, organizations employing people with disorders accommodating considerations for hospital visits, and constructing a system so that organizations can ask for help or support when needed, may be considered effective for people with mental disorders to experience stable and long-term employment.

Research from the National Institute of Vocational Rehabilitation implicated ongoing efforts and counseling, from before to after employment, would improve work issues for people with intractable diseases and developmental disorders. It would seem that workers receiving ongoing and comprehensive support from employment support institutions would face fewer problems related to employment. Therefore, it would be effective for companies to actively encourage individuals with disabilities who want employment/rehabilitation to use such services of employment support institutions.

A REVIEW OF EMPLOYMENT PRACTICES FOR PERSONS WITH DEVELOPMENTAL DISABILITIES IN JAPAN

Introduction and Background

As mentioned above, "Universal Design" is an approach for diversity management. For example, creating a cognitive disability-friendly workplace can lead to a workplace that has low cognitive load for all employees. Overall, companies should strive to construct a work environment that "enables every member of the work force to perform to his or her potential" (Arimura, 2009). In this section, we focus on developmental disorder as an example of cognitive disability. By reviewing research on employment management examples in Japan, we wish to provide evidence that cognitive disability-friendly management results in diversity management.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Method

We searched for studies that focused primarily on employment management procedures for individuals with developmental disorders. To do so, we used the search terms "Developmental Disorders" and "Employment Management" using the database CiNii (http://ci.nii.ac.jp/). Four studies were identified; however, one (Ayukawa, 2011) was excluded from analysis because the study focused on procedures of legal employment management.

Results

Aoki (2008) reported an example of employment management of an employee diagnosed with Asperger's syndrome. The management technique described can be classified into four categories: "Consideration for imagination disorder," "Consideration for cognitive load," "Construction of a support system," and "Management of motivation." It is difficult for individuals with autism spectrum disorders, including Asperger's syndrome, to deal with vagueness and an undecided future. These individuals find it difficult to resolve vagueness with imagination. To address "Consideration for imagination disorder," management carried out at least five interviews, and talked about working conditions repeatedly, to fill the gap between the actual workplace environment and what the employee with Asperger's syndrome thought.

In addition, management visualized information using pictures and documents, as well as oral explanation, when they instructed duties or suggested an improvement of duties, and avoided sudden changes or addition of duties. "Consideration for cognitive load" means controlling the quantity of information handled at one time, and attempting to lower the load of information processed in the brain. Considering cognitive load becomes important because some people with developmental disorders have difficulty processing numerous information sources at one time. Specifically, management assigned one, and only one supervisor to a person with developmental disabilities to instruct any and all duties. They also gradually increased work difficulty, starting with easy tasks, and gradually extending work hours (starting with 5–6 hours), depending on the degree of achievement.

In addition, management facilitated the acquisition of supplemental means to reduce recognition load by instructing employees with disabilities to write down work content, work points, and questions. To address "Construction of a support system," management emphasized enhancing the employee's strengths, explained the characteristics of the employee's disability to neighboring employees, and created a notebook to facilitate communication between the company and employee's home, when needed. The fourth category, "Management of motivation," was the employment management technique that Aoki regarded as most important. There are people with developmental disorders who have a strong unease for work because they did not receive appropriate support in school life, and experienced numerous failures.

Therefore, it is important for the employee him/herself to steadily acquire successful experiences in his/her career, to enhance self-esteem, while also being aware that "he/she is a valuable member of the workforce to both the company and themselves" (Aoki, 2008). Aoki introduced examples such as commending the employee for achievements, promoting awareness as part of the company by giving the employee a business card, comparing the employee's past and present achievements at regular intervals to increase the employee's confidence, and making it easy to experience success by creating aims that he/she can definitely accomplish.

Sano (2011) pointed out that people with autism spectrum disorder were not suitable for customer duties. In addition, he stated that consideration for communication was "key to continue working,"

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

because relationships are also necessary in line work found in the manufacturing industry. He insisted on consideration for cognitive load by assigning a job coach and restricting work at the beginning and gradually increasing it. People with autism spectrum disorder tend to have a limited range of interests, so it is comparatively easy to strengthen such areas, while it is difficult to strengthen areas outside of this range, because they feel distress in making such efforts. Sano, as well as Yamada (2014), pointed out that approaches that maximize his/her strengths are more effective than emphasizing the overcoming of weaker characteristics (e.g., communication).

Takezawa (2015) extracted a total of 33 instances of people with developmental disorders from a database that recorded employment examples of people with disabilities. Six categories were found for employment management: "The allotment of duties that maximize the employee's strength," "Consideration for communication," "Consideration for imagination," "Visual support," "Consideration for mental health," and "Construction of a sustainable support system for sharing information." These categories are similar to that from previous studies. "The allotment of duties that maximize the employee's strength" means assigning duties that capitalize on employee strengths.

As Sano (2011) previously pointed out, people with autism spectrum disorder have a limited range of interest. However, their knowledge on the domain of interest tends to be far richer than people without developmental disorders. Maximizing this wealth of knowledge in the workplace would be Yamada's (2014) "approach to maximize strengths." More specifically, Takezawa reports an example of an employee with developmental disorders who had "persistence to follow a certain procedure" be assigned office work, such as confirming monthly attendance records and requests. Such work that requires the employee to follow a certain procedure was performed better, more precisely, and was enjoyed more than other employees who would have found the work too monotonous and/or uninteresting.

With respect to "Consideration for communication," examples included permitting an earlier break time that did not overlap with other employees, for those that were uncomfortable with communicating with other employees. Communication for people with developmental disorders falls under the area Sano (2011) stressed as "weaker characteristics that are hard to strengthen." Rather than expect the employee to resolve issues on communication, it is fundamental to build a workplace environment that prevents such trouble from occurring in the first place. With respect to "Consideration for imagination" and "Visual support," similar considerations were reported as those that Aoki suggested in "Consideration for imagination disorder" and "Consideration for cognitive load." With regard to "Consideration for mental health," similar considerations were reported as those Aoki pointed out in "Management of motivation."

However, some individuals with developmental disorders gain high academic achievement in school life, and they are resistant towards receiving support in their work life. In that case, Takezawa suggests the need to assign duties that give a sense of accomplishment, along with subtle consideration as it becomes necessary. With respect to "Construction of a sustainable support system for sharing information," an example of cooperation with job support organizations was extracted, in addition to the cooperation with home that Aoki highlighted.

In the above-mentioned review, accommodation of nonphysical workplace environment was examined, such as how to assign duties, how to instruct duties, and building a social support network. However, consideration for employees with developmental disorders is also possible by accommodating the physical workplace environment. An example of such physical accommodation is "Job-Related Assistive Technologies." However, assistive technologies for people with developmental disorders are hardly known in Japan. Actually, in the above-mentioned CiNii database, there were no hits when we entered the search terms "Developmental Disorders" and "Job-Related Assistive Technologies."

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Only one study (Enomoto, Ishiwata, & Inoue, 2013) was significant with the search terms "Developmental Disorders" and "Technologies." Enomoto et al. (2013) investigated the use of job-related assistive technologies in 503 business establishments which had received commendation on the employment of people with disabilities. Of the 29 locations that replied, none had implemented the use of job-related assistive technologies. Meanwhile, active development of job-related assistive technologies for people with developmental disorders is happening abroad. For example, Montgomey, Storey, Post, et al. (2011) reported an employee with autism spectrum disorder who had difficulties memorizing job goals, used a system that alerted job goals by sound at regular time intervals (e.g. "Did you finish wiping the table?").

As a result, the employee was less likely to be told by other staff members to work more, and ultimately, work time of the employee increased. Kandalaft et al. (2013) reported that performance of judging emotions from others' facial expressions and voice improved for people with autism spectrum disorders after social skill training, such as practicing a job interview using virtual reality. In recent years, a meta study (Lang et al., 2014) on assistive technologies for people with autism spectrum disorders has appeared. However, in the study group reviewed, research remains at the evidence level of the comparison of pre-to-post assistive technology use. In other words, in the present conditions, accumulation of evidence is not yet adequate.

Discussion

As a result of the review of management procedures for people with developmental disorders in Japan, although examples of effective employment management techniques were found, it is clear that objective inspection of effects has not yet been performed. Additionally, job-related assistive technologies have failed to attract attention as an object of study. However, despite case study-like examination, it is easy to imagine that the introduced employment management techniques may effectively function not only for people with developmental disorders, but also for people without developmental disorders.

For example, techniques of how to instruct duties to an employee with developmental disorders that are easy to recognize (e.g., "Instruct each duty after having prioritized it," "Instruct the next work after one is completed and do not convey vague plans") would also be easy for individuals without developmental disorders to recognize. Therefore, constructing an effective management procedure method for employees with cognitive disorders leads to clarifying a workplace environment where cognitive load is lessened for all employees. It is necessary to clarify the effect of management procedures for people with cognitive disorders, by conducting a high-level research design, which would lead to universally designing the workplace environment and contribute to diversity management.

BEST PRACTICES IN WORKPLACE IMPROVEMENT FOR PERSONS WITH DISABILITIES IN JAPAN

Introduction and Background

In addition to evidence provided by empirical research, case studies of actual work places describing effective management of individuals with disabilities are also informative. The proceedings of workplace improvement case studies, annually issued by the Japan Organization for Employment of the Elderly, Persons with Disabilities and Job Seekers (JEED), provides helpful, effective management strategies for

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

use in the workplace. JEED is an organization that facilitates employment of people with disabilities as stipulated by the Promotion of Employment of Persons with Disabilities Act.

JEED is a quasi-official organization that offers free employment support services to people with disabilities, companies, and related organizations. JEED recruits successful workplace case studies of various improvement/efforts, such as employment management and workplace environment accommodation for people with disabilities, to publish, and commends the most outstanding case example, in order to promote employment and job retention. A total of 19 issues have been published from 1992 to 2015, with the best company approaches and useful tools for the employment of people with disabilities awarded the outstanding performance and encouragement awards.

Objective and Method

Based on the above background, this section's objective is to provide background information of effective employment management of people with disabilities by introducing successful case studies of workplace improvement in companies of Japan. Outlines are given of successful workplace improvement case studies from 2004 to 2015 that were awarded the highest award and are posted on the JEED website.

Results

Practice 1: Approaches for People With Disabilities That Experience More Difficulty in Employment: Individuals With Mental Disorders, Developmental Disorders, and Higher Brain Dysfunction

Here we introduce approaches of job retention for people with mental and developmental disorders, conducted by an insurance special subsidiary company (JEED, 2016). A special subsidiary company is defined as a company that has adopted a system of special considerations for people with disorders, and meets certain requirements. Workers employed in the subsidiary company can be ascribed to the parent company, and are calculated in the parent company's employment rate. Duties performed by employees in this subsidiary company were office work for the parent company, such as using computers and organizing paper work. The company's case example of improvement was as follows.

For an employee with mental disorders, the company understood his/her characteristics and made appropriate assignment transfers. His/her superior offered support, after building trust by creating a comfortable environment for him/her to seek guidance, and talking to him/her on a daily basis, enabling him/her to further his/her career. For an employee with higher brain dysfunction, work accuracy improved after understanding his/her characteristics and practicing appropriate accommodation. For an employee with developmental disorders, support from his/her superiors and senior colleagues enabled a system where he/she could perform to his/her full potential.

Efforts made in this company included all employees understanding each other's disabilities to construct support networks inside and outside the company; one-on-one advice from senior colleagues and training workshops/liaison meetings for senior colleagues; strengthening of cooperation between employment support institutions, medical institutions, and families; and strengthening systems by accumulating accommodation techniques into "human care examples" books. As a result of these approaches, 37 employees with mental disorders retained their jobs. They were able to work with confidence, were

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

motivated to try new assignments, expanded their work, displayed a decrease in mistakes, and their time management skills improved.

Practice 2: Approaches to Issues People With Disabilities Face: Career Building and Aging

Here we introduce approaches conducted by a department store special subsidiary company that improved selling efficiency and created assignments by constructing an employment management system for people with disabilities (JEED, 2013). Duties performed by people with disorders here were light duties, such as box folding, writing expense sheets, sealing/stamping documents, printing, bookbinding, stocking shelves, and labeling. Approaches conducted here included creating in-house assignments by breaking down and reconstructing existing assignments; practicing duties anchored by employees with disabilities; maintaining training workshops for employees with disabilities; improving communication skills of employees with disabilities; and support from in-house job coaches.

Specifically, in-house personnel were appointed to be in charge of employees with disabilities, and created light assignments by breaking down and reconstructing existing assignments previously conducted by each store between distributions. As a result, the burden for each sales person was reduced and selling efficiency improved. Additionally, a work procedure was determined through discussion within teams, and skill improvement was conducted based on work in which each employee was already excelled. As a result, employee's confidence and motivation improved. On some occasions, "on-the-job training in other companies" was set up for employees with developmental disorders.

As a result, employees were able to rediscover their own issues and goals, which improved their ability to adapt during work. To improve communication, employees took initiative in explaining and instructing work, and using the cafeteria when students from special needs schools and university students came for job training. As a result, employees developed awareness and a sense of responsibility as personnel in charge of job training, as well as natural improvement of communication skills through the accumulation of these experiences. In-house job coaches also supported the independence of employees with disabilities, and helped employees adjust their own assignments themselves. This lead to an improvement in the trust of clientele, because employees were able to perform business transactions single-handedly. Employees also acquired the skills to voluntarily resolve problems on-site, without the support of job coaches.

Practice 3: Approaches for People With Hearing Disabilities

Here we introduce approaches conducted by a department store that increased work by developing job fields for people with disabilities (JEED, 2009). Duties performed by people with hearing disability were checking quality, writing expense sheets, and putting price tags on expensive merchandise, such as clocks and jewelry. Approaches included developing new job fields focused on the strengths of people with hearing disability; using support systems designed for job retention; creating a task manual to increase task efficiency; developing skills; supporting communication; and environmental accommodation and safety management using subsidies.

In further detail, all quality checks of group businesses were assigned to employees with hearing disability, focusing on their superior concentration and accuracy. By matching the strengths of people with hearing disability and task content, task efficiency of group business increased. This led to more new

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

job contracts. Additionally, effective assessment of compatibility between the company and the person with the disability became possible by using a trial employment system before official employment. Moreover, all people with hearing disability participated in creating a task manual, that explained all task flow photographically, and all characters had phonetics to make it easier to read.

As a result, tasks were standardized and accuracy increased. Productivity and goal management was conducted through "self-assessment tables" and "performance assessment tables." Based on the data, successful employees were rewarded, while less successful were provided guidance. As a result, employee's skills improved and the working level as a whole improved. In addition, meetings/training workshops took place every Saturday to acquire job knowledge/skill and improve working levels. Furthermore, a sign language dictionary was created for 100 technical terms that previously did not have sign phrases, and a sign language translator was dispatched using subsidies.

The company also spread awareness by having sign language courses for employees with no hearing disability. Efforts focusing on sign language improved sign language skills of employees with no hearing disability, and smooth communication became possible without a translator to mediate. Electronic panels, patlites, and flashlights were also installed using subsidies. By conducting evacuation drills using these, an environment where people with hearing disability could work safely was accommodated.

Discussion

This section introduced three successful case studies of work place improvement in companies. Although we only introduced three examples, many more efforts have been conducted by various types of businesses. In the three examples introduced, a wide range of management efforts, tailored to the company situation, task content, and characteristics and strengths of people with disabilities, were conducted. In addition, two of the examples were special subsidiary companies. A special subsidiary company is a system unique to Japan, which a parent company sets up to accommodate people with disabilities independently from the parent company.

Therefore, the majority of the employees in special subsidiary companies are people with disabilities. From the perspective of aiming toward competitive employment of the USA, employment in special subsidiary companies may be perceived as discriminatory, and this cannot be completely denied. Further examination and discussion is needed after an accurate understanding of working conditions in special subsidiary accompanies. However, as introduced in the case studies, by demonstrating the strengths of special subsidiary companies, such as accommodating people with disabilities and sensitive long-term efforts, implementation has facilitated the employment where people with disabilities were able to work safely.

Many commonalities were found with customized employment in the USA. That is, matching employee characteristics and tasks, creating assignments by breaking down and reconstructing existing assignments, and contributing to companies through productivity and task effectiveness. Although customized employment in the USA is workplace cultivation before job application, the examples in Japan introduced here can be perceived as customized employment within the company with affirmative action (i.e., an employment rate system, special subsidiary company) after employment. This difference may reflect the different culture between Japan and U.S. companies, and the different employment rate system for people with disabilities.

Efforts made in the given case studies included employees with disabilities supporting each other, improving independence and confidence, and creating a manual, with people with disabilities taking

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

lead. These efforts could lead to peer-support and empowerment of people with disabilities, and are important efforts for the recovery and rehabilitation of people with disabilities, as well as improving employment management and productivity. In addition, support from superiors and senior colleagues, training workshops and spreading awareness to employees with no disabilities, and support from peers, were also reported. These are all efforts for standardization of natural support in supported employment.

Although there was no verification through research, and levels of evidence were low, many of the efforts of employment management of people with disabilities were confirmed and effectiveness was implicated, in the case studies introduced. Management of people with disabilities in other companies may move forward effectively by using these case studies as a reference. However, limitations include no objective verification, and caution is needed, as the case studies reported were efforts that were awarded, and made by forward-thinking, highly motivated companies, and therefore do not reflect average efforts. Conducting objective research on organizational/individual factors, and the effect of people with disabilities/organization on management is important in the future. As a result, standardization and generalization of employment management, and improvement of the quality of employment management for society as a whole, is expected.

GENERAL DISCUSSION

Clarifying what an effective diversity management for people with disabilities in the workplace was the main issue raised in this study. In order to clarify this issue, we reviewed studies/practice outcomes on employment management of people with disabilities in the USA and Japan. As a result, improvement in productivity, and characteristics of universal design for employment management in U.S. companies was confirmed. In addition, treatment, training, and support services from case studies of employment support and other related organizations in Japan were also reported. Thus, many U.S. studies reported meso-level studies focused on organizations and management, and their efforts were not restricted to people with disabilities, but seem to discuss effective employment management that may be applicable to all employees.

Conversely, many studies in Japan were micro-level studies which were focused on the person with the disability, and almost no studies had a universal perspective akin to the U.S. studies, but discussed employment management, medical care, education, and employment support services for people with disabilities. By integrating information from Japan and the U.S., meso-level and micro-level methods of support and the whole concept of organization/workplace employment management for people with disabilities that may be highly effective, was implicated. Macro-level influences, such as bills and systems of international organizations, as well as country, county, and local government bodies, should also be examined.

Limitations include the review of studies on employment management of people with disabilities in the USA and Japan from a certain perspective, and thus, do not cover all studies. Studies on employment of people with disabilities are conducted in many fields, such as various fields of psychology, welfare, labor policies, and rehabilitation, making it difficult to cover studies from all fields. Many studies in Japan were case studies and few studies had high levels of evidence. In addition, most of the studies reported in Japan focused on support organizations, and very few focused on organization and management of companies. Furthermore, in both Japan and the U.S., there seems to be no consensus yet on whether diversity including people with disabilities is effective for management. However, promoting employ-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

ment of people with disabilities from a macro-level perspective, such as through social and employment policies would be important.

FUTURE RESEARCH DIRECTIONS

For further research, macro-level, micro-level, and meso-level efforts on effective employment management for people with disabilities from an organizational management perspective, and verification using experimental data is important. More specifically, international trends regarding the rights of people with disabilities, and influences of systems and policies of each country, need to be considered in macro-level studies; examination of effects of management policies/systems of company organizations are needed for meso-level studies; and factors of managers, administrators, superiors, peers, and employees with disabilities, and efforts made on-the-spot are needed for micro-level studies.

Hard and soft accommodation for people with disabilities can lead to a safe and efficient work environment for employees without disabilities. Therefore, examining the achievement attained from the employment of people with disabilities studies with the framework of universal design is possible. These universal designs are not only essential knowledge for employees, but also for managers and administrators of the modern labor market, which is inevitably becoming more diverse (gender, age, race, etc.), due to internationalization and a decrease in the labor force.

CONCLUSION

This chapter clarified effective methods of employment of people with disabilities, an attribute of diversity, by reviewing literature of the USA and Japan. As a result of the review, the following emerged as effective employment management practices. That is to say that affirmative action and reasonable accommodation, such as employment quotas and special subsidiary companies for people with disabilities, were confirmed to be effective at the macro-level; mission and systems of organizations/workplaces, soft and hard environmental accommodations, and a cooperation system between support institutions and families were confirmed to be effective at the meso-level; and natural support from superiors and peers in the workplace, and creating task manuals and tools were confirmed to be effective at the micro-level.

The following emerged as successful examples of employment management for persons with disabilities introduced in companies: (1) matching appropriate tasks (with strengths and characteristics, and creating assignments), (2) consideration for a variety of aspects (communication, imagination, mental health, cognitive load, motivation, task efficiency, independence, and developing skills), (3) accumulating knowledge for support, (4) constructing a support system (both inside and outside the workplace, and building trust so it is easy to ask for advice), and (5) well-equipped environment and safety measures.

These efforts had many commonalities with achievements of customized employment of the USA and supported employment in both the USA and Japan. In order to promote such company employment of people with disabilities, and guarantee work quality, efforts of the company alone is not enough. Governments and employment support organizations will need to support companies and contribute to practical management. Furthermore, experimental verification of employment of people with disabilities is hoped for in the future. From a philosophical standpoint, it is clear that promoting employment for people with disabilities is important for the independence and rights of people with disabilities.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

However, in order for companies to employ people with disabilities, employ them long-term, and expand, it is essential for employees with disabilities to contribute to the organization/management, and for it not to be considered a social contribution or paternalistic employment. For that, realizing a society where people with disabilities can perform to their best abilities and strengths is needed. Additionally, it is essential for governments and employment support organizations to support companies and work together with them. A workplace where employees with disabilities can perform to their full potential is also a pleasant workplace for employees without disabilities. Therefore, effective universal employment management will contribute to employees succeeding, regardless of disability, and enhance the development/continuation of companies and career advancement of workers.

KEY TERMS AND DEFINITIONS

Diversity: Any dimension of attributes one may have.

Employment First: A U.S. movement of employment support for persons with disabilities, where integrated employment is preferred over welfare-based employment.

Natural Support: Providing natural or planned support to persons with disabilities in the workplace.

Special Subsidiary Company: A company that has special accommodations for persons with disabilities using a system unique to Japan. The employment rate of persons with disabilities is calculated in the parent company's employment rate.

Universal Design: Design of an environment that is user-friendly to a diverse population.

This research was previously published in the Handbook of Research on Human Factors in Contemporary Workforce Development edited by Harish C. Chandan and Bryan Christiansen; pages 333-356, copyright year 2017 by Business Science Reference (an imprint of IGI Global).

Chapter 74
Play-Based Bereavement Centers for Children and Families

Renee Turner
https://orcid.org/0000-0002-0451-5488
University of Mary Hardin-Baylor, USA

ABSTRACT

This chapter outlines the structure and therapeutic foundation for a play-based bereavement center geared toward children and families experiencing grief. Organizational structure and duties are discussed along with information regarding developing a playful facility including art/expressive writing, music, drama, symbolic play, and emotional regulation and release therapeutic opportunities. The author focuses on the supervision and training of community volunteers and counselors-in-training to increase positive outcomes and drive sustainability.

INTRODUCTION

In recent years, services for bereaved children have increased; however, most communities still lack appropriate resources for this specific population. Bereavement-based play therapy clinics can be a viable and sustainable option for most communities to fill this need. Bereavement-based play therapy clinics differ from non-bereavement counseling clinics in the depth of grief services provided by specialty staff in an environment which supports connection, wonder, and the supportive, playful exploration of grief and the soul's journey.

While the precise number of children impacted by bereavement is unknown, "an estimated 1 out of 15 children in the U.S. will experience the death of a parent or sibling before they reach the age of 18" (Judi's House/JAG Institute, 2018). It is also difficult to identify reliable statistics regarding the number of children who experience the loss of any significant loved one before adulthood; even the term "significant" is nebulous and subject to debate as family structures vary considerably. The pain and impacts

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

associated with childhood grief, on the other hand, are evident. Short-term impacts on bereaved children may include increased behavioral and academic issues (Holland, 2001; Worden, 1996), reduced self-esteem, symptoms of depression and anxiety, psychosomatic complaints, and physical illness (Worden, 1996), while long-term impacts may include attachment issues (Field & Filanosky, 2010), substance use and related disorders (Holland, 2001), along with anxiety, depression, and other psychiatric and behavioral disorders (Worden, 1996) which may continue into adulthood. According to Dowdney (2000), the majority of children return to baseline functioning within one year, with only an approximated 20% of children requiring mental health intervention. Fortunately, even brief bereavement support after the loss of a parent is shown to reduce the likelihood of severe long-term issues (Bergman, Axberg, & Hanson, 2017). Bereavement support may occur in many formats to include individual, family, and group therapy.

Grief support groups are the most widely cited form of bereavement support (Bergman et al., 2017) and have been shown to reduce isolation and provide a vital support network (Leick & Davidsen-Nielsen, 1991; Hopmeyer & Werk, 1994; Siddaway, Wood, Schulz, & Trickey, 2015), reduce educational issues and behavioral concerns in youth (Tonkins & Lambert, 1996), improve sense of self, and increase resiliency. The group setting provides a space for children to learn about grief and connect with other bereaved children, thereby normalizing their experiences (Siddaway et al., 2015). From a social learning perspective, observational experiences encourage growth through vicarious learning and processing. For many children, this experience returns the child to a sense of normalcy in peer groups, creating a sense of belonging, a vital aspect of child development. Moreover, peer support groups may serve as additional support for caregivers who are unable to provide children with the support needed due to the weight of their own grief (Dopp & Cain, 2012). Therefore, grief support groups may also provide a sacred and supportive space for children to share emotions and thoughts which may make family members and other non-grievers uncomfortable (Worden, 1996).

This chapter explores various options for the structure and therapeutic foundation of bereavement-based play therapy clinics geared toward children experiencing grief with an emphasis on group play therapy.

Play Therapy and Bereavement

Children experience and process bereavement differently from their adult counterparts (Cohen, Mannarino, & Knudsen, 2004; Webb, 2003); therefore, clinicians must carefully consider a child's developmental level before applying interventions. Based on their developmental level, children may be unable to cognitively understand the process and permanency of death (Crenshaw, 1995) or verbally express their emotions (Landreth, 2012). Moreover, current literature suggests children with trauma histories, such as traumatic bereavement, may have inhibited language capacity and ability to verbally process traumatic events (Porges, 2011; Van der Kolk, 2015). For these reasons, children are more likely to process grief through symbolic representation and metaphor (Creshaw, 1995; Webb, 2003), which naturally occurs during the process of play therapy.

Play therapy is developmentally matched to meet the complex emotional needs of grieving children (Creshaw, 1995; Webb, 2003). Because play is considered the universal language of children (Landreth, 2012), it is a natural medium for problem-solving and self-soothing. Play therapy provides children the opportunity to process and play out their feelings and experiences, including grief, using their natural language (Axline, 1969; Kottman & Meany-Walen, 2015; Landreth, 2012). Through metaphors and stories, children project and explore life, death, abandonment, and grief without directly talking about

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the experience (Green & Connolly, 2009). Webb (2003) suggests play therapy is effective for individuals, groups, and families, and it is the optimal therapy for bereaved children.

Play therapists align with a range of theoretical orientations; however, there is currently no evidence to indicate that any specific theoretical orientations are superior when working with grieving children. Despite a lack of empirical evidence in support of specified theoretical orientations, it appears that non-directive play therapy approaches are favored when working with grieving children (Green & Connolly, 2009; Webb, 2003), particularly during the early phases of the therapeutic process. The literature consistently highlights the importance of establishing a safe, trusting relationship (Green & Connolly, 2009; Landreth, 2012; Webb, 2003) and providing children the opportunity to explore and express feelings associated with grief (Green & Connolly, 2009; Reddy, Files-Hall, & Schaefer, 2005; Webb, 2002). Given the need for theoretical flexibility, throughout this chapter, conceptual frameworks and general insights are provided instead of specific interventions to encourage clinical staff to employ individualized, theoretically-driven play therapy.

Building a Playful Facility

Literature offers scant resources for creating play-based bereavement clinics, and insufficient research exists to support a single standardized model. Clinics will need to adjust services based on available space, funding, the volume of children seeking services, and community needs. For example, in a military-based community, a stronger emphasis on military service loss and suicide best aligns with the community's grief experience (Sories, Maier, Beer, & Thomas, 2015). Structure aside, foundational to a bereavement-based play therapy clinic is creating a space in which children are invited into a world of healing. This goal is achieved by intentionally building a playful facility which includes therapeutic toys and varied opportunities for expressive engagement.

Toy Selection

Appropriately selected materials are essential for clients to navigate their therapeutic work. In general, toy selection should include a range of toys which facilitate symbolic and therapeutic play (Landreth, 2012). Guidelines for toy inclusion vary by theoretical orientation, but it is generally agreed that toys should be durable, simple to use, attractive to children in different developmental stages (Kottman & Meany-Walen, 2015; Landreth, 2012; Ray et al., 2013), and culturally sensitive (Drewes, 2005). However, the literature offers inconsistent information regarding the inclusion and exclusion of specific toys and categories based on theoretical orientation and population. In a study examining the most frequently used toys in Child-Centered Play Therapy, Ray et al. (2013), found the top 11 toys (sandbox, arts/crafts, paint and easel, water, kitchen, puppets, bop bag, hats, and big aggressive animals) were used by 25% or more of children in the sample (p. 52). Despite these results, Ray et al. cautioned play therapists against making uniform decisions regarding toy choice, instead encouraged play therapists to include toys based on the needs of individual children. Therefore, intentional selecting, not collecting, of toys (Landreth, 2012) asks the question, "what does this facilitate?" More specifically, when working with grieving children, "how does this toy facilitate *grief*?" While toys are a fundamental part of the therapeutic play process, it is essential to also consider in what method, or modality, toys will be used and available therapeutic space.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Therapeutic Modalities

While no therapeutic modality is shown to be more effective than others with grieving children, many therapeutic modalities and interventions are generally accepted. These include (but are not limited to) expressive arts and written expression (Malchiodi, 2011), dramatic play (Weber & Haen, 2005), and traditional symbolic play (Webb, 2002). In addition to these therapeutic modalities, the inclusion of space for physical and emotional self-regulation is suggested as trauma and attachment-related concerns which often accompany grief (Badenoch, 2008). In large clinics, it is reasonable to assume that separate rooms would house each of these therapeutic opportunities. However, in the case of smaller clinics, these therapeutic opportunities may be condensed or scheduled based on weekly topics or emphases. Furthermore, while each modality is supported by empirical research that demonstrates its effectiveness with bereavement populations, it is not critical to offer each modality when funds and space are limited. When these practical constraints limit therapeutic opportunities, this author recommends minimally providing symbolic and dramatic play areas.

Please note that each of the therapeutic opportunities listed above has an associated specialty designation (e.g., Registered Drama Therapist, Registered Art Therapist) which requires significant modality-specific training and supervision. To ensure that modalities are ethically and correctly applied, the clinic director should obtain ongoing training, supervision, and consultation in areas that fall outside of their scope of competency. Details and rationales for each of these rooms/specialties follow.

Art and Creative Writing

Art is a powerful tool for bereavement because the pain of grief is often unspeakable (Malchiodi, 2011; Rozman, 2015). Therapeutic art is an example of a creative intervention that facilitates opportunities for the child to express deep pain without the use of concrete language (Edgar-Bailey & Kress, 2010; Webb, 2002; Webb, 2003). According to Van der Kolk (2015), grief and trauma experiences are encoded in the body as sensory memories and experiences. The practice of creating art enables individuals to connect with this embodied sensory experience as they explore, process, understand and recover from grief (Steele & Malchiodi, 2012). Because children naturally engage in this medium with little prompting or intervention, it is an obvious choice for bereavement-based play therapy clinics.

Visual arts encompass a broad range of expression including collage, painting, drawing, scrapbooking, sculpting, art/craft making, and multi-media creations. Written expression including poetry and story writing, integrate easily into this room and may be utilized as a multi-modal form of therapeutic intervention. Specific art interventions to process grief include scrapbooking (King, Prout, Stuhl, & Nelson, 2016), creating memory books and other memorial creations, doll-making (Feen-Calligan, McIntyre, & Sands-Goldstein, 2009), visual representations of the deceased, and so on. Simple prompts with as few directions as possible, provide children permission to choose, therefore increasing the child's sense of control (Edgar-Bailey & Kress, 2010; Rozman, 2015). For example, the play therapist might say, "we can make a memory book about your mom, or we can make something else out of these supplies. You get to choose." This approach echoed in the literature, provides a safe place for the grief narrative to arise (Stutey, Helm, LoSasso, & Krieder, 2015) when the child is ready to process.

Art supplies in a room designed for this modality may include:

- Finger paints and other washable-style paints for children or acrylics for adolescents;

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Various materials to serve as a base or canvas (e.g., construction paper, scrapbooking paper, stretched canvas);
- A range of developmentally-appropriate writing and drawing utensils
- Miscellaneous craft supplies (e.g., ribbon, pom-poms, glue, glitter, scissors, art paper, dowels, sequins, beads, yarn, feathers);
- An easel;
- Various types of clay and Play-Doh;
- And magazines and poster board for collages (Kottman & Meany-Walen, 2018).

Consider the age and developmental level of children utilizing this therapeutic modality and select art materials which are attractive to the specified age group. Finally, art rooms need smocks, plastic table covers, durable and easy-to-clean surfaces, and a large assortment of brushes. Additional information regarding art room set-up and therapeutic practices are found in Malchiodi (2011).

Dramatic Playroom

Drama therapy creates an "embodied, experiential process that draws on the patient's capacity for play" (Haen, p.236, 2015) which promotes insight, resolve conflict, and changes cognitive structures (Haen, 2015). Using dramatic play, children create and act out stories about their world in an attempt to make sense of life events using fantasy, metaphor, storytelling, enactment, and dress-up (Cattanach, 2007). Weber & Haen (2005) suggest very young children respond positively to dramatic play as it requires no verbalization; with a mere costume change, children are transported to another time, place, or, version of self through a "double reality. For example, a pair of nursing scrubs and stethoscope allows the child to become a nurse or physician and "cure" the patient's cancer. However, dramatic play is not always so apparent due to the need for emotional distance. In the example provided, the nurse may represent a nurturing or caregiver theme; the same theme is present when the child pretends to be a veterinarian tending to a sick animal. The second example, on the other hand, allows the child to enact nurturing/rescue without directly considering a hospital scene or people, thereby creating emotional distance (Haen, 2015). It is not uncommon, therefore, for bereaved children to use dramatic play to act out illness, death, funerals, and other specific bereavement-related events.

Dramatic playrooms vary based on the size of the bereavement clinic and the number of group participants. Due to a lack of empirical support for bereavement-based dramatic play, the following is based on the author's clinical observation in bereavement-based play clinics. An elaborate center may include a stage with production-quality lights, sound, smoke machine, and so forth; however, most small or start-up centers will operate on a significantly smaller scale and budget. In these settings, a mirror with dress-up items serves as a sufficient base. For purposes of simplicity, dramatic play items are divided into two broad categories: interactive items (e.g., hands-on, dress-up items) and support items. Interactive items serve as the foundation for dramatic play; support items enhance the dramatic process. Bereavement play requires specific interactive items including medical kits/supplies (e.g., stethoscope, band-aids, gauze, surgical masks), judge's gavel, tombstones, scrubs in varying sizes, capes of varying colors and sizes (e.g., superhero, judge's robe), miscellaneous fabric in varying materials (e.g., gauze, silk), magic wands and crowns, rescue worker hats and jackets (e.g., EMS, Police), and military-related items. While this list may be expanded to match the culture and clients of the center, these items will facilitate most bereavement-based play. Support items include a director's clapboard, mirror(s), writing

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

supplies, director's chair, seating for audience members, and various props (e.g., clock, puppets, masks). Additional information regarding drama therapy and dramatic play is found in Weber and Haen (2005).

Symbolic Playroom

This room is best viewed as a "traditional" play therapy room. As previously stated, play is the language of children and toys are their words (Landreth, 2012) therefore, including a room which facilitates symbolic play therapy is necessary for young children to process their grief. The recommended toys to facilitate symbolic play vary by theoretical orientation. Both Landreth (2012) and Kottman and Meany-Walen (2018) provide comprehensive lists of toys needed to facilitate symbolic play.

Therapists should ensure that the room includes a balanced selection of toys across each toy category for the optimal choice of expression (Landreth, 2012) while providing ample choices increases the likelihood that the child will have what they need to process their grief (Edgar-Bailey & Kress, 2010). Nurturing toys allow the child to nurture self and others using a) babies and baby items (e.g., cradles, blankets, clothes, baby bottles); b) stuffed animals; c) domestic animal figures (e.g., cow, dog, cat); d) child-sized cozy blankets and pillows. Real-life play items mirror everyday life and include a) dollhouses with dolls and furniture; b) domestic items (e.g., dishes, food, child-sized brooms, dustpans, play kitchens); c) phones and other play electronic devices; d) doctor's kits; and e) transportation toys (e.g., ambulance, fire truck, police car, military vehicles). Scary toys are crucial for bereaved children including a) monsters; b) figures that defy death (e.g., zombies, mummies, vampires); c) sharks and alligators; d) snakes and insects; e) ghosts and demons; and f) mystical items (e.g., ogre, Cerberus, Chimera, dragon). Finally, aggressive toys provide a vital opportunity for energetic release (Oaklander, 2006) and mastery. Aggressive items include a) punching bag or bop bag; b) foam swords and soft bats; c) toys soldiers; and d) weapons (e.g., rubber knives, retractable knives, play gun, dart gun, rope).

The symbolic playroom may also include a sandbox, which is among the most frequently used play therapy toys (Ray et al., 2013). This author has observed bereaved children frequently use the sandbox as a valuable backdrop for burial play. In this form of play, children can bury and resurrect figures (e.g., dolls, zombies) and create tombs and crypts (e.g., graves, Egyptian pyramids) as they gain an understanding of death permanency and process funeral processions.

Self-Regulation: Physical Release

In some children, processing grief increases difficult emotions like abandonment, anxiety, and anger. As children process grief, it is not uncommon for dysregulation to occur (Badenoch, 2008) as the child embodies the grief experience. As a result, it is not uncommon to observe an increase in children's kinesthetic energy and desire to release this energy through movement or physical aggression as they experience hyperarousal (Warner, Cook, Westcott, & Koomar, 2014). Therefore, clinics are encouraged to minimally provide an outlet through which children can release a sympathetic charge. In line with findings by Ray et al. (2013), the bop bag is a popular aggression/emotional release toy utilized by grieving children, especially boys. However, other options achieve the same goal and are more conducive to group interactions. Group activities which involve the movement of the whole body are excellent methods of for regulation for children in a hyperactive state (Warner et al., 2014). Consider installing a basketball hoop (if sufficient outdoor space is available) or including items such as jumping balls, a beach ball, a small trampoline, or other therapeutic movement-based interventions.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

When space allows larger clinics may further consider designing a designated physical release regulation room. For example, a room with padded the walls, foam wedges and bolsters, weighted blankets, foam swords, and physioballs of varied size (Warner et al., 2014). As a safety measure, maintain low ratios of children to facilitators (e.g., 1:3) and post at least one facilitator any time the room is in use. Some children will neither need nor desire participation in a physical release room and may benefit from a calming room, as described below.

Self-Regulation: Relaxation Room

The purpose of a relaxation room is to return the child to the here-and-now, promote integration, and create a felt sense of safety (Badenoch, 2008). This room is useful for a variety of therapeutic interventions. First, children may need a respite from the chaos of everyday life and experience the room as a space for reconnection, grounding, and centering before beginning any depth processing (Green & Myrick, 2014). This room may also serve as a grounding tool for children who have become activated during their bereavement play (Badenoch, 2008; Warner et al., 2014). Features of this room may include comfortable seating, items scented with aromatherapy, sensory toys, cozy blankets, plush pillows, a small play tent, and low lighting. If smaller facilities are unable to designate an entire room for relaxation, facilitators can adjust the curriculum and add relaxation time to the closing group activity. Closing group activities may include deep breathing, grounding activities (e.g., sensing feet on the ground, progressive relaxation), or group connection activities (e.g., singing a song, huddles).

As previously mentioned, the set-up of a bereavement-based play therapy clinic is dictated by the facility's size, funding, and the volume of children receiving services; therefore, the preceding information should serve as a general guide that is open to adaptation. Based on the size of the facility, the rooms described above may exist separately or combined into one or two multi-purpose therapeutic rooms. A topical description of possible organizational structures follows.

Organizational Structure

Many organizational and program options exist for providing bereavement-based play therapy support based on setting and community needs. When a university setting houses the counseling clinic and part of a counselor training program, a clinic director or appointed faculty supervisor is likely responsible, whereas, in a community-based setting, the responsibility falls to either an executive or clinical director. To determine the most sustainable structure, clinical directors must consider 1) funding, 2) clinical staffing, and 3) community needs.

Funding

As one would imagine, building a play-based center has significant upfront costs. While funding is critical to the success of any clinic, it is rarely discussed in the literature. Competing and dissimilar accreditation and licensure paths further complicate determining a clear funding path. Helm, O'Halloran, and Kahlo (2010) encourage pursuing endowments and grant and creating community partnerships. In consideration of community partnerships, clinical staff may provide bereavement training to area agencies, conduct in-service training for school administrators, or offer assessment and screening services to local mental health authorities. This author also recommends creating community partnerships with

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

area churches, hospitals, and hospices. It is further recommended to "outsource" services as a method of cost sharing while still meeting community needs (for an elaborated discussion, see Helm et al., 2010).

Clinical Staffing

Equal in importance to funding is an adequately trained clinical staff. The clinical director or whoever is deemed responsible for the treatment aspect of the center, oversees program design, supervision of students, and community outreach. As the most critical member of the clinic, the clinical director must possess a clinical license and have ample experience working with play therapy and bereavement. Moreover, for ethical purposes, this author strongly recommends that the clinical director also hold the Registered Play Therapist-Supervisor designation. Additionally, many bereavement center models operate as non-profits with minimal paid staff and volunteer support. The use of counselors-in-training (discussed later) may reduce financial burdens, fill clinical needs, and provide invaluable clinical training.

Community Needs

Groups should serve the needs of their communities. Therefore, consider administering a community needs assessment to determine the types of services that best meet the unique needs of the grief community. For example, in some communities, individual play-based bereavement services may exist, but not group therapy opportunities. In other communities, group therapy may exist for one group but not for others. Create therapeutic programs which match the strongest needs, and add additional programs as needed. Also, consider the culture in which the clinic is based to determine if individual or family services best meet the community's needs.

Therapeutic Program Groups

Many play therapy experts support the use of play therapy with bereaved children (Green & Connolly, 2009; Reddy et al., 2005; Webb, 2002); however, most literature is anecdotal. Unfortunately, there is scant research regarding models for play-based bereavement clinics, and no data is available regarding the impact of long-term bereavement group effectiveness. Nonetheless, between expert opinion and available research, play-based bereavement therapy groups are supported. One study examined children's response to three intensive group therapy "workshops" using play therapy on consecutive weekends, lasting three to five hours each (Siddaway et al., 2015). This study demonstrated a reduction in psychiatric symptoms (i.e., depression and anxiety); however, that children who had experienced the death of a parent benefitted significantly less from the workshops than those who had experienced the death of an extended family member. Siddaway et al. (2015) suggest that this difference to the degree of secondary losses (i.e., change of schools and financial status) and the intensity of losing an attachment figure. In another study, researchers conducted a meta-analysis analyzing grief camps that used play therapy for periods ranging from two to five days (Clute & Kobayashi, 2013). While the study found an overall increase in coping skills and feelings of connectedness, there was no significant differences in PTSD scales or long-term behavior. It is reasonable to assume that a longer-term evaluation period is needed to yield these changes. Finally, another study analyzed short-term play therapy grief groups (eight-week duration), which were found to significantly reduce grief symptomology in children aged seven through eleven (Tonkins & Lambert, 1996).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Group Play Therapy

Group play therapy is the primary format of therapy services at most bereavement centers and echoed in the literature (Bergman et al., 2017). In a grief group setting, play therapy is thought to provide a mix of engagement and avoidance, enabling children to better assimilate the processing of grief (Clute & Kobayashi, 2013). According to Ray (2011), the benefits of group play therapy include increased comfort and participation of the child, vicarious and induced catharsis, vicarious and direct learning, therapist observation of social interaction, social reality testing and limit setting, and positive social interactions (for a comprehensive review of group play therapy, see Sweeney, Baggerly, & Ray, 2014). The frequency of each group depends upon participant/facilitator ratios, type of death loss, and community needs. Ideally, bereavement clinics should have multiple programs based on types of loss and participants' age.

Screening and Selection

Group dynamics are driven by the participating members therefore, it is critical to screen potential group members (Corey, Corey, & Corey, 2018). Setting, theoretical orientation, group function and member demographic/population all impact the inclusion or exclusion of potential group members (Corey, et al., 2018; Sweeney, Baggerly, & Ray, 2014). In general, screening for children should include (a) the child's social ability to participate in a group, (b) the child's ability to maintain their safety and the safety of others, (c) recent hospitalizations and self-harming behaviors, and (d) amount of one-on-one attention required. Bereavement specific considerations include the type of death loss and the degree of trauma associated with the loss (Worden, 2009). Because traumatic losses are positively correlated with increased levels of anxiety and elevated symptoms of PTSD, children who have experienced a highly traumatizing loss, such as a loved one's death by homicide or suicide, are more likely to need 1:1 support. However, rather than automatically screening children out of the group process, consider lowering the facilitator to child ratio to support or adding additional facilitators to provide individual support as needed. If a child is screened out of the group process, the child should be referred for individual counseling within the clinic if possible until they are ready for the group process. Ray (2011) and Sweeney, et al., (2014) offer additional guidelines for screening play therapy groups.

Group Type

Because children bereaved by different death loss types have been found to grieve in different ways, the literature supports a division of grief types into separate groups (Worden, 1996; Worden, 2009). In a start-up bereavement clinic or small bereavement clinic in which participant numbers are low, consider dividing participants into two primary groups: sudden death/accident or terminal/chronic illness. The sudden/accidental death group includes car accidents, drowning, heart attacks, suicide, and homicide, while the terminal/chronic illness group includes death due to cancer, advanced age, and so on. This division is not ideal, however, as suicide and homicide grievers are shown to experience different grief trajectories that people grieving other types of sudden death; among these differences, people who have lost a loved one to suicide or homicide are at increased risk for complicated grief (Currier, Neimeyer, & Bergman, 2008). In larger bereavement centers with more funding and clinical support, a more specific division may include:

- Sudden/accidental death,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Death from a terminal or chronic illness,
- Death of an extended family member,
- Sibling loss,
- Death by suicide,
- Death by homicide (Wordon, 2009) and
- Military-related loss (Sories et al., 2015).

Age

Children benefit most from the group therapy process when they are placed with children of similar age (Sweeney, et al., 2014). This remains true for grieving children as their developmental understanding of death is dictated in part by their cognitive development (Crenshaw, 1995). According to Ray (2011), it is generally recognized to match children within one year of age. While this suggestion is the optimal choice, given the specialized nature of grief groups, clinics may need to expand the age range slightly. Therefore, it is useful to consider the overall match between the personalities and therapeutic needs of included children more so than chronological age (Ray, 2011).

Group Structure

While ample literature exists regarding adults in group therapy, there is very little research regarding group *play* therapy or clear suggestions for best managing the group process with children. Therapeutic groups with adults generally run for 60 to 90 minutes in length (Corey, et al., 2018), however, based on this author's clinical observations, groups longer than 45 minutes will likely fall outside the threshold of the developmentally appropriate attention span for children. Due to a lack of available literature of bereavement-based play groups, the following is a sample format based on the author's clinical observations, which should be adjusted based on the developmental age of the children, facilitator ratio, and theoretical orientation of the group:

- **30 minutes**: Pre-group with facilitators/clinical staff.
- **15-30 minutes:** Ice breaker and group process (depending on age).
- **15-30 minutes:** Non-directive play (depending on age).
- **15 minutes:** Group closing.
- **45 minutes:** Post-group process.

The described hypothetical structure allows for adequate supervision of counselors-in-training, therapeutic intervention, and group management. *Pre-group* includes facilitators and the clinical director with a discussion regarding known case changes, the theme of the group, and so forth. During the *group process*, children meet together for check-in, centering, and connection with a light discussion or overview of the group topic. *Non-directive play* immediately follows the group process. In non-directive play therapy groups, it is optimal to have a 1:2 or 1:3 ratio (Ray, 2011) of children to group facilitators. During this phase, children may float between rooms/modalities at their discretion. *Group closing* is meant to bring the group together, ground children in reality, and close the group session. Closing rituals are soothing for children; therefore, consider how the group may close in the same way each week. Finally, the *post-group process* is intended for group facilitators and the clinic director (who may or may not take part in the group facilitation process) to come together and process the group session. Not only

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

is this helpful for the clinic director to understand group members' progress; it is also a vital part of the supervisory process (discussed later).

Bereavement-Based Play Therapy Training and Supervision

Thus far, this chapter has provided a rationale for bereavement-based play therapy clinics, recommended toys and materials for setting up bereavement-based play therapy groups, and discussed options for therapeutic programs, however, the best-organized clinic is only as effective as its therapeutic staff. Facilitating play therapy groups is considered an advanced skill (Ray, 2011); therefore, facilitators should demonstrate solid play therapy knowledge before facilitating group therapy. Additionally, this author recommends facilitators have a basic understanding of the developmental aspects of grief, loss, and trauma. Finally, facilitators should also explore their personal grief histories, as well as strategies for self-care and burnout prevention.

Grief Training

Because the Council for Accreditation of Counseling and Related Programs (CACREP) does not explicitly require grief training as part of their standards (CACREP, 2016), it is reasonable to assume that not all counselor preparation programs require this material as part of standard coursework. Therefore, this author recommends that clinics address the following topics during training: 1) the history of grief counseling and grief counseling models, 2) circumstances of death, 3) developmental reactions to grief, and 4) personal grief histories. A working knowledge of these areas expands conceptualization capacity. In turn, this capacity may improve empathetic understanding and therapeutic presence, both of which are critical components of play therapy (Ray, 2004).

Grief Models

Although not play therapy specific, facilitators should possess a working knowledge of grief counseling fundamentals to include the evolution of grief through historical and cultural contexts, as well as grief recovery models. Elizabeth Kubler-Ross paved the way for grief therapists with her ground-breaking book, *On Death and Dying* (1969). While this book was seminal to the field of bereavement, linear multi-stage models such as the one described by Kubler-Ross have subsequently received criticism, as grief is generally not linear in its progression. In addition, early authors minimized the grief experience in children. In the last thirty years, clinicians have moved away from stage models of grief and toward task models (Worden, 1996; Worden, 2009), meaning-making models (Neimeyer, Burke, Mackay, & van Dyke Stringer, 2010; Wong, 2008), attachment models, and embodiment models (Turner, 2017). Worden (1996) provides an excellent foundation for understanding the developmental aspects of children's grief and conceptualizing the contextual components of systemic grief.

Circumstances of the Death

Grief reactions vary based on the circumstances surrounding the death; therefore, these circumstances should influence the topics addressed within the group process, as well as interventions applied. Bereavement resulting from a terminal or chronic illness creates contradictory feelings of relief and sad-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

ness, which may create minor levels of guilt. Generally, terminal and chronic illness death increase the opportunity for saying good-bye, whereas sudden deaths (e.g., accident, drowning, heart attack) often have a degree of suddenness and violence (Worden, 1996; Worden, 2009). Violent death losses (e.g., suicide, homicide) are shown to increase a child's risk for substance abuse, mental health problems, and physical health problems (Burke, Hellman, Scott, Weems, & Carrion, 2011; Mersky, Topitzes, & Reynolds, 2013). Children bereaved by suicide and homicide are also more likely to experience symptoms of complicated grief (Currier, Neimeyer, & Bergman, 2008; Kristensen, Weisaeth, & Heir, 2012). Prigerson et al. (1995) describe complicated grief as bereavement that is accompanied by elevated and persistent distress about death separation, impaired functioning, disbelief, and difficulty moving forward with life without the person who died. The bereavement experiences of children whose parents die by violent means (e.g., suicide or homicide) are distinctive in many ways, including increased feelings of rejection/abandonment, shame, and guilt (Worden, 2009); difficulty with attachment; difficulty with continuing bonds (Currier, Irish, Neimeyer, & Foster, 2015; Field & Filanosky, 2010; Hunt & Hertlein, 2015); and difficulty establishing trust in adult relationships.

Developmental Reactions to Grief

To effectively facilitate bereavement play, facilitators need an understanding of expected developmental behaviors associated with grief. While there is no standard trajectory for grief recovery, Piaget's theory of cognitive development (Piaget & Inhelder, 1969) is a useful guide for understanding children's ability to understand and process grief. Children two to seven years of age have a relatively small working concept of death. Cognitively, children at this stage are egocentric with minimal ability to think outside themselves. In a world governed by fantasy, children at this stage may create faulty beliefs regarding their ability to cause death. For example, a five-year-old may conceptualize the death of a loved one as a direct result of the child's negative behavior (Piaget & Inhelder, 1969). Children at this stage need simple, clear, consistent, and honest descriptions of death (Crenshaw, 1995). Children eight to eleven years of age generally have a working concept of death; however, their understanding may be based on television and video games, which inaccurately depict the permanence of death. Due to the concrete nature of cognitive processing among children in this age group, facilitators should expect children to ask specific, fact-driven, and often detailed questions about the process of death and dying. Such questions may create emotional surges for the facilitator; thus, it is critical that facilitators understand and have processed their personal grief histories.

Personal Grief Histories

Therapists who are self-aware are thought to have increased empathetic understanding, unconditional positive regard, and congruence (Ray, 2011). While training facilitators does not require deep emotional processing of grief experiences, which is more in line with personal therapy, facilitators should demonstrate emotional awareness regarding their loss history, as well as an ability to explore their grief without emotional or physical dysregulation. In essence, the more self-aware facilitators are, the more likely they are to effectively support the therapeutic relationship. This author recommends engaging trainees in an experiential grief activity, such as creating a grief timeline, in order to explore their personal grief histories and beliefs about death, dying, and the afterlife. Children notoriously ask questions like, "What happens after you die?" and "is Heaven real?" Self-understanding of personal beliefs increases

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the likelihood student facilitators will remain present and genuine in the therapeutic relationship during these difficult moments (Blanco, Muro, & Stickley, 2014).

Bereavement-Based Play Therapy Training

As previously mentioned, it is recommended that facilitators have basic play therapy training before facilitating bereavement-based play therapy groups. While foundational play therapy skills are critical for practice, this section focuses on advanced play therapy skills as they relate to bereavement-based play therapy: conceptualization, enlarging meaning, identifying play themes, and connecting with children (Ray, 2004).

Conceptualization of the Whole Child

The death of a loved one, particularly a parent, has far-reaching impacts. In addition to bereavement, the child is likely to experience a cascade of losses including potential changes in residence, changes in economic status, separation of parents, change of school, loss of friends, and so forth (Worden, 1996). Focusing solely on the death loss does not meet the needs of the whole child. Supervisors are encouraged to ask supervisees questions which facilitate conceptualization of the whole child. The following questions facilitate the whole child conceptualization.

- "What else has changed in the child's life?"
- "What somatic complaints or behavioral issues have occurred since the death?"
- "Is the child depressed?"
- "What did the child lose when they lost (the person who died)?".

Thorough case conceptualization drives effective treatment strategies and plans; in the context of play therapy, it also facilitates identifying play themes and enlarging meaning.

Enlarging Meaning

Enlarging meaning occurs across theoretical orientations and is intended to facilitate understanding and insight of the child (Landreth 2012; Kottman & Meany-Walen, 2018). Enlarging meaning occurs through identifying and verbalizing patterns in play or verbalizing play themes which are foundational to the presenting issue. Play therapists may enlarge meaning, or increase awareness of emotions, core beliefs, values, meaning, relationships, or other theoretically-based concepts, through well-timed facilitative responses. While enlarging meaning increases a child's insight, poor timing may disrupt the therapeutic relationship (Ray, 2004) or give the child an impression that the therapist is not attuned or "listening" (Badenoch, 2008). Determining what content to bring to the child's awareness can be a challenge, as competing theoretical orientations offer different stances on directive versus non-directive application of play (Yasenik & Gardner, 2012). Since literature does not support a specific theoretical application, the Play Therapy Dimensions Model (PTDM) by Yasenik and Gardner (2012) may serve as a useful guide for facilitators and supervisors. In the PTDM model, there are two dimensions, consciousness and directiveness, that drive degree and type of responding, therapist participation, and open discussion and exploration.

Identifying Play Themes

Play themes help conceptually identify the child's communication during a play therapy session. According to Ray (2011), very little literature is available regarding identifying play themes; however, they remain central to client conceptualization and tracking play therapy progress. Ray encourages play therapists to demonstrate solid play therapy skills and self-awareness before interpreting play themes to avoid potential disruptions in the therapeutic relationship. Therefore, play theme identification should occur under the context of supervision. This author recommends focusing on this aspect of training during *post-group*.

While numerous play themes exist, the most commonly identified are a) protection, b) relationship, c) mastery, d) nurturing, e) grief/loss/abandonment, f) helpless/inadequate, g) power and control, h) aggressive, and i) safety and security (Ray, 2004). As expected, grief and loss are prominent themes in bereavement play; however, in this author's clinical observations, bereavement play is subject to producing all play themes at various points in the healing process (for an extensive review, see Ray, 2011). Grief is associated with many primary and secondary losses (Worden, 2009) and reducing the child's pain to the experience to death loss, discredits the child's whole experience and may limit their opportunity for growth.

Connecting With Children

Connecting with children means being fully present (Kestly, 2016) and bearing witness to the stories they tell (Weber & Haen, 2005). The use of non-directive play therapy and expressive therapy interventions with bereaved children is underscored in the literature for several reasons. Primarily, demonstrating therapeutic presence or a "be with" attitude (Landreth, 2012) means the connection is valued over performance or therapeutic progress. Despite theoretical orientation, a warm and genuine therapeutic relationship is regarded as central for progress to occur (Blanco et al., 2014; Landreth, 2012; Kottman & Meany-Walen, 2018; Yasenik & Gardner, 2012). In a group setting, "being with" instead of "doing" may mean giving children opportunities to experience joy in a social context again without needing to worry about others. Specifically, for grieving children, the group process may be one of few venues in which the child is viewed independently from their grief. This author does not encourage facilitators to force children to name the deceased loved one. Group experts emphasize 'passing' and silence are a natural part of the initial group stages and necessary to build trust within the therapeutic relationship and the group (Corey et al., 2017); grieving children deserve the same regard. When the therapist is attuned to the needs of the child, rapport and relational connection still occur (Badenoch, 2008).

Supervision of Student Facilitators

Empirical research supporting the effectiveness of play therapy is steadily growing; however, there remains a dearth of literature regarding the process and practice of play therapy supervision. In a review of the literature, Donald, Culbreth, and Carter (2015) found that parallel to the child-therapist relationship, most current approaches to play therapy supervision focus on the relationship as the cornerstone for growth. In addition, exploring the person of the therapist is of equal importance to learning play therapy specific skills to enforce the importance of self and genuineness in the therapeutic relationship, especially in the early phases. Furthermore, VanderGast and Hinkle (2015), found a key aspect of supervisory satisfaction is working with a supervisor who has a clear identity as a play therapist and fosters a play therapy

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

identity in others. Therefore, it is crucial for play therapy supervisors to create a safe space for empathy and unconditional positive regard (Donald, et al., 2015; Ray, 2011)

To achieve this goal, a combination of individual, group, and live supervision provide varied opportunities for facilitators to learn through direct mentorship and peer support. Individual supervision is necessary to focus on individual student progress, however, live, and post-group supervision serves multiple purposes. First, observation of the overall group process keeps the clinic director alert to the clinical activity of individual children. Second, post-group supervision that occurs immediately after the group session which allows the student facilitator to reflect on the child's progress, their performance and conceptualize the child at a deeper level. The immediacy of live/post-group supervision drives the effectiveness of the feedback and learning (Thanasiu, Rust, & Walter, 2018). To increase skills and growth, a play therapy skills checklist (for sample checklists, see, Ray, Purswell, Haas, & Aldrete, 2017) and peer-rating feedback (Swank, 2018) are helpful additions to the play therapy supervision process.

Supervision Content Areas

Content areas such as client progress, theoretical application, therapeutic interventions, and ethics are standard components of supervision (for an extensive review, see Bernard & Goodyear, 2018 or Drewes & Mullen 2008). However, supervision in bereavement-based play therapy clinics requires additional focus. The following areas are the most consistent areas of supervision content in the author's clinical observations.

Countertransference

According to Elliot (2016), countertransference with child clients is a larger ethical issue than of confidentiality. Countertransference may be related to maternal or paternal instincts, feelings toward the caregiver, or the supervisees lack of self-awareness. While there is a lack of research regarding countertransference with childhood grief, this author has observed supervisees experience discomfort with death-related content, have emotional reactions to a death story, or attempt to shield their child clients from pain. One way in which it may occur is via redirection or minimization of play themes related to specific death-related content. For example, if a child experiences an emotional reaction during a medical reenactment play (for instance, as the child attempts to perform CPR on a doll), a facilitator may point that child to another play area rather than tracking and reflecting. Indications that a supervisee may be experiencing countertransference during a session include being unable to recall session events (disassociation), feeling emotionally overwhelmed during the retelling of the session events (personalization), over-focusing on one client, avoiding a particular child/situation, or becoming angry at a caregiver. Supervisory questions such as "What about this case is hard?" or pointed observations such as "I notice you do not like to talk about this case" or "It seems your grief is clouding your view" can facilitate self-awareness for the supervisee.

Self-Care

Holding space and maintaining a therapeutic presence for children with grief and trauma has all-encompassing impacts. Burnout impacts emotional, physical, cognitive, relational, and spiritual wellness which in turn impair therapists' empathy and judgment. While all therapists are at risk for developing

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

burnout and impairment, the risk increases when a significant portion of client present with trauma and crisis (Iqbal, 2015; MacKay, 2017). For these reasons, recent literature suggests, self-care is vital to trauma training programs (Iqbal, 2015; MacKay, 2017). Working with children may be especially taxing due to the degree of presence, attunement, and attachment required for effective play therapy (Meany-Walen et al., 2018). At the time of this writing, only one research study has explored the self-care of play therapists. Participants in this study overwhelmingly reported that wellness and self-care were not sufficiently addressed in their graduate programs (Meany-Walen et al., 2018). Supervisors can thus assume that student supervisees have a limited understanding of wellness, methods for assessing wellness and burnout, and ways to maintain self-care over the long term. Based on this data, supervisors have an ethical obligation to explore self-care and wellness strategies with their supervisees on an ongoing basis.

Termination

Endings and goodbyes are painful, particularly for children with death or abandonment histories (Worden, 1996). If parents are absent or unavailable due to their grief, children may crave attuned connection. In these cases, it is not uncommon for children to develop deep attachments with facilitators. Given the high degree of attachment that can characterize the therapeutic relationship, ongoing discussions of termination are warranted to prevent the child from perceiving the termination of that relationship as another painful loss (Gil & Crenshaw, 2015). Planned terminations which therapeutically processed may provide a corrective experience for children in need of healthy good-byes (Garcia, 2012). Two parties may terminate the therapeutic relationship: child/family and facilitators. Caregiver psychoeducation regarding attachment and good-byes may reduce the number of premature terminations but avoiding all premature termination is unavoidable. However, regarding facilitators, it is vital that clinical staff set clear expectations of facilitators and plan therapeutic programs that align with the natural ebb and flow of facilitator seasons, such as an academic semester.

CONCLUSION

Grief is an unfortunate experience for many children, which can have significant long-term impacts (Worden, 2009). Fortunately, bereavement-based groups have many demonstrated positive impacts (Bergman et al., 2017; Tonkins & Lambert, 1996). During their time of confusion and sorrow, children positively respond to the support and normalization bereavement groups provide (Siddaway et al., 2015), and because play therapy is empirically supported for children, it is a natural match for the complex emotional needs of grieving children (Creshaw, 1995; Webb, 2003). By developing a play-based bereavement clinic, grieving children receive a place to therapeutically engage in developmentally appropriate methods of healing in connection with other grieving children. However, building a successful bereavement-based play clinic requires more than stocking therapeutic toys. The development of a successful bereavement-based play therapy clinic requires clear vision, funding support, an understanding of the community's needs, and a willingness to engage with community partners. Most importantly, a successful clinic must provide thorough grief and play therapy training and supervision. Building a bereavement-based play therapy clinic can have long-lasting impacts that shape children and families for generations. While this vision may seem daunting, it is entirely possible to realize it with a clearly defined organizational model, well-trained clinical staff, and above all, a shared commitment to the therapeutic effects of play.

KEY TERMS AND DEFINITIONS

Bereavement: Bereavement is a period of mourning which occurs after any type of death loss, influenced by cultural and religious norms.

Group Play Therapy: Two or more children engaging in therapeutic play therapy.

Play Themes: Patterns of play which aid the therapist in conceptualizing play communication.

Play Therapy Supervision: The process in which a skilled and experienced play therapy practitioner develops, mentors, and monitors a supervisee's play therapy practice.

Self-Care: The intentional practice of supporting emotional, physical, and spiritual health to promote counselor wellness.

Support Groups: A support group is a group of individuals who come together to process their common experiences which may or may not be led by a licensed professional.

Termination: The ending phase of therapy.

Chapter 75
Pre-Marital Counselling and Sustainability of Marriages in Contemporary Ghanaian Society

ABSTRACT

Marriages in Ghana are usually preceded by counseling. It is believed that premarital counseling helps to sustain marriages because it gives couples the initial skills needed to enable them to start their marriage and solve minor problems that may be encountered in the relationship. This study was aimed at assessing the significance of premarital counseling to the sustenance of marriage. The study adopted a mixed methodological approach in gathering the data. Data was gathered from 112 individuals from three different suburbs of the capital city of Ghana. The results showed that although pre-marital counseling was observed to be important for would-be couples, it does not help sustain all marriages. Married couples that were given pre-marital counseling were getting separated as well as those who never had pre-marital counseling. It is therefore recommended that although premarital counseling may be necessary, it is not sufficient to sustain marriages. Therefore, counseling should continue even after marriage.

INTRODUCTION

Pre-marital counseling is always aimed at preparing would-be couples to begin a good and healthy relationship that leads to marriage (Stahmann & Hiebert, 1997; Myrick, Green & Crenshaw, 2014). It is a form of training that according to Harway (2005) equips couples with the necessary skills needed by couples to advance in their relationships. Doria, Kennedy, Strathie, & Strathie, (2014) have argued that if family lives and relationships would improve, then institutions must highlight and intensify their coun-

seling interventions and activities. Although pre-marital counseling is aimed at ensuring that individuals relationship are enhanced, it also help to prevent problems associated with courtship or marriage and any problems that could lead to conflicts in the relationship or divorce, but could also enhance relationship quality (Stanley, Amato, Johnson, & Markman, 2006 as cited in Carlson, Daire, Munyon & Young, 2012). It is however argued that some religious groups and organizations go beyond just organizing marriage ceremonies for would-be couples and organize pre-marital counseling sessions for individuals who desire to marry. Although some critics argue that people consider pre-marital counseling as a preparatory tool that could help reduce the number of cases of divorce there seems to be no empirical evidence to substantiate the argument that it reduces the number of divorce cases (Stahmann & Hiebert, 1997; Carlson et al., 2012). A reasonable number of couples do engage in pre-marital counseling to enable them to have a better understanding and foundation knowledge needed in married life (Goerz & Goerz, 1999). Yet some couples continue to have problems in their marriages while marriages continue to collapse.

THEORETICAL FRAMEWORK

To help counselors provide support for would-be couples, some theoretical models have been developed. In the 1950s, Person-Centred theory was developed in the USA as a counseling theory which roots could be traced from the humanistic psychology, views individuals as being capable and having the potential of solving their own problems (Seligman, 2006). The ability of counselees as individuals who have an understanding of themselves and the problem they face. However, a major contributor of Person-Centred theory Carl Rogers emphasized that a counselor and the quality of the relationship that exists between the counselor and counselee will determine how successful the counseling process will be (Corey, 2005). According to Carl Rogers, there were six conditions for change to occur in the counseling process. They include; psychological contact between two persons; incongruence marked by vulnerability and anxiety on the part of the client; congruence and integration on the part of the therapist; unconditional positive regard on the part of the therapist towards the client; the counsellor's experience of empathy of the client's internal frame of reference and endeavouring this awareness to the client and the achievement even if it is minimal, of both the therapist' unconditional positive regard and empathetic understanding of the client.

Techniques appropriate for this type of therapy include listening, accepting, understanding and sharing. One major technique used by Person-Centred therapists is to create an atmosphere that facilitates the development of self-awareness and self-esteem. Person-centered approach theory assumes that every individual has the tendency to work towards self-actualization (Seligman, 2006). Self-actualization is the tendency for every individual to develop his/her capacities. However, the genuineness on the part of the counselor is key to a successful therapy session (Rogers as cited in Corey, 2005). Allowing counselees to understand themselves and their problems is a way of helping would-be couples to develop the skills that will help them solve their problems in the future.

The solution-focused theory is another counseling theory that has been used over the years to address marital problems. It was introduced in the 1980s by Steve De Shazer and his colleagues at the Brief Family Therapy Center in Milwaukee (O'Conneli, 1998; Friedman & Lipchick, 1999). Solution-Focused theorists argue that every problem is unique and that both counselors and their clients generate ideas for solutions after a careful study of the problems. The theory seeks to guide couples to develop skills that will help solve problems in their marriages.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Solution-Focused theory indicates that it is practically impossible to know everything about an individual (Corey, 2005). Every individual is unique in its own way. The solution-focus theory focuses on how individuals construct meanings about their experiences, relationships and future plans. The focus is usually on the solution and not the problem. Solution-Focused counselors are interested in finding solutions to problems rather than how and why a problem started. Solution focussed theory helps clients to review how they look at things and review solutions which might not initially be evident (Watson, 2006). Solution-focused theorists believe that emphasis should not be placed on the problem or a full description of it to get a solution. Rather the counselor and the client should move forward to know what the problem will be like when solved. This approach can make counseling sessions brief because the emphasis is on the solution and not how the problem arose. According to Corey (2005), research has shown that this therapy has been successfully applied to dealing with problems associated with drug and alcohol abuse, poor communication in a relationship, and anger management, among others.

Solution-focused theorists argue that little changes can lead to bigger changes; nonetheless, the focus is on any little change that may be observed by the counselor. Change occurs when the client does something different and this change can take place at any time. This assumption can help would-be couples to develop strategies that will help them modify their ways to achieve their goal in marriage. Though it can be a very difficult task, Solution–Focused could be to help clients to redirect their thinking from Problem-Focused to Solution-Focused. Silliman and Schumm (1999) have argued that counselors can adopt Solution-Focused therapy to a wide range of topics that are often discussed during pre-marital counseling sessions such as proper communication in marriage and conflict resolution.

De Shazer et al. (1986) described the process of solution-focused counseling as a session that includes a definition of the problem, stating goals and finding solutions to the problem. In the second and subsequent sessions, there is no focus on the identified problem. Here, the client is helped to identify what he/she ameliorated the solution and what he/she wants to do continue. If there has been no improvement, the client is asked what he/she has been doing which may be working and amplifies them. If things are getting better the interval between sessions are lengthened to reduce the therapy process. At each session, assessment is made to ascertain the level of progress made.

There are several assumptions under solution-focused therapy. They include: beneficial changes take place when the focus is on successes; all problems have identifiable exceptions that are transformable into solutions; small changes cause a ripple effect that grows into larger changes; every client has what it takes to resolve his/her problem; client goals are viewed in positive rather than negative terms (Sklare, 2005). Bannink (2007) explained that during the second visit, the client is assessed on how he/she feels on a scale of say zero to 10 and he/she may have moved from one to four. The question is how he/she managed to reach four so quickly. The first meeting helped him/her to focus on where he/she wants to be. He /she is asked what will move him to five.

MARRIAGE AND PRE-MARITAL COUNSELING: A CONCEPTUAL FRAMEWORK

Marriage is a union between a man and a woman for the purpose of living together harmoniously and often have children. There are many reasons that contribute to individuals who enter into any relationship and such individual also have different beliefs and expectations about relationships and marriage (Johnson, 2011). A lot of people including married couples understand marriage in different ways, and this makes people's understanding of marriage subjective. The Longman Dictionary of Contemporary

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

English explains marriage as a union of a man and a woman by a ceremony in law. This legality is in agreement with Oyedepo's (2001) observation of marriage as a legally recognized union between a man and a woman in which they are united sexually, co-operate economically, and may give birth to, adopt or rear children. However, Mbiti (1977) has argued that marriage is not just a union of two individuals alone, but then it brings families, relations, and friends of spouses together. Marriage is when two individuals come together to learn and share power, put their finances together, manage them and share their intimate feelings (Napier, 2000). Therefore, when a man and woman pledge their love to each other and decide to live together as husband and wife legally, then the institution of marriage is said to have been established (Undiyaundeye, 2000). Dzobo (1975) also acknowledges marriage as a legal institution which is an acceptable and respectable mode of ensuring continuity of a family line.

The greatest desire of most adults is to be married (Marano, 2002). In an African society, for instance, women feel respected when they are married, so at a certain stage in life, a reasonable number of African women will do all they can to ensure that they settle down in a marriage and bear children. Johnson (2011, p. 23) has argued that individuals "with a strong sense of commitment will view marriage as a permanent state, be optimistic about the resolution of problems, and remain in the marriage not because they feel trapped, but because they are optimistic about the possibility of relationship renewal". Women who are unable to bear children after years of marriage are often mocked at by family members and friends. Njoroge (1996) asserts that a woman who is not able to bear children for the husband is often tormented by the extended family members and this could lead to stressful feeling or in some cases depression. Often times it ends as a tragedy and in most cases divorce.

Hansson and Laidmäe, (2014) observed in a study conducted in Estonia that although divorce rates continue to increase, many women consider divorce as a failure and as a result try as much as possible to avoid it. Some couples also find alternative ways to sustain their relationship to ensure their marriages do not collapse, however Johnson (2011, p. 28) has argued that some "individuals can enter into intimate relationships with a clearer idea of what they expect, and some awareness that their partner will not always be able to meet". Yet they expect their marriages to survive. Marriage is considered as a very important institution in societies, so there are laid down rules that govern it. Though the concept of marriage differs from society to society and culture to culture (Sarpong, 1974) in most cultures, sex before marriage is prohibited and in some cases, considered a taboo. This reinforces the debate of pre-marital counseling which according to some critics promotes sustainability of marriages.

Pre-marital counseling is a form of counseling used to prepare individuals for marriage. It is used as an aid to strengthen would-be couples' relationship, and also equip them with marriage skills to enable them to face any possible challenges in their marriage, especially in the early years of the relationship. It provides a couple with valuable information as well as ways to address important matters before problems develop. It gives would-be couples the opportunity to discuss issues such as how to communicate well in marriage, sexual intimacy, the role of husbands and wives among others. Pre-marital counseling helps would-be couples to acquire the needed skills that can help them resolve future conflicts in their marriage (Ambakederemo & Ganagan, 2006). It becomes a form of pre-service training skills for marriage.

For instance, Christians believe that pre-marital counseling is a partnership counseling with the Holy Spirit (Goerz & Goerz, 1999). It may involve problem-solving or crisis management counseling because like any other human institutions, no matter the preparation, there would be problems. So, such counseling sessions could help individuals to acquire some basic skills for their relationship. Senediak (1990) argued that pre-marital counseling is knowledge and skills-based training which aims at providing couples with information on ways to improve their relationship.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Pre-marital counseling is a marriage preparatory session that is made based on the assumption that if it is done it will help strengthen one's relationship and equips the individual to effectively handle future marriage challenges. Pre-marital counseling sessions are typically educational in nature, time-limited and content specific (Friesen & Friesen, 1989). However, some critics argue that it has some importance. According to Messina, Kolbert, Bundick, Crothers & Strano (2018, p. 4) it provides clients the opportunity "to develop self-awareness, exploring their thoughts, feelings, values, and goals, enables clients to make gains" in their relationship. Besides, it enables the clients to look 'beyond present difficulties to possibilities for ongoing growth and fulfillment (Southern & Cade, 2011, p. 252). It is geared towards using an awareness of problems that are likely to occur during marriage. Couples are able to have a better understanding of any potential problems which may occur during the marriage as well as providing couples with information and resources to effectively manage any problems that may arise. According to Stahmann & Hiebert (1997), pre-marital counseling is usually done to achieve specific goals, some of which include:

- **Understanding the different personality traits:** The couples involved are able to learn and understand each other's personality traits;
- **Clarification:** This is, partners realize and understand that each individual is unique;
- **Create better communication channels:** Couples are taught the importance of communication in marriage, ways of communicating with the opposite sex when in a relationship that is; what to communicate, how and when to communicate.

Some religious groups believe that building a strong foundation early in marriage can help avoid many of the problems that married couples face. Jordan, Russell, Afousi, Chemel, McVicker, Robertson and Winek (2014) have argued that, during premarital counseling, couples are encouraged to discuss their fears and expectations about marriage. The discussion with the marriage counselor also helps to eliminate fears and anxieties about marriage and gives them the opportunity to learn skills that will help them effectively deal with challenges in marriage. Doria, Kennedy, Strathie and Strathie (2014) noted that pre-marital counseling helps couples to pause, think and assess their relationship. It also helps them to identify loopholes in the relationships: those that are likely to affect their relationship negatively and address them appropriately before the knot is tied.

Gyekye (2003) observed that in some African societies, marriage is considered so important that as part of puberty rites young people are given some form of training to usher them into adulthood and in a future marriage. These young people are educated on topics such as living a good sexual life, marriage and family life that could make you a responsible adult. Traditionally, in Ghana, before two individuals get married, they are given some form of training which is also a form of counseling session that is given by mostly elderly women in the family to equip them with some basic skills that would enable them to survive in the marriage. Nunkunya (1999) pointed out that the Anglos of the Volta Region of Ghana have a traditional practice in which young ladies due to be married are kept indoors and are given some marriage skills training that will help them they marry. This is done when women are ripe for marriage. Traditionally, every Anglo girl who reaches puberty is made to go through a ceremony known as nudro - in which the girl is paraded through the village to demonstrate to the public that she is matured enough for marriage (Nunkunya, 1999). These girls are kept indoors and are taken through marriage skills training. Young men are also given training on the need to be responsible and industrious because a responsible young man has to send cattle and sheep to the young woman he wants to marry as a demonstration of

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

being a responsible man (Abochie, 1997; Nunkunya, 1999). However, Adei (1991) has observed that due to modernization, some families and communities have stopped taking their children through this training exercise.

Although marriage is one of the institutions found in almost every culture or society in the world, it is very disturbing to learn that it is one of the institutions confronted with a lot of challenges. In recent times divorce rates have hit records levels. The Finder (2014) reported that in Accra Metropolitan Assembly (AMA), (a local administration in the capital city, Accra) which has records of only customary marriages, between 2006 and 2013, 4,080 divorced cases were recorded. The paper reported that the data were not complete because while the AMA keeps records of customary marriages and divorce cases, the courts keep records of marriage by ordinance and divorces. Startling statistics from the Greater Accra Head Office of Legal Aid Ghana also indicates that at least 40% of marriages registered annually in the Greater Accra Region break up within fourteen months (Ghanaweb, 2011).

In the year 2010, Legal Aid Ghana received and referred about 125 marital cases to its legal office for amicable resolution. The report further explains that the number of females who apply for separation every week far outweighs that of their male counterparts. So, the questions that remain unanswered, are: is it really important for would-be couples to undergo pre-marital counseling? Does it mean that without pre-marital counseling marriages will not survive? Or do people seek pre-marital counseling with the hope of making their marriages work? Answers to these questions would enable the researchers to achieve the following objectives:

- To identify the contents of pre-marital Counseling;
- To examine the processes involved in pre-marital Counseling;
- To assess the importance of pre-marital Counseling and its relevance to marriages;
- Evaluate whether pre-marital Counseling could help sustain marriages.

A study to ascertain the relevance of pre-marital counseling in contemporary Ghanaian society, therefore, become very important. Whether individuals can sustain couples' marriages through pre-marital counseling remains an issue that this investigation very relevant.

METHODOLOGY

The study adopted two philosophical standpoints – positivists and social constructivists, while the study also followed the descriptive and exploratory research paradigms. The respondents were from different backgrounds and relationships, but most married couples, divorcees and those who had separated from their spouses were selected from three suburbs in the Greater Accra region. Greater Accra Region which is the capital city of Ghana was conveniently selected due to its cosmopolitan nature. The city has migrants from all the regions in the country. This region could, therefore, be said to be representative of Ghana. According to the last Population and Housing Census which took place in 2010, the population of this region is 1,665,086. The region is divided into 26 administrative districts. Three of these districts were randomly selected for the study. These three districts had a total population size of 411,377 (city population, 2019). One hundred and fifty individuals were conveniently sampled for the survey. Out of this number, 112 participated in the study. They were made up of 47 males and 65 females. In addition

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

to this, two married persons, two divorcees, one person going through pre-marital counseling, and three counselors from the three locations were interviewed.

The questionnaires were distributed on a Sunday since most people in Ghana do not work on Sundays and those may go to church may not go anywhere after church so would be available to participate in the data collection. Although the questionnaires were given to the respondents at the same time, the respondents were allowed to fill them in at their own convenience and without any researcher influence to ensure its reliability. This was done to enhance the dependability and consistency of the questionnaires (Neuman, 2011; Cohen, Manion & Morrison, 2011). The data obtained from the questionnaires were used in the quantitative analyses.

In addition to the questionnaires, some interviews were conducted for twelve (12) respondents. Two married persons, two divorcees, one person going through pre-marital counseling, and three counselors from the three locations agreed to be interviewed. The respondents were given the opportunity to withdraw if they felt uncomfortable to continue. All the interviews took place at a 'neutral' ground. The interviews were also recorded on an audio recorder in order not to miss any verbal information. Two research instruments namely questionnaire and interview schedule were employed. The questionnaires were distributed to the respondents to be filled by them. The questionnaires were edited, and all inconsistencies cleaned. The data was coded and put into an SPSS for analysis. Cross-tabulations were made and used in the results. The interview data were transcribed, coded and the common themes put together and analyzed.

RESULTS AND DISCUSSIONS

At the commencement of counseling, would-be couples are given a form each to fill individually. Answers to questions that bother on couple's reasons for getting married, ages of the couples, the number of children they desire to have, and parental concern among others are sought. A careful study of the responses to these questions shows that the independent filling of the forms may be informative and revealing enough for the counselees to be advised. The form seeks information on almost all relevant issues that would-be couples may have overlooked in their courtship. An interview with a counselor revealed that sometimes misunderstandings crop up after the filling and submission of the forms. He said:

When I go through the answers given by the counselees, I see that in some cases though they are planning to get married, they have very different objectives and opinions of marriage. For instance in the case of a couple that I handled recently, whiles the lady indicated that she desired to have four children, the man specified he wanted two children. In that instance I had to assist them to synchronise their positions.

A situation like this obviously underscores the importance of pre-marital counseling. Since the aim of pre-marital counseling is to help would-be couples to travel well in their marriage journey, so it is important for them to confront some of those potential challenges of marriage earlier and deal with them before the marriage journey starts.

However, to delve into the contents of pre-marital counseling respondents were asked to provide information on the major topics treated at pre-marital counseling sessions. Out of the numerous topics that are discussed during pre-marital counseling, the most common topics include; financial issues, communications, in-laws, attending different churches, conflict resolution, planning a family, phone

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and internet usage. The topic that featured prominently was communication (87%). Financial issues appear to have prominence as well with 80% of respondents indicating this topic was treated. Issues involving in-laws, conflict resolutions and family planning also received some attention as these topics were mentioned by two out of every three respondents who received pre-marital counseling. Internet users may not have come to the attention of the organizers of pre-marital counseling sessions, as just two percent of the respondents indicated that internet usage was discussed during pre-marital counseling. It appears as though temperament of partners and infidelity as topics are not discussed specifically. This may be part of the broad topic of communication. However, it is important for counseling sessions to include character traits and issues of infidelity as these are one of the major causes of divorce (Fan & Lui, 2004; Zare, 2011).

The respondents indicated that effective communication is key to the resolution of conflicts and other related problems identified in the study. Invariably, the way a person communicates is said to be a behavior cultivated from infancy. Nonetheless, the reaction of an individual in certain situations will determine how that person reacts to issues later on in life. If a person grew up in an environment where the parents argued constantly, then that person might become apprehensive in his/her communication, for fear it will become a heated argument. Individuals who have witnessed hot exchanges between parents may sometimes grow to become an argumentative adult who only knows how to argue, instead of learning how to communicate properly.

Conflicts in marriage could remain unresolved if there is ineffective communication in a relationship. Good communication includes giving each other undivided attention. The advantages of effective communication in marriage are enormous. Effective communication can help build family bonds that result in stress-free relationships and blissful marriages. Counselors must make couples aware that no problem is too small or too big to discuss in a friendlier environment. Would-be couples must be encouraged to keep the line of communication open in their relationship. An interview with a married woman from one of the suburbs confirmed that effective communications have helped sustain her marriage. She explained that:

As for me pre-marital counselling has helped me a lot. I have come to understand the importance of transparency in my marriage. I know everything about my husband and he knows everything about me too. There is no limit to the issues that we can take on in discussions, even sex.

Conflict resolution was listed as one of the topics that were stated as the most talked about topic. Would-be couples are taught how to resolve conflicts amicably during pre-marital counseling sessions. This is important because would-be couples who do not have the requisite knowledge and skills to effectively manage conflicts in marriage may have problems which could lead to bigger conflicts in their relationships. Antunes-Alves and De Stefano (2014) have observed that a very cordial and harmonious environment is a key to a stable relationship and it also reduces a lot of conflicts in the home. The Solution-Focused theory discussed in the theoretical framework section also provides a structure for exploring and utilizing counselees' existing resources like strength, and ideas. Counselors can encourage would-be couples to use their strengths and ideas to find solutions to conflicts that may occur in their marriages. Counselors may have to delve more into the lives of the counselees in order to help them identify and acknowledge their strengths as applied in Solution- Focused, theory to resolve conflicts. In order for this theory to be applicable, it is imperative for counselors to bring to the attention of counselees, the need

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

to focus on solutions to problems and not the problems. For instance, rather than complaining that there is no money, the emphasis should be on how to raise enough money for specific purposes.

There was a clear indication that matters concerning in-laws were discussed during pre-marital counseling, as 65% of respondents indicated that the role of in-laws in marriage was discussed during pre-marital counseling sessions. In Ghanaian society, in-laws play a major role in the stability of marriage. They act as watchdogs over the marriage; help in taking care of babies, particularly when couples are working parents (Kondor, 1993). In the past, parents selected spouses of their choice for their children. This may not be bad in itself as parents investigated and scrutinized the backgrounds of the would-be couples. However, there is also the perception that in-laws intermeddle with relationships and their issues can be very thorny.

The limitation to the approach of parents looking for suitable partners for their children is that the two may not be compatible. However, due to westernization, this phenomenon has reduced, so the grown adults rather choose their own partners they feel they can marry. As a result, a partner may not be the ideal choice of the in-laws, but the marriage ceremony would still be honored. This situation often creates conflict between couples and their in-laws. It is therefore important for would-be couples to know the roles of in-laws in marriages. Pre-marital counseling also teaches would-be couples how to maintain good relationships with in-laws. An interview with a married woman revealed that if not for pre-marital counseling she would have had serious problems with her mother-in-law and that would have generated conflict in her marriage. She said:

For me pre-marital counselling has helped me a great deal because I had problems with my in-laws right from the on-set of my marriage. I remember my counsellors told me that I should always remember that I would also be a mother in-law someday, so I should treat mine with all respect no matter what. That statement always rings a bell in my ears, and I can testify to the fact that it has helped me maintain good relationship with my mother in- law in particular.

The topics discussed during the counseling sessions are similar to the contents in other parts of the world. In a cross-sectional survey in Florida in the US on topics treated during premarital counseling for instance, the participants who were clergy from different Christian denominations ranked the topics treated at pre-marital counseling (Murray, 2006). There were 23 topics in all. Murray ranked the top five topics as follows:

1. Commitment to the marriage
2. Communication skills
3. Attitudes/beliefs towards marriage
4. Conflict resolution
5. The importance of spending time with one's partner

It became evident that it is mandatory for would-be couples to go through at least a number of weeks of pre-marital counseling. In some churches, some pre-marital counseling sessions could take up to twelve weeks. If it is a church setting then the counselor is required to report back to the congregation any evidence of the would-be couples' preparedness or otherwise. When the respondents were asked how long counseling sessions should last, 52% recommended twenty-four (24) weeks whiles 34% suggested 16 weeks. In addition, 14% suggested twelve (12) weeks. The duration for counseling, in itself,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

may not essentially be critical, but the content of the counseling and again the ability of the beneficiary to put into practice what they learn at the sessions. Both the married and the divorcees were of the view that pre-marital counseling should go beyond twelve weeks to ensure that all issues about marriage were discussed. Although this is not very likely to happen.

Family planning and intimacy in marriage were also mentioned by respondents as topics discussed during pre-marital counseling. It is therefore pertinent for counselors to invite experts to discuss the different birth control methods with would-be couples. There are several family planning clinics available in health facilities across the nation and counselors may do well to encourage couples to visit these facilities for professional advice and guidance.

Respondents were asked to indicate their views on the importance of pre-marital counselling and the results are presented in Table 1.

Table 1. Importance of pre-marital counselling

Importance of Pre-Marital Counselling	Strongly Agree (%)	Agree (%)	Indifferent (%)	Disagree (%)	Strongly Disagree (%)
Important	63	32	5	0	0
Waste of time	0	8	12	73	15
Sustaining marriage	33	58	4	5	0
Should be mandatory	12	37	11	28	12

Source: Fieldwork Data

None of the respondents disagreed or strongly disagreed to the importance of pre-marital counseling although a few of the respondents (8%) agreed that pre-marital counseling is a waste of time. Eighty-eight (88%) percent of the respondents either strongly disagreed or disagreed that pre-marital counseling is a waste of time. Pre-marital counseling, contributing to marriage sustainability, was either agreed or strongly agreed by 91% of the respondents and four percent of the respondents were indifferent. On the issue of whether or not pre-marital counseling should be mandatory or not, there was very little difference between those who agreed and those who did not agree. This is interesting as the majority asserted to its importance but did not recommend its enforcement.

The relationship between pre-marital counselling and current marital status is explored in Table 2.

Table 2. Pre-marital counselling and current marital status

Pre-Marital Counselling	Marital Status			Total
	Married	Separated	Divorced	
Respondents with pre-marital counselling	67%	44%	45%	54
Respondents without pre-marital counselling	33%	56%	55%	46
Total	100	100	100	100

Source: Fieldwork Data

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The results presented in Table 2 suggest a relationship between marital status and pre-marital counseling. Respondents who were married were more likely to have received pre-marital counseling than their separated or divorced counterparts. Table 2 shows that while 67% of the married respondents had received pre-marital counseling, only 44% and 45% of the separated and divorced respectively had received pre-marital counseling. Consequently, while about a third of the married did not receive pre-marital counseling, more than half of each of the respondents who were separated or divorced did not receive pre-marital counseling. This clearly suggests that pre-marital counseling may have led to marital stability.

Although some respondents stated that they did not undergo formal pre-marital counseling this may not necessarily mean they did not have an informal pre-marital briefing. This is similar to what Nukunya (1999) observed in his study in the Anlo traditional area, in which young women and men are kept in-doors and prepared into adulthood and into marriage. This is another form of pre-marital preparation which is done in some communities in Ghana. The relevance of pre-marital counseling to the sustainability of marriages cannot be overemphasized. Obviously, a good preparation before marriage can be crucial to a successful marriage.

CONCLUSION

Marriage is an institution that is very important in most societies. However, the decision to get married is an individual decision or through the influence of family members in some communities. Day-in and day-out people get married but to what extent are they prepared? Most conflicts in marriages come as a result of inadequate preparation of would-be couples. Would-be couples must know the dos and don'ts in marriage before going into it. Pre-marital counseling serves as a tool that assists would-be couples to have a better understanding of what is expected in marriage. Some people enter into marriage with wrong perceptions and unrealistic expectations but when they are confronted with reality, it becomes difficult to handle the situation and in often times leads to separation or divorce. Couples who receive pre-marital counseling may be able to handle such challenges.

Would-be couples may contract marriage when they are not prepared for family life. In this direction adequate preparation before the marriage could be significant as a mean to sustain the marriage. Pre-marital counseling is a tool used to prepare would-be couples for marriage. It is used to equip would-be couples to have a strong footing in life as a husband and wife. Pre-marital counseling is still relevant although some marriages have not been sustained in spite of going through pre-marital counseling. Although pre-marital counseling seems not to solve all marriage problems, it should not end after individuals get married but rather, it should be an on-going process in marriage. In other words, counseling should not be an event but a process because sometimes issues, as they are perceived, may be different from reality and such issues may be evolved in the relationship.

DECLARATION OF CONFLICT OF INTERESTS

Chapter 76
The Impacts of Reactive Aggression and Friendship Quality on Cyberbullying Behaviour:
An Advancement of Cyclic Process Model

ABSTRACT

With the advancement of communication tools, the incident of cyberbullying has become a social issue (Edwina, 2014). Anouk et al. (2014) have developed a Cyclic Process Model with the aims to examine the underlying mechanisms of cyberbullying behavior pertaining to the process how victims become cyberbullies. It examines the interplay between peer victimization, anger/frustration, exposure to antisocial media content and cyberbullying behaviour among the adolescents (Anouk et al., 2014). However, this model does not provide sufficient understanding to what extent the reactive aggression and friendship quality affect the transformation of cyberbullying behaviour from the stage of peer victimization. In addition, there are relatively few investigators who have examined the impacts of reactive aggression and friendship quality to cyberbullying behaviour. The purpose of this research would like to investigate the relationships among the peer victimization, anger/frustration, exposure to social media content, reactive aggression, friendship quality and cyberbullying behaviour. A quantitative research was conducted

among the addressed within the age group of 18 to 22 years old that have experienced certain extent of cyberbullying. A total of 520 questionnaires were distributed via judgmental sampling technique. The finding of this research concluded that peer victimization, anger/frustration, exposure to antisocial media content and reactive aggression are the key determinants of cyberbullying behavior. Two mediation effects were discovered in which exposure to antisocial media content mediates the relationship between anger/frustration and cyberbullying behavior as well as reactive aggression mediates the relationship between peer victimization and cyberbullying behavior. However, the study did not support the role of friendship quality in moderating the relationship between anger/frustration and cyberbullying behavior.

INTRODUCTION

In the 21st century, technology has changed the ways how the adolescents communicate with each other. According to Kowalski et al. (2008), majority of the adolescents view electronic communication tools as essential for their social interactions. With the advancement of technology, some adolescents conveyed their messages through electronic media to harm someone or others and this phenomenon is known as "cyberbullying" (Wang et al., 2012). The incident of cyberbullying has become a social issue because the misunderstanding of the underlying causes of cyberbullying behaviour may lead to the wrong development of prevention method to cope with the cyberbullying problem (Ikuko Aoyama et al., 2011). Furthermore, many college students have committed suicide because they get cyberbullied from other people and it causes individuals feel uncomfortable in the school environment (Edwina, 2014).

Cyberbullying behaviour is defined as an aggressive behaviour that having three characteristics, including repetitive, imbalance of power and intended to harm the targeted individual (Bauman, 2010). Victims of cyberbullying will reflect the feelings of sadness, unhappy, anxiety, worry, fear, and moody which may affect their lifestyle (Beran & Li, 2005). Based on the research done by Edwina (2014), the bullying behaviour normally occurs at the middle, and high school and even in the higher education in which it may lead individuals feel uncomfortable when studying in the school environment.

Anouk et al. (2014) have developed a Cyclic Process Model with the aims to examine the underlying mechanisms of cyberbullying behaviour pertaining to the process how victims become cyberbullies. The Cyclic Process Model examines the interplay between peer victimization, anger/frustration, exposure to antisocial media content and cyberbullying behaviour among the adolescents (Anouk et al., 2014). Anouk et al. (2014) argue that peer victimization has direct impact on both anger/frustration and cyberbullying behaviour among the adolescent victims. The anger/frustration felt by the adolescent victims can directly affect the cyberbullying behaviour and indirectly affect the cyberbullying behaviour via the exposure to the antisocial media content. However, this model does not provide sufficient understanding to what extent the reactive aggression and friendship quality affect the transformation of cyberbullying behaviour from the stage of peer victimization. In addition, there are relatively few investigators who have examined the impacts of reactive aggression and friendship quality to cyberbullying behaviour. Danielle et al. (2012) argue that the face-to-face bullying was related to reactive aggression and at the end led to cyberbullying behaviour. Victims may pursue reactive aggression if they interpret the intentions of a person like to exert aggression through gossip and rumour spreading of another as being hurtful and therefore they fall in anger and retaliate as they reacting to the perceived threat from another (Danielle et al., 2011). The study on the relationship between reactive aggression and cyberbullying behaviour is

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

becoming more critical as the adolescents are using the internet as their tools for demonstrating aggression toward others (Hinduja & Patchin, 2008; Pew Internet and American Life Project, 2010; Li, 2007; Ybarra & Mitchell, 2004). The study from Danielle et al. (2011) concludes that peer victimization is related to the reactive aggression and subsequently leads to the cyberbullying behaviour. The adolescents spend a lot of time with their friends or peers and the quality of close friendship has significant influence on their emotional well-being (Flanagan et al., 2008). The anger/frustration felt by the victim adolescents during peer victimization will be released when there have someone listens and cares for them (Kochenderfer-Ladd & Skinner, 2002; Naylor et al., 2001). Therefore, friendship quality in certain extent will moderate the relationship between the anger/frustration and cyberbullying behaviour. In due respect, the purpose of this research would like to investigate the relationships among the peer victimization, anger/frustration, exposure to social media content, reactive aggression, friendship quality and cyberbullying behaviour. The main research question in this research is "what are the factors that determining cyberbullying behaviour?"

LITERATURE REVIEW

Theoretical and Framework Background

Cyclic Processing Model

Anouk et al. (2014) have adopted a cyclic processing model approach to investigate the relationships among peer victimization, anger/frustration, exposure to antisocial media content and cyberbullying behaviour among the adolescents. This model is aimed to examine the underlying mechanisms of cyberbullying behaviour that pertaining to the process of how victims become cyberbullies (Fanti et al., 2012).

Crick & Grotpeter (1996) define peer victimization as the harassment that involving directly from perpetrator, face-to-face physical or intimidation and verbal aggression toward the target that taken places among peers at a school. Peer victimization can also be described as doing an action to harm others and victims suffering from the attacks being performed by bullies through either directly with physically and verbally aggression (Hanish & Guerra, 2000; Hawker & Boulton, 2000) or indirectly through a third party to having manipulative attack toward the victims (Mishna, 2003; Rigby, 1996). Some studies have indicated that the victims who experience from face-to-face bullying will become cyberbullies as they are in the desire for revenge to those who bullied them (Wright & Li, 2012; Varjas et al., 2010; Grigg, 2010; Ko¨nig et al., 2010) or by taking cyberbullying as their compensation in exchange for their feeling of unable to retaliate in the face-to-face bullying (Ybarra & Mitchell, 2004; Smith et al., 2008). Therefore, various studies have shown that there is a relationship between being a victim of peer bullying and being a cyberbully (Ybarra & Mitchell, 2004; Smith et al., 2008).

General Strain Theory

Peer victimization experiences negative emotion that related to the feelings of anger (Ortega et al., 2009; Patchin & Hinduja, 2006; Beran & Li, 2007; Didden et al., 2009). Adolescents who experience the emotion of anger may turn to involve themselves into cyberbullying and this kind of relationship could be explained by the General Strain Theory (Patchin & Hinduja, 2010). According to the General

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Strain Theory, individuals who experience in strain, and as a result of that strain in a situation that make them feel angry or frustrated, they are more likely to engage in criminal or deviant behaviour such as cyberbullying (Agnew & Helena, 1992; Agnew, 2011). Therefore, General Strain Theory provides a solid foundation to elaborate the relationship between victimization and emotion of anger (Agnew & Helena, 1992). In conclusion, those highly victim-sensitive individuals would be particularly motivated to avenge the prior victimization (Gollwitzer & Denzler, 2009; Gollwitzer et al., 2011).

General Aggression Model and Social Cognitive Theory

The relationship between the exposure to antisocial media content and cyberbullying behaviour can be best described by the General Aggression Model and the Social Cognitive Theory (Bandura et al., 1963; Bandura, 2001). For the General Aggression Model, Hill (1960) and Mowrer (1960) claim that the occurrence of vicarious learning phenomena is contingent on the administration to the performing model and therefore reinforcing stimuli which the observer presumably experiences as vicarious reinforcements or imitative behaviour from television (Bandura et al., 1963) as well as social media content (Anouk et al., 2014). Whereas, Social Cognitive Theory argues that the psychosocial functioning will be depended on the triadic reciprocal causation: behavioural determinants, personal determinants and environmental determinants (Bandura, 1963; Bandura, 2001; Bandura, 2001b). According to Bandura (2001, p. 266), these three determinants are influenced by personal factors in the form of cognitive, behavioural patterns, biological events, affective and environmental events; and all these factors will interact with the three determinants reciprocally (Bandura, 2001, p. 266). Therefore, Bandura (2001) claims that media in the social network and community setting will influence individuals by providing natural incentives and continuous personalized guidance for the desired change (Bandura, 2001).

Downward Spiral Model

Downward Spiral Model can be used to illustrate the issue that in related to the violent media content (Slater et al., 2003). Slater et al. (2003) claim that the aggressiveness among adolescents leads to a higher attractiveness to the violent media content. Conversely, the exposure to such violent content will reinforce their aggressiveness and indicating a downward spiral of negativity (Slater et al., 2013). Therefore, the exposure of youth to media violence will lead to the increasing in their aggressiveness (Anderson & Bushman, 2002). By exposing to the antisocial media content (such as rough language, substance abuse, gossiping, and risky behaviour) (Brown & Witherspoon, 2002), it will reinforce the adolescents to perform cyberbullying behaviour (Vandebosch & Van Cleemput, 2009; Walave & Heirman, 2011; Livingston et al., 2011).

Cyberbullying Behaviour

A bullying is an unwanted aggressive behaviour in the real world that will happen repeatedly against a victim. The cyberbullying materials such as e-mail, text, comment, pictures or video can be viewed or observed repeatedly by anyone who can access and that materials can also be published by the perpetrator (Campbell, 2005; Slonje & Smith, 2008). It can be related to "observed or perceived" power imbalance, physical cues such as hitting and kicking, verbal cues such as teasing and threatening and relational cues such as rumour spreading and exclusion (Gladden et al., 2014). Moreover, types of the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

bullying may include negative actions such as physical, verbal, and indirect aggression that which form the traditional bullying (Roberto, 1999). In short, cyberbullied may receive nasty text messages, photos or video of violent scenes, silent or prank phone calls, or nasty or rude e-mails, humiliate on Web pages or web sites, insults in instant messaging, insults in chatrooms, disagreeable pictures or photos on Web sites from the cyberbullying (Dowell et al., 2009).

The problem of cyberbullying is rampant among the young people or adolescents of whom often utilize websites, instant messaging, access video, e-mails, chat rooms, social networking sites, and sending text messaging (Boyd, 2008; Bryant et al., 2006; Palfrey & Gasser, 2008). Majority of the adolescents view electronic communication tools as the essential for their social interactions (Kowalski et al., 2008). According to Willard (2006), seven methods of violent acts in the cyberbullying have been identified, including irritation, harassment, cyberstalking, denigration, masquerading, trickery, and exclusion. Adolescents who experience being bullied online are more likely to skip schools, avoid public places, possess high degree of detentions or suspensions, and carry arms to protect himself (Ybarra et al., 2007). Victims will reflect their feelings of sadness, anxiety, worry, sorrow and fear; and exhibit inability to concentrate in the study that may affect their academic grades (Beran & Li, 2005).

Peer Victimization, Anger/Frustration and Cyberbullying Behaviour

Peer victimization can be defined as victimization occurs repeatedly and aggressively when an adolescent is the targeted person from bullies as an inequality of power such as social, physical or perceived abilities of the victim involved, and there is an intention from bullies to cause any harm to the victim (Hazler et al., 1996). Furthermore, peer victimization is a kind of harassment that involving direct confrontational (i.e. an individual threatens to stop being friends with the victims unless they do what the aggressor wants them to do) (Crick & Grotpeter, 1996) or suffering attacks by bullies either direct with physically attack or verbally attack via name-calling (Hanish & Guerra, 2000; Hawker & Boulton, 2000) or manipulative attack that bullies through a third party to attack indirectly (Mishna, 2003; Rigby, 1996).

Research shows that most of the victims share similar characteristics in the bullying environment. The characteristics include the willingness to give anything that wanted by bullies, to express their outward stress and distress, their unwillingness to retaliate, low self-esteem, low social adjustment, the victims are too soft, and cultural victimization (Jordan & Austin, 2012; Cénat et al., 2014; Garaigordobil et al., 2013; Suresh & Tipandjan, 2012; Cook et al., 2010; Olweus, 1999; Monks et al., 2008).

Rudolph et al. (2009) argue that the victims of violence would become aggressive to cyberbullying as the experiences of peer victimization could undermine the development of effective emotion management. In addition, some of the research discover that most of the cyberbullies were also cyber victims, and there is almost half of the cyberbullies reported that they have been victims of traditional bullying before they have intended to be cyberbullies (Ybarra & Mitchell, 2004). Therefore, Anouk et al. (2014) conclude that there is a positive significant relationship between peer victimization and cyberbullying. Anouk et al. (2014) also assert that there is a positive significant relationship between peer victimization and anger/frustration. In due respect, two hypotheses were developed as follows:

H_4: Peer victimization is positively related to the anger/frustration.
H_5: Peer victimization is positively related to the cyberbullying behaviour.

Antisocial Media Content and Cyberbullying Behaviour

Media always plays an important role in the adolescent developmental process (Konijn et al., 2007). Most of the adolescents are heavy users of electronic media and social media (Rideout et al., 2010). Antisocial media content will influence the cyberbullying behaviour, belief and attitudes of adolescents in negative way (Konijin et al., 2007). Huesmann and Malamuth (1986), Josephson (1987) and Pearl (1987) also assert that viewing violent television programs will increase the aggressive behaviour among some children. When the adolescents angry, they will use violent media to lower their angriness (Flammer & Schaffner, 2003; Olson et al., 2007; Olson et al., 2008). According to Lee et al. (2004), some research show that increasing the exposure to violent media is related to the face-to-face bullying, while it is amplified by feelings of the anger. In addition, Lee and Kim (2004) as well as Knutsche (2004) also report that increasing the exposure to violent media is related to peer bullying which is amplified by feeling of anger.

In conclusion, most victims of the electronic bullying felt that the bullying negatively affected them, making them feel sad, hopeless and depressed (Raskauskas & Stoltz, 2007). The antisocial media content currently also seems to be highly popular among adolescents (Strasburger, 2009; Strasburger et al., 2010) in which the popularity may coincide with their increased need for deviant behaviour and turn to being cyberbullies due to their developmental stage and search for an independent identity (Arnett, 1992).

H_1: Anger/Frustration is positively related to the cyberbullying behaviour.
H_2: Exposure to antisocial media content is positively related to the cyberbullying behaviour.
H_3: Anger/Frustration is positively related to the exposure to antisocial media content.
H_8: Exposure to antisocial media content mediates the relationship between anger/frustration and cyberbullying behaviour.

Reactive Aggression, Peer Victimization and Cyberbullying Behaviour

The meaning of reactive aggression is a mix of hostile, impulsive, and angry responses that function as retaliation to real or perceived threat, frustration, or provocation (Rebecca et al., 2014). A person who bullies the other person can be viewed as reactive -- it's a defense reaction to perceived threat that come together with anger (Price & Dodge, 1989). Some cyber-perpetration may be reactive in which adolescents "defend" themselves in the face of victimization (Kathryn et al., 2012). Besides, Fite et al. (2008) claim that reactive aggression is a defensive-driven and it is the result of others' behaviour, particularly if those behaviour are perceived as threatening or being recognized as deliberate. In addition, reactive aggression perhaps is a form of physical or verbal retaliation such as pushing or shouting toward an aggressor or bully (Burton et al., 2013). In a typical development, both bullies and victims are known for their high degree level of anger (Kochenderfer-Ladd, 2004; Mahady Wilton, 2000), but this anger may be generated from different underlying factors such as the desire for dominance in bullies and an attempt to defend themselves in victims (Carolien et al., 2012). Moreover, anger in bullies and victims alike may stem from a tendency towards reactive aggression that being reflected in the victim's behaviour with the intention to protect themselves (Camodeca et al., 2002; Salmivalli & Nieminen, 2002).

Anouk et al. (2014) and Carolien (2012) state that adolescents will experience anger or frustration when they get to be bullied face-to-face by other people and they are more at risk of engaging themselves in cyberbullying behaviour. Beside anger, victims are also represented by other negative feelings such

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

as distress, worry and sadness (Camodeca & Goossens, 2005; Fleming & Jacobsen, 2009; Hawker & Boulton, 2000). It is important to note that cyber site is the place that allows adolescents to release their anger from physical bullied and hence they release their anger by cyberbullying other people through online (Rebecca et al., 2014). In other words, victims that being involved in the face-to-face bully, they will likely to protect themselves via reactive aggression, and hence they will start bully other people through online so that they can defend themselves in the victimization (Agnes, 2012).

Based on the above arguments, it can be hypothesized that the reactive aggression is a mediator between peer victimization and cyberbullying. As part of the defending behaviour from the victimization process, reactive aggression will accelerate the peer victimization towards a cyberbullying behaviour. Rebecca (2014) concludes that reactive aggression is significantly correlated with cyberbullying. The following hypotheses were developed:

H_6: Peer victimization is positively related to reactive aggression.
H_7: Reactive aggression is positively related to the cyberbullying behaviour.
H_9: Reactive aggression mediates the relationship between peer victimization and cyberbullying behaviour.

Friendship Quality, Peer Victimization and Cyberbullying Behaviour

Flanagan et al. (2008) argue that adolescents spend a lot of time with their peers and the quality of close friendship is associated with emotional well-being. In other words, the emotional well-being or feeling of adolescents will be influenced by the quality of close friendship. The bullying victims use various coping strategies such as getting the social support from their friends (Naylor et al., 2001). The victims will feel more accepted and empowered to overcome the challenges when expressing their painful experiences to someone who listens and cares (Kochenderfer-Ladd & Skinner, 2002; Naylor et al., 2001). This argument is supported by Greca & Harrison (2005, p.58) and they claim that "it is possible that the qualities of best friendships (support, disclosure) may actually reinforce depressive feelings for some adolescents, if the adolescents discuss [...] and focus on negative feelings". Woods et al. (2009) argue that the victims of traditional bullying may turn to a friend who is not a member of bullying network to receive support and help.

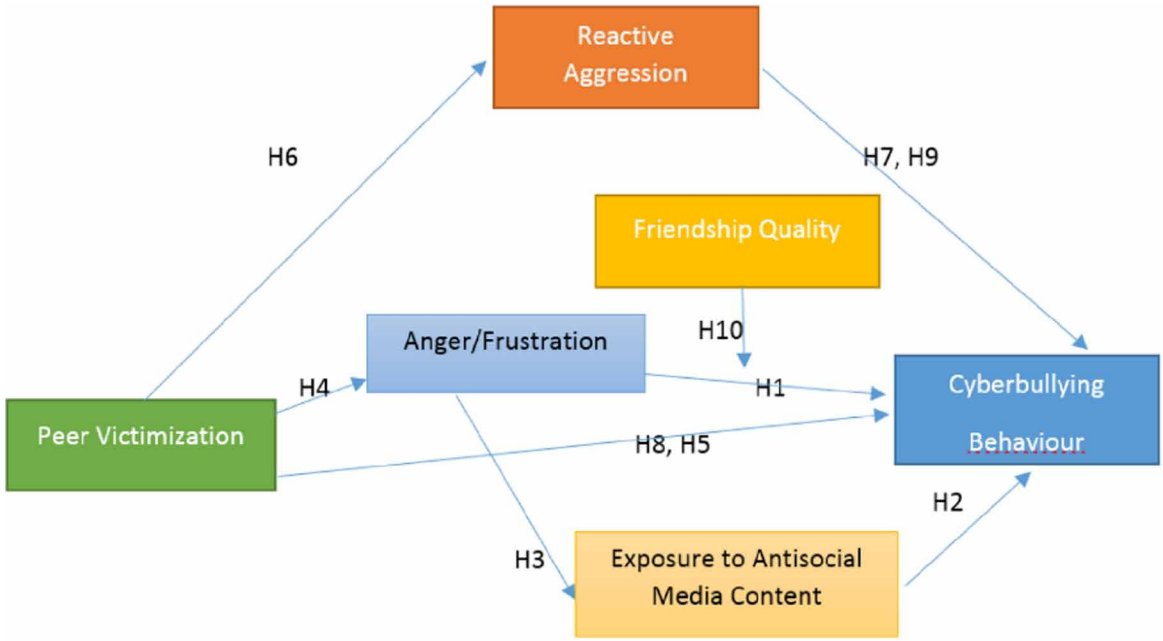
According to Ikuko Aoyama et al. (2011), the friendship quality serves as moderator between the negative effects of cyberbullying on the psychological states of students. Although the effect size of the moderating effect is small, friendship quality appears to influence self-esteem among victimized youth (Ikuko Aoyama et al., 2011). Among the victims with low self-esteem, a better friendship quality can work as a buffer to minimize the negative effects on the psychological states of students (Ikuko Aoyama et al., 2011). Therefore, a good friendship quality can moderate the relationship between anger/frustration and cyberbullying behaviour. The following hypothesis is developed:

H_{10}: Friendship quality moderates the relationship between anger/frustration and cyberbullying behaviour.

Based on the above literature review, a proposed conceptual framework was presented in Figure 1

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The proposed conceptual framework



METHODOLOGY

Research Design

This research adopted quantitative research design to evaluate the hypothesized relationships because the quantitative research design involved the quantification of data to aid the relationship between the variables (Bryman & Bell, 2011). In this research, primary data would be collected via cross-sectional study.

Measures

The questionnaire was divided into two sections. The first section of the questionnaire was dealing with the measurement scales that used to measure the respective constructs that appeared in the conceptual model. Whereas, the demographic profiles of the respondents were measured in the second section of the questionnaire. Six items were adapted from Anouk et al. (2014) to measure the construct 'Peer Victimization'. The anger/frustration is measured by seven items that adopted from Anouk et al. (2014). The construct 'Exposure to Antisocial Media Content' was measured by eleven items that all sourcing from Anouk et al (2014). Eleven items that measuring the construct cyberbullying behaviour were adopted from Anouk et al. (2014). A total of six items that sourced from Danielle et al (2012) were used to measure the construct reactive aggression. Lastly, the construct friendship quality was measured by six items that sourcing from Ikuko Aoyama et al. (2011). A five-point Likert scale (1 = Never, 5 = Very Often) was used to measure the constructs peer victimization, anger/frustration, exposure to antisocial media content, cyberbullying behaviour and reactive aggression. However, the scale of friendship quality was measured by a five-point Likert scale (1 = Not True, 5 = True).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Sampling and Data Collection

Based on the research done by Edwina (2014), the bullying behaviour normally occurrs at the middle, and high school and higher education; and it causes individuals feel uncomfortable when studying in the school. Therefore, adolescents within the age group of 18 to 22 years old will be targeted as the possible respondents in this study. This group of adolescents mostly study in the university. Respondents were selected from a private university in Malaysia. Judgemental sampling technique was used in this research to select the potential respondents of the population of interest that must experience certain extent of cyberbullying (Malhotra, 2010, p.379). Pilot test was carried out to ensure all the items in the questionnaire were understandable, readable, and clear so that the researchers have the opportunity to make the amendments (Zikmund et al., 2010). Questionnaire was revised as according to the feedbacks received from the pilot test. Self-administered questionnaire survey was adopted to collect the primary data. A total of 520 questionnaires were distributed and only 471 usable questionnaires were analysed in the study.

Control Variables

The control variable in this research that studying the cyberbullying behavior among the adolescents are age group and gender. Erica (2015, p.19) acknowledges that age has been shown great influence on adolescent' involvement in bullying as a perpetrator and as a victim. Moreover, the study from Şenay Sezgin and Murtaza (2015) indicates that there is a significant difference in terms of gender for the issue of adolescents' problematic internet use; and male adolescents displayed more problematic internet use that led to higher cyberbullying tendencies. On the other hand, there is another finding shows that girls engage more in perpetration behaviour than boys by using indirect and relational forms of bullying such as social exclusion, spreading rumours, peer rejection, through cyberbullying (Ibrahim Tanrikulu & Campbell, 2015). Therefore, it is important to classify the roles of age and gender as possible risk factors for bullying behaviour. Therefore, the age group of adolescent ranging from 18 to 22 years old and both male and female will be the targeted as the potential respondents.

Method of Analysis

A series of statistical tests were performed, including Preliminary Analysis, Descriptive Analysis, Scales Measurement, and Inferential Analysis. For the Preliminary Analysis, Non-response Bias Analysis, Common Method Variances Analysis and Multicollinearity Analysis were conducted to ensure the quality of the research findings (Bryman & Bell, 2011). For the scales measurement, the reliability and validity tests were conducted to ensure the internal consistency and accuracy of the variables that measuring the respective constructs (Zikmund et al., 2010). Internal consistency reliability which is measured by Cronbach's Alpha will be used to assess reliability test. Whereas, construct validity which is measured by Exploratory Factor Analysis will be used to assess validity test. The inferential analysis such as regression analysis, mediated regression analysis and hierarchical regression analysis were used to test the hypothesized relationships. All the statistical analyses were conducted via the Statistical Package for the Social Science (SPSS) version 22.

DATA ANALYSIS AND FINDING

Preliminary Analysis

Non-Response Bias Analysis

According to Armstrong and Overton (1977), independent sample T-test can be used to evaluate the non-response bias. The rule of thumb for identifying non-response bias can be detected at the $p>0.05$ level (Armstrong & Overton, 1977) in which the result indicates that there is a significant different outcome between response and non-response samples. Based on the gender criteria, the outcome of the non-response bias analysis via independent sample T-test was found to be non-significant as $p=0.001$ ($p< 0.05$). Thus, the sample can be treated as a single data and it can be concluded that "non-response bias was not evident" (Mathews 2011, p. 8).

Common Method Variance Analysis

Podsakoff (2003) claims that response bias can be one of the systematic measurement errors that creating suspicion on validity of the relationship between the constructs being estimated. A solution to avoid response bias on common method variance can be measured by applying a statistical method and it is known as Harman single-factor test to minimize the effect of common method variance on the outcome of the research study (Podsakoff et al., 2003) and to ensure there is "actually does nothing to statistically control for (or partial out) method effects" (Podsakff et al 2003, p. 889). To support this argument, Podsakoff et al. (2003) claim that the existence of problem in common method bias was associated with variance more than 50%. According to the statistical finding in this research, the percentage of variance extracted for factor was 26.71% in which this figure was less than 50% rule of thumb set by Podsakff et al. (2003). Therefore, the data concluded that there was non-existence of the problem in common method bias in this research.

Multicollinearity Analysis

Hair et al. (2010) claim that the multicollinearity issue will not improve the independence assumption of the normality of the distribution because "the existence of problem in calculating the independent regression coefficients for the correlated independent variables due to the high correlation between independent variables". In addition, Hair et al. (2010) argue that the outcome of multicollinearity analysis can be evaluated by Tolerance Value and Variance Inflation Factor. To ensure no problem in the multicollinearity analysis, the value for 'Variance Inflation Factor' (VIF) for all the independent variables were less than 5.0 and the value of 'Tolerance Value' (TV) for the independent variables were more than 0.1 (Hair et al., 2010). According to the statistical findings, the value for VIF was ranging from 1.199 to 1.420 and the value for TV was ranging from 0.704 to .0834. In other words, all the values of VIF & TV were within the guidelines of the rules of thumb. In conclusion, the data indicated that there was non-existence of the problem in the multicollinearity analysis and therefore the independence assumption of the normality test can be identified.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Descriptive Analysis

According to the statistical findings from the survey, male respondents represented 47.3 percent (223 male respondents) while female respondents represented 57.2 percent (248 female respondents) of the total respondents. In the case of age distribution, the highest number of respondent is 19-year-old (35.5 percent). According to the education level, most of the respondents were mainly come from the diploma programme (64.3 percent). In terms of time spending for the internet surfing per days, majority of the respondents spent more than 6 hours per days (47.6 percent). Lastly, the result showed that majority of the respondents stay at home for internet surfing (85.8 percent).

Reliability and Validity Tests

Reliability

Reliability is the important scale measurement to evaluate the internal consistency of the items for the respective contructs (Yvonne, 2011). The coefficient value of Cronbach Alpha Coefficient 0.7 is used as a rule of thumb to assess the internal consistency of the items (Cavana et al., 2001). The results of Cronbach's alpha in Table 1 showed that all the constructs were well above 0.7. The Cronbach's alpha for all the tested constructs ranging from 0.820 (anger/frustration); 0.872 (peer victimization); 0.873 (reactive aggression); 0.873 (friendship quality); 0.906 (exposure to antisocial media content); and 0.932 (cyberbullying behaviour). It can be concluded that all the items that measure the respective constructs have high internal consistency and stability.

Validity Test

The validity of the scale measurement that reflected by construct validity was tested by using the exploratory factor analysis (Cavana et al., 2001). Based on the output of the factor analysis as indicated in Table 1, the analysis was appropriate because the Kaiser-Meyer-Olkin (KMO) was 0.920 in which the value is between 0.5 and 1.0. The output showed significant result for all the correlations within a correlation matrix by the Bartlett test of sphericity in statistical test with the value of p=0.000 (d.f.=1081; approx. Chi-Square=12982.933). Based on the principal axis factoring and oblique rotation procedures, all the constructs have greater Eigenvalues than 1.0 (lowest of 1.935 to highest of 3.795). All the values of factor loadings were more than 0.5. Construct validity includes convergent validity and discriminant validity According to the Rotated Component Matrix, convergent validity was achieved because the scale correlates positively with other scale that measuring the same construct. In addition, discriminant validity was fulfilled because the "measure does not correlate with other constructs from which it is supposed to differ and "it involves demonstrating a lack of correlation among differing constructs" (Malhotra, 2010, p.321). It can be concluded that the measurement scales are valid because "the extent to which differences in observed scale scores reflect true differences among objects on the characteristic being measured, rather than systematic or random error" (Malhotra, 2015, p.226).

Inferential Analysis

Simple Regression Analysis

Simple regression analysis was used to evaluate the relationship between peer victimization and anger/frustration. Based on the model fit analysis, peer victimization accounted for a significant 26.1% of the variability in anger/frustration, $R^2 = .261$, adjusted $R^2 = .259$, $F(1,469) = 165.407$, $p = .000$. The P value for peer victimization is 0.000 and the value of un-standardized Beta coefficient for peer victimization is 0.500 indicated that peer victimization is positively related to anger/frustration. Hence, the fourth hypothesis (H4) is accepted.

Multiple Regression Analysis

Multiple regression analysis was used to evaluate the relationships of reactive aggression, anger/frustration, peer victimization on cyberbullying behaviour. Based on the model fit analysis in combination, reactive aggression, anger/frustration, and peer victimization accounted for a significant 44% of the variability in cyberbullying behaviour, $R^2 = .440$, adjusted $R^2 = .437$, $F(3,466) = 122.111$, $p = .000$. From the statistical findings, the P value for reactive aggression was 0.000 ($p<0.05$) and the associated value of un-standardized Beta coefficient was 0.888. The study concluded that reactive aggression is positively related to cyberbullying behaviour. Hence, the seventh hypothesis (H7) is supported in this research. Besides, the statistical findings also indicated that the p value for anger/frustration was 0.008 ($p<0.05$) and the corresponding value of un-standardized Beta coefficient was 0.177. The study concluded that anger/frustration is positively related to cyberbullying behaviour. Hence, the first hypothesis (H1) is supported in this research. In addition, the statistical findings also indicated that the p value for peer victimization was 0.000 ($p<0.05$) and the corresponding value of un-standardized Beta coefficient was 0.259. The study concluded that peer victimization is positively related to cyberbullying behaviour. Hence, the fifth hypothesis (H5) is supported in this research. In conclusion, the study showed that reactive aggression has strongest relationship (0.888) with cyberbullying behaviour, then following by peer victimization (0.259) and anger/frustration (0.177).

Mediated Regression Analysis

Based on the guidelines of mediated regression analysis proposed by Baron and Kenny (1986), mediating effect will be taken place when four conditions are fulfilled in the statistical analysis. The four conditions are: (1) Peer victimization (independent variable) is significantly related to the cyberbullying behaviour (dependent variable); (2) Peer victimization (independent variable) is significantly related to reactive aggression (mediating variable); (3) When both peer victimization and reactive aggression acting as predictor variables to the cyberbullying behaviour in the regression analysis, the result must indicate that reactive aggression and peer victimization are significantly related to cyberbullying behaviour; (4) The regression coefficient for peer victimization obtained from the third condition as above will be smaller than the regression coefficient for peer victimization that obtained from the first condition.

The result of the mediating regression analysis was presented in Table 2, there is a significant positive relationship between peer victimization and cyberbullying behaviour (p value = 0.000; β value = 0.647). Based on the model fit analysis, peer victimization accounted for a significant 16.6% of the variability

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

in cyberbullying behaviour, $R^2 = .166$, adjusted $R^2 = .164$, $F(1,468) = 93.083$, $p = .000$. Therefore, the first condition was fulfilled. In addition, the result from Table 2 also indicated a significant positive relationship between peer victimization and reactive aggression (p value = 0. 000; β value = 0.337). Based on the model fit analysis, peer victimization accounted for a significant 12.6% of the variability in reactive aggression, $R^2 = .126$, adjusted $R^2 = .125$, $F(1,469) = 67.874$, $p = .000$. Therefore, the second condition was fulfilled. When peer victimization and reactive aggression concurrently become the predictor variables for cyberbullying behaviour, the result from Table 2 indicated that both reactive aggression and peer victimization are significant positively related to cyberbullying behaviour (p value = 0.000). Based on the model fit analysis in combination, reactive aggression and peer victimization accounted for a significant 43.2% of the variability in cyberbullying behaviour, $R^2 = .432$, adjusted $R^2 = .429$, $F(2,467) = 177.371$, $p = .000$. Therefore, the third condition was fulfilled. Lastly, the result from Table 2 also indicated that when reactive aggression is added as mediating variable, the regression coefficient of peer victimization has been reduced from 0.647 to 0.335. Therefore, the fourth condition was fulfilled. In conclusion, the study supports the ninth hypothesis (H9) in which peer reactive aggression mediates the relationship between peer victimization and cyberbullying behavior.

Table 2. Result of mediator analysis for Hypothesis 9 (mediated multiple regressions)

Independent Variable	**Reactive Aggression (Mediator)**	**Cyberbullying Behaviour (Dependent Variable)**	
	Model 1	**Model 2**	**Model 3**
Peer Victimization	0.337* (p=0.000) (1st equation)	0.647* (p=0.000) (2nd equation)	0.335* (p=0.000) (3rd equation)
Reactive Aggression			0.924* (p=0.000) (3rd equation)

*p<0.05

Second mediated regression analysis was evaluated based on the four conditions: (1) Anger/frustration (independent variable) is significantly related to the cyberbullying behaviour (dependent variable); (2) Anger/frustration (independent variable) is significantly related to the exposure to antisocial media content (mediating variable); (3) When both anger/frustration and exposure to antisocial media content acting as predictor variables to the cyberbullying behaviour in the regression analysis, the result must indicate that exposure to antisocial media content and anger/frustration are significantly related to the cyberbullying behaviour; (4) The regression coefficient for anger/frustration obtained from the third condition as above will be smaller than the regression coefficient for anger/frustration that obtained from the first condition.

The result of the second mediating regression analysis is presented in Table 3, there is a significant positive relationship between anger/frustration and cyberbullying behaviour (p value = 0.000; β value = 0.615). Based on the model fit analysis, anger/frustration accounted for a significant 14.4% of the variability in cyberbullying behaviour, $R^2 = .144$, adjusted $R^2 = .142$, $F(1,468) = 78.419$, $p = .000$. Therefore, the first condition was fulfilled. In addition, the result from Table 3 also indicated that there is a significant positive relationship between anger/frustration and exposure to antisocial media content

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

(p value = 0. 000; β value = 0.535). Based on the model fit analysis, anger/frustration accounted for a significant 10.6% of the variability in the exposure to antisocial media content, $R^2 = .106$, adjusted $R^2 = .104$, $F(1,469) = 55.395$, $p = .000$. Therefore, the second condition was fulfilled. When anger/frustration and exposure to antisocial media content concurrently become the predictor variables for cyberbullying behaviour, the result from Table 3 indicated that exposure to antisocial media content and anger/frustration are significant positively related to cyberbullying behaviour (p value = 0.000). Based on the model fit analysis in combination, exposure to antisocial media content and anger/frustration accounted for a significant 20% of the variability in cyberbullying behaviour, $R^2 = .200$, adjusted $R^2 = .197$, $F(2,467) = 58.387$, $p = .000$. Therefore, the third condition was fulfilled. Lastly, the result from Table 3 also indicated that when exposure to antisocial media content is added as a mediating variable, the regression coefficient of anger/frustration has been reduced from 0.615 to 0.482. Therefore, the fourth condition was fulfilled. In conclusion, the study supports the eight hypothesis (H8) in which exposure to antisocial media content mediates the relationship between anger/frustration and cyberbullying behavior.

Table 3. Result of mediator analysis for Hypothesis 8 (mediated multiple regressions)

Independent Variable	**Exposure to Antisocial Media Content (Mediator)**	**Cyberbullying Behaviour (Dependent Variable)**	
	Model 1	**Model 2**	**Model 3**
Angry/Frustration	0.535* (p=0.000) (1st equation)	0.615* (p=0.000) (2nd equation)	0.482* (p=0.000) (3rd equation)
Exposure to Antisocial Media Content			0.248* (p=0.000) (3rd equation)

*p<0.05

Hierarchical Regression Analysis

The moderating effect was reflected by the significant level of the interactive variable. Based on the model fit analysis in combination, anger/frustration and interactive accounted for a significant 14.6% of the variability in cyberbullying behaviour, $R^2 = .146$, adjusted $R^2 = .142$, $F(2,467) = 39.850$, $p = .000$. The statistical output in Table 4 showed that anger/frustration is significant positively related to cyberbullying behavior (p value = 0. 000; β value = 0.374). However, the statistical output in Table 4 also indicated that the significant level of the interactive variable is 0.266 (p>0.05). This result indicated that the friendship quality does not moderate the relationship between anger/frustration and cyberbullying behaviour. Thus, tenth hypothesis (H10) was failed to be accepted.

Table 4. Hierarchical regression analysis

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.000	.043		-.011	.991
	Anger/ Frustration	.379	.043	.379	8.855	.000
2	(Constant)	-.007	.043		-.153	.878
	Anger/ Frustration	.374	.043	.375	8.724	.000
	Interactive	-.045	.041	-.048	-1.114	.266

a. Dependent Variable: Cyberbullying Behavior

CONCLUSION

Discussion and Conclusion

The findings of this research conclude that peer victimization, anger/frustration, exposure to antisocial media content and reactive aggression are the key determinants of cyberbullying behaviour. The study also asserts that exposure to antisocial media content does mediate the relationship between anger/ frustration and cyberbullying behaviour. The study also supports the statement that reactive aggression mediates the relationship between peer victimization and cyberbullying behavior. However, the study does not support the role of friendship quality in moderating the relationship between anger/frustration and cyberbullying behaviour.

Theoretical and Managerial Implications

The findings of this research enrich the Cyclic Process Model proposed by Anouk et al. (2014) in understanding the determinants of cyberbullying behaviour. This study advances the Cyclic Process Model by asserting that reactive aggression does mediate the relationship between anger/frustration and cyberbullying behavior. The study also provides empirical evidence to questioning the role of friendship quality in moderating the relationship between anger/frustration and cyberbullying behavior. The role of friendship quality as a moderator is rejected in this study may be due to the Asian culture in which it is not a common practice to share anger/frustration with someone else as well as most of the victims are low self-esteem and introvert (Jordan & Austin, 2012; Cénat et al., 2014; Garaigordobil et al., 2013; Suresh & Tipandjan, 2012; Cook et al., 2010; Olweus, 1999; Monks et al., 2008). By understanding the underlying process of cyberbullying behaviour, the authorities may able to develop effective interventions, resistance and prevention policies to curb the problem of cyberbullying behaviour. Authorities may improve their rules and regulations in controlling the content of the media that spreading out to the community and maintain the endurance of the victims.

Limitation and Recommendation for Future Research

The development of cyberbullying behaviour is a time bound event. By using cross-sectional study, it may not able to provide a thorough understanding of the cyberbullying behaviour. By using a longitudinal study to evaluate the determinants of cyberbullying behaviour in the Cyclic Process Model, it will provide a clear understanding on how the exposure to antisocial media content, reactive aggression and cyberbullying behaviour amplify on each other. In addition, the issue of friendship quality may be perceived differently in the cross-cultural setting. The impact of friendship quality in moderating the relationship between anger/frustration and cyberbully behaviour is yet to be studied in the cross-cultural environment. Lastly, there is a need to conduct research about how the peer victimization affects the personality of adolescent and changes their behaviour by involving them in the cyberbullying behaviour.

Chapter 77
Emerging Ethical Issues in Police and Public Safety Psychology:
Reflections on Mandatory vs. Aspirational Ethics

Jeni L. McCutcheon
Phoenix Area Independent Police & Public Safety Psychology Practice, USA

ABSTRACT

This chapter presents commonly experienced ethical dilemmas among police and public safety psychologists. Real-world, relevant examples are offered with an emphasis on emerging ethical issues. Related American Psychological Association (APA) ethical principles and standards for psychologists and codes of conduct are highlighted. The possibility that ethical dilemmas go unrecognized due to a focus on mandatory rather than aspirational ethics is considered. Solutions for resolving ethical dilemmas are presented.

INTRODUCTION

Ethical issues abound in the specialty of police and public safety psychology. Psychologists working in this specialty encounter ethical dilemmas that are thought-provoking and challenging. These dilemmas are likely among the toughest aspects of police and public safety psychology practice. A paucity of research exists about commonly experienced ethical dilemmas among police and public safety psychologists. Zelig (1988) surveyed police psychologists and found that the three most encountered ethical dilemmas involved multiple relationships, confidentiality concerns, and resolution of conflicts between professional standards and an organization's needs. Multiple studies of psychologists nationally and internationally have resulted in similar findings, with concerns related to confidentiality and multiple relationships cited

as the most frequently experienced ethical challenges in psychology practice (Colnerud, 1997; Pettifor & Sawchuk, 2006; Pope & Vetter, 1992; Slack & Wassenaar, 1999). Zelig (1988) also found that many police psychologists reported they did not experience any ethical dilemmas. This too was consistent with the results of Pope and Vetter (1992), who reported that 134 of their 679 psychologist respondents did not encounter a single ethically troubling incident in the last year or two prior to the survey.

Several reasons likely exist for a lack of identified ethical dilemmas. Psychologists may fail to recognize ethical challenges. They have busy practices or copious work to complete within an agency and may overlook such issues. Conversely they may think too concretely and miss the complexity of situations. Over time, they may have encountered similar dilemmas and have become immune to them. Alternately, perhaps with experience, they become better at managing dilemmas, such that situations are no longer viewed as anything out of the ordinary. Perhaps some police and public safety psychologists fail to consider potential differences between mandatory and aspirational ethics. Ethical dilemmas may go unrecognized due to a focus on mandatory ethics.

Practicing mandatory ethics involves only acting in compliance with enforceable standards. This approach involves following the letter of the law or the specifics of a code. The focus is on conforming to requirements. Close considerations include risk management, avoidance of harm, adherence to requirements and recognition of "right" action. Mandatory ethics are the "floor" of expectations in resolving any given ethical challenge.

Aspirational ethics involve striving for the best possible ethical outcome. In contrast to the floor example of mandatory ethics, aspirational ethics are the "ceiling" in any given ethical dilemma. Goals include pursuing the best outcome for the involved parties and seeking to "do good." This involves embracing principles, a philosophical stance, or an overarching thinking style to resolve ethical dilemmas. The APA's ethical principles for psychologists—in contrast to the enforceable (mandatory) principles—are aspirational in nature. They call upon psychologists to adopt core beliefs rather than simply following a set of rules, laws, or codes.

In considering aspirational ethics, there are multiple relevant areas of the APA Ethics Code. The General Principles relate to and address the need for psychologists to do good, avoid doing harm, be aware of their influence, have integrity, be conscientious and attuned to their responsibilities, be fair, exercise good decision-making, and recognize their biases and the limits of their competence (APA, 2002).

ETHICAL DILEMMAS OF POLICE AND PUBLIC SAFETY PSYCHOLOGISTS

Police and public safety psychologists experience a multitude of ethical dilemmas in different areas. Concerns about confidentiality, multiple relationships, managing conflicts between ethics and organizational demands, and professional competence are particularly relevant for police psychologists. Each of these key areas is addressed in the next section of this chapter and may be associated with a variety of ethical challenges. Psychologists encounter dilemmas when working in any of the four core functional domains of police and public safety psychology: assessment, intervention, consultation, and operations (Aumiller et al., 2007).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Confidentiality

Codes regarding confidentiality address the need for police and public safety psychologists to maintain confidences, identify the client or patient and other involved parties, clarify and make explicit these relationships, and acquire informed consent. The APA Ethical Principles of Psychologists and Code of Conduct (2002) Standard 4, Privacy and Confidentiality, that apply are:

Maintaining Confidentiality

Psychologists have a primary obligation and take reasonable precautions to protect confidential information obtained through or stored in any medium, recognizing that the extent and limits of confidentiality may be regulated by law or established by institutional rules or professional or scientific relationship.

Discussing the Limits of Confidentiality

(a) Psychologists discuss with persons (including, to the extent feasible, persons who are legally incapable of giving informed consent and their legal representatives) and organizations with whom they establish a scientific or professional relationship (1) the relevant limits of confidentiality and (2) the foreseeable uses of the information generated through their psychological activities. (b) Unless it is not feasible or is contraindicated, the discussion of confidentiality occurs at the outset of the relationship and thereafter as new circumstances may warrant. (c) Psychologists who offer services, products, or information via electronic transmission inform clients/patients of the risks to privacy and limits of confidentiality.

Minimizing Intrusions on Privacy

(a) Psychologists include in written and oral reports and consultations, only information germane to the purpose for which the communication is made. (b) Psychologists discuss confidential information obtained in their work only for appropriate scientific or professional purposes and only with persons clearly concerned with such matters.

Disclosures

(a) Psychologists may disclose confidential information with the appropriate consent of the organizational client, the individual client/patient, or another legally authorized person on behalf of the client/patient unless prohibited by law. (b) Psychologists disclose confidential information without the consent of the individual only as mandated by law, or where permitted by law for a valid purpose such as to (1) provide needed professional services; (2) obtain appropriate professional consultations; (3) protect the client/patient, psychologist, or others from harm; or (4) obtain payment for services from a client/patient, in which instance disclosure is limited to the minimum that is necessary to achieve the purpose.

Difficulties with confidentiality can be many. Complications may present when the relationship is hazy and fails to be properly identified, defined, or made clear to the involved parties. Consider the example of a psychologist having breakfast with a Chief of Police who asks about an officer the chief regards as reactive and knows is seeing the psychologist. The ethical police psychologist does not nod and stay quiet, or expound on the identified officer's virtues or troubles. Instead, the ethical psychologist clarifies the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

relationships, with a polite reminder of the importance of confidentiality. An ethical psychologist would also realize that multiple relationships exist and would therefore clarify the relationship with the chief. Reminding the chief that the current conversation is confidential, the psychologist might then suggest that the chief speak directly with the officer about the stated concerns.

Other ethical dilemmas about confidentiality may arise in regard to practical and business details of police and public safety psychology practice. Sometimes these concerns are about records. Consider, for example, a firefighter sent to see a psychologist following a child drowning incident. The psychologist provides a confidential therapy session or sessions to this patient and may provide a letter verifying attendance to the agency. Importantly, the details of the session, the disclosures, and certainly the subsequent records remain private and confidential. However, the records may no longer be confidential if this same firefighter decides that, after a third child drowning, he/she is distressed and no longer able to perform the job. If that individual seeks a medical retirement or files a Workers' Compensation claim, the psychological treatment records may be required to be disclosed to the employer's Workers' Compensation company in accordance with a state statute. The ethical psychologist will have covered such potentialities in the first meeting with the patient and will have obtained the patient's expressed written consent to these exceptions to confidentiality.

Other related examples include assessment and evaluation subjects who have misimpressions about their rights and roles in the evaluation processes. This often occurs despite repeated verbal and written informed consent procedures prior to and during the course of the evaluation. These procedures clarify the role of the agency as the client and the role of the subject as participant who is not privy to any of the findings, results, recommendations, or the final report. Consider the pre-employment evaluation subject who demands to know psychological test results, "Especially that Wonderlic score, because I want to know how I compare to the guys in the NFL who get that test, too." Or, the peace officer applicant not recommended for hire who does not understand that the agency is the hiring authority after being told by the department's background investigator, "We can't hire you because you failed your psych." This applicant then repeatedly calls the psychologist's office demanding a sit-down discussion to plea for a change in rating. An ethical police and public safety psychologist politely reiterates the relationship, directs the subject back to the hiring agency, and informs the agency commander of the situation. The psychologist may also discuss with the commander the agency's candor, clarifying the psychologist's role as a consultant in the pre-employment process.

Additional concerns about confidentiality arise in the context of providing assessment services as a police psychologist. Though all of the traditional doctor-patient expectations regarding confidentiality may not apply in such evaluations, only relevant details should end up in the assessment reports. In the case of a fitness-for-duty evaluation, detailed information about the individual may not be included in the report sent to an agency, and the psychologist may arrange with the agency to provide a simple fit or unfit recommendation. In the case of a pre-employment psychological screening evaluation, sensitive and private disclosures may be withheld from the report. As an example, consider the applicant with suicidal ideation with a plan in the past year. Instead of detailing this information in the report, the psychologist might identify "recent and significant concerns about emotional instability" in the relevant psychological and mental health history section of the report. Similarly, instead of reporting that the subject of the pre-employment evaluation had numerous previous mental health contacts consisting of medication to decrease symptoms of depression and therapy to cope with the sudden death of a parent, the now-stable applicant's report may read, "Past treatment, no recent or current concerns, currently emotionally stable." In addition, personal information that is not directly job relevant should often be

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

omitted from psychological reports. Examples include an evaluation subject who is cohabitating with a partner and who is not fully out as a lesbian. The report may list the person as "single," and if reference is made to the partner, for example, and a loud verbal argument that led to a welfare check by a local police agency, the report may describe this situation as "a loud verbal altercation with a romantic partner."

In many cases, inquiries about family are limited, if conducted at all, due to consideration of federal laws such as the Genetic Information and Nondisclosure Act (GINA). GINA mandates that genetic information about a job applicant's family members is not queried about or even addressed in a pre-employment psychological evaluation, let alone included in employment-related evaluation reports. This becomes a careful task for the interviewing psychologist, as far as ferreting out appropriate, germane, and job-related details in a pre-employment screening decision and report.

Irrelevant details should not be disclosed in pre-employment psychological screening reports of law enforcement applicants. As an example, consider the psychologist who asks a young applicant about a history of fighting in school, school suspensions, and later mental health treatment. The applicant discloses "having a fairly messed up childhood and dealing with problems with my family." The applicant's father and several uncles were in and out of prison for drug-related charges, and this may be relevant to the screening decisions, since the applicant may have been routinely exposed to illegal behavior. The psychologist may question the applicant's handling of family functions, fraternization with inmates and felons, as well as possible ongoing exposure to illegal drugs due to family members' involvement. What should not be considered or explored, and what may call for a GINA admonishment, would be the content disclosed in a statement such as, "My father was depressed and had a drug problem. I think that is why he used to be so mean, and why I was such an angry kid." An admonishment in this type of scenario might be phrased as follows: "I hear what you are saying, and due to the Genetic Information and Nondisclosure Act, we cannot pursue this area of conversation about your father's health problems. Instead, please tell me about what you do now at the family barbecues, where as you reported, your uncles smoke marijuana in the backyard."

A firm stance on confidentiality in police and public safety psychology practice is needed. This author's recommendation is to become adept at defining all relationships from the first contact, stating these explicitly, identifying other involved parties, and also defining rights and duties inherent with these professional relationships.

Unless otherwise explicitly arranged or as mandated by law, informal contacts and services should be treated entirely as confidential. Examples include a phone call to the psychologist's office inquiring about services, an officer's disclosures made to a psychologist during a ridealong with the officer, a question a dispatcher asks of a psychologist during a sit-in at a call center, a firehouse conversation with a firefighter, or a detention officer's comment in a jail facility's control room about her difficulty coping with her husband's illness. When contacts between a psychologist and public safety personnel occur physically in the field and out of the office, they are confidential, and this often needs to be stated and affirmed.

Confidentiality prevails in formal services as well. When contacts are formal sessions, meetings, or in-office services, these services are defined by written documentation, and expressed written consent is obtained. When services are not confidential, such as pre-employment evaluations, the limits of confidentiality are provided in written form and verbally reviewed, with the expressed written consent of the subject obtained. Finally, in situations where there may be a lack of guaranteed confidentiality and/or privilege, such as with a peer support team's services, these limits are openly discussed with the involved parties.

Multiple Relationships

Much has been written about multiple relationships in psychology, and for good reason. Multiple relationships are common and may pose challenges or dilemmas that are difficult for police and public safety psychologists to manage. Multiple relationships occur in several ways. First, they happen when the psychologist has more than one role or relationship with a client or patient. They happen when the psychologist has one original role or relationship with a client or patient and the psychologist intentionally or inadvertently enters into a new or different relationship with that client or patient. Multiple relationships may also exist when the psychologist enters a relationship with another person associated with the original client or patient. The relevant APA Ethical Principles of Psychologists and Code of Conduct (2002) Standard 3: Human Relations, that apply are:

Avoiding Harm

Psychologists take reasonable steps to avoid harming their clients/patients, students, supervisees, research participants, organizational clients, and others with whom they work, and to minimize harm where it is foreseeable and unavoidable.

Multiple Relationships

(a) A multiple relationship occurs when a psychologist is in a professional role with a person and (1) at the same time is in another role with the same person, (2) at the same time is in a relationship with a person closely associated with or related to the person with whom the psychologist has the professional relationship, or (3) promises to enter into another relationship in the future with the person or a person closely associated with or related to the person. A psychologist refrains from entering into a multiple relationship if the multiple relationship could reasonably be expected to impair the psychologist's objectivity, competence, or effectiveness in performing his or her functions as a psychologist, or otherwise risks exploitation or harm to the person with whom the professional relationship exists. Multiple relationships that would not reasonably be expected to cause impairment or risk exploitation or harm are not unethical. (b) If a psychologist finds that, due to unforeseen factors, a potentially harmful multiple relationship has arisen, the psychologist takes reasonable steps to resolve it with due regard for the best interests of the affected person and maximal compliance with the Ethics Code. (c) When psychologists are required by law, institutional policy, or extraordinary circumstances to serve in more than one role in judicial or administrative proceedings, at the outset they clarify role expectations and the extent of confidentiality and thereafter as changes occur.

Conflict of Interest

Psychologists refrain from taking on a professional role when personal, scientific, professional, legal, financial, or other interests or relationships could reasonably be expected to (1) impair their objectivity, competence, or effectiveness in performing their functions as psychologists or (2) expose the person or organization with whom the professional relationship exists to harm or exploitation.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Exploitative Relationships

Psychologists do not exploit persons over whom they have supervisory, evaluative, or other authority such as clients/patients, students, supervisees, research participants, and employees.

Informed Consent

(a) When psychologists conduct research or provide assessment, therapy, counseling, or consulting services in person or via electronic transmission or other forms of communication, they obtain the informed consent of the individual or individuals using language that is reasonably understandable to that person or persons except when conducting such activities without consent is mandated by law or governmental regulation or as otherwise provided in this Ethics Code. (b) For persons who are legally incapable of giving informed consent, psychologists nevertheless (1) provide an appropriate explanation, (2) seek the individual's assent, (3) consider such persons' preferences and best interests, and (4) obtain appropriate permission from a legally authorized person, if such substitute consent is permitted or required by law. When consent by a legally authorized person is not permitted or required by law, psychologists take reasonable steps to protect the individual's rights and welfare. (c) When psychological services are court ordered or otherwise mandated, psychologists inform the individual of the nature of the anticipated services, including whether the services are court ordered or mandated and any limits of confidentiality, before proceeding. (d) Psychologists appropriately document written or oral consent, permission, and assent.

Not all multiple relationships are problematic. Indeed, they are common, navigable occurrences, and with careful attention they can be managed ethically. The main concern is to avoid harm or exploitation to the client or patient, as well as to avoid entering into or maintaining relationships that will impair the psychologist's objectivity, competence, or effectiveness in performing her or his duties. The burden for meeting these requirements, and showing that the requirements have been met if the need arises, is on the psychologist (McCutcheon, 2011; Younggren & Gottlieb, 2004).

Previously, psychologists received a message, whether explicit or implicit, to simply avoid multiple relationships (Younggren & Gottlieb, 2004). This position was espoused in previous ethical codes for psychologists and routinely taught in graduate training programs. This singular client or patient view of maintaining only one relationship or role still exists.

While maintaining only one role or relationship may be a fine, easy, and straightforward choice in an ideal world, this is not necessarily practical, or even representative of the reality that most police and public safety psychologists face. Unless psychologists practice simply in one functional domain (such as assessment) and in only one functional competency (pre-employment evaluations, for example), it is increasingly likely that one will be regularly, if not constantly, bombarded with the task of managing multiple relationships. Fortunately, in both general psychology practice and police and public safety psychology practice, this reality is being recognized. With due regard and to be clear, some relationships, such as those of a sexual nature or in situations involving a conflict of interest, are clearly inappropriate and must always be avoided. With this acknowledgement, the question at hand for most police and public safety psychologists is not, "How does one avoid multiple relationships?" Rather, the quandary becomes how to ethically manage multiple relationships.

The most obvious multiple relationships are those that happen in an unplanned, circumstantial fashion. Police and public safety psychologists, like all psychologists, experience these. They have patients who

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

live in the same communities and whom they bump into at the grocery store, at the dentist's office, at the gym, or at the local gas station. They inevitably see patients and professional contacts in their own friendship networks, religious organizations, and community events and associations. They also have children attending the same schools as the children of their patients and other public safety personnel with whom they work. They see their clinical patients in different roles, whether they are working off-duty as police officers at a concert or at a street fair. All of these ordinary situations, occurring in both big and small cities, need to be navigated carefully. The psychologist must have a plan of managing such circumstances confidentially and without doing harm, being exploitive or losing objectivity.

Aside from these real-world occurrences, police psychology differs somewhat from other specialty areas of psychology in that multiple relationships may increase naturally over time. Aside from practicing in a rural community or perhaps within military psychology settings, police and public safety psychology is likely unique in the existence of these growing relationships. There is often a flow of contacts that leads to multiple relationships in police and public safety psychology, and this occurs inevitably over time because of the frequent contact the psychologist has with client agencies and their personnel. Such contact may be particularly pronounced if one is an in-house psychologist or if one is a consulting psychologist with a busy practice, providing services to multiple agencies. Over a span of years, a psychologist will likely see the same person in many different contexts and roles.

Consider the following example of a psychologist's many roles and relationships over time. A psychologist sees a deputy sheriff applicant for a pre-employment interview. The applicant is hired, eventually advancing to a class sergeant position for the agency's law enforcement training academy where the psychologist teaches. The sergeant and the psychologist discuss concerns about underperforming academy recruits, and the sergeant refers recruits for counseling to the in-house Employee Assistance Plan, which the psychologist runs.

Years later, the psychologist, now in a private practice setting, employs a contract psychologist who performs a pre-employment evaluation on the same sergeant as he successfully laterals to another agency. Afterward, this individual attends a local continuing education seminar, sits near the psychologist who conducted the initial pre-employment screening years earlier, and suggests a marital retreat that he attended with his spouse as a helpful resource. In the course of this conversation, the sergeant discloses some details about his marital and financial difficulties to the psychologist.

Ultimately, this sergeant advances to a lieutenant position in charge of pre-employment processes at the same agency where the psychologist has provided pre-employment services for a decade. The lieutenant contacts this psychologist to discuss the battery being used in psychological pre-employment evaluations and to enlist the psychologist's help in reviewing policies and procedures for promotional exams. This example illustrates how the psychologist's familiarity and demonstrated competence and helpfulness over time lends to the psychologist's credibility in the field and therefore, leads clients and agencies purposefully to seek out these relationships.

Even when ongoing professional contacts inevitably lead to multiple relationships, police and public safety psychologists should be mindful of the possibility for exploitation and harm, as well as loss of objectivity. Recall that multiple relationships are unethical when they impair objectivity or exploit one or more parties or expose one or more parties to harm. When contemplating which path to take (or whether to take any path at all) that creates or continues a multiple relationship, five questions are suggested:

- What are the options?
- What is in the best interest of the client and the other involved parties?

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Are the proposed roles incompatible?
- Would it be best to simply refer out?
- If I engage in these multiple relationships, how do I navigate these different roles so as not to cause harm or lose objectivity?

Managing Conflicts between Ethics and Organizational Demands

Similar to multiple relationships, negotiating conflicts between ethics and organizational demands can be tricky. Such conflicts may arise when there appear to be differences between the standards of practice for the police and public safety psychologist, the APA Ethical Principles of Psychologists and Code of Conduct, and the demands or expectations of the agency. The relevant codes from the APA Ethical Principles of Psychologists and Code of Conduct (2002) Standard 3: Human Relations, that apply include:

Third-Party Requests for Services

When psychologists agree to provide services to a person or entity at the request of a third party, psychologists attempt to clarify at the outset of the service the nature of the relationship with all individuals or organizations involved. This clarification includes the role of the psychologist (e.g., therapist, consultant, diagnostician, or expert witness), an identification of who is the client, the probable uses of the services provided or the information obtained, and the fact that there may be limits to confidentiality.

Cooperation With Other Professionals

When indicated and professionally appropriate, psychologists cooperate with other professionals in order to serve their clients/patients effectively and appropriately.

3.11 Psychological Services Delivered To or Through Organizations

(a) Psychologists delivering services to or through organizations provide information beforehand to clients and when appropriate those directly affected by the services about (1) the nature and objectives of the services, (2) the intended recipients, (3) which of the individuals are clients, (4) the relationship the psychologist will have with each person and the organization, (5) the probable uses of services provided and information obtained, (6) who will have access to the information, and (7) limits of confidentiality. As soon as feasible, they provide information about the results and conclusions of such services to appropriate persons. (b) If psychologists will be precluded by law or by organizational roles from providing such information to particular individuals or groups, they so inform those individuals or groups at the outset of the service.

Managing the conflicts between one's professional ethics and the organizational demands that one encounters can be a difficult aspect of police and public safety psychology practice. Difficulty arises when an agency requests that the psychologist practice in a manner that is outside the standard of practice and that may even be unethical.

Consider this example. A request for proposals for psychological services resulted in bids and a subsequent contract award. Proposal submission review results were published on a website. Here, bidders were privy to their tallied scores and evaluative comments. A recorded weakness of a submitted

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

proposal regarding provision of confidential counseling services was that "the psychologist declines to report violations of law to the agency." Points were also deducted because the psychologist declined to provide both confidential counseling services and subsequent fitness-for-duty evaluations, citing a conflict of interest. In this case, that which was perceived as a weakness was actually appropriate ethical action. Appropriate ethical action included maintaining confidentiality based on standards of practice as defined by relevant police psychology guidelines, applicable case law establishing psychotherapist-patient privilege (e.g., *Jaffee v. Redmond*), APA Ethical Principles of Psychologists and Code of Conduct regarding confidentiality, applicable state statutes, and the applicable state's Board of Psychologist Examiners Rules of Professional Conduct.

Such situations point to the need for education about what constitutes competent police and public safety psychology practice. Agencies are likely unaware of relevant guidelines, ethical codes, and laws that apply to psychological services and practice. Even when they are aware, a key point to consider is that agencies may choose to ignore these requirements, though psychologists who aspire to be ethical will not.

Also to consider is that psychologists have responsibilities to multiple parties. Fisher (2009) wrote about how psychologists often have duties to multiple parties:

If we stopped asking "Who is the client?," what should we ask instead? Regardless of the type of case or the number of relationships it involves, the question psychologists should ask might be "Exactly what are my ethical responsibilities to each of the parties in this case?" (p. 5).

Another example of conflict between ethics and organizational demands occurs due to pressure to make a quick hiring recommendation. Eager to fill an upcoming law enforcement academy class, an agency requests a psychological pre-employment evaluation "pass" or "fail" rating. The psychological screening decision for a particular applicant is deferred because relevant mental health records were not yet received from a recent mental health provider. The quandary here is meeting organizational demands while ethically performing the pre-employment evaluation. Ethical action involves declining to render a screening decision until needed information is received and the evaluation can be fully completed, per usual practice.

Consider a psychologist asked to provide an inappropriate fitness-for-duty evaluation on an incumbent officer. The officer does not meet threshold criteria for a fitness-for-duty evaluation, and the psychologist discerns that appropriate supervisory actions, such as discipline, have not been taken. It appears the agency is likely dealing with a difficult employee and expecting the psychologist to resolve the officer's employment status. When a psychologist works in-house for an agency, conducting this evaluation may be a directive, thus placing the psychologist in a difficult situation. Psychologists in any practice setting should explain the reasons for declining the referral, and through consultation, explore with the referring party ways to address the problematic employee's behavior. They may also educate about threshold criteria for a fitness-for-duty evaluation needing to be met.

Another example involves a request for a marketing blurb describing the pre-employment psychological procedures that will be used to attract applicants and demystify psychological pre-employment screening procedures. The psychologist provides a general description, omitting specific test names to maintain the validity of the pre-employment procedures. The agency requests more detailed test information "to be thorough," challenging the psychologist's refusal to provide test names and descriptions.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

How should the psychologist resolve this conflict? In an ideal world, the psychologist explains the concern and make it clear why she/he is taking a particular stand. If needed, the psychologist presents data to the agency's decision makers and involved persons to educate and explain the conflict. Such data may include the relevant APA Ethical Principles of Psychologists and Code of Conduct, applicable guidelines, laws, and the basis for why something is done the way that it is, and the psychologist's experience in providing appropriate services. In an ideal world, this strategy should suffice. However, such matters are not always easy, and sometimes the psychologist is directed to take unethical action. The appropriate response is to decline, but to do so in a professional and respectful manner. To be successful in this process involves presenting information in such a way that the psychologist is perceived as helpful and educative, rather than insubordinate or subversive. This can sometimes be a difficult feat. Strong relationships with key agency personnel are vital. Being perceived as experienced and competent is essential in order to effect change and guide successful resolution of such conflicts.

Competence

Competency is vital for ethical police and public safety psychological practice. Competence involves being current on skills, abilities, and knowledge and is developed through a psychologist's seeking out and participating in relevant continuing education opportunities, reading and reviewing police and public safety literature, and staying up-to-date with evolving practice guidelines. A critical pathway for the development of competence is performing the intervention or other services with appropriate supervision and/or consultation from already competent psychologists. Competence in police and public safety psychology also involves a continuing expansion of knowledge in science, legal, and other areas related to police and public safety psychology. Several areas of the APA Ethical Principles of Psychologists and Code of Conduct (2002) Standard 2, Competence relate to police and public safety psychologists:

Maintaining Competence

Psychologists undertake ongoing efforts to develop and maintain their competence.

Bases for Scientific and Professional Judgments

Psychologists' work is based upon established scientific and professional knowledge of the discipline.

Delegation of Work to Others

Psychologists who delegate work to employees, supervisees, or research or teaching assistants or who use the services of others, such as interpreters, take reasonable steps to (1) avoid delegating such work to persons who have a multiple relationship with those being served that would likely lead to exploitation or loss of objectivity; (2) authorize only those responsibilities that such persons can be expected to perform competently on the basis of their education, training, or experience, either independently or with the level of supervision being provided; and (3) see that such persons perform these services competently.

Codes about competence also point to the need to have supervisees of police and public safety psychologists practice within their competence, and to have the psychologist assume full responsibility for appropriate supervision. Such supervisees may be practicum students, pre-doctoral interns, post-doctoral

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

residents, and even other personnel, such as administrative staff who may assist police and public safety psychologists with their practice.

A newer measure of competence, available to police and public safety psychologists since 2011, is board certification through the American Board of Police and Public Safety Psychology (ABPPSP). Board certification is achieved when psychologists are judged as successfully able to demonstrate competence in the specialty area, as rigorously evaluated by peers through a formalized process. Experienced psychologists working with police and public safety personnel may be competent but choose not to seek board certification. As Corey noted:

To be sure, psychologists who choose for any number of reasons not to pursue board certification may still be competent in the specialty of police psychology, but only ABPPSP-certified psychologists have demonstrated that competence to the satisfaction of their peers through a demanding series of examinations overseen by a nationally recognized certifying organization (2011, p. 104).

ABPPSP has identified ten foundational competencies that must be successfully demonstrated to obtain board certification in Police & Public Safety Psychology. These competencies are Professionalism; Reflective Practice/Self-Assessment/Self-Care; Scientific Knowledge and Methods; Relationships; Individual and Cultural Diversity; Ethical/Legal Standards; Practice Standards; Interdisciplinary Systems; Knowledge of Client Milieu; and Evidence-Based Practice. Detailed descriptions and corresponding behavioral anchors can be found in the Examination Manual (American Board of Police and Public Safety Psychology, 2014, pp. 35-39).

Examples of ethical dilemmas related to competence are plentiful. The clearest example is practicing in an area in which one is not competent to practice. This can present in multiple ways. Consider the psychologist who has never performed a pre-employment evaluation of a police officer applicant, yet secures a contract to provide such services and then inquires of colleagues how to perform these evaluations. Ponder the psychologist who uses outdated test measures in evaluations, or uses as primary assessment measures psychological tests that have not been validated for police psychology applications. Consider also psychologists who perform assessments unethically, such as when a psychologist's meeting with a candidate in a pre-employment evaluation consists of only a 10-minute face-to-face meeting rather than a more standard 40-minute meeting. A final example is the psychologist who does not keep abreast of developments in the field, never attends any relevant continuing education opportunities, and is either unaware of or does not follow relevant guidelines for police psychology practice.

While it is of concern when one practices incompetently, it is often likely not intentional. Practicing competently is difficult if one does not know, or does not take steps to know, the standard of practice. As with most ethical transgressions, problems with competence can be seen as errors. Such errors are not typically deliberate departures from a standard of practice or may not reflect malicious intent. Such errors may be committed because of a lack of knowledge or a lack of application of existing knowledge (Knapp, Bennett, & VandeCreek, 2012). Regardless of intent, when such errors are made it is insufficient to simply cite a lack of knowledge as justification. Therefore, psychologists should strive to gain knowledge to gain and maintain competence.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

NEW AND EMERGING ISSUES

Additional and current topics create ethical dilemmas for police and public safety psychologists. While none of the previously covered ethical challenges are necessarily simple to rectify or manage, they seem to pale in comparison to the tough ethical questions and aspirational challenges raised by new and emerging competencies, practices, and issues in police and public safety psychology.

Telehealth is an example of one such emerging practice area that brings with it a multitude of ethical challenges or dilemmas (Drum, 2014; Ragusea, 2012). Many police and public safety psychologists are uncertain of the right way to proceed. Prohibitive licensure laws currently limit interstate practice. For example, currently psychologists may only practice in states where they are licensed, excepting when other states allow for practice on a limited or other basis. Fortunately, an interstate compact is under development (Nordal, 2015). As the rest of the mental health world grapples with determining how telehealth will work, the specialty of police and public safety psychology will do so as well. For example, there is controversy about whether remote pre-employment psychological evaluations are acceptable. The International Association of Chiefs of Police (IACP) has established pre-employment psychological evaluation guidelines that currently call for face-to-face interviews, and while many psychologists view remote video evaluations as acceptable under the guidelines' specifications, some do not. And what about other services? Should law enforcement-related intervention or consultation services be performed via remote technology? Most police and public safety psychologists would likely report that they have at one time, if not routinely, provided executive consultation to command staff via telephone. While there is likely not much difference in providing such consultation services telephonically or through other remote communication means, it is currently unclear how telehealth modalities can be ethically implemented in regard to other functional competencies within police and public safety psychology.

As psychologists embrace telehealth, ethical issues will surface. A need to maintain confidentiality necessitates utilizing secure, private methods of communication. Competence is also an issue. Consider remotely conducted pre-employment evaluations. How will the psychologist assure adequate proctoring of written testing if the testing measures are administered to applicants in another state? Other services will likely expand telehealth delivery methods in police and public safety psychology practice. Perhaps webinars or remote teaching methods will replace in-person classes on mental illness and stress management at law enforcement training academies. A psychologist conceivably could participate as a consultant in crisis negotiations remotely if the technology allows the psychologist to see, hear, and perceive the call-out in real time. Issues of confidentiality and other ethical issues will arise, and will need to be resolved ethically.

Other emerging practice issues present ethical challenges. Maintaining confidentiality in digital or electronic data exchange can lead to ethical and aspirational challenges. As an example, consider the delivery of a pre-employment evaluation or fitness-for-duty report. Fifteen to 20 years ago, psychologists typically printed out and hand-delivered or securely mailed reports to agencies. For in-house psychologists, reports were completed, printed out, and delivered via an interoffice mail system. As time evolved, reports were sent via courier or any variety of secured mail service, with a signature guarantee and to a designated person. And then the Internet was born, accompanied by the expectation for quicker delivery of reports, often to aid in rapid hiring decisions. Many reports are now sent via email or other digital or electronic methods. Attending to ethical guidelines and building in safeguards to maintain confidentiality and privacy of information are important priorities. Safeguards include sending reports to designated personnel only, formatting issues such as converting documents from Word to PDF format, encryption

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

of documents, password protection of documents, access to secure data in the cloud, and use of data storage systems to be accessed remotely by agencies when reports are available.

Proper data storage and backup are also important areas of consideration for police and public safety psychologists. Any busy police and public safety psychologist is already familiar with maintaining data and records and the related physical space challenges. Electronic storage of data has been a helpful convenience for many police and public safety psychologists. Some state statutes now allow for electronic storage of data. Once records are scanned and backed up appropriately, the physical record may be destroyed. While many legal issues are at play, the ethical issues of confidentiality and competence are significant (Gamble et al., 2015). Records need to be maintained securely and remain accessible if and as needed.

It is easy to imagine all that can go awry in this electronic/digital age of information sharing. Recently, a well-regarded psychologist colleague mistakenly sent a report meant for one designee to an active psychology listserv. The report was not password-protected, and because of the collegial tone of the accompanying email, several listserv members clicked on the link to the cloud within moments of receiving the email and accessed the report. This was a humbling and concerning incident for the psychologist in question.

A subject's access to evaluation reports is another recent challenge to forensic practice. Traditionally, pre-employment psychological evaluation subjects are not provided access to copies of their reports, given that the agency is the client. Except as mandated by state statutes, specific agency policy, or by appeal rights, applicants in pre-employment evaluations do not receive evaluation results. It is standard procedure in pre-employment evaluations, as in any third-party or forensic evaluation, for the subject to be asked to sign a waiver to waive the right to access the report, as well as evaluation findings and recommendations typically included in such reports. It should be delineated in the informed consent document who will be informing the applicant of any final decision regarding his or her suitability. Typically the agency makes the hiring decision, dependent also on other data learned across multiple pre-employment hiring processes. The psychologist should not disclose findings about suitability to the examinee without the agency's explicit informed consent to do so (Bush et al., 2006). With the advent of the Health Insurance Portability and Accountability Act (HIPAA), questions arise regarding whether applicants will be privy to evaluation results, especially because of HIPAA requirements, which would typically allow individuals access to their medical information. There is now a reasonable question being asked: Is it ethical for evaluators to require evaluation subjects to sign a waiver relinquishing their right to access their records? Some psychologists argue for transparency in sharing evaluation findings with applicants (Arcaya, 2011). Some psychologists believe that any practitioner who falls under HIPAA has an entire practice that falls under HIPAA (Borkosky, Pellett, & Thomas, 2014). In other words, the police and public safety psychologist who conducts psychotherapy services and submits invoices electronically to agencies falls under HIPAA and therefore may not be able to separately parcel out pre-employment evaluations as HIPAA exempt. Finally, a number of authoritative sources have concluded that it is consistent with ethical practice to require applicants sign a waiver relinquishing their right to access their records (e.g., Spilberg & Corey, 2014). This is certainly a complex and currently controversial area with diverse perspectives on appropriate courses of action.

Psychologists are often faced with assisting police agencies with community relations. Considering aspirational ethics may be key here: psychologists committed to the best possible outcomes may see opportunities to use their competencies to help facilitate improved community relations. Concerns include the increasing public scrutiny of and discontent with law enforcement. One example of scrutiny is 21st

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

century policing controversies including "Warrior vs. Guardian" mindsets. Recent publications about these mindsets originate from a 2014 White House task force's efforts to examine and make recommendations for 21st century policing (President's Task Force on 21st Century Policing, 2015). This task force was created in the wake of highly visible officer-involved shooting incidents and multiple cities entering into settlements or consent decrees with the Department of Justice for unconstitutional patterns of police practices. Another example of public discontent is the growing influence of social media and technology. As reported in a recent publication, it is currently a tough world in which to be a police officer:

In a Gallup survey in June (2015), just 52% of Americans expressed confidence in the police, down 4 points from a year earlier and tying the lowest level since 1993. The atmosphere then was defined by the beating of Rodney King, recorded by a man on the balcony of his Los Angeles apartment with a Sony Handycam. Cops have always been tribal, keeping to their own in the weary belief that what they do is work only another cop could understand. Now everyone is an expert, and the zeal of bystanders "with their cameras out, 'waiting for something to happen,'" as one Philadelphia officer puts it, has altered the fraught dynamic between the arrested and the arresting (Vick, 2015, p.35).

Another current controversial topic in policing is the interplay between public service agencies and military returnees. Departments are dealing with military returnees, both as new applicants for public safety positions and as returning employees, back from deployment and ready to resume positions in law enforcement. While there is a well-intentioned, often political push and a lay-perception that veterans are seemingly well suited and deserving of public safety positions, according to Aamodt (2004), "There is little empirical support for the notion that officers with military experience are more successful than those without such experience" (p. 72).

Sometimes, military returnees are service-connected through the Department of Veteran's Affairs for medical and mental health disabilities. Such disabilities include cognitive disorders, traumatic brain injuries, depressive disorders, and/or trauma-related disorders such as Posttraumatic Stress Disorder. As of 2013,16% of veterans received disability pay (Congressional Policy Office, 2014). Pre-employment evaluations of applicants with these disabilities are complex. The agency has passed along and would like to hire a veteran or reserve. During the pre-employment evaluation, the subject reports being free of mental health problems and able to perform essential job functions for the high-risk, high-stress public safety position for which he or she has applied. On the other hand, during a Disability and Compensation evaluation, the subject has reported to the Veteran's Affairs evaluator, typically also a psychologist, symptoms and reactions to circumstances that have led to a mental health diagnosis, a disability rating, and subsequent financial compensation. The competent police and public safety psychologist recognizes that in each case, an individualized assessment should be performed. An aspirational emphasis here necessitates consideration of all available information, including information from the current evaluation as well as collateral information, such as the Disability and Compensation evaluation rating form, the interview notes that led to the ratings, and if applicable, other relevant medical and mental health records.

In contrast, the already-hired, incumbent public safety employee returning from deployment and military service is better protected from such scrutiny. The Uniformed Services Employment and Reemployment Rights Act of 1994 (USERRA) defines such an individual's rights. Included in these rights is an allowance to return to a previous job without undue scrutiny. Public service agencies are often unaware of or do not understand the implications of USERRA. Agencies sometimes request evaluations of returning veterans "in order to make sure they are okay to go back to work." The ethical psychologist

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

must decline this request and helpfully educate agencies about appropriate reasons to conduct a fitness-for-duty evaluation.

A final area of recent ethical concern in regard to police and public safety psychology relates to the functional domain of operations. Operational and military psychologists, as well as psychology as a whole, have recently come under fire. In 2014, the APA responded, after years of allegations, that they had supported torture and inappropriate "enhanced" torture techniques against prisoners during the war on terror (Risen, 2015). APA hired an independent investigator, David Hoffman, to investigate whether there was proof that the APA covered up activity that would represent collusion with torture. Several psychologists were previously accused of assisting in torture of prisoners during the war on terror. The claim was that leaders within APA turned away or actively colluded with attempts to cover up this information and attempted to manipulate or wordsmith the APA Ethical Principles of Psychologists and Code of Conduct so that they would not be in opposition to the enhanced torture techniques in which psychologists were involved.

The independent review report, known as the Hoffman report, created great controversy in the field of psychology and asserted that allegations were correct, that the APA had acted inappropriately, and that recommendations for change were needed. These recommendations involved scrutiny of APA leadership who had acted unethically (Risen, 2015). Another recommendation that was proposed in the report was to eliminate operational psychology entirely. Operations is one of the core functional domains of police and public safety psychology. Understandably, police and public safety psychologists watched with concern as the APA Council of Representatives convened, discussed, sought input, and ultimately voted on actions based on report recommendations and fallout.

In August 2015, the APA Council of Representatives voted to ban the participation of psychologists in national security interrogations, even non-coercive interviews. This ban, which applies only to national security interrogations, does not apply to psychologists' participation in domestic law enforcement and corrections interviews where detainees are afforded constitutional protections (Risen, 2015).

At the time of publication in 2016, there is a call to revise the relevant code(s) within the APA Ethical Principles of Psychologists and Code of Conduct. Input is sought. Police and public safety psychologists are in a unique position to provide feedback. The importance is two-fold for police psychologists and those psychologists working in public safety settings such as national security and military settings. One concern is that well-intentioned efforts by the greater psychological community to avoid doing harm may not realistically take into account the complexities of operational psychology. Unfortunately, in certain operations, people are sometimes harmed. Similarly, within operational and forensic psychology roles, often psychologists serve several parties. It is important that a revision in the ethics code not marginalize the legitimate practice of operational police and public safety psychology where psychologists are acting ethically.

As an example, consider the functional competency of crisis and hostage negotiation. Police and public safety psychologists routinely serve on crisis negotiation teams. While a goal of crisis and hostage negotiation is de-escalation and a successful outcome for those involved, such incidents are high-stakes situations in which a person has taken hostages. An ethical dilemma and aspirational challenge arises for the psychologist in weighing what "do no harm" means. For instance, if a successful resolution involves hostages being released, unharmed and alive, and the hostage taker surrendering, all is well. However, sometimes tactical action is taken, and quickly, in order to protect the hostages as well as nearby citizens who are at risk. Though ideally the psychologist steps back in those crucial seconds as a situation escalates, and is certainly not a participant in the tactical action, the action may result in the hostage

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

taker's loss of life. In this loss of life, the threat to the hostages, officers, and the public is eliminated. In this day and age of public scrutiny, operational psychologists need to be clear of their role in such negotiations and actions. However, a concern is that police and public safety psychologists who perform operational functions are vulnerable to the scrutiny of others, including fellow psychologists who are not savvy about this work and may not agree with and openly criticize psychologists' involvement in this key operations functional competency.

SOLUTIONS AND RECOMMENDATIONS

Psychologists must strive to do good, avoid doing harm, be aware of their influence, be trustworthy and mindful of responsibilities, be honest, truthful, fair, exercise good judgment, recognize their own biases and limitations of competence, and avoid participation in activities that may harm others (APA, 2002). In addition to consulting the APA Ethical Principles of Psychologists and Code of Conduct, psychologists have other ways to resolve ethical dilemmas including relevant guidelines, consultation, ethical decision-making models and adopting a critical thinking style involving a prioritization of aspirational ethics (Gottlieb & Younggren, 2011; Nagy, 2011). Each of these can assist with ethical police and public safety psychology practice.

There are multiple guidelines from IACP. These guidelines, revised typically every five years on a revolving schedule, are created in coordination with law enforcement command staff and personnel by psychologists of the Police Psychological Services Section of the IACP. The guidelines assist law enforcement agencies by offering best practice recommendations in police psychology service provision, and in being responsive to certain types of situations and critical incidents within law enforcement agencies. An example of such an incident is an officer-involved shooting. While these guidelines fall specifically under the IACP, police and public safety psychologists may follow recommended practices, such as those laid out in Pre-employment Psychological Evaluation Guidelines, with other public safety populations and settings, such as when working with corrections, detention, and fire personnel and agencies. The current guidelines include: Guidelines for Consulting Police Psychologists (2011); Pre-employment Psychological Evaluation Guidelines (2014); Fitness-for-duty Evaluation Guidelines (2013); Officer-Involved Shooting Guidelines (2013); and Peer Support Guidelines (2011). Additionally, as some competencies in police psychology are forensic, the recently revised APA Specialty Guidelines for Forensic Psychology (2013) may also serve as a useful source of information.

Consultation is important in thinking through ethical dilemmas. Easy access to consultation opportunities is found in becoming a participating member of one of the three major police and public safety psychology organizations: the International Association of Chiefs of Police, Police Psychological Services Section (IACP PPSS); the APA, Division 18, Police & Public Safety Section; and the Society for Police and Criminal Psychology (SPCP). Membership in these organizations offers benefits such as collegiality, opportunities for consultation, listservs, networking, and continuing education to increase competence. One of these organizations, IACP PPSS, offers confidential consultation to their police psychologist section members via the IACP PPSS Ethics Consultation Committee. Another way to seek consultation is to locate a board-certified specialist in police and public safety psychology; a current list of board-certified specialists can be found on the website of the American Board of Police and Public Safety Psychology. Additionally, attorneys and other professionals (such as physicians) who specialize

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

in work with police and public safety psychology may also be valuable resources in resolving ethical dilemmas.

There are many ethical problem-solving models. These all involve a successive and meticulous series of steps to be utilized in considering and resolving ethical dilemmas. Sequential steps often include pinpointing the inherent ethical dilemma(s); identifying pertinent ethical principles and codes, as well as relevant laws, other practice, and professional issues; recognizing and weighing choices with their subsequent pros and cons; identifying and seeking sources for consultation; choosing a prudent course of action; and a thoughtful review and evaluation of the chosen solution. An in-depth discussion of ethical problem-solving models with examples of application in police psychology practice can be found in McCutcheon (2011).

While adherence to the APA Ethical Principles of Psychologists and Code of Conduct is vital, adherence alone is not enough for competent, thoughtful resolution of ethical dilemmas in police and public safety psychology practice. A mindset of thinking aspirationally is encouraged. Instead of thinking about what they must do and must not do, psychologists should first consider what is the very best they are able to do. As one psychologist remarked to me recently, "Each day driving to work I wonder, what are the best things I will do to help today?" Psychologists should not only discern the minimum requirements for action and then complete them, but also strive to consider and opt for the best actions they are able to achieve for the involved parties. Rather than simply finding an applicable code of conduct and applying it to any given ethical dilemma, a psychologist should adopt a mindset of striving for good. This mindset may function as a source of inspiration for best action when a psychologist is faced with difficult ethical decisions. If not already a mindset for the police and public safety psychologist, aspirational ethics need to be encouraged and adopted as a frame of mind in daily police and public safety psychology practice.

Finally, a mindset of thoughtful and patient humility is often called for. Sometimes, no matter how seasoned psychologists are, they do not know the best way to proceed. When a psychologist is uncertain of the best way to proceed, often not acting immediately is the best option, except in emergent situations. When faced with ambiguity, a psychologist may find it helpful to take time to think through the dilemma before acting. An answer or solution may present itself. If a solution does not naturally come to mind for the psychologist, deliberately practicing an aspirational mindset, along with other practical methods to resolve ethical dilemmas, may be beneficial. Such a stance will assist police and public safety psychologists in successfully resolving more traditional ethical dilemmas and dealing effectively with new emerging practice issues.

FUTURE RESEARCH DIRECTIONS

Rich opportunities for research exist regarding ethical dilemmas in police and public safety psychology. An updated survey of psychologists is needed. Areas for investigation include which ethical dilemmas police psychologists most encounter, whether ethical problem solving models are utilized, and what heuristics are employed, such as the distinction presented in this chapter between mandatory and aspirational ethics. Additional research is also needed regarding the resolution of ethical issues involving new and emerging issues in police and public safety psychology. These include ethical issues inherent in telehealth and digital information storage and exchange, as well as the potentially changing views of who is privy to evaluation results.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

This chapter covered commonly experienced ethical dilemmas and aspirational challenges among police and public safety psychologists. Examples and commentary on emerging ethical challenges were presented. The possibility that ethical dilemmas go unrecognized due to a focus on mandatory rather than aspirational ethics warrants consideration and future research, especially in regard to new and emerging practice issues.

Chapter 78
Perspectives on the Historical Evolution of the People Side of Business

Marianne Greenfield
Argosy University, USA

ABSTRACT

Determining the direction of where a field is headed often requires a reflection of its founding principles, the transformations it has endured, and the driving forces that shape its existence. For the past century the world has experienced evolutions in technology, business, and education. This chapter provides a historical review of the practices and professions dedicated to the people side of business. The origins of Personnel Management are discussed where the department formed to meet workforce needs. A transformation to Human Resource Management is explored with an examination of the influence of professional societies on practice. The reflection of the progression of this field of practice ends with a list of challenges facing Industrial Organizational Psychology practitioners of the future. A recommendation to rethink the employer-employee relationship with the workforce of tomorrow closes the chapter and hopefully encourages human resource professionals, I/O professionals, and their professional societies to embrace the next requisite transformation.

INTRODUCTION

Search current literature, blogs, and conferences relevant to people at work and one will find there are numerous reports indicating a time for change in the Human Resource (HR) department and function. Some predict the department will be eliminated from most firms by 2020. The July/August 2015 issue of *Harvard Business Review* headline read, "It's Time to Blow Up HR and Build Something New". Afterwards, panic in the HR professional associations went into full force and the millions of HR professionals in the world are in a fight for self-preservation. For over a decade, HR professionals have been clamoring to have a seat at the proverbial executive table. Once in that position, many did not know how to posi-

tively contribute to the organization beyond reporting on their 50-year tradition of filling job openings faster, processing payroll and benefits more economically, and striving to ensure all employees should be treated equally by complying with "check-the-box" training and enforcing policies (McDonald, 2001).

HR professionals have made attempts to learn more about business terminology, setting financial goals, and reporting new metrics to the C-level. It has also been noted that in some cases, the HR department has been moved in the organizational structure to report to the Chief Financial Officer (CFO) which may contribute to the unfortunate interpretation of the phrase "People are our most important assets" to literally being something owned versus a philosophy that employees bring the most value to the firm. Transforming the HR department to a metric-driven cost center is obviously not the answer to people or talent management as the war for talent continues to be a major topic of concern around the world (Ulrich, 2015).

The Society for Human Resource Management (SHRM) published a study in 2012 investigating what HR practitioners thought the challenges facing their profession would be over in the upcoming decade. Results reported that retaining and rewarding the best employees was first on the list. Asking what their HR competencies needed to be is reported in this order: Business Acumen, Organizational Navigation, Relationship Management, and Communication Skills (SHRM, 2012). Similarly, Silzer and Cober (2010) conducted a study of Industrial Organizational Psychology practitioners to determine what they perceived to be important for the future of practice in their field. The conclusion was that they would be considered the gurus of talent.

The insinuation that many of the talent management functions now managed by human resource professionals might be moving to another field of practice has created alarm among the millions of HR professionals and has created increasing interest from business leaders. As in other professions, external forces have been the catalyst to begin this transformation of practice in both human resources and industrial organizational psychology. To better understand the current transformative opportunities for those that wish to be the talent experts, a clear understanding of the historical progression and relationship of the people management function over time is investigated beginning with its creation. The purpose of this chapter is to outline a brief historical summary of the people side of business and introduce contemporary challenges facing business leaders as these professions collide.

BACKGROUND

Personnel Administration

Some might argue that the function of human resources dates back to prehistoric days where consistent methods of selecting tribal leaders have been documented (Rotich, 2015). Others prefer to recognize the origins in the Chinese employee screening techniques used between 2000 BC and 1500 BC and still others claim the first human resource function was documented with the Greek practices of developing and implementing an apprentice system (Beagire, 2004). Modern historical reports tend to note the beginnings of this functional department to be related to the growth of large factories during the British Industrial Revolution during the 19th-century. This revolution brought a demand for rapid hiring practices and record keeping for a large employee population (Boudreau & Ramstad, 2009). According to the Trustees of the British Museum (2016), during this time, "Children were sent to work in factories, where they were exploited and ill-treated; women experienced substantial changes in their lifestyle as

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

they took jobs in domestic service and the textile industries, leaving the agricultural workforce and spending less time in the family home" (para 16). For some, the social and technological innovations brought new wealth and a better life. However, for others these changes brought poor working conditions which gave way to pressures for government intervention to introduce legislation for human rights and safety.

At the beginning of the 20th century in the United States, Personnel Administration emerged as a business function focused on employee related issues, safety of workers, and compliance with newly introduced laws (Klerck, 2009). In 1900, the B.F. Goodrich Company established the first employee management department and in 1902, National Cash Register established a Personnel Department to handle employee issues (Niles, 2013). Because of the economic improvements in the United States, the U.S. Department of Labor was established in 1913 with the mission to promote the welfare of working people and their work conditions (Department of Labor, 2010). The members of the Personnel Department were then accountable to stay abreast of regulations. They were also responsible for the administrative aspects of hiring, evaluating, training, and compensating employees.

After World War II, the introduction of formal workforce development training programs became a respected unit of the Personnel Department. According to Nankervis (2011), business practices emphasized employee productivity through various motivation techniques, initiated a concern for workforce welfare issues including morale, and activated the emergence of job descriptions which improved recruitment and selection of talent. Additionally, the official recognition of trade unions emerged in various countries, mainly in the United Kingdom and United States. These events were a catalyst for change in the profession as personnel administrators needed knowledge and skills in collective bargaining, employment law, job analysis, recruitment, labor relations, training, and benefits (Nankervis, 2011).

By the 1970s, technology had provided the ability for multinational firms to excel and globalization to become an important directive for the personnel functions. The shift from industrial to service economies also impacted the functions and responsibilities of these professionals. Leadership and succession planning became critical elements to the strategic success of the business (Vani, 2011). Competitive advantages for the business were intended to be realized through these functions of the Personnel Department.

With this acknowledgment that Personnel was gaining importance in the organization, the department name changed to Human Resources and professional associations expanded to assist in the transformation of knowledge and practices as stated by the Society for Human Resources Management (SHRM, 2016). At some point during the mid-1980s, human resource management was recognized as the proper term for those responsible of managing the human assets of the organization. While employee commitment and motivation were at the center of organizational objectives, attaining technological resources were also a priority in business practices. Examining the subsequent thirty years of global business and employee practices we acknowledge that employee experiences with change become more frequent, the need for education and training continues to rise, the inclusion of technologies disrupts the way we work and play, and the war for talent is formalized. Corporate culture becomes more fluid, data is abundant and ubiquitous, connectivity to others is far reaching, and career options are becoming specialized for those both in and outside of personnel administration.

Human Resource Management

In the 21st Century, the conversation regarding the personnel responsibilities has been one laden with much debate. While there is agreement that having the right employees in the right jobs performing at maximum productivity with excellent quality and costing the firm the least amount possible is one

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

objective, the details of who, what, where, when and how to do this remain in dispute with a variety of approaches utilized. Human Resources (HR) as a functional department of the business continues to be responsible for the acquisition, assessment, and retention of talent. However, the war for talent brings many organizational challenges resulting in operational responses that range from outsourcing these tasks to unrealistic demands of the internal HR department. Technologies such as applicant tracking systems and employment websites have assisted in reaching job seekers yet they bring additional difficulty in the selection process. This expensive process of building a workforce has led to professional evolutions in the HR functional department. Rotich (2015) reported that through extensive research in the history, evolution and development of human resource management (HRM), there have been several varying definitions of the role but traditionally, HRM is a product of the human relations movement of the 20th century. Additionally, Rotich (2015) reports that HRM, or the predominantly transactional work of HR, has evolved over time due to globalization, consolidation of firms, and technology innovations. The United States Department of Labor (2016) defines the occupation of a Human Resources Manager as those that, "plan, direct, and coordinate the administrative functions of an organization. They oversee the recruiting, interviewing, and hiring of new staff; consult with top executives on strategic planning; and serve as a link between an organization's management and its employees" (para. 1). And while similar positions described on the website are noted to be specialists in labor relations, training and development, and compensation and benefits, the profession requires only a bachelor degree. This US Department of Labor (DOL) description aligns with one of the mainstream definitions of human resources where HRM has administrative and transactional responsibilities in the process of managing people within an organization. However, business leaders are asking for the HR department to perform beyond this education and skill level as the complexities of managing the people side of business continue to multiply.

According to SHRM (2016), another contemporary view of HRM exists where the practice encompasses the management of people in the form of a collective relationship between the management and employees. This approach focuses on the objectives and outcomes of the HRM function and lends itself to be in alignment with the metrics of the business for which they serve. Terms such as *employee engagement* and *people development* are often used. These practices may contribute to productivity, retention, and sustainability but the evidence is not clear. What is clear is the need for the transformation of human resource practitioners to possess the knowledge, skills, abilities and competencies beyond the origins of personnel administration or even 20th-century human resource practices. Of particular importance is the evolution of the practice from being directed to protect the employer from employees to a practice empowered to establish the right relationship between the employer and employee so they both realize their individual vision of success. During this transformation, the need increased for a professional society to strengthen the field, educate the practitioners, and drive recognition of their value to the businesses.

The Professional Societies

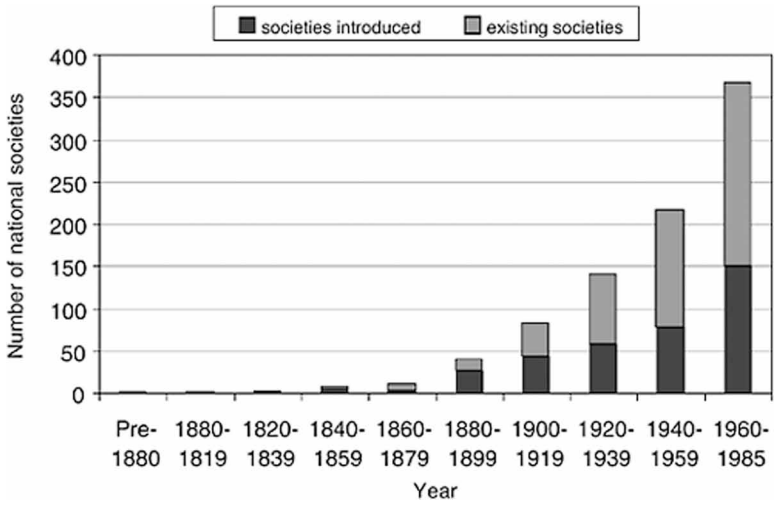
It is recognized that professional societies have the potential to develop change for the profession they represent. Typically, these associations and societies are structured as a non-profit organization seeking to further a particular profession, the interests of individuals engaged in that profession, and the public or private sector interest of the profession. The mission of professional societies has been to serve their members primarily through educational and informational services (Clark, 1989). Often the society can gain influence from commonly defined functions: to publish professional journals, to develop profes-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

sional excellence, to certify talent, to raise public awareness, host professional conferences, possibly affect legislation, and to create and present professional awards.

Some societies might provide job postings, professional development workshops, and networking events for members. When a professional society is established it is expected the society will keep abreast of the changes that affect the profession they represent. As the workforce has evolved through the centuries, professional societies have been introduced, formalized, and evolved as well. To see this as a visual trend in professional societies, the growth of national societies from 1880 to 1985 is shown in Figure 1. As transformation in the workplace occurred, increases in the introduction of new professional associations occurred with the most dramatic increase in new societies launching in the 1960-1985 timeframe.

Figure 1. Growth of Professional Societies (Clark, 1989)



By 2010, the Internal Revenue Service of the United States recognized 92,331 trade and professional associations (ASAE, 2012). The pattern of coordinated activity in the private sector has shaped and advanced the United States dating back to the first American settlers and their guilds (ASAE, 2012). As seen throughout history, when the community the professional society serves is transforming, the professional society will either need to transform or risk the possibility they will be replaced with a society that better meets their needs. This is evidenced in the human resource and I/O fields with both new professional societies emerging and others transforming. For example, the Association for Talent Development is the result of the 2014 transformation of the American Society for Training & Development (ASTD) after 71 years of existence.

A second example is the creation of the National Association of Organizational Psychology (NAOP) which was legally established in 2014 to support and mentor new I/O Psychology practitioners as they elect a career transition. Even the Society for Human Resource Management (SHRM) organization, which has traditionally been the association of choice for human resource professionals, has experienced transformation in their renowned certifications. Beginning in 2015, a competency-based certification for human resource professionals replaced the industry standard PHR and SPHR certifications. With a multitude of specializations in the I/O psychology field emerging, professional associations continue to

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

launch and gain mindshare such as the Association of Corporate Executive Coaches (ACEC), the Association for Professional Executive Coaching and Supervision (APECS), the Association of Executive Recruiters (NAER). This list expands with a simple online search in your area of interest. And with these changes, the clear roles and responsibilities of the human resource professional no longer exist.

This transformation can be seen as a natural reaction to employees being a huge expense in a decade of a declining economy. In the 21st century organization, the HR department is no longer seen as bringing value if their only role is as an administrative cost center to the organization. Professional associations are attempting to promote the value that their members bring to the business community. But both the associations and businesses are struggling with the new demands of a multigenerational workforce. Millennial workers are reported to place less value on formal and traditional means of networking, preferring to establish their own relationships in their own ways (Lucas, 2014). Social networks now provide easy and convenient ways for industry members to find each other and network. The proliferation of online content has led to vast and often free access to the types of information that professionals used to be able to access only through association membership and industry conferences. With these transformations, it is becoming unclear as to not only the role of a human resource professional versus an I/O professional but also the number of these professionals currently in practice.

In an effort to better understand what is trending during our current shift in employment positions that are focused on the people side of business, we might inquire with the social networks, industry forecasters, and the United States Department of Labor for predictions. Each year Randstad, a global HR services company, publishes its predictions of hot jobs based on an analysis of economic projections and market trends. In 2015, Randstad research indicated that most midsize and large companies continue to operate on a lean HR team but with the demand for talent in STEM (science, technology, engineering, and mathematics) on the rise and projected for the future a more savvy HR professional will be required (Maurer, 2015). Some say this means the HR administrator will be replaced with an I/O practitioner. According to Miller-Merrell (2013), there are over 2 million LinkedIn profiles that claim an affiliation to a human resource role, the United States Bureau of Labor Statistics reports over 5.6 million HR professionals in practice, and Bloomberg BNA (2016) reports human resources staffing relative to the workforce tumbled in 2015 but the job duties increased for those remaining in the HR department. As the needs of talent management efforts grow and change, it is hopeful that human resources and I/O practitioners will both be in higher demand. A possible confusion for both business executives and managers is that they won't know the difference between them. It is possible that the I/O job title will continue to be illusive as I/O practitioners begin to redefine the roles and values of employees responsible for addressing issues and objectives focused on the people side of business. It is possible that the job titles of HR professionals will have to be amended and/or new certifications will need to emerge in order to better distinguish the knowledge, skills, abilities and competencies of these professionals around the world. Historically the professional societies have driven these initiatives. The following global professional societies may be key stakeholders in the transformation of the practitioners whose talents are targeted at managing talent in the global workforce.

Asia

The Asia Pacific Federation of Human Resource Management (APFHRM) is one of the major human resource professional associations representing countries in the Asia Pacific region. As a collective, the Federation's purpose is to advance the standing of the human resource and people management profes-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

sion within the region (APFHRM, 2016). Accordingly, the Federation's major focus is in matters relating specifically to HR in the Asia Pacific region, though it is also an active branch of the World Federation of People Management Associations (WFPMA). The countries that form the federation are Australia, Bangladesh, Fiji, Hong Kong, India, Japan, Malaysia, New Zealand, Papua New Guinea, Philippines, Singapore, Sri Lanka, Taiwan, Thailand and Vietnam (APFHRM, 2016). One of the countries in the Federation has developed their own very active HR association, the Australian Human Resource Institute (AHRI), and state they have over 20,000 members (AHRI, 2016). While they do express acknowledgement of the need for some innovative and transformative ideas, their actions remain similar to other associations in education, conferences, legislation, and networking.

In the ever evolving world of human resources, new initiatives and changes to existing practices are constantly coming to light. HR practitioners have often been accused of jumping on the latest fad or idea in the market. It is important for practitioners to assess new HR practices for their appropriateness and the potential to add value in assisting an organisation to achieve goals. (AHRI, 2016, para 1)

Europe

The European Association for People Management (EAPM) was founded in 1962 by the national associations and professional institutions of personnel management in France, Germany, Switzerland and the United Kingdom (EAPM, 2016). EAPM has member associations in 30 different countries across Europe where each of the countries is represented by its own national association or professional institute of personnel management (EAPM, 2016). With the current transformation in the United Kingdom as a result of the vote to leave the European Union, the consequences for human resource professionals may be a catalyst for disruptive change. The professional society of today will be called upon to assist in this transition or it is possible that other associations may emerge.

United States

The Society for Human Resource Management (SHRM), formerly called the American Society for Personnel Administration, was founded in 1948 by a group of 28 individuals and in 1984 with the name changed to the Society for Human Resource Management in 1989 (SHRM, 2016). This professional society claims to be the world's largest human resource professional society with approximately 285,000 members in more than 165 countries with more than 575 affiliated chapters within the United States and subsidiary offices in China, India and United Arab Emirates (SHRM, 2016). Established in 1951, the National Human Resources Association (NHRA) places primacy on advancing the careers of its members by enhancing their planning and leadership skills. The American Council on International Personnel (ACIP) is a leading voice and resource for employers working worldwide to advance employment-based immigration of highly educated professionals. The College and University Professional Association for Human Resources (CUPA-HR) is an HR organization that places primacy on the efficient management of human resources within the university and college setting.

The Global Initiative

With millions of human resource professionals and strong professional associations and societies around the world championing their relevance to business, change may be especially difficult as a global initiative. However, at the time of this publication businesses and the world's transformations are driving another evolution of the human resource, or people management, function. There is no worldwide agreement regarding exactly what the HR department should do, or be, or what their value contribution must be moving forward. Entrepreneurial and innovative firms have been noted to delete the human resource department from their organizational chart to find later that some aspect of the traditional function is needed. Just as globalization, company consolidations, and technology innovations have been disruptive to the world as we know it, many agree disruptive change to people management is required in some way. Morgan (2016) reflects on the new technologies, new recruitment approaches, new discussions on a multigenerational workforce, and the evolution of organizational structures to comment that out of all of the functions of business, "HR has perhaps remained static for the longest period of time yet it is also the only department inside of our organizations that is focused on touching every single employee" (para. 1). Unfortunately, the professionals in this space have been seemingly slow to respond, possibly resisting these changes by holding on to old business practices, norms, metrics, and concepts that are not relevant to the contemporary needs, much less the future needs, of both the business and the employees. Or possibly the change cannot be seen by those on the inside but rather should be initiated from those outside of the human resource community. The practitioners in the field of Industrial Organizational Psychology are eager to address these contemporary needs of the organization as either an internal or external consultant.

MAIN FOCUS OF THE CHAPTER

Industrial Organizational Psychology

For a field of study that has been in existence for over 100 years, there has been some confusion about its name, its purpose, and its practitioner. The evolution of this field has been consistently filled with disagreements from within the community of professionals and their associated societies. For many, the profession is known to consist of researchers who may publish new findings and consult with large firms or teach at prestigious universities. Moving research to practice and having a psychology practice are very different in nature, skill, and licensure. Current issues in business practices and people management are now driving those in the industrial organizational psychology field to reflect on their purpose and develop innovative approaches to applying their knowledge, skills, and abilities to a fluid, fast-paced, real-time, global business environment.

For some, the field has experienced an identity crisis which remains relevant today. Even the name has been an element of confusion and contention. Gaining perspective of the history of the advancement of the I/O Psychology field begins with the name. The term *industrial psychology* in the United States became popular after World War I and was characterized by ability testing and vocational assessment (Koppes, 2007). Other names such as *economic psychology, business psychology,* and *employment psychology* have also been briefly used. With a number of changes in social, legal and business practices, by 1973 the addition of the word *organizational* was added to *industrial psychology* to reflect the grow-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

ing influence of social psychologists and organizational development consultants (Landy, 1997). Most everyone in the field was dissatisfied with the name of I/O Psychology and in 1976 the first attempt to change the name for the field was made (Campbell, 1997). Complaints and debates remained for almost 30 years yet nothing was changed. By 2010, a vote by the membership of the Society for Industrial and Organizational Psychology (SIOP) to change the name to Organizational Psychology was made yet the existing name prevailed by 15 votes (Benjamin, 1997b). For now, the name remains but so does the deliberation about the I/O Psychology practitioner.

As Campbell (2007) notes, I/O psychologists "have borrowed heavily from social, cognitive, clinical and counseling psychology, personality and individual differences and even behavioral genetics" (p. 454). But I/O research has also been applied, or put into practice, for decades. The US Bureau of Labor Statistics (2012) Occupational Outlook Report stated that while the current number of I/O practitioners in the workforce is small, employment will rise 53 percent nationwide between 2012 and 2022. This profession is described by the BLS (2016, para. 9) as those that:

Apply psychology to the workplace by using psychological principles and research methods to solve problems and improve the quality of work life. They study issues such as workplace productivity, management or employee working styles, and employee morale. They also work with management on matters such as policy planning, employee screening or training, and organizational development.

The professional society for Industrial Organizational Psychology has been investigating what this business job function, or practice, might demand. Silzer and Cober (2010) conducted a study with existing I/O psychology practitioners who were members of the professional society SIOP (Society of Industrial Organizational Psychology) in order to gain a better understanding of how they saw the future of I/O psychology practice. Their report suggests that the field of I/O Psychology is highly likely to go through some significant changes similar to those of the human resource field. A key question now is whether I/O psychologists and SIOP are prepared to proactively shape the future of the field or will they let professional societies such as ATD, SHRM, NAOP, ACEC, APECS, NAER, WFPMA or others attempt to take the lead.

Professional Society for Industrial Organizational Psychology

As expected, the Society of Industrial Organizational Psychology (SIOP) has evolved just as the profession has evolved over the decades. Today, SIOP (2016) states it is "the premier membership organization for those practicing and teaching I/O psychology" (para. 2). The history of SIOP is a long and winding road where it is noted to begin as part of the American Psychological Association whose mission was to advance psychology as a science. With a lack of recognizing applied psychology early on, there was a need to create a division of industrial psychology. "Reluctantly, APA created a Section of Clinical Psychology in 1919 to accommodate the applied psychologists in clinically-related jobs; however, nothing was created for industrial or educational psychologists" (SIOP, 2016, para. 4). For over 50 years, applied psychologists sought other professional organizations to pursue their interests and in 1921, the New York Association of Consulting Psychologists (ACP) was founded (Sokal, 1992). Tension continued to grow within APA and other professional societies were created as local and state interest groups of the applied and professional psychologies. According to Sokal (1992), one of those was the American Association of Applied Psychology (AAAP) which was introduced as a national association to represent the interests

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

of applied psychology and this organization grew rapidly throughout the United States. Membership was dominated by university-based psychologists although many psychologists employed full-time in industry were members (Benjamin, 1997b). Strife continued and by 1982, what had been developed as Division 14 of APA incorporated as the Society for Industrial and Organizational Psychology, Inc.- A Division of the American Psychological Association. Hakel (1979, p. 78) stated:

Incorporation as The Society for Industrial and Organizational Psychology was proposed to provide Division 14 with an independent and secure base, to sharpen our public identity, to increase member identification with our organization, to gain flexibility and responsiveness in dealing with legal (EEO) issues, to gain more control over our financial affairs, and to enable us better to pursue opportunities.

According to Weiner (2013) in the most recent publication of the Handbook of Psychology, there remain tensions between the testing and selection focus of the Industrial side of the profession with those of the attitudinal and social factors of the Organizational side. Another tension is whether the I/O psychology practitioner serves the employer or the employee. From the field's research, it is indicated that a better understanding of a potential employee coupled with a strong understanding of the current employee provides a bridge to self-actualization of the individual and the productivity goals of the organization.

Evolutionary Briefs on Practice

It may be that the leaders of businesses, universities, and professional societies in the fields of human resource management and industrial organizational psychology will need to determine a clearly defined synergy moving forward in order to continue bringing value to their shared clients which are both people and organizations. However, the emigration of I/O psychology and I/O training to business schools has been another source of contention for decades. Universities are moving from only offering a research-based I/O doctoral degree program towards including a practitioner-based master degree program. Degree programs are also migrating from the psychology department to the business department. Weiner (2013) states "this may provide some positive benefits to the field by making it more interdisciplinary" (p. 5). However, he continues to state that there is also a danger to the field in that this could lead to I/O psychology becoming synonymous with human resource management or organizational behavior. Organizational Behavior has been described as the study of the way people interact within groups (Boundless, 2016). This has historically been important to the study of business management as well as to the results of business practice in terms of efforts to enhance overall organizational performance, individual employment satisfaction, and to determine delegation of tasks to resources for maximized productivity. Other components include examining organizational culture, leadership, and team building (Boundless, 2016). It is clear that all of these fields of study and practice have a goal to improve performance and satisfaction of individuals, teams, and organizations. While not necessarily strategically outlined in planned organizational movements, historical classifications do emerge as we examine the work of I/O and other practitioners focused on the employer to employee relationship over time. Beginning with the Hawthorne Studies in the 1920s, the theme in practice has been to gain a better understanding of human relations in the workplace as outlined in Table 1. By 2015, the evolution can be depicted in terms of four generations of focus by grouping key.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

First Generation: Human Relations

It is often noted that the 1920 Hawthorne Experiments were revolutionary in terms of research into workplace behavior (Gillespie, 1991). In reflection, throughout the thirty years that followed there was much inquiry for business practices to gain a better understanding of how to achieve higher production rates from existing employees. This remains a concern in business today albeit the work itself and the environments in which work is performed may be vastly different. What we learned in this period is that people influence the results of productivity by their own human complexities. Employees must feel a need for security of basic life needs. Managers were thought to be the decision maker and must demonstrate their authority. Organizational loyalty was strong and working with their peers or in groups was desired. The consultants of this time were attempting to assist managers and individuals to work more effectively as individuals. At the same time, the historical reports of personnel departments indicate the 1920s was a time of administrative performance and a focus on avoiding labor unions (Massarik & Pei-Carpenter, 2002). Power was heavily weighted in favor of the employer, managers were often abusive, and workers had few rights or protections other than to quit. With the economy beginning to improve, the larger corporations often saw value in providing a few employee benefits as a way of recruiting, retaining and motivating employees. However, there was a worldwide recession that hindered others from adopting new approaches in the employee-employer relationship as they had no difficulty in recruiting labor. During the 1930s, due to collective bargaining tactics and the New Deal, some personnel departments transformed into industrial relations (IR) departments as the need for strong union negotiations and management was prevalent (Zeitlin,1987).

Second Generation: Management Development

By 1945, employment management and welfare work had become integrated under the broad term *personnel management* (Klerk, 2009). Experience of the war had shown that output and productivity could be influenced by employment policies. According to Klerk (2009), the role of the personnel function in wartime had been largely that of implementing the rules demanded by large-scale, state-governed production, and thus the image of an emerging profession was very much a bureaucratic one. Peter Drucker, one of the first management specialists to achieve guru status, was a representative of this era in business (McGrath, 2014). With his response to Alfred P. Sloan's challenge to better understand how to manage a complex organization such as General Motors, Drucker responded with his book *Concept of the Corporation* in 1946. Drucker began to see that value created within the organization was not just from productivity but also created by workers' use of information. As knowledge work grew in demand with the changing business environment of the 1950s into the 1960s, researchers including Ginsberg, Drucker, McGregor, and Likert were presenting methods, theories, and ideas that challenged previous business practices. Motivation and engagement of workers became the center of focus while control and authority transitioned to a more participative coaching role (McGrath, 2014). Topics of research, theories of practice, and consultants focused on increasing performance quality through design or redesign of systems, providing new research and sound theory on how to promote proper conversations and behavior in the workplace, and training managers on the effective use of both informal and formal feedback sessions using communication skills with subordinates such as listening, asking questions, and providing feedback. Team building and conflict management became centers of interest as did implementing surveys, setting goals, and introducing problem solving processes.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Third Generation: System-Wide Strategic Change

The economic upheaval of the 1970s led to a new era of economic changes. According to Conte and Karr (2001), the new president of the United States, Ronald Reagan (1981-1989), based his economic program on the theory of supply-side economics, which advocated reducing tax rates so people could keep more of what they earned. The theory was that lower tax rates would induce people to work harder and longer, and that this in turn would lead to more saving and investment, resulting in more production, and stimulating overall economic growth. By 1983, inflation had eased, the economy had rebounded, and the United States began a sustained period of economic growth (Conte & Karr, 2001). With a positive outlook came hope, innovation, and investments in the future rooted in strategic change.

Toffler (1980) in *The Third Wave* characterized this shift to relentless change as the defining feature of the third phase of civilization which followed a first wave being agriculture and the second as being the industrial wave. This work further claimed that the dawn of this new phase will cause great anxiety for those that grew up in the previous phases, and will cause much conflict and opportunity in the business world. Bradford and Burke (2005) revisited the transitions of organizational development and reported that during the 1980s organizational development became a more established field with courses and programs being offered in business, education, and administration curricula. In the 1990s and 2000s organizational development continued to grow and evolve and its influences could be seen in theories and strategies such as total quality management (TQM), team building, job enrichment, and reengineering (Bradford and Burke, 2005). Many authors and pundits have attempted to explain what all of this means for business strategy. In 1988, Henry Mintzberg examined the strategic process and concluded it was much more fluid and unpredictable than people had thought. In 1990, Richard Pascale wrote that relentless change requires that businesses continuously reinvent themselves. In his works, he suggested that people generally tend to depend on what has worked before and they often resist change.

Successful strategic businesses in this era were implementing technology solutions or products and services at a rapid pace, the workplace was becoming 24 hours by 7 days by 365 days per year operations with automated interactive voice response (IVR) systems, the phone network was integrating with the data network, the employees assumed more accountability, and greater competencies for the workforce were required. Planning, implementing, and managing change was at the center of activity. Topics of research, theories of practice, and consultants focused on facilitating change through self-managed teams, cross-functional teams, developing learning organizations, introducing 360° feedback systems, and assisting organizational leaders in any way possible to facilitate organizational change and innovation.

Fourth Generation: Innovation and Connection

Leaving the era of systematic, planned change we enter the era of constant and disruptive change. Businesses relied on organizational development, human resources, and I/O psychology educators, consultants and practitioners to bring businesses through a dynamic age of progress. Human resource professionals were also undergoing changes in their function as the people in the organization were now being considered an important asset. The process of attracting talent was changing with the influence of technology applications, the Internet, and applicant tracking software. Social media became a common way for people to connect with others. A new generation of future employees emerged with differences that are now complicating the practices of business and talent management. Additionally, in the early years of the 21st century, personnel research departments have largely disappeared from organizations,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

outsourced to research consulting firms, and I/O psychologists have broadened their roles and responsibilities inside organizations (Koppes, 2007). Practitioners in I/O psychology have expressed professional interests and needs that are noticeably different from those I/O psychologists focused on conducting research. Silzer, Cober, Erickson and Robinson (2008a) describe three subgroups of the profession: research, education and practice.

While the fields of human resources, organizational development, and industrial organizational psychology continue to overlap, merge, diverge, compliment, and contradict each other business leaders are searching for information from all of these professions or any of these professions to assist them in problem solving and strategic planning efforts similar to what they have experienced in the past. Moving into the uncertain future we take with us virtual teams, online communities, social media platforms, global or boundaryless business environments, mergers and acquisitions, a decade of distress in the workforce, and a promise of even more changes in the future.

Theories and methods of industrial and organizational psychology are those of all psychology, only slightly constrained by characteristics of employment settings and assumptions about those who populate them (Katzell & Austin, 1992). In review of these theories of human behavior in organizations we can see they are consistent with a classic model that views behavior as a function of ability, motivation, and situational opportunities. Differences among theories within the field are primarily differences of emphasis. Some look within the individual and others focus on tasks, interpersonal factors, or organizational structures to explain behavior. The issue at hand today is to determine what the fifth generation of theory and practice should target and how we might align human resources, organizational behavior, and industrial organizational psychology disciplines in order to address the needs of the workforce of the future.

SOLUTIONS AND RECOMMENDATIONS

Rethinking the People Side of Business

From a review of the perspectives of the historical evolution of the people side of business, there are no indications that understanding and managing people in the workplace is going to slow down, stabilize, or get simpler in the future. On the contrary, all indicators point to a time of transformation for all professions dedicated to the study and practice regarding people at work. The war for talent continues on a global stage. Technology continues to evolve and bring more automation and self-service applications. The digital revolution has contributed to increasing the value of people in the organization with specialized knowledge and skills. The shift in power has occurred where people desire more control over their careers and loyalty is often not the priority. Pensions are rarely offered. Millennials are bringing new perspectives to the terms *work* and *leadership*. The transparency and accessibility of new job opportunities indicate that whoever emerges as the talent gurus for this next era need to change the goals and metrics of what defines successful talent management.

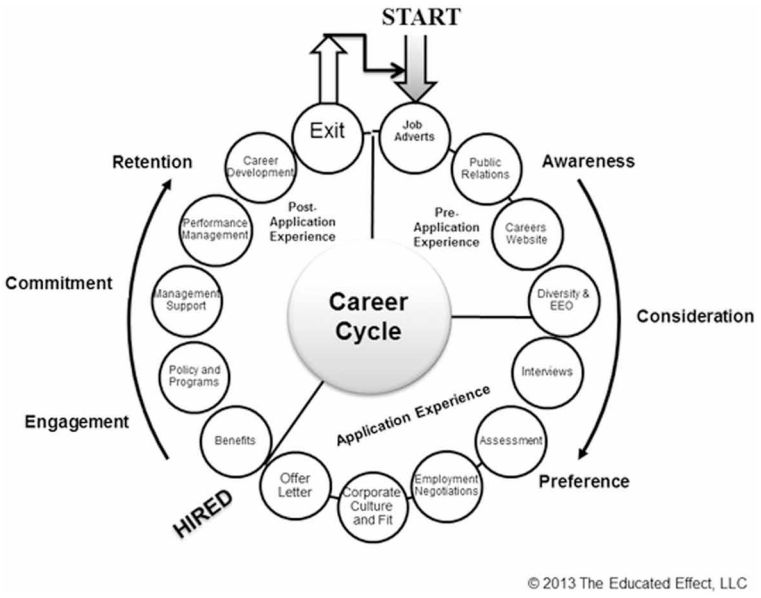
A few of the possibilities might be such ideas as to consider that a firm might only need to retain all necessary talent for while the talent is truly utilized and should consider opportunities to trade talent when business needs change. Or maybe to recognize that passion for one's work is becoming increasingly important to individuals and replaces the desire to simply get a job. We must understand matching work tasks to passion could be a competitive advantage when the labor market grows tighter with improved

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

economic conditions. Whatever we determine to be the solution, the Fifth Generation of people practices will have to evolve from where we are today in the employer-employee relationship.

The employer-employee relationship has typically had an obvious entry and exit point represented in the hiring and termination processes. All of the relationship considerations in between these events are developed by the leadership and people within the organization, guided by competitive pressures and legislation, and not always appreciated as a contributor to organizational goals. Figure 2 represents the cycle of an individual career with typical relationship elements, called touchpoints, shown as bubbles around the circle.

Figure 2. Cycle of Career Touchpoints



At the top, there is a Start indicator representing when someone becomes familiar with the organization and begins their relationship with it. Moving clockwise, the first few touchpoints are not necessarily sequential but represent the idea that as soon as someone learns of your organization, they have entered the cycle and begin their relationship even though they are not an employee. This could be a customer, a referral, or a potential talent anywhere in the world that happens to know of the organization. During this Awareness period, there is no clear assignment as to what professional is the expert in this space. Often, it has been a mixture of human resources, marketing, or an outsourced recruitment agency. The talent winners of the future will need to develop expertise in activities of employment awareness. Continuing clockwise around the touchpoints, the Consideration and Preference mindset of talent must be mastered. Being this is a behavioral and psychological experience, it would behoove us to realize that only paying attention to the process is a weakness of HR historical practices. The relationship the organization builds during the application experience with talent participating in interviews, assessments and negotiations is crucial to the success of the organization. I/O practitioners are noted to be the experts in this particular set of functions. Once the talent is officially hired, a new set of talent management activities begin which will need to be revolutionized for the predicted future workforce. Engagement, Commitment and

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Retention phases have been the focus of business practices in recent years with many of the talent issues and programs being focused after the Hire.

All professionals focused on the people side of business play a role in the success of each of the touchpoints. Historically, the organization has believed that they control the touchpoints and make the decisions about the employee at each stage of the relationship. However, it is becoming more apparent that as an individual is contemplating their career, they may or may not decide to move forward with the organization based on the pre-application experiences or a reflection and understanding of their passion as it relates to the practices of the firm under consideration. When the individual decides to move forward around the diagram, they next enter the Application experience touchpoints. Once they have applied to the organization, the individual is attentive to additional experiences encountered with the organization through the entire application process. Again, the individual will make decisions whether to move forward to the post application experience touchpoints just as the organization determines if they would like to move them forward. While represented as a few bubbles on the diagram, the employment experiences and touchpoints on the left of the diagram grow increasingly more complicated and the employer-employee relationship is intensified, affected on a daily basis, and often misunderstood. At some point in time, the employee either elects to move to the Exit process from the company or may apply for a promotion or other movement within the organization. The organization can also decide to move the employee to the Exit process. If the employee-employer relationship goes well, individuals could exit from their position and be promoted around to the right side of the diagram quickly and into a new position beginning with the onboarding touchpoint with the new job title and responsibilities. This promotion link is represented by the black arrow shown between the Exit arrow and the Start arrow in Figure 2.

To rethink the touchpoints in the future, we can expect that the cycle will move more quickly and individuals will desire more input into their career choices and experiences. This only amplifies the need for I/O psychology practitioners to rise in numbers as employees of businesses working with human resource professionals and business leaders with the joint purpose to work strategically and diligently on each of the touchpoints in order to cost effectively operate the business.

The Millennial Workforce

The workforce of tomorrow is actually here today. The Millennial generation has become the largest group of workers as noted in Figure 3. This Millennial generation has been characterized in a number of different ways but is generally defined to be the generation born after 1982 that have been raised with technology at their fingertips. On the negative side, they have been described as lazy, narcissistic and prone to move from job to job in relatively short amounts of time. It is possible that they will prove to be more civically and politically disengaged as well as more focused on materialistic values. On the positive side, they have been described to generally be more open to new ideas, confident, self-expressive, liberal, and upbeat. In Simpson (2016), the study reported that Millennials place more of an emphasis on extrinsic values such as money, fame, and image, and use social media applications such as Twitter and Instagram to socially identify with people they desire to follow. This study also noted that Millennials do not see leaders of industry to be interesting to follow but rather, they follow leaders for inspirational purposes or those that assist them in their pursuit of money, fame, and image. Implications of this report could include a catalyst to rethink the employee-employer relationship in ways that have never been considered before.

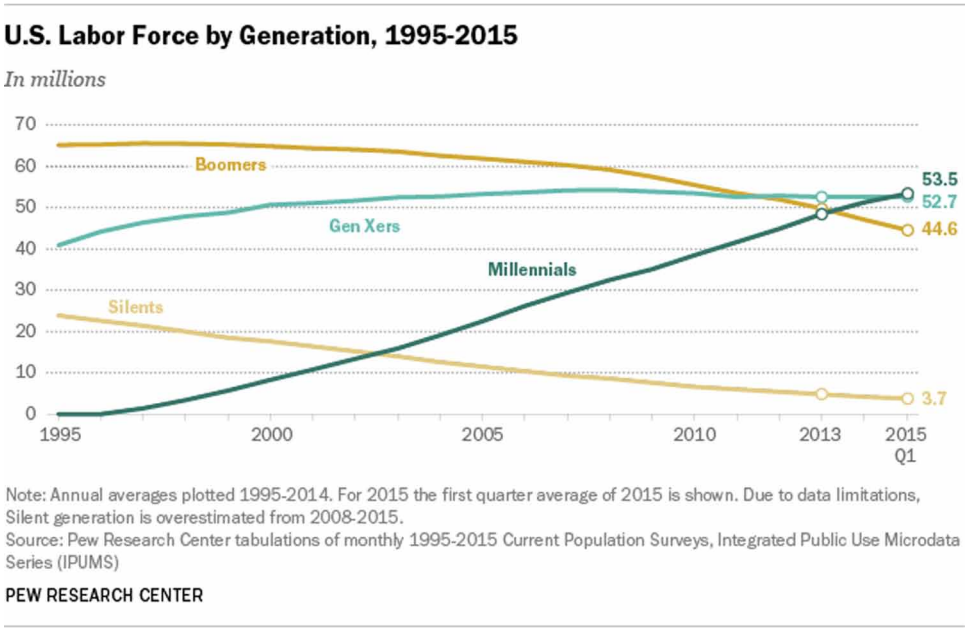
Figure 3. Labor Force Composition (Pew Research, 2015)



With these changes in the workforce upon us disruptive change is eminent for those practitioners of I/O psychology, human resource management, and all other professionals proclaiming to focus on the people side of business.

CONCLUSION

Through this historical review of the evolution of professionals focused on the people side of business it is evident that the lines have blurred and no clear division in responsibilities towards workforce success and talent management can be found. It is understood that HR professionals and I/O Psychology professionals have redefined their duties and attempted to respond to the ever-changing needs of organizations throughout the last century. These professions are currently asking questions about the changes that might be necessary to continue to add value to their field and to the clients in the years to come. In today's global economy with a new generation taking their place in the workforce, it has become apparent that the need to develop innovative workforce strategies is now more important than ever before. Particular to the future of I/O Psychology practice, there continues to be a need for research in the psychology of work in these changing environments. Additionally, there is an increasing need for I/O practitioners to be internal and external consultants to businesses of all sizes. Possibly, I/O practitioners should consider individuals as their focus of practice for career strategies. Then the educational institutions have opportunities to develop relationships with those in I/O research and practice and most likely will be challenged to develop a curriculum that integrates the multiple dimensions of business which includes the people side of business. Of course, human resource professionals will be challenged to implement

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

programs, policies, and events that strengthen the touchpoints in the employer-employee relationship which may necessitate a rethinking of their job titles and roles.

Silzer and Cober (2010) conducted a brief survey on the future of I/O practice with members of the I/O Psychology professional society SIOP. In their report, the need for a transformation was acknowledged but a resistance to change was prevailing. A fear of irrelevance, a threat of competition from other fields of practice, a loss of identity for the profession, a challenge to demonstrate their return on investment for contributions, and an academic migration to business schools was the responses to how current practitioners saw their future (Silzer& Cober, 2010). At a minimum, I/O practitioners should develop a strong identity and purpose and then clearly share their message which differentiates them from the historical views of human resource professionals or administrative coordinators or compliance managers. There is opportunity for every field of practice within this genre if lines of demarcation are created. While we cannot definitively say today what tomorrow will bring but what we do know is that the evolutionary process of people at work will continue.

KEY TERMS AND DEFINITIONS

Career Cycle: The lifecycle of the employee-employer relationship beginning with ones awareness of the organization through their employment at the organization to the exit from the organization.

Human Resource Management: An administrative function in organizations designed to maximize employee performance through the planning, organizing and coordinating of activities such as hiring, firing, performance management and training.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Industrial Organizational Psychology: The scientific study of human behavior in organizations and the work place focused on deriving principles of individual, group and organizational behavior and applying this knowledge to the solution of problems at work.

Organizational Behavior: The study of the way people interact within groups.

Personnel Administration: An administrative function of an organization that exists to provide the personnel needed for organizational activities and to manage the general employee-employer relationship.

Professional Societies: Usually a nonprofit organization seeking to further a particular profession, the interests of individuals engaged in that profession, and the public interest.

Talent Management: A set of integrated organizational processes designed to attract, develop, motivate, and retain productive, engaged employees.

Chapter 79
Neurological Disorders, Rehabilitation, and Associated Technologies: An Overview

Sateesh Reddy Avutu
North-Eastern Hill University Shillong, India

Dinesh Bhatia
North-Eastern Hill University Shillong, India

ABSTRACT

Patients with neurological disorders are increasing globally due to various factors such as change in lifestyle patterns, professional and personal stress, small nuclear families, etc. Neurological rehabilitation is an area focused by the several research and development organizations and scientists from different disciplines to invent new and advanced rehabilitation devices. This chapter starts with the classification of different neurological disorders and their potential causes. The rehabilitation devices available globally for neurological patients with their underlying associated technologies are explained in the chapter. Towards the end of the chapter, the reader can acquire the fundamental knowledge about the different neurological disorders and the mal-functionality associated with the corresponding organs. The utilization of advanced technologies such as artificial intelligence, machine learning, and deep learning by researchers to fabricate neuro rehabilitation devices to improve patients' quality of life (QOL) are discussed in concluding section of the chapter.

INTRODUCTION

In human's, disease or injury due to nervous system is treated as neurological disorder. The malfunction of either central or peripheral nerves system due to biochemical, electrical or structural abnormalities can cause neurological disorders. The neurological disorders are categorized as movement, sensory and

mental. Abnormalities in the central nervous system will affect the functionality of brain and spinal-cord. The functionality of hands, legs and other sensory organs are depending on performance of peripheral nervous system. Rehabilitation to neurological patient depends on kind of neurological disorder, age, gender, living atmosphere and life style. Based on situation and purpose the rehabilitation devices are helpful for physiotherapist and nurses to make their task easy and reduces the burden on patient. The rehabilitation device will play the role for neurological patient throughout their life-spam. The advanced technology such as artificial intelligence, machine-learning and deep-learning in the field of computer science and robotics facilitate the bio medical engineer to design multipurpose devices rather than single application oriented devices and size of the devices are tremendously decreased which lead to easy transportation. New physiotherapy techniques are discovered based on the advanced technology. Irrespective of the technology, the purpose of any rehabilitation device is to facilitate the user to do their daily activities by themselves without any risk. However, independent of technology used each device has its own merits and demerits. The objective of this chapter is to provide fundamental knowledge of different neurological disorders and classification. The working principle and associated technology, along with merits and demerits of various rehabilitation devices and therapy techniques are briefly explained. The future scope of the current technology in neuro-rehabilitation engineering is discussed in the concluding section of this chapter.

NEUROLOGICAL DISORDERS AND CLASSIFICATION

Based on the literature survey it can be concluded that humans are suffering from more than 600 types known neurological disorders. According to the Global Burden of Diseases (GBD) Neurological disorders are the leading cause for disability and sometimes lead to death. Feigin et al gave the brief summary on global, regional and national wide burden of neurological disorders for the period from 1996 to 2015 (Headache, dizziness, raised intracranial pressure, unconsciousness, Neurological problems and Neurological disorders). The international classification of functioning, disability and health (ICF) provides the description of health and related states. In order to design best or innovative rehabilitation device/ therapy, the designer must possess the basic knowledge of various neurological disorders, causes and effects on performance of the organs. Any neurological disorder can cause impairment in movement, sensory and mental. The classification of the neurological disorder based on the nature of impairment is shown in table 1.

REHABILITATION FOR NEUROLOGICAL DISORDERS

Rehabilitation services provide help to improve the abilities against the impairment of disabled people and not focus on the disease. The impairment may have related to consciousness, cognition, speech, vision, sensory and physical movement. The level of impairment depends on the neurologic function across multiple domains. The various scales such as Glasgow Coma Scale and American Spinal Injury Association Impairment are used to evaluate patient's condition. The patient's ability to perform their routine tasks are measured in terms of daily living activities and functional independence measure. Rehabilitation will be achieved through learning compensatory techniques and adaptation to promote neurological recovery. Over the past two decades' tremendous growth in neuro rehabilitation technologies

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. The classification of neurological disorders based on cause of impairment

Movement Related Neurological Disorders	Sensory Related Neurological Disorders	Mental Related Neurological Disorders
Ataxia Cervical dystonia Chorea Dystonia Functional movement disorder Huntington's disease Multiple system atrophy Myoclonus Parkinson's disease Progressive supranuclear palsy Restless legs syndrome Rett Syndrome Spasticity Tardive dyskinesia Tourette syndrome Tremor Wilson's disease	Autism spectrum disorder (ASD) Blindness and low vision Hearing loss and deafness Sensory processing disorder Sensory hypersensitivity	Anger Anxiety and panic attacks Bipolar disorder Body dysmorphic disorder Borderline personality disorder Depression Dissociative disorders Recreational drugs and alcohol Hypomania and mania Loneliness

such as robotic systems, electrical stimulators and wearable sensors to check the actual performance. Since, the rehabilitation is combination of multiple technical expanses, multi-disciplinary professionals are needed to provide effective and efficient rehabilitation for people with long term neurological problems. The different component related to rehabilitation is shown in figure 1.

ADVANCES IN NUERO REHABILITATION DEVICES AND THERAPY TECHNIQUES

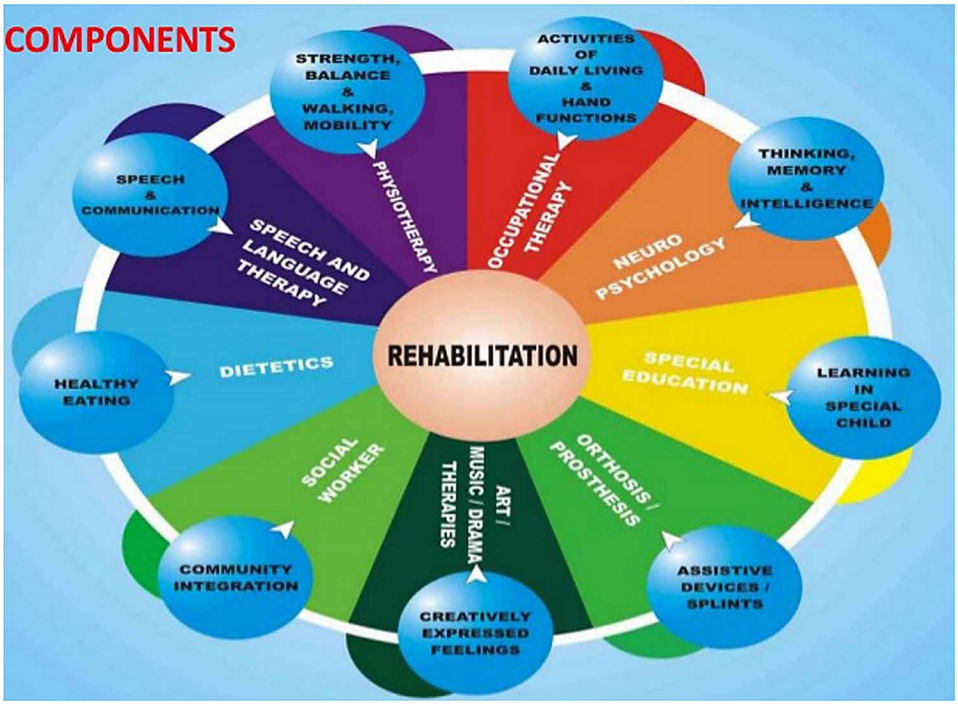
The advances in technology offers more practical applications in both engineering and medical field. It allows the doctor to give better treatment for patient and allows an engineer to design a suitable rehabilitation device. From past two decades, tremendous technological advancement and change has taken place in manufacturing the rehabilitation devices. All kind of neurologic patients are benefited with advanced rehabilitation techniques. The role of rehabilitation for various kind of neurological disorders are explained in the section titled "Rehabilitation For Neurological Disorders." Globally available rehabilitation devices and various therapy techniques along with merits and demerits are elaborated in following sections.

Rehabilitation Devices

Movement disorder due to neurological syndrome results an excess of movement or unnatural movement. In the year 2011, Stanley Fahn explained the classification of movement disorders including parkinsonism, Dystonia, and tremor (Fahn, 2011). Irrespective of the movement disorder classification, the main objective of rehabilitation device, or technique/method is to provide balance in movement, gait and posture. Based on the disorder and requirement, the patient can choose the devices like wheelchair, robotic arms, exoskeletons etc. to fulfil their movement related tasks.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The different components related to rehabilitation
(source: Saans Saksham Rehabilitation and Home Care)



Wheelchair

Wheelchair is an ancient rehabilitation device used to overcome the mobility disorder. The first wheelchair was invented in 1595 and called as invalid's chair. The Bath wheelchair was invented in 19th century. After making so many improvements a wheelchair model was invented with rear push wheels and small front wheels and patented in 1869. The first spoked wheels and motorized wheelchair was invented in 1900 and 1916 respectively. Unfortunately, motorized wheelchairs were not available commercially in 1916. The first folding wheelchair was invented by Harry Jennings, in 1932 which is similar to the traditional manual wheelchair available globally. George Klein, a Canadian scientist put more effort to improve the motorized wheelchair. In 1956, Everest and Jennings started manufacturing electric wheelchair on mass scale. The various wheelchair models from past to present is shown in figure 2.

In 19th century people used wood to make wheelchair frame and parts. In 20th century various materials are used by the manufacturing industry to design a wheelchair without violating the design ethics. The innovation in design of the wheelchair facilitate the user in comfort seating and safety in all- terrains during the ride. But, controlling the wheelchair movement is difficult for neurological disorder patient compared with other patients, these people should depend on either add-on devices or caregivers as per their safety concern. The doctors will prescribe the powered wheelchair to neurological disorder patients in the absence of care givers. Joy stick is common device used to control the wheelchair movement. However, the modern wheelchairs are added with touch panels to control the wheelchair at less physical effort. Operating the touch panel is difficult for people not able to control their finger movements, in such cases external controlling device must be added to wheelchair to help the rider and trained profes-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

sional is mandatary to demonstrate the device. The performance, accuracy and reliability of the device will decide the safety of the rider. The various smart control methods are:

- Brain computer interface (BCI)
- Voice control method
- Various physiological signals

Brain computer interface (BCI) is a direct neural interface that enables the direct communication pathway between the brain and wheelchair and classified as Active BCI, Reactive BCI and Passive BCI. In Passive BCI, the command signal is from spontaneous brain activity instead of voluntary control. Irrespective of classification, BCI is combination of hardware and software and consists of signal acquisition and processing unit to generate the control signal. The signal processing unit made with algorithms to perform the tasks such as feature extraction and data translation (Hassanien & Azar, 2015). In 2005, Tanaka et al proposed the first BCI controlled wheelchair based on Electroencephalogram (EEG). Bi et al did the survey on EEG based brain controlled robots and explored the various kind of algorithms used (Bi, Fan, & Liu, 2013). In 2017, Ramadan et al explained the various controlled signals, types and classification used for BCI. The various electrodes used for data acquisition, its merits and demerits and challenges associated with current technology which restricts the accuracy of BCI are elaborated (Ramadan & Vasilakos, 2017). The accuracy of the whole BCI system depends on user and their re-

Figure 2. The various wheelchair design models from past to present [A] Spain wheelchair [B] Steven Farffler wheelchair [C] Bath chair [D] First wheelchair with spokes [E] Basic manual wheelchair [F] Basic powered wheelchair [G] I-bot wheelchair [H] Direct drive hub motor wheelchair
(Source: https://abilitytools.org)

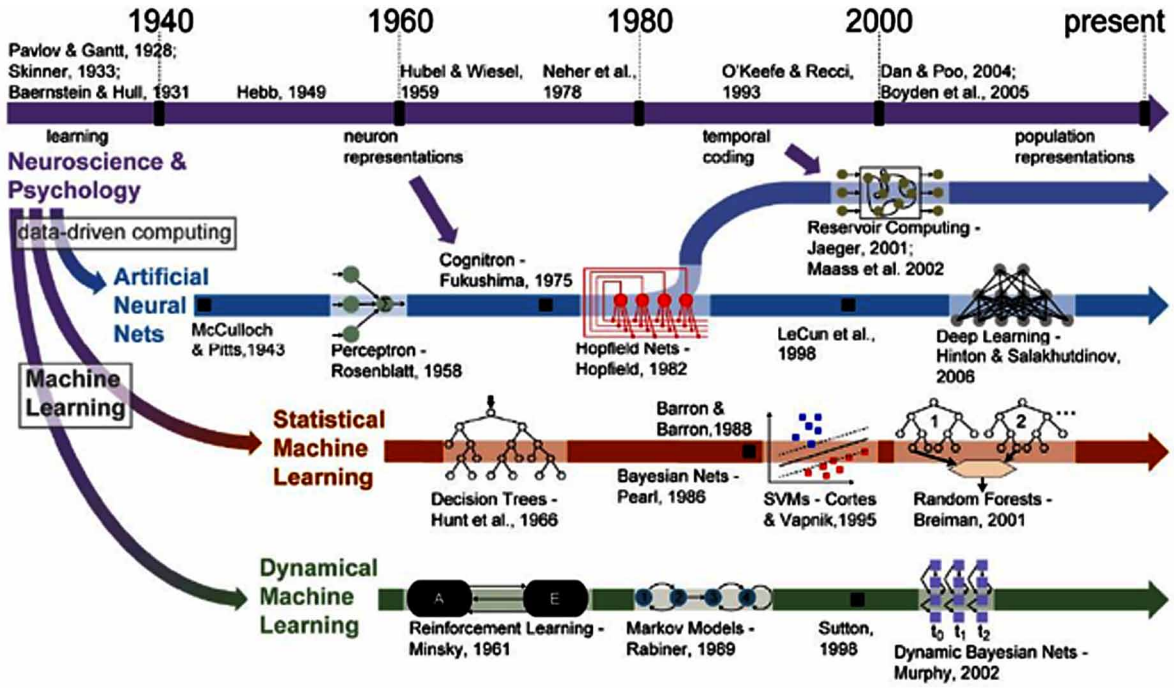
EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

quirements are depending on nature of the disability. Unfortunately, the guidelines have to be followed by the BCI developers are not yet standardized and till fully autonomous BCI controlled wheelchair are not commercialized in global market.

Voice control method is the best remedy to control the wheelchair movement and recommended for wheelchair bounded patients. It is easy to attach a Vo powered wheelchair. The input voice signal can be generated by the wheelchair user or collected from the bio signals. A microphone is used to take the input from the wheelchair rider and electrodes are used to collect the bio signals. Irrespective of input signal the accuracy of the output depends on signal processing algorithms. Separate algorithms are required for voice processing and bio signal processing. The two major disadvantages with voice control are, human voice is not unique and the features of the voice signal is depending on the emotional status of the user.

Hansen et al explained about the problems associated with the speaker recognition (Hansen & Hasan, 2015). Schultz et al (2017) explained the bio signal based speech processing algorithms. Tirumala et al (2017) discussed various speaker recognition algorithms. The development tree for neural-inspired algorithms and hardware architecture is shown in figure 3.

Figure 3. The development tree of neural-inspired algorithms and hardware architecture
(James et al., 2017)



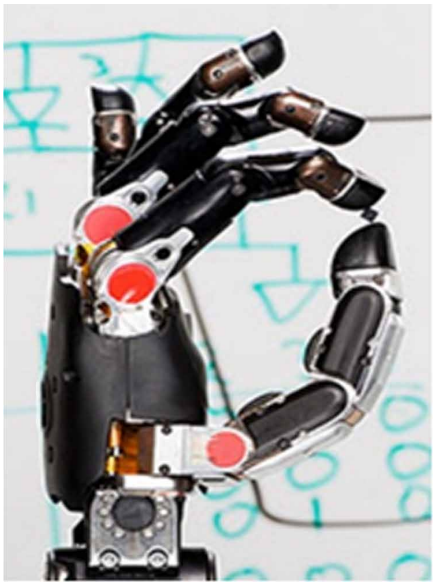
Robotic Arms

The Robotic arm is used as assistive device to fulfil the tasks done by human arm. It may be a complete prosthetic device or augmentation device made with lightweight materials and low power consumption motors. In case of amputee patients, the robotic arm is directly attached to patient hand and movement

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

was controlled by electromyogram (EMG) signals. It can be fixed with support of rigid body for patients with neurological disorders. In case of wheelchair or bed redounded patients it can be used to feed the patient. The accuracy and efficiency of robotic arm movement depends on quality of hardware components and algorithms used. The degree of freedom (DOF) define the number of hand or finger movements in different directions. The people with muscle impairment prefer augmentation device for extra support so that they can do the task easily. Saikia et al (2016) explored the recent advancements and history in prosthetic hand design. In year 2016, the defense advanced research projects Agency (DARPA) released food and drug administration (FDA) approved mind – controlled robotic arm as shown in figure 4. It has an ability to bend, rotate, and twist in 27 different ways like a normal human hand.

Figure 4. DARPA'S prosthetic hand
(Source: www.darpa.mil)



Exoskeleton

An external skeleton made with lightweight material and mechatronic devices to support the internal skeleton is treated as exoskeleton and these are classified as full body, upper extremities and lower extremities. The upper extremities are used to support arms and trunk. The lower extremities are used to control the parts below the trunk such as hip, knee and ankle or its combination. Exoskeletons with batteries to run the sensors and actuators is treated as powered exoskeleton otherwise it is treated as passive exoskeletons. The powered exoskeletons are classified as static and dynamic. The passive exoskeletons are used for weight re-distribution, energy capture, dampening and locking. The exoskeletons based on functional electrical simulation (FES) is treated as hybrid-exoskeletons. The exoskeletons can be controlled by biosignals such as EEG or EMG signals. The Berkeley lower extremity exoskeleton (BLEEX), hybrid assistive limb (HAL), XoR, Body Extender, hydraulic lower extremity exoskeleton (HLEE), Institute for machine and cognition mobility assist exoskeleton (IHMC MAE), MIT Exoskeleton

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

are the few models developed by the research and development organizations. Ansari et al (2015) gave the brief explanation about performance and mathematical modeling for above models.

The full body exoskeletons can change the life style of wheelchair or bedridden patients due to neurological disorders. However, it is mandatory to check the walking style to avoid the damage of another biological system or organs of the patient. The difference in nature of human walking can estimated by using the gait lab. In BLEEX and HAL they used the EMG and pressure sensors to collect the walking data. Machine learning classification and clustering algorithms are required for off line data mining to predict the movement of lower limb. In 2012, Zhao, Zhang, & Guo (2012) explained the application of the machine-learning algorithms and various lower limb movements for motion analysis. Caldas et al (2017) explained the adaptive algorithms used to analyze the gait cycles based on inertial sensor data.

Rehabilitation for Sensory Related Disorders

Sensory receptors are specialized cells to detect specific stimuli occurring in the human body. These cells are classified as interoceptors and Exteroceptors. The mall function in exteroceptors will result in the impairment in the ability to taste, smell, vision, and hearing. The impairment in the sensory organs such as Eyes, Ears, Nose, Tongue and Skin can cause low vision/blindness, partial/complete loss of ability to hear, smell, taste and touch feel respectively. The low vision/blindness is due to chronic visual deficit which is not compensated by ordinary glasses and lens. The advanced devices such as video magnifiers, sonic cane, mini-guide, victor reader stream, haptic shoes and navigation bracelet are mostly expensive and unfamiliar to common people. The modern smart phones available in the global market allows the patients to do multitasking with the help of some add-on applications. The various electronic gadgets available in the global market to serve the visually impaired people are classified as travelling, path oriented and position locator devices and their performance is depending on following aspects.

- Exchange of information between user and sensors in an indoor and outdoor environment will help to avoid the obstacles
- The sensors should work at any condition of light i.e., day and night
- The range of obstacle detection should be more than five meters as safety concern
- An ability to differentiate the static and dynamic objects

Elmanni and Elleithy (2017) elaborated the broad classification visual assistive technologies and brief explanation about the sensor based assistive devices along with working principle and future aspects.

The hearing loss can be categorized as sensorineural and conductive hearing loss or combination of both. The damage in the cochlear/vestibulocochlear nerve can cause sensorineural hearing loss. The impairment of physical and mechanical obstruction to air conduction channel of ears can cause the conductive hearing loss. Hearing machines/aids are used to avoid the problems associated with ears impairment and classified as implanted and non-implanted devices. Implanted devices are fixed in ear and non-implanted devices are placed outside of ear. The broad classification of implantable devices is shown in figure 5.

Hearing aid is simple electronic device consisting of microphone, an amplifier and speaker. The power is needed for amplifier to boost up the signal strength and the quality of the device is based on performance of signal processing algorithms. The development in the hardware and software technology leads to reduce the physical size of the hearing aids drastically and current research is ongoing to

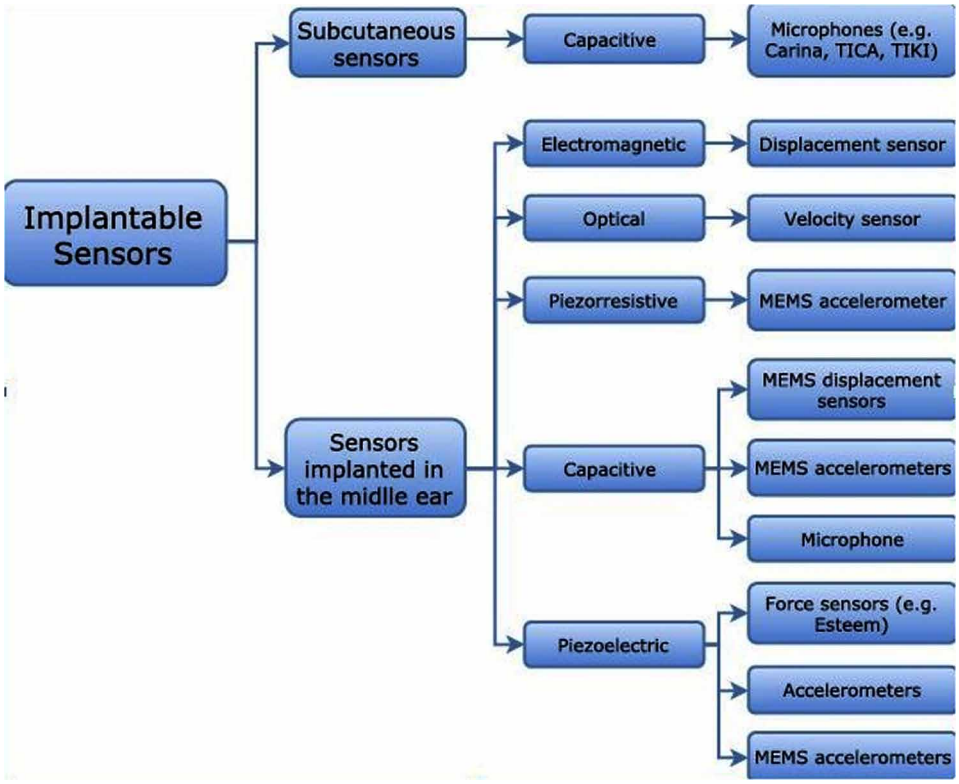
Figure 5. Classification of implantable sensors for hearing devices
(Brody, Smith, & Ray, 2018).



develop a self-rechargeable implantable hearing device. Calero et al described the technical development of implantable sensors (Brodie, Smith, & Ray, 2018). Brodie, Smith, and Ray (2018) did the survey to explain the impact of hearing aids on quality of life of hearing loss patients (Calero, Paul, Gesing, Alves, & Cordioli, 2018).

The inability to smell and taste is treated as olfactory. It is the common problem occurred in adults aged between 65 to 80 years. There are multiple factors such as olfactory epithelium damage, age-related nasal epithelium atrophy, decrease in nasal mucosal metabolizing enzymes that are responsible for olfactory sensation (Wongrakpanich, Petchlorlian, & Rosenzweig, 2016). Patel (2017) reviewed the various therapy techniques to improve the ability of olfactory patients. Tongue is an organ made with muscles and capable to move without any bone support. The restrictions in the tongue movement results in dysfunction of mastication, deglutition and speech. The rehabilitation to this patient depends on the nature of glossectomy. Therapy techniques are mandatory along with prosthetic tongue.

Rehabilitation for Stroke and Trauma Patients

The sudden death of neurons inside the human brain can be treated as stroke. Ischemic stroke and hemorrhagic stroke are the two common types. The rehabilitation for stroke patients depends on several factors such as nature of stroke, age and living atmosphere and class of evidence. The class of evidences are well explained by American heart association (AHA) and American stroke association (ASA). According to

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

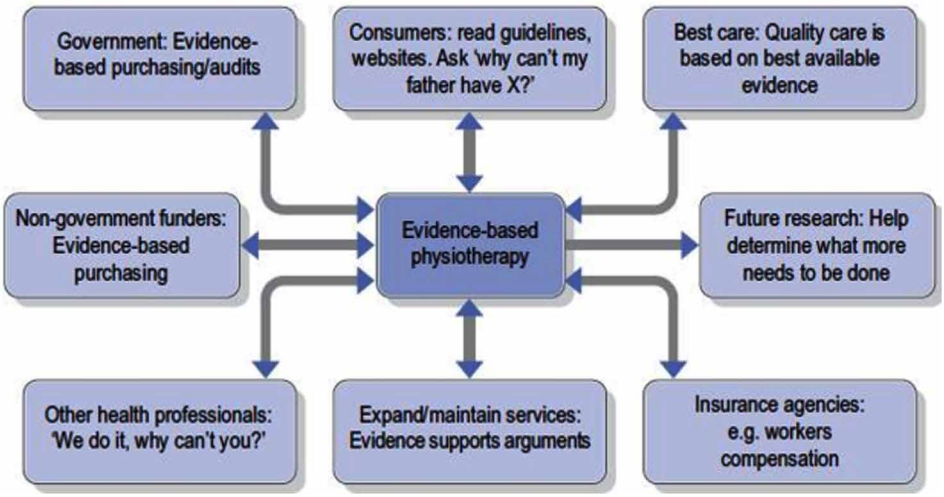
the guide lines given by AHA/ASA (Winstein et al., 2016) large team support is needed for adult stroke rehabilitation. Suarez-Escobar et al briefly explained the technology developments of robotic/mechanical devices for post stroke rehabilitation (Suarez-Escobar & Rendon-Velez, 2018).

Any physical injury which leads to severe wounds, broken bones or internal organ damage can be treated as trauma. The severity of injury is calculated by injury severity score (ISS). The rehabilitation to the trauma patients depends on the severity of the injury or nature of the damaged organ. Long and Koyfman (2018) explained the advances in neuro-trauma management.

ADVANCES IN THERAPY TECHNIQUES

Psychotherapy is kind of treatment used to cure the mental related disorders. According to American psychiatric association (APA) the therapy techniques are classified as cognitive behavioral therapy, interpersonal therapy, psychodynamic therapy and psychoanalysis. Based on the patient's disorder and circumstances the doctor will suggest the suitable therapy technique (American Psychiatric Association, 2011). Evidence based practice (EBP) is the common technique used by many psychotherapists. The drivers of EBP is shown in the figure 6.

Figure 6. The drivers of EBP
(Lennon & Stokes, 2009)



Akyuz et al explained about the physical therapy modalities to cure the neuropathic pain (Akyuz & Kenis, 2014). Sullivan, briefly explained the various manual therapy techniques for chronic and low back pain disorders (O'Sullivan, 2005).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

We have classified Neurological disorders as Movement, Sensory and Cerebral. Movement disorders are those where the Neurological injury restricts the movement of the patient. Sensory disorders are those where the some or most of the senses (sight, sound, touch, smell) are disturbed and the patient is unable to function normally. Mental disorders are those where the patient has lost the balance of his mind. However, with some technological help such patients can be normal or near normal and carry on their daily activities. The main difficulties in the movement and sensory disorder patients are:

- Movement from one place to another
- Performing daily tasks (such as closing doors, crossing roads, climbing stairs)
- Performing tasks involving effort such as lifting weights.

The principal utilities to help such patients are:

- **Automated Wheelchairs:** These are wheel chairs which are battery operated and can be controlled with available controls (movement, speed, breaks) on the arm rests or foot pedals, as desired by the patient These chairs require no further assistance making the patient fully independent. More advanced versions have additional features such as step climbing and therapeutic abilities.
- **Robotic Arms:** Robotic arms are extensions of human arms. These arms are either controlled via a BCI (Brain Computer Interface) or are attached to the arms themselves and controlled via mouse/keyboard. Typically, these Robotic arms can lift weights, can perform very precise tasks or tasks which require great skill. For example, robotic arms are used by surgeons to perform intricate surgery with great success.
- **Exoskeletons:** Exoskeletons are for those who cannot move their arms or legs. The exoskeleton allows control/movement of robotic arms and legs. Thus, paraplegic patients can use such a system to both move and perform tasks with ease and control.

Chapter 80
Individual, Institutional, and Environmental Factors Promoting Patient Retention and Dropout

Precious Arnan
University of West Indies, Barbados

Emmanuel Adugu
University of West Indies, Barbados

ABSTRACT

The primary purpose of this chapter is to determine factors that shape client dropout and adherence to Cardiac Disease Prevention and Rehabilitation Programs. The sample consists of 68 individuals, including those currently in the program (adherents) and those who have dropped out (dropouts). Findings show that clients undergoing rehabilitation are much likely to drop out when they are in the critical zone. This is a point where institutional factors, individual factors and environmentally-related factors are not favorable to clients. The risk of clients dropping out can be drastically reduced through the provision of an enabling environment comprising a set of factors that foster adherence such as financial sponsorship, institutional support, high intrinsic motivation, improved illness perception. In that context, there is the need for program administrators to closely monitor at-risk clients, especially those whose social, economic and psychological profiles predict non-adherence.

INTRODUCTION

The issue of client dropout from Cardiac Disease Prevention and Rehabilitation Programs (CDPRP) is a global problem. Client dropout from CDPRPs has generated concern at the institutional level, prompting the need to determine barriers to adherence as a means to both address the problem and improve institutional planning (Leon et al, 2005). It is in that context that determining barriers to client adherence and retention have been the concern of the Heart and Stroke Foundation of Barbados.

The following are the objectives of this chapter:

1. To investigate reasons that influence client adherence dropout from the program.
2. To determine the effectiveness of the program.
3. To assess if there are differences in adherents (current participants) and dropouts with respect to client satisfaction, intrinsic motivation, social support, institutional support, family support, illness perception and psychological distress.

BACKGROUND

Barbados is a densely populated island of 431 square kilometers with a population of 284,644 (World Bank, 2013). The Heart and Stroke Foundation of Barbados initiated the Cardiac Disease Prevention and Rehabilitation Program in 1994. It aims at rehabilitating clients through the use of medically monitored exercise, dietary advice, psychological counseling and education to enable participants (clients) become more informed and empowered to adopt a healthy lifestyle and ultimately sustain the benefits of rehabilitation over a lifetime (Heart and Stroke Foundation of Barbados). Unfortunately, client participation and adherence to the CDPRP have been declining over the years.

Despite the evidence of benefits, many patients fail to participate in or adhere to cardiac rehabilitation (Ades as cited in Leon et al., 2005). Adherence rate is operationally defined as 'the number of persons who remained active in a program at a given time compared with the total number of persons who began the program' (American Heart Association, 1994, p. 1605). According to the American Heart Association, adherence rate is highest in the first three months of exercise training programs, typically above 80%, down to 60% -71% in the sixth month, 45% -60% in twelfth month, 30%-50% after the second to fourth years. While factors linked to client drop-out are varied and somewhat interconnected, Aldosary and Garba (1999) stated that these factors could be grouped into two main categories namely (1) individual factors-those factors associated with individual traits and (2) institutional factors-those factors associated with the institutional environment.

Barriers to Participation and Adherence

There are barriers to client participation and adherence to health rehabilitation. Evidence from survey research indicates that there are several obstacles faced by patients who are eligible to participate in outpatient cardiac rehabilitation. In that context, Yohannes, Yalfani, Doherty, and Bundy (2007) studied a group of 189 patients who had been referred to a six-week outpatient cardiac rehabilitation program. The specific focus of their research was to identify the predictors of early drop-out from a cardiac rehabilitation program perceived to contribute to the drop-out problem, and assess the major differences between adherents and drop-outs. Yohannes and colleagues found significant differences between adherents and drop-outs, hence concluded that gender, younger age, Hospital Anxiety Depression Scale score, illness perception consequences, illness perception personal control and illness perception treatment control to be the major predictors of persisting or dropping-out. Similarly, Wittmer, Volpatti, Piazzalonga, and Hoffmann (2012) reported that low exercise capacity, high body mass index, smoking, diabetes, and widowhood were significant factors associated with early withdrawal. Daly et al. (2007) reported that factors associated with adherence included non-referral by physicians, associated illness, specific

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

cardiac diagnoses, reimbursement, self-efficacy, perceived benefits of CR, distance and transportation, self-concept, self-motivation, family support, social support, self-esteem, and job. Whereas, factors associated with non-adherence included being elderly, female, having fewer years of formal education, CR perception benefits, having angina, and lower activity level during leisure time.

While views for improving retention are wide reaching, they are reflective of the fact that peoples' non-participation or adherence often draws on a number of contributing factors, rather than just one main issue. A relevant conceptual framework will offer insight into the dynamics of client adherence/ retention and dropout.

CONCEPTUAL FRAMEWORK

The purpose of the conceptual framework is to present a clear picture to help in understanding client dropout and adherence to the program and how it impacts program success.

Figure 1 is a diagram of the conceptual framework which depicts the factors associated with drop-outs and adherence to treatment- individual factors, institutional and environmental related factors. The authors posit that clients do not act in isolation hence conceptualizing that there are certain factors contributing to and or inhibiting the development of long-term adherence to Cardiac Disease Prevention and Rehabilitation Programs. The core problem of low rates of adherence which subsequently inhibits the ability of the program to achieve its shorter, intermediate and long-term outcomes, comprise individual, institutional and environmental factors.

The complexes of dynamic individual factors which are obstacles to adherence include: low intrinsic motivation, psychological distress, illness perception beliefs and financial constraints. Institutional obstacles to adherence include lack of institutional support, service cost, and negative or low client satisfaction. Environmental factors that can also pose a challenge to adherence are lack of family and social support. The above obstacles to adherence may put clients at risk of dropping out of the program.

On the other hand, a number of positive set of factors can foster clients' adherence to the program. There are: high intrinsic motivation; improved illness perception beliefs; improved psychological functioning; financial sponsorship; positive institutional support; adequate equipments; gym environment conducive to do more exercises; positive family support; high level of customer satisfaction.

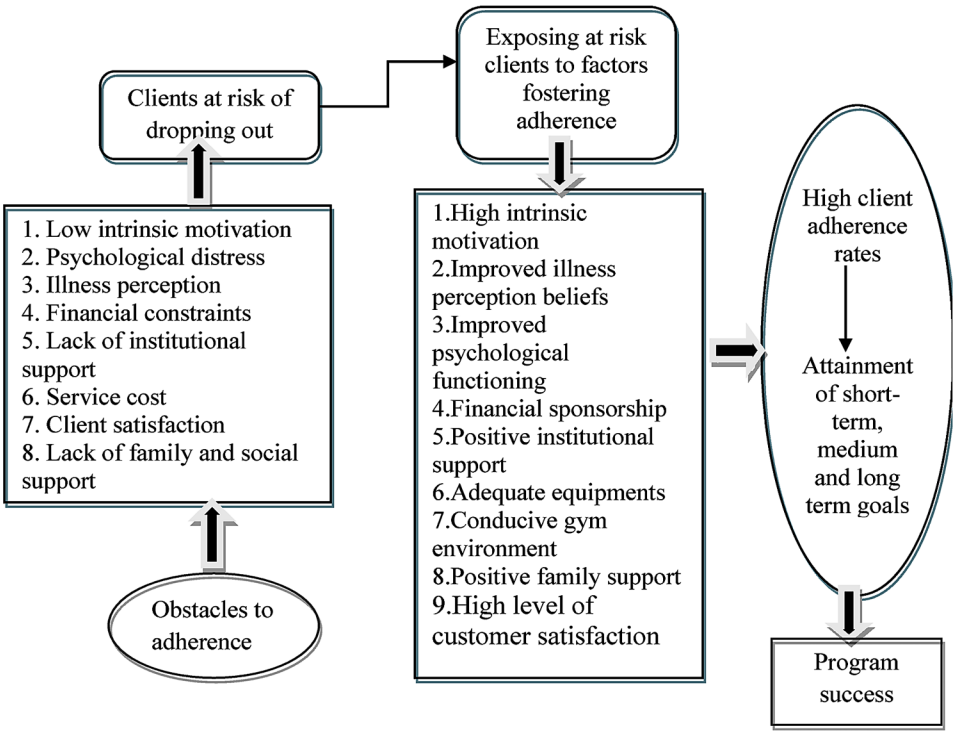
It is important to note that subjecting (exposing) clients at-risk of dropping out to the above positive factors fostering adherence may change their status from dropout to adherent. This change may ultimately lead to program success. In other words, obstacles to client motivation can be removed through the provision of an enabling environment of set factors that foster adherence such as high intrinsic motivation, improved illness perception, financial sponsorship, institutional support, etc. Using reverse logic, it means that where factors fostering adherence are absent, an environment may be created which predispose clients to the risk of dropping out.

MEASUREMENT OF VARIABLES

The main variables measured are as follows.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Conceptual framework



Institutional Support

The institutional support that is provided by a program tends to influence client retention (Wittmer et al, 2012). In that regard, respondents were asked to indicate their level of agreement regarding six questions measuring institutional support, with strongly disagree (1) to strongly agree (5). These were: I believe the CDPRP staff care about me; My personal difficulties are understood by the CDPRP staff; It is important to the CDPRP staff that my health improves; I look forward to interacting with the CDPRP staff during the week; The CDPRP staff create a gym environment conducive to do more exercises; I can always find a CDPRP staff to explain things to me about the program.

Client Satisfaction

It was measured by asking respondents the following questions: I believe my overall wellbeing has improved as a result of joining this program; if necessary, I will recommend this program to other friends and family; This program meets my expectations; I like this program. The response options ranged from strongly disagree (1) to strongly agree (5).

Intrinsic Motivation

Ades and Allen as cited in Leon et al. (2005) posited that intrinsic motivation influences adherence to cardiac rehabilitation. Intrinsic motivation was measured by asking respondents the following questions:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

I decide my goals in life by myself; I challenge myself to exercise; I believe I have control over the way my life turns out; I am motivated because I believe this program (CDPRP) will make my health better; I do my best to improve my health; I make a lot of effort to live up to what my friends expect. The response options ranged from strongly disagree (1) to strongly agree (5).

Social Support

Wittmer et al. (2012) stated that social support that is provided by program staff also influences client retention. In order to investigate this, respondents were asked to rate on a scale of 1 to 5, with 1 coded as never, and 4 coded as always, social support system that they have during the period of rehabilitation. Specific questions asked were: There is someone in your life who you can count on to listen to you when you need to talk; There is someone available to give you good advice about a problem; There is someone available to you who shows you love and affection; You can count on someone to provide you with emotional support, such as talking over problems or helping you make difficult decisions.

Family Support

Marzolini, Brooks and Oh (2008) found out that clients were more likely to dropout from cardiac rehabilitation programs if they have no family support systems available. It is in that context that three sets of questions were developed to measure family support, with response options ranging from strongly disagree (1) to strongly agree (5). These were: I have family who encourage me to maintain a healthy lifestyle; my family encouraged me to join this program (CDPRP); it is important to most of my family members that I stay in this program (CDPRP).

Psychological Distress

Available literature shows that individuals' mood may affect whether they drop out of a program or stay in it (Yohannes et al., 2007). Following that, five sets of questions were developed and used to measure the mood/psychological distress of respondents. These were: I feel miserable and sad; I feel life is not worth living; I feel scared or frightened; I feel as if I have slowed down; worrying thoughts constantly go through my mind. The response options were not at all (1) to always (4).

Illness Perception

Similar to psychological distress, the literature has shown that illness people's perception may influence whether they stay in or drop out from health rehabilitation (Broadbent, Petrie, Main, & Weinman, 2006). In that regard, a battery of two questions was used, with response options ranging from 0 to 10: how much control do you feel you have over your illness?; and how well do you feel you understand your illness?

DATA

As indicated earlier, the primary foci of this evaluation research is to determine factors that shape client dropout and adherence to the program. Given the data needs, a mostly quantitative research technique

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

was employed by involving the major stakeholders (adherents and dropouts) of the program. This approach was desirable for this study as the underlining evaluation research objectives were to determine the effectiveness of the program, to investigate factors that shape client dropout from the program and assess if there are differences in adherents and dropouts with respect to institutional support, client satisfaction, intrinsic motivation, social support, family support, psychological distress and illness perception.

The study population for this survey consisted of two groups. These are: those who are currently in the program (adherents) and those who had earlier enrolled in the program (CDPRP) and dropped out (dropouts). The total study population is 279.

Availability sampling procedure was used to select the samples from both dropout and adherents. Using this random procedure, a sample of 30 individuals who had dropped out of the program was selected. With respect to those participants currently in the program (adherents), availability sampling procedure was used to select the sample from a population of 142. Availability sample studies cases or units that are readily accessible (Weisberg, 2005; Zikmund, 2003). Using this sampling procedure is consistent with available information from the CDPRP which shows that most of those currently enrolled in the program and dropouts are at least 50 years old, retired or unemployed. They constitute a homogenous population. In that context, there is very little variation in the population which justifies the use of convenience sampling (Saunders, Lewis, & Thornhill, 2009). It must be emphasized that this research is correlational in nature, thus a sample size of about 30 participants is considered appropriate (Daniel, 2012).

Using a structured questionnaire, data was collected from adherents within a four-week span. Program staff approached all eligible participants and provided an explanation of the study. Interested persons were given a questionnaire upon verbal agreement to fill-out. Similarly, data was collected from dropouts within a four-week timeframe. The selected dropouts were first contacted by the researcher via telephone to ascertain their willingness to participate. Then they were later contacted at an agreed scheduled time. Administering the telephone questionnaire took approximately 15-25 minutes each to complete.

There were ethical considerations in the conduct of this research. The dignity and welfare of all respondents were ensured by protecting them from any harm, unnecessary risks, or mental and physical discomfort that might be inherent in the research procedure. The respondent's participation in the survey was not obligatory and they were informed that they had the right not answer any question, or withdraw from the study at any point. Additionally, they were assured that all information would be treated in a confidential manner and that no individual would be identifiable in the study findings to ensure confidentiality and anonymity.

EVIDENCE/FINDINGS

The research findings are presented with respect to individual, institutional and environmentally-related factors.

Individual Factors

Three main factors are discussed under this section. These are: intrinsic motivation, psychological distress and illness perception.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Intrinsic Motivation

A six item summated scale of intrinsic motivation (Cronbach's alpha reliability=0.6 for each group) was created. The above Cronbach's alpha reliability value means that the internal consistency of the intrinsic motivation scale is quite good. The results are presented in Table 1 below. An independent-sample t-test was conducted to compare intrinsic motivation scale scores for adherents and dropouts. There was a significant difference in scores for adherents (M=25, SD=3.36) and dropouts, M=22.7, SD=2.8; t (60) = 2.92, p=.005 (two tailed). This finding is consistent with Evenson and Fluery (2000) study which revealed that patients are more likely to drop out of outpatient Cardiac Disease Prevention and Rehabilitation due to lack of motivation. This finding is consistent with Ades and Allen as cited in Lean et al. (2005) which noted that a contributing factor to dropout is low client intrinsic motivation. In this regard, the services of a psychologist might help in motivating clients to have a more positive attitude to life in general and their health in particular.

Table 1. Intrinsic motivation

	Adherents				Dropouts			
	Mean	**Min**	**Max**	**SD**	**Mean**	**Min**	**Max**	**SD**
I decide my goals in life by myself	4.3	2	5	.8	4.1	2	5	.74
I challenge myself to exercise	4.3	1	5	.96	3.8	2	5	.91
I believe I have control over the way my life turns out	4.2	1	5	1	3.9	2	5	.91
I am motivated because I believe this program (CDP & RP) will make my health better	4.7	3	5	.48	3.9	3	5	.55
I do my best to improve my health	4.6	4	5	.50	4.1	2	5	.66
I make a lot of effort to live up to what my friends expect	2.6	1	5	1.5	2.7	1	5	1.14
Intrinsic Motivation Scale (Cronbach's alpha reliability): Adherents=0.6 Dropouts=0.6	25	18	30	3.3	22.7	15	27	2.8

Psychological Distress

Individuals' mood/psychological distress may affect whether they stay or drop out of a program. In that regard, a five item summated psychological distress scale (Cronbach's alpha reliability of 0.6 for adherents and 0.6 for dropouts) was created. This suggests that the internal consistency of the psychological distress scale is quite good. The scale ranged from 5 to 15 for adherents and 5 to 19 for dropouts. The results are shown in Table 2.

An independent-sample t-test was conducted to compare psychological distress scale scores for adherents and dropouts. There was no significant difference in scores for adherents (M=8.8, SD=2.6) and dropouts, M=10.3, SD=3.7; t (64) = -1.885, p=.073 (two tailed). However, a closer look at the mean psychological distress scores shows that dropouts had a higher score of 10.3 compared with 8.8 for adherents. This supports Yohannes et al. (2007) study which revealed that dropouts had higher psychological distress scores than adherents. Hence psychological distress scores can be considered as predictors of early dropout from Cardiac Disease Prevention and Rehabilitation programs.

Table 2. Psychological distress

	Adherents				Dropouts			
	Mean	**Min**	**Max**	**SD**	**Mean**	**Min**	**Max**	**SD**
I feel miserable and sad	1.9	1	3	.94	2.1	1	4	.91
I feel life is not worth living	2.1	1	4	.91	1.6	1	4	1.9
I feel scared or frightened	1.4	1	3	.71	1.7	1	4	.92
I feel as if I have slowed down	2.2	1	3	.76	2.7	1	4	.83
Worrying thoughts constantly go through my mind	2.18	1	4	.98	2.17	1	4	1.02
Psychological Distress Scale (Cronbach's alpha reliability): Adherents=0.6 Dropouts=0.6	8.8	5	15	2.6	10.3	5	19	3.7

Illness Perception

The literature has shown that people's illness perception may influence whether they stay in or drop out from health rehabilitation (French, Cooper & Weinman, 2006). Two main questions were used to assess the illness perception of adherents and dropouts. In terms of control over the illness, adherents have a mean value of 6.03 compared with 7.4 for dropouts (on a 10-point scale). Similarly, for understanding of illness, adherents have a mean value of 8.14 compared with 9.17 for dropouts. When an independent t-test was conducted to compare adherents' understanding of illness; and feelings of control over illness, the tests were statistically significant. The mean scores for dropouts were higher than those for adherents. These suggest that dropouts feel they have much control over their lives; and also have better understanding of their health status compared with adherents.

Institutional Factors

Institutional factors deal with influences (issues) relating to the Cardiac Disease Prevention and Rehabilitation Program. These factors may foster clients' retention or dropout from the program. For analytical purposes, institutional factors are subdivided into client satisfaction and institutional support.

Institutional Support

The institutional support that is provided by a program tends to influence client retention. An institutional support scale (Cronbach's alpha reliability of 0.84 for adherents and 0.92 for dropouts) was created using a battery of six questions. This suggests that the scale has good internal consistency (Pallant, 2007). In general, the responses ranged from 13-29. Table 3 shows the distribution of the responses from both adherents and dropouts.

An independent-sample t-test was conducted to compare the institutional support scale scores for adherents and dropouts. There was a significant difference in scores for adherents (M=27.3, SD=2.4) and dropouts, M=23.6, SD=3.4; t (61) = 5.037, p=.000 (two tailed).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Respondents' views on institutional support

	Adherents				Dropouts			
	Mean	**Min**	**Max**	**SD**	**Mean**	**Min**	**Max**	**SD**
I believe the CDP &RP staff care about me	4.6	4	5	.49	4.2	2	5	.73
My personal difficulties are understood by the CDP &RP staff	4.3	3	5	.68	3.9	2	5	.73
It is important to the CDP &RP staff that my health improves	4.6	3	5	.55	4.1	2	5	.52
I look forward to interacting with the CDP &RP staff during the week	4.6	3	5	.56	3.9	2	5	.64
The CDP &RP staff create a conducive gym environment for clients	4.5	4	5	.50	3.7	2	5	.67
I can always find a CDP &RP staff to explain things to me about the program	4.5	3	5	.60	3.7	2	5	.64
Institutional Support Scale (Cronbach's alpha reliability): Adherents=0.84 Dropouts=0.92	27.3	23	30	2.4	23.6	13	29	3.4

There is a significant difference in scores for adherents compared with dropouts. The magnitude of this difference in terms of eta squared statistic is large. This strongly suggests that unlike dropouts, adherents have a better perception of program support with respect to caring about them; creating conducive atmosphere, understanding of their personal difficulties, etc. This finding is consistent with Pack et al. (2013) and Zarani, Besharat, Sadeghian, and Sarami (2010) in their studies which concluded that providing institutional support improved patient adherence. Their findings showed a significant increase in attendance and completion of Cardiac Rehabilitation when purposeful encouragement and reinforcement strategies are employed.

Examining the reasons given by respondents for dropping out of the program, about half of them stated that they dropped out due to financial constraints or lack of sponsorship. Given the fact that about 50% of the respondents are retirees, it means that they may not have enough income to afford paying for the program services.

Apart from financial constraints leading to client dropouts, some clients dropped out because they felt they did not have enough assistance on equipment use; and others did so due to lack of sufficient monitoring during exercise; inflexible time schedules; and bad experience with program staff. Thus in general, client dropout is shaped by lack of sufficient sponsorship, staff attitudes to clients and equipment. These may become obstacles to client adherence and ultimately the effectiveness of the program.

It is worthy of note that when dropouts were asked about their willingness to rejoin the program, about 62% answered in the affirmative. This suggests that they may have been impacted by the program. For example, when asked about their improved overall wellbeing as a result of joining the program, the mean score (on a five-point scale) were 4.63 and 4.1 for adherents and dropouts respectively. This further suggests that the program has been quite effective even for dropouts too (though there is also a statistically significant difference between adherents and dropouts in terms of their improved overall wellbeing score). It is in that that regard that it may be understandable why a good number of them are willing to rejoin the program—if given the necessary support and resources.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Client Satisfaction

A four item summated scale (Cronbach's alpha reliability of 0.76 for adherents and 0.85 for dropouts) was created from a series of questions related to client satisfaction. This means that the internal consistency of the client satisfaction scale is good. The scale ranged from 15 to 20 for adherents and 9 to 20 for dropouts. The results are presented in Table 4 below.

Table 4. Client satisfaction

	Adherents				Dropouts			
	Mean	**Min**	**Max**	**SD**	**Mean**	**Min**	**Max**	**SD**
I believe my overall well-being has improved as a result of joining this program	4.6	3	5	.54	4.1	2	5	.68
If necessary, I will recommend this program to other friends and family	4.7	4	5	.46	4.2	2	5	.81
This program meets my expectations	4.5	3	5	.60	3.9	2	5	.66
I like this program	4.5	4	5	.50	4	2	5	.85
Client Satisfaction Scale (Cronbach's alpha reliability): Adherents=0.76 Dropouts=0.85	18.5	15	20	1.6	16.2	9	20	2.5

An independent-sample t-test was conducted to compare client satisfaction scale scores for adherents and dropouts. There was a significant difference in scores for adherents (M=18.5, SD=1.6) and dropouts, M=16.2, SD=2.5; t (61) = 4.425, p=.000 (two tailed).

The research findings clearly show that the mean scores in all measures of client satisfaction are relatively higher for adherents compared with dropouts. This consistency in higher client satisfaction scores is ultimately reflected in the higher score for the summated scale measuring client satisfaction. Following Cohen (1988), this finding suggests that a high magnitude of the difference in client satisfaction is explained by the client's status (either adherent or dropout). Thus there is compelling evidence from the findings to show that adherents are more satisfied compared with dropouts. In essence, clients who adhere to the CDPRP are more satisfied compared with the dropouts. This is consistent with Wittmer et al. (2012) findings that highly satisfied participants had a low rate of dropout from Cardiac Disease Prevention and Rehabilitation Programs.

Given the above results in the context of respondents' views about strengths of the program, it can be inferred that in order to reduce clients' dropouts and increase adherence, the program has to improve upon the following: provide friendly and supportive environment; provide very good exercising machines; make clients feel they can ultimately achieve an improved overall wellbeing.

Environmentally-Related Factors

The factors that are discussed under this section are: family support, and social support. These factors may foster adherence to the program or facilitate dropout.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Family Support

Clients were more likely to dropout from CDPRP if they have no family support systems available. It is in that context that a three item summated scale (Cronbach's alpha reliability of 0.64 for adherents and 0.68 for dropouts) was created. These values suggest that the internal consistency of the family support scale is quite good. The results are shown in Table 5 below. An independent-sample t-test was conducted to compare family support scale scores for adherents and dropouts. There was a significant difference in scores for adherents (M=12.64, SD=1.95) and dropouts, M=10.97, SD=2.22; t (61) = 4.936, p=.002 (two tailed). In addition to that, the magnitude of the difference is large according to the eta squared statistic. This supports Marzolini et al. (2008) findings that family issues are linked to premature withdrawal from Cardiac Disease Prevention and Rehabilitation programs.

Table 5. Family support

	Adherents				Dropouts			
	Mean	**Min**	**Max**	**SD**	**Mean**	**Min**	**Max**	**SD**
I have family who encourage me to maintain a healthy lifestyle	4.5	3	5	.56	4.1	2	5	.84
My family encouraged me to join this program (CDP & RP)	3.9	1	5	1.14	3.3	2	5	1.01
It is important to most of my family members that I stay in this program (CDP & RP).	4.2	2	5	.74	3.6	2	5	.96
Family Support Scale (Cronbach's alpha reliability): Adherents=0.64 Dropouts=0.68	12.6	7	15	1.95	10.97	6	15	2.2

Social Support

As discussed in the methodology section, social support that is provided by program staff also influences client retention. In order to investigate this, a four item summated scale (Cronbach's alpha reliability of 0.87 for adherents and 0.86 for dropouts) was created as shown in Table 4 below. This suggests that the social support scale has good internal consistency. The scale ranged from 8 to 16. An independent-sample t-test was conducted to compare the social support scale scores for adherents and dropouts. There was a significant difference in scores for adherents (M=14.2, SD=2.4) and dropouts, M=11.5, SD=2 t (66) = 4.936, p=.000 (two tailed). Findings revealed that there is a statistically significant difference between the social support of adherents and dropouts. This difference according to the eta squared statistic is large. Adherents scored much higher in social support compared with dropouts. This is consistent with Chatham as cited in WHO (1993) finding that the social support provided to a patient is as important as the intervention. This suggests that dropouts do not have the necessary social support to stay in the program.

LESSONS LEARNED: INTERACTION OF FACTORS AFFECTING PROGRAM EFFECTIVENESS

It can be inferred from the above discussion that three main factors affect the effectiveness of the Cardiac Disease Prevention and Rehabilitation Program. These are: institutional factors; individual factors; and environmentally-related factors. These factors can either be obstacles to adherence or foster adherence depending on the context. For example, institutional factors such as providing financial sponsorship, creating conducive atmosphere, being accessible to clients, etc. may foster adherence. On the other hand, lack of financial sponsorship, inaccessibility of staff to clients, etc. may become obstacles to client adherence, which may ultimately lead to dropout. Similarly, individual factors such as low intrinsic motivation, coupled with high psychological distress may act as obstacles to adherence. However, high intrinsic motivation coupled with low psychological distress may foster adherence. It follows logically that an environment that provides a good family and social support can foster adherence to the program. These interactions between the factors are depicted in Figure 2 below. For analytical purposes, the following typology was developed and used:

1a. Positive institutional factors = high institutional support plus high client satisfaction.
1b. Institutional support is considered negative when either institutional support or client satisfaction or both are negative.
2a. Positive individual factors = high intrinsic motivation plus high illness perception plus low psychological distress.
2b. Individual factors are considered negative when one at least one of the variables has a negative connotation. For example, high psychological distress or low illness perception or low intrinsic motivation.
3a. Positive environmental factors = high family support plus high social support.
3b. Environmental factors are considered negative when either family support or social support or both are negative.

Based on the above typology, the following possible program outcomes (scenarios) are derived:

1. Positive institutional factors plus positive individual factors coupled with positive environmentally-related factors may lead to the most desirable program outcome. On the other hand, when all the afore-mentioned factors are negative, a critical point is reached. At the critical point, obstacles to adherence are at their highest levels and client dropout is guaranteed.
2. Positive institutional factors plus positive environmental factors coupled with negative individual factors may lead to weakened client adherence and hence dropout.
3. Positive institutional factors plus positive individual factors coupled with negative environmentally-related factors may facilitate client dropout.
4. Positive environmentally-related factors plus positive individual factors coupled with negative institutional factors may not foster program adherence.

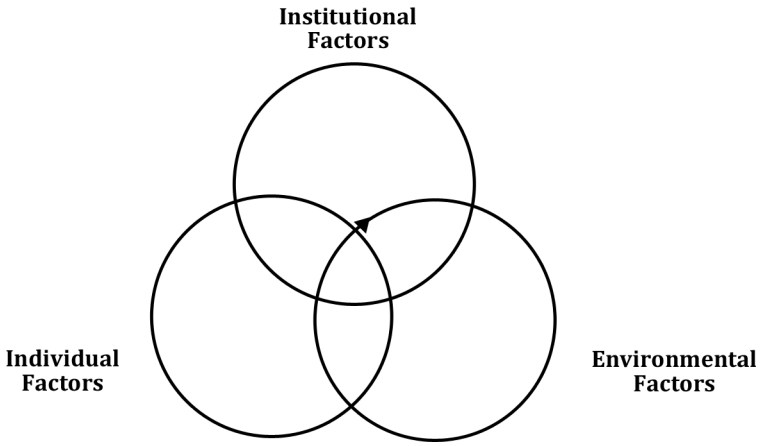
Figure 2. Interactions of factors affecting program effectiveness



CONCLUSION

In view of the findings, it can be concluded that a number of factors put clients of the Cardiac Disease Prevention and Rehabilitation Program (CDPRP) at risk of dropping out. These are: low intrinsic motivation, low illness perception, low client satisfaction, lack of institutional support, lack of family and social support, high psychological distress, and financial constraints/lack of sponsorship. On the other hand, certain factors may foster client adherence/retention. These are: high intrinsic motivation, high level of consumer satisfaction, positive institutional support, positive family support, improved illness perception, improved psychological functioning, financial sponsorship, adequate equipments, and conducive gym environment.

In general, the CDPRP has good client evaluations with respect to institutional support and client satisfaction. However, the fact that there is a significant difference between adherents and dropouts it implies that the program must improve its institutional support mechanisms and also strive better to improve the satisfaction levels of all clients in general, and dropouts in particular. Similar to client satisfaction and institutional support, in general, there is a consistent, significant and high magnitude difference between adherents and dropouts in terms of intrinsic motivation, social and family support, illness perception, and psychological distress. Thus the program facilitators must initiate measures to close these gaps between adherents and dropouts to improve the effectiveness of the program. Davies et al. (2010) alluded that adherence can marginally be improved with some interventions.

RECOMMENDATIONS

These research findings have practical implications for the Cardiac Disease Prevention and Rehabilitation Program. Clients undergoing rehabilitation are guaranteed to drop out when they are in the critical zone. The critical zone is a point where institutional factors, individual factors and environmentally-related factors are not favorable to clients. On the other hand, if all the above factors are favorable, client adherence is ensured. At any point in a client's journey of rehabilitation, when any of the aforementioned factors become unfavorable, client retention is weakened. Consequently, the following are recommended:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. There is the need to closely monitor at-risk clients, especially those whose socio-economic, social and psychological profiles predict non-adherence.
2. Longer follow-up period with former clients (dropouts) need to be reinforced to convey a positive and supportive message from the Cardiac Disease Prevention and Rehabilitation Program. Regular telephone calls, emails, mail-in newsletters, etc. can serve as a good way of keeping former clients up to date with new and exciting improvements to the program. In addition to that, communication channels with current clients (adherents) should be maintained through meetings to keep them up to date thus fostering a culture of belonging.
3. Program administrators should continuously evaluate the institutional policies, practices and social environment of the program in order to cater for the evolving needs of their clients. In such evaluations, the concerns of the clients need to be reviewed carefully and incorporated into institutional planning, policies, and practices.

ACKNOWLEDGMENT

We would like to express our gratitude to the staff of Heart and Stroke Foundation of Barbados for facilitating the collection of data for this evaluation research. This book chapter would not have been possible without their support.

KEY TERMS AND DEFINITIONS

Adherence Rate: The number of persons who remained as active participants in a program compared with the total number of persons who started the program.

Barriers: An influence that reduces the chances of participation in cardiac rehabilitation program.

Cardiac Rehabilitation: A medically supervised program aimed at improving the overall wellbeing of its participants/clients thereby reducing morbidity and mortality.

Clients: Persons whose needs are to be satisfied or whose behavior or circumstance the agency aims to change.

Critical Zone: This is a point where institutional factors, individual factors and environmentally-related factors are not favorable to clients.

Illness Perception: Subjective beliefs, attitudes, or ideas about health and illness.

Institutional Support: Influences relating to the program which may facilitate/foster clients' retention or dropout from the program.

Rehabilitation: The restoration to a former capacity through training or therapy.

APPENDIX

Table 6. Summary of T-tests and Eta Squared

Indicator	T-test	Eta Squared	
		Value	Interpretation
Client satisfaction scale	Significant	0.24(24%)	Large effect. Magnitude of the difference between means of adherents and dropouts in relation to client satisfaction scale is large. Statistically, 24% of the variance in client satisfaction is explained by respondents' status (adherent/dropout).
Institutional support scale	Significant	0.29(29%)	Large effect. Magnitude of the difference between means of adherents and dropouts regarding institutional support scale is large. Implies that 29% of the variance in institutional support is explained by respondents' status (adherent/dropout).
Improved overall wellbeing	Significant	0.15(15%)	Large effect. Magnitude of the difference between means of adherents and dropouts with respect to improved overall wellbeing is large. This means that 15% of the variance in improved overall wellbeing is explained by respondents' status (adherent/dropout).
Understanding nutritional guidelines	Significant	0.12(12%)	Moderate effect. Magnitude of the difference between means of adherents and dropouts with respect to understanding of nutritional guidelines is moderate. Implies 12% of the variance in understanding nutritional guidelines is explained by the status of respondents (adherent/dropout).
Intrinsic motivation scale	Significant	0.12(12%)	Moderate effect. Magnitude of the difference between means of adherents and dropouts in relation to intrinsic motivation is moderate. Thus 12% of the variance in intrinsic motivation is explained by the respondents' status (adherent/dropout).
Control over illness	Significant	0.06(6%)	Moderate effect. Magnitude of the difference between means of adherents and dropouts with respect to control over illness is moderate. Thus 6% of the variance in control over illness is explained by the respondents' status (adherent/dropout).
Family support scale	Significant	0.14(14%)	Large effect. Magnitude of the difference between means of adherents and dropouts in relation to family support is large. Implies 14% of the variance in family support is explained by respondents' status (adherent/dropout).
Social support scale	Significant	0.27(27%)	Large effect. Magnitude of the difference between means of adherents and dropouts with respect to social support is large. Thus 27% of the variance in social support is explained by the respondents' status (adherent/dropout).

Chapter 81
An Exploration of Mental Skills Among Competitive League of Legend Players

Daniel Himmelstein
Premier eSports Academy, Denver, CO, USA

Yitong Liu
University of Denver, Denver, CO, USA

Jamie L. Shapiro
University of Denver, Denver, CO, USA

ABSTRACT

ESports, also known as competitive video gaming, has seen tremendous growth over the past few years. Several studies have been conducted that examined the potential cognitive benefits of playing video games, but few have examined the psychosocial factors needed to perform at the highest level of competitive video gaming. In this study, the researchers aimed to identify specific mental obstacles players face and any mental techniques gamers already utilize by conducting a qualitative content analysis. Interviews with five high-level competitive League of Legend players were conducted to shed light on their experiences. The interviews resulted in two high order themes. Those high order themes were the following: techniques used to achieve optimal performance and obstacles encountered by competitive gamers. The data collected can be used by a wide population in both the performance psychology field and the eSports realm, more specifically, future mental skills consultants working with League of Legends players, gamers themselves, and academics who wish to serve, improve, or study those involved in an emerging performance domain.

INTRODUCTION AND STATEMENT OF THE PROBLEM

The video game industry as a whole has been growing rapidly. Lately, the industry has seen a legitimate professional community arise. In fact, international competitions and six-figure contracts are no longer just a fantasy for video game players. Certain video games have become highly competitive performance domains offering fame and fortune comparable to traditional sports (e.g., football, basketball, soccer). Thus, more gamers are partaking in high-level competitions regularly and becoming competitive, professional video gamers. ESports is short for "electronic sports" and are defined by Morris (2013) as "organized video game competitions that pit world class players against each other for cash prizes" (Gamers Are Not Only Athletes, para. 2). ESports are commonly compared to traditional sports or physical sports (e.g., Dovey & Kennedy, 2006; Ferrari, 2013; Jones, 1998; Taylor, 2012; Witkowski, 2012).

League of Legends is one of the most popular video games in the world and is played at a highly competitive level. In fact, on October 29th, 2016, two teams battled for the World Champions title and a total prize pool of just over five million dollars (Howell, 2016). League of Legends is a five player versus five player (5v5) video game that is played on the computer. It is classified as a multiplayer online battle arena (MOBA) game as opposed to games classified as first person shooters (FPS) or role playing games (RPG). MOBAs typically consist of two bases that serve as objectives and lanes that make up the battle grounds in between the bases. The objective in League of Legends is to take control of the opposing team's base and destroy their Nexus (a crystal). There are five roles that determine various factors of play, such as characters (referred to as champions) you can fight as, personal goals and objectives, and positioning on the map. The five roles are bot (short for bottom lane), jungle (an area between the bases), top (short for top lane), mid (short for middle lane), and support. Each role requires a different skill set to play at a competitive level. For example, some roles require players to deal a high amount of damage to the opposing team, whereas the support role is tasked with healing dying allies or boosting their team's abilities. Each player must execute their role in a coordinated effort to defeat the opposing team. Professional matches can last anywhere from 20 minutes to over an hour.

As of late, eSports teams are being housed together with coaches, managers, and strategists. Sponsors are investing more money and the crowds are growing thicker. With the level of competition rapidly increasing, it is only natural that there is a high demand for performance enhancement strategies. Companies like MMO Coach (https://www.mmocoach.com/) offer online one-on-one strategy and mechanics coaching to eSports players in various games, and Game Without Pain (http://gamewithoutpain.com/) offers nutrition, diet, and exercise programs designed for enhancing eSports players' training routines.

Despite the rising recognition of eSports performance enhancement techniques, performance psychology's effectiveness in eSports has yet to be studied. Sport and performance psychology is widely accepted as a method to improve the mental side of performance in many domains such as sport, dancing, acting, law, medicine, business, and high risk occupations (Hays, 2009). However, there is very little literature available on the mental side of competitive gaming.

Most of the literature has been focused on studying the effects of gaming either socially or cognitively, and studies were not designed to examine how to enhance performance. Additionally, the literature that does exist on gaming fails to differentiate competitive, video gamers, from casual or recreational gamers. This presents a large gap in the current understanding of high-level performance in eSports. To bridge the gap, the current researchers aimed to get an understanding of what competitive gamers experience mentally. Exploring the mental skills that competitive gamers possess and utilize is an important stepping stone to integrating sport and performance psychology effectively with this population.

LITERATURE REVIEW

Relationship Between eSports and Traditional Sports

As eSports have developed, literature has been produced drawing comparisons between traditional sports and eSports (e.g., Dovey & Kennedy, 2006; Ferrari, 2013; Jones, 1998; Taylor, 2012; Witkowski, 2012). Similarities in the two arenas may be an indication that sport and performance psychology can be applied to eSports. While there is debate about eSports being considered "traditional sports", previous studies have drawn clear parallels between traditional sports and eSports.

Ferrari (2013) proposed six conditions seen in traditional sports and argued that eSports fits them all. These six conditions are listed below:

1. Their rules and spatial layouts demand a high level of performative play, typically developed through many years of testing, modification, and refinement
2. They have been around long enough to see the rise of expert practitioners with skills sufficient to reliably separate their play from that of casual players (Ericsson 1996, 10-13)
3. Frameworks and career models exist for a child's introduction into the peculiarities of the game, matching them against others of similar skill and ability (Ericsson 1996, 19-24)
4. People want to watch others play these games, and they may go so far as to build their identities around famous players or teams (Crawford 2004, 38-51)
5. Broadcast media relay data about these games to fans who cannot observe live play, and companies willingly sponsors [*sic*] players and teams because of this (Crawford 2004, 130-133), and
6. Infrastructures exist for the fair treatment of players as laborers, for collective bargaining between owners and performers, or for ethics and rules negotiation. (p. 4)

In fact, Taylor (2012) dedicated an entire book chapter, *Computer games as a professional sport*, to document how competitive video games can be seen as a sport. Throughout Taylor's chapter, Dovey and Kennedy were referenced saying:

Bodily experiences of gameplay are not solely emotional or affective – they are also highly physical. The body is always committed to engaging gameplay, from sensorial perceptions experienced as embodied emotional states, through busy hands and fingers in many games, and all through the entire body being involved when playing. (p. 171)

They go on to say "gameplay is a tactical and kinesthetic experience" (p. 171), which is counter to the argument that eSports are not physical enough to be considered sport.

Additionally, Witkowski (2012) linked sports and eSports by looking at players of a competitive video game called Counter-Strike, a first-person shooter game (FPS), and maintained that a certain set of physical skills was required that could be compared to traditional sports movement. It is evident that eSports and traditional sports share a lot of subtle physical and kinesthetic properties but similar comparisons have not yet been drawn for the mental side.

Jones (1998), however, did examine the occurrence of flow in video games and computer based learning environments. Flow is described by Csikszentmihalyi (1991) in seven elements and is commonly associated with optimal experience in sports. Jones (1998) broke down the seven elements of flow (and distinguished between effortless involvement and ability to concentrate on the task at hand creating eight elements) and described how each manifest in video games:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. Task that we can complete: The use of levels in a game provide small sections that lead to the completion of the entire task
2. Ability to concentrate on task: Creation of convincing worlds that draw users in. The Dungeons and Labyrinths in Doom II help you suspend your belief systems for a time.
3. Task has clear goals: Survival, collection of points, gathering of objects and artifacts, solving the puzzle
4. Task provides immediate feedback: Shoot people and they die. Find a clue, and you can put it in your bag.
5. Deep but effortless involvement (losing awareness of worry and frustration of everyday): The creation of environments that are far removed from what we know to be real helps suspend belief systems and take one away from the ordinary
6. Exercising a sense of control over their actions: Mastering the controls of the game, such as mouse movement or keyboard combinations
7. Concern for self disappears during flow, but sense of self is stronger after flow activity: Many games provide for an environment that is a simulation of life and death. One can cheat death and not really die. People stay up all night to play these games. It is the creation of an integration of presentation, problem, and control over the system that promotes this.
8. Sense of duration of time is altered: Years can be played out in hours. Battles can be conducted in minutes. The key point is that people can stay up all night playing these games. (p. 5)

In addition to the previously drawn comparisons to traditional sports, eSports' developmental and professionalization path can be compared to that of traditional professional sports. First, both competitive video gamers and athletes compete within a restricted setting, involving specific rules and regulations (Hebbel-Seeger, 2012; Lee & Schoenstedt, 2011). It is a common practice in traditional sports that foreign athletes get granted B-1 visas by the United States government to compete within the United States. In 2013, the government began accepting foreign competitive video gamers on B-1 visas just like they do for traditional sports athletes (Morris, 2013; Tassi, 2013). One year later, Robert Morris University became the first university to recognize video gaming at the varsity level and provided the first collegiate scholarships for competitive video gamers. This development of the gaming industry is likely to mirror that of mainstream traditional athletics in which sport and performance psychology already has a clear place.

ESports Literature

Although performance psychology in eSports has not been studied thoroughly, previous studies have focused on identifying mental effects of gaming, providing some insight on what gamers may experience cognitively and/or psychosocially.

Research on attention and gaming has been studied previously, which could be applicable to sport and performance psychology training. Dye, Green, and Bavelier (2009b) found that action video game players of various ages have enhanced attentional skills. In another study, Dye, Green, and Bavelier (2009a) found that self-identified video gamers, when compared to novice video gamers, had increased information processing speed with no decrement in accuracy. They concluded that the more experienced video gamers were not just jumping to a conclusion quicker, but were processing the information and appropriately responding quicker.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Nardi and Harris (2006) identified multiple styles of collaborative, interactive play in World of Warcraft. They highlighted the importance of both collaborative play with strangers and friends and outlined ways in which players must adapt to a particular culture that dictates how to interact with one another. Referring to interactions with strangers:

Buffs are part of the culture of the game in which players commit small acts of kindness to maintain a mutually beneficial atmosphere even though no immediate reciprocity is in the offing and no rewards such as experience points are gained. (p. 3)

Although World of Warcraft is not necessarily a player versus player competitive game, this is an indication that communication (both verbal and non-verbal) are important ways to navigate and succeed.

Furthermore, Jeong and Biocca (2012), who used an FPS game as a method to manipulate arousal level, and Jameson, Trevena, and Swain (2011) concluded that video gaming systems could be used as a method of pain distraction. Both studies highlight ways in which gaming may influence the body and cognition.

Performance Psychology

An article written by Almelo (2014) that was posted on Thinkpiece.gg, a popular website for gamers, directly addressed the need for League Championship Series players (the professional League of Legend players) to acquire a sport psychologist. In fact, the now famous eSports team, Schroet Kommando (SK Gaming), has hired a sport psychology consultant to deliver sport and performance psychology services (Partridge, 2014). In addition, Nairn (2016) wrote about Immortals eSports hiring a full-time performance coach, and Fischer (2016) wrote about an eSports Psychologist joining the professional eSports team, Team SoloMid. Although these services now exist, it is only recently that eSports teams are learning that performance psychology services might be effective in enhancing performance. With the increased interest in performance psychology application in eSports, performance psychology literature for eSports is needed.

Lesyk (1998) proposed that there were nine pivotal mental skills that should be in a sport and performance psychologist's toolbox to best serve performers. These nine proposed mental skills are: attitude, motivation, goals and commitment, people skills, self-talk, mental imagery, dealing effectively with anxiety, dealing effectively with emotions, and concentration. These, in addition to other mental skills, are trainable skills that should be practiced and improved upon to ensure successful performances, each of which has been studied in sport extensively. For instance, Larsen and Engell (2013) researched goal setting in professional football; Smeeton, Hibbert, Stevenson, Cumming, and Williams (2013) used imagery enhancing techniques to improve athletes' anticipatory reactions; Davis and Sime (2005) examined the relationship of anxiety on sport injury recovery relating to performance; Robazza, Pellizzari, and Hanin (2004) researched energy management for optimal performance; Wagstaff (2014) examined the ability to regulate emotion and the effects on sport performance; Losier and Vallerand (1999) examined both intrinsic and extrinsic motivation in sport; Eccles and Tenenbaum (2004) researched expert sport teams and their ability to communicate effectively; and Bell and Hardy (2009) examined attentional control and skilled performance in golf. In the sport and performance psychology literature, some studies utilize objective measures to assess use of mental skills (e.g, the Athletic Coping Skills Inventory-28; Smith, Schutz, Smoll, & Ptacek, 1995), while others use case study or qualitative methodology to gain a more in-depth understanding of performers' use and experience with mental skills (e.g., Larsen & Engell, 2013).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In addition to the above studies, Edwards and Beale (2011) identified breath control as being a fundamental skill that is trainable and can be used to improve performance via energy management. Deep breathing and energy management could potentially be a tremendous asset to high-level mostly sedentary performers, such as gamers. Because these skills have been studied extensively in sports and there are stark similarities between traditional sports and eSports, many of them should be applicable to eSports.

PURPOSE

To address the gap in the literature and the application of sport and performance psychology in competitive gaming, the purpose of this research was to gain insight on (a) the mental skills that competitive gamers already possess and utilize, (b) the mental obstacles or barriers competitive gamers encounter, and (c) the role performance psychology may play in eSports.

METHODS

Research Design

Since examining the psychological aspects of eSports performance is scarce in the literature, an exploratory study utilizing a qualitative design and content analysis was conducted. In content analysis, "the aim [is] to build a model to describe the phenomenon in a conceptual form" (Elo & Kyngäs, 2008). By applying this framework, the researchers could gain knowledge and generate discussion regarding competitive video gamers' mental strengths and needs based on the data collected. This exploratory study could provide a foundation for future research and "gaming psychology" theory development.

Dunn (2013) stated "qualitative research approaches are distinguished by a reliance on verbal reports, descriptions, and interpretation of events" (p. 36). Much of what the current researchers wanted to understand was what competitive gamers' interpretation of the mental side of high-level eSports performance is; for this reason, a qualitative methodology was deemed appropriate. A qualitative, interview-style approach allowed the researchers to get answers to complex questions in which their answers could then be further explored for themes and patterns. Quantitative methods such as answering questions on a Likert scale would have restricted the amount of information that was obtained.

Participants

Among various gaming types, the target population was competitive League of Legend (LoL) players in the metro area of a Western city for the following reasons: (a) LoL is currently one of the most popular competitive eSports games in the world; (b) LoL is a team game - players have to interact in a similar way as traditional sports teams do; and (c) each round in LoL is different, which could potentially require a strong set of mental skills in order to adapt and compete in a variable environment.

A competitive player was defined as a player who had competed in a minimum of two tournaments within the past 12 months. Player rank was also a factor. There are seven levels within the League of Legends hierarchy of talent. The levels (from lowest to highest) are as follows: bronze, silver, gold, platinum, diamond, master, and challenger. Each level has a sub-ranking from one through five where five is

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the most novice of the levels (i.e., Diamond 5 would be ranked lower than Diamond 1). Only those who had achieved the rank of Platinum 5 (lowest of the platinum sub-levels) or higher were eligible for the study. The rank of platinum is a difficult rank to achieve. Using this level targeted the more competitive and experienced gamers.

Five participants were interviewed for the study. As discussed by Dunn (2013), convenience sampling was the best-fit technique given that our population was only coming from one geographical area. The participants were all male and ranged in age from 19-23 years old. This range was targeted because most professional gamers fall into the age of young adults. The maximum age of eligibility for the study was 25 because, at this point, gamers may have more life experiences which may overshadow the scope of mental skills developed and used during gaming. See Table 1 for a summary of participants' demographic information.

Table 1. Demographic Information of Participants

Participant #	Age	Years Competing	Tournaments Played in Last 12 Months	Current Rank	Peak Rank
Participant 1 (P1)	20	2	4	Diamond 4	Diamond 1
Participant 2 (P2)	22	5	13	Platinum 2	Diamond 2
Participant 3 (P3)	19	2	5	Platinum 3	Diamond 2
Participant 4 (P4)	20	2	8	Diamond 4	Diamond 2
Participant 5 (P5)	23	5	6	Platinum 3	Diamond 2

Measures

Interviews were semi-structured to allow the participants and researchers to explore in-depth concepts and produce rich results. The interview questions were designed and reviewed by all researchers to ensure methodological coherence (Elo & Kyngäs, 2008). Five dimensions of video gamers' play identified by Gentile (2011) were considered when creating the structure of the interview questions. These were: the amount of play, the content of play, game context, structure of the game, and mechanics of gameplay (Gentile, 2011). In addition, the interview script included open-ended questions regarding the history of the participant's involvement in eSports, future goals, mental strengths they may exhibit, challenges and obstacles they face, participation on teams, and mental preparation. Furthermore, to understand gamers' perception of sport and performance psychology, a number of directed mental skills questions were asked towards the end of the interview. The mental skills that were listed at the end of the interview were adapted from the work of Lesyk (1998) and Edwards and Beale (2011) mentioned in the literature review. A complete list of questions can be found in Appendix A.

Procedure

Institutional Review Board (IRB) approval was granted to ensure ethical procedures were being followed. After consent was obtained, participants completed the interview with the researchers. The interviews took place in-person in a private room. Interviews ranged from 45 minutes to an hour and 45 minutes long. The interviews were recorded using a voice recorder to eliminate recall error. Given that the re-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

searchers were also an instrument in the research, the interviewers practiced the script and ran two pilot interviews before meeting with the participants.

Data Analysis

Content analysis (Elo & Kyngäs, 2008) was the qualitative method used in this study. The audio recordings were transcribed verbatim to text. The transcriptions were then coded through an open-coding procedure. Two primary investigators co-coded the data until there was 100% agreement on the codes. The software Atlas.ti was used to aid the researchers in the coding process. The quotes that were coded were grouped into meaning units. Those meaning units were then grouped into higher and lower order themes. The higher and lower order themes were compared to identify if the techniques gamers already utilized could counter any obstacles they face. The directed mental skills questions were analyzed by examining the frequency of "yes or no" responses when participants were asked about specific mental skills applying to competitive gaming.

RESULTS

Two higher order themes were identified by the primary researchers: (a) techniques used to achieve optimal performance and (b) obstacles encountered by competitive gamers. *Techniques used to achieve optimal performance* relates to skills (mostly mental) that competitive gamers reported either using themselves or seeing other successful gamers use. *Obstacles encountered by competitive gamers* encapsulates the perceived barriers that stop gamers from performing optimally for both practice and competition. The higher order themes, lower order themes, and meaning units are discussed below. A visual representation of the data can be found in Figure 1. Table 2 was compiled by the researchers to make comparisons between the mental techniques that gamers already utilized for successful performances with their perceived obstacles. A second data set was compiled using the participants' responses when asked directly about if, and how, a particular mental skill applies to gaming. The results on whether they thought the mental skills apply to gaming are displayed in Table 3.

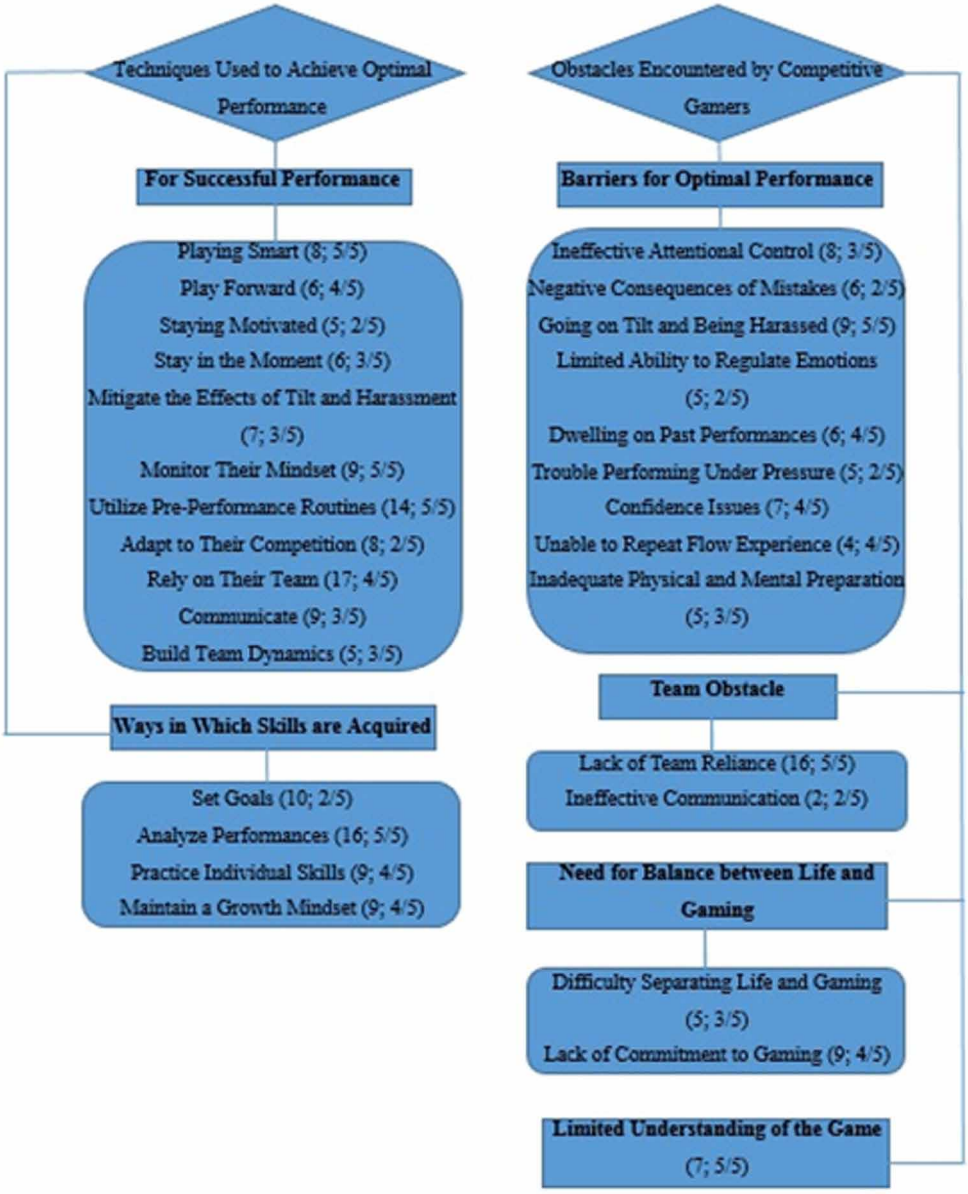
Techniques Used to Achieve Optimal Performance

For Successful Performance: This refers to the techniques that gamers already use to perform at the top of their skill level.

Playing Smart: The participants identified specific techniques in order to get the best results from their performance. They mentioned utilizing game knowledge, smart decision making, playing uniquely, and thinking strategically as ways to create successful performances. P4 expressed playing uniquely as, "you have to see a problem and identify it and in a way that your opponent won't anticipate your move, so you have to be intelligent and kind of unique." In addition, taking a safer approach to gameplay during competition (in comparison to practice) was another technique some participants used to outplay their opponents. P1 mentioned that very high level players have a written game plan. Knowing the limitations of the game was also stated to be important for successful performances.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The hierarchical structure of techniques gamers already use for success and the obstacles they encounter. The diamonds represent the higher order themes, the rectangular boxes represent lower order themes, and the rounded edged boxes represent meaning units. The numbers listed after each unit indicate the number of quotes related to the meaning unit, and the ratio defines how many participants out of five mentioned the particular meaning unit



EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Pairing Perceived Obstacles to Techniques Already Used for Successful Performance

Obstacles	Techniques for Successful Performances
Confidence Issue	Maintain Growth Mindset Practice Individual Skills
Trouble Performing Under Pressure	Playing Smart Utilize Pre-Performance Routine
Dwelling on Past Performances	Play Forward Stay in the Moment
Going on Tilt and Handling Harassment	Monitor Mindset Mitigate the Effects of Tilt and Harassment
Limited Ability to Regulate Emotion	Monitor Mindset Stay in the Moment Play Forward Rely on Their Team
Inadequate Physical and Mental Preparation	Utilize Pre-Performance Routine Monitor Their Mindset
Lack of Team Reliance	Build Team Dynamics Rely on Their Team
Ineffective Communication	Build Team Dynamics Communication
Limited Understanding of the game	Analyze Performance Maintain a Growth Mindset Practice Individual Skills Set Goals

Note. This table displays meaning units derived from codes that have been categorized into two main themes: obstacles encountered by competitive gamers and techniques already used by gamers to achieve optimal performance. This table draws parallels between the perceived obstacles and what strengths can be utilized to overcome those obstacles, as determined by the researchers.

Table 3. Participants' Perceptions of Utility of Specific Mental Skills Application in Gaming

Mental Skill	Participant				
	P1	P2	P3	P4	P5
Goal Setting	Unsure	Yes	Yes *	Yes	Yes**
Imagery	Yes	No	Yes	Yes	Yes**
Anxiety Management	Yes	Yes	Not asked	Yes	Yes**
Energy Management	Yes	Yes	Unsure	Yes	Yes**
Emotional Regulation	Yes	Not asked	Yes	Yes	Yes**
Motivation	Yes *	Yes	Yes *	Yes	Not asked
Communication	Yes	Yes	Yes *	Yes	Yes**
Attentional Control	Yes	Yes	Yes	Yes	Yes**

Note. The participants were asked directly whether they believe the mental skills listed above could be used effectively in gaming. Some participants were not asked specifically about particular mental skills due to the researcher's error. Any response followed by * was discussed earlier in the interview and therefore was not directly asked about during this part of the interview. Responses followed by ** indicate that responses were given after the researchers listed singular mental skills rapidly and received a yes or no response, as opposed to asking about the mental skills and discussing them each one by one.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Play Forward: Several of the participants identified not dwelling on past games or performances to continue playing at a high level. In addition, P4 was able to play forward by making sure to accept that there is always another game, and it is that one that now matters.

Staying Motivated: A couple of the participants spoke about ways in which they maintain their motivation. P3 stated that after a win, he tries to carry that over and use the momentum for the next game. P2 mentioned that he tries not to blame losses solely on himself. Pride was a source of motivation identified by P3 as well. He also mentioned that his friends push and motivate him to keep improving.

Stay in the Moment: Multiple participants identified staying in the moment as being important for getting the most out of their performance. Eliminating distractions and separating daily life from performance were two techniques P1 utilized to stay focused on the performance. P1 mentioned being absorbed in the task at hand and focusing on the current game as two strategies he uses to maintain high level performance.

Mitigating the Effects of Tilt and Harassment: Three of the participants identified that not allowing tilt and harassment to affect performance was a strength seen in themselves or other successful gamers. Tilt was referred to by P2 as a time when "it's really hard to handle if you make a bad play and it's called going on tilt.". Two participants identified that they themselves had the ability to not allow these obstacles to affect their performance.

Monitor Their Mindset: Several different mindsets were reported to contribute to successful performances, one of which was identified by two participants as having a mindset that allowed thriving under pressure. P3 identified an aggressive mindset as desirable; P1 described a winning mindset. In addition, three participants identified maintaining a positive attitude as being important, and P3 highlighted the importance of having fun while playing.

Utilize Pre-Performance Routines: The importance of warming up either physically, mentally, or both was identified by all participants. Techniques reported were playing different games, deep breathing, pushups, listening to music, and adjusting their body temperature as ways to prepare for a performance.

Adapt to Their Competition: Adaptation to variable circumstances was reported by two participants to contribute to successful performances. P2 mentioned in-the-moment adapting, while P1 reported changing an entire game plan according to the opponent. They also identified specific adapting techniques such as scouting and analyzing their opponent's weaknesses in order to better understand their opponents.

Rely on Their Team: P1 stated, "bottom line is, League of Legends is a team game. It's 5 v. 5. It's not 1 v. 1." Team trust was thought to be important for performing well by three participants. Two of the participants mentioned that establishing and knowing roles within the team contributes to success. Another factor that contributed to team reliance was identified as understanding each other's strengths and weaknesses - not only understanding their team's strengths and weaknesses but also using each other's strengths and weaknesses to maximize effectiveness. As P3 put it, "I understand what champs they want to play and what play style they're gonna do." In addition, P2 mentioned relying on their team for tactical support, and P1 relied on his team for dealing with adversity in the game. Moreover, three participants reported using their team, or aiding their team, with emotional support.

Communicate: Communication was brought up in a number of capacities. Verbal team communication was reported as being important for success several times. More specifically, verbalizing mistakes were stated as being important by P3. A technique that was mentioned to be successful for high

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

level players was simplifying communication in order to increase the efficiency of it. In addition, P3 recommended that high level players should, and often do, mute or cut off their communication when playing in solo queue (game type where individuals match up with random teammates) for practice in order to block out any unnecessary negative commentary such as harassment.

Build Team Dynamics: Building team dynamics was something that was reported to contribute to more successful performances. Specific techniques identified were establishing a team logo, building connections through outside interactions, and communicating regularly to grow stronger team bonds. Building specific team dynamics between positions (e.g., bottom lane partners) within the game was also reported to contribute to success.

Ways in Which Skills are Acquired: This refers to the techniques used to improve gamers' skills.

Set Goals: Various types of goal setting were mentioned by the participants. They identified setting short term goals, long term goals, and process goals. In addition, P3 mentioned that he tries to provide his entire team with goals as well. Adjusting goals was also a technique P1 reported using himself.

Analyze Performances: Analyzing mistakes was a technique that all participants identified as being crucial in order to improve. P3 mentioned analyzing mistakes during the performance, while three participants specifically identified mistakes by watching replay video of their performance. In addition to analyzing mistakes, two participants reported processing both mistakes and what went well once the game ended. P4 reported watching other high level players and analyzing their techniques in order to improve his own skill.

Practice Individual Skills: P5 stated, "when I was playing challenger level games…we would practice almost every single day. We would be on probably from 5-10 every single night," exemplifying that practice is essential in maintaining a high level. Many of the participants identified solo queue as the place to learn individual skills to be brought into competitive 5's (a game type where gamers compete with their five-person team against another 5 person team). P1 identified two different, but effective, practice styles used by competitive gamers - one in which the gamer plays to the best of their abilities, the other a more exploratory style where trying new things is the goal. Principles of deliberate practice, as defined by Ericsson, Krampe, and Tesch-Römer (1993), were also described as important by several of the participants. For example, isolating a skill to practice, practicing with a goal in mind, and receiving feedback were all identified as ways to develop skills.

Maintain a Growth Mindset: Several of the participants mentioned key components of Carol Dweck's work seen in Mindset: The new psychology of success (2006) on the growth mindset. The participants mentioned experimenting with new things in practice, learning from mistakes, viewing challenge as an opportunity for growth, and improving on weaknesses as efficient ways of gaining knowledge through practice.

Obstacles Encountered by Competitive Gamers

Barriers for Optimal Performance: This consists of all obstacles identified that participants encountered during a performance, either in practice or in a tournament.

Ineffective Attentional Control: Maintaining focus or getting trapped in "tunnel vision" were identified by the participants as two difficulties during the game. In addition, limited attentional capacity was also reported by P5, who identifies as the shot caller (the person who calls the plays in the game) for his team.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Negative Consequences of Mistakes: The first negative consequence of mistakes identified was creating a bad habit. P1 identified that "the biggest thing is sometimes mistakes, like you'll make them so much that they turn into a bad habit." Furthermore, mistakes could lead to confidence issues during the game; P3 referred to it as "second guessing yourself." In addition, two indirect consequences were reported by participants. Refusing to take responsibility for mistakes was identified as a barrier that stops gamers from improving themselves. On the other hand, being unable to retain knowledge learned from mistakes was another reason why gamers could not better themselves. In addition, facing those consequences of mistakes during games could be tough. For example, P3 said:

Usually, you can't really do anything, because once you make that decision you can't really go back and change it, so you're kinda stuck with that choice, and deal with the consequences. It's kinda the bad side, so it does lead to a lot of lost games.

Going on Tilt and Being Harassed: Going on tilt generally refers to the situation when someone underperforms and becomes emotional generally caused by others such as teammates; thus, the person going on tilt is unable to adjust performance accordingly and performs even worse. As P2 reported:

A lot of times it's really hard to handle if you make a bad play and it's called going on tilt. You'll hear that a lot in solo queue and, say you gave up first blood, or the first death of your team. And then there are a lot of intermediate or beginner players who will just lose their mind. They'll end up trying to recover something or just keep dying over and over again and it never helps.

Going on tilt is a common and detrimental obstacle gamers will encounter during the game. In addition, harassment is another common obstacle that gamers will encounter when practicing online. As P2 reported:

Anybody who's played competitive video games has been attacked at some point in time about being bad, or being a certain ethnicity, or even young, and a lot of times in video games people will curse at you all the time.

Participants also reported that they have seen gamers who do not have proper coping skills choose to leave the gaming community.

Limited Ability to Regulate Emotions: Participants expressed that they could get emotional when processing a loss during the break of a tournament and that inadequate coping would negatively affect future performances. P1 reported that he has seen other gamers panic when they were outplayed by better opponents causing a wide range of emotions beyond frustration classically seen in tilt. He stated, "[once] in panic mode, they're probably gonna get killed again and get snowballed on". Participants also reported when coming off a win you still must be remain composed for the next match.

Dwelling on Past Performances: Participants reported this obstacle was encountered most often during a tournament. P1 said, "I'll lose 3 games in a row, and I know I'll have to, I have to play 6 more." As P4 learned from his own experience, "Like at [some] tournament my team did really poorly… we lost 0-2. So most people were pretty upset about that."

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Trouble Performing Under Pressure: Participants identified that the pressure perceived when competing on a "big stage" or while performing in front of audiences was greater than the pressure perceived when playing in a comfortable environment, such as their own home. According to the participants, this dramatic increase of perceived pressure could be problematic for gamers without proper coping skills. P2 observed other teams who played on a "big stage" and concluded, "If you go and watch a new team play on a big stage you can tell they're dead silent, they're shaking, they're not really sure what they should be doing before the match. They're trying to figure it out."

Confidence Issues: Several participants reported that overconfidence has a negative effect on performance, by using the words such as "cocky" and "egotistical". As stated by P5: "There are a lot of people I know, who get very egotistical about it… Have this whole ego complex to me and no that's not a good thing, because it becomes destructive." In addition, lack of confidence was identified as an obstacle under certain situations as P2 shared:

In lower Elos [levels] you'll see people play, they'll look at a situation and be like 'oh there's three enemies and just me by myself, I need to run away', when in all reality, LoL is totally skilled game play. You can beat 3 people by yourself if you play it correctly, and you predict their movements.

Unable to Repeat Flow Experience: All participants reported experiencing flow in the past. A flow-like experience, as defined by Csikszentmihalyi (2014), is the subjective experience of seemingly effortless movement while being completely engaged in a task for its own sake (no external purpose). However, when asked what led to the flow experience, and if they could replicate that experience, the most common answer was "No." They either have no knowledge regarding what led to flow, like P2 reported, "You know if I knew what led to that, I would try and do it every single time" or they think they know what caused flow, but are unable to replicate that state, like P3 reported, "I've never really been able to replicate it, it's kinda just been situational."

Inadequate Physical and Mental Preparation: Three participants addressed the importance of physical and mental preparation. P4 stated, "So I think just kind of getting in the right mindset is challenging sometimes but important." In addition, the importance of physical warm-up was also stressed by two participants. For instance, P2 shared:

Like [a tournament], I wasn't prepared for how cold it was there, so that was tough. The tournament was in the morning so I wasn't really prepared at all mentally… physically. I played a couple warm up games but couldn't get my groove. That was a bad day.

Team Obstacle: This refers to the challenges that gamers would encounter as a team and also captures the team component of LoL. Team obstacles were reflected in two ways: lack of team reliance and ineffective communication.

Lack of Team Reliance: Unlike traditional sport, eSport players do not need to meet each other in person - they could choose to form an online team, a local team, or a mix of both. Professional LoL gamers usually play on a set team. However, the lack of team trust is problematic for solely online teams, as P1 stated, "You don't know them like personally so you can't take it to that higher level of trust." Furthermore, P2 reported that within a single team, certain members could have joined for a variety of reasons causing a difference in the level of commitment to that team, which can be problematic. Participants also expressed that regardless of online based teams or local teams, lack

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

of team cohesion can be a problem for both types. Moreover, keeping the team calm and providing emotional support for the team when they go on tilt was identified as two separate difficulties by participants.

Ineffective Communication: Three participants claimed that when they practice in solo queue, or play on a random team, team unfamiliarity and lack of teamwork could lead to poor performance. In addition, communication in solo queue is generally ineffective. P2 reported, "They just completely mute their team, but I don't necessarily agree with that cause I previously stated, you can use your teammates to help you get back in the game …"

Need for Balance Between Life and Gaming: This reflected the intertwined relationship of life and gaming, which was perceived as an obstacle by participants.

Difficulty Separating Life and Gaming: Participants identified the difficulty to keep emotions from life and game separated. For example, P4 reported, "If I've had things going on during the day like, or just had a bad day with friends, or dealing with something in real life then it can be difficult to look past that and play well in the game."

Lack of Commitment to Gaming: None of the participants were professional gamers - three of them are in school and two of them have day jobs (one referred to his job as his career). As reported by participants, they would not consider "going pro" because of other things happening in their life. As P4 stated, "One of our main players just stopped playing the game for a long time. He basically sold his accounts and decided to focus on other things in life and he was kinda the leader of the group." However, P3 reported that he would still maintain the dream to become a pro player: "If any opportunities come up for gaming, I would take that in a heartbeat."

Limited Understanding of the Game: This referred to the lack of knowledge about the game. The specific knowledge referred to a wide range of aspects, from the limitation of each pre-programmed champion (refers to the animated characters gamers control in the game), to what one should do under certain circumstances, to the best way to gain the knowledge.

Directed Mental Skills Questions

Eight mental skills were asked about on a consistent basis throughout the five interviews. In total, 34/40 responses were recorded as: yes, this mental skill applies to gaming, 2/40 were unsure if the particular mental skill applies to gaming, 1/40 believed that this particular mental skill does not apply to gaming, and 3/40 were not asked about a particular mental skill due to the researcher's error. Goal setting was thought to be useful by four participants, while P1 was unsure if it would be effective: "It's almost like when you're going up, do you look at each step you take, or are you always looking up?" Imagery was also thought to be useful by four participants, however, P2 believed it would not be useful: "When I think of imagery I think of set ways, and that's not necessarily how it should be." Of the four participants asked specifically about anxiety management, all four said that it is an important skill to have. Energy management was believed to be useful by four participants, however, P3 was unsure if it could actually be useful. He stated, "since we're sitting down a lot of the time it's kinda not as important, so I don't know, I wouldn't say that's too important but I could definitely see that being useful." Emotional regulation was said to be useful in gaming by all four participants who were asked directly about it. Motivation was brought up by two participants organically throughout the interview while two participants said it applies to gaming when directly asked. Communication was identified by all five participants as being

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

important in gaming. Attentional control was also identified by five out of five participants as being relevant to gaming. See Table 3 for a full list of participant responses to the directed mental skills questions.

DISCUSSION

Techniques Used to Achieve Optimal Performance

One of the higher order themes that emerged from the data was techniques gamers already use to achieve optimal performance (consistently playing to the best that an individual's skill level allows). This higher order theme can be conceptualized as strengths gamers already possess, which were broken up into two categories: (a) what gamers do to ensure successful performances and (b) what gamers do to improve upon their skills. These mental strengths allow performers to cope and to overcome obstacles that could impede performance. They allow the performers to gain an edge on their competition, to work as a team, and to focus on what is important for performing effectively. Furthermore, these strengths can be utilized by consultants in the consulting process to better serve their clients.

Mechanical skills made up a small portion of the transcripts and could potentially be categorized as strengths but were not coded for (e.g., reflexes, speed of hand movement, speed accuracy trade off). These mechanical skills could be conceptualized as physical skills seen in traditional sports and therefore were not reported on. However, they did provide insight to the two main mechanisms driving performance - mental skills and mechanical skills. Gamers, coaches, and future consultants involved in this performance domain should utilize and train both facets of the game. Mental skills training could allow performers to better utilize and solidify the strengths they already possess as well as develop new tools in order to achieve optimal performance consistently.

Obstacles Encountered by Competitive Gamers

The four lower order themes under obstacles encountered by competitive gamers indicated that gamers need certain tools to overcome those obstacles in order to maintain or reach a high level of performance. For instance, P5 mentioned that sometimes his teammates would get "trapped in tunnel vision," and it was difficult to get them out. Without proper attentional control skills, the "tunnel vision" could be harmful to team performance. Furthermore, these obstacles could be categorized into three levels: (1) barriers to optimal performance is mainly focused on an individual performance level, (2) team obstacles is mainly focused on the team level, and (3) need for balance between life and gaming is focused on the broader picture of life and gaming. However, the fourth lower order theme, limited understanding of the game, could be considered as a necessity that builds the foundation of both individual and team performance.

The researchers found that the three levels of obstacles are similar to those that are encountered by traditional sports athletes. For instance, a lack of ability to regulate emotion and attention are two common topics encountered between sport psychology consultants and athletes (e.g., Robazza, Pellizzari & Hanin, 2004). Moreover, a lack of team reliance could be encountered by newly-built sports teams (e.g., Filho, Tenenbuaum, & Yang, 2014). Difficulty balancing school and sports is commonly seen among high school and collegiate athletes as well (e.g., Rosenberg & LaLiberte, 2011).

Since the benefits of sport psychology have already been acknowledged by traditional sport administrators and athletes (Wrisberg, Withycombe, Simpson, Loberg, & Reed, 2012), and the obstacles encoun-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

tered by athletes and gamers are similar, it is safe to assume that sport and performance psychology can have a clear role in eSports. Given this knowledge, mental skills training should be a useful technique to improve gamers' performances.

Unique Findings Among Competitive Gamers

Although there were many similarities between eSports and traditional sports in terms of mental strengths and obstacles, there were findings unique to competitive gamers. One stark contrast to traditional sports is the online component of eSports and the unique environment that it facilitates. Many of the participants mentioned either forming a team online or joining online teams. As mentioned by Nardi and Harris (2006), online culture along with rituals are formed by unwritten rules. A particular set of social intelligence skills may be required to form and continue to thrive on online teams. Forming online teams could have pros and cons. In traditional sports, we often see teams formed through an institution, such as a school, where there is not much say as to who is a member of the team from the player perspective. However, in eSports, players are often forming teams by themselves, indicating that there may be prior social bonds that are taken into consideration when forming, potentially independent from age, location, goals, skill level, etc. The online interaction of competitive gamers presents a plethora of research that can be done regarding cohesion, social interaction, motivation, goal alignment, etc.

Many of the mental skills discussed by the gamers were comparable to mental skills in traditional sports, however, the terminology in eSports was often unique from traditional sports. For example, "tilt" was discussed frequently throughout the interviews. The competitive gamers would talk about themselves or others going on tilt which is generally caused by mistakes from the player or a teammate. Going on tilt can be associated with a high level of frustration that can negatively impact the remainder of the game. Another example was "comms", a term short for communication. Knowing the language that players use can enhance consultants' understanding of the context and help them relate better with the players.

The Gap Between What Gamers Do and Obstacles Encountered

Some of the obstacles displayed in Table 2 can relate to the techniques that gamers already utilized to achieve optimal performance. For instance, P2 and P3 identified communication as a strength of their own, while P1 stated that ineffective communication style is an obstacle at the team level. Thus, the obstacles perceived by some gamers could be overcome by techniques that have been utilized by other gamers. However, not all obstacles can be matched with a technique that gamers already used to be successful. More specifically, the need for balancing life and gaming was not able to be matched with a specific technique identified in this research. This is an example of an area that a consultant can help the gamer work on. The researchers believe that certain mental skills, such as attentional control and emotional regulation, could be helpful for keeping gamers focused on the task at hand. However, when taking all the life events occurring outside gaming into consideration, mental skills might not be the only appropriate interventions, and consultation might expand to life skill development.

Directed Mental Skills Questioning

The first part of the interview was exploratory questioning, attempting to listen to the gamers' language and uncover whether they utilize specific mental skills before asking them directly using sport and

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

performance psychology verbiage. Oftentimes, during the exploratory questioning, the participants identified mechanical skills when they were asked about mental skills, strengths, or obstacles. The direct questioning at the end of the interview allowed for the researchers to get clear "yes or no" responses on whether the participants believed the specific mental skills adapted from Lesyk (1998) and Edwards and Beale (2011) applied to competitive gaming.

ESports has become a highly competitive domain where performance is heavily driven by the mind's ability to process and respond to a large amount of input in a short amount of time, and as efficiently as possible. Therefore, psychological skills training could prove to be very effective with competitive gamers. As most of the participants resonated with the specific mental skills and agreed they could be applied, buy-in appears to be predisposed. A strong foundation of mental skills is likely to be necessary to achieve optimal performance. Therefore, gamers and performance consultants can work together to train and further condition competitive eSports players to compete at the highest level their capabilities will allow.

Limitations

The first limitation to the study was that the sample size was small, hindering generalizability; however, the nature of qualitative studies is that they typically have small sample sizes (Dunn, 2013). Given that five participants were involved in the study, the results are illustrative of these particular gamers' experiences and cannot be generalized across the entire population of competitive gamers.

In addition, no professional gamers were involved as participants. The target population was highly competitive gamers, but none of these participants saw gaming as a current source of income. The specific needs for professional versus competitive gamers may vary. It is possible that professionals would present a different set of mental strengths and needs.

The next limitation was that only one specific game was studied. However, looking at one game made the study more specific and catered to the needs and strengths of the players involved in what is currently one of the most popular competitive eSports in the world.

Age was also a limitation of this study. Many professional gamers are under the age of 18 and therefore classified as minors. Although minors could participate in the study, none volunteered. Minors may also provide a very different set of challenges to performance and strengths they may exhibit. There was also a lack of diversity among participants. In fact, P5 brought up gender discrimination as being a huge issue in eSports and the gaming community; therefore, future researchers may want to explore experiences of different genders in eSports.

In addition, participants were only drawn from one major Western city. Although the results of the study were very applicable towards League of Legends players in this area, of this gender, and of this age group, more work needs to be done to further explore the experiences of different groups identifying as competitive gamers.

Practical Implications

The results identified two major factors - mental strengths gamers already have and obstacles they perceived. Performance consultants could build on strengths successfully utilized by high level gamers to overcome obstacles. For instance, P2 reported that he plays a different type of game prior to a performance to prepare him for LoL. Similarly, the consultants could suggest that their clients use FPS (first

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

person shooter, which is a different game type than LoL) games to regulate their arousal level prior to the performance (Jeong & Biocca, 2012). Moreover, the research also provided a general list of the common obstacles identified by competitive gamers. Therefore, consultants should be able to enter a consulting relationship with a better understanding of what a gamer specifically needs. Furthermore, gamers perceived mental skills commonly talked about in traditional sports as interesting and applicable to eSports.

Future Directions

The researchers drew the conclusion that competitive video gamers have similar mental needs as athletes, thus, sport and performance psychology, as well as mental skills training, should be able to help gamers perform at an optimal level. For future research, the effectiveness of mental skills training could be assessed. Moreover, future studies could target other competitive gamers from a larger sample and more diverse group. Different demographics may provide varied insights. Finally, performers from different game types should be studied as well, such as those who play Counter-Strike: Global Offensive (CS: GO), Hearthstone, Defense of The Ancients 2 (DOTA 2), Heroes of the Storm, StarCraft, etc. Since Bavelier, Ashman, Mani, and Föcker (2012) already found that action video game players have better attentional control skills than non-gamers, studying a variety of game types could add tremendous value to the literature.

CONCLUSION

The purpose of this research was to provide scholars, performance psychology consultants, and competitors with more information on the specific mental strengths and needs of gamers. This research identified several strengths and obstacles perceived by gamers, some of which overlap, potentially indicating that some of the obstacles could be tackled by their current strengths. Performance psychology consultants could better serve those in the gaming community by helping them utilize their strengths to help them overcome obstacles and integrating mental skills training into their practice.

APPENDIX

Interview Questions

1. Tell me about your history of involvement in gaming. (e.g., How/why did you get involved?)
2. What other games do you play if any?
3. What do you want to achieve in your competitive gaming career?
4. What are some mental strengths required to be successful?
5. What are some mental challenges or obstacles you face?
    a. Before performance?
    b. During?
    c. After performing?
6. Do you work with a set team or join random ones as you play? Please talk about some of the challenges/benefits that presents.
7. Please talk about some of the ways that you mentally prepare for practice and performances.
8. (Ask only after briefly describing sport and performance psychology) Describe some ways in which you think sport and performance psychology could be of use to gamers such as yourself.
9. Think back to a time where you played really well, what did that look like, what did it feel like, and what led up to that experience?

Chapter 82
Addressing the Impact of Trauma in High Poverty Elementary Schools:
An Ecological Model for School Counseling

La Vera Brown
The University of Phoenix, USA

Tahani Dari
John Carroll University, USA

Natalie Spencer
North Carolina A&T State University, USA

ABSTRACT

A positioned-subject qualitative approach was used to uncover multiple perspectives held by elementary school counselors as to how they interpret their work with children affected by trauma in high-poverty schools. As such, school counselors' knowledge of the impact of ecological factors that led to childhood trauma was examined. Findings indicated that complex and systemic trauma were common themes that informed the schools counselors' ability to advocate effectively for mental health programs for children in high poverty schools. This qualitative study also introduces an ecological and social justice (ESJ) school-counseling model for school counseling in high poverty elementary schools that demonstrates how social justice-oriented school counselors seek to meet the needs of their students with mental illness who come from high poverty backgrounds.

INTRODUCTION

School counselors who work in high poverty schools face two challenges to traditional school counseling service delivery; first, they may discover that students suffer from institutional sources of oppression that may contribute to their problems and secondly, the traditional focus on helping students adapt to the school environment is indefensible when the environment is unjust in the treatment of students (Coyne & Cook, 2004). Many schools in high-poverty areas struggle to cultivate positive environments. Moreover, students who attend schools that are unjust and oppressive are at-risk of experiencing trauma in the forms of bullying, neighborhood gang exposure, or exceedingly harsh punishments from school personnel, (Kira, Lewandowski, Chiodo, & Ibrahim, 2014). Ignoring the dynamics associated with systemic trauma could produce chronic and acute threats to students' social inclusion, belonging, and identity formation (Kira, Lewandowski, Chiodo, & Ibrahim, 2014; Montenegro, & Matz, 2015),which could create harsh and punitive environments, rather than responsive and caring environments. Children educated in high-poverty schools exposed to punitive rather than sensitive and caring school environments are at risk of re-traumatization and increased mental health symptoms (Brown, 2016). The present study advocates the implementation of an ecological model of school counseling to better serve elementary-aged children who face complex, systemic trauma in their high poverty schools.

School counselors may successfully leverage their position as advocates to ensure that the school environment promotes cohesiveness and structure between stakeholders while implementing strategies and interventions for children with mental health disorders in their schools (i.e., teachers, students, and administrators). Such a system ensures the existence of compassionate environments for children with mental illness in high-poverty schools. Moreover, to provide cohesiveness and effective planning, knowledge related to the impact of environmental factors on the emotional health of children is imperative (Bronfrenbrenner, 1979; Brown, 2016). Ensuring that stakeholders across multiple systems have access to knowledge specific to their unique populations is a vital component to the success of high-poverty schools (Brown, 2016). While school counselors may be the first responders and primary advocates, fostering ecologically sensitive school environments requires the commitment of all school personnel. Additionally, due to the increased need for mental health services for low-SES students and limited access to resources within the community, sustainability requires the collaborative efforts of local, state, and regional stakeholders to identify alternative solutions to meet the emotional needs of students to prepare them to become healthy contributors to the school community.

Very little is known about the dynamics, processes, and functions of school counselors who serve successfully in high-poverty schools where mental health disorders are also prevalent. The American School Counselor Association (2016) recently provided guidelines to counselors seeking to promote positive, systemic change in their schools. Exploring school counselors' depth of knowledge surrounding the influence of ecology on the emotional wellbeing of children and their roles in eliminating structural barriers is essential for identifying how school counselors can best serve students with traumatization in low-SES areas. With this in mind, the following research questions guided the present study:

- What knowledge do elementary school counselors have about the impact of environmental factors affecting students from low-SES families?
- What are the perceived barriers that served to impede counselor leadership while serving students from low-SES families with mental health issues?

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- How do elementary school counselors provide leadership for students with mental health issues in high poverty schools?
- How do the participants narrate their roles as leaders in program delivery that include mental health solutions in high poverty schools?

REVIEW OF THE LITERATURE

In this study, a range of social science literature was used to identify how poverty influences learning environments and the likelihood that a child will experience a mental illness. This literature was then used to explore how elementary school counselors in high- poverty schools might advocate for the development of responsive wraparound services for students with mental health issues. The review begins by exploring the link between poverty and mental illness in children and how trauma figures into that relationship. The review then provides an overview of social justice principles and the tenets of ecological counseling that can be mobilized to ameliorate the impacts of poverty and experienced traumas on children's mental wellbeing.

Poverty, Trauma, and Mental Illness Among Children

According to the U.S. Department of Education, one in five public schools qualifies as high-poverty (Marquis-Hobbs, 2014, p. 34). Likewise, the number of high-poverty schools has increased by 60% in the past ten years (Marquis-Hobbs, 2014).

High-poverty schools have been associated with increased exposure to systemic and interpersonal trauma, which can lead to adverse psychological and academic consequences for particular students (Evans, 2004; Evans, Li, & Whipple, 2013; Gerald & Buehler, 2004). Previous studies reveal, however, that poverty affects the educational process for all students, not only those diagnosed with mental health issues (Amatea & West-Olatunji, 2007; Brown, 2006; Chabbra, Chavez, & Harris, 1999). All children are affected when teaching is disrupted because the behaviors of children in distress are not responded to appropriately. Therefore, it is essential to implement preventive and responsive services to address these disruptions and ensure that children with mental health concerns are supported.

Children are linked to the economic experiences of their parents. In high-poverty areas families may encounter social and cultural barriers that limit their accessibility to basic needs, including housing, food, health, education, and public space (Huston, 2011; Ladd, 2012; Ridge, 2002). This deprivation can expose children to interpersonal traumatic events occurring within the family "caregiving system" (Kisiel, Fehrenbach., Liang, Stolbach, McClelland, Griffin, & Spinazzola, 2014; O'Neill, Guenette, & Kitchenham, 2010), which can result in harmful effects for children that are often observable in early childhood (D'Andrea, Ford, Stolbach, Spinazzola, & van der Kolk, 2012; O'Neill, Guenette, & Kitchenham, 2010). Such cases can include physical abuse or neglect where a child's parents or legal guardians fail to provide adequate food, clothing, shelter, medical care, or supervision that a parent with greater access to resources or who is more conscientious would take (Kisiel, Fehrenbach, Liang, Stolbach, McClelland, Griffin, & Spinazzola, 2014; Pino, Herruzo, & Herruzo, 2015). In addition to physical abuse and neglect, sexual abuse and other forms of family violence may be present (Kisiel, Fehrenbach, Liang, Stolbach, McClelland, Griffin, & Spinazzola, 2014; O'Neill, Guenette, & Kitchenham, 2010).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Interpersonal trauma perpetrated by primary caregivers is referred to as complex trauma (Greeson, Briggs, Kisiel, Layne, Ake & Fairbank, 2011). Chronic exposure to complex trauma can put children at increased risk for a wide range of symptoms expressed across developmentally relevant life domains (Brown, 2016; Kisiel, Fehrenbach, Liang, Stolbach, McClelland, Griffin, & Spinazzola, 2014). At minimum, complex trauma is recurrent and results in maladaptive emotional, behavioral, and cognitive functioning in children (Greeson, Briggs, Kisiel, Layne, Ake,…Fairbank, 2011). Exposure to complex childhood trauma, thus, impairs school-related areas including academics, interpersonal relationships, and communication skills (Bell, Limberg, & Edward, 2013). These experiences of complex trauma can be intensified when they are compounded with systematic trauma-- psychological stressors that are perpetrated by one social system or group(s) against members of the same or different group(s). Examples of systemic trauma relevant to schools in high-poverty areas include bullying, neighborhood gang exposure, and harsh consequences received from school personnel (Kira, Lewandowski, Chiodo, & Ibrahim, 2014).

School counselors serving in high-poverty elementary schools are uniquely positioned to identify students who are affected by exposure to traumatic events. Furthermore, school counselors are equipped to develop school-wide strategies and interventions that support students who present with trauma-related symptoms (ASCA, 2016). However, responding to these concerns requires an understanding of the ecological factors that impact children exposed to adversity and who are emotionally impacted by complex trauma (Brown, 2016). It is imperative that schools situated in high-poverty districts are not only equipped to report incidences of maltreatment in children but are also able to effectively respond when the behaviors of children impacted by trauma are present. Ecological development examines various ecosystems that directly impact children ability to thrive (Bronfenbrenner, 1979).

Ecological Development

Ecological development is derived from the work of Bronfenbrenner (1979, 1984, 1986, 1994). According to Bronfenbrenner, human development occurs through processes of progressively complex reciprocal interactions between active, evolving human beings (Brown, 2016). Ecological models include a body of theory and research concerned with "the processes and conditions that govern the lifelong course of human development in the actual environments in which people live" (Bronfenbrenner 1994, p. 37). The ecology of development focuses on the influence of immediate or proximal settings, and for children, the home and school environments represent such settings. In the context of treatment for children exposed to traumatic events the home and school, settings are where effective interventions and strategies should occur (Bronfenbrenner, 1979; Brown, 2016). As such, the study of ecology in school settings would enhance school counseling program planning and implementation in high-poverty schools by including all relevant micro and macro systems (home, school, neighborhoods, and school-district) in the assessment and decision-making process.

Ecological School Counseling

McMahon, Mason, Daluga-Guenther, and Ruiz (2014), developed an ecological framework specific to professional school counselors. The basic assumptions of ecological school counseling involve the school counselors' ability to conceptualize their students through the lens of the multiple systems that affect student success (ASCA, 2016). Moreover, ASCA (2016) indicates that by focusing on ecology, schools are able to inform multi-level, collaborative strategies to develop sustainable change.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

McMahon et.al. (2014) also submit that in order to promote healthy well-functioning systems and to maintain health, balance, and flexibility, clear boundaries are necessary to create cohesiveness and structure between groups (i.e., teachers, students, administrators). As stated previously, creating an environment that represents cohesiveness and structure is essential while working with children in high-poverty schools who are affected by trauma. School environments that are balanced and flexible are also harmonious and open to implementing changes that are essential to eliminating barriers to learning for traumatized children (McMahon, & Mason, Daluga-Guenther, & Ruiz, 2014; Brown, 2016).

Additionally, according to Trusty and Brown (2005), the school counselors' adherence to advocacy guidelines strengthens their ability and positioning in schools. Stronger positioning within schools can offer opportunities for greater access, harmonious environments, and equitable programming. Harmonious environments are those that represent mutuality and "good-fit" between students and the school environment (Brown, 2016; Kisiel, Fehrenbach, Liang, Stolbach, McClelland, Griffin, & Spinazzola, 2014; O'Neill, Guenette, & Kitchenham, 2010). Furthermore, mutuality and "good-fit" between students and the school environment were essential elements towards eliminating systemic trauma (Kisiel, Fehrenbach, Liang, Stolbach, McClelland, Griffin, & Spinazzola, 2014; O'Neill, Guenette, & Kitchenham, 2010). Therefore, the assurance of mutuality and "fit" require the promotion of mental health awareness and sensitivity programs in school settings serving students in high-poverty schools with high populations of children with traumatization.

Ecological School Counseling and Social Justice Advocacy

The United States Surgeon General reported that approximately 20% of children under the age of 18 years old suffer from mental health issues, and nearly five million children have some form of impairment that considerably impacts their daily lives (Wilkinson, 2012). Schools represent a system with established concepts, values, and perceptions that either creates spaces for positive student outcomes or barriers that encumber student success (Amatea & West-Olatunji, 2007). Because children spend the majority of their time in schools, school counselors play an integral role in responding to their needs, particularly in situations where the home caregiving system may be failing. Educational institutions might perpetuate inequality for students from low-SES families and other marginalized populations if advocacy and leadership are not priorities in practice (Brown, 2016). Therefore, school counselors are charged to identify and eliminate systemic barriers that create inequality and impede learning for children (ASCA, 2012).

Furthermore, counselors who practice through a social justice lens will advocate on behalf of those students who are underrepresented to change and transform practices that are potentially harmful to them (Dixon, Tucker, & Clark, 2010; Hunsaker, 2011; Odegard & Vereen, 2010). According to ASCA (2016), school counselors have an ethical obligation to address the needs of marginalized groups, while establishing programs, strategies, and interventions designed to promote student achievement. Therefore, providing learning environments where all children have access to resources that support learning is the school counselor's responsibility. The concept of social justice is grounded in the notion of equitable allocation of resources including economic, cultural, and social capital (Simpson, Lumsden, & McDowell Clark, 2015). Schools that assess their environments for evidence of inequality are positioned to implement new and innovative solutions that positively impact academic outcomes for children from low-SES families, especially those suffering from complex trauma exposure.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

When schools combine social advocacy with attention to the ecological functioning of the environment, they may be more likely to create cohesiveness and structure between stakeholders (i.e., teachers, students, and administrators). McMahon et al. (2014), describe schools as ecosystems where "a network of interdependently connected components...are in a constant state of change, yet they work to maintain a healthy balance within change" (p. 462). These school ecosystems function as "feedback loops" which can identify imbalances or disturbances within the organization (McMahon, & Mason, Daluga-Guenther, & Ruiz, 2014, p.463).

Often student behaviors are interpreted as problems. However, from an ecological perspective, new behaviors create new structures that provide feedback that could indicate an imbalance within the system. For example, a school-wide evaluation of students' attendance records might reveal that attendance has decreased significantly. Further evaluation of the issue might reveal that a local employer has moved their organization away from the community, causing the loss of jobs (Brown, 2016). Lack of employment has created stress in the home, which results in increased absences among the students who might be experiencing psychosomatic abdominal pain and other ailments. Moreover, the loss of employment has affected attendance and created imbalance in the system for children who have difficulty coping with the stressors of this new life structure.

An ecosystem's feedback loop allows schools to function efficiently with adaptability. Adaptability is necessary to create environments that are able to flourish and maintain viability for future generations. Healthy schools are sustainable when they maintain a "reciprocal, collaborative relationship with the community system in which it exists, thereby enabling citizens and workers to sustain the functions of the community," which "provides the school with a new generation of students ready to contribute to the school community" (McMahon, & Mason, Daluga-Guenther, & Ruiz, 2014, p. 463).

Providing resources that are designed to promote the sustainability of low-SES students requires the commitment of all school personnel; however, school counselors are particularly important contributors to the process through their advocacy and leadership efforts (Brown, 2016). Additionally, due to the increased need for psychological services for low-SES students and limited access to resources within the community, sustainability requires the collaborative efforts of local, state, and regional stakeholders to identify alternative solutions to meet the psychological needs of students to prepare them to become healthy contributors to the school community.

Figure 1 represents the relationship between ecological and social justice advocacy theories. Substantial findings published in the literature on the influence of poverty and the psychological wellbeing of children has emerged across many social science disciplines (Amatea & West-Olatunji 2007; Barnett & Allison, 2012; Chabbra, Chavez & Harris, 1999). As such, ecological development and social justice advocacy theoretical perspectives were used during this study in keeping with the post-positivist tradition of individuals' defining their own realities and identities (Charmaz, 2014). Both ecological development and social justice advocacy principles espouse a constructivist relationship between the researcher and participants in which knowledge is co-created and disseminated. The researcher conceptualized ecological theory and social justice principles and developed strategies and interventions that best represent an ecological and social justice (ESJ) school counselors' model for serving students in high-poverty schools with mental illness. Research questions and the participant selection were derived from this thematic representation.

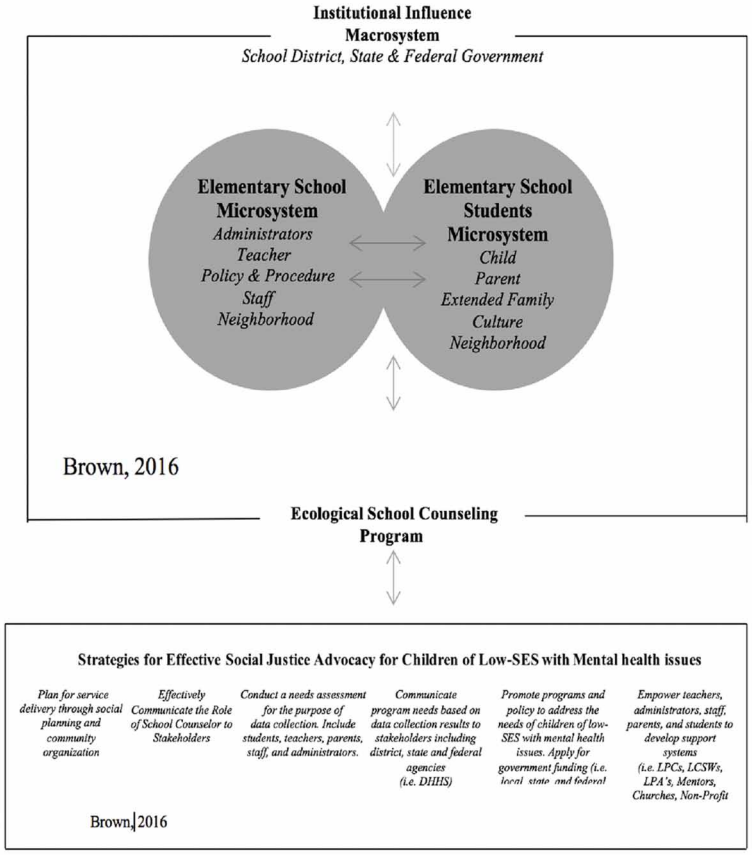
Figure 1. Thematic representation



Methodology

This qualitative study introduces an Ecological and Social Justice (ESJ) school-counseling model for school counseling in high poverty elementary schools (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017). The ESJ school-counseling model demonstrates how social justice-oriented school counselors seek to meet the needs of students with mental illness who come from high poverty backgrounds. Data collection was completed primarily through the collections of positioned subject narratives (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017). In this study, the stories were examined from a social, economic, and cultural context that accounted for the perspectives of counselors who are invested in elementary school counseling for students from low-SES families (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017).

Positioned Subject Approach

The positioned subject approach was used for this study because it allowed the researchers to explore the varied perspectives of a diverse group of elementary school counselors and interpret their perspectives through the lens of their unique settings and situations (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017; Cohen, Vega, & Watson, 2013). The subjects in the present study are committed to leadership

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and social justice work for students of low-SES with mental health issues and/or behavioral concerns in schools. Theoharis (2007) indicates that when using the positioned subject approach, the researcher assumes that the participants create meaning from and interpret their own work from the vantage point of where they serve students (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017). The goal of using the positioned subject approach in this study was to assess how elementary school counselors working in high-poverty schools describe the meaning associated with their experiences and articulate what they value about their work with children from low-SES families (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017).

The Participants

The researchers utilized purposeful and snowball sampling (Creswell & Creswell, 2013) methods to secure school counselors for participation in this study. The study included eight participants currently working as elementary school counselors in high-poverty schools. Additionally, the participants work in several school districts in the United States (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017). The participants were screened to determine the appropriateness of their inclusion in the study, and each met the following criteria (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017). They: (a) currently work in a high-poverty school, as evidenced by 70% or higher of the school population participating in the Free or Reduced Lunch (FRL) program or a school identified as Title I; (b) are elementary school counselors; (c) have an awareness of the various ecological factors that influence their work with children of low-SES, and; (d) advocate, lead, and keep at the center of their practice an understanding of issues related to race, class, gender, disability, sexual orientation and other historically marginalized populations (Theoharis, 2007). All of the participants were assigned pseudonyms to offer the participants anonymity (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017). Furthermore, interviewing elementary school counselors from various school districts enriched the study by offering geographically specific descriptions of counselor roles, responsibilities, and expectations. All of the participants were assigned pseudonyms to offer the participants anonymity (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017). See Table 1 for participant's common characteristics.

Data Collection

The participants in the current study received an email explaining the purpose of the research with a handout attachment that highlighted the theme, 'ecological counseling and social justice' (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017). The researchers conducted initial phone conversations with each potential participant to discuss the content of the handout and determine the appropriateness of their inclusion in the study. Upon completion of the telephone call, those participants identified as eligible then received a demographic information survey via Survey Monkey. The survey required information that pertained to the participant's age, date of graduation from graduate school, childhood economic status, and general educational histories of the participants (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017).

The researchers conducted semi-structured interviews where they asked open-ended questions to elicit responses of depth from the participants (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017; Creswell, 2013). The participants were interviewed in a face-to-face protocol format via Abode Connect. Adobe Connect is a virtual application that recorded and stored the interviews on a password-protected computer. Utilizing a virtual application was the most appropriate and efficient process for data collection from

multiple participants who are geographically situated in several school districts across the U.S. (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017; Wilkerson, Iantaffi, Grey, Bockting, & Rosser, 2014).

The lengths of the interviews were approximately 75 minutes and were transcribed by a professional transcriptionist (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017). Two participants received their transcripts to assure the accuracy of the content. The other participants declined the opportunity to review their transcripts (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017). Moreover, to assure anonymity, the transcripts were modified if they contained specific names of people or organizations. The video files and the transcripts were saved on a password-protected computer storage device (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017).

Trustworthiness

The goal of eliminating potential bias as a participant was accomplished through "triangulation" and the subjectivity statement (Creswell, 2013, p. 251). Triangulation involves the use of multiple sources to provide corroborative evidence to eliminate potential bias. The researchers utilized bracketing strategies to remove themselves from the data. Over and above, the researchers employed an independent auditor to read the transcripts and the study results following their review by participants for accuracy of interpretation (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Data Analysis

The semi-structured interview framework and a positioned-subject perspective that emphasizes the respondents' lived experiences and stories informed the analysis in the study (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017; Creswell, 2013). The analytic steps included: (a) an examination of the interview transcripts for general statements about how the influence of ecological theory knowledge impacts elementary school counselors' attitudes towards social justice advocacy for children with mental health issues from low-SES; (b) the development of themes around these topics; (c) the construction of analytic categories from the themes, and; (d) the linkage to the previously identified analytic categories into a coherent process (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017; Creswell, 2013).

Coding

The researchers coded the contents of the transcripts. Several phases of coding were conducted. The initial phase involved the process of "naming" items prior to the focused selective phase. The focused selective phase was the process of extracting the most significant or frequent codes while sorting and integrating data (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017; Creswell, 2013). Additionally, the researchers employed an a priori coding schema influenced by their exploration of previous literature on school counseling programs and child mental health in high-risk SES areas.

Six themes and parallel clusters emerged from the data analysis. These include: (a) motivation to advocate; (b) prioritizing mental health in schools; (c) trauma; (d) school-based support (micro-level support); (e) school district support (macro-level support), and; (f) preparedness. The identified clusters are: (a) counselor childhood experience; (b) professional identity; (c) establishing school protocols; (d) complex trauma; (e) systemic trauma; (f) positive and negative school support; (g) positive and negative school district support; (h) childhood experiences, and; (i) feeling prepared and not feeling prepared (Brown, 2016; Brown, Bass, Spencer, & Dari, 2017).

The themes highlighted in this chapter are complex and systemic trauma. One emerging issue that was related to the influence of ecology on students' mental health was complex trauma. Trauma as a single theme emerged from research question number one. Complex trauma is the exposure to multiple and chronic, interpersonal traumatic events; these events occur most often within the family system and typically begin in early childhood (Kisiel, Fehrenbach, Liang, Stolbach, McClelland, Griffin, & Spinazzola, 2014; O'Neill, Guenette, & Kitchenham, 2010).

Embedded in the theme of trauma are interpersonal and systemic factors. Interpersonal factors are described as physical abuse, neglect, sexual abuse, and family violence (Kisiel, Fehrenbach, Liang, Stolbach, McClelland, Griffin, & Spinazzola, 2014; O'Neill, Guenette, & Kitchenham, 2010). Systematic trauma refers to stressors that are caused by one social system or group(s) upon members of the same or different group(s). Examples of systemic trauma included bullying, neighborhood gang exposure, and harsh consequences received from school personnel (Kira, Lewandowski, Chiodo, & Ibrahim, 2014).

Results

The counselors in this study noted that possessing knowledge about the ecological influences helps them recognize behaviors in children affected by their exposure to traumatic events. This knowledge better equipped them to implement procedures to cultivate schools that are healthy, well-functioning,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

dynamic, balanced, and flexible (Brown, 2016; McMahon, Mason, Daluga-Guenther, & Ruiz, 2014). All participants felt that raising awareness of the ecological factors specific to students from low-SES families would also result in their ability to address emerging issues. Two themes related to complex and systemic trauma emerged from the present study.

Complex Trauma

Children are linked to the economic experiences of their parents and, therefore, encounter social and cultural barriers that often limit their accessibility to basic living standards, including housing, food, health, education, and public space (Huston, 2011; Ladd, 2012; Ridge, 2002). Deprivation produces harmful effects for children that are observable in early childhood (D'Andrea, Ford, Stolbach, Spinazzola, & van der Kolk, 2012). According to the literature related to trauma, childhood privation often leads to traumatic interpersonal adversity (Kisiel, Fehrenbach, Liang, Stolbach, McClelland, Griffin, & Spinazzola, 2014; O'Neill, Guenette, & Kitchenham, 2010). Based on the information obtained from the interviews, the school counselors acknowledged the existence of interpersonal factors related to child trauma among their students. All counselors reported that interpersonal factors influenced behaviors and created challenging environments for educators and the students.

Rebecca expressed concerns about her students who have been exposed to traumatic circumstances:

You've got stressors of their family. They're food insecure and they're not getting their basic needs met… A lot of times if there are stressors in the family… then they are more likely to…act out. You know I see a lot of trauma kids because of domestic violence or neglect or abuse and that's the cumulative risk … of having those things happen …and then having a mental diagnosis because of those things too…. all because they were lower SES and the parents couldn't handle all of the stress.

Michael also shared his thoughts related to the students in his elementary school who have food insecurities:

My students who come from poverty, they don't have anything. And from my middle class background… I see students who are all getting lunch at the same time, within thirty seconds of each other and it's always about who is going to get theirs first. Even in higher grades where you would think they would grow out of this, it can still be an issue. It's a power thing…it's status. And I think sometimes it means more to our kids in poverty… Maybe they don't have that much and they don't get much food.

Interpersonal trauma was also discussed in the form of abuse and neglect, which implies cases in which a child's parents or legal guardians fail to provide adequate food, clothing, shelter, medical care, or supervision as a more conscientious parent would (Kisiel, Fehrenbach, Liang, Stolbach, McClelland, Griffin, & Spinazzola, 2014; Pino, Herruzo, & Herruzo, 2015). Because child neglect is the most prevalent form of child maltreatment, it was a concern for a few of the counselors who reported that often what appeared as neglect was actually the parent not having resources to address a crisis situation. For example, sometimes, children come to school without clean clothing because the family does not have electricity or water. Additionally, a few counselors reported that the extent of the problems required creative logistical processes to meet students' needs. Nancy stated:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

I know multiple families that have utilities turned off. So we do what we can and we realize that a child wants to have a sense of pride. So we (counselors) have clean uniforms and the nurse has clean uniform and they (students) can shower and dress and just feel good about their day. It feels good to come in and have a hot shower and put on a clean uniform and learn.

All of the counselors shared their views on the benefit of having effective communication with families as a strategy to identify potential traumatization. This strategy was oriented specifically toward social justice advocacy because the school counselors' adherence to advocacy guidelines strengthens their ability and positioning among their stakeholders (ASCA, 2012). Possessing stronger positioning offers opportunities for greater access, harmonious environments, and equitable programming (Trusty & Brown, 2005). Additionally, because families from low-SES are traditionally without a voice within institutions, the school counselor as a social justice advocate can identify and serve as a voice for families with greatest risk exposure (ASCA, 2012; Martin, 2002).

The counselors in the present study indicated that remaining connected with the families provided insight into the complexity of the issues children face in their homes. Terri stated:

We have family intakes and do a home visits before they (kindergarteners) even come to school. So we go into the homes, they (parents) sign a contract of excellence and then we talk to them about...What hurdles do you have in your family right now? Where do you see your kid in 20 years? How can we help you get there? What are you gonna do to help your kid get there?

Remaining connected with families also provided opportunities for the counselors to assess for high levels of lethality that might exist in students' homes. This is necessary to implement effective school-based interventions, strategies, and referrals (ASCA, 2012). Terri described an incident that might have resulted in the serious injury of one of her students. She stated, "his mom threw herself out of a car because of an abusive situation; he (student) threw himself out of the car to protect her (mom) while it was moving." Terri stated that the student was referred to counseling because he began acting out in school and demonstrating aggressive behaviors toward his peers. She stated,

it wasn't like he was a bad kid… it was more like… we knew something was going on in the home that needed to be addressed…so we thought he needed some help because he appeared angry all the time.

She indicated that the student's parent was able to offer information used to address his aggressive behaviors and prompt the school- based clinician to conduct therapy and establish interventions to help him cope with anger.

Systemic Trauma

Advocacy is defined as the "act of arguing in favor of a particular idea, cause, or policy on one's behalf" (Coyne & Cook, 2004, p. 290). Recent literature reveals that individuals with mental health issues could benefit from social justice advocacy (Lewis & Bradley, 2000; Toporek, Gerstein, Fouad, Roysircar, & Isreal, 2006a). School counselors who work in high poverty schools face two challenges to traditional school counseling service delivery (Coyne & Cook, 2004). First, school counselors could discover that students suffer institutional sources of oppression that might contribute to their problems. Second, the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

traditional focus on helping students adapt to the school environment is indefensible when the environment is unjust in the treatment of students (Coyne & Cook, 2004).

Many of the counselors shared concerns about the impact of systemic factors that contributed to student distress. A few of the counselors discussed the presence of gang activity in communities as a systemic factor. Mark indicated that in the community where his school is located, gangs and drug use is a major concern. He stated, "Oh wow, the environment they live in. There is a lot of gang activity in my school area and we have a lot of folks who are dependent on drugs. It's a lot." Rebecca stated that,

"when you're looking at a rural community like this… it is really easy to build unseen meth labs, you know… to put it simply. So there's a high drug risk."

Rebecca expressed concerns about what she described as racial and ethnic "dogma" that produces an environment of hostility and violence in her school:

Honestly I would say some of the culture…you are looking at here are mostly whites…and this is not always a positive thing. Some of my kids come to school spouting a whole lot of white supremacy dogma because that's what their families hold on to… because they have nothing else. I think, that this kind of mindset that often breeds… it just breeds violence… it just does. And I say that about kids that I really like…and it hurts me to say this… that but it's true.

The ASCA (2012) National Model provides guidelines that reflect an appropriate response to systemic inequality in schools by encouraging school counselors to promote positive, systemic change in schools. (p. 24-25). The literature on systemic trauma reveals that ignoring the dynamics associated with systemic trauma might produce chronic and acute threats to students' social inclusion, belonging, and identity for children (Kisiel, Fehrenbach, Liang, Stolbach, McClelland, Griffin, & Spinazzola, 2014; Montenegro, & Matz, 2015).

A few counselors discussed how school environments perpetuated inequality and inflexibility. Many counselors discussed how inflexibility created conflict between the staff and the students (Coyne & Cook, 2004). Many also expressed that their school environments were disempowering to students and served to discourage positive and productive learning environments. Rebecca stated, "It has to do with administration … I think certain attitudes breed a certain amount of school anxiety and then that leads to behaviors that we don't want sometimes." Empowerment is a necessary component to advance social justice. The counselors expressed the value of strengthening the school culture to eliminate systemic trauma for students. All of the counselors responded "yes" to the question, "Do you feel that the school environment has implications on student behaviors?" Cynthia stated:

Yes, I can see that especially with the younger teachers. They haven't worked long enough I guess. If a student doesn't feel loved and they can tell. And, then they know that you (the educator) really don't care. Just like their parents are giving them the message that they really don't care. If we're not inviting at school and try to make them feel comfortable, then we're not going to make progress.

Social justice advocacy is the embodiment of powerful relationships that incorporate visions of a just society. All of the counselors discussed the importance of creating environments that support the cultivation of powerful relationships among school personnel and students (Cohen, Vega, & Watson,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

2013; Toporek, Gerstein, Fouad, Roysircar, & Isreal, 2006a). Many of the counselors discussed how they felt compelled to observe their school environments to become aware of the attitudes and perceptions of school personnel. Many of the counselors felt this was necessary to create welcoming and less stress provoking environments for students who have experienced trauma. Assessing the school environments is consistent with one of the major tenets of ecological school counseling that implies that "meaning" is both constructed and experienced within schools and their subsystems (McMahon, Mason, Daluga-Guenther, & Ruiz, 2014).

Nancy was concerned with the impact of the "dismissive" behaviors perpetrated by teachers and administrators and how her students might apply "meaning" to comments and behaviors of school leaders:

If a teacher or an administrator have already dismissed or written a child off, they have no motivation to do better. If I (teacher/administrator) dismiss you (student) or write you (student) off ……then the children are going to behave poorly.

Inflexibility in providing consequences was also discussed. Nancy stated:

If a child knows that (they're) going to be disciplined for one mistake that (they) may make 35 minutes at the beginning of the day…in (their) minds the rest of the day is a loss. If we create a culture and a climate of loving correction, accepting and learning and using mistakes ….to make us better than I think that will kind of fuel the child's inner motivation and their ability to try to be their best.

Conducting informal observations were discussed as a strategy for monitoring student and staff interactions.

Aisha expressed her challenges related to the interactions that she observed between students and teachers in her school that she felt re-traumatized students:

I have seen reactions from certain teachers that demonstrate absolutely no empathy. Because the needs are so great, we must meet the students where they are…. I have a kid who is traumatized at home and is also traumatized at school because of the teacher's reaction to them. When the child comes from a horrible home environment, he has no control over his situation and the reaction of the teachers makes life more challenging for him.

The purpose of the current study was to understand how school counselors advocate for students affected by trauma in high poverty schools. The following themes emerged during this study: complex and systemic trauma. These themes guided implications for practice, theory, policy and advocacy and future research. Additionally, as a result of this qualitative study, an Ecological and Social Justice (ESJ) school counseling model for school counseling in high poverty elementary schools was introduced as a guide for elementary school counselors serving in high poverty elementary schools.

Discussion

Complex trauma is described as the exposure to multiple and chronic interpersonal traumatic experiences that typically occur within the family and often begin in early childhood (O'Neill, Guenette, & Kitchenham, 2010). Although the literature suggests that the significance of child abuse on child adjustment

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

to the school environment has not been studied extensively, abuse and neglect is shown to have negative consequences for educators and children (O'Neill, Guenette, & Kitchenham, 2010).

The counselors in the present study identified fear, hyperactivity, aggression, depression, and self-harming behaviors among their students. The symptoms they described were the result of exposure to multiple and chronic interpersonal traumatic experiences. Exposure to cumulative risk factors is also characterized by marked impairment of academic and developmental functioning. Because risk exposure is more likely among students in high poverty schools, counselors working in these settings would benefit from professional development and certification related to trauma informed treatment. The counselors in the present study discussed the value of identifying and providing services to students affected by traumatic experiences; however, none of the counselors have pursued certification or training in trauma informed treatment in children.

Implications

The present study contributes to the knowledge about elementary school counselors' perceptions regarding the effects of poverty, importance of advocacy, and school-based mental health programs. The variables considered in this study are easily replicated for future research. As stated earlier, there is limited research regarding ecological school counseling. More specifically, research is sparse related to school counselors serving students from low-SES with mental health issues from an ecological perspective. Due to limited research, it is difficult to understand how to meet the needs of students impacted by adverse environmental conditions that have resulted in their impaired academic and emotional functioning. Future research considerations might include an exploration of the concept of school counseling along with Systemic Trauma Theory. Because there exists a large body of literature that addresses trauma from an individual perspective, obtaining additional knowledge related to the consequences of trauma from a systems perspective could be useful for school counselors as social justice advocates concerned with eliminating systemic barriers for children from abusive environments (Briere & Scott, 2015; Corrigan & Hull, 2015; Hudspeth, 2015)

A study of systemic trauma might serve to advance research related to school improvement from an ecological school counseling perspective. Engaging in further research might be valuable to the process of implementing protocols for students with a history of trauma.

McMahon et al. (2014) expanded on the ecological framework established by Coyne and Cook (2004) by offering an ecological counseling model specific to professional school counselors. The constructs of the Ecological School Counseling Model could be utilized as a framework to create evaluation plans and instruments designed to assess school environments in high poverty schools for evidence of possible practices that may result in developmental delays and contribute to the obstruction of their academic and social advancement (Kira, Lewandowski, Chiodo, & Ibrahim, 2014).

Chapter 83
Positive Psychological Interventions and Information and Communication Technologies

ABSTRACT

Since the advent of Positive Psychology there has been a connection between positive psychological interventions (PPIs) and the digital world. The development of PPIs, especially those delivered online, is becoming widespread within and outside the scientific field. Therefore, there is currently a need for accurate information that provides a critical view of all the interventions currently available. This chapter presents an updated review of the relationship between these two fields (PPIs and technologies), and discusses relevant considerations that should be taken into account when technologies are used to deliver PPIs, as well as the elements that can moderate their effectiveness. The final aim of the chapter is to provide readers with basic tools to make critical judgments about PPIs delivered via a technological format.

INTRODUCTION

Positive Psychological Interventions (PPIs) can be defined as interventions or intentional activities designed to cultivate positive feelings, cognitions and behaviours (Sin & Lyubomirsky, 2009). Since the establishment of the basic principles and objectives of Positive Psychology, increasing and relevant knowledge, both empirical and theoretical, has been produced in this field, demonstrating the efficacy of these interventions for improving well-being and reducing clinical symptomatology (specially depressive). Some examples of this idea come from the two meta-analyses carried out by Sin and Lyubomirsky (2009) and Bolier, Haverman, Westerhof, Riper, Smit and Bohlmeijer (2013). In the latter, the authors concluded that most of the analysed PPIs had a self-applied format, sometimes with face-to-face support, but most were delivered online (Bolier et al., 2013).

The connection between PPIs and Information and Communication Technologies (ICTs), especially with the development of the World Wide Web (WWW), has been present since their inception. Positive Psychology emerged at the same time as the expansion of the digital era; from the beginning it has taken advantage of many of the possibilities offered by ICTs, especially the Internet. In fact, one of the first studies to assess the efficacy of different PPIs was carried out over the Internet by recruiting a sample of people who had visited the webpage https://www.authentichappiness.sas.upenn.edu/ (Seligman, Steen, Park & Peterson, 2005).

Most of PPIs are brief and simple exercises or activities that can be implemented as part of one's daily routine, and where both commitment and daily practice become essential elements of their efficacy (Sheldon & Lyubomirsky, 2006). ICTs (especially mobile devices with Internet access) are being introduced exponentially in our daily lives. They can be very useful tools for designing, introducing and managing the intervention naturally as part of a routine, taking advantage of the growing number of innovative resources they offer, which can make the intervention more attractive and flexible. Moreover, the Internet provides accessibility that allows that these interventions reach a population that otherwise would not have access to them (Andersson, 2009; Andrews, Cuijpers, Craske, McEvoy & Titov, 2010; Bolier, et al., 2014). The current technological advances not only offer a new way to provide treatment, they also open up new possibilities for assessment and intervention. For example, sensorisation systems, currently available through mobile technologies, allow to monitor an intervention, patient's parameters, and environmental indicators, with a degree of ecological validity not previously achieved in the field of Psychology (where the main sources of information were self-reports and retrospective information). There are also examples of the potential benefits of other ICTs. Virtual Reality and Augmented Reality offer high-quality simulations of environments at an increasingly affordable cost, making them powerful tools for therapeutic change. Video games are also presented as innovative learning methods aimed at improving adherence and motivational components, both important variables for increasing treatment efficiency and efficacy. It is not surprising that the potential of ICTs has promoted most developed countries to consider them as the basis for health-care solutions.

This work aims to further examine and describe the associations between PPIs and ICTs. First, the current definitions of the relationships between the two fields will be clarified, and a summary of the PPIs using ICTs for which scientific evidence exists, including several technological applications developed by our group, will be described. Then, relevant considerations to be taken into account when technologies are used to deliver PPIs, as well as the elements that can moderate their effectiveness and their relationship with technologies will be considered. Finally, information from existing scientific literature regarding who consumes technology-based PPIs will be provided.

RELATIONSHIP BETWEEN PPIs AND ICTs: DEFINITIONS

The application of technology to the field of PPIs has led to the emergence of different terms and definitions that try to capture this interaction. The terms are summarised below:

- **Online Psychological Interventions (OPIs):** These are defined by Ritterband, Gonder-Frederock, Cox, Clifton, West and Borowitz (2003) as interventions focused on behavioural aspects designed to modify and establish certain behaviours and subsequent improvement in symptomatology. Generally, they refer to customisable and interactive interventions that fit the individual's own pace and use the multimedia format offered by the Internet.
- **Technological Behavioural Interventions (TBIs):** Mohr, Burns, Schueller, and Klinkman (2013) proposed this term for technological apps specifically designed to intervene on behavioural, cognitive and emotional aspects, in order to improve physical and psychological health and well-being. TBIs use different devices and technological developments (for example, smartphones, computers, virtual reality, videogames, social networks) for self-assessment, monitoring, psychoeducation, goal setting, skills training, and feedback among others.
- **Positive Technologies (PTs):** This term was proposed by Botella, Riva, Gaggioli, Wiederhold, Alcañiz and Baños (2012) and Riva, Baños, Botella, Wiederhold and Gaggioli (2012) to refer to the scientific and applied approach focused on the study of the use of technology to improve the quality of personal experiences. It is a perspective that seeks to promote the use of technology to foster personal growth and the development of human virtues and strengths, thus contributing to social and cultural development.

As can be seen, there are overlaps between these definitions. Some definitions are more general than others, emphasising either the intervention or the technology used. In this chapter, the focus will be on the definition of PTs proposed by Botella et al. (2012a) and Riva et al. (2012), as it is the only definition that establishes a classification of technologies based on conceptualisations of subjective, psychological and social well-being (Diener, 1984; Kahneman, Diener & Schwarz, 1999; Ryff, 1989; Keyes, 1998; Ryan, Huta & Deci, 2008). According to Botella et al. (2012a), each level of wellbeing includes different goals (hedonic level: emotion regulation; eudaimonic level: flow and presence; and social level: community aims and social connections), and different technological applications can be designed to influence each level. Examples of hedonic PTs would be those that induce a positive and enjoyable experience, such as a virtual reality environment of joy/relax induction (e.g. Alcañiz, Baños, Botella & Rey, 2003; Baños et al., 2004, 2006). Eudaimonic PTs include technologies that help people achieve experiences focused on the search for a full and meaningful life (e.g., Botella et al., 2012b, Mira et al., 2012b). Social PTs include technologies that support and enhance communication and cooperation among individuals, groups and organisations (e.g., Botella et al., 2011).

PPIs AND ICTs

As previously mentioned, in recent years there has been a significant rise in the number of interventions aimed at increasing positive emotions, behaviours and thoughts that contribute to improved well-being and happiness. Currently, a set of PPIs has already shown efficacy in increasing well-being and reducing

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

depressive symptoms. Despite these advances, it is still necessary to carry out further rigorous work, especially regarding the effectiveness of PPIs (Bolier et al., 2013). This section first summarises those PPIs that have received greater empirical evidence. For each type of PPI, some currently available applications will be listed as examples. Then, technological applications developed by our group, as well as other PTs with evidence-based effectiveness, will be described.

1. PPIs

- **Savouring:** this activity is designed to intensify and prolong pleasurable experiences (Peterson, 2006). Several studies have shown the effectiveness of savouring in increasing positive mood and happiness (Bryant, 2003). The savouring intervention can be used with a sensory experience, such as eating an ice cream or feeling the sunshine on one's face, and also with memories. The variants within this intervention can be grouped into two categories: 1) the ones that teach and promote the practice of savouring in general; and 2) the ones that teach a specific savouring skill and promote its use. The first group usually includes asking the person to stop every day for at least 2-3 minutes and direct his/her attention to the present moment, focusing on the details and trying to prolong the pleasure of the activity as much as possible. For example, in the case of drinking hot chocolate, the person might focus on the taste, texture or temperature, then on the different sensations experienced when drinking it, and then on the mixture of flavours it leaves in the mouth. This same strategy can be applied at different times or in different situations, for example, walking to work or sitting on the bus, taking the same trip one takes every day. By contrast, the second group involves more structured training, so that people remember pleasant aspects of their lives, for example, being in a specific time and scenario, remembering what the temperature was, who they were with, or why it was a good time. In this case, participants use savouring techniques anchored in positive reminiscence work in order to re-edit a past moment and re-experience an event that has already occurred or even discover new positive feelings about it. The "Live Happy" (Parks, Della Porta, Pierce, Zilca, & Lyubomirsky, 2012) application is an example of transferring several PPIs to an online format; the app includes two savouring exercises. "Remembering happy days" is focused on creating a personal photo album to remember good times, where the user must also write a short description of that special moment. Thus, the exercise uses savouring while activating past experiences and recovering the original emotions and feelings. In the other exercise, "Savouring the moment", the user must take a picture of something beautiful and meaningful and write a brief paragraph that describes the value of the image and what he/she notices when watching it.
- **Gratitude:** This is one of the most used PPIs and with more empirical evidence compared to other PPIs (Bolier et al., 2013; Parks & Biswas-Diener, 2013). It involves doing activities to cultivate gratitude, either reflexively and following structured guidelines, or by carrying out a specific activity. These interventions have proved their effectiveness in increasing well-being, positive affect and physical health, and in reducing negative symptoms. However, literature has also pointed out the need for caution when prescribing this type of intervention. For example, Seligman, Steen, Parks and Peterson (2005) showed the usefulness of gratitude activities in people suffering from mild to moderate depression. In addition, Sergeant and Mongrain (2011) examined the effects of a gratitude intervention in depressed people with different styles of functioning (e.g., people with a greater need for support from others, or people with a self-critical functioning style). They found

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

that people with a greater need for support and stronger feelings of helplessness about their goals did not benefit from the intervention, or, in some cases, even worsened when they did the activity.

One of the strategies focusing on a "more reflective" gratitude is the "Journal of gratitude". In this case, participants are asked to record once a week, for several weeks, at least five things for which they are grateful (Emmons & McCullough, 2003; Lyubomirsky, Sheldon & Schkade, 2005). Another exercise to cultivate gratitude is the intervention designed by Seligman and his team (Seligman et al., 2005), entitled "Three blessings". Every night, participants should think for 10 minutes and write down in a journal three events about which they feel grateful and why. This exercise is not designed to record important or unusual events, but rather to focus on those small things that are part of their daily routine and make them feel good. Unlike the "Journal of gratitude", which deals with general functioning areas such as family, friends, work, studies, etc., the "Three Blessings" exercise focuses on situations that occur throughout the day. Regarding implementing specific activities, one example is "The visit of Gratitude". In this case, the participant is asked to write a letter of appreciation to someone about some detail or event that he/she has not had a chance to thank that person for, listing the details and/or situations that reflect the feeling of gratitude. Some authors recommend delivering this letter (Seligman et al., 2005), while others say it is not necessary (Lyubomirsky, Dickerhoof, Boehm & Sheldon, 2011). Regarding online interventions using this technique, one example is "Day to Day" (https://intellicare.cbits.northwestern.edu/#apps), an intervention delivered over smartphones that includes among its activities an exercise designed to cultivate gratitude. For seven days the user receives on his/her phone a simple exercise that must be done throughout the day. In addition, short simple messages explaining the importance of this exercise are sent, and the person is encouraged to follow the received guidelines. "Day to Day" also includes other exercises to increase connectedness, the frequency of pleasant moments, flexibility of thinking and problem solving. Each exercise lasts for seven days and maintains the same structure: at the beginning of the day, the user receives the activity to be done, brief messages of explanation and reinforcement are sent, the user is asked if he/she thinks the prescribed exercise will be positive for him/her, and at the end of the seventh day, two short questionnaires assessing levels of depression and anxiety are administered.

The "Live Happy" application also includes gratitude exercises. In the "Gratitude Journal" exercise, the user records something that happened during the day and why he/she is grateful. In another version of the exercise, the person chooses somebody to whom he/she wants to express gratitude.

- **Kindness**: In any of their variants, in general all these PPIs are aimed at getting the person involved to perform acts of kindness in his/her daily activities. The intention is to produce an interaction between the feelings aroused by doing something for someone and the feeling of gratitude, thus generating a reciprocity between giving and receiving that can lead to increased levels of happiness and well-being. An example of this procedure is the one developed by Lyubomirsky, Tkach and Sheldon (2004), in which the person must commit to five daily acts of kindness for 6 weeks. Another variant of interventions to foster kindness, although based on pro-social behaviour, proposes spending money on another person (Dunn, Aknin, & Norton, 2008). Regarding the number of acts of kindness, the important thing is that the person strives to do more actions of this kind than usual during his/her daily routine. "Live Happy" also includes a diary for recording acts of kindness and nurturing kindness in daily routines through making contact with a friend, relative, etc. With this exercise, "Live Happy" seeks to improve the quality of the user's social interactions.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Promoting Positive Social Relationships:** This PPI includes interventions focused on increasing social contacts and the quality of the interactions. One of the PPIs designed to meet this goal is "Respond actively and constructively" (Gable, Reis, Impett & Asher, 2004), which aims to train the user to respond actively and constructively to good things that happen and/or that someone is sharing with him/her. The user is asked to try to respond with happiness and genuine interest when asking about the event or situation. The purpose of the intervention is to transform neutral (or negative) styles of social interaction into positive interactions and generate new positive social interactions. These new interactions can range from a simple greeting in the morning when encountering someone to fostering genuine relationships with people with whom there is a deep bond of friendship. An example of PPI that includes interventions of this type is one of the exercises proposed by the "Day to Day" app, previously mentioned. In this case, for a period of one week the user receives a daily pattern of positive social interactions to perform. The app tells what, how and how many interactions should be performed every day. The exercise is designed to increase social connectivity and improve the quality of the connections by strengthening ties with close links (e.g., friends) and with people with no bonds or distant links (e.g., salesman, etc.).
- **Search for Meaning:** These interventions help a person build meaning and goals in life that contribute to happiness. An example of these interventions is the "Best Possible Self". This technique is based on the work of King (2001), who proposed the therapeutic activity of writing about future objectives in life in order to achieve greater awareness and define life goals. The exercise requires the individual to write about a future where he/she has worked hard and, as a result, achieved all of his/her objectives and developed his/her full potential. Then, the assignment is to visualise this version of the self at least three minutes a day for a week (Sheldon & Lyubomirsky, 2006).

A similar exercise for building meaning is the "Summary of Life", proposed by Seligman, Rashid and Parks (2006). In this case, the person is prompted to write one or two pages reflecting how he/she expects to live day to day, and think about whether he/she can imagine actively working to achieve the objectives described in the narrative.

As we have seen, in general PPIs that promote the construction and search for meaning have narrative content. However, a study conducted by Lyubomirsky, Sousa and Dickerhoof (2006) warns of the differences in working on positive and negative material to generate increases in emotional well-being. When working with the memory of past experiences, it is preferable to work on the negative material analytically, using questions (e.g., why, how) that will lead to its restructuring. In these cases, the construction of written or oral narratives is very useful, as they involve a systematic, step-by-step process, providing coherence and an explanation for the negative event. The positive material, however, should be worked on without this type of analysis, without trying to make sense of it through written or oral narratives. The repetitive, circular and disorganised nature of experiences that "presumably" remains when remembering the event in private would be more beneficial to increasing well-being, as it would lead to reliving, savouring and capitalising on the experience (Langston, 1994; Quoidbach, Berry, Hansenne & Mikolajczak, 2010). This type of intervention is currently spreading, and there are numerous studies that evaluate this exercise in different clinical and non-clinical populations (Lyubomirsky et al., 2011; Meevissen, Peters & Alberts, 2011; Peters, Meevissen, & Hanssen, 2013). An example of this type of intervention is "Live Happy", which includes an exercise based on the "Best Possible Self" designed to promote optimism.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Personal Strengths:** Although there are some variations in their applications, in general the activities associated with this PPI attempt to identify, use and develop a personal strength. From the perspective of Seligman (2002), a personal strength is a positive personality trait with the following characteristics: the feeling that it is something one owns, a sense of excitement about showing it off, a fast learning curve when practicing it for the first time, a longing to find new ways to use it, the inability to prevent its use, a more energetic feeling when using it, the creation and pursuit of personal projects that revolve around it, and a feeling of joy, excitement and even ecstasy when using it (Seligman, 2002). It is possible to identify one's personal strengths through the VIA (Values In Action) Strengths Inventory (Peterson & Park, 2009), which evaluates 24 strengths grouped into six virtues: "wisdom and knowledge", "courage", "humanity and love" "justice", "temperance", and "transcendence". Usually interventions on personal strengths ask people to identify their 5 main strengths, and then they have to exercise one or more of them in a new way for a week, whether at work, at home or during leisure time. Several important issues should be considered in the training: to clearly define the way the located strength must be practiced, the individual must record how he/she felt before, during and after doing it. It is also important that the individual assess whether the activity was stimulating and easy, whether time passed quickly, and whether he/she planned to repeat the activity. Thus far we have described the PPIs most used and with the most empirical evidence, some of which have been adapted to be delivered through the Internet and mobile devices. Next we will focus on interventions that were initially designed to be applied through ICTs.

2. Positive Technologies to Deliver PPIs

Below, we present a brief description of various positive technologies developed by our team (EARTH of Well-being, Butler system, and Smiling is fun), as well as other applications with evidence-based effectiveness in improving well-being.

- **EARTH of Well-Being (Baños et al., 2014):** This is a self-applied system that includes three modules with activities for working on different aspects of positive affect and hedonic and eudaimonic well-being. A module called "Well-being Park" includes two virtual reality environments and is designed to induce two emotional states (joy and relaxation) by using widely validated emotional induction methods (Lang, Bradley, & Cuthbert, 1995; Velten, 1968). Another module, "Well-being in Nature", also includes two virtual reality environments and different PPIs activities to induce joy and relaxation (savouring, slow breathing and positive reminiscence). The third and final module, the "Book of Life", works like a personal diary and includes 16 exercises focused on the past or the future. The former are directed at recalling past experiences related to different topics (e.g., "A happy moment", "The best place", "Important people", "An achievement", "Courage", "Optimism", "Gratitude", and "Passion"), and the latter involve defining objectives and positive future goals (e.g., in relation to oneself, family, friends, work, and life in general). All exercises have the same structure: a general instruction that explains the overall objective of the exercise and a series of secondary guidelines to aid in writing the narrative. In addition, the user can add multimedia resources (videos, pictures and music) to each chapter. Some of the exercises proposed have been validated in different populations: students (Baños et al, 2014.), people with adjustment disorders (Andreu-Mateu et al., 2012), cancer patients (Baños et al., 2014), and older

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

adults (Baños et al., 2012), among others. EARTH of Well-being was initially developed for the Mars-500 project as a self-guided system to generate positive experiences for astronauts during a simulated Mars mission (Botella, Baños, Etchemendy, García-Palacios & Alcañiz, submitted), and it was then tested with Spanish university students. Both studies showed that the system was effective in increasing positive mood and decreasing negative emotions (Farfallini, 2014).

- **BUTLER System (Botella et al., 2011):** This is a positive technology (PT) designed to influence social well-being, but it also has resources aimed at promoting hedonic and eudaimonic well-being. Butler is a social and e-health technological platform based on web technology and virtual reality. It is aimed mainly toward older adults with no experience with ICTs and includes tools to support formal and informal caregivers, families, etc. Its main objectives are to improve users' emotional state, empower the social support network through the use of ICTs, and provide activities that help improve quality of life of the older population (Botella, et al., 2011). The system was designed based on both the Active Aging and Positive Psychology perspectives. Butler's structure includes three types of users (older adults, formal caregivers and relatives/friends of an older adult), and the structure has tools for each of these profiles. In addition, two ways of functioning have been generated (leisure and professional), but they share the same users flow (the older adults). The two types of functioning are described below:
  - **Butler-Leisure** (www.mundomayordomo.com)**:** This function offers tools for older adults and their relatives/friends, and is designed to improve the social use of the platform. Butler-Leisure is a completely open access platform that can be used from any computer with Internet access and works as any e-social network currently available on the Internet (e.g., Facebook, Twitter), where each user obtains and administers his/her own account and enjoys the system. Butler-Leisure offers an e-mailbox, videoconference, a search for friends in the Butler net, and the Book of Life (blog) where the users can write and later share their writing with friends from Butler net. There is also a digital library with multimedia elements (photos, music, videos) and easy access to the Internet with favourites links and access to two virtual environments to generate positive emotions (joy and relaxation).
  - **Butler-Clinical:** This function includes the three user profiles above mentioned (older adults, formal caregivers and family or friends), and each user profile has different tools available. Its main feature is that the caregiver is the main administrator of the e-social and e-health tools. Therefore, Butler-Clinical is not an open platform like Butler-Leisure, as a caregiver must generate access to this type of use. Regarding older adult users, the social tools are the same as in Butler-Leisure. In the case of e-health tools, Butler-Clinical adds the Therapeutic Book of Life, which applies a training program of specific positive events from the autobiographical memory, based on the Review of Life Therapy (Haight & Webster, 1995; Serrano, Latorre, Gatz, & Montañez, 2004). For formal caregivers, the main goal of Butler-Clinical is to facilitate and optimise professional work through daily mood assessment tools, as well as a database with all the user's daily emotional information. In addition, an alarm system is included to send a warning to the professional in charge when the user's score reaches a certain clinical level. The system also restricts user access to social or clinical tools when this is therapeutically recommended. Last, this option allows older adults to share their book of life with relatives and friends and contact them using the e-mail and videoconference tools.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

An interdisciplinary team consisting of psychologists, engineers and programmers monitored the development of Butler. The function has been tested in different seniors' profiles in different contexts. All the studies found positive results regarding efficacy in increasing positive mood states and decreasing negative ones, and it also has shown a high degree of acceptance (satisfaction, usefulness, difficulty of use) in older adult users (Baños et al., 2012, Botella et al., 2009; Castilla et al., 2011; Etchemendy et al., 2011, Preschl et al., 2012).

- **Smiling is Fun (Mira, 2014):** This is another example of a eudaimonic technological development. It is an Internet-based, multimedia (video, image, etc.) interactive programme that allows the individual to learn and practice adaptive ways to cope with depressive symptoms and confront daily problems. *Smiling is fun* trains a range of skills based on the Positive Psychology approach and seeks to break the vicious cycle of stress, isolation, depressive or anxiety symptoms, poor coping, and poor functioning (self-efficacy). Specifically, the programme was designed to promote activity and positive emotions, enhance social support, and work on meaningful goals and values. It has several modules complemented by transversal tools that accompany the user throughout implementation. These tools provide useful feedback that is important for participants' motivation and reinforcement:
  - The "Activity Report" for self-monitoring provides feedback to users, showing them that their mood is related to the activities performed, and the benefits of being active. First, users are asked about their coping ability, mood state and stress level on a scale from 0 to 10. Then, they are asked about their degree of satisfaction with each activity performed during the past 24 hours and to what extent these activities are related to their own goals and values in life. Furthermore, users are asked about the percentage of the day that they have been active or involved in their lives for the past 24 hours.
  - The "Calendar" allows users to know what step they are on throughout the program, and provides information about homework and tasks already completed, reminding users about those still outstanding. Furthermore, the "Calendar" shows which days the participant has filled in the activity report.
  - "How am I?" offers a set of graphs and feedback to visualise the user's progress. It shows the evolution of information about activity level, emotional distress (anxiety and sadness), positive emotionality (active, enthusiastic, energetic, etc.) and negative emotionality (angry, fearful, stressed, tense, moody, etc.). With this tool, participants can graphically see the relationship between their activity level, mood state, stress and coping ability.

The system has been tested in different studies with different sample profiles (Botella et al., 2012b; Mira, et al., 2012a; Mira 2014). Results showed that *Smiling is fun* is effective in improving clinical status and decreasing depressive symptomatology. Currently, a large-scale study designed to compare the effectiveness of *Smiling is fun* with treatment as usual is in progress. Thus far, the results obtained are promising.

- **Live Happy:** We have commented about this technological application in the previous section. It is one of the few evidence-based applications for mobile devices, and its use has been shown to improve users' happiness (Parks et al., 2012). The application was developed using the research approaches of Lyubomirsky, and it includes 8 interventions, all of which have been shown in

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

previous studies to be effective in improving well-being and reducing depressive symptoms: 1) savouring, 2) reminiscence, 3) journal of kindness, 4) strengthening social relations, 5) evaluation and monitoring of objectives, 6) journal of gratitude, 7) expressing gratitude and 8) optimistic thinking.

- **Psyfit.nl (Bolier, et al., 2013):** A completely self-applied online intervention with no support from a therapist, developed to improve well-being and reduce depressive symptoms. The intervention was designed based on the principles of Positive Psychology, focusing on positive experiences, personal strengths and skills rather than mental health problems and deficiencies. It includes 6 modules, each with exercises and evidence-based content: setting life goals, positive emotions, positive relationships, mindfulness, optimistic thinking and mastery of life. Each module includes 4 lessons to be taught once a week, and each lesson provides some brief psycho-education and an exercise. In addition, Psyfit.nl includes self-administered questionnaires for monitoring mood, levels of happiness, and well-being, as well as videos of experts, a personal action plan, and an online community where participants can share their experiences.
- **Happiness Coach (Vansteenwegen, 2011):** Is an intervention developed following the same pattern as Psyfit.nl. In this case, the programme uses a subway ride as a metaphor for the interventions. A map emulates different subway tracks and indicates different strategies to improve happiness levels given the different objectives and progress. The programme includes information, advice and interactive exercises to generate behavioural changes.
- **Better Days (Drozd, Mork, Nielsen, Raeder, Bjokli, 2014):** Is an online intervention designed to be used through the mobile phone and aimed at improving daily lives and well-being. It consists of 13 sessions lasting 10 minutes each distributed over 4 weeks. Each session contains some initial psycho-education and an exercise. The available exercises include: gratitude, acts of kindness, optimism, coping strategies, living in the present moment, and strengths. Recently, a controlled study showed an increase in the level of happiness of its users (Drozd et al., 2014).

As described above, different PPIs have shown their effectiveness in improving well-being. In addition, due to the simplicity and ease of use of these interventions, the vast majority have been adapted to a technological format. At present, there is a broad range of applications developed and available on the network that are based on the precepts of Positive Psychology. However, not all technology-based PPIs rely on empirical evidence or have been tested to evaluate effectiveness. For this reason, it is important to mention the Beacon website (www.beacon.anu.edu.au), which offers rigorous assessment by experts and researchers, various online interventions, and apps developed for different physical and emotional disorders. For each intervention, there is a brief description, login information and a summary of the accumulated scientific evidence. Although the Positive Psychology category includes few interventions, Beacon is a good example and tool for the dissemination and use of ICT-based PPIs.

Another recent initiative worth mentioning is the *Center for behavioral intervention technologies* (Cbits; webpage http://www.cbits.northwestern.edu/), opened in 2011 and directed by David Mohr (Northwestern University Feinberg School of Medicine, Chicago). The purpose of this institute, formed by an interdisciplinary team of researchers (computer experts, psychologists, engineers, doctors, etc.), is to develop technological applications that promote behavioural changes in order to improve physical, mental and emotional health. Currently, it has technological developments for smartphones, virtual reality, websites, or phone therapy. The practical use of Cbits is a good example of evidence-based technological

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

developments. Its applications can be downloaded from the Internet, and they also give access to scientific studies that test the effectiveness of each system developed (https://intellicare.cbits.northwestern.edu/#apps). Specifically related to PPIs, "Day to day", "Aspire" or "My mantra" are worth mentioning.

SOME CONSIDERATIONS ON PPIs, EFFECTIVENESS, AND ICTs

As mentioned earlier, the connection between PPIs and ICTs offers a number of benefits and improvements that help to reinforce the spread of PPIs. ICTs are considered powerful resources in the field of PPIs: the progress made in the digital era makes it possible to detect, evaluate, investigate, monitor and intervene in a way that had never been seen before in the disciplines that study human behaviour (Miller, 2012). However, PPIs also present difficulties and limitations that must be acknowledged, in order to make an effort to further improve them. Below, some of these difficulties are highlighted.

Motivation and Commitment

Adherence is a key element in the effectiveness and efficiency of any psychological intervention. Lack of motivation, low levels of commitment and dropout rates are some of the main difficulties in any treatment. Unfortunately, online interventions are not exempt from these problems, which may even be greater in this area (Eysenbach, 2005). Studies show that dropout rates that occur with the traditional format are lower than those observed with the online format. If we also consider online interventions that are delivered outside the scientific field, which are not included in the studies, or those that are simply available on the Internet or through mobile applications, the dropout rates are even higher because there is less pressure to stay on task when there is no previous commitment (Christensen, Griffiths, & Farrer, 2009; Parks, 2014). Therefore, this problem is by no means a minor issue, thus justifying the fact that a significant part of the research efforts at the moment are directed to try to resolve it. Some of the resources being used and analysed in order to maintain the person's commitment and adherence are: message reminders, positive reinforcement sent via mobile, daily emails, gamification of the intervention process, the possibility of publishing results in social networks, and frequent feedback on progress. There is a large body of literature about the factors that promote engagement and prevent neglect. However, when it comes to technology-based interventions, it is necessary to learn how to adapt to the connection between the two fields.

According to Rogers (1983), it is important to abandon the naive idea that technological innovations that involve some degree of improvement in efficiency and will be directly adopted by users, and that they will easily obtain more positive results than previous options. Instead, Roger explains that the process of accepting the adoption of improved technology is much more complex, and he proposes five qualities that would influence the adoption rate of an innovation ("comparative advantage", "support", "observability" "complexity" and "experimentation"). Table 1 provides a brief explanation of each of the qualities and its relationship with PPIs. Taking these qualities into account when designing, analysing and selecting a PPI can contribute to solving the problem of the attrition rate, the lack of motivation, and adherence.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Qualities that influence the adoption of an innovation and their relationship with PPIs

Definition by Rogers (1983)	Connection with PPIs
Comparative Advantage: The degree to which an innovation is perceived as better than the idea it replaces. The nature of the innovation will determine the specific type of relative advantage it should have (whether social, economic, political, etc.).	Finding out the opinions of other users regarding the user experience, having a ranking based on the scores given by other users, including videos of experts and participants explaining the advantages of its use, etc. are all aspects that would facilitate this quality.
Compatibility: The degree to which an innovation is perceived as consistent with existing values, past experiences, and needs of potential users. A compatible innovation is the one that is less uncertain for the potential user. In this sense, an innovation can be compatible or incompatible with social values and beliefs, with previous ideas, with needs, and so on.	At these levels it is important to have information on user preferences and whether the intervention is suitable for them. Moreover, given the flexibility offered by current technologies, being able to customise aspects of the intervention would also contribute to this quality.
Observability: The degree to which the results of an innovation are visible to users. The results of some ideas are easily observed and reported by others, while some innovations are difficult to describe.	Giving users constant feedback about their progress, making this information visible through graphs, ratings, messages, etc. helps to make the results of the intervention visible to users.
Complexity: The degree to which an innovation is perceived as relatively difficult to understand and use. Any idea can be located on the complexity-simplicity continuum. Some innovations have a clear meaning to potential users, while others do not. Studies suggest that the complexity of an innovation is negatively related to the rate of adoption.	In this case it is important to consider what PPIs are being prescribed to what user, taking into account their age, degree of immersion in technology, etc. Some online interventions are simple, while others include many more functions. It is not advisable to give a PPI with many options to a person who is not familiar with technology or, conversely, offer something oversimplified to someone with a high technological profile.
Experimentation: Refers to the degree to which an innovation can be experienced on a limited basis. New ideas that can be tested in parts are generally accepted more quickly than innovations that are not visible. In other words, an innovation that can be experienced by prospective users is less uncertain for them and would facilitate its adoption.	Currently there is a widespread dissemination of free or very affordable apps. This aspect helps to promote experimentation.

Rogers, 1983.

Variety and Doses

The vast majority of the PPIs that have shown effectiveness generally come from studies with only one intervention (gratitude, best possible self, etc.). However, the literature suggests that when users practice PPIs outside the scientific field (that is, naturally in the real world context), they prefer to use a wide variety of activities (Parks et al., 2012). In addition to the fact that the implementation of interventions in empirical studies is often disconnected from the users' preferences in a real context, the literature has also indicated that offering variability in interventions has a positive impact on motivation and adherence and increases effectiveness (Parks et al., 2012).

Another element to consider in PPIs is the hedonic adaptation, a phenomenon inherent to almost all positive changes. Along time, an action that once produced an increase in positive emotions and happiness loses its strength until becoming ineffective (Lyubomirsky, 2011). This adaptation also occurs with PPIs. If a person is carrying out only one activity for a long time, it will probably become saturating and boring and, therefore, disable the benefit pursued by the intervention. The literature suggests that one way to deal with hedonic adaptation, either avoiding it or delaying it, is to offer several activities and not just one (Layous & Lyubomirsky, 2012). However, this does not mean that more is always better. A

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

recent study shows that when two, four and six interventions were compared, the combination of four interventions showed greater efficacy (Schueller & Parks, 2012).

Another curious aspect related to the intervention doses, but equally relevant, has to do with the time required by PPIs. While scientific studies point to reducing them to the shortest possible time, in the natural context, outside of empirical studies, people spend an average of 1 hour a day on activities aimed at increasing happiness (Parks et al., 2012).

In conclusion, doses and variability are major issues in the effectiveness of PPIs. These factors need to be consider when prescribing a PPI, given that all these minor changes can undermine motivation and adherence, two crucial elements for a PPI to be effective in increasing well-being. These cautions are even more relevant in the context of research, since attempts to highly standardise the procedures and to guarantee internal validity could reduce the effectiveness of a PPI by making them less attractive.

Customising Interventions

It is important for people to perform activities that suit their preferences and profiles. For instance, the study by Schueller (2012) concludes that introverts and extroverts benefited from different interventions. For extroverts, the best results were shown by the "gratitude visit" and "savouring" exercises, while introverts benefited more from the responding actively and constructively and "strengths" interventions and the "three blessings" exercise. Another finding from the same study showed that when participants focused on the "visit of gratitude", whether in person, by mail or by telephone, extraverts benefited most from the visit in person, while this variation was not the best solution for introverts.

In a similar vein, another study also conducted previously by Schueller (2010) investigated whether preferences for some exercises were related to preferences for other exercises. The results showed three preference groups: a group that preferred savouring and responding actively and constructively, another group that favoured three blessings and summary of life, and a third group that preferred the visit of gratitude and strengths. Regarding this grouping, Schueller also found that the participants' preferences were related to a greater probability of completing both the intervention and its matching intervention.

Therefore, it is important to take into account the preferences and adjustment to the interventions. However, again it is imperative to be careful not to oversimplify the findings from the literature and conclude that just because people like to perform a prescribed procedure, the procedure would be sufficient to increase their well-being. The study by Parks et al. (2012), in which participants could choose what activity to perform, showed that the strategies they chose to increase happiness were not necessarily the most effective. For example, two of the most popular activities, "Goal evaluation and tracking" and "Savouring the moment", were not associated with increased happiness and mood. This finding highlights an important issue: individuals' opinions when choosing what is good for them may be wrong. Therefore, deciding which intervention should be prescribed based only on the participant's choice would over-simplify the decision and not lead to more effective results.

The types of mistakes people make when engaging in emotional predictions have been widely demonstrated by theorists who study "Affective Forecasting" (Wilson & Gilbert, 2003). The literature shows that people tend to make mistakes and are not necessarily accurate in predicting the intensity and duration of their emotional responses. Therefore, their decision-making about the activities they can do to increase their levels of happiness and well-being might not be related to reality, especially in people who have difficulties with emotional regulation (Halpern & Arnold, 2008).

Identified Profiles of Consumers of ICT-Based PPIs

Currently, a PPIs without any technological elements are almost inexistent, the access to interventions is faster, free and very easy. In fact, there are numerous interventions divulgated daily through social networks as Facebook, Twitter, etc. In addition, a large number of studies are realised through calls via Internet that seek people that want to be happier. Nevertheless, there are not enough data about the profile of people who use or seek ICT-based PPIs. This means that samples and data obtained could be biased. So, to identify and analyse the different PPIs consumers' profiles and the effects of interventions is important. In our search we have found some relevant but still few studies addressing this question. Parks et al. (2012) carried out three studies focused in consumers of online interventions. The first one shows the non-homogeneity of the people who use PPIs; two clusters of people were found. The first, "non-distressed", showed lower rates of depression, adequate levels of satisfaction with life, a balance between positive and negative affect, and happiness. The second, "distressed", showed clinical depression rates, low life satisfaction, improper balance of positive-negative affect, and low levels of happiness. The second study was focused on finding out how people increased their levels of happiness and well-being naturally in everyday life, that is, outside of experimental procedures that prescribe who, what, for how long and how often to do the exercise. The results showed that, in a real context, people use between 7 and 8 activities at once, that the hedonic adaptation that is produced in any intervention does not occur until "several months" after beginning an activity, and that the most meaningful activity for them was practiced several times a week and at least one hour a day. That is, there are relevant differences between the procedures being used in the experimental field and spontaneous behaviours that people perform in their daily lives. Finally, the third study, conducted with the Live Happy application and focused on the activities undertaken to increase happiness, showed that in the real world people use, like, and obtain benefits for their mood and happiness by using the same activities that are being used in experimental studies. A variety of preferences were found, as the most preferred activity was "Goal evaluation and tracking", and the least preferred one was the "Acts of kindness journal". Finally, the people who used the application reported a greater increase in well-being.

FUTURE RESEARCH DIRECTIONS

ICTs have much to offer, but the digital world develops and spreads at a much greater rate than the scientific field can keep up with. One of the first consequences involved, which surely cannot be avoided, is that not all the currently available exercises were developed through an evidence-based method. For this reason, it is important to improve the effectiveness of Positive Technology through evidence-based practices as randomized controlled trials in order to discern between "good" and "bad" practices. It is crucial for people (clinicians and users) to have information that allows them to discern between interventions, so they can choose critically which interventions they want to use, knowing whether they are supported by the scientific literature.

On the other hand, the ease and simplicity that characterise PPIs might suggest that any exercise can be effective in increasing these variables. However, this is far from reality. A growing body of literature shows the importance of certain variables that are critical to the effectiveness of these interventions. Some of these variables are: the characteristics of the activity, previous well-being levels, the intervention dose, users' motivation, hedonic adaptation, the match between the activity prescribed and the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

person, personality characteristics, and the technological user profile, among others. For this reason, the effectiveness of PPIs cannot be taken for granted. It is important to further deepen the knowledge about the profiles of people who use PPIs, their daily practices and preferences, in order to promote a rigorous dissemination of positive psychology over the Internet.

CONCLUSION

ICTs are making it possible to redesign the forms, scope and quality of psychological interventions. They offer significant advantages without sacrificing the quality of the intervention, and they allow an accessibility to interventions that was unviable in the traditional format. At the same time, given their simplicity, PPIs are presented as very good candidates to be adapted to and delivered in digital format. This union has led to a great expansion of PPIs in digital format and to different lines of research on the effectiveness of these interventions, the promotion of rigorous and evidence-based practice, and the study of the different factors that contribute to increasing PPIs' effectiveness when delivered digitally.

As a consequence, the number of apps, webpages, or online exercises that "sell happiness" increases exponentially day by day. It should be kept in mind that most PPIs, due to their simplicity, are mainly designed to be self-administered, and ICTs offer a format and advantages that make their use in this area convenient. However, as mentioned above, the technological offer grows so quickly that makes it impossible to ensure the reliability of all its contents and to all its users, and, in fact, a number of applications and exercises currently available were not developed through rigorous studies that show their effectiveness in increasing happiness and well-being.

As stated, Positive Psychology was born during the digital revolution, thus the union between the two fields has been present since its inception. This union certainly will grow and improve in the future. The 21st century represents a new era in which PPIs and technology can interact synergistically. Future technologies allow for constant monitoring, sensing and feedback (at the pace that the user wants) and this one will help to increase the efficacy and effectiveness of PPIs. In addition, future technological strategies (such as artificial intelligence or augmented reality) will be able to provide either new enhanced experiences. These new mixed ICT tools might evolve into experts in "increasing well-being" in all its facets (hedonic, eudaimonic, and social-interpersonal). Nevertheless, given that the expansion and growth of ICT developments will be faster than the psychological scientific evidence, it is necessary to improve and disseminate PPIs with the help of ICTs. But we cannot forget that "not everything works"; "not everything works for everyone" and "not everything works with everything". This "growth with caution" is one of the most important challenges of Positive Technology based in evidence.

KEY TERMS AND DEFINITIONS

Eudaimonic Positive Technologies: Technologies that help people to achieve experiences focused on the search for a full and meaningful life.

Hedonic Adaptation: Along time, an action that once produced an increase in positive emotions and happiness loses its strength until becoming ineffective.

Hedonic Positive Technologies: Technologies that induce a positive and enjoyable experience, such as a virtual reality environments of joy or relax induction.

Online Positive Psychological Interventions: Customizable and interactive interventions offered by the Internet and focused on behavioural aspects, designed to improve symptomatology.

Positive Psychology Interventions: Interventions or intentional activities designed to cultivate positive feelings, cognitions and behaviours.

Positive Psychology Intervention's Effectiveness Moderators: The different variables that influence on the effectiveness of these interventions such as the characteristics of the activity, personal characteristics of the users, the intervention dose, elements that contribute to motivation, variety, etc.

Positive Technologies: Technologies designed to improve the quality of personal experiences, foster personal growth and develop human virtues and strengths.

Social Positive Technologies: Technologies that support and enhance communication and cooperation among individuals, groups and organizations.

Technological Behavioural Interventions: Technological apps specifically designed to intervene on behavioural, cognitive and emotional aspects, in order to improve physical and psychological health and well-being.

This research was previously published in Integrating Technology in Positive Psychology Practice edited by Andrea Gaggioli, Giuseppe Riva, Daniela Villani, and Pietro Cipresso; pages 38-58, copyright year 2016 by Information Science Reference (an imprint of IGI Global).

Chapter 84
Sensory Impairments and Challenges in Ageing

ABSTRACT

This chapter describes how sensory impairment is often regarded from a medical/disability point of view and its effects on mental health can be poorly recognized. Communication is a key issue for deaf and deaf-blind people and difficulties here underlie developmental, psychological and emotional problems and delay or prevent appropriate assessment and treatment. Sensory related issues are seen as medical problems and as disabilities. 95% of the information about the world around us comes from our sight and hearing. However, the main concerns of visual and hearing affected by the total or partial absence of sight and/or hearing are usually how to live, how to learn and how to communicate. Their difficulties are often as much to do with society's attitudes towards them as with the direct effect of sensory impairment.

INTRODUCTION

The best way to keep something bad from happening is to see it ahead of time... and you can't see it if you refuse to face the possibility." William S. Burroughs

Ageing is the process of becoming older. Ageing can refer to single cells within an organism which have ceased dividing (cellular senescence) or to the population of a species (population ageing). In humans, ageing represents the accumulation of changes in a human being over time (Bowen, & Atwood 2004), encompassing physical, psychological, and social changes. Ageing is among the greatest known risk factors for most human diseases (Dillin, Gottschling, & Nyström 2014), of the roughly 150,000 people who die each day across the globe, about two thirds die from age-related causes. The causes of ageing

are uncertain; current theories are assigned to the damage concept, whereby the accumulation of damage (such as DNA oxidation) may cause biological systems to fail, or to the programmed ageing concept, whereby internal processes (such as DNA methylation) may cause ageing. Programmed ageing should not be confused with programmed cell death (apoptosis). Human behaviour is highly dependent on the reception and integration of information derived from sensory organs, such as the eye and ear, as well as from nerve endings in skin, muscle, joints, and internal organs. There is, however, no direct relation between the sensitivity of receptors and the adequacy of behaviour, because the usual level of stimulation is considerably greater than the minimum required for stimulation of the sense organs. In addition, an individual adapts to gradual impairments in one sensory organ by using information available from other sense organs. Modern technology has also provided glasses and hearing aids to compensate for reduced acuity in the sense organs.

Age can result in visual impairment, whereby non-verbal communication is reduced (Worrall, & Hickson, 2003) which can lead to isolation and possible depression. Macular degeneration causes vision loss and increases with age, affecting nearly 12% of those above the age of 80 (Mehta, 2015). This degeneration is caused by systemic changes in the circulation of waste products and by growth of abnormal vessels around the retina (Nussbaum, Thompson., & Robinson, 1989).

Ageing is a complex multifactorial process leading to loss of function and a very broad spectrum of diseases. Sensory impairment is often regarded from a medical/disability point of view and its effects on mental health can be poorly recognised. Communication is a key issue for deaf and deaf–blind people and difficulties here underlie developmental, psychological, and emotional problems and delay or prevent appropriate assessment and treatment. Sensory functions are the critical means by which individuals gain access to information and connect to their physical environment and the people around them. Unfortunately, many older people and their families, as well as the professionals who serve them, accept sensory loss as a "normal" part of the Ageing process. Furthermore, few are fully aware of the range of rehabilitation interventions available for older adults with sensory impairments. 95% of the information about the world around us comes from our sight and hearing. Sensory impairment is when one of the senses; sight, hearing, smell, touch, taste and spatial awareness, is no longer normal. Communication is the greatest challenge. A sighted and hearing person will explore their surroundings, a person with sensory impairments will need encouragement to explore and interact. Normal progress to language is hard and intensive education and support is needed throughout the person's lifetime. Ageing has long been associated with decline in sensory function, a critical component of the health and quality of life of older people.

Sensory functions are the critical means by which individuals gain access to information and connect to their physical environment and the people around them. Unfortunately, many older people and their families, as well as the professionals who serve them, accept sensory loss as a "normal" part of the Ageing process. Furthermore, few are fully aware of the range of rehabilitation interventions available for older adults with sensory impairments. Sensory impairment is often regarded from a medical/disability point of view and its effects on mental health can be poorly recognised. Dual sensory impairment is the combination of both hearing and sight impairment. It is not necessarily a total loss of both senses – indeed the majority of dual sensory impaired people do have some degree of sight and/or hearing. Those with a less severe degree of both sight and hearing impairment may also be referred to as having a dual sensory impairment or loss. Sensory impairment is often regarded from a medical/disability point of view and its effects on mental health can be poorly recognised. Sensory impairment is the most common health

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

problem that the elderly experience and could occur or increase as a result of disease or Ageing (Kim, Kim., & Kim, 2011; Saunders, & Echt, 2007).

Any temporary or permanent loss or abnormality of body structure or function, whether physiological or psychological. An impairment is a disturbance affecting functions that are essentially mental (memory, consciousness) or sensory, internal organs (heart, kidney), the head, the trunk or the limbs. The term sensory impairment is therefore often used when referring to damage that occurs to the structure of the eyes or ears affecting the normal functioning of our vision and hearing senses.

TYPES OF SENSORY IMPAIRMENTS

The latest prevalence estimates on vision, hearing, and dual impairment come from the National Health and Examination Surveys 1999 to 2006 (Schiller, Lucas, & Peregoy, 2012; Swenor, Ramulu, Willis, Friedman, & Lin, 2013). Vision impairment was considered best corrected visual acuity of 20/40 or worse in the better eye, and hearing impairment was considered pure-tone average >25 decibels in the better ear. Dual impairment in their study was a combination of vision impairment and hearing impairment. It is true that sensory impairment particularly vision and hearing impairment is common in Ageing. These normal age-related sensory impairments are common, as are vision and hearing impairments due to multifactorial etiologies such as chronic diseases (e.g., diabetes, hypertension) as well as exposure to excessive noise, ultraviolet sun light, and excessive tobacco use (Agrawal, Platz, & Niparko, 2008; Dillion, Gu, Hoffman, & Ko, 2010). There are three major types of sensory impairments were discussed in following order namely; visual impairment, hearing impairment and Deaf-blindness (dual sensory impairment).

VISUAL IMPAIRMENT

Among the various issues that affect the elderly, common health problems including age related visual Impairment will be one of the major concerns. Demographic studies have consistently shown that age is the best predictor of blindness and visual impairment (Padula, 1982). It was also reported that legal blindness (best corrected visual acuity of less than 20/200 in the better eye) occurs in up to 3% of the world population by the age of 60 (Padula, 1982; Patterson, 1994). Visual impairment among the elderly is a major health problem. With advancing age, the normal function of eye tissues decreases and there is an increased incidence of ocular pathology. Demographic studies have shown that age is the best predictor of blindness and visual impairment. The most common causes of age related visual impairment in the elderly are presbyopia, cataracts, age related macular degeneration, primary open angle glaucoma and diabetic retinopathy. Untreated visual impairment leads to physical handicap, increased incidence of fall, depression, social isolation and dependency. Active screening for visual loss in the elderly should be part of the health examination. The elderly should be encouraged to come for formal 1-2 yearly eye assessment for early detection of visual impairment and to treat all associated problems in order to prevent permanent visual loss. People who are blind or have low vision can use technology aids, equipment and strategies to lead fairly independent and safe lives at home and in the community. Blindness and low vision can occur as a result of disease or infection, conditions or accidents. Symptoms of vision impairment are central vision loss, peripheral vision loss, contrast impairment, glare, reduced

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

depth perception and blur. Vision loss among the elderly is a major health care problem. Approximately one person in three has some form of vision-reducing eye disease by the age of 65. The most common causes of vision loss among the elderly are age-related macular degeneration, glaucoma, cataract and diabetic retinopathy. Age-related macular degeneration is characterized by the loss of central vision. Primary open-angle glaucoma results in optic nerve damage and visual field loss. Because this condition may initially be asymptomatic, regular screening examinations are recommended for elderly patients. Cataract is a common cause of vision impairment among the elderly, but surgery is often effective in restoring vision. Diabetic retinopathy may be observed in the elderly at the time of diagnosis or during the first few years of diabetes. Patients should undergo eye examinations with dilation when diabetes is diagnosed.

HEARING IMPAIRMENTS

Age-related hearing loss (presbycusis) is the loss of hearing that gradually occurs in most of us as we grow older. It is one of the most common conditions affecting older and elderly adults. Approximately one in three people in the United States between the ages of 65 and 74 has hearing loss, and nearly half of those older than 75 have difficulty hearing. Having trouble hearing can make it hard to understand and follow a doctor's advice, respond to warnings, and hear phones, doorbells, and smoke alarms. Hearing loss can also make it hard to enjoy talking with family and friends, leading to feelings of isolation. Age-related hearing loss most often occurs in both ears, affecting them equally. Because the loss is gradual, if you have age-related hearing loss you may not realize that you've lost some of your ability to hear. There are many causes of age-related hearing loss. Most commonly, it arises from changes in the inner ear as we age, but it can also result from changes in the middle ear, or from complex changes along the nerve pathways from the ear to the brain. Certain medical conditions and medications may also play a role.

Many factors can contribute to hearing loss as you get older. It can be difficult to distinguish age-related hearing loss from hearing loss that can occur for other reasons, such as long-term exposure to noise. Noise-induced hearing loss is caused by long-term exposure to sounds that are either too loud or last too long. This kind of noise exposure can damage the sensory hair cells in your ear that allow you to hear. Once these hair cells are damaged, they do not grow back and your ability to hear is diminished. Conditions those are more common in older people, such as high blood pressure or diabetes, can contribute to hearing loss. Medications that are toxic to the sensory cells in your ears (for example, some chemotherapy drugs) can also cause hearing loss. Rarely, age-related hearing loss can be caused by abnormalities of the outer ear or middle ear. Such abnormalities may include reduced function of the tympanic membrane (the eardrum) or reduced function of the three tiny bones in the middle ear that carry sound waves from the tympanic membrane to the inner ear. Older people who experience hearing loss have a combination of both age-related hearing loss and noise-induced hearing loss. Age-related hearing loss is also known as presbycusis. Although age-related hearing loss is not a life-threatening condition, it can have a significant impact on your quality of life if left untreated.

Age-related hearing loss occurs gradually over time. Various changes in the inner ear can cause the condition, these include:

- Changes in the structures of the inner ear.
- Changes in blood flow to the ear.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Impairment in the nerves responsible for hearing.
- Changes in the way that the brain processes speech and sound.
- Damage to the tiny hairs in the ear that are responsible for transmitting sound to the brain.

Age-related hearing loss can also be caused by other issues, including:

- Diabetes
- Poor circulation
- Exposure to loud noises
- Use of certain medications
- Family history of hearing loss
- Smoking

Symptoms of age-related hearing loss typically begin with an inability to hear high-pitched sounds. Typical we may notice that they have difficulty hearing the voices of females or children. They also have difficulty hearing background noises or difficulty hearing others speak clearly.

Other symptoms that may occur include:

- Certain sounds seeming overly loud.
- Difficulty hearing in areas that are noisy.
- Difficulty hearing the difference between "s" and "th" sounds.
- Ringing in the ears.
- Turning up the volume on the television or radio louder than normal.
- Asking people to repeat themselves being unable to understand conversations over the telephone.

These are the early symptoms for hearing impairment. They could be signs of other medical conditions and should be checked out by a doctor. Hearing loss or hearing impairment is a partial or total inability to hear. It can be caused by genetics, Ageing, exposure to noise, illness, chemicals and physical trauma. It is usually described as mild, mild-moderate, moderate, moderately severe, severe, or profound. Hearing loss exists when there is diminished sensitivity to the sounds normally heard. Deafness is defined as a degree of impairment that a person is unable to understand speech even in the presence of amplification. Many in the deaf community view it as a condition, rather than an illness.

DUAL SENSORY IMPAIRMENT

Dual sensory impairment (DSI), or deaf-blindness, is a combination of vision and hearing impairment that interferes with the person's ability to acquire information and communicate with others (Watters, Owen., & Munroe, 2005) DSI encompasses a spectrum of sensory loss and individuals may be completely deaf and completely blind or they may have some residual hearing and/or vision. The widely used Nordic definition states that "deaf-blindness is a combined vision and hearing disability. It limits activities of a person and restricts full participation in society to such a degree that society is required to facilitate specific services, environmental alterations and/or technology." (Puts, Deeg, Hoeymans, Nusselder., & Schellevis, 2008). The loss of functioning in one sense cannot be compensated for with

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the other sense, resulting in a distinct disability. Those with DSI can be broadly classified into two main groups based on when the sensory losses occurred: a) congenital (individuals who experience the onset of hearing and visual impairment before the age of two years, including onset at birth) (Munroe, 2001) acquired (onset later in life). Common causes of congenital DSI include intra-uterine infections (e.g., congenital rubella syndrome), (Dammeyer, 2010) congenital brain damage and chromosomal abnormalities such as CHARGE syndrome (Lew, Weihing, Myers, Pogoda., & Goodrich, 2010; Kramer, Kapteyn., & Kuik, 2002). Acquired DSI can be related to Ageing, post-natal infections/early childhood infections and acquired brain injury, (Lew, Weihing, Myers, Pogoda., & Goodrich, 2010; Saunders, & Echt, 2007; Spandau & Rohrschneider, 2002). Among older persons with DSI, vision loss is often a result of presbyopia, decreased pupil size, cataracts and glaucoma, (Saunders, & Echt, 2007; Watson, 2001) and causes of hearing loss include age-related changes in the inner ear and a reduction in blood flow and loss of neurons that result in a diminished capacity within the central auditory system (Saunders, & Echt, 2007).

The occurrence of DSI is particularly prevalent among the Ageing population, with studies showing between 9% and 21% of adults older than 70 years having some degree of DSI. (Campbell, Crews, Moriarty, Zack., & Blackman, 1999; Jee, Wang, Rose, Lindley, Landau., & Mitchell, 2005), Despite this, there is little direction regarding recommended clinical practice and rehabilitation of individuals with DSI. It is assumed that the problems encountered by individuals with DSI are considerably greater than the effects of vision impairment or hearing impairment alone, because when these two sensory impairments are combined, the individual is seriously deprived of compensatory strategies that make use of the nonimpaired sense. In this article, the literature available regarding DSI is summarized, and research needs regarding rehabilitation strategies are outlined and discussed. Simple suggestions for addressing DSI are provided that use available tools and technology.

Impaired vision and hearing are common among older adults, (Watters, Owen., & Munroe, 2005; Puts, Deeg, Hoeymans, Nusselder., & Schellevis, 2008), and can occur separately or in combination (Munroe, 2001). Visual loss impacts negatively on functional independence, mental health and cognition, and reduces quality of life, as well as increasing the need for support services (Dammeyer, 2010; Saunders, & Echt, 2007). Age-related hearing loss is more frequent and is associated with an increased risk of depression, and impairs quality of life and the ability to conduct activities of daily living, as well as leading to an increased reliance on community and informal supports (Puts, Deeg, Hoeymans, Nusselder., & Schellevis, 2001; Spandau, & Rohrschneider, 2002; Fisher et al., 2014). Hence, strategies include the provision of corrective lenses, hearing aids, assistive devices (e.g., magnifiers, listening devices) and rehabilitative services such as visual, auditory and communication training should be encouraged and/or implemented by clinicians in order to promote both longevity and an improved quality of life in their older sensory impaired patient.

PHYSIOLOGY OF SENSORY IMPAIRMENT IN AGEING

Physiological Ageing refers to the changes in structure and functioning of the body that occur over a lifespan. Many of these changes are involuntary and occur very gradually while others occur over a short period. After the age of 70 other sense organs may show a reduction in sensitivity. Reduced taste sensitivity is associated with atrophy and loss of taste buds from the tongue in the elderly. Human Ageing, physiological changes that take place in the human body leading to senescence, the decline of biological functions and of the ability to adapt to metabolic stress. In humans the physiological developments are

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

normally accompanied by psychological and behavioural changes, and other changes, involving social and economic factors, also occur. Ageing begins as soon as adulthood is reached and is as much a part of human life as are infancy, childhood, and adolescence. Gerontology (the study of Ageing) is concerned primarily with the changes that occur between the attainment of maturity and the death of the individual. The goal of research in gerontology is to identify the factors that influence these changes. Application of this knowledge is expected to reduce the disabilities now associated with Ageing. The biological-physiological aspects of Ageing include both the basic biological factors that underlie Ageing and the general health status. Since the probability of death increases rapidly with advancing age, it is clear that changes must occur in the individual which make him more and more vulnerable to disease. For example, a young adult may rapidly recover from pneumonia, whereas an elderly person may die. Physiologists have found that the performance of many organs such as the heart, kidneys, brain, or lungs shows a gradual decline over the life span. Part of this decline is due to a loss of cells from these organs, with resultant reduction in the reserve capacities of the individual. Furthermore, the cells remaining in the elderly individual may not perform as well as those in the young. Certain cellular enzymes may be less active, and thus more time may be required to carry out chemical reactions. ultimately the cell may die.

Ageing also brings about a reduction in the ability to change the focus of the eye for viewing near and far objects (presbyopia), so that distant objects can ordinarily be seen more clearly than those close at hand. This change in vision is related to a gradual increase in rigidity of the lens of the eye that takes place primarily between the ages of 10 and 55 years. After age 55 there is little further change. Many people in their 50s adopt bifocal glasses to compensate for this physiological change. The primary age change in the skin is a gradual loss of elasticity. Although this basic change plays a role, other factors, such as exposure to the weather and familial traits, also contribute to the development of wrinkles and the pigmentation associated with senescence. The ability of the skin to take up slack and remain closely adherent to the underlying structures is due to the presence of fibres of the proteins elastin and collagen. Because of the importance of hormones in the regulation of many physiological systems, impairments in endocrine (ductless) glands have traditionally been cited as important determinants in Ageing. With Ageing, the bones gradually lose calcium. As a result, they become more fragile and are more likely to break, even with minor falls. Healing of fractures is also slower in the old than in the young.

PREVALENCE OF SENSORY IMPAIRMENT IN AGEING

Prevalence estimates indicate the burden of a condition (e.g., visual impairment) at a defined location at a point or period in time. Accurate prevalence estimates are needed to plan for availability of health care services, associated monetary costs, and quality of life connected with having the condition. Such data are also of importance in planning future studies, such as controlled clinical trials of prevention and treatment of the disease. Periodic estimates of prevalence enable the tracking of temporal trends; this is important especially in situations where new, costly interventions are being introduced.

Vision impairment has been identified as the second most prevalent physical impairment observed within the elderly population (U.S. Department of Health and Human Services, 1995). Prevalence rates of blindness and visual impairment for elderly persons have been consistently demonstrated to increase sharply and monotonically with increasing age. Like vision impairment, hearing impairment has been identified as a major chronic condition in old age (U.S. Department of Health and Human Services, 1995). Recent studies have shown that hearing impairment among elderly people has doubled in prevalence

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

over the past 30 years in the United States, based on self-reported data on trouble hearing (Strawbridge, Wallhagen, Shema, and Kaplan, 2000). Millions of Americans are affected by sensory impairments, with vision and hearing loss being two with the highest prevalence. Vision and hearing loss are particularly prominent in the older adult population. While vision loss has a negative impact on a person's perception of the world, hearing loss diminishes a person's mode of communication and can lead to social isolation. The World Health Organization (WHO) estimates approximately 360 million or 5% of the world's population has at least a moderate hearing loss (WHO). An estimated half of these hearing loss cases result from a lack of preventative measures, including but not limited to immunizations or noise exposure reduction. In the United States, an analysis of data from 2001 to 2010 estimated 60.7 million individuals aged 12 years or older have hearing loss in at least one ear. The prevalence of hearing loss in the US is even higher in the older adult population; 75% of individuals aged 70 years or older have hearing loss, defined by pure-tone thresholds as mild (>25 through 40 dB HL), moderate (>40 through 55 dB HL), moderately severe (>55 through 70 dB HL), severe (>70 through 90 dB HL), or profound (>90 dB HL) (Goman, & Lin, 2016; American Speech-Language-Hearing Association, 2016) . Despite this high prevalence of hearing loss in the elderly population, less than 30% of those who could benefit from hearing aids (HA).

Vision loss is another sensory impairment with a high prevalence in the elderly population. The WHO estimated in 2014 that 285 million people are estimated to have a visual impairment, with 39 million classified as blind and 246 million as low vision (World Health Organization, 2014). Low vision is defined as the grouping of moderate and severe visual impairments. Approximately 65% of these individuals are aged 50 years and older. Reportedly, the treatment of visual impairment over the past 20 years has improved significantly worldwide. Unlike the prevalence of hearing loss, the prevalence of visual impairment has decreased despite an increasingly larger population of older adults globally. This is primarily due to a decline in vision loss caused by infectious diseases worldwide. The high prevalence of dual sensory impairment in the older adult population, there continues to be a lack of awareness and resources not only among those affected but also among professionals in these fields. Increased collaboration among the interdisciplinary fields is crucial to lessen the impact of undiagnosed or untreated dual sensory impairment.

CHALLENGES IN AGEING

For many of us, it can be unpleasant to grow older. Our society and culture value youth, and being old is sometimes treated like a disease that has no cure. Of course, it's a reality that all of us have to face at some point, so Ageing is a huge topic of study for sociologists. Among other things, they observe patterns of social activity and identify the challenges we all face as we age. Three of the larger challenges that have been identified are retirement, ageism and social isolation. Challenge of Ageing that may seem more obvious is ageism. Although it can target any age group, ageism generally refers to prejudice and/or discrimination against older people. Ageism can be blatant or subtle. For example, it involves anything from refusing to hire an elderly worker to assuming an older woman needs help crossing the road. The elderly are often given a negative stereotype: slow, confused, helpless, resistant to change, and/or generally unhappy. Like racism and sexism, discrimination can happen when unfair generalizations like this are made. Although the stereotype is not true of every older individual, age-related bias, unfortunately, exists in practically every setting. Another challenge of Ageing is that of social isolation. Being alone

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

can be extremely unpleasant at any age. It's something that many people fear about growing old because, unfortunately, social isolation is common amongst the elderly.

Our journey through the second half of life requires each one of us to adapt to a variety of age-related challenges. The physical challenges of Ageing result in various forms of functional decline in the body. The psychological challenges of Ageing impact our sense of identity, independence, and purpose in life. The spiritual challenges of Ageing demand reflection on difficult issues such as loss, grief, death, and impermanence. The cultural challenges of Ageing include retirement, financial planning, ageism, inclusion, and contribution. And finally, the environmental challenges of Ageing include dealing with change, transition, transience, thresholds, and liminality. The challenge of Ageing is a means to cultivate clarity, understanding, and self-compassion. The challenges and choices of Ageing impact our quality of life. It is important to understand the essential characteristics and influences that Ageing has on our body, mind, spirit, culture, and environment so that we give ourselves an opportunity to meet the challenges ahead with the spirit of creativity.

The major challenges of Ageing conjure doubt, despair, difficulty, discomfort, uncertainty, and anxiety. Our tendency is to approach Ageing with a sense of enmity. Our tendency is to avoid, deny, or hide ourselves from the raw realities of Ageing. Perhaps this is the most significant challenge of all that is, overcoming our fear of Ageing.

CONSEQUENCES IN AGEING

Impairment is the effect of any problem associated to any body part. These are reflected as the cause of disabilities; this means that they act as symptom prior to the disability, which could be treated or would be attempted to stop by consulting a doctor or prescribing a treatment. The Ageing of our societies is one of the greatest success stories of the twentieth century. More than three decades have been added to the lives of hundreds of millions of people over the last hundred years. This is an accomplishment well worth celebrating; but we must also bear in mind that with increased longevity come significant long-term economic consequences – and that many societies are ageing at a record speed.

One of the most recognized consequences of ageing is a decline in immune function. While elderly individuals are by no means immunodeficient, they often do not respond efficiently to novel or previously encountered antigens. This is illustrated by increased vulnerability of individuals 70 years of age and older to influenza, a situation that is exacerbated by their poor response to vaccination.

Hearing loss affects more than 8 million people in the UK. About 5 million people could benefit from hearing aids, but over half of these are reluctant to use an aid because of the associated stigma.

Multiple psychosocial factors have been associated with poor vision in elderly people. Visual impairment among elderly people has been correlated with psychological distress, low morale, and depression.

Empirical evidence that documents the full sequence of events involving the indirect effects of sensory impairment on quality of life and well-being is lacking. Only one previous study (Lee et al. 1999) has examined the impact of both vision and hearing impairment on psychological well-being. Ageing of the population affects all aspects of the society including health, social security, education, socio-cultural activities and family life.

SENSORY IMPAIRMENT AND DISABILITIES

A disability is a condition in which there is a lack of an individual's mental, mobile or moving functions of its respective organ or part. In this condition, the individual is not able to function or complete any task which is associated to its absent part or organ. It can also entail to any sensory, physical, cognitive or intellectual impairment and various types of chronic disease and mental illnesses. It's not compulsory in disability that the condition should occur from birth; it can rather occur at any time in an individual's life span. The term broadly classifies the illness or irregular capacity of any functioning of a body part, then it may relate to any associative physical, cognitive, mental, sensory, emotional, developmental, or some combination of problems.

Sensory disabilities dramatically increase with age and may seriously compromise an older person's ability to carry out routine daily activities. In 1991, visual and hearing impairments were reported by over 10% and 17% of persons aged 65 years and over, respectively (Raina, Wong, Dukeshire, Chambers., & Lindsay, 2000). Given the projected growth of the older adult population, it is particularly important to continue understanding the relationship between visual and hearing impairment and functional independence.

Impairment is a cause of Disability. According to the federal government, the term impairment is defined as: an "inability to engage in any substantial gainful activity by reason of any medically determinable physical or mental impairment which can be expected to last or has lasted for a continuous period of not less than 12 months." Medically, it is a condition which leads to disability in an individual. It can be stated as the basic root cause of any disability. It's an abnormality associated with the physiological, psychological, or anatomical structure or function of a body part or organ. Impairment can relate to the permanent or temporary loss of functioning of an organ. It acts as an alerting symbol to identify an affected problem in an individual. The problem when diagnosed at the specific time can be cured by consulting or taking a prior treatment.

SCREENING AND IDENTIFICATION

Timely screening of hearing and vision will: (1) facilitate identifying those in need of referral to a hearing or vision professional; (2) enable individually tailored care for residents, thus promoting the health and well-being of older adults with sensory impairments; (3) identify sensory impairments and, by addressing them to whatever extent possible, care plans can be adapted to accommodate for these impairments.

Simple approach that can be used by general internists to routinely screen the functional status of elderly patients in office practice. The approach relies on checking a limited number of targets that are commonly dysfunctional but often unappreciated when conventional histories and physical examinations are done for elderly patients. The new focus is on carefully selected tests of vision, hearing, arm and leg function, urinary incontinence, mental status, instrumental and basic activities of daily living, environmental hazards, and social support systems. Brief questions and easily observed tasks are used to obtain the information needed for a suitable, effective screening while minimizing the time for administration.

Visual impairment is common among older people and is associated with falls and reduced quality of life. Visual problems in older people are often not reported to medical services. Screening has been recommended because vision could be improved by encounter ageing treatment in the majority of older people with impaired vision. There are several ways to screen for hearing impairment. For example,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

there are a number of physical measures and scales that seem to correlate reasonably well with pure tone audiometry, the current "gold standard." (Dupuis et al., 2015; Moher, Shamseer., & Clarke, 2015). Pure tone audiometry can be made more or less sensitive and specific depending on the frequencies tested and the decibel threshold used to define hearing loss. Third, there are hearing handicap scales (Carpenter & Hirdes, 2013; Schow, & Nerbonne, 1980; The American Speech-Language-Hearing Association, 2016).

REHABILITATION SERVICES

Rehabilitation services for older adults with age-related sensory loss need to accommodate these difficulties. Improved staff education and rehabilitation programmes providing clients and carers with strategies to overcome communication breakdown is required. A multidisciplinary perspective to the assessment and remediation of older adults is recommended.

Vision rehabilitation services can vastly improve quality of life and help them live more independently.

Vision rehabilitation services include:

- Communication skills: reading, writing, Braille and assistive computer technology.
- Counselling: to help you, your spouse, family members and friends adjust to your vision loss.
- Independent living and personal management skills: home management, home modifications, personal self-care, financial management.
- Occupational therapy.
- Independent movement and travel skills: orientation and mobility training.
- Low vision evaluation and training with low vision devices.
- Vocational evaluation and training.

Hearing loss services include:

- Comprehensive hearing evaluations.
- Cochlear implants.
- Speech and language therapy.
- Assistive devices (e.g. audio loops).
- Training on hearing aids, assistive devices.
- Supportive workshops.
- Recreational/social activities.

In current practice, rehabilitation of sensory impairments in the ageing population is divided into separate rehabilitation services for impairments in vision (low vision rehabilitation centres) and in hearing (audiology centres and hearing aid providers). Concurrent hearing impairment could affect the success of low vision rehabilitation (Leonard, & Horowitz, 2004) and vice versa. Moreover, healthcare providers do not automatically deal with impairment of the 'other sense', which may lead to less effective rehabilitation.

Educating our peers and using these guidelines in our practice will enhance the quality of life of the geriatric patient. One of the greatest challenges in the geriatric population is their ability to communicate their problems, needs, and desires in a medical setting. Hearing and visual impairments can hamper a

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

patient's ability to express himself or herself clearly or to understand questions or commands. This is an enormous burden on the patient, the caregiver, and the physiatrist as they work to achieve rehabilitation goals. Addressing these issues on the patient's initial visit can ameliorate problems and prevent frustration and further difficulties.

Rehabilitation comprises the provision of a custom-fitted hearing aid and instruction on its use and maintenance. Progress during rehabilitation depends on patient and family education to help the patient adjust to the hearing loss and the use of hearing aids. Family training with a speech therapist is also crucial to teach them about auditory enhancement techniques and communication skills. Improving the geriatric patient's ability to hear can lead to significant gains in terms of rehabilitation and the patient's overall quality of life. Physicians should evaluate their patient's hearing on a regular basis and consider the management of hearing deficits as they care for their patients. Utilization of healthcare resources and assistance increases in the geriatric population with visual impairment because of their decreased level of function overall.

RESEARCHES ON SENSORY IMPAIRMENT IN AGEING

Researchers have discovered that sensory impairment is more dangerous than previously thought, particularly in regard to mortality. Vision loss has been associated with a 5% to 29% increased mortality rate in older adults (Cugati et al., 2007; Karpa et al., 2010). Hearing impairment alone has been linked to all-cause mortality through three mediating variables: disability in walking, cognitive impairment, and self-rated health (Karpa et al., 2010). A recent cohort study from Australia documented that dual sensory impairment increases risk of mortality over 10 years by 62% compared to older adults without sensory impairment (Gopinath et al., 2013). In addition, older adults with best corrected vision impairment and moderate to severe hearing loss had a two-fold increase in 10-year mortality (Gopinath et al., 2013). A strength of this population study was the objective measurement of sensory impairment through pure tone audiometry and distance visual acuity. Asking older adults about their vision and hearing impairment is often not sufficient. The researchers also controlled for smoking, body mass index, systolic blood pressure, diabetes, cancer history, angina, stroke, acute myocardial infarction, and cognitive impairment (Gopinath et al., 2013). Additional steps to improve the care of older adults with sensory impairment include: (a) reconsideration of the "lack of evidence" supporting population screening for vision and hearing impairment; (b) development and testing of primary care models of interventions for hearing and vision screening and referrals; (c) development of safe environmental designs; (d) technology designed and tested for this population; and (e) neuro-imging studies to investigate brain changes due to sensory impairment.

FUTURE RESEARCH DIRECTIONS

Future research will need to examine the influence of other concurrent health conditions on sensory impairment. Asking the elderly about their overall hearing and visual function is not sufficient in detecting sensory impairment. To detect hearing and vision impairments among elderly home care patients, standardized measurements of their hearing and vision are necessary. Today's practitioners should focus

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

on the use of screening tools in the clinic, risk assessments, programs for fall prevention, and rehabilitation after a fall.

CONCLUSION

Impairments of vision and hearing are common in this frail older outpatient population. Combined vision and hearing impairments have a greater effect on function than single sensory impairments and influence functional status independent of mental status and comorbid illness. Elderly home-care patients cannot be expected to take the necessary actions to meet their sensory impairments themselves; they need close assistance and help. With the increasing need for and use of health care services due to an ageing population, the major goal in public health and medicine is to keep elderly individuals living independently and to prevent institutionalisation. Small improvements in vision and hearing impairment may enhance physical and psychological functioning in older adults.

KEY TERMS AND DEFINITIONS

Ageing: Ageing is the process of becoming older.

Consequences: It is a result of a particular action or situation often one that is bad or not convenient.

Physiology: It is the scientific study of normal mechanisms and their interactions which works with in a living system.

Rehabilitation: It is a treatment or treatments designed for psychosocial aspects to facilitate the process of recovery from injury, illness or disease to as normal condition as possible.

Sensory Impairment: It refers to a defect in sensing and passing on the imulse. This leads to absense of sensation and neuronal coordination.

This research was previously published in the Handbook of Research on Geriatric Health, Treatment, and Care edited by Barre Vijaya Prasad and Shamsi Akbar; pages 253-268, copyright year 2018 by Medical Information Science Reference (an imprint of IGI Global).

Chapter 85
Psychological Impacts of Downsizing Trauma

Jozef Simuth
City University of Seattle, USA

ABSTRACT

The chapter summarizes research studies as well as case studies from companies worldwide that show how organizational changes followed by downsizing create a traumatic experience for all organization members. The author's focus is on the psychological perspective on traumatic experience by all employees (victims and survivors) and managers whose task is to organize and implement changes in the organization. Based on the literature review, the chapter describes symptoms and psychological effects of organizational change trauma on individuals and the ways to minimize the traumatic effects. The author believes that outplacement and therapeutic approach are effective tools for overcoming the layoff trauma and also send positive signals to employees and to general public.

INTRODUCTION

This chapter is based on a thorough summary and critical analysis of relevant available research and non-research literature with the aim of summarizing the valid findings about the traumatic impacts of downsizing on members of organizations. The author used the traditional literature review of Google Scholar, Business Source Complete and Psych Web databases. The main research task was to find relevant research studies describing the traumatic impacts of downsizing on all organization members. Only studies with relevant research and reliable sources were selected for the chapter. The main goal of the selection process was to bring the reader up-to-date with available and reliable literature on the traumatic effects of organizational restructuring resulting in downsizing. This serves as the basis for practical proposals of procedures to minimize the traumatic effects of downsizing. The proposals are intended to be useful for practitioners such as managers, consultants, psychologists.

Trauma in organization is a consequence of a situation which causes traumatic experiences to individuals within the organization. Before the symptoms of organizational trauma and ways to cure or prevent them are discussed, the reasons that lead to such situations need to be revealed. Traumatic events are quite often results of rational business decisions to optimize business efficiency. One of the frequent strategies is a restructuring the company that is accompanied by downsizing. As the definition states: downsizing is a deliberate organizational design which reduces the manpower and is planned to improve organizational performance. It is an approach that influences the workforce size, operational costs and work processes (Appelbaum, Patton, & Shapiro, 2003). Fisher & White (2000) say that like "rightsizing" and "reengineering", downsizing is a class of management tools for attaining desired change. The decision to downsize a company is among the toughest managerial decisions. It is a legitimate managerial approach to solving critical problems in an organization. Among the main reasons for downsizing are, for example, declining profits, increased pressure from competitors, a merger, the introduction of new technology, the desire to decrease levels of management, and getting rid of unproductive employees.

There are various approaches to this process. Companies follow a structured and planned procedure or they run this process in a haphazard manner, in which layoffs are happening without planning or prior warning. In this case, employees even do not realize what is happening or why. It is obvious that the first-case scenario has much less impact on the members of the organization. However, even in such a process there are negative impacts on the victims – people who are laid off as well as on survivors – people who remain in the company, including employees and managers. Unfortunately, there is no indication that downsizing in organizations, despite its negative effects, is declining.

On the contrary, there are several assumptions that tend to persist in managerial decision making. First, downsizing and decline are natural and even desirable phases of an organization´s development. There is a need to reduce waste and inefficiency that builds up in organizations. Downsizing then leads to efficiency, higher productivity and flexibility as "agility and leanness go together" (Cameron, 1994). Therefore, a common assumption is that organizational downsizing will spur business performance. The usual belief is that organizational restructuring accompanied by downsizing will provide a better alignment with the external competitive environment, improve financial indicators, and ultimately improve stock price performance (Lee & Teo, 2005). Trends like technological advances, environmental emergencies, and global economy are shaping the world. They affect corporate culture and the employees who support the culture. Environmental forces such as technology as well as political/regulatory, economic, and socio-cultural challenges, coupled with bad decision-making, a lack of resources and knowledge, and global competition, are all factors driving change. A good example could be the growth of mergers and acquisitions which result in restructuring frequently accompanied by downsizing. The internationalization of companies is on a growth pattern. This brings the necessity to restructure the companies where one of the necessities of such a process is the change in employee structure and/or downsizing. The number of multinational companies was around 17,000 in 1980; this figure had increased to more than 63,000 in 2000 and had increased further to 70,000 by 2004. At the same time, the number of subsidiaries of multinational companies in 2004 stood at approximately 690,000. Consequently the size and power of Multinational Corporations (MNCs) has grown steadily during recent decades through mergers and acquisitions: between 1990 and 1999 the number of global mergers increased from 9,000 to nearly 25,000. The number of transnational mergers during the same period increased from 2,500 to more than 7,000 in 1999 and over 8,000 in 2000 (Voss et al, 2007). Just in Europe in period from 2002 to 2010, more than 11 000 cases of restructuring were recorded by the European Restructuring Monitor, with the ratio

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

of announced job losses/job creations standing at 1.8:1. In the period 2008-2010, that ratio increased to 2.5:1(Voss et al, 2007). A similar trend in US as well as globaly can be assumed.

MAIN FOCUS OF THE CHAPTER

Even though organizations keep coming up with new expressions for their organization restructuring methods, it is still the same old strategy for hitting financial targets. These methods have been called names like "restructuring," "termination," "permanent layoffs," "resource alignment," "downsizing," and "rightsizing" (Schiro & Baker, 2009). So it is obvious that organizational downsizing has become an important part of business life. Burke (2005) indicated that organizational restructuring and downsizing are a complex and difficult task quite often resulting in completely missing the original strategic goal. Interestingly, there is growing amount of literature suggesting that restructuring fails to reach the stated objectives (usually financial) about half the time" (p. 21). Downsizing is especially hazardous to learning organizations, which is another trend. Because a single individual has multiple relationships in such an organization, unselective, nonselective downsizing has the potential to cause significant damage to the learning and memory capacity of organizations. That damage is far greater than might be implied by a simple count of the number of employees laid off. One needs to consider the multiple relationships generated by one individual. It is obvious that restructuring that involves significant reductions in employees can inflict damage and create the loss of significant "chunks" of organizational memory. Such a loss damages ongoing processes and operations, loses current contacts, and may lead to missing business opportunities. Moreover, this process may increase stress and influence the well-being of employees (Amabile & Conti, 1999; Reynolds-Fisher & White, 2000). There are further disadvantages to downsizing regardless of the type of the organization. For example according to Schiro & Baker (2009), the drawbacks of downsizing could include:

1. Morale issues can surface,
2. Growth is stymied,
3. Productivity can go down, and
4. Employee health and behavioral problems can appear.

It is well-known that organizational change (including layoffs, downsizing, acquisitions, and mergers, but also job relocations, technological innovations at work, management restructuring, introduction of team-based work, and the like) may have adverse effects on employee well-being.

In this chapter, the author is going to look inside the organization during and after the downsizing process. The focus will be primarily at the individuals within an organization. The author strongly believes that organizational trauma is a concept referring to experience of trauma by the members of the organization.

After one looks inside the organization, s/he can see that the whole organism of the company is traumatized. Separate parts of the system undergo various symptoms of the trauma. The psychological impacts are most severe for victims of downsizing. However, the survivors - the remaining employees - also suffer from this traumatic situation. The survivor literature provides convincing evidence that organizational downsizing has negative consequences for remaining employees (e.g. Brockner, 1988, Makawatsakul

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

& Kleiner 2003; Devine, et al., 2003). Similarly, evidence shows that organization restructuring can be a traumatic event for middle as well as for top managers.

Although organizational trauma originates at the individual level, the individual projects his or her trauma into the larger organizational system. The human body cannot differentiate between an emotional emergency and physical danger, trauma that results from experiences which represent psychological emergencies can trigger significant emotional trauma. Unresolved emotional trauma blocks people's capacity to be effective and ability to perform (DeKlerk, 2007).

The trauma is understood, according to American Psychiatric Association, as a

situation when the person has experienced and event that is perceived as a serious threat to his or her life or physical integrity; serious threat or harm to his or her children spouse, or other close relatives or friends; sudden destruction of his home or community; or seeing a friend or a close person experiencing such an traumatic event (American Psychiatric Association, 2013)

Quite often organizations approach downsizing with sheer ignorance of the emotional dimension of the organizational setting. They focus on articulating a vision, selling the positive rational aspects of the change. This is an important aspect; however, it doesn't help to overcome the emotional wounds that lead to experiencing of trauma. It is like telling a person who just lost a partner about new opportunities for new partners. This ignores the pain and harm that comes with a change.

The next part is a description of the symptoms and causes of downsizing trauma on organizational members. It is important to realize that these symptoms are natural and are part of the healing process; therefore, they need to be acknowledged. Feeling sadness caused by the downsizing should not be considered as a weakness but as a natural part of the organizational healing process. As DeKlerk (2007) states it is not the trauma itself that produces disorders such as post-traumatic stress disorder, but rather the failure to process trauma adequately that can lead to pathological behavior.

The Victim

Losing a job is very difficult life situation. Holmes & Rahe (1967) consider this as the 8th the most stressful situation in life. It does not only mean losing a job. With the job loss, a person loses social networks that one developed at the work place. The person also loses the daily routine and activities. Losing a job may quite often mean losing a hook to one identity related to the job performed. All this leads to numerous emotional and physical side effects of losing a job. The emotions that accompany a job loss actually resemble the Kubler-Ross grief cycle experienced when losing a loved one. Most people report feeling a rush of emotions, but the most typical are denial, shock, sadness, anxiety and anger.

The typical reactions to the layoff trauma based on the Kubler-Ross grief cycle consists of 5 stages:

- **Stage 1**: Denial — "I feel fine."; "This is not happening, not to me."

Denial is usually only a short-term defense mechanism. Denial can be conscious or unconscious denial to accept the reality and factual information. It is a defense mechanism and some people can become locked in this stage.

- **Stage 2**: Anger — "Why me? It's not fair!"; "How can this happen to me?"; '"Who is to blame?"

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

During this stage, the individual grasps that denial cannot continue. Person feels anger that is directed toward the organizations as such, to manager personally, other colleagues or even toward him/herself. The person is very difficult to deal with for misplaced feelings of rage and envy to the survivors of the downsizing.

- **Stage 3**: Depression — "I'm so sad, why bother with anything?"; "I invested so much time, energy and effort in the company and this is the result? So what's the point?"; "I miss my job, my daily routine so why to go on?"

During the fourth stage, the person begins to understand the certainty of job loss. Because of this, the individual may become silent; refuse social contact not only in the company but also with relatives and friends. Colleagues usually try to show sympathy or attempt to cheer the person up. However, this only allows the victim of downsizing to avoid looking into future opportunities. So it is not recommended to attempt to cheer up an individual who is in this stage. It is an important time for grieving that must be processed. For example, Greenglass, Burke, & Moore (2003) conducted a study with 488 unemployed hospital nurses whose units had closed as the result of restructuring. Their findings suggested that anger, cynicism, and emotional exhaustion operationalized distress, indicating the importance of studying patterns of negative reactions and their consequences for depression.

- **Stage 4**: Bargaining — "I'll do anything for a few more days, months at the company." This stage involves the hope that the individual can somehow postpone or delay the job termination decision. Psychologically, the individual is saying, "I understand I will lose the job, but if I could just do something to get another chance at least for some time..."
- **Stage 5**: Acceptance — "It's going to be okay."; "I can't fight it, I may as well accept it and move on."

In this last stage, individuals begin to come to terms with the fact of job loss. (Adapted from Kübler-Ross, E. (2005).

However, the person who just lost a job may suffer of further symptoms in various stages of the cycle. These symptoms can lead to trauma formation:

- **Anxiety**: Irrational anticipation that danger is about to happen, which causes unhealthy nervousness.
- **Apprehension**: A dreaded and fearful anticipation that something bad will happen to oneself in the organization
- **Cynicism**: Having distrust of action and intentions of other, accompanied by skepticism, suspicion and sarcasm.
- **Decreased Commitment**: Reduced willingness to take up time or energy to fulfil obligations.
- **Distrust** - Losing faith or confidence about organizations trustworthiness and honesty.
- **Emotional Numbness**: Apathy demonstrated by absence of emotional sensations and reactions such as feeling good, happy or sad.
- **Higher Absenteeism and Turnover**: Being more inclined to take sick leave or resign.
- **Lack of Focus**: Inability to concentrate on one's work.
- **Lack of Involvement**: Reluctance to immerse oneself in the work or organization.
- **Perception of Betrayal**: Feeling that organization was disloyal unfaithful and deceitful.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Rejection**:The experience of not being accepted, but rather pushed aside by the organization.
- **Sadness**: Intense feelings of unhappiness, grief and sorrow.
- **Uncertainty**:Being undecided and not knowing what to do or where to go with one's actions.
- **Withdrawal**: Removing oneself emotionally from organizational obligations and relations (DeKlerk, 2007).

Naturally, one cannot expect that every individual will undergo the same cycle. Especially in reaching acceptance, many victims will fight before reaching the acceptance stage. A lot depends on the strength of psychological contract between the individual and organization. A psychological contract is according to Armstrong (2014), a group of unwritten expectations that exists between the employee and the organization. It is a sum of beliefs that includes the expectations of organization from the employee as well as the employee´s expectations that the organization will meet. These expectations usually include fair and consistent treatment, job security, opportunity for using of the talent, and believing in the promise fulfilment from the management. To many of the victims and survivors downsizing may imply a one-sided renegotiation of the terms of the psychological contract between the organization and its employees, such that the latter receive less from this relationship and invest more in this relationship.

There are also other variables that influence the intensity of the traumatic effect of downsizing on the laid-off employees. Cascio (2002) published an Australian study with71 individuals who had accepted voluntary buyout packages (after 7 to 44 years of service, with an average of 25 years) and were contacted 2 to 7 years after leaving their firms. Almost 90 percent were married, and about half had dependent children. Surprisingly, 61 percent considered their health to be about the same, and 29 percent considered it to be "better" or "much better."

Cascio (2002) also cites research showing that one's financial situation is a major factor in how people perceive and respond to job loss, both physiologically and psychologically. Financial incentives, which often accompany voluntary severance agreements, may well moderate the ill effects of job loss. As one set of authors noted, "evidence is mounting that events viewed as uncontrollable and undesirable are more likely to be associated with psychological and physical distress." The findings of this study suggest that rather than considering themselves to be "victims," individuals who are offered voluntary buyouts may see themselves as having the opportunity to make choices about their future prospects that are not available to the "survivors." As a result, they experience less distress later on (Cascio, 2002). However, our empirical evidence from working in outplacement projects for companies after takeovers shows that job loss generates substantial distress above and beyond the loss of income.

Terminating employees, even when it seems an absolute and obvious necessity, is extremely unpleasant for all involved. At worst, the victim can quickly get into a severe state of anxiety, stress, self-doubt, and depression. Devine et al. (2003) reported that individuals are called downsizing victims because the literature documents job loss and the psychological and physical consequences. Devine et al. explained that "based on a small number of empirical investigations it is accepted that those who lose a job through no consequence of their own become anxious, depressed, unhappy, and dissatisfied with life in general" (2003, p. 110).

To summarize, the downsizing has obviously traumatic effects on employees who are victims of this process. Despite the fact that people react to this situation differently, losing a job is more than losing an income, it often means losing the social connections and quite often also losing the self fulfilment. The main symptoms that indicate the trauma formation in the downsizing victim are anxiety, distrust,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and lack of focus and perception of betrayal. However, similar symptoms can also be noticed in people who remain in the organization.

The Survivor

It is a mistake to believe that downsizing would not affect the remaining employees. The employees who remain with the organization after downsizing are identified as "survivors".

These employees are responsible for new business performance and ultimately the success of implementation of restructuring (Baker, 2006). However, it is quite common that these people are taken somehow for granted are often neglected in the organization restructuring process. As Chipunza & Berry, (2010) show, survivors are the greater losers than those laid-off, because they have to bear cynicism, irritation and in general feel insecure. Research (e.g., Noronha & D'Cruz, 2005) indicated that in the new situation emerged after downsizing; an organizational success depends on the well-being of the survivors in terms of their attitudes, loyalty and eagerness to work. Travagione & Cross (2006), claim that survivors feel a reduction in affective commitment, performance and job satisfaction and increase in health problems. The research findings show that downsizing is negatively correlated with survivors" organizational commitment, work motivation and psychological well-being (Faheem et al, 2013). The survivors usually have feelings of guilt, stress, anxiety, distrust, fear, insecurity, and depression.

Thus, it is rather naïve to believe that downsizing employees may automatically boost profit. Cascio (2002) shows the data that clearly prove this point. Data from the S&P 500, 1982-2000, showed that profitability, as measured by the return on assets, does not necessarily follow downsizing, even as long as two years later. The 2001 Layoffs and Job Security Survey, conducted by the Society for Human Resources Management, reported that only 32 percent of respondents indicated that layoffs improved profits. Even massive staff cutbacks at firms such as Eastman Kodak, Apple Computer, and AT&T have not produced increased earnings years later. Furthermore, Cascio (2002) shows data indicating that downsizing employees does not improve productivity. The American Management Association surveyed 700 companies that had downsized in the 1990s. In 34 percent of the cases, productivity rose, but it fell in 30 percent of them. These results are consistent study of 250,000 manufacturing plants by the National Bureau of Economic Research which concluded that the productivity-enhancing role of employment downsizing has been exaggerated. While some plants did downsize and post healthy gains in productivity, even more (including many of the largest facilities) managed to raise output per worker while expanding employment. They contributed about as much to overall productivity increases in manufacturing as did the successful downsizes.

A review of the adverse effects of downsizing on the remaining employees: For example, Cascio (2002) found that 70 percent of senior managers who remained in downsized firms reported that morale and trust declined. Survivors felt overworked (54 percent), overwhelmed by workload (55 percent), having a lack time for reflection (59 percent), not having time to complete tasks (56 percent), and having the need to multitask too much (45percent). Similar situation is with the managers. Cascio (2002) cites a study that asked a simple question. How had the restructuring changed the nature of the managers' jobs? More than 30 percent of the managers said they now had more staff reporting to them,64 percent had increased responsibility, 69 percent had a wider range of duties,77 percent worked longer hours, 83 percent experienced increased stress, and 85percent had increased workload overall. Against all that, however, only 37 percent said they'd received a salary increase. Is it any surprise that 49 percent felt a decreased sense of commitment to one bank or that 64 percent experienced decreased job satisfaction?

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Asked about their level of commitment and their views on working for the bank, the managers offered 8 positive and 390 negative comments. There is other substantial evidence that organizational downsizing has negative consequences for remaining employees (Beylerian & Kleiner, 2003; Brockner, 1988; Devine, Reay, Stainton, & Collins-Nakai, 2003; Makawatsakul & Kleiner, 2003).

Vahtera et al. (1997) noted that some common changes in mental health surface during and after a downsizing or an organizational change:

Stress is "a dynamic condition in which an individual is confronted with an opportunity, demand, or resource related to what the individual desires and for which the outcome is perceived to be both uncertain and important" (Schuler, 1980. p. 189).

Self-esteem is the individuals' perception of liking or disliking themselves and the degree to which they think they are worthy (Brockner, 1988).

Anxiety is common when stressed. It helps individuals to cope with various tense situations (National Institute of Mental Health [NIMH], n.d.a).

Depression is another issue that may surface in the wake of downsizing, according to the (NIMH, n.d.b)

Besides these negative symptoms, there are other accompanying symptoms that the victims may experience. According to Rice & Dreilinger (1991), survivors can experience:

- **Low Morale**: Survivors have the tendency to become depressed when their friends and associates leave the organization. They are not sure what to do to save their own jobs, so they maintain a low profile.
- **Decrease in Productivity**: Survivors usually face worker overload because there are fewer employees to get the work done. They can get confused about their specific roles or responsibilities, as well as what management thinks about them.
- **Distrust Management**: Survivors have seen that competence and performance no longer equate with continued employment. Their psychological contract with management has been unilateral, and they question management's trustworthiness.
- **Excessive Caution**: Survivors usually discontinue risk taking and decision-making, and innovation. Shifting the responsibility or playing it safe is the new rules of conduct.

Similarly, Noer (1993) shows that the survivors typically experience a number of emotional reactions, including fear; sadness, depression, and quilt. Betrayal, distrust, and anger; unfairness; anxiety and stress are also among the emotional reactions as the social network gets damaged during downsizing. Comparable results were noted by Schiro et al (2009); the employees who had remained with the organization in transition exhibited a lack of confidence, distrust, high levels of stress, and doubts about their roles.

Review the most prevalent trauma symptoms of survivors such as stress, anxiety, depression and survivor syndrome in detail:

Faced with the possibility of a layoff, increased workload, the unknown, or an early retirement, many employees experience an increase in their stress level. Situations that results in stressful reactions affect virtually everyone in the organization. Stress can be good or bad, and by itself, it might not alter behavior. However, the cumulative effects of stress can reach an individual's coping threshold (Gilmore, 1994). Beehr & Newman (1978) had defined stress as a situation which will force a person to deviate from normal functioning due to the change (i.e. disrupt or enhance) in his/her psychological and/or physiological condition, such that the person is forced to deviate from normal functioning.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Behavior can be changed at certain levels of stress given that a person's ability to function is at risk. The continued threat of possible victimization as the causative agent in deteriorating psychological health induces such stress-related illnesses as heart disease and ulcers (Leana & Feldman, 1988). Stress also can reform a person's character. It may change feelings, perceptions, social relations, well-being, behavior, and almost all social or individual reactions. It is very damaging, and if it is not controlled, it can lead to serious health consequences.

Torkelson & Muhonen (2003) conducted a study to determine how men and women cope with stress during a period of change and how there is a relationship between coping strategies to health. Ninety-eight health care administrators participated in the study. Denial explained a significant proportion of variance in the health problems. A study to systematically separate and combine the effects of organizational downsizing and work-related stress on a measure of health in survivors of layoffs included 240 men and 319 women ages 16 to 59 (Dragano, Verde, & Siegrist, 2005). The researchers found that although health associated with organizational downsizing was partly related to an increase in work-related stress, the findings showed an additional synergy produced by the combined exposure to both conditions.

Cheng et al (2005) administered a survey to 8,705 male and 5,986 female Taiwanese individuals' ages 25 to 65 years old from the general population. The findings reported that job insecurity was an important source of stress and that adverse psychosocial work conditions and poor health followed. Rose (2003) studied the results that the stress in work environment reduces the intention of employees to perform better in jobs with the increasing level of stress the employees thinking demoralize and his tendency to work well also decreases.

Similar to victims, survivors may show symptoms of anxiety. The feeling of anxiety can be infinite, and many emotions can be apparent during the period of uncertainty at a wok place. The emotional, psychological, physical, and job-related problems of the survivors influence them and their families. The emotional and psychological toll is similar to the grieving associated with death and the devastation of fighting in military conflicts. It means that survivors may go through a similar grieving cycle as the victim. Of course, not all necessarily undergo such emotional distress. But Greenglass & Burke (2000) surveying 1,363 nurses found that the heavier was the nurse's workload, the greater were their levels of emotional exhaustion, cynicism, depression, and anxiety. This means that not only the survivor's social network and relationships get damaged. The increased workload pressure combined with job insecurity causes further traumatic experience.

The enormous exposure to traumatic and stressful situations in which a person feels symptoms of anxiety can lead to developing a depression. There is a strong connection between depression and high-risk behaviors. Excessive drinking and drug abuse are all self-injurious behaviors that individuals may use to provide temporary relief from intense emotional pain. These behaviors are observable with victims as well as with the survivors. In any case such a behavior can have devastating effect on the future recovery from the trauma.

The emotional symptoms of depression potentially include the following:

- Withdrawal from socializing;
- Loss of interest in previously enjoyed activities;
- Constant irritability or sadness;
- Constant pessimism;
- Feelings of inadequacy and self-loathing (Sue, et al, 1990)

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

All these symptoms obviously influence the performance, attitude and behavior of the employees. This makes it very difficult to make these people to behave so they are in line with the company's strategic goals.

Moreover, the employees who remain on the job face some of the same symptoms as the survivors of catastrophic accidents. Survivor syndrome is a set of attitudes, feelings, and perceptions that occur in employees who remain in organizations following staff reductions (Devine, Reay, Stainton, & Collins-Nakai, 2003). Doherty & Horsted (1995) described survivor syndrome as the expression of many different emotions by the surviving employees after a downsizing. The survivors may suffer of survivor syndrome as they feel the guilt of surviving (Conway, 1993). According to Gandolfi (2008) survivors feel positive inequity, anger, relief, and job insecurity. Research to date has suggested that the various reasons for survivor syndrome include a violation of the psychological contract, an act of unfairness by the management, or an organization's lack of vision (Schiro et al 2009).

The syndrome first affects morale and then influences the company's productivity at the bottom line. Moreover, downsizing has been linked to elevated levels of burnout, cortisol and testosterone, cardiovascular complaints, psychosomatic complaints, absenteeism, and sickness and absenteeism of the remaining employees (Kalimo et al, 2003).

Paterson & Cary (2002) surveyed 71 employees in an organization that had just downsized. Their analysis showed that procedural justice and change anxiety explained the effects of change management procedures on acceptance of downsizing. Although distributive justice did not have the predicted direct effect on employee morale, it did help to explain the effects of procedures on the employees' acceptance of change and morale by helping reduce anxiety about the change. By showing that procedural justice and change anxiety explained the effects of change management procedures on acceptance of downsizing. Although distributive justice did not have the predicted direct effect on employee morale, it did help to explain the effects of procedures on the employees' acceptance of change and morale by helping reduce anxiety about the change. The results disclosed that all employees needed specific leadership behaviors pertaining to inspiration, encouragement, and challenging the process to ensure that they achieved the best performance results. All in all their research clearly pointed out that the most severe and frequent job stress events occurred because of a lack of organizational support and stress due to inadequate pay and insufficient staff.

Manager

Managers are not immune to the traumatic effects of downsizing, either. A growing amount of literature draws attention to the fact that managers may also suffer from the traumatic effects of downsizing. This especially true for mid-level managers. As the previous discussion suggests, managers in firms undergoing significant restructuring are much more likely to feel that their psychological contracts have been violated and to respond with reduced loyalty and increased attempts to leave the organization.

Armstrong-Strassen, (2005) in her analyses of the empirical evidence, shows that management-level survivors are not immune from the adverse effects of downsizing. The author examined number of studies related to management reactions to downsizing in general without differentiating among the management levels.

Downs (1995) contended that middle managers have the hardest job of all during downsizing because they are usually the ones who are responsible for laying off employees and, at the same time, they worry about the permanence of their own jobs. The findings of the present study indicate that middle managers

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

perceived a significantly greater sense of powerlessness over decisions affecting the future of their job than executive-level managers prior to the downsizing and that this sense of powerlessness increased significantly during the involuntary departure period.

Laying people off can be a traumatic situation for managers as this is an unusual and emotionally tense situation to which they are not trained and psychologically equipped. Quite often the managers make mistakes in communication that only contribute to damage of the company culture and social interactions. While top executives may make general, almost abstract, decisions about the total number of employees to be laid off, first- and second-line supervisors are often the ones who have to select and then personally inform the particular individuals to be let go. These front-line managers are caught in the middle, between their responsibilities to the organization and to their subordinates (DeWitt, Trevino, & Mollica, 2003). To dismiss employees who may be long-term colleagues or even friends is a traumatic situation that leaves a permanent label on managers who carry these decisions out. The layoffs cause so huge amount of much discomfort for managers that psychologists note a common tendency among them to try to minimize the discomfort by avoidance and distancing behaviors.

REDUCING THE TRAUMATIC EFFECTS

The most effective way to reduce the traumatic effects of downsizing is to avoid it. There are alternatives to layoffs such as:

- Internal transfers
- Restricting overtime
- Reducing the hours in a standard workweek
- Not renewing contracts for temporary and part-time workers
- Offering temporary leaves
- Job sharing
- Retraining
- Giving early retirement with preferential conditions
- Reducing executive salaries and incentive pay (Jackson et al, 2009).

However, downsizing can become an inevitable approach in situations when all the other alternatives are not realistic. To make this process the least painful for everyone, we need to look at methods which can minimize the traumatic effect of such processes. Some available methods that can assist the victims, survivors and managers follow.

The Victim

Companies usually offer the downsizing victims a severance package. Nevertheless, offering only monetary compensation is insufficient. One of the services that may help to reduce the traumatic effect of a lay off is outplacement. This service can be used as a part of the complex severance package.

Outplacement can be defined as a service that assists the management during the lay off period maintaining the positive image of the company. The service starts with the psychological assistance during the announcement of the decision of downsizing to group of employees or to individuals. The

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

outplacement counselors are available to the victim of the lay off right from the moment of learning about the decision. This is important factor as the emotional support is needed from the first seconds to minimize later traumatic reactions which can be directed inward or outward toward the company, manager and other survivors. Our experience in coordinating large outplacement project clearly proves that this is the basis for the success of later intervention which is on more rational level. So, this psychological assistance should not be underestimated. It can contribute to shortening of the grieving cycle. In some cases, managers undergo training and coaching sessions aimed at managing emotionally distressing situations during the announcing of terminations. The timing of an outplacement offer is important because as time passes people tend to lose interest in such services after lay off.

After the psychological support during which the employees are accompanied through the emotional distress, the outplacement consultants start to work with the victims on analyzing their reemployment potential, auditing their experience, knowledge and skills and also proposing further training areas necessary for the labor market. The next stage of the outplacement process is the job search counselling and training starting with preparing resumes, and training in job search techniques. This is supposed to keep the victims activated and focused on future rather than dwelling in the past. Experience proves that people tend to look back and focus too much on what they did for the company and how unethical and unfair it was to lay them off. Therefore, these people need to be focusing on job search, training activities that concentrate their attention toward future. The important factor is to maintain the momentum in job search. Quite often employees who are left without this assistance tend to lose the work habits and routines. The critical period seemed to be around 6 months. After this time people struggle to be motivated in their job search.

The main goal of outplacement is reemployment of the laid off employee. We can call this service also a last benefit for the employee. It can actually help to maintain the image of the company, trust and reputation in the eyes employees as well as the public. The research of Messenger (2003) confirms that the outplacement improves the image of the company inward and outward as well. It reduces the level of managerial stress and improves the morale of remaining employees. The company is showing that it cares for employees and will not ignore them in the future if similar situation happens.

One of the conditions of successful outplacement is selection of outplacement experts. The external experts should be preferred. Victims accept the assistance from a different person or entity preferably to the one who actually caused the situation and laid them off. The main criteria for outplacement expert should be:

- Reputation and references
- The communication strategies and professionalism
- The professional background of outplacement consultants
- Flexibility in delivering the assistance methods

De Vitte et al. (2005) state the emotional support; education and individual coaching are the most important methods. Psychological assistance is necessary to minimize the reactions such as anger, denial and apathy. In some cases, it is necessary to include family member in the process of trauma healing after lay off.

Next, very important procedures lead to identification of skills, abilities and needs for further education and training. The career counselling should consist of resume writing, active job search, successful interview, establishing professional contacts, entrepreneurial training, etc.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

After the identification of educational needs, the outplacement professionals should recommend the educational institutions the victim should attend (any fees related to this should be part of the severance compensation).

Above all complex entrepreneurial training seems to be the most effective way in overcoming the unemployment especially in regions with high unemployment.

The recent trends indicate that the use of outplacement as a part of severance package is widely used. As revealed in the 2015 study by Lee Hecht Harrison (LHH) (Phuong, 2015) surveying nearly 400 employers worldwide, the majority of respondents stated that their organization offers outplacement, either full or partial, to all levels of employee. The study confirms our recommendations stating that 90% of respondents prefer human interaction in outplacement programs. They indicated that in-person meetings, seminars and coaching are deemed to be the most important elements of a successful outplacement program.

Despite of this, there is obvious trend to use information and communication technology (ICT) as main and/or supporting tool in outplacement programs. Using platforms that can support a variety of self-development options such as e-learning courses, virtual interview center, personality assessments along with consolidated job-search database seem to be very effective and efficient tools. The LHH study showed that more than 50 per cent of respondents praised such platforms. However, only 2 per cent of respondents prefer a technology-based outplacement program. These findings may seem a little confusing. The main reason for this discrepancy is the difference between using a blended approach with personal face to face contact and purely online outplacement program. A research study (Simuth, Sarmany-Schuller, 2010) clearly indicates that the lack of direct social interactions is one of the main barriers of using ICT as the only tool for communication in adult educational settings. Moreover, offering online help to traumatized employee is completely missing the point of what outplacement program is supposed to achieve. Based on this, the main recommendation is to use blended learning program with in-person interventions with a support of the ICT tools.

It is clear that the victims of downsizing go through a traumatic experience and depending on individual need to get through emotional healing process. The outplacement service can help to minimize the impact of the downsizing process.

The Survivors

As with the victims of downsizing, there are several ways to minimize the traumatic impacts of downsizing on surviving employees and managers. The main actors in the trauma reduction process for employees are managers themselves.

Therefore let´s, look at what would help managers. According to Ramsey (2004), following simple recommendations could minimize the negative impact of downsizing on managers:

- Make a big deal out of full disclosure.
- Radiate confidence and a “we’ll get through this” attitude.
- Show true care about former co-workers who have been let go and about those still on the job.
- Remind employees that the mission of the organization is still the mission.
- Rally the staff or crew by emphasizing the best insurance against further layoffs is to make them more productive, more profitable and more indispensable to the overall organization.
- Provide additional training and growth opportunities for employees.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Do whatever possible to lighten the load of your downsized workforce that is overstretched and over-stressed.
- Make a case to the front office for retaining all remaining employees.
- Take care of yourself so you have the resilience and energy to offer others all the support they need during tough times (Schiro, 2005).

A manager needs to create an environment where the emotional wounds could be open in creative non-threatening way to make a team of survivors up and running in the direction of new strategic goals. This can, however; be done by trained manager or by a trained specialist or by psychologist.

De klerk & Sasol (2007) propose a therapeutic model for healing emotional trauma caused by downsizing. This model consists of four interconnected steps.

1. Acknowledging the existence of trauma;
2. Providing a safe place to work through the trauma;
3. Symbolizing the trauma;
4. Allowing emotions and dealing with emotions.

First the organization needs to accept the existence of organizational trauma. Managers need to take action against the as Iancovini (1993 in De Klerk, 2007) described "the unconscious conspiracy of silence about the feelings of sadness, anger, denial and fear that employees experience" (p.66). As with physical wound, De Klerk (2007) claim, the wounds of emotional trauma should be open, the problem correctly addressed and emotions must be symbolized and dealt with before employees can progress to acceptance of the situation and it consequences. This is the role of managers and leaders. They not only have to allow the organizational members to deal openly with the traumatic emotions, they need to deal with their own trauma openly. Among the most powerful strategies for handling this are sensitivity to the traumatic, effects of change, compassion, emphatic listening skills, introspection to understand own emotions and ability to show and talk about their own traumatic symptoms.

The second step lies in providing a safe place where even the most irrational thoughts and emotions can be expressed openly. Many of the trauma victims do not understand the symptoms and get confused by their feeling and thoughts. They quite often blame themselves and feel that there is something wrong with them. The symptoms of trauma are very often associated with weakness; people tend to be ashamed of their thoughts and feeling and try to hide them. This can lead to traumatic residue that may last for years in some individuals. Therefore, De Klerk (2007), stress that such an environment needs to allow the traumatized people to express their fears, anger, and helplessness without being judged, moralized.

The third step is based on a therapeutic approach using the combination of expressive art therapy (e.g. drawing, painting, writing etc.) with narrative therapy (especially story telling). This approach is particularly important as adults tend to suppress their traumatic feelings and thoughts into their unconsciousness. Then, it is very difficult to express the true thought and emotions in front of a group of colleagues. As De Klerk (2007) clearly demonstrate, developing one's story can bring order to the emotional chaos of recollections and emotions. Putting the negative experience in words and /or images allows the victims of trauma to stop the inhibition process of their negative thoughts and feelings. They also describe how important it could be to use metaphors in this process. It eases discussing difficult emotions. This kind of approaches offer an environment providing emotional safety that makes the trauma visible explicitly and clearly.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The last step refers to the grieving process during processing the trauma. Grieving is an emotionally heathy process that takes some time. Therefore, to fully overcome the trauma, a lot of patience is necessary. Hasty resolution of grieving usually leads to anger and resentment. The trauma victim needs to go through the whole grieving cycle as described previously.

A very important factor in this healing process is the use of humor. De Klerk (2007), stress that humor is a great way to deal with trauma. Humor and laughter can be reflecting and distancing from the grief at the same time, allowing the victim to recover and enjoy current life more fully. It is generally believed that laughter can be therapeutic. As the writer Leo Rosten says "Humor is the affectionate communication of insight."

Of course, we are aware that this approach is psychological and not every manager or leader would be able to pursue these steps. However, it is important to realize that the survivors of the downsizing process are the victims as well. They undergo emotional upheaval that quite often leads to traumatic experience with all the symptoms and consequences. Trauma in organization is a psychological phenomenon and needs to be treated by psychological methods.

Another way to look at the traumatic experience is from the perspective of psychological contract between the organization and the employee. During the restructuring and downsizing process the psychological contract can be broken and therefore it needs to be renegotiated. From this perspective managers must communicate clearly with employees about the scope of the changed psychological contract and the time frame within which violations will be remedied. One of the conditions for this is carefully and honestly explain any external forces which cause organizations to "change the deal" to all survivors. After the change, managers should avoid micro-managing employees during, otherwise employees would get the feeling of decreased autonomy and responsibility which would contribute to their feelings of hopelessness.

CONCLUSION

This chapter has shown the trend of using organizational restructuring accompanied by downsizing as a common strategic tool. Whatever the expectations of this process are, it always entails some degree of organizational trauma. The author indicated that organizational trauma is actually a trauma for specific individuals who happen to be members of the organization. A body of research was provided clearly demonstrating that this process can be very traumatic and have serious consequences for individuals. The people who are affected the most are those who lose their jobs. As a consequence, they suffer displaying clear trauma symptoms such as anxiety, decreased commitment, and emotional numbness, lack of focus, sadness, uncertainty and withdrawal. One way to minimize the impact is to offer to these victims of downsizing the benefit of outplacement services. We have shown that outplacement can be an effective method if it follows certain principles. The core principle is to maintain a personal contact of the outplacement consultant with the victim right from the moment of learning about the job loss until reemployment. This principle needs to be stressed nowadays when there is a trend of using ICT in supporting victims. The author recommended a blended approach including regular personal contact with a support of ICT in some aspects of learning and job search.

The author has also provided enough evidence to show that downsizing can have negative impact also on people who remain in the company. These survivors show the trauma symptoms such as higher level of stress, anxiety, depression accompanied by loss of interest in socializing with colleagues, irri-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

tability, pessimism and feeling of inadequacy. As a result these employees show lower morale, decrease in productivity and tendencies to distrust management. This, then, can have negative impact on the productivity, customer satisfaction resulting in loses rather than higher profits. As noted, downsizing has traumatic effects on the employees who remain in the company as well as on managers. In some instances, the effect can be very similar to the experiences of the terminated employees if not even more severe. Managers need to carry on with the trauma survivors, provide them with support and keep the business running toward the new strategic goals at the same time. Therefore, the author proposed a procedure based on a therapeutic model that can help the managers to go through the traumatic experience in a healthy way. This would enable the manager to create an environment where the emotional suffering can be discussed in a creative and non-threatening way. The author firmly believes that this is the only way to make the remaining employees loyal again, and to keep them productive and innovative even after such turbulent period.

KEY TERMS AND DEFINITIONS

Downsizing Survivor: An employee or a manager who remain at the company after the organizational restructuring accompanied by downsizing.

Downsizing Victim: A person whose contract is terminated due to the organizational restructuring accompanied by downsizing.

Organizational Downsizing: Process in which a company attempts to optimize its human resources by reducing the number of employees.

Organizational Trauma: A situation in which the members of the organization go through an unpleasant situation that causes traumatic symptoms.

Outplacement: Service provided to assists the management during the lay off period maintaining the positive image of the company.

Trauma Healing: A directed process in which a manager or specialist use therapeutic methods to help the employees to deal with their negative emotions during and after the traumatic period.

Trauma Symptoms: Typical reaction to organizational change that is dramatic. Such symptoms include, stress, anxiety, depression and fear.

This research was previously published in Impact of Organizational Trauma on Workplace Behavior and Performance edited by Richard Brunet-Thornton and Stanislav Háša; pages 120-139, copyright year 2017 by Business Science Reference (an imprint of IGI Global).

Chapter 86
Making the Unbearable Bearable through Existential Spirituality

R. Scott Webster
Deakin University, Australia

ABSTRACT

In this chapter the case is made that spirituality can indeed have a significant impact upon practical life. Existential spirituality refers to the way one gives meaning and purpose to one's life. The value of spirituality is best appreciated when one's life undergoes an existential crisis, particularly when a worldview, which was assumed to give sense to one's life, no longer has the legitimacy it once had. When a religious, traditional or customary doctrine or worldview loses its authority through an existential crisis, the individual often experiences nihilism. This can often make an experience of hardship quite unbearable because one's suffering is unable to reference any grand narrative or framework of meaning to give sense to one's situation. Using Kierkegaard's three stages of existence, it is argued that making one's spirituality more authentic by taking personal responsibility on an individual level, might be able to make unbearable experiences more bearable.

INTRODUCTION

Spirituality is found in the very core of our being and because it is so deep its impact upon everyday living is not often recognised. However, it usually receives our attention especially when it is 'weak' or absent typically perhaps when we are being deeply reflective or during a difficult time in our lives such as when suffering or confronting an existential crisis. This is echoed by Debats (2000, p. 102) who explains that "[w]e are reminded of Frankl (1973), who stated that, in general, the issue of the meaning of one's personal life has no relevance until some personal or professional crisis occurs." Often this can occur when one's worldview, usually established in traditions, doctrine and 'authoritative' representations for life, fail the individual in particular contexts. When one lacks an adequate spirituality – i.e. when one can be understood as 'spiritless' – the impact can be quite obvious through feelings of ennui, boredom, anxiety, sorrow, uncertainty, angst, depression, emptiness, meaninglessness, or even as an

unbearable grief in which one is unable to navigate purposely through a particular situation. The need to become spiritual, in an authentic manner in such a situation, is understood to potentially have a huge impact. This is because an authentic spirituality can enable one to come to terms with and work through one's present condition by finding meaning and purpose beyond the immediate situation. Such an impact can therefore make a difficult or even a seemingly unbearable experience to become bearable. In this chapter, it is argued that making our spirituality more authentic in an existentialist sense, can possibly enable lives to become more meaningful – even in some apparently meaningless or unbearable situations.

SPIRIT, SPIRITUALITY, AND THE RELIGIOUS

It can sometimes be difficult to take spirituality seriously, especially regarding its potential role or impact upon 'real' practical life in the 'here and now'. One of the problems that has contributed to this is a tendency to reify what we understand by 'spirit'. Doing so, leads to questions such as what is the 'stuff' which spirit consists of? Is it partly divine? Is it immortal? From the Greek term *pneuma* and the Latin term *spīritus* we understand that spirit refers to a life-giving breath of vigour and as such it is not a 'thing' but rather is more like a life-giving 'force'. Consequently, spirituality can be understood to refer to the desires, interests and purposes which energise us, and also give inspiration to our existence. Consequently, spirituality is not a commodity that we can obtain, but it refers to our very being where, for example, being either full of spirit or being spiritless can be aspects of the manner or the way in which we participate in living our lives and facing our challenges.

In addition to avoiding reification in order to take spirituality more seriously, it is also important to recognise that spirituality is not dependent upon religion (Webster, 2009). Spirituality refers to the ultimate meaning and purpose for life and it can often appear religious. However, it is important to recognise that spirituality is not identical with religion because spirituality is pertinent for all persons – both the religious and the non-religious. Religion can tend to represent a particular body of doctrine which an adherent can obtain and so it can be related to epistemology. Smith (1978, p. 20) usefully recognised that the Latin *religio*, being the root for 'religion', has a much "more stable history" as an adjective rather than as a noun substantive concept. Hence other derivatives such as *relegare* and *religare* refer to the manner in which activities – such as worship – are undertaken.

In a similar sense, Caputo (2001, p. 43) has identified that in the Middle Ages the term *religio* was understood to be a virtue and hence it is more ontological in nature because it refers to the attributes of people rather than statements of knowledge or beliefs located beyond people usually in sacred texts. This understanding has led him to state elsewhere that "to be 'religious' in its deepest sense is to be a searcher, living in search of something" and he contrasts this with those who "are satisfied with the reality that sits under our noses" (Caputo, 2007, p. 38) who are not questioning, doubting or grappling.

Being religious refers to a way-of-life or a way of living, while having a religion can refer to a particular set of doctrine, which can be obtained. In this context spirituality is associated with being religious because it represents a life of continual searching and meaning-making, of living the questions. This is in contrast to one who has 'found' answers and is no longer doubting, searching or questioning and has succumbed to what Dewey (1929) refers to as the quest for certainty. The spirituality of religious persons pertains to how they relate to and live out their religion and this often occurs at an individual and very personal level. Being able to live a good life and being able to die a good death necessarily requires persons to have a rigorously developed spirituality, which may or may not make reference to any religion.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

This is not to say, however, that people who have a religion cannot also be spiritual. Spirituality for those who are religious therefore refers to the manner that they relate to their religion. So, while one may be an adherent to a particular religion, one may still be questioning and searching for important meanings to gain 'deeper' insights and more nuanced meanings regarding certain aspects of one's life. Spiritual people can be identified by their openness to new meanings and the possibilities associated with re-considering current beliefs and values, rather than stubbornly hanging on to particular meanings in a closed-minded fashion, being unwilling to re-evaluate one's beliefs.

The ultimate meanings associated with spirituality can be sourced in two basic ways. Firstly, they can be found in formalised systems such as religions, ideologies or philosophies, and secondly these meanings can be created by individuals. Yalom (1980) refers to the first kind of sources as Cosmological, as they proclaim various worldviews about the meaning of life and are typically associated with mainstream religion, while the second source is found within individuals themselves, which Yalom terms as Terrestrial as this existential kind relates to each individual as the meaning of my life in contrast to the meaning of life. It is important to recognise that these two sources overlap with each other in the form of hermeneutics where individuals make meanings for themselves within the context of their immediate culture in which they reflect upon traditional and 'authoritative' narratives which may be partly or completely embraced, adopted or rejected and how one chooses to relate to these. 'Terrestrial' or existential meaning is not created *ex nihilo* as if the individual could transcend reality and' bracket out' (as per Husserl's *epoché*) all the objective realities which have been encountered. Spirituality therefore refers to a dialogical engagement with both the Cosmological and Terrestrial dimensions.

EXISTENTIAL SPIRITUALITY

In order to better appreciate the potential impact that spirituality might have on 'real' life, it ought to be understood as being existential in nature (Webster, 2004). Existentialism, unlike other more esoteric philosophies, is one of the most important practical philosophies "to be lived" (Cooper, 1999, p. 21) and therefore it is not a philosophy of purely subjective inwardness but is inescapably integrated with the environment and all others that are encountered. As a philosophy, Existentialism deals with meanings of existence and it is often called upon to engage with any felt meaninglessness of life as per Sartre's nausea and musings on the absurdity of life, often with references to nihilism. Certainly, existentialism is related to various 'crises' of sorts when an individual is confronted with an apparent emptiness, vacuum and meaningless to their existence as has been portrayed through Edvard Munch's painting *The Scream*. However, the immediate individuating response to an existential crisis is only one aspect of this philosophy. It is also able to offer some guidance for providing purposefulness for life, and therefore it has an important role to play in making the unbearable bearable, when such purposefulness is lacking, to be able to live well in a very practical sense.

When spirituality is understood to be existential, it becomes clearer to understand that it addresses a role that the individual must actively undertake. Writers, psychotherapists and theologians who draw on Existentialism, all identify that the active role required of individuals to take personal responsibility for giving themselves meanings and purposes to live by, is very difficult. It is much easier for people to surrender their individual freedom in this regard and to conform to what many others believe in, such as external authorities found in traditions, customs and cultural norms. The acknowledgement of this challenge is partly captured in works such as Eric Fromm's (1942) *Fear of Freedom*, Rollo May's (1981)

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Man's Search for Himself and Paul Tillich's (1980) *The Courage to Be*. There are other examples of course and they draw on a broad range of theistic, humanistic and existential preferences. Importantly, their focus is upon enabling humans to live well in a very practical sense.

Existential spirituality provides the 'why' and the foundation for morality and how people understand what it means to be a good person. Without this, individuals would be adopting a passive and obedient way-of-being to accept authoritarian moralities which are external to themselves Our desires regarding what we want to do, what we want to attain and what we want to become, are very much embedded within our spirituality. Consequently, because it is existential, our moral conduct is not dependent upon passive obedience (in a deontological sense) to external codes of conduct and authorities found in various legal, religious and secular sources. Rather our conduct with others and the way we live our lives through practical activities are expressions for how we understand what it means to live a good and purposeful life. The definition of 'good' must in this context make continual reference to the relations with others and to the environment in which one finds oneself. This is much like Dewey's (1985; 1988) individualism where being moral requires individuals to make constant reference to how their activities are affecting others – hence his reference to morality as consisting of the whole character of individuals. There is therefore a very important link between spirituality and the desires that people have. Existential spirituality which is authentic may even allow people to transcend common codes of ethics (Caputo, 1993) understood as what authorities and/or traditions require of citizens, and instead engage with the 'big picture' concerns regarding ultimate meanings and purposes of a good life. Kierkegaard refers to this as the 'teleological suspension of the ethical' – meaning that an individual doesn't necessarily have to be bound to universal ethical rules if there is a higher purpose that is able to transcend such rules. This can be difficult to understand and accept but it has great importance for enhancing personal responsibility and potential in an existential sense, which is a central key for living a personally meaningful life. Due to the potential impact of this, it is considered important to explore some of Kierkegaard's works on this matter.

KIERKEGAARD'S THREE STAGES OF EXISTENCE AND SUBJECTIVE TRUTH

Although Søren Kierkegaard (1813 – 1855) was a Christian philosopher, much of his insights have been adopted by humanists and secular psychotherapists. Before him, Hegel (1983) employed the concept of spirit (i.e. Geist) in three different ways – the Subjective; Objective; and the Absolute, which transcends differences to achieve a unified system or theory of understanding. Kierkegaard (1992, p. 112) rejected this emphasis upon 'systematizing' and 'objectifying' existence arguing emphatically "that there can be no system of existence and that a logical system must not boast of an absolute…" and instead argued for the predominance of the contextual and uniqueness of individuals which comes to the fore through reflection. He argued that by being educated "spiritual existence [is] intensified by reflection" of a dialectical sort in a continuous manner, but without reaching a 'final' conclusion as is often presented via 'objective' knowledge. There are similarities which Kierkegaard shares with Dewey (1929, p. 88) who also promoted a rigorously reflective attitude that one ought to have "toward the material of direct sense-perception" including 'facts' of religious beliefs.

It is important to recognise that this existential perspective of Kierkegaard's is not solipsistic. It might be argued by those with more 'objective' leanings such as Rieff (1966) that through Freudian psychotherapy persons become lost in self-interest and isolated from others in society, including being isolated

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

from moral authorities. Dworkin (2015) and O'Hara (2009) however, position Rieff and his perspective as failing to appreciate the relational nature of persons from an existential perspective. Clearly individuals are embedded in a multitude of I-Thou relations for which s/he is inescapably morally responsible. So, in contrast to the isolated and self-interested characteristics associated with solipsism, existentialists understand the individual to be primarily a relational being.

This existential perspective offers some differences to psychotherapy that have been espoused by Freud. For example, Rollo May (1983, pp.14-15) indicated what makes Kierkegaard's writings an attractive addition to traditional psychotherapy sources is that "Kierkegaard was writing about exactly what my fellow patients and I were going through. Freud was not …Freud …knew about anxiety. Kierkegaard … he knew anxiety". As such, it can be appreciated that psychotherapists who draw upon Existentialism do not consider themselves as the sorts of 'priests' that Rieff (1966) feared, because they are focussed on sharing their human-ness phenomenologically with their clients (Reker & Chamberlain, 2000; Sharpio, 2016). It would appear that in order to offer others profound insights regarding the meaning and purposes of human life, one first has to undergo some direct existential confrontations oneself in order to gain an authentic understanding (Shapiro, 2016). Kierkegaard himself experienced some critical existential crises in order to communicate to his readers that he really knew anxiety and existential suffering almost to the point of it being unbearable to himself.

In order to appreciate Kierkegaard's (1988) insights regarding existential spirituality, it is helpful to review his three 'stages' of existence or rather 'existence-spheres'. The first is the aesthetic stage and represents the pursuit of happiness. However, this stage is much like irresponsible hedonism, where one pursues temporary pleasures one after the other and attempts to avoid all kinds of unpleasantness, pain and suffering. Being motivated by these two main principles of pleasure and pain is actually enslavement to one's caprice and base appetites or alternatively enslavement to external authorities who determine how 'good' is to be understood and experienced. Consequently, this stage of existence invites people to choose between taking on certain roles assigned to them in life to perform what is expected of them. Even being 'ethical' is reduced to a form of obedience such as Bauman (1991) observes of 'good' Nazis. Kierkegaard refers to these roles as masks which hide the real 'self' of individuals. If a person living in this first sphere of existence was to undergo suffering, such a person would be very limited for dealing with it. This is because her mindset understands that all suffering is wrong and ought to be avoided. Pain and suffering are understood to be unwanted inconveniences to the pursuit of pleasures and if such suffering is severe or prolonged, they can be considered to be unbearable.

The second stage of existence for Kierkegaard is termed the ethical and it focusses upon personal responsibility. In contrast to playing various 'roles' as per the previous aesthetic stage, this ethical stage unites the person as a responsible self who is committed to a particular moral code of conduct and uses it to constantly measure or judge himself or herself against. Such codes, be they religious, legal or cultural, have authority over one's life. They determine the meanings of present and future situations – including the occasions of suffering. All that is required is the commitment and obedience of the individual. If there is to be an experience of suffering, then this is given 'sense' through the code to which one is attached. As long as one accepts that such a code has authority over one's life, then suffering can be made bearable by giving it meaning in the overall doctrine. Suffering can be accepted stoically because it is understood to be one's lot in life. However, if the legitimacy of the code itself is doubted and an individual is unable to reconcile their own suffering as having a purposeful role within the doctrine, then such suffering (and indeed perhaps life itself) might become meaningless as the moral code is no longer believed to be legitimate or 'true'.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The third stage of Kierkegaard's is the religious stage, which he argued can in some (extreme) situations actually take one beyond – or 'suspend' – ethical codes. His best-known example is found in his (1983) book *Fear and Trembling*, which refers to when the patriarch Abraham who, when spoken to by God, agreed to sacrifice his son Isaac. Kierkegaard explained that this event can only be understood religiously because if we only consider it from an ethical perspective, then we must condemn Abraham as guilty of the intention to murder. Clearly Kierkegaard's religious perspective is specifically Christian as some Jewish authors (e.g. Levinas, 1998 and Rieff, 1966) interpret this event differently to Kierkegaard. From Kierkegaard's Christian perspective Abraham is not guilty of criminal intent but rather he can be understood as the father of the faithful. Importantly through this story Kierkegaard identifies that faith is necessarily a very individual affair for which the universal realm (of ethical codes) does not have authority. In this sense the individual is alone and separated from the certainty and comfort that is often promised by doctrines, which can give sense and purposes to existence. Walking by individual faith is therefore a risk-filled existence that can simultaneously involve anxiety and angst as well as a sense of empowering freedom.

Due to its very nature, the foundations and justification for one's faith cannot be clearly communicated in an intelligible way to another person because it transcends the rationality of meanings which are intrinsic to language itself, and so Kierkegaard often describes Christian faith as a paradox. It is also not something that is developed by an inwardness but is dependent upon a relationship with the divine, which takes one outside of oneself and even beyond rationality. Faith is not obtained simply by reading books or listening to sermons, but rather it is cultivated "by immersing oneself in existing" because Christianity itself "is an existence-communication" that an individual has alone with God (Kierkegaard, 1992, p. 560). While this is important for Christianity as understood by Kierkegaard, there are some practical implications that can be gleaned for spirituality in general, which refers to Kierkegaard's notion of subjective truth about being alone in relations.

For Kierkegaard's (1992, p. 33) pseudonym Climacus, "Christianity is spirit; spirit is inwardness; inwardness is subjectivity; subjectivity is essentially passion…". This indicates that this third 'stage' or sphere of existence for Kierkegaard – the religious state of being – is quite different to the second stage of the ethical, which relies upon certain rules and codes having authority over the individual. Climacus is clear that Christianity is not a doctrine (ibid., p. 383) but instead is the intense and single-minded ultimate interest (passion) that an individual can have for the whole of her existence. This is essentially subjective in the sense that the meaningfulness of one's life is not 'objective' as if it could be obtained through an impersonal statement of doctrine. Rather it is only possible through the way that one personally relates to the divine in a dialogical relationship. Kierkegaard's subjectivity is not solipsistic because it is the relationships that are engaged with and that give it grounding in 'reality'. This is echoed by others such as John Macmurray (1961, p. 28) who explains that "Now we have recognised that our change of attitude takes us from the isolated self to the self in relation to the Other …I exist as an individual only in a personal relation to other individuals." This is very similar to the I-Thou relation of Buber, which he argued represented a shift from communication to communion. For Kierkegaard (1998, pp. 109 & 115) this notion is based on his understanding that "Christ …would not have anything to do with the crowd" and instead only wanted to relate "to the single individual" in a meaningful relationship – which simultaneously includes everyone in relation with him/her-self and with each other.

Due to the understanding that Christianity is fundamentally a relation of dialectical communication – or communion –, Kierkegaard did not spend effort arguing for the objective reality and existence of his Christian God and divine Son. Instead, he claimed that "objectivity is believed to be superior to subjec-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

tivity, but it is just the opposite" (ibid., p. 185) and throughout his works he argued for the importance of subjective reflection being understood as subjective truth. He focussed upon how we as individuals relate to God – even as a possibility. This priority of the 'how' of our relating over and above the verification of any 'what' of an object's existence, led him to claim that subjective truth is the most valuable sort of truth we can be a part of (Kierkegaard, 1992). The issue for our reflection is not to verify whether objects such as God actually exist, but rather to reflect upon how we make sense of our relating to God and the meaningfulness that we understand our lives to have. Here Kierkegaard's notion of subjectivity can be appreciated to be a central component to phenomenology and hermeneutics – especially through Heidegger and Gadamer.

This notion of subjective truth might be explained more clearly using a couple of examples. The first of these involves Kierkegaard's story of a flower growing up on a pile of dung in an obscure part of a back garden. In this situation, the flower might reflect "I myself have not been able to determine the situation and the circumstances, and so it is not in the remotest way my affair; that I stand where I stand is God's will." (Kierkegaard, 1971, p. 339). The unfortunate location where the flower finds itself represents the 'throwness' – as per Heidegger's (1996) 'facticity' – that we often find ourselves in life, being in situations that we would prefer not to experience because they are either uncomfortable, unpleasant, or involve suffering. Nevertheless, no matter what our current situation, we might be able to find or create some meaning that gives sense and purpose to our existence.

The second example for explaining subjective truth is with reference to the story of the Good Samaritan who came upon a victim of crime while travelling along a road. Kierkegaard uses this metaphor to argue that what matters is not the actual road upon which our lives are travelling along, but how we are travelling on the road. He observed that the same 'objectively real' road in the story was walked upon by five different people – the victim, robber, priest, Levite and the Good Samaritan. He comments that "spiritually speaking, we have to say that each one walked his own road – so the highway, alas, makes no difference, it is the spiritual that makes the difference and distinguishes the road" (Kierkegaard, 1993, p. 290). Interestingly, he argues that 'worldly wisdom' is deceptive when it focusses solely upon the question 'where is the road?' as exemplified by such questions as 'where might I find truth?' – as if this were a commodity to be located and obtained. This is problematic because it reduces one to pursuing an external source to have authority over how one ought to live. He claimed that "spiritually understood the road is: *how* it is walked" [original emphasis] (Kirkegaard, 1993, p. 291) and importantly that this is more difficult to live well rather than simply 'finding' an objective road as promoted through Rieff – even although it might be a true one, such as true religion or philosophy.

Kierkegaard's notion of subjective truth indicates that our personal identity is a task activity achieved through exercising one's interest, will and purpose. Similarly Dewey (1985, pp. 361-2) argues that "In fact, self and interest are two names for the same fact …interest means the active or moving identity of the self with a certain object…" Rather than essentialise ourselves with an identification which is formed through our 'throwness' in the world, for example, a flower on a dung heap, or our gender, ethnicity, social status, death of a loved one or a disability -, our identity is formed through how we give sense and purpose to the conditions with which we live. This involves evaluating the way that we relate to all the elements in our environment. This is where the role of suffering may actually enhance one's capacity for living a more purposeful life when it is understood that while the crisis can be unique to the individual, each of us is nevertheless a unique person with an identity that is uniquely our own. No one else can experience the exact hardships we experience. No one else can die our death. Only we as individuals can experience the uniqueness of these events. Our experiencing of these encounters can

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

contribute to our own uniqueness and help us to be the individuals we are. However, this is not always easy to appreciate when feelings of anxiety and suffering appear overwhelming and even senseless as in the case of nihilism.

UNBEARABLE DISPAIR AS NIHILISM

Nihilism is an orientation to nothingness and meaninglessness and when one is confronted with a crisis which might be considered as being unbearable, there is also a nihilistic sense of meaningless associated with the encounter. The philosopher Friedrich Nietzsche (1967, p. 9) described nihilism as a condition where an "aim is lacking" and the question "'why?' finds no answer." It often emerges when individuals come to recognise that their taken-for-granted cultural traditions, including religious and moral norms, have lost their significance and/or legitimacy for giving meaning to their lives. Nihilism is similar to being spiritless because it understands life to have no point or purpose to it. A person who is nihilistic acknowledges an absence of a 'grand narrative' that might give meaning to an immediate situation or even to one's existence in general and has not (yet) generated a purpose of their own to replace the traditional one.

Nietzsche (1967, p. 23) offers some valuable insights into nihilism, describing it as the absence of any "ultimate meaning". He lamented that the dominant culture of his time promoted a 'herd mentality' and a 'slave morality' which lost sense of people as being unique individuals and focussed instead upon the expectation of all to passively comply and obey for the purpose of 'fitting into' their assigned roles and to perform what was expected of them to ensure the public 'good'. He observed that the traditional norms of a culture offer individuals their meaning and purposes for living 'a good life' in an authoritative manner, but this subsequently makes them into 'good' slaves.

This condition of slave morality is described by Nietzsche (1998, p. 24) as being nihilistic, who argued that "[w]e see today nothing that wishes to become greater, we sense that things are still going downhill, downhill – into something thinner, more good-natured, more prudent, more comfortable, more mediocre, more apathetic…". He identified that the loss of the individual will to a surrender to the mass, attracted a certain 'approval' by authorities as being 'good', but he saw this as a 'levelling' which enslaved people to the will of others. In response to this, Nietzsche took a position that was against people becoming 'uniform', 'regular' and 'predictable' and instead he argued for a sovereign individual, who, "resembling only himself, [becomes] free again from the morality of custom, autonomous and supermoral" (Nietzsche, 1998, p. 36) who is so free that he can create his own values and can choose his own good and evil (Nietzsche, 1966).

Nietzsche has often been misunderstood as an 'immoralist' (to use his own term) because of his call to challenge cultural norms by 'sounding them out with a hammer' and to live a life of 'master morality'. Interestingly, he argued that those who give up on religion tend to "cling that much more firmly to the faith in morality" and yet every system of morals without a religious background "necessarily leads to nihilism" in the sense that there lacks an answer to the question 'why be moral?'. Nietzsche contended that individuals ought to be able to give their own personal reasoning and justifications for choosing to live their lives the way that they do – even although their reasons may take them beyond the realm of pure rationality. He encouraged his readers to become 'free spirits' who could be identified by the fact that they could think differently to what is commonly believed and taken for granted by mass society (Nietzsche, 1996, p. 139). One of the purposes he had for making such an argument was that he was

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

concerned about the lived experiences of the individual having their meanings being given from outside sources such as legal customs, religious traditions and moral codes, because this tends to marginalise personal responsibility. Consequently this submission to slave morality encourages the will of each individual to be 'unfree' because people become slaves to what is assumed to be necessary.

In contrast to this, Nietzsche argued that individuals ought to break free from their unquestioning dependence on customs and traditions, re-evaluate their values and even 'create' their own. Importantly, he didn't argue that all values should be rejected but rather that their legitimacy might be evaluated. Morals ought to have a 'why' to justify their value and currency. This requires individuals to exercise their own will because not only must they critically examine the customs of society, but they must also be committed to living according to particular purposes. Nietzsche (1990, p. 33) recognised that this was very important and even empowering for each person as he explained that "if we possess our why of life we can put up with almost any how." This is crucial if people are to bear situations of suffering, which can appear unbearable to them.

A sense of nihilism can often accompany situations where one is suffering without apparent 'good reason'. This kind of meaninglessness is in contrast to examples such as 'suffering' the pains and anxiety of childbirth or 'suffering' through the pain barriers of exercise, because these sorts of experiences have readily recognizable meanings which transcend the immediately difficult time by referencing some expected good consequences that the present situation is contributing towards. Being nihilistic or spiritless occurs when one's existence or situation of suffering or emptiness appears to be without sense, that is, 'senseless', and without a connection to any purpose beyond the present moment. As Nietzsche argued, having a purpose or a 'why' helps to face such situations more ably and even to be made more bearable. This understanding has been adopted by Victor Frankl, who through his approach to psychotherapy, has used it to explain why some individuals have been able to cope with some extreme and unbearable sufferings such as those which he witnessed in the concentration camps during the Holocaust.

While Frankl's context of the concentration camps might appear extreme, he has nevertheless argued through his research ever since, that no matter what our circumstances, humankind's spirituality (which he describes as our search for ultimate meaning) is universal and is necessary for living well. His 'Logotherapy' approach to psychotherapy is designed to heal through the formation of meanings. It is clearly secular and Frankl limits how often he references spirituality so as not to confuse it as a therapy that might be construed as religious. He claimed that "[t]he consciousness of one's inner value is anchored in higher, more spiritual things, and cannot be shaken by camp life" and he provokingly asks, "But how many free men [sic], let alone prisoners, possess it?" (Frankl, 1984, p. 83) to indicate that an authentic spirituality is not common. He references several studies, especially of young adults, to conclude that 'developing a meaningful philosophy of life' is a more valued life-goal above others such as making money and improving one's living standards (Frankl, 2000). However, this life-goal is very difficult to achieve. Frankl critiques Maslow's hierarchy of 'needs' claiming that the search for a meaningful life should not be considered the last 'need' to be attained after all the biological and psychological needs have been met. Rather, he contends that spirituality is the most fundamental 'need', especially so when the other needs are not being met – such as in the concentration camps which he experienced. Indeed, it is often when people lack some or even only one of the other 'needs' for a good life in Maslow's list such as food, shelter, health, relationships, self-esteem and love, that spirituality then can be understood as offering significance for practical living. It is able to make an unbearable situation more bearable.

THE IMPORTANT ROLE OF SPIRITUALITY DURING SUFFERING

Unbearable suffering – be it extreme anxiety, apathy, despair, or physical/emotional grief – can be made more bearable if some sense can be given to the event which gives it a 'place' and therefore a purpose in a big picture understanding of life. Failure to give sense to such suffering can lead to a sense of nihilism. Due to Kierkegaard's intense interest in living as a Christian, he understood that being called by God usually also involves some suffering in order to partake in the sufferings of Christ. Clearly suffering is also experienced by those existing in the aesthetic and ethical stages of existence, but in such cases it is usually understood as being accidental. For Kierkegaard's religious stage suffering has a more significant role for deepening an understanding for life and for undergoing further repentance and therefore personal transformation. He explained that suffering is "crucial for religious existence" and "the more that is suffered, the more religious existence" (Kierkegaard, 1992, p. 288). Kierkegaard was well-aware of the role that suffering has for Christianity in the sense that it often plays an important part in purifying the hearts/motivations of those who are converted. He stated that "in the profoundest sense one may suffer indescribably, also have one's thorn in the flesh, but despite this …one can find joy …to live for an idea" (Kierkegaard, 1998, p. 229). Debats (2000, p. 105) notes that it is important to recognise that meanings reside in meanings and are not to be found in the empirical world or with 'things'. Therefore one must often go beyond immediate experiences in order to attain meaningful insights which might offer some purpose to one's suffering.

It is more than an intellectualised idea that is needed to bring one through an experience of suffering, because the idea must be lived with intense belief and interest. Kierkegaard (1992, p. 313, 387, 397) claims that "the existing person continually has a *τέλος* [ultimate purpose]" which is able to play a significant role in transforming individuals through how they relate to various entities, by appealing to a sense of happiness, fulfilment or meaningfulness. Such a *telos* must be related to with a totally committed subjective truth that one understands that the purposefulness of one's life literally depends upon it. In his entry titled, *The Gospel of Sufferings*, Kierkegaard (1993, p. 235) argues that for the religious person "the heavy burden is beneficial – that must be believed; it cannot be seen. Later it perhaps can be seen that it has been beneficial, but in the period of suffering it cannot be seen." Elsewhere he explains that in many instances our lives 'make sense' when we look backwards and can see how the consequences of certain events – such as those involving suffering – have all had an impact on how we have developed, changed and become the persons we are today. However, in our day-to-day existence we must live our life forwards. This means that we are unable to know what the long-term future consequences will be from the situations in which we currently find ourselves. This is why Kierkegaard encouraged his religious readers to believe in the good of their current sufferings even although it may not be apparent in the immediate moment how their lives are to be benefitted from the hardship.

Importantly, Kierkegaard warns of an attitude which might work against spiritual growth. When in the midst of a suffering situation, people might hope for relief from an unseen hero such as a god-like king in a Molière play, who almost magically intervenes at the final scene to make everything right. This might be reflected in the wish for an outstanding physician with a guaranteed cure or the return of a loved one. Kierkegaard argued that such an attitude is problematic because the focus of the one suffering becomes focussed on the immediate (temporal) situation and its relief, rather than upon the long-term/eternal life that lies before one. Consequently, there is only a concern being given to the temporary realm and for finding comfort in it rather than in something more substantial and longer lasting. This is in contrast to the one who is focussed upon the long-term/eternal rather than the temporal. Such a person understands

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the importance of what sort of being she is becoming and what sort of virtuous character she has become to be able to take with her into the (eternal) future. Kierkegaard (1993, p. 379) acknowledged this in his statement that "the person who truly wills to suffer everything disdains temporality's relief and thus is comforted eternally."

In the previous section reference was made to Kierkegaard's review of the story of the Good Samaritan and that the key for spirituality in this passage was not so much finding the 'right' road in an objective sense, but rather how one walks upon the road that one finds oneself 'thrown' upon. It is important to note that the road to which Kierkegaard refers, is the 'narrow' and 'hard' one, which Christians are called to travel. This is why he titles this section of his work as "*It is not the road that is hard but that hardship is the road*" [original emphasis] (Kierkegaard, 1993, p. 292). Throughout this section of his book he repeatedly uses the phrase "hardship is the road" to emphasise that spiritual life does not necessarily depend upon searching to find a particular road/ultimate meaning/true doctrine in an objective sense, but rather bearing up under the hardship that one might be experiencing in the here and now. He observes that most people have often commenced upon a road of life for living well by willing the good. However, "most people fall away when it is apparent that the road becomes harder instead of easier." (ibid., p. 297). This seems to be the point that he is making for being spiritual – one "does not so much as a moment …looking around – no, with all his might and main he is in the hardship, joyful in the hardship, joyful in the thought that hardship is the road." (ibid, p. 299)

The value of this understanding is not limited to Kierkegaard's philosophy or to existential Christianity, but it is also taken up by those who intervene in the lives of those who are suffering in order to help them. Psychotherapist and author Scott Peck (1978, p. 13) in his *The Road Less Travelled* commences his first chapter with the sentence "Life is difficult". In his book, he makes the case that "it is in the whole process of meeting and solving problems that life has its meaning." (ibid., p. 14). This could be understood as the manner of walking the road, rather than the road itself. In his work he makes the case that the spiritual growth of his clients is often due to them taking on personal responsibilities for engaging differently with the situations that they are grappling with, rather than 'solving' them through the removal of the actual hardships themselves.

Similarly, the psychiatrist Viktor Frankl, through his Logotherapy, has aimed to heal his clients through their exercising of their own 'will to meaning', rather than providing them with strategies to remove the objective conditions of the hardships. Frankl was familiar with the works of Kierkegaard and his therapeutic approach is reflective of Kierkegaard's subjective truth. To illustrate this, Frankl shares the following;

An example of meaningful suffering drawn from my own practice is the story of the old general practitioner who consulted me because of his depression after his wife had died. Using the form of a Socratic dialogue, I asked him what would have happened if he rather than his wife had died first. "How she would have suffered," he said. I replied, "Don't you see, Doctor, that great suffering has been spared her, and it is you who have spared her this suffering; but now, you have to pay for it by surviving and mourning her." Our dialogue induced him to discover a meaning in his suffering… (Frankl, 1988, p. 90)

Here we can appreciate that the objective conditions relating to the suffering of this man – that is the death of his wife – did not change. However, he came to see the situation differently and therefore the manner of how he related to this unbearable suffering of her death, did change. This is the potential

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

value that existential spirituality can offer. It can potentially transform an unbearable sense of meaningless suffering into a purposeful activity.

MAKING THE UNBEARABLE MORE BEARABLE THROUGH THE AUTHENTICITY OF ONE'S SPIRITUALITY

Spirituality is able to have a significant impact upon practical life. It is able to transform senseless and nihilistic hardships into purposeful activities. This has been recognised by Rollo May (1983, p. 37), who observed that "…psychotherapists, confronted as they are in clinic and consulting room with the sheer reality of persons in crisis whose anxiety will not be quieted by theoretical formulas", require a spirituality which is very practical. He argues that in these situations the potential value of spirituality is immense, because it can help turn lives around to become more profound and purposeful in the face of apparently unbearable situations.

Suffering and hardships might be tolerated by people who can draw upon external sources to provide meanings for their experiences – including those which are very challenging. For example, a person who is suffering may hold fast that the event is from God and is a just form of punishment to be endured. This understanding of a reward and punishment frame of reference is typical of Kierkegaard's ethical sphere of existence. In such a case this hardship would not constitute an existential crisis with its characteristic anxiety and uncertainty because this suffering 'makes sense' according to a particular doctrine or 'grand narrative.'

However, an episode of doubt, despair or suffering can develop into an existential crisis, which is nihilistic if it leads a person to question the legitimacy of certain doctrines, codes or traditional grand narratives which have been accepted in the past as having authority over her life. But coming to the brink of nihilism through such a crisis can potentially be of great benefit. As a psychotherapist, May (1983, p. 57) considered that "a crisis is exactly what is required to shock people out of unaware dependence upon external dogma and to force them to unravel layers of pretense to reveal naked truth about themselves which, however unpleasant, will at least be solid." Through breaking away from uncritically accepting external sources of authority, one is able to begin acting and behaving out of one's own freedom to choose and be personally responsible for the purposes that one lives by. It is important to recognise that such a sense of personal freedom is simultaneously a sense of great personal responsibility, and therefore this cannot be a retreat to relativism or solipsism, because individuals are inescapably accountable to all others for their activities and consequences – both intended and unintended. Significantly, this authenticity of one's spirituality may enable some unbearable experiences to become bearable.

It is often through an 'existential crisis' that we confront the strength (or weakness) of our spirituality which is needed to bear up and to navigate through what may seem to be an unbearable situation. May (1969, p. 19) even asserts that "[i]t is only in the critical situation of emotional and spiritual suffering …that people will endure the pain and anxiety of uncovering the profound roots of their problems." Hence such crises may provide the necessary experiences that are required for healing 'deep' problems in people's lives. The process of working through an existential crisis often requires us to uncover the foundations of our values which we often uncritically take for granted, to reflect upon, 'test' and re-evaluate these, and to take on a greater sense of personal responsibility for the way that we relate to and value various purposes and aspirations.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

It was argued by Kierkegaard that those people who were not existing in the religious stage of spiritual maturity, tend to conform unquestioningly to the roles that are assigned to them by their culture. Becoming more authentic requires individuals to recognise and accept that they are 'alone' in the world as 'individuals' and that they are free to exist outside of these roles, which are often imposed on them. This 'free' existence is not as a sovereign or isolated individual, but as a self who is inescapably embedded in relations, who must decide for herself and accept responsibility for her decisions and actions. Being 'alone' in this sense means being aware that the actions and activities which are performed are done so on the basis of her own intentionality and volition and not because she was obediently 'told' to do so by an external authority – even a moral or religious one.

Understanding human beings to be fundamentally intentional beings means that meaningfulness and purposefulness for life do not pertain to acquiring or having some things like a sacred piece of knowledge or 'truth', a skill or technique, or even a cure. This is because all of these depend upon the intervention of external authorities. In contrast, purposefulness and existential meanings come from within the individual in response to her relations with the other entities in her environment. Certainly, individuals can receive things external to themselves, which may provide them with some relief from apathy, despair or 'suffering without meaning', but in order to be able to live a meaningful life as an intentional being, one must prioritize one's being over one's inclination to have and exercise one's own will towards a personal sense of purposefulness.

Eric Fromm (1976, 1989) has written extensively on the two modes for existing – of being and having. He does this to create a contrast for how the mode of being provides the only way for living a meaningful life, which he associates with authentic solidarity, altruism and love. This is in contrast to the other mode of possession-centred having, which he associates with selfishness and egotism. As a mode of existing, being is activity-related and therefore it focuses on verbs rather than nouns – because nouns presume objects and things, which are to be acquired and possessed with little demand upon the receiver to actually change or grow. For example, rather than finding 'love' as a thing or as an 'other' who might provide certain things, or being 'in-love' as a location, the mode of being focuses on the importance of being loving as an aspect of one's intentions and activity. This mode of being draws attention to the interests, desires and will of people, which are central elements of spirituality.

As a person moves away from Kierkegaard's aesthetic and ethical stages of existence characterised by their having mode, she becomes more in tune or attuned to the being mode of the religious stage. This movement involves a conscious rejection of any assumed authority that external sources might claim to have over the individual. This is not to say that she cannot live her life in accordance with particular cultural norms, moral codes or religious doctrine, but what must occur for living authentically is for the individual to actively choose to make such norms, codes and doctrine her own. This means that she will follow the teachings or requirements of a code because she freely chooses and desires to do so, rather than feeling compelled that she must. This affects all aspects of her life from paying taxes, driving within the speed limit and being polite, which are all performed because she wants and desires to do them rather than feel that she needs to do them out of obedience. Becoming more authentic requires that one exercise this freedom of choice – not just for everyday activities but also with regards to choosing what ultimate meanings and purposes to live by. From a heightened sense of personal freedom and responsibility, a more authentic spirituality produces a greater sense of commitment to personally chosen meanings and purposefulness. The effect of this is to further inspire us to invest ourselves in something much larger than the immediate present in order to transcend nihilistic experiences in our lives resulting in making these unbearable situations bearable.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In his *Upbuilding Discourses,* Kierkegaard represents the importance of being single minded through his notion of a 'purity of heart'. He explained that a singleness of mind is needed to address the weaker double-mindedness which besets those who operate with ulterior motives as is typical with those who live in the first two of his stages of existence. This is demonstrated in his observation "that the person who wills the good for the sake of reward does not will one thing but is double-minded" (Kierkegaard, 1993, p. 37). This is a significant insight for an authentic spirituality if it is to enable one to see purposefulness in a situation which initially might appear to be unbearable. Elsewhere, Kierkegaard (1992, p. 436) argues that "[e]ssentially, the religious address has [the task] of uplifting through suffering …so the faith of the religious is in this, that life lies precisely in suffering …As soon as the religious address casts a side-long glance at fortune, comforts with probability, strengthens temporality, it is a false teaching, is a regression into the aesthetic". To have 'purity of heart' means that one's spirituality consists of desiring and willing only one thing upon which all other purposes, interests and desires are founded. In short, this is an appeal to the whole character of a person involving all the virtues. This single purposefulness seeks to capture one's life as an overall project that necessarily transcends the single event of suffering, which may be experienced in the immediate moment towards a virtuous character as a life-project.

Being purposefully single-minded and having a 'purity of heart' involves one to be actively intending and willing for something understood to be 'the good'. This can usually be demonstrated by one's commitment. A person's commitment, which stems from their will, is intrinsic to their identity. As Frankl (1988, p. 98) explains, identity is made apparent through our "dedication to some cause", and if authentic, is something that we have chosen for ourselves and are responsible for enacting. Similarly, Fromm (1976, p. 111) acknowledges how one's spirituality is intrinsically an aspect of one's identity as he claims that "we are what we are devoted to, and what we are devoted to is what motivates our conduct." So having some spiritual purpose to aspire towards, should not be adopted reluctantly, but ought to be something we actually desire and are motivated by. In addition to being purposeful and having a 'why' to live by, spiritually authentic people will also be sensitive to the consequences of their actions and shall be open to constantly evaluating the consequences of living their commitments in light of their anticipated goodness.

Creating one's own meaning and purpose out of one's freedom can appear rather daunting, especially if a person is currently experiencing some sense of anxiety and feels unable to create an ultimate purpose and meaning to give sense to her existence. However, an important insight on this matter can be gleaned from Kierkegaard. He claims that human existence is a risky business because it must be lived forwards while knowing full-well that we are only able to understand meanings for our lives after certain events are completed, and we can reflect upon the consequences and impacts that they had for us. It is possible therefore, to understand that through such crises of hardships, our very identity of who we are can actually change for the better. We can actually become better people through exercising our spirituality in an authentic sense in the face of suffering and even unbearable situations, even although our physical situation and conditions remain unchanged. This transformation of our being is made possible through our spirituality. According to Kenyon (2000, p. 12), growing through such encounters with existential crises "is less a matter of having a new story and more a matter of being a new story". This indicates that there is the potential for 'good' to emerge from situations that are difficult to bear, whose physical conditions seem to be unchangeable. To demonstrate this, Frankl (1988, p. 57) recounts an incident where a young boy who grew up in a Nazi concentration camp, eventually confessed quite a number of years later that "I really understood the meaning of suffering. It can have a meaning if it changes you

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

for the better." This can be very empowering in situations where the individual feels quite powerless to change the actual oppressive physical conditions.

Kierkegaard argues that a certain degree of anxiety is inescapable because anxiety itself is intrinsic to authentic spirituality and freedom (Kierkegaard, 1980). Consequently, Anz (2000, pp. 47-8) suggests that Kierkegaard's notion of "[a]nxiety is our teacher" and it can even transform dying because it provides an opportunity for us to have access to relating in unique ways to it through Kierkegaard's subjective truth. Anz (ibid., p. 47) argues that "If we allow ourselves to be educated by anxiety, then we will come to understand that dying is not a process that happens to us from outside; rather it is our own-most being, which as a not-yet-grasped possibility 'concerns' us in anxiety."

Again, another example offered by Frankl is helpful on this point. He explains that there was a woman who was experiencing great anxiety as she was dying from an incurable disease. Through an encounter with a spiritual teacher – a Rabbi – she then was able to reflect on her situation and accept that while she couldn't change the physical condition that she was in, she could become stronger as a person through the experience and could choose a new way of relating to her inevitable death. This led her to state that "[p]erhaps my single act of immortality might be in the way I face this adversity. Even though my pain at times is unbearable – I have achieved an inner peace and contentment that I have never known before" (cited by Frankl, 1988, p. 50). Attaining this insight through her spirituality enabled her to die with dignity and to be remembered for her courage.

CONCLUSION

It has been argued here that spirituality can undoubtedly have a significant impact upon lives and especially so in times of anxiety and suffering. Particular attention has been given to existential spirituality which is ontological in nature. It refers to the way that individuals relate to their relationships and also to the meanings by which they give sense and purpose for their lives. It therefore clearly pertains to all people – both the religious and the non-religious. By being able to create a greater sense of meaningfulness and purpose for lives, engaging with one's existential spirituality is not just useful in order to survive crises but such an engagement can also provide people with the capacity to grow and become stronger as persons with virtuous character. This is made possible through grappling with the unique opportunities which are provided by confronting even apparently unbearable situations and crises.

The crises which are considered more likely to be unbearable have been identified as initially appearing to be nihilistic because people experience hardship and suffering without such difficulties having any sense or meaning in a grand scheme. On occasion the demise or de-legitimation of a doctrine, worldview or framework for guiding life, such as found typically in religions, customs and traditions, can provide a sense of nihilism. However, by drawing upon Kierkegaard's third existence sphere we can appreciate that one might be able to authentically choose, how one is going to relate to and give meaning to one's life. Nihilism is not to be feared, but existential crises can be accepted as providing opportunities to plumb the depths of one's being to engage with one's life world and to allow some contentment for living for a purpose to be experienced. Such a spiritual way of living can make possible some hope for good to emerge even if there appears to be little possibility of any good in the current physical environment.

Chapter 87
Prison Education in Nigeria

Gbolagade Adekanmbi
Independent Researcher, Botswana

Ukoha Ezikpe
Federal Prisons, Nigeria

ABSTRACT

This chapter explores prison education in Nigeria and examines its history, programs, methods, and challenges. It makes the point that prison services and education are not alien to the Nigerian and African settings. However, whereas traditional African prison education emphasizes restorative justice and learning, modern prison services tend to amplify punishment. While rehabilitation is one goal of incarceration, an all-inclusive prison education in Nigeria is still at a nascent stage. The chapter suggests ways of improving current practices and consolidating gains through specific interventions and researches.

INTRODUCTION

All over the world, there are rules which govern the day to day living in different contexts, which when defied, lead the state to respond in various ways, including sending erring individuals to some forms of confinement, and with varying degrees of punishment. The prison is one such confinement which takes away the occupant's rights and privileges. Prisons serve a major purpose of keeping society out of offenders and criminals' reach. While they predominantly serve a punitive role, prisons' reform and restorative roles are gradually becoming a major focus. One example of this restorative focus is education which identifies the needs of prisoners and helps the latter channel their energies toward a productive existence. Educational experiences of prisoners vary from one context to another, just as the penal systems vary across countries.

Writing on the expectation of the United Nations 2015-30 Agenda for Sustainable Development, Penal Reform International (2016) makes reference to the Doha Declaration which had requested a review of national penal policies with a view to ensuring that prisoners not only get fair trial and proper

treatment, but that their future life beyond the walls is adequately prepared for, through relevant and appropriate educational and rehabilitation programs. Against this background, the aim of this chapter is to examine the Nigerian prison context, and comment on its prison educational system. The chapter relies extensively on documentary evidence and literature review, and draws the strength of its argument from data garnered from these documents.

BACKGROUND

The background information discusses the state of prisons in Sub-Saharan Africa and in Nigeria.

A prison is a place where offenders are kept for the purpose of restraining their freedom in compliance with correctional law or until satisfactory rehabilitation has been achieved. Ayinde and Opeyemi (2011 p.9) indicate that it is as 'an institution which has been set aside by law for safe custody of people legally confined for anti-social behavior'. They further note that the ultimate goal is to train prisoners to become useful to the society, following incarceration, and to prevent a relapse into further crimes. This is the expectation of various human rights organizations and related bodies interested in the welfare of prisoners. Thus, most prison rehabilitation programs aim to prevent recidivism.

In its report on *Global Trends in Prison*, Penal Reform International (2015), citing the United Nations Office on Drugs and Crime (UNODC) and Jacobson, Heard and Fair (2017:10), has reported that while prison population rates worldwide have remained fairly stable in the last ten years, there has been a decline in all the sub-regions of Africa. Sarkin (2008) has noted that prisons in Africa do not generally meet minimum human rights expectations and that a reform of the prison system in Africa is needed. Among challenges listed by him are those related to lack of resources, inadequate prison governance, overcrowding, poor conditions, and the 'unfulfilled mandate of rehabilitation' (p.23). Perhaps the main challenge, historically understood is that Africa's prison system is 'a European import designed to isolate and punish potential opponents, exercise racial superiority and administer capital and corporate punishment' (p.24). He further notes that 'Africa's earliest experience with formal prisons was not with an eye toward the rehabilitation or re-integration of criminals' (p.24). Thus, in his view, prisons in Africa are for this reason unable to 'pursue rehabilitation' dreams. Digging further into prison practices, he notes that the average number of prisoners who are awaiting trial in Africa is put at 45 to every 100,000 against a global rate of 44 to 100,000. This waiting period is somehow high in West Africa and also Central Africa. Overcrowding is particularly common in such countries as Zambia, Rwanda, Kenya, Cameroun and Burundi (Sarkin, 2008). This problem is also found in Nigeria where the 'awaiting trial' category of prisoners is competing with actual convicts, making rehabilitation something of a nightmare.

A look at the incarceration rate of prisoners in Sub-Saharan Africa reveals that out of every 100,000 inhabitants, Seychelles, South Africa, Gabon and Botswana, Ethiopia, Kenya, Uganda and Cameroun had an incarceration rate of 799, 292, 193, 128, 121, 120 and 114 respectively (UNDP, 2016). Interestingly, Seychelles has the highest Human Development Index (HDI) ranking in sub-Saharan Africa (UNDP, 2016) and in the world. Somehow, Botswana, Gabon, and South Africa with relatively high HDI rankings in the region also had high incarceration rates. This could perhaps be an indication of the level of intolerance for crimes in the countries with high HDIs.

In spite of all these challenges, Africa is being gradually seen as a continent where various innovative instruments as well as institutions which aim to protect prisoner rights are being developed (Sarkin, 2008).

The Nigerian Situation

Nigeria is a West African country which attained political independence on 1st October, 1960. It occupies a land area of about 923, 768 square kilometers. It is an Anglophone country and it is the most populated Black state-nation in existence, with a population of about 182 million people (UNDP, 2015). It is projected that Nigeria's population would reach 392 million by 2050 (CIA, 2017). Nigeria's population growth rate is put at 2.6% against a global rate of 1.18 (UNDP, 2015). While life expectancy is put at 53.4%, the literacy rate is 59.6% and the unemployment rate among youth aged 15-24 years is 8.1% (CIA, 2017). A look at the demographic structure of the population shows that 42.7% are between 0-14years of age, 19.48% are 15-24 years old, 30-65% are within the 25-54-year bracket while 3.96% and 3.12% are between 55-64 years and 65 years and above respectively. Nigeria's HDI ranking is 152 against Seychelles', South Africa's and Botswana's 63, 119, and 108 respectively (UNDP, 2016).

The Nigerian Prison Service, through its website (www.prisons.gov.ng/history_of_nps) and various other publications, has provided some background on the emergence of the prison system in the country. The account captures the history and various phases of development and transition of the system, from its most indigenous forms, to the current prison system in Nigeria. Based on this, we learn that before the advent of colonialism, various forms of societal response existed in Nigeria, which provided avenues to address those who erred against societal norms and practices. As such, how a tribe responded to insubordination and wrong was determined solely by the tribal groupings in which such offences were committed. In this respect, Shajobi-Ibikunle (2014) provides an extensive discussion on the nature of imprisonment in various parts of Nigeria. Thus, in Northern Nigeria, the justice system was tailored after the Islamic system, through the use of discretionary punishment. The Yorubas on the other hand used 'tubus' (meaning: prison), with reports that various chiefs had their own 'tubus'. But the Yorubas also used the 'Ogboni House' to incarcerate serious offenders. Citing Bradbury (1957), Shajobi-Ibikunle (2014) notes that the Edos used the 'ewedo', for keeping prisoners in custody before their eventual sale into slavery or subsequent release. Other tribal groupings such as the Igbos and Tivs also had various incarceration strategies traditionally.

Writing on the goal of imprisonment in the African traditional system, Sarkin (2008) observes that 'incarceration as punishment' was not the way Africans dealt with offences committed but 'wrongdoing was rectified by restitution rather than punishment' (p.24). As such, 'the goal of incarceration remained to secure compensation for victims rather than to punish offenders' (p.24) and capital punishment or imprisonment only became used for repeat offenders as a last resort (Sarkin, 2008). These traditional arrangements would soon change with the advent of colonialism.

The emergence of a formally organized prisons system in Nigeria started as part of the day to day administration of Lagos by the British Colonial Government. With the establishment of colonial administration in Lagos in 1861, and the appointment of judges and other officials from 1862, the road became clear for a way of managing law and order, to a degree. Subsequently, the Broadway Street Prison was set up in 1872 and the prison accommodated 300 prisoners (Nigerian Prisons Service, 2017). Records also have it that by 1876 the first prison ordinance was promulgated, thus allowing the prison system to formally take off. As expected, the prison system was modeled on the British system, with the expectation that it would help in the running of the new colonial administration.

Early prison administration relied extensively on the existing police force, and by 1910, prisons had been set up in places like Calabar, Benin city, Degema, Sapele and Asaba, Ibadan, Jebba and Lokoja (Nigerian Prison Service, 2017). It should however, be noted that by 1901, the native court proclamation

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

had provided for native courts and native prisons which were supervised by the local police. Records have it that while a system of colonial prison was emerging, there was, according to the Nigerian Prison Service (2017), 'no systematic penal policy' in place. As such the prison duties were mostly carried out by the police and later, ex-servicemen. However, with the amalgamation of the Northern and Southern protectorates in 1914, there were published the prison ordinance of 1916 and later, the Prison Regulation of 1917. The aim was to establish a uniform standard prison administration. As later observed the policy was very 'limited in its application' (Nigerian Prison Service, 2017). But modern prison emerged out of the advent of the colonial system, with a specific goal of protecting the merchants in Lagos, the missionaries and of course the colonial masters and administrators.

Thus, the ordinances gave the Governor tremendous power for the establishment of regulation for prison administration in Nigeria. This then, prepared the ground for the appointment of officials responsible for the general management and superintendence of prisons system in Nigeria. These various reforms of the modern prison system did very little to impact positively both the prison and society as all the ills and decay which were associated with modern prison (with its emphasis on punishment) continued un-abated.

Meanwhile, the number of various types of prison grew albeit slowly over the years, whereas government and other specialized sections of society (the judiciary, political class, etc.) remained incapable to supply viable solutions to the challenges facing the prison system and by inference the challenges facing society. Table 1 displays the various types of prison and the number of each of the types of prison currently existing in Nigeria.

Table 1 shows that Adamawa, Borno, Kaduna, Bauchi, Taraba, Katsina, Jigawa, Kano and Kebbi states house the highest numbers of prisons in Nigeria. The numbers of prisons found in each of these states run into a double digit. Specifically, they house 17, 15, 15, 13, 12, 11, 11, 10 and 10 prisons respectively. While every state has at least one main prison or more, the use of satellite prisons appears to be more prevalent in the north. Also, only Kaduna and Plateau states have a camp each while Borstals (youth prisons) exist in Kaduna, Kwara and Ogun states. Two female prisons exist in Lagos and Ondo states.

Over time, the roles of the Nigerian prisons have multiplied to include isolation, punishment, deterrence and prisoner rehabilitation. However, in the view of Agbakwuru and Awujo (2016), Nigerian prisons equally seek to protect the prisoner, provide public safety and induce bail administration. Citing Evawona-Enuku (2006), the authors had submitted that the purpose was custodian, diagnosis, correction, training and rehabilitation. There were other landmarks in the history of prisons in Nigeria. There was a decree number 9 of 1972 which provided direction to the running and administration of prisons in Nigeria and this led to the setting up of specialized divisions. These were the Technical, Inspectorate and the Welfare divisions. These two divisions were later broken up into six directorates. There have been other major developments in terms of the growth and development of the prison system. In addition to the information displayed in Table 1, Table 2 provides a list showing prisoner numbers and incarceration rates over the years in Nigeria.

Table 2 indicates that between 1982 and 2015, the lowest population of prisoners was recorded in 2004 (38,999) and the highest population of prisoners was recorded in 2015 (68,259). Table 2. also shows that the lowest and highest incarceration rates were recorded in 2008 (27) and 1996 (64) respectively. With a population of over 180 million people, Nigeria managed to have a surprisingly low incarceration rate of 27 in 2008. A probable reason for the situation appears to be clearer when one considers the view of Ifediorah Orakwe, in an interview he granted Nigeria's Prime Times reporter Ben Ezeamalu on 12 March 2017. Orakwe had served the Nigerian Prisons Service for 34 years, and was the Controller of Prisons in charge of Planning, Research and Statistics for many years, before retiring. When Orakwe was asked

on what his thoughts were on Nigeria's prison population as a ratio of the total population, he responded by saying: 'It's very low, very low, and it is as a result of the criminal justice system that is not performing' (Orakwe, 2017). Then the former Controller added, hinting at a needed solution to the problem:

When you see a population of 180 million in this modern world with a prison population of 68,000, it would have indicated one thing; that this place is without a crime. I leave you to judge whether we are without a crime or not (Orakwe, 2017).

Against the background that Nigeria has often been cited for its corruption and related social challenges (Transparency International, 2014), Orakwe's submissions are worth noting. However, all is not gloom and doom in and around the Nigerian prisons. Despite the fact that the Nigerian Prison Services has lost many of its staff through encounters with Boko Haram insurgents (Jacobson, Heard and Fair, 2017), the Government of Nigeria *released 25000 prisoners, some of whom had been waiting trial for a decade* (Sarkin, 2008, p.28). Sarkin (2008) has also noted prison boards including human rights have been formed and a position of Chief Inspector of Prisons who reports to the President of the Republic has been established.

Prison Education Practices

Various instruments of the United Nations, especially many specific to UNESCO, highlight the importance of education and the need for it to be accessed by all, from the basic to tertiary levels. The provisions in Nigeria's National Policy on Education (Federal Republic of Nigeria, 2004) recognize the right of every Nigerian to education at all levels. Two goals of a just and egalitarian society (p.6) and one in which the country is seen as a land full of opportunities for all its citizens (p.6) are notable, and provide a platform

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

for prison education. Apart from education being for personal and national development, the philosophy guiding the National Policy on Education also makes room for the full integration of the individual into the community (p.7). It additionally provides for equal access to educational opportunities for all citizens of the country at the primary, secondary and tertiary levels, both inside and outside of the formal school system (p.7). In particular, Section 6(32) i, Section 7 and Section 9 of the Policy make provisions respectively for adult, vocational and distance education interventions in the lives of Nigerian citizens. While Section 10 of the policy deals with special education, these various provisions have served as a basis for prison education intervention in Nigeria. It should be noted that prison education and training is not mentioned at all in the National Policy of Education, a point we shall return to later in this chapter.

Following various developments over the years, the Nigerian Prisons Service currently has six major directorates that attend to the various aspects of operation of the Service. Of these, two directorates, the Health and Social Welfare, and the Inmates' Training and Productivity directorates jointly handle matters of prisoners' education, training and rehabilitation. While the former focuses on counseling inmates, helping organize group work, engaging in case work services, religious and recreational, adult and remedial education activities, the Inmates' Training and Productivity section focuses on the provision of skills for prisoners through the prison workshops, farms and garden centres. The goal is to adequately help the prisoners prepare for life after prison, and address various social and psychological issues which may hinder full rehabilitation. A major part of the prison mandate in Nigeria is to address the vocational skills of inmates as part of the rehabilitation efforts of preparing them for life after prison. Some of the vocations include tailoring, soap manufacture, carpentry, shoe making, shoe cobbling, electrical and electronic repairs and others. Upon discharge, the prison also buys equipment for those being released to prepare them for life after prison to enable them to do the work for which they have been trained.

A look at actual practices shows that prison education and training initiatives in Nigeria have been addressing the basic education needs (including primary and early secondary), secondary education, adult education and especially, the vocational needs of its inmates. Tertiary education needs are also being addressed to some degree. In the northern part of Nigeria, a lot of needs arise for many of the inmates at the basic education level while in the south, it has been reported that most prisoners have completed their primary education. It has also been reported that in Abakaliki, Enugu, Port Harcourt prisons, the state government has built secondary schools for inmates and ensured that teachers were allocated to such. This has resulted in inmates sitting for their West African School Certificate examinations (Nigerian Prison Services, 2017). Also, non-governmental organizations and churches have been involved in sponsoring inmates' education.

For those who teach the inmates, Government rules are followed to ensure that required qualifications are utilized, except in vocational skills areas where the knowledge of the trade is considered often sufficient to allow trainers to provide vocational training to prisoners. However, many studies have shown that the various workshops and equipment used for vocational training have become obsolete and require replacement. This situation was confirmed by the Controller-General of the Nigerian Prisons Service, Mr Jaafaru Ahmed in an interview he gave to one Ewache Ajefu (Ahmed, 2017) on March 6 2017. In excerpts from the interview, he indicated that 'we have issues with dilapidated infrastructures across the prisons in the country' (para.3), and commented that some of the prisons 'are over a hundred years old', with mud buildings and wooden doors. He commented on the state of the farm centres and industries, noting that they are in their current state, 'choked up'. However, he later highlighted plans aimed at rebuilding and establishing various initiatives aimed at improving the situation nationwide, which plans include focusing on maize production in Kujama, using the Lampushi Farm Centre for rice production

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and using the Ozalla Farm Centre for palm oil production (Ahmed, 2017). To enable this, he made reference to the Service's purchase of new farm machineries, facilitated by the 2016 budgetary provisions.

Various studies have been carried out on the Nigerian prison system, covering states such as Abia, Anambra, Edo, Oyo, Rivers, Imo, Delta, Kano, Lagos and the Federal Capital Territory. Through these studies, themes such as information needs, psychological well-being, adult and non-formal education, age levels and vocational interests, basic education and career placement, rehabilitation services, inmates' welfare, and issues of rehabilitation and re-integration of prisoners, have been covered. Through an examination of these and related international studies, a few observations have been made.

Omoni and Ijeh (2009) in their work on prison education in Edo State have highlighted the need for prison education, noting that it can serve as 'panacea for effective rehabilitation and integration into society' (p.28). In a related study by Asokhia and Agbonluae (2103) on Edo state, a list of the various types of educational intervention obtainable and tailored toward rehabilitation in prisons was provided. The groupings include educational programs, skills acquisition programs, counseling services, religious service, mid-range industrial production, recreational activities, agricultural skills and group work programs. Under educational programs are adult and remedial programs as well as educational development projects. Under skills acquisition are carpentry, tailoring, printing, building and masonry. Under counseling are educational/academic, vocational/career and socio-personal services. Under mid-range industrial production are furniture making, soap making, toilet roll making, manufacturing aluminum pots, metal work fabrications and shoe making. Table tennis, football, volley ball, badminton and indoor games fall within the recreational programs while farming methods and animal husbandry skills are provided as part of agricultural skills acquisition programs. A major challenge has been the inadequacy of modern equipment and materials needed to ensure full rehabilitation.

In a study carried out by Tenibiaje (2012) on literacy and communication tools for prison inmates in 21 prisons in 12 states of the federation, it was reported that over 90% of the prisoners surveyed said they had no access to literacy. 62% of the same group agreed to having vocational skills provision noting that this was insufficient. In short, the study confirms a high level of illiteracy in prisons and the inmates perception of what the literacy could do for them was positive, hinting that it could change their behavior and even serve as a deterrence to crime. In another study carried out by Tenibiaje (2010), it was noted that the increase in the number of prisoners appeared not to have been matched by a corresponding increase in infrastructural facilities, and that no serious effort had been made towards reformation of the prisoners. The writer then made a call for NGOs to come to the rescue. It should be observed that in the United States and a number of developed countries, prisons are actually managed on a private basis. This has been the subject of many papers, including the one on the 'Economics of Private Prisons' (Mumford, Schanzenbach and Nunn, 2016). According to the authors, the emergence of private prisons was as a result of increased incarceration, lengthened sentences, and consequent explosion of prison populations in the USA (Mumford, Schanzenbach and Nunn, 2016). While the morality of privatizing prisons is a subject for debate, such privatization measures, where used, are aimed at checking overcrowding and increasing effectiveness in prison management. It is however the view of Orakwe (2017) that the 'criminal justice system is government business' and anything to the contrary is 'an abdication of responsibility'. He cited the failures of private prison schemes in South Africa, Mozambique and the United Kingdom to back up his case.

Ewelum, Madu and Mbara (2015) have focused on the reformation of prison inmates in Anambra State. The writers report that 1198 prisoners wrote their WAEC GCE examinations in 2006 and this figure increased to 1306 in 2007, an increase of 8% over the previous year. As a result, it was reported

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

that WAEC then decided to create a centre for the yearly examinations in Ikoyi Prisons. While Lagos showed some progress, the study observed that Anambra State did not achieve the same success as there was no reformatory program in place. The authors have also suggested that moving forward would require specific actions. These include full funding of the Nigerian Prisons Service, recruitment of professionals, the provision of medical facilities, the training and re-training of staff and administrators and the recognition that visits by men of God to the prisons will help greatly in addressing the moral challenge prisoners faced (Ewelum, Madu & Mbara, 2015).

Emasealu and Popoola (2016) have examined the information needs of prisoners in Nigeria, focusing on two prisons, the Harbor Road Prison in Port Harcourt, and the Aba Prison in Abia state of Nigeria. They observed a dearth of information resources both for recreational and academic use, and that generally, in the view of the prisoners, there is a lot of frustration experienced in this regard. The same authors observe that 'majority of Nigeria's prisons Vocational Training Centres and Skills Acquisition Workshops are in a dilapidated state as training equipment and facilities are broken down, and in some cases non-existent (p.3). On a way out, the authors suggest the provision of adequate information resources as well as the provision of adequately trained staff to ensure good use of such (Emasealu & Popola, 2016).

In Agodi Prisons in Ibadan, Oyo State, prisoners have the opportunity of participating in, among others, religious education, and to this, they seem to be attracted (Ayinde & Opeyemi, 2011). In addition, prisoners are exposed to various forms of adult education intervention, including basic literacy, post literacy, vocational, technical education, and distance learning (Ayinde & Opeyemi, 2011). Concerning the impact of adult education on inmates in Agodi prison, the writers further observe that there is a positive impact as well as a great improvement as illiterates became literate although there was a general lack of inadequate access to computers. The authors note that the methods of instruction include simulation, discussion, problem solving, demonstration and apprenticeship. The study also revealed that learners wanted 'occasional tests and desire to sit for external examinations. The writers also report that funding of adult education in Agodi was inadequate as there were no monthly salaries for facilitators which, prompted the engagement of ad hoc facilitators in lieu of full time facilitators. The study then concludes with the 'need for adult and non-formal education programs in prison yards in order to uplift the welfare of inmates' (Ayinde & Opeyemi, 2011, p. 18).

Uche and Harris-Jenkins (1994) have examined the age, levels of education and training and the vocational interests of Nigerian prisoners, in their work, later published on-line in 2006. Although the research was carried out over two decades ago, the issues raised by the writers are still germane to the discussion around prisoner education in Nigeria. Using a careful determination of actual trades within the Nigerian economy, the authors surveyed the possible interests of prisoners and came up with a set of interesting findings. At the time the study was carried out, the only trades available to the prisoners were mainly in carpentry, joinery and also mat making. Uche and Harries-Jenkins (1994) observed that these were 'mainly arts and crafts which the prisoners rated least attractive' (p. 152).

The trades for which the prisoners were surveyed were grouped as follows:

Group 1: Arts and Crafts.
Group 2: Machine operation.
Group 3: Repair trades.
Group 4: Secretarial trades.
Group 5: Paper-print trades.
Group 6: Unrelated trades.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Uche and Harries-Jenkins (1994) report that the prisoners' preferences for one trade or the other was tied to age groups and levels of education and training before prison entry. For example, most prisoners with less than 20 years were more interested in machine operation, followed by repairs whereas those between 20-24 years had a preference for the repair trades. Those 25-29 years wanted machine operations trades, a similar feature to those in the 30-34-year bracket, and others over 39 years old. On the education and training experience of prisoners, the ones with no formal education rated Groups 2, 6, 3, 1, 4 and 5 in that order, whereas those with Diploma and equivalent qualifications ordered their choice for Groups 4, 5, 2, 3, 6 and 1.

Generally, Uche and Harries-Jenkins noted that the 'top ten trades' rated highly by the prisoners, from the highest to the lowest were:

- Vehicle driving,
- TV and video machine repair,
- Refrigerator and air condition repair,
- Furniture making,
- Motor mechanic,
- Tractor driving,
- Playing musical instruments,
- Electrical work,
- Wood carving, and
- Radio repair.

The trades most unattractive to them were shoe making, catering, photography, watch repairs, book binding, barbering, fiber and mat-making, sheet metal work, bicycle repairs and masonry.

From the studies analysed, the following preliminary observations are drawn on prison education in Nigeria:

- There is a gap in the present National Policy on Education in its inability to specifically make a provision for prisoner education, as well as provide a clear mandate on its expectations.
- In practice, prison education is currently generally aimed at basic and functional literacy provisions, vocational training and development, secondary schools level academic attainment, and to a low degree, tertiary level provisions.
- The context in which prison education is provided, as seen in the literature, with the overcrowding of prisons and inadequate infrastructure, would go against effective education and training of prisoners.
- There is a growing recognition by key prison management, past and present that Nigerian prisons require reform, and the rehabilitation programmes require improvement. However, there appears to be a growing will to make such improvements.
- A comprehensive needs analysis that captures the education and training needs of prisoners nationwide is lacking, and meeting of prisoner education needs appears to rely on established practices in various prisons.
- While some level of rehabilitation is expected, it is difficult, in the present circumstances, to expect full prisoner rehabilitation and prisoner and restoration due to dilapidated infrastructure and inadequate resources.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- There appears to be a general level of inadequacy regarding the existence of current learning materials, as attested to by studies relating to information provision through a viable library system.

In summary, Nigeria has over the years grown its prison system in terms of changes made to the goals, the structure, staffing, the training of its staff and the general response to the expectations from both local and international bodies. However, it appears the attempts to pursue prison education have not benefitted from serious and robust intervention in the lives of the prisoner. The educational and rehabilitative interventions have been affected by the challenges of overcrowding, the problem of having many awaiting trial along with convicted ones, the lack of sufficient facilities and workshops for prisoners and the inhuman conditions which the prisoners suffer. There is still a lot required to turn prisons into places where rehabilitation becomes a major goal. A full and comprehensive adult and lifelong educational system is required in the prison system.

RECOMMENDATIONS

A number of recommendations have been made by various scholars on Nigerian prisons and prisons elsewhere. Many of those recommendations are adopted in this chapter, in addition to other recommendations made by the authors.

- The continued promotion of religious activities and relevant vocational education programs and the employment of counseling psychologists and care givers as suggested by Agbakwuru and Awujo (2016) would ultimately improve prison services in Nigeria. It is to be added that efforts need to be made to renew and replace all obsolete equipment currently in use for the implementation of vocational programs.
- The specific establishment of a Directorate of Prison Education as recommended by Ayinde and Opeyemi (2011) is also a step in the right direction. However, instead of limiting itself to literacy and religious studies, this directorate should be proactive in exploring and promoting all new educational ventures that would continually increase opportunities for reintegration and thereby reduce recidivism among former prisoners.
- Government is not able to take up all the material and financial needs of Nigerian prisons. This is one area in which the Prison Education Trust (2017) suggestion comes in handy. That recommendation states that NGOs and related partners in the education and training of prisoners should be encouraged to complement and support government efforts in the domain of prison education.
- As recommended by Orakwe (2017), detainees awaiting trial should be kept in separate facilities from convicted prisoners in order to facilitate easy management of educational provision to prison inmates. The fate of convicted prisoners having been determined, it would be easier to plan an educational scheme for them on the basis of their prescribed length of stay and these convicted prisoners need both space and conducive environment devoid of avoidable distractions to carry out their learning.
- Nigerian prisons should be linked more solidly to the Nigerian National Open University (NOUN) for the purpose of making distance education more readily available to prison inmates. A related linkage with well-established adult education departments of a number of universities is also vital.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- The cause of prison education would further be helped if subsequent revised editions of the Nigerian Policy on Education specifically and consciously include the terminology prison education or correctional education.

SUGGESTIONS FOR FUTURE RESEARCH

Based on the discussions so far, there are five areas of recommendation for further research.

- The Planning, Research and Statistics Division of the Nigerian Prison Service needs to compile a compendium of all the researches carried out on Nigerian prisons to date. This will help to compile the major findings, determine gaps, and identify challenges of the prisons management system and the education and training of its inmates.
- There is need to determine how much of the research findings have been utilized and used as a basis for improved practice. A careful analysis of this, with timelines for implementation of various suggestions and recommendations will go a long way into improving education and training, as well as the needed rehabilitation of prisoners.
- The need exists for tracer and longitudinal studies to help track prisoners, including noting their stay in prison, the extent of their rehabilitation process and post prison life. Through such studies, necessary mitigation can be provided on how to bridge observable gaps in prison education practice and enhance rehabilitation plans.
- A comprehensive study on the education and training needs of Nigerian prisoners, following from Uche and Harries-Jenkins (1994) is desirable.
- Finally, there is need for studies on alternatives to prisons in Nigeria with a view to exploring innovative rehabilitative programs and procedures by Nigerian prison authorities.

KEY TERMS AND DEFINITIONS

Distance Education: A system of instruction in which the learner and tutor are separated in time and in space, and for which instruction is mediated through print and electronic media.

Literacy Education: A process of learning that enables an individual to acquire the basic skills of reading, writing and enumerating.

National Open University of Nigeria: A national university whose mandate is to facilitate learning at a distance for people living within and outside Nigeria.

Prison: A place where offenders are kept for the purpose of restraining their freedom in compliance with correctional law or until satisfactory rehabilitation has been achieved.

Prison Education Policy: A set of principles and guidelines on the purpose and plans of prison education and training, with identifiable rehabilitation outcomes.

Rehabilitation: A process of returning an offender to a state of mental wholeness that ultimately allows him or her to reintegrate into society.

Vocational Education Program: A program of learning that equips an individual with skills and knowledge capable of rendering him or her functional and useful within society.

This research was previously published in Strategic Learning Ideologies in Prison Education Programs edited by Idowu Biao; pages 197-214, copyright year 2018 by Information Science Reference (an imprint of IGI Global).

Chapter 88
Gratitude and Subjective Well-Being:
Cultivating Gratitude for a Harvest of Happiness

Philip Charles Watkins

Jhenifa P. Parker
Eastern Washington University, USA

ABSTRACT

In this chapter we review the good of gratitude and recommend various methods for cultivating this human strength. First, we show how gratitude is indeed good. We show how gratitude is important to flourishing and happiness. Gratitude is strongly correlated with various measures of well-being, and experimental studies suggest that gratitude actually causes increases in happiness. If gratitude is good, then it behooves us to investigate how the disposition of gratitude can be enhanced. We suggest that grateful responding can be enhanced by training in noticing the good in one's life, and by encouraging interpretations and appraisals that have been found to promote gratitude. We then present a discussion of unresolved issues in the science of gratitude. This is followed by a discussion of who might benefit most from gratitude. We conclude with a summary of the cultivation of gratitude. Research strongly supports the idea that the cultivation of gratitude should result in a harvest of happiness, but cultivating gratitude is not likely to be an easy process.

INTRODUCTION

True contentment is a thing as active as agriculture. – -G. K. Chesterton

The epigraph by Chesterton (1986) suggests that true happiness is not an easy pursuit. Like farming, the cultivation of happiness takes time, focus, and effort—one does not simply slide into happiness. We believe that Chesterton's agriculture metaphor is effective for understanding the development of subjective well-being (SWB), and in this chapter we will argue that the cultivation of gratitude may be one of the most effective ways of harvesting happiness. In order to accomplish this goal, we first will establish the foundations of a science of gratitude, discussing basic definitions and means of measuring gratitude. We then turn to the focus of the chapter: the good of gratitude, explaining how gratitude is important for human flourishing. If gratitude is important to well-being, it behooves us to understand how gratitude can be cultivated, and we spend considerable space exploring this issue. We will then discuss unresolved issues in gratitude research, and conclude the chapter by showing who benefits most from gratitude interventions. Our goals for this chapter are to describe gratitude, identify needed areas of gratitude research, and show how one may use gratitude to enhance their happiness.

Foundations for a Science of Gratitude

In order to investigate any phenomenon in science, we must first be able to define and measure it effectively. This is, of course, no less true of gratitude, and in this section, we discuss the definition and measurement of gratitude. As Rosenberg (1998) explained, any emotion may be described at one of three levels: state, mood, or trait. Thus, we will attempt to define gratitude at the level of emotional state (the relatively brief psychophysiological response to the appraisal of an event), mood state (the more enduring emotional state operating in the background of awareness), and affective trait (the enduring disposition for a particular emotion).

Defining and Measuring Gratitude as an Emotional State

Following Emmons (2004), we have defined gratitude as the emotion people experience "when they affirm that something good has happened to them, and they recognize that someone else is largely responsible for this benefit" (Watkins & McCurrach, in press). We take a broad approach to "something good", in that the benefit need not be constrained to a specific place and time, and the "good" of the event may be in the awareness that something bad did not happen (as in one's flight landing safely in the midst of a storm). Although some definitions of the grateful state simply require that the benefit be attributed to an external source, we submit that the external source is explicitly or implicitly perceived as an intentional agent. This personalization of the source of a benefit may not be conscious, and indeed many people are grateful for events that may not be attributed to human cause. Thus, the benefactor may be a human, but it might also be divine, and later we discuss new research related to gratitude to God.

It appears that the emotion of gratitude may be measured in a fairly straightforward manner. The Gratitude Adjectives Scale (GAS; McCullough, Emmons, & Tsang, 2002) simply asks participants to respond to three adjectives (grateful, thankful, and appreciative) on a Likert-type scale, and this appears to be a valid assessment of the grateful state. More recently, another state gratitude measure has emerged

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

out of the organizational psychology literature (the State Gratitude Scale; Spence, Brown, Keeping, & Lian, 2014), but it remains to be seen if this is an improvement on the GAS.

Defining and Measuring Gratitude as a Mood State

Of the three levels of analysis, the least amount of work has been devoted to studying gratitude as a mood state. By definition, gratitude as a mood state is more enduring than gratitude as an emotional state, and although it would be more in the background of awareness than the emotional state, potentially, it could have a greater impact on cognition and behavior (Rosenberg, 1998). Measuring gratitude as a mood state has proved to be difficult (but see McCullough, Tsang, & Emmons, 2004), but we believe that considerable progress could be made in the science of gratitude if we could effectively measure grateful moods.

Defining and Measuring Gratitude as an Affective Trait

Very simply, gratitude as an affective trait refers to the disposition for gratitude; people high in the trait of gratitude should have a low threshold for gratitude and thus should experience gratitude more frequently in a wider variety of circumstances. Considerable psychometric work has been devoted to trait measures of gratitude, and the two most utilized instruments are the GQ-6 (Gratitude Questionnaire-6; McCullough et al., 2002), and the GRAT (Gratitude, Resentment, and Appreciation test; Watkins, Woodward, Stone, & Kolts, 2003). Both of these measures have excellent psychometrics, but the GQ-6 has more research supporting its use. The GQ-6 is a more descriptive, theoretically neutral measure, whereas we attempted to develop the GRAT based on a theory of grateful people. We surmised that grateful individuals have an appreciation for the giftedness of all of life, and this higher order trait is based on three lower order traits: sense of abundance (or negatively, a lack of a sense of deprivation), appreciation for simple pleasures, and an appreciation of others. Some evidence supports this 3-factor structure of dispositional gratitude (Hammer & Brenner, 2017; Watkins et al., 2003), and we have now developed a shorter measure (GRAT-S; Thomas & Watkins, 2003), that may be more useful for researchers.

Recently measures have been developed to tap more specific facets of gratitude, and one of the more interesting instruments is the Multi-Component Gratitude Measure (Morgan, Gulliford, & Kristjánsson, 2017). This measure aims to assess four distinct components of gratitude: grateful emotions, one's conception of gratitude, one's attitude toward gratitude, and gratitude-related behaviors. This measure appears to be more comprehensive than other gratitude measures, has good empirical support for its use, and may be valuable to researchers for specific gratitude research questions. Whereas all of the gratitude questionnaires described above appear to be good instruments, one issue plagues them all: self-report bias. These instruments suffer from negative skew: people like to think of themselves in a positive fashion, and thus the distribution of the scores for these scales are clustered toward the higher end of these measures, and in some cases the modal score is very close to being the maximum score. Thus, gratitude measures that are not as prone to response bias are needed, and in this context we recommend the development of implicit measures of gratitude.

The Good of Gratitude

Is gratitude indeed good? Is gratitude an important facet of the good life? Most gratitude researchers began their investigation of gratitude with the idea that gratitude is important to happiness, and in a

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

nutshell, their hope was fulfilled. In our review we will follow the well-established approach in happiness research to date, taking the subjective well-being method to defining happiness. Although the hedonic definition of happiness certainly has its issues (see Watkins, 2016; Wong, 2012), most of the research on the good of gratitude has been conducted with hedonic happiness measures, and questions remain regarding whether eudaimonic happiness—particularly as it is currently measured—represents a distinct form of happiness (Biswas-Diener, Kashdan, & King, 2009; Disabato, Goodman, Kashdan, Short, & Jarden, 2016).[1] In this section we will briefly review correlational, prospective, and experimental evidence for the good of gratitude. First, multiple studies have found that gratitude is strongly correlated with a number of different happiness measures, and this relationship has been demonstrated in diverse populations (e.g., McCullough et al., 2002; Watkins et al., 2003; for a more comprehensive review, see Watkins, 2014). Moreover, recent research suggests that gratitude may be more strongly linked to eudaimonic than hedonic well-being (Watkins, McCurrach, & Timbrook, 2016). Demonstrating the importance of gratitude to happiness, Kaufman (2015) conducted a multiple regression analysis and found that of the 24 VIA strengths, only gratitude and love of learning uniquely predicted well-being after controlling for age and gender.

Although these results appear compelling, the cross-sectional correlational nature of these findings leaves open a number of alternative interpretations. Correlations between gratitude and happiness may be because gratitude enhances SWB, but it is just as likely that this result is the *consequence* of happiness causing gratitude, or third variables could explain this relationship. Prospective results offer stronger support for the theory that gratitude causes happiness because it removes the problem of temporal sequence and third variable issues such as operational confounds and self-report bias. In prospective studies researchers administer gratitude and happiness variables in at least two time points. Indeed, a number of studies have found that trait gratitude predicts subsequent increases in happiness, but perhaps the best of these studies was conducted by Wood, Maltby, Gillett, Linley, and Joseph (2008). They found that trait gratitude predicted increased happiness six months later. Interestingly, the reverse relationship was not found: initial happiness scores did not predict enhanced gratitude over time.

The most powerful evidence for a cause and effect relationship between gratitude and SWB would come from experimental designs. By our count, there are now over forty experimental studies that have found evidence for gratitude exercises enhancing happiness. Studies have demonstrated that gratitude exercises enhance emotional well-being both in one session interventions (e.g., Watkins et al., 2003, Studies 3 and 4), and long-term interventions have been shown to enhance SWB as well (e.g., Emmons & McCullough, 2003; Seligman, Steen, Park, & Peterson, 2005; Watkins, Uhder, & Pichinevskiy, 2015; for reviews, see Davis et al., 2016; Watkins, 2014; Wood, Froh, & Geraghty, 2010). Thus, considerable evidence now exists for the theory that gratitude actually causes increased happiness.

Later we will consider in more depth how gratitude enhances well-being, but here we would like to highlight one possible mechanism: the experience of joy. Although joy is perhaps the most frequently experienced positive emotion, very few studies have been devoted to the investigation of joy. Perhaps this is because joy has often been used as a synonym for happiness, and thus has been treated as a general non-specific positive affect. Recent results however, suggest that joy is a discrete positive emotion in its own right (Watkins, Emmons, Greaves, & Bell, 2017). Recent integrative formulations of joy have emphasized that the trait of gratitude may prepare one for experiences of joy (Volf, & Crisp, 2015). Indeed, in Studies 1 and 2 of Watkins et al. (2017), we found that our joy measures were strongly correlated with gratitude, and in Study 3 we showed that trait gratitude prospectively predicted increases in the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

frequency of experiences of joy over a two-month period. Thus, one way that gratitude might contribute to the good life is by increasing the experience of other positive emotions such as joy.

Questions About the Good of Gratitude

Although the evidence supporting the idea that gratitude is important to flourishing appears to be strong, recently several reviews have questioned the effectiveness of gratitude interventions (Wood et al., 2010; Davis et al., 2016). Wood et al. (2010) pointed out that the "control" conditions (counting one's hassles) used in early grateful recounting studies may have actually decreased SWB, thus not providing for an adequate comparison condition. Although this was an important observation, their recommendation that we use wait list groups for the control condition also presents problems, most importantly in not controlling for placebo effects and demand. Davis et al. (2016) reported that the effect size of gratitude treatments was comparable to placebo effects, with the apparent implication that gratitude interventions induce little more than placebo. There are a few issues we would like to highlight with this review. First, the authors admirably included non-published gratitude intervention studies, but because these studies have not gone through the peer review process, there are often significant problems with these studies that may have resulted in non-significant results. For example, many of these studies lack treatment integrity; there is no report for whether the participants actually did the gratitude intervention. In some cases, the researchers asked the students if they had completed the gratitude exercises, but when students are receiving credit for their participation, we cannot have confidence in their self-report. Furthermore, placebo effects with a clinical population are likely to be much larger than placebo effects in a normal population, so to compare positive psychology intervention effect sizes to clinical placebo effects may not be an appropriate comparison. Finally, in the two studies of which we are aware that used effective placebo conditions (Seligman et al., 2005; Watkins et al., 2015), both studies showed that the gratitude intervention enhanced SWB significantly more than the placebo treatment.

Nonetheless, we believe that these reviews provide for a more balanced view of gratitude. Indeed, in a recent gratitude intervention study in our lab involving over 120 participants, we found no evidence for grateful recounting enhancing well-being. Although this is the first of seven gratitude intervention studies conducted in our lab where we failed to find a significant impact on SWB, these results should help to curb our enthusiasm about gratitude. Although gratitude appears to be one of the most important factors contributing to happiness, it is not an simple magic formula for producing well-being. As we will emphasize later in the chapter, it is the grateful lifestyle that is likely to be important to happiness, and this cannot be simply produced by a few episodes of counting one's blessings. In short, research strongly supports the supposition that gratitude is indeed good, but gratitude may take considerable cultivation for it to produce a harvest of happiness.

How Does Gratitude Enhance Well-Being?

We believe that one of the most important research questions currently facing the science of gratitude is the question of the mechanisms of the gratitude and happiness relationship. In short, how does gratitude promote SWB? Unless we identify the psychological mechanisms that mediate the gratitude and happiness relationship, we cannot really understand how gratitude functions to enhance human flourishing. Unless we understand how gratitude supports human flourishing, we cannot improve our gratitude interventions and we cannot understand when and for whom these interventions will be most effective. First, it is

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

important to acknowledge that different gratitude interventions may impact happiness through different mechanisms, and below we will review the various gratitude interventions and offer putative mechanisms for each treatment. A recent theoretical review of gratitude suggested that gratitude enhances well-being through two distinct paths: cognitive/emotional and social (Alkozei, Smith, & Killgore, 2017), and we believe this is a helpful heuristic for understanding how gratitude impacts well-being.

Theories Explaining How Gratitude Enhances Well-Being

As we consider the mechanisms of gratitude, we first review two theories that have attempted to explain how gratitude enhances well-being: Fredrickson's Broaden and Build theory of positive emotions (Fredrickson, 2001, 2004), and our amplification theory of gratitude (Watkins, 2008, 2014; Watkins & Bell, 2017). Fredrickson's Broaden and Build theory of positive emotions has been influential in the development of positive psychology, and we find that her application of this approach to gratitude has also been very helpful (Fredrickson, 2004). In short, she argues that positive emotions broaden one's thought-action tendencies so as to enhance long-term survival; They enhance human flourishing by building one's physical, cognitive, and social resources. As a positive emotion, when one feels grateful this promotes creative cognition that results in a wide array of possible prosocial responses toward one's benefactor. For example, when one responds in gratitude for being invited over for a meal, one might consider a wide variety of responses, rather than the simple tit-for-tat response of hosting a meal for one's benefactor. In this way, gratitude should be important for building social resources, and Algoe's "find, remind, and bind" theory of gratitude nicely elaborates on the social benefits of gratitude (2012). In applying Fredrickson's theory to gratitude, Algoe argues that gratitude helps people *find* new relationships, *remind* of current important relationships, and *bind* developing relationships—all factors that are likely to be important to one's happiness. Indeed, Algoe has conducted a research program that has garnered considerable support for this theory (e.g., Algoe, Gable, & Maisel, 2010; Algoe, Haidt, & Gable, 2008; for a review, see Algoe, 2012). Thus, gratitude is likely to be important in relationships, and Fredrickson (2004) made the interesting suggestion that this should also apply to one's relationship to God—an idea we will explore later. In short, Fredrickson argues that gratitude should enhance well-being because in broadening one's thought-action tendencies, it enhances resources important to living well.

We have developed a complementary theory for how gratitude enhances well-being that relies on an amplification analogy (Watkins, 2008, 2014; Watkins & Bell, 2017). We proposed that gratitude enhances happiness because it amplifies the good in one's life. As an amplifier enhances the signal strength of sound, so too gratitude "turns up the volume" of what is good in one's life. In enhancing the awareness, importance, and meaning of the people and things that actually contribute to one's SWB, this should help one to more effectively pursue happiness. We proposed that gratitude not only enhances our awareness of the goodness of others, it also amplifies the good in ourselves, enhancing prosocial tendencies. As argued in a compelling review (Baumeister, Bratslavsky, Finkenauer, & Vohs, 2001), in terms of psychological processes, "Bad is stronger than good." We attend to and spend more energy on bad feedback than good, bad interactions than good, bad memories than good, bad experiences than good. Even though most all of us have many more good than bad experiences, it is easy to let the bad drown out the good in our life. Thus, we need some psychological process that amplifies the good in our life, and we propose that the reason gratitude appears to be so effective at enhancing happiness is because it amplifies the good in our life.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Gratitude Interventions and How They Work

As we hinted at earlier, we believe that one of the most important questions facing gratitude research is how gratitude interventions enhance SWB, and we now explore the different gratitude exercises and discuss possible mechanisms that help us understand how gratitude increases one's happiness. We explore three different forms of gratitude exercises: grateful recounting, grateful reflection, and grateful expression. We first discuss the treatment that has the large share of research support: *grateful recounting*. Also referred to as "counting blessings" and "gratitude lists", in this intervention participants simply list things that they're thankful for. This has been accomplished in several different formats, e.g., "list up to five things you're grateful for" (Emmons & McCullough, 2003), "recall three good things (things that have gone well) that have happened in the past 24 hours" (Seligman et al., 2005). We modified the Seligman et al. "3 blessings" technique to make it more specifically focused on gratitude by asking participants to write about how each thing made them feel grateful (Watkins et al., 2015). Studies have also varied as to how often this exercise is practiced, varying from once per week (e.g., Emmons & McCullough, 2003) to every day (e.g., Seligman et al., 2005; Watkins et al., 2015). This technique has been shown to enhance SWB in a number of studies across diverse populations (Watkins, 2014).

How does grateful recounting improve happiness? We believe that an exploration of the mechanisms of grateful recounting nicely explicates the importance of understanding the mechanisms of gratitude. Some have proposed that grateful recounting improves happiness simply because it boosts one's mood following the exercise. If this is the case, then we should do whatever we can to make the exercise more enjoyable. This might entail asking for shorter gratitude lists, doing it less frequently, or even asking people to simply imagine the benefit rather than writing about it (Lyubomirsky, Sousa, & Dickerhoof, 2006). Several studies have shown that gratitude mediates the effectiveness of grateful recounting (e.g., Watkins et al., 2015; Watkins, McCurrach, Schiebe, & Mathews, under review). But is it simply the case that grateful recounting enhances long-term SWB because it makes one momentarily feel better? Several pieces of evidence appear to speak against this theory. In both Seligman et al. (2005) and Watkins et al. (2015), SWB continued to climb well after the intervention phase, and this did not appear to be due to people continuing the gratitude practice. It is difficult to imagine that simply activating momentary positive emotions caused continued improvements in SWB well after the treatment phase. We also found that people did not benefit because they found the treatment enjoyable. Indeed, participant's report of how much they enjoyed the grateful recounting exercise at the end of the treatment phase showed a small negative correlation with gains in SWB ($r = -.18$). Thus, the limited evidence we have suggests that grateful recounting does not enhance happiness simply by momentarily making one feel better.

Another possibility is that grateful recounting improves SWB by training cognitive processes important to happiness (Watkins & McCurrach, 2016). We initially proposed that grateful recounting might encourage attending to benefits in one's life, and help one habitually interpret social benefits in a positive manner. We conducted a study to evaluate this theory (Watkins et al., under review), and although there was some evidence that grateful recounting helped train people to look for the good, there was no evidence that this gratitude exercise encouraged a positive interpretation bias. Even though we found that positive benefit interpretation bias was significantly correlated with trait gratitude, we found no support for the idea that grateful recounting trains individuals to interpret social benefits in a positive manner. In retrospect this makes some sense; it is unlikely that writing a few sentences about a benefit should change one's habitual and automatic pattern of interpretation bias. Nonetheless, the evidence did point to the importance of positive interpretation bias for dispositional gratitude, and we will return to this

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

issue when exploring how trait gratitude may be enhanced. We concluded that grateful recounting likely trains cognitive processes closely related to appreciation (see Watkins & Bell, 2017). Janoff-Bulman defines appreciation as noticing and increasing the psychological value of some benefit (Janoff-Bulman & Berger, 2000; Janoff-Bulman & Frantz, 1997). When a house appreciates, it increases in monetary value; when we appreciate something, its value is enhanced for us. We believe that investigations into the cognitive processes of appreciation are warranted, and this research should enrich our understanding of gratitude at several levels. In sum, we propose that one way that grateful recounting improves happiness is through training cognitive processes related to noticing and appreciating the good in one's life. If future research supports this theory, it would follow that grateful recounting exercises could be improved by having these exercises oriented more to noticing and appreciating the good in one's life. For example, if grateful recounting is successful in enhancing happiness by training cognitive processes, it would seem that this would call for daily exercises for a limited amount of time (one or two weeks), rather than more intermittent frequency of exercises (such as once per week). Indeed, we believe that one reason our most recent study failed to significantly improve SWB was because our participants completed the gratitude exercise every other day, rather than every day.

It is also possible that the mechanism for grateful recounting is some ideal combination of improving mood (particularly gratitude) and cognitive training. Although it does not appear that participants must enjoy the exercise in order for it to be successful (Watkins, Pereira, Davidson, & Davidson, 2013), if the exercise is too aversive, it's unlikely individuals will be motivated to continue the exercise or fully engage with the practice. Counting six blessing per day may more effectively train individuals to look for the good in their life, but it may prove to be so difficult and frustrating that it actually works against the effectiveness of the exercise. Whatever turns out to be the case, it is clear that grateful recounting is an effective exercise, but that there are many questions remaining regarding how it works and how to best use this treatment to enhance happiness.

Grateful reflection is an exercise that has been shown to improve one's emotional state (see Study 4 of Watkins et al., 2003). By grateful reflection we refer to simply contemplating benefits or benefactors in one's life. In our version of this exercise, we simply asked participants to first identify, and then to think about someone who was alive for whom they were grateful. This five-minute exercise resulted in reliable increases in positive affect, and we found that simply thinking about the person produced greater increases in positive affect than writing about them (cf. Lyubomirsky et al., 2006). We found that this exercise sometimes resulted in powerful emotional responses, but somewhat surprisingly, to our knowledge this approach has not yet been investigated in a more long-term treatment outcome design. Considerable thought would need to be put into a long-term treatment protocol for grateful reflection (e.g., it is unlikely that people could meaningfully engage in this exercise everyday), but we believe that grateful reflection has promise for enhancing long-term happiness. If this exercise is found to enhance SWB, what would be the likely mechanism? In this case, we speculate that it would be effective in so far as it enhances positive emotion. Again, we should be quick to note that these suppositions are highly speculative at this point, but the promising early results suggest that grateful reflection might be a fruitful target for gratitude researchers.

Because of the success of gratitude research, quite naturally there has been much popular interest in gratitude. However, one of the things that has concerned us about some popular approaches to gratitude is that they tend to emphasize the experience of gratitude at the expense of the expression of gratitude. Grateful recounting, for example, can be accomplished in a very private manner without having to interact with anyone. There does not seem to be much that emotion researchers agree about, but one

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

thing they do tend to agree on is that emotions adaptively activate thought-action readiness. Emotions prepare us to think and act in a way that enhances our ability to live well. Thus, when we experience gratitude, the function of that experience is to prepare us to express our gratitude, and an emphasis only on the experience of gratitude is only half of the gratitude story. Thus, recent research has investigated and indeed shown the adaptiveness of expressing our gratitude to others.

The classic gratitude expression exercise was first investigated by Seligman et al. (2005). In the so called "gratitude visit" individuals first choose someone who has made a significant contribution to their life that they feel they have not properly thanked. They spend some time writing a gratitude letter to this individual, and then express their gratitude by reading their letter to their benefactor in person. This treatment showed large increases in happiness—indeed, the gratitude visit showed the largest increases in happiness compared to all of the positive psychology interventions that they tested. Three months after the end of treatment however, the happiness of those in the gratitude visit condition had returned to baseline. Although this may seem to be a discouraging result, we should not expect one gratitude expression to result in permanent increases in happiness. More permanent increases of happiness should result from a more consistent practice of grateful expression, and this should serve to highlight our theme that the cultivation of gratitude will not produce a harvest of happiness unless a more effortful and consistent gratitude practice is established. What research has yet to determine however, is how frequently one should engage in this practice, and again, it is likely that this would be determined from identifying the mechanisms of grateful expression. We are aware of one study that asked participants to text "gratitude letters" to friends several times a day for several weeks. Not surprisingly, this treatment produced no impact on SWB. If one is writing gratitude letters to significant benefactors in their life, this cannot be an exercise that one could meaningfully practice several times a day. How often should one engage in the "gratitude visit" to see more permanent increases in happiness? Research has yet to answer this important question.

Sara Algoe's research program has most consistently investigated the impact of grateful expression, and in a nutshell, she has shown that expressing one's gratitude—particularly to significant others in one's life—is very beneficial to social well-being (Algoe et al., 2010; Algoe et al., 2008; Algoe, Kurtz, & Hilaire, 2016; for reviews, see Algoe, 2012; Watkins & Scheibe, in press). Thus, not only experiencing, but also expressing gratitude enhances human flourishing, and ultimately, experiencing without expressing gratitude is unlikely to be very fulfilling. How does expressing gratitude enhance well-being? Perhaps this is somewhat obvious, but we propose that the mechanism of grateful expression is through enhancing one's relationships, perhaps one of the more important foundations of SWB (Lakey, 2013). In sum, we have seen that various gratitude interventions have been shown to reliably improve one's happiness, and the important question we now face is: how do these exercises enhance SWB? It is likely that various interventions enhance happiness through different mechanisms, and research that identifies these mechanisms will go far to advance the science of gratitude.

Finally, we suggest that gratitude might enhance happiness by increasing meaning in one's life. Meaning is a strong predictor of SWB (Wong, 2012), and it is possible that when individuals process events with gratitude, this gives them the perspective that their life is indeed good, which enhances the meaning of the event and results in increased happiness. This might be a particularly powerful mechanism when individuals process painful events with gratitude, and is perhaps best illustrated through the gratitude intervention called grateful reappraisal (Watkins, Cruz, Holben, & Kolts, 2008). In the grateful reappraisal treatment participants first recall a painful memory that is still "open" for them—a memory they feel that they do not really understand and consistently intrudes into their consciousness. They then

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

write about this memory for three consecutive days for 20 minutes each day. While acknowledging that the event was truly bad, they are instructed to write about the consequences of this bad event that they might now feel grateful for. When comparing this treatment with emotional disclosure writing and a control condition that did not write about the memory, we found that at one-week follow-up those in the grateful reappraisal condition reported more closure and less negative affect associated with the memory, and the memory was also less intrusive (Watkins et al., 2008). We believe that one reason those in the grateful reappraisal condition showed more healing of the memory is that the event took on more meaning to them, and they were able to better fit the memory into a coherent life story. Unfortunately, we did not directly assess the meaning of the memory, but subsequent text analysis of the journaling samples showed that insight into the memory combined with positivity helped explain why this intervention was effective (Uhder, Kononchuk, Sparrow, & Watkins, 2010). In other words, if individuals were able to gain positive insight into why this unpleasant event happened, they were better able to bring the memory to closure. This seems to us to be closely related to enhancing the meaningfulness of the event. Thus, one way that gratitude enhances well-being might be through increasing the meaningfulness of events, and we look forward to future research that investigates this mechanism.

How Can Gratitude Be Enhanced?

We have seen that research strongly supports the supposition that gratitude is one of the more important strengths for human flourishing. If gratitude is indeed important to the good life, it is critical for us to learn how to enhance the grateful disposition. Not surprisingly, research supports the supposition that trait gratitude is more important to SWB and prosocial behavior than isolated grateful experiences (Ma, Tunney, & Ferguson, 2017). It is unlikely that a few gratitude exercises will result in stable increases in SWB; rather, developing the disposition of gratitude—a lifestyle of gratitude—is likely to be more important to consistent elevation in one's happiness. In this section we explore how the grateful disposition may be developed.

As we begin this discussion we should be quick to note that there is very little research on how the trait of gratitude may be developed. The major exception to this however, is the work of Jeff Froh and Giacomo Bono (2013; Froh et al., 2014). Working from Wood, Maltby, Stewart, Linley, and Joseph's (2008) social-cognitive theory of gratitude, they developed a gratitude training program for youth that encouraged students to increase appraisals to benefits that are known to enhance gratitude responses. In this program, children were taught to appreciate the benevolent intentions of their benefactors, the cost of benefits to their benefactors, and the value of the benefits. In two studies Froh et al. (2014) showed that their gratitude training program enhanced gratitude, positive affect, grateful appraisals, and grateful expressions, compared to an attention control group. Because recognizing benefits is of first importance for enhancing grateful responding, it would seem that the program could be improved by more explicitly attending to this aspect (see Watkins, 2014). If one of the primary mechanisms of grateful recounting is to enhance the awareness of benefits, then perhaps adding grateful recounting to Froh and colleagues' program might enhance its effectiveness. Although this program was developed for youth, it would seem to be easily adapted for adults. Investigating how the grateful disposition can be enhanced is an important issue to the science of gratitude, and we believe that the work of Froh and Bono offers an important framework for researchers to follow.

An essential aspect of Froh and associates' gratitude program emphasized recognizing the personal value of benefits. Indeed, in research evaluating the appraisals important to grateful responding, the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

value appraisal appears to be most important. For example, in a recent study where we investigated the appraisals important to gratitude for a significant raise (Watkins, Wood, & Shields, 2016), we found that the personal value of the raise was by far the most important predictor of gratitude for the raise. Moreover, the personal value of the raise mediated the contribution of the actual value of the raise to gratitude. Thus, programs that seek to enhance the grateful disposition should focus on how we can encourage individuals to appreciate the personal value of benefits.

Understanding and Enhancing Psychological Processes of Appreciation

We have seen that appreciating the value of benefits is perhaps one of the most important cognitive tendencies for grateful responding. This highlights the importance of appreciation as a cognitive process fundamental to gratitude. We believe that Janoff-Bulman and Berger have provided the most helpful definition of appreciation (2000; see also Janoff-Bulman, & Frantz, 1997), and we will work from their conceptualization. According to Janoff-Bulman and Berger, when we appreciate something there is an "Appraisal of increased value or worth … We increase its perceived value in our eyes" (p. 32). When our home appreciates, its monetary value increases. When we appreciate something, the psychological value of the object increases. Thus, we believe that in order for the science of gratitude to progress, it is important to investigate how we can enhance the appreciation of benefits.

How can we increase the appreciation of benefits? First, it is important that individuals are trained to recognize benefits in their lives. As Janoff-Bulman and Berger (2000) rightly note, to appreciate something you must first notice it. "Attending and noticing" are necessary but not sufficient for appreciation to take place. Why don't we notice things that are valuable to us? Janoff-Bulman and Berger explain that often we don't notice things because of automatic processes. Many benefits in one's life "fly under the radar" so to speak because they are so regular and we adapt to them (Frijda's law of habituation, 2007). So, the first step to enhancing the appreciation of benefits is simply to recognize the many benefits that come one's way. One way of doing this is to first recognize our tendency to let faithful benefits pass beneath our awareness, but once again a practice of grateful recounting might help establish the cognitive habit of noticing the good in one's life. Recently, researchers in the Cognitive Bias Modification paradigm have shown that people can be trained to attend to positive things, and we believe that this technique has great potential for helping people develop the cognitive habit for attending to benefits in their life (e.g., MacLeod & Clarke, 2015).

Once individuals have developed the skill of becoming more aware of the benefits in their lives, research suggests that training in several other cognitive processes may enhance the appreciation of benefits. First, when one understands the giftedness of benefits, this should enhance their appreciation. When one recognizes that they are not entitled to most benefits, and many good things are intentionally given for one's benefit, this should enhance appreciation for these "gifts." Here again is where gratitude to God may come into play; individuals who believe in a benevolent God may be more inclined to see the giftedness of the benefits where a human benefactor is not evident.

Research also suggests that when we understand how benefits specifically fulfill our needs, we're more likely to appreciate—and feel grateful—for these benefits. When we see that a gift was given specifically with us in mind—a gift given to fill my unique individual needs—we're more likely to feel grateful for that benefit. Sara Algoe's work perhaps best demonstrates this principle. In one study (Algoe et al., 2008), she used a gift giving tradition in sororities to investigate gratitude and how it impacted the development of relationships within the sorority. In this tradition, big sisters shower their new sis-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

ters with anonymous gifts until a "revelation" ceremony reveals to the younger members the identity of their anonymous benefactor. In this study she found that one of the best predictors of gratitude was the perception of "benefactor responsiveness": how much the beneficiary felt that her benefactor was responsive to her individual needs. Thus, if one can be encouraged to see how benefits fill one's unique needs, this should enhance appreciation for benefits.

Another way that the appreciation of benefits can be enhanced is suggested by the so-called "George Bailey effect" (Koo, Algoe, Wilson, & Gilbert, 2008). Named after the character played by Jimmy Stewart in the classic Christmas film *It's a Wonderful Life*, this refers to the finding that we tend to be more grateful for something when we imagine what it would be like if we didn't have that benefit, rather than imagining the presence of the benefit. For example, when one imagines what their life would be like without their spouse, they will probably feel more grateful for their spouse. We propose that when we imagine the absence of some benefit this makes us more aware of heretofore unseen aspects of the benefit, in essence providing for the appreciation of the benefit. In a related finding, we found that when students vividly imagined their own death, this enhanced their gratitude (Frias, Watkins, Webber, & Froh, 2011). Following Chesterton, we reasoned that when we recognize what might not be, this increases our appreciation and gratitude for what we have, in this case, life itself. Might a regular practice of imagining the absence of faithful benefits in our lives enhance the disposition of gratitude? This would appear to be an important research question.

Gratitude is a cognitively imbued emotion—there are a number of cognitive processes that appear to enhance the emotion of gratitude. Several interpretation biases appear to be important to grateful responding, such as perceiving the goodness of the gift, the goodness of the giver, and the gratuitousness of the gift (Watkins, 2014). Using a non-self-report measure of online interpretations of social benefit scenarios, we found that grateful people tend to have these interpretation biases (Watkins et al., under review). Thus, if these interpretation biases can be trained, the disposition for gratitude should be enhanced. Here again, we believe that gratitude researchers may find guidance from the Cognitive Bias Modification approach (Hertel & Mathews, 2011). It might seem difficult to change habitual interpretation biases, but in fact researchers have developed creative computer tasks that change interpretation biases that result in emotional consequences (e.g., Mackintosh, Mathews, Eckstein, & Hoppitt, 2013; Mathews & Mackintosh, 2000). Could such tasks be modified so as to develop interpretation biases that are known to be important to grateful responding? We believe that cognitive biases important to gratitude may be trained in such a way, and that this might be important to cultivating the disposition of gratitude.

A few other recent studies offer hints as to how gratitude might be cultivated. Gilovich has directed an impressive research program showing that experiential purchases (e.g., concert tickets, vacation) enhance happiness more than material purchases (e.g., jewelry, furniture). Across a number of studies, Gilovich and associates have shown that experiential purchases (buying something for the purpose of doing) produce more enjoyment and longer satisfaction than material purchases (buying something for the purpose of having, for a review, see Gilovich & Kumar, 2015). Recently, Walker, Kumar, and Gilovich (2016) have shown that one of the reasons that experiential purchases are advantageous to happiness is that they tend to produce more gratitude than material purchases. Across a series of studies, they showed that reflecting on experiential purchases produced more gratitude than thinking about material purchases. We believe that this is an important finding and it suggests an important route to cultivating gratitude: when we choose to allocate more of our resources to experiential than material purchases, this should foster more gratitude (and less materialism). Moreover, the authors suggested that this might result in a cycle of virtue where experiential purchases enhance gratitude that then increases the likelihood of

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

experiential purchases. This should in turn should produce more gratitude. Future research might show that this upward spiral is not only important to cultivating gratitude, but also important to producing a harvest of happiness.

Recently we investigated the relationship of joy to gratitude, and our findings might offer another suggestion as to how one might cultivate gratitude (Watkins et al., 2017). Across three studies we showed that joy and gratitude were strongly related, but Study 3 provided the strongest evidence for this relationship. In this study we used a prospective design where we administered measures of state and trait gratitude and joy at two time points about two months apart. As we predicted, we found that Time 1 trait gratitude predicted increased state joy two months later. Somewhat surprisingly however, we also found that Time 1 joy predicted increases in Time 2 state gratitude. Not only do these findings suggest another cycle of virtue between gratitude and joy, this also suggests that if one could foster joy in their life, this should cultivate gratitude. At this point, very little is known about joy and how it might be encouraged, but the fact that we found that joy is a discrete positive emotion (not simply a diffuse positive affect), suggests that it would be prudent for positive psychology researchers to engage in focused research on joy and how it might be fostered. In short, the cultivation of joy might be one important avenue for enhancing the disposition of gratitude.

Understanding the Thieves of Thankfulness

We have discussed several ways by which the trait of gratitude might be enhanced. As we discuss the cultivation of gratitude however, it is also important to explore what might inhibit gratitude. In short, what are the thieves of thankfulness? Recently we conducted a two-month prospective study where we investigated four putative inhibitors of gratitude (Solom, Watkins, McCurrach, & Scheibe, 2017). As predicted, we found that narcissism, cynicism, and envy predicted declines in the experience of gratitude over time (the evidence regarding trait indebtedness was mixed). Moreover, we found that narcissism and cynicism operated in a vicious cycle that might be particularly damaging to gratitude. These results suggest that there might be some important barriers to cultivating gratitude, and narcissism and cynicism might be two of the most important "thieves of thankfulness."

A subsequent study suggested that there might be good news for narcissists, however. Based on the Solom et al. (2017) results, we utilized a quasi-experimental design to build on these findings (Bell, 2017). Two days after assessing individuals' levels of narcissism and cynicism, individuals were randomly assigned to a gratitude, pride, or neutral emotion induction. We predicted that narcissism would inhibit gratitude responses. Although we did find that narcissism significantly moderated the response to the gratitude induction, results were the opposite of our predictions: narcissists actually showed a greater increase in gratitude in response to the gratitude induction. While this might have simply been narcissists trying to show that they were the most grateful person in the room, the negative correlations of narcissism with our gratitude measures in the first session speaks against this interpretation. We believe that one possibility is that it's not that narcissists can't experience gratitude, rather, most benefits that narcissists could feel grateful for fly under their radar. Because they believe that they are entitled to benefits and favors from others, more than likely most of the benefits that they could feel grateful for go unnoticed, and thus their experience of gratitude is decreased. The fact that narcissists can in fact experience gratitude when encouraged to reflect on benefits from others suggests that gratitude interventions might be particularly effective with narcissistic individuals (and this has the potential to decrease their narcissism as well).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In sum, although research on how the disposition of gratitude may be enhanced is sparse, there are a few promising directions that have been suggested by the extant literature. First, training in the appraisals that promote gratitude has the potential for cultivating trait gratitude. In particular, it appears that if individuals can be trained to appreciate the value of benefits, the disposition of gratitude should be enhanced. Of course, this requires that individuals are first able to recognize the benefits that come their way, and grateful recounting might be effective because this is exactly what it accomplishes. Understanding the giftedness of benefits, how benefits specifically fill our personal needs, the value of benefits we tend to take for granted, all appear to be viable means for enhancing the appreciation of benefits. We also suggested that adapting the computer tasks used in the cognitive bias modification paradigm for changing interpretation biases might be used for encouraging interpretation biases known to be important to grateful responses. Finally, recent research suggests that increasing experiential purchases and fostering joy might also be effective means for cultivating gratitude. Clearly, however, more research needs to investigate how the disposition of gratitude may be enhanced. Whatever future research ends up concluding on this matter, one thing seems clear: the cultivation of gratitude will not be easy. In order to become a more grateful person, considerable time and effort will need to be invested in this process. One does not simply slide into a grateful lifestyle or a grateful orientation toward life.

Unresolved Issues in the Science of Gratitude

Clearly, one of the most important issues facing the science of gratitude is the need for research that investigates how the trait of gratitude can be enhanced. Other unresolved issues are also important. Although we know fairly conclusively that gratitude exercises enhance well-being, we do not clearly understand how they encourage happiness. This is an important issue that needs to be pursued, but we would caution researchers that it is likely that different gratitude exercises involve various mechanisms. Grateful recounting may enhance happiness by encouraging the habit of noticing and appreciating benefits, but grateful expression may increase well-being by enhancing one's relationships. Clearly however, it will be important for gratitude researchers to continue to investigate the "how" of gratitude.

How Is Gratitude Related to Other Positive Emotions?

Another important unresolved issue that we see as critical to the science of gratitude revolves around the question of how gratitude is related to other emotions. First, we suggest that it is important to investigate how gratitude might activate other positive emotions. This is an important question because it relates to the "how" of gratitude. One way that gratitude might encourage human flourishing is by activating other positive emotions such as joy. We have seen that the disposition of gratitude encourages experiences of joy (Watkins et al., 2017), but how does it relate to other positive emotions? Does gratitude have any unique relationship with specific positive emotions (such as joy or awe), or does it simply activate the positive emotion system and enhance the likelihood of any positive emotion? Perhaps more importantly, how does gratitude relate to negative emotions? Although we began with the proposal that gratitude would decrease the experience of resentment and anger, subsequent research has shown that gratitude appears to have even stronger negative relationships with sadness and depression (Watkins, Grimm, Whitney, & Brown, 2005; Watkins et al., 2003). Although these were strong relationships, we still do not know whether gratitude actually inhibits negative emotions. The preliminary results however, offer

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the intriguing suggestion that gratitude exercises might be particularly effective in reducing depression, and we await more research that investigates this possibility.

How Is Gratitude Related to Spirituality?

Finally, we believe that there are many issues surrounding the spirituality of gratitude that call for further investigation. How is gratitude related to spirituality? A number of studies have shown that grateful people are more likely to be religious and spiritual (e.g., McCullough et al., 2002; Watkins et al., 2003), and both gratitude and spirituality are associated with greater happiness. Thus, one reason that spirituality enhances happiness might be in that religiosity encourages gratitude, and we have found some evidence to that effect (Budde, Kindred, Pray, & Watkins, 2016). The assumption by most researchers is that because religions promote the importance of gratitude, it is religion and spirituality that enhance gratitude. It is worth considering however, that the opposite might also be true: it is possible that gratitude enhances religiosity. Indeed, in G. K. Chesterton's account of his conversion, he seems to suggest that it was his gratitude that pushed him from atheism to theism (1986, p. 258):

Here I am only trying to describe the enormous emotions which cannot be described. And the strongest emotion was that life was as precious as it was puzzling. …The test of all happiness is gratitude; and I felt grateful, though I hardly knew to whom. Children are grateful when Santa Claus puts in their stockings gifts of toys or sweets. Could I not be grateful to Santa Claus when he put in my stockings the gift of two miraculous legs? We thank people for birthday presents of cigars and slippers. Can I thank no one for the birthday present of birth?

Thus, although it is likely that religiosity encourages gratitude, it is altogether possible that gratitude encourages spirituality as well, and we look forward to new research that investigates this aspect of the spirituality of gratitude.

Gratitude to God

As we discuss the spirituality of gratitude it is important not to neglect gratitude to God. Because most people believe in a benevolent deity, this would seem to be an important concern for gratitude researchers, but unfortunately only a handful of studies have investigated this issue (but see the work of Neal Krause, e.g., Krause, 2006; Krause, Emmons, Ironson, & Hill, 2017; Krause & Hayward, 2015). Studies have shown that gratitude to God might be an important buffer to the effects of stress on health (Krause, 2006) and it also might be important to SWB (Rosmarin, Pirutinsky, Cohen, Galler, & Krumrei, 2011). We have developed a reliable measure of gratitude to God and have found that it is indeed associated with subjective well-being, but gratitude to God appears to have much stronger relationships with spiritual well-being (Scheibe, Watkins, & Uhder, 2017). Indeed, in several prospective studies we found that gratitude toward God predicted increases in spiritual well-being over time (Scheibe et al., 2017). This raises the intriguing possibility that a grateful recounting exercise that is adapted to focus on gratitude to God might improve the spiritual well-being of religious people. Why does gratitude to God appear to be so important to spiritual well-being? For us, this is an important issue for the spirituality of gratitude, and we hope that more investigators will pursue this question.

Who Benefits From Gratitude?

As we conclude this chapter we would like to consider the important question of who might benefit most from gratitude. As others have emphasized, personal fit is probably going to be an important issue in positive psychology interventions. More than likely, different positive psychology interventions benefit different people. So who stands most to gain from gratitude exercises? Here we will consider some of the moderators of gratitude interventions. Gender differences in gratitude have become an important issue in gratitude research. Because women are generally higher in trait gratitude than men, and because women seem to value gratitude more and are less likely to see the costs of gratitude than men (e.g., Kashdan, Mishra, Breen, & Froh, 2009), some have suggested that gratitude exercises would provide a better fit for women than men. We also expected that this might be the case, and although we found that gender did moderate the impact of grateful recounting, our results were actually the opposite of what we expected (Watkins et al., 2015): men actually gained more from grateful recounting than women. Although women also gained from counting their blessings, there was a greater impact on the well-being of men. Thus, if anything, it appears that men might have more to gain from gratitude interventions.

Because women tend to be more grateful than men, this raises the interesting question of how trait gratitude might moderate the impact of gratitude interventions. We thought that because grateful people would more easily and willingly recall blessings and process them gratefully, those high in trait gratitude would gain more from grateful recounting. Once again however, contrary to our predictions it was those who were low in trait gratitude that gained most from grateful recounting (Watkins et al., 2015), and others have demonstrated this effect as well (e.g., Rash, Matsuba, & Prkachin, 2011). Similarly, although narcissism appears to inhibit gratitude, our findings from the gratitude induction quasi-experiment described earlier (Bell, 2017) suggest that those high in narcissism might actually gain more from gratitude interventions. In short, the proud may have more to gain from gratitude than the humble.

Some positive psychology scholars have assumed that people need to enjoy positive psychology interventions for them to be successful; the more you enjoy an exercise, the more beneficial it's likely to be. If you don't enjoy a positive activity, then "it probably isn't for you," and you'd best try another activity to improve your happiness. Again however, the picture that emerges is that at minimum, enjoyment of grateful recounting exercises is not required for it to be effective. Indeed, in our study, although women enjoyed the exercise more than men and grateful people liked counting their blessings more than their less grateful counterparts, men and those less grateful gained more from the exercise in terms of their happiness (Watkins et al., 2015). At the end of the one-week daily recounting phase, we asked our participants how much they enjoyed the exercise. Contrary to our expectations, people's reports of how much they enjoyed the exercise was actually negatively correlated with their improvement of happiness at the five-week follow-up assessment ($r = -.18$). Although this correlation was small and only marginally significant, it is in direct opposition to the idea that you need to enjoy a positive exercise in order for it to be effective for you.

Who benefits most from gratitude interventions? Although there is much more research that needs to be done on this question, a fairly clear picture is emerging: men benefit more than women and those less grateful benefit more than grateful individuals. Moreover, it does not appear that one need enjoy the exercise in order for it to be effective. Indeed, some minor frustration with the exercise may suggest that it is what is needed for the person's happiness. So how can we characterize these results? In a nutshell, it appears that those who need gratitude most, benefit most from gratitude interventions. Women probably do not gain as much from the exercises as men because they're already noticing and appreciating the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

good that others provide to them. Similarly, grateful people already have the habit of attending to and appreciating blessings in their life, thus, grateful people do not gain as much from gratitude interventions as less grateful people. Although this conclusion seems to be almost too obvious, it was not initially apparent to us, and it seems to be opposed to what some positive psychologists are suggesting. If a "good personal fit" of positive activities means that we have to enjoy the activity, this might be opposed to what exercises should be recommended to improve our happiness. If, on the other hand, by "personal fit" we mean the exercise that is most likely to bring the person long-term happiness, the exercise might prove to be somewhat difficult because it is exactly the exercise that they need to overcome the obstacles that are thwarting their happiness. Once again, through this discussion we see that the road to happiness through gratitude may not be an easy journey full of pleasure. Cultivating gratitude—particularly if that is what we most need—is likely to be a difficult venture.

CONCLUSION

In summary, we have seen that gratitude is indeed good: Gratitude is strongly correlated with well-being and a number of experimental studies have shown that gratitude exercises enhance happiness. Because gratitude appears to be valuable to the good life, it is important that we continue to investigate how gratitude might be cultivated. Research strongly supports the suggestion that cultivating gratitude should result in a harvest of happiness. Who benefits most from gratitude? It appears that those who need gratitude most are most likely to benefit from gratitude interventions. In terms of improving their happiness, men benefit more than women and those less grateful benefit more than the grateful. And in this observation comes the rub: If gratitude is lacking in your life, research suggests that it is probably what you should pursue to improve your well-being, but research also suggests that this will not be an easy pursuit. Of course, this is true in other aspects of life as well. People who most need physical exercise are those who are out of shape—those who might be somewhat overweight. Exercise is going to be more difficult for those of us who are overweight—but it's exactly the thing we need to pursue to improve our life. It would clearly be wrongheaded advice if we were to recommend to an overweight person, "If exercise doesn't feel good for you, then it probably isn't for you." If a lack of gratitude is the thing that is the obstacle preventing us from lasting happiness, it is probably going to be a difficult thing to gain. To use Chesterton's analogy from the epigraph, just as it is difficult to farm in a way that produces a fruitful harvest, so too gratitude will require significant time and effort to produce a harvest of lasting contentment. And here, we think it helpful to provide the full context of Chesterton's quote from the epigraph:

True contentment is a thing as active as agriculture. It is the power of getting out of any situation all that there is in it. It is arduous and it is rare. The absence of this digestive talent is what makes so cold and incredible the tales of so many people who say they have been "through" things; when it is evident that they have come out on the other side quite unchanged. A man might have gone "through" a plum pudding as a bullet might go through a plum pudding; it depends on the size of the pudding—and the man. But the awful and sacred question is "Has the pudding been through him?" Has he tasted, appreciated, and absorbed the solid pudding, with its three dimensions and its three thousand tastes and smells? Can he offer himself to the eyes of men as one who has cubically conquered and contained a pudding? (Chesterton, 1986)

You probably aren't going to become permanently happier from one gratitude visit, one grateful reflection, or one week of counting your blessings. In order for gratitude to produce lasting contentment, it must become a lifestyle, a life orientation.

And now we conclude with some bad news and some good news. The bad news is that the pursuit of gratitude will not be easy. It will require time, intentional effort, and perhaps even some frustration. You will not simply slide into a grateful attitude toward life. Because psychologically "Bad is stronger than good" (Baumeister et al., 2001), it will be difficult to develop a practice of intentionally and mindfully appreciating the good in your life. But there is good news too: Gratitude is a well-tested path to well-being, and the research strongly suggests that although it may be a difficult journey, it is a road that is well worth traveling. If it is a lack of gratitude that is blocking your pursuit of happiness, cultivating gratitude is not likely to be easy, but it is likely to produce a harvest of happiness. As St. John of the Cross wisely observed (cited in Foster, 1992, p. 17): "To come to the pleasure you have not you must go by a way in which you enjoy not."

ENDNOTE

[1] We believe that the eudaimonic approach to happiness offers significant insights to positive psychology, such as the importance of meaning to happiness (e.g., Wong, 2012). One of the significant issues with this approach however, is that it often conflates the independent with the dependent variables in happiness research (see Watkins, 2016). For example, we believe that having a meaningful life (the independent variable) contributes in an important way to happiness (the dependent variable). However, when meaning is incorporated into the very definition of happiness, this creates significant conceptual and empirical issues.

This research was previously published in Scientific Concepts Behind Happiness, Kindness, and Empathy in Contemporary Society edited by Nava R. Silton; pages 20-42, copyright year 2019 by Information Science Reference (an imprint of IGI Global).

Chapter 89
Attitude towards People with Intellectual Disabilities (PWID)

Mythili Hazarika
Gauhati Medical College Hospital, India

Sandamita Choudhury
Gujarat Forensic Sciences University, India

ABSTRACT

History on PWID indicates influence of various psycho-social, biological, religious and educational factors for the existence of stereotypical attitudes towards PWID. Across the world until the mid-80's they were a marginalized group of people who were discriminated from others' who considered themselves as "normal". But since the early part of the 21st century significant efforts have been reported across countries in integrating and mainstreaming the PWID in the community at large. To attain this challenging milestone attitude plays a very significant role. Families of PWID undergo high levels of stress and emotional reactions resulting from daily care demands, emotional distress, interpersonal difficulties (family discord), financial hardships as well as social isolation which call for intervention not just for the intellectually disabled but also with the family members. Positive attitude among the health and all professionals with humane qualities such as empathy, genuineness, unconditional positive regard towards the PWID leads to positive expectation and better outcome. Interestingly in developing countries stereotypes are based on ignorance and families find it extremely difficult to disclose the presence of Intellectual Disability (ID) as it is considered to be a 'loss of face'' and is believed to tarnish the family reputation. Hence, families often adopt strategies to hide the existence of a disability, which in turn delays the treatment, and rehabilitation of PWID. Along with parents and family members other stakeholders like siblings and relatives, teachers, educationists, health professionals and general public's attitudes towards them are highly influential factors for their rehabilitation and integration in the mainstream community. Hence, this chapter is an attempt to focus on the importance of attitude that determines the course towards acceptance of PWID. The authors' focus is on the various perceptions towards intellectual disability and the implications of the favorable and unfavorable attitudes towards PWID since

the Egyptian era in developed and developing nations. Further, the recommendations provided are for the policymakers and stakeholders to design intervention programs to alter people's attitude towards acceptance and compassion towards PWID. This is believed to help in their rehabilitation, and integration into the society at all levels and thereby reduces the prejudice and discrimination towards them.

BACKGROUND

Intellectual disability (ID) is one of the most common disabilities across countries. Braddock and Parish (2002) have defined disability as socially determined interpretation of impairment by others. Therefore the whole concept of ID or how to define or categorize people with ID (PWID) has been always affected by how people in different places, cultures at different periods of time have defined it and perceived it. Rehabilitation of PWID has largely been affected by changing concepts and attitudes. Attitudes are learned pre-dispositions to respond in a favorable or unfavorable manner to a particular person, behavior, event, thing, belief or situation in a direct or discreet manner. According to Charles Osgood, an attitude has three dimensions i.e. Moral (good or bad), potency (strong or weak) and activity (active or passive). These dimensions classify people's attitude towards ID. As relationships with significant others as well society are important determinants for the quality of life of individuals with ID our chapter is focused on attitudes towards them and their various dimensions of life which are significant factors for their adaptation and assimilation in the society.

The authors would focus on attitude towards persons with intellectual disabilities (PWID) worldwide and the review of literature will give an overall insight about this population. The terms mental retardation (MR) and intellectually disabled (ID) is used interchangeably in this chapter.

ATTITUDES TOWARDS PEOPLE WITH INTELLECTUAL DISABILITIES (PWID) IN THE EARLIEST CENTURIES

Egyptian Papyrus of Thebes in 1552 B.C. (Harris 2006) was the first to refer to ID. Attitudes in the earlier times were delimited by religious and spiritual explanations. The ancient Greeks and Romans before 18th century believed children with ID are the cause of curse by god who were allowed to die while some societies in Rome did allow some form of protection to children with ID who were born to the wealthy, by allowing them with right to property and also to have guardians (Beirne-Smith et al. 2006; Harris, 2006). Traditionally, in Indian context mental retardation (MR) or intellectual disabilities (ID) has been referred by Charaka and Susruta in Ayurvedaas as 'manasmandyam' (weak head) caused by genetic, nutritional and environmental factors and is influenced by 'Graha' (planetary influences). In the current scenario the past, present and future are attributed to supernatural powers and there is a strong belief in 'karma'. Hence, disabilities have been considered punishments for sins committed in a previous life by the individual or their family members (Schlossar, 2004). Interestingly before the 18th century, societies differed in conceptualization of intellectual disability. Those with mild ID who were socially competent never received special identification or treatment, and those with more severe conditions received protective care from their families or in monasteries while few societies believed people with more severe ID to be capable of receiving divine revelation (Beirne-Smith et al. 2006; Harris 2006).

Jean-Marc Itard in 1799, first developed systematic and documented program of intervention for ID in France. Seguin elaborated on Itard's methods and formulated a systematic program to educate the "feebleminded" at Salpetrière Hospital in Paris. Henceforth, the stakeholders in Europe worked towards educating PWID which received recognition and subsequently began to spread to other developed and developing countries. In the U.S., and other developed countries there was an initial optimism about rehabilitating, training, and reintegrating PWID into "normal" life. Positive attitudes prevailed and reformers like Dorthea Dix advocated improving treatment of people who were living in asylums, poorhouses, country homes, and almshouses in the mid-1800s. Samuel Howe in 1848 established the first public training facility in the U.S. for PWID and in the same year Hervey Wilbur established in his home the first private institution for PWID (Beirne-Smith et al. 2006) at Massachusetts. There were favorable attitudes during those times towards the PWID as mainstream education was the goal.

However, in the latter half of the 1800s US population became more urbanized and the early optimism about the curability of ID waned. It became highly apparent that people with more severe ID were less able than those without ID to adapt to a developing nation where employment depended on intellectual ability and less so on physical ability in most cases. Furthermore, the ideal of training, rehabilitation, and reintegration of PWID proved to be an illusion as with time it was noticed that people although learned skills but failed to attain "normalcy" as they couldn't pace themselves with the progressive society. Hence, eventually residential institutions were established after the systematic programs were not found to be quite effective. People's attitude towards ID became less favorable and they were called "feebleminded," and were blamed for the poverty, illness, and crime that accompanied urbanization creating a fearful and hostile attitude toward PWID. In those days again the anti-social behaviors and ID, as well as mental or psychiatric illness, tuberculosis, prostitution, and poverty were thought to be heritable. Negative attitudes prevailed to such an extent that great attention was focused on eliminating the possibilities for PWID and others to reproduce so as to control the undesirable heritable traits from passing on to their offspring (Beirne-Smith et al. 2006; Radford 1991; Reilly 1987).

The Eugenics movement started with the publication of the first book on *Hereditary Genius* in 1869 by Sir Francis Galton, a cousin of Charles Darwin, which established a theoretical basis for the heritability of ID (Beirne-Smith et al. 2006). The eugenists rightly concluded that only nature (not characteristics of nurture, like socio-economic status, education, nutrition) determined personality and intellect, so breeding had to be brought under supervision to prevent the degeneration of the human species (Radford 1991; Bachrach 2004). This social myth of heritability and ID was reinforced by the publication of two popular books in 1877 namely The Jukes: A Study in Crime, Pauperism, Disease and Heredity by Richard Louis Dugdale, and The Kallikak Family: A Study in the Heredity of Feeble-Mindedness in 1912 by Henry Goddard. Moreover, Goddard published from his research that many of the immigrants to the US were "*feebleminded*" (Beirne-Smith et al. 2006). Heritability factors in ID dominated the attitude towards them which was not favorable. This led to the belief among the supporters of the eugenics movement that medicine interfered with Darwinian natural selection and kept the weak alive and that people with MR and mental illnesses reproduced faster than intellectual and productive people (Bachrach, 2004).

ATTITUDES TOWARDS PEOPLE WITH INTELLECTUAL DISABILITIES (PWID) IN THE 20TH CENTURY

Following the Eugenics movement of the 19th century, US states like Indiana, Virginia, North Carolina, Georgia, and California enacted sterilization laws (Sofair and Kaldijian 2000). Indiana passed the nation's first sterilization law in 1907 for the "imbeciles" and they have been diagnosed as "unimproveable" (Reilly 1987). Between 1907-1944, more than 42,000 people in US and 22,000 people in 27 states were sterilized in an attempt to eliminate the presumed genetic sources of diseases including ID (Radford, 1991; Sofair and Kaldijian, 2000).In the UK, the Mental Deficiency Act of 1913 emphasized segregation of males and females over sterilization which was active till 1959. Unlike in the U.S., British practitioners preferred to implement educational programs for PWID and used a social definition of mental deficiency as "those individuals who could not fit in to the modern world" (Radford 1991; Reilly 1987). In Germany, compulsory sterilization law was passed during 1933, under which people with "congenital feeblemindedness" which was a very subjective diagnosis could be forcibly sterilized (Bachrach, 2004; Sofair & Kaldijian, 2000).

Further, the most common method of controlling reproduction by PWID was segregation in the U.S., Canada, and Great Britain, through limitations on marriage, immigration controls, sterilization, and, most importantly, custodial institutionalization (Joseph 2005; Radford 1991; Reilly 1987). The reason for the segregation was to protect the so-called "normal" people from the PWID and also to control their reproductive lives. "Custodial institutions were the means by which the feebleminded were removed from a society in which they were perceived as a genetic threat and they were placed in isolated environments, completely segregated by gender" (Radford 1991). Within institutions "feebleminded" men and women were kept strictly apart from each other and lot of them was forcefully sterilized. Medical literature supported sterilization in the 20th century. Unfortunately "euthanasia" of "idiot" children was advocated by some professionals in the US so as to avoid passing on their genes and thereby to reduce the burden on the society (Joseph 2005; Reilly 1987).

ATTITUDES TOWARDS PEOPLE WITH INTELLECTUAL DISABILITIES (PWID) IN THE PRESENT CONTEXT

The 20th century marks the beginning for the search of the cause and cure of PWID in a scientific manner for which the psychological tests were developed leading to early identification of PWID. Tests identified mild intellectually disabled who were otherwise not been given a diagnosis (Beirne-Smith et al., 2006). Although there has been a positive transformation with the development of qualitative methods in social sciences in Britain and in the U.S. but institutionalizing them still continued (Radford, 1991).

Favorable attitudes towards PWID prevailed slowly when heritability as the only cause was refuted in 1928 by Penrose and contemporaries, when they revealed multiple etiologies for ID (Radford 1991). Various non-genetic factors such as metabolic disturbances or PKU (phenylketonuria) and environmental factors, such as infection, trauma, and endocrine disturbance, were recognized as having an association with ID. Though there were mixed reports about genes vs environment on the development of feeblemindedness still social policies reflected deterministic and largely inaccurate hereditarianism views of mental deficiency until after World War II (Radford 1991). Eugenic sterilization in Germany and in the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

U.S. was opposed by the Catholic churches and the Holocaust discredited eugenics practices (Bachrach 2004; Sofair and Kaldijian 2000; Reilly 1987).

By the early 1960s most state sterilization programs had ended in the developed countries (Reilly 1987).Legal rights, protection and services for PWID revolutionized the attitudes towards them in developed as well as in underdeveloped countries. In 1911, first time New Jersey mandated that education be provided for students with intellectual disabilities (Beirne-Smith et al., 2006).

With the formation of The National Association of Parents and Friends of Mentally Retarded Children in 1950 in US there was the transformation towards tolerance and compassion among the children and families with ID, along with the availability of financial support and formulation of new legislations and community services.

The world has undergone tremendous alterations in attitudes towards PWID in the last four decades with an increased focus on early intervention, community-based rehabilitation (CBR), definition and diagnosis, human rights, and legislation, with particular stress on deinstitutionalization leading to better quality of life and improved choice making (Beadle-Brown et al. 2007). The institutionalized ID population has declined at a significant rate in England, Canada, and Norway, and there is no report of anyone living in an institution in Sweden. Scandinavia was the first country to introduce the concept of "normalization" in 1950s, and suggested access to supports to ID so that they can experience patterns and conditions of everyday life that are as similar to those in the mainstream society (Beirne-Smith et al. 2006). In the US there has been an increase in the trend for individuals with ID to live in inclusive community settings, with appropriate supports to facilitate their experience. Since the 1980s the number of children diagnosed as intellectually disabled has dropped, partly as a result of increased early intervention, and also because of a more cautious professional outlook on definition and diagnosis (Beirne-Smith et al. 2006). The rate of institutions had declined in Australia and Ireland though both countries still have substantial portions of their PWID housed in institutions (Beadle-Brown et al. 2007). Though in Germany, Spain, the Netherlands, Greece, and Belgium deinstitutionalizing was but institutional care continued to dominate. Reports suggests that deinstitutionalization has just begun in countries like France, Poland, Romania, Hungary, and the Czech Republic while many PWID live in poor quality group settings (Beadle-Brown et al. 2007). Argentina continues to institutionalize a large proportion of its people with mental disabilities including ID (MDRI 2007) though mental health care providers are present unlike some developing countries like India where the mental health service providers for PWID in some states are absent.

Interestingly, according to a survey conducted by the World Health Organization's Atlas on 2007 among ID reported that institutional settings still continue to be prevalent in the middle income countries .It is insightful that though education, health, disability, and social welfare were the key governmental sectors involved in programs and policies related to ID, but the availability or the accessibility of such services were more widespread in high income countries with almost 90% reported of having high levels of access compared to only 10% of similar levels of access among low income countries. Special judicial laws for offenders with ID were prevalent in only half of the countries indicating under-development in many of the sectors

Though taxes accounted for the largest source of finances for services of the PWID but only 60% of such services were covered in low income countries compared to 90% in high income countries. Hence, the financial burden incurred for PWID is quite high in the societies of low income countries due to out of pocket expenditure with no favorable returns from PWID.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Across the world there has been a relentless effort for community care of the individuals with ID. Worldwide voluntary disability organizations have been providing community-based supports and services for decade, which are now evolving as 'mainstream disability specialists'. The intrinsic features which make the organizations a vital community resource include: they are naturally person-centered; they have specialist knowledge and skills; they can innovate and adapt to change; and they have forged strong connections both within communities and beyond (National disability survey, 2006). Social inclusion in the community requires active support to establish and maintain connections with family, friends, carers and community members. Successful campaigns carried out in Scotland and New Zealand influenced public attitudes towards PWID which involved a combination of strategies, like information, training and media portrayal (NSW Consumer Advisory Group). While in India and other developing countries the concept of community care needs a very different conceptualization because informal support is the norm and support by untrained non-professionals in non-institutional settings without any responsibility and accountability is apparent. The major program of the United Nations Development Programs (UNDP) is the community–based rehabilitation (CBR).In a very short time CBR has become very popular among the masses in India and integration of the people with ID into the societal mainstream has been the main focus. The goals of CBR would be fulfilled if people with disabilities, their families, and the local community join in this program and work together for realization of the goals (Dalal, 1998) but the efforts would fail if the attitude towards individual with intellectual disability is not favorable.

There has been a "strong awakening of interest in humane treatment of the mentally retarded" (Anastasi, 1982) in the 19th century in developing countries like but the common perception exists that intellectually disabled children are social outcasts, due to the stigmatizing consequences of the process of labeling (Parekh and Jackson, 1997). Throughout the 1990's, the government of India has been developing acts and strategies, amendments and laws to cater to the various needs of the disabled people. Apart from the government, the Non-governmental organizations (NGO) too play a major role in supporting the inclusion of individuals with ID in various educational and occupational institutes. Though they have established orphanages, vocational training programs, parental organizations, half way homes, day care centers etc. to increase awareness and to empower individuals with ID there is still a huge gap between needs and services available for them.

The Multinational Study of Attitudes (2003) conducted in Brazil, China, Egypt, Germany, Ireland, Japan, Nigeria, Russia and USA showed cultural differences in the perception and attitudes toward PWID. Worldwide, the public perceives individuals with intellectual disabilities as more capable of engaging in simple activities such as sustaining friendships and washing and dressing, but less capable of complex activities such as understanding a national news event or handling emergencies. Across these countries, the public notion is that ID should "live with their family." In those countries that do not favor placement with the family, they believe that ID should live either in supervised apartments or independently.

Worldwide (more than 60% in the countries) people believe there are significant obstacles to the inclusion of individuals with intellectual disabilities in society. In particular, the public believes the lack of available supports (e.g., the lack of community services, job training and school resources), the negative attitudes of others and the negative attitudes of the media as major obstacles to inclusion (Siperstein et al., 2005).

In developing countries people perceive disability differently. In some studies they are considered as an object of pity, sympathy, and are isolated or rejected in the family and other social institutions while in others they have been looked as special people in need of love and affection. Interestingly in a few cases families regard their children with ID as "cursed" and a burden that they must deal with, which at

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

times leads to their neglect, abuse and rejection; and often the child is hidden from the community as the family fears social rejection (Girimaji et al. 2001;Census Bureau, 2001). This leads to social isolation for which the community care fails to reach them. Despite advances in public policy and legislation, significant barriers towards people with ID exists while attitudes held by general public as well significant care givers especially parents are often cited as an important component of the "handicapping" environment by various researchers from time to time. The rigid social structure in India makes it extremely difficult to include individuals with ID into various occupations and institutes as they are perceived as fundamentally "flawed" having diminished capabilities, thereby placing them at the bottom of the social structure (Ghai, 2002).

Detection and identification of mild intellectual disabilities is not simply recognized and the benefits too do not reach them easily because unlike individuals who have genetic disabilities, those with mild ID, is often caused by environmental factors such as malnutrition and under stimulation, and they may have no anomalies in their physical features similarly with individuals with no disability (Reschly, 1996)

In conclusion there is not much change in the perception and acceptance of individuals with ID from earlier to modern times as the stereotypes are based on ignorance and families find it extremely difficult to disclose the presence of disability as they believe disability to be a 'loss of face'' which tarnish the family reputation. Hence, families often adopt strategies to hide the existence of a disability, which could be a source of delay in treatment and rehabilitation services and many times due to lack of knowledge about intellectual disability they do not seek for treatment services as well.

GENERAL PUBLIC ATTITUDE TOWARDS INDIVIDUALS WITH ID

Every individual with or without ID is a part and product of his social environment so one's relationship, attitude and behavior patterns are vitally affected by the nature and extent of the harmony or disharmony of relationship with the family members, relatives, friends, community members, workplace colleagues and employers etc. Tragically enough, the persons with disabilities are comparatively less handicapped by their own disability than by the attitude of the society towards them (Silver, 1957; Shrivastava, 1970).

Moreover, they are not accepted by the society because people's attention is more focused on his/her disabilities rather than on his/her abilities and they are further victimized by the peculiar and irrational prejudice of the society. It has been a well-established fact that the able-bodied people tend to avoid interacting with people with disabilities, because they are uncertain about how to behave in their presence (Yamamoto, 1971; Thompson, 1982). Hence, the common attitudes towards individuals with ID range from curiosity, pity, mild dislike or embarrassment, repugnance, indifference, fear or sympathy.

There has been interesting facts from developing countries where services for ID are lacking. In 2003, Gary N. Siperstein et al. assessed the attitudes of the public in India towards PWID which included questions about perceptions of people with ID, knowledge of Special Olympics (SO) and beliefs about inclusion. Findings indicated that people in urban India were aware of ID as more than 70% had some type of contact with a person with ID like any other countries in the world. Also that people in India interacted with disabled people but majority i.e. more than 54% didn't have any knowledge about SO. United States and Ireland was estimated to have high levels of awareness and involvement with SO but India and all other countries lacked knowledge and were less involved in SO. Indians underestimated the capabilities of the people with ID and viewed them as severely impaired not only in complex independent living skills but also in simple self-help skills. This reinforced the stereotype that exists among the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Indian public that individuals with ID as less capable than their non-disabled peers and are categorized as problematic comparable to other children (Ghai, 2002). Whereas in a few studies (Hazarika et al., 2014) it was seen that training in special schools helps in the development of self-help skills and social skills in children with ID like any other children without ID.

The importance of language in disability is very significant and so labeling disabled people with negative terms reflect negatively which is detrimental (Gorden & Rosenblum, 2001). Hence, the language used by general public to describe about disability and impairment affects the way society views them. Inappropriate language prove to be disempowering, humiliating and rude and often terms like victim, abnormal, defective, infirm, invalid, idiot, unsound expresses perceptions of helplessness and dependency on other individuals.

FAMILIES AND PARENTS' ATTITUDE TOWARDS THEIR CHILDREN WITH ID

Some people in the neighborhood hate him. They never let their children to play with my son. Even if he tries to play with them their parents stop them. Others are kind, and tell me these children are blessings from God – Father of a 12 year old boy with intellectual disability in a study (Hamdani et al., 2014).

The attitude towards PWID is mixed but more towards negativity. Every child is special to a parent while some children have special needs and others do not and this determines the parental care and treatment services in the developmental stages of life (Ravindranadan, 2007). No parent would like his or her child to have any deficits in intellectual functioning. Intellectual disability typically reflects a misfit between the capabilities of an individual and the structure and expectations of the environment. All prospective parents look forward to a baby free from flaws, deformity and disability, but the birth of a intellectually disabled child comes as a traumatic experience involving strong negative reactions. Often terms such as " disabled", " impaired" or "abnormal" are interchangeably used for the child which itself profoundly influences the parent's opinions and attitudes towards their own children with intellectual disability. It has been noted that mothers undergo a more intense psychological trauma or emotional state as it involves adjustment of the notion of so called "perfect child" and the "death" of the child of parental expectation.

When a child is diagnosed to have ID the early parental reactions include ambivalence, anger, confusion, denial, self-pity, blame, feelings of helplessness, depression, disappointment, grief, guilt, mourning, rejection, shock, impulses to kill the child and suicidal impulses (McConachie, 1986; Mary, 1990; Ntombela, 1991). Parental reactions vary from experience of a state of shock at the initial disclosure with being unable to register or understand the news and thus withdraw. This is usually followed by a reaction stage, during which sudden emotions of denial, sadness, anger evolves and gradually parents enter an adaptation stage when they start inquiring and asking questions about what could be done for the future and finally enters a stage of reorganization when they would seek help and begin to plan ahead. But during all these stages love and sorrow, guilt, high expressed emotions of hostility, criticality, and over-protectiveness were reported. So the people working with individuals with ID need to know at which stage of adaptation the parents of ID are in for adequate treatment and rehabilitation of the child.

In a study by Hazarika et al., 2015 (in press) it was seen that though the parents of children with ID had love and acceptance towards their children but frustration, disappointment and overprotectiveness were significantly high which were considered to be deterrent factors in their growth and adaptive functioning in the society. Hence, the father of attachment theory (Bowlby, 1988) had rightly mentioned

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

that the greatest loss and negative consequences of an ID child is lack of adequate nurturing relationship with parents. When parents are critical towards the child's immediate environment it negatively hampers the process of development. The way parents' react to a child with special needs partly depends on how they perceive it and the practical implications the disability or illness has on them (Chaturvedi, 1984). This in turn determines their attitude. Findings have been consistent about families experiencing high levels of stress and research has focused on parental dynamics. One view suggests that the presence of a child with special needs causes a crisis in the family. Hence, the environment in which a child is born and brought up has a huge impact on a child's psychological and physical well-being.

One very significant finding suggests that disability increases stress and negative emotions due to the manner by which they are informed of the child's disability that strongly influences initial reactions by parents (McConachie, 1986). Cunningham & Davis argued that parents who were informed 'well' reported feelings of sadness rather than of anger (as cited in McConachie, 1986). If there is a delay in the news about disability and is told in an impersonal manner than they are unlikely to accept the status easily (Ntombela, 1991).Though "there is no good way of letting parents know that their child is mentally handicapped, but there must be ways of not making a bad situation worse" (Hannam, 1975) and this is to be always kept in mind while dealing with children with ID and their parents for comprehensive management.

It has been suggested that negative reactions hampers ones emotionality with more of pessimistic and self -blaming attitude leading to family disharmony. Positive reaction combined with valued support, love, acceptance and contentment with one's own situation increases ones coping efforts. Problem focused coping strategies such as gathering information to deal with the underlying problem, planning, making decisions, resolving conflicts and making realistic goals acts as a booster to the psychological and physical resources during stress. Adverse consequences of stress further deteriorates the child's growth and development. (Gupta & Singhal, 2004)

In a study done by Lakhan & Sharma (2010) among 55,366 people on knowledge, attitudes and practices related to intellectual disability among families in Barwani, India it was found that a large number lacked knowledge and information about ID for which misconceptions and misperceptions were evident. Parents believed that birth of these children has taken place only due to sins of their previous life and not because of poor nutrition, improper delivery, or other birth related problems. This was reinforced by Persha and colleagues study in 2007 where in parents were convinced that their offspring could be cured if they could remove the effects of "God's punishment" by prayers. They paid money to faith healers to conduct worship rituals. However, many of these faith healers used practices like beating, burning on stomach, and not giving food for days in the name of treatment. In some studies the community believed that the intellectual disability is contagious, and can infect other children (Madhavan & Menon, 1988). Another belief was that marriage cures disability so many respondents wanted their disabled children to get married early in life (Peshawaria, 1994)

Grebler (1952) believes that the parent's attitude towards their child impacts greatly on the child's sense of self while Govender (1984) further mentioned the development of positive self-concept in disabled children if they are defined positively by their "significant others" and vice-versa. Thus the role of parents and siblings is of vital importance, especially for the mentally retarded child whose inter-personal experiences are mainly within the family context. Grebler mentioned in his study that the parents are immensely frustrated due to the elements present in the child's condition and external limitations as reported in most studies. Parent's personality determines the level of frustration and anxiety too. Parental reactions are interrelated to the attitude hence, if parents have feeling of guilt then ambivalence is mostly seen towards the child and if they condemn the external world for the child's status then they

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

reject the child, and parents who don't blame anyone for the child's ID accept the child as he or she is. Parental unfavorable attitude cause behavior problems in these children which in turn prevent them from using their limited capacities. According to Ntombela (1991) emotional stress of parents is unavoidable due to the constant physical care, financial demands, restrictions placed lifestyles, the disappointment of having a handicapped child, the guilt feelings arising from their anger and rejection of the child and concerns about his/her. Another common attitude of parents i.e. Hyperpaedophilia,is reported in many studies which is the pathological over-attachment to the child. When this happens the parents love for the handicapped child develops into a grossly exaggerated devotion and over-protectiveness which negatively affects the life and needs of other members of the family as well as for adequate adaptation of the child to the mainstream society.

ATTITUDES OF SIBLINGS AND RELATIVES TOWARDS INDIVIDUALS WITH ID

System theory suggests the importance of sibling sub-system as important determining factor for family homeostasis. Sibling relationships make up a child's first social network and are the basis for his or her interactions with people outside the family (Powell & Ogle, 1985). A child's temperament plays an important role in their response toward a sibling, including one with an ID. Although both positive and negative feelings exist in all sibling relationships, McHale and Gamble (1987) states "for school-age children and young adolescents, these relationships tend to be more positive than negative in their feeling tone. It is an interesting insight that children with disabled siblings appear to have more positive and fewer negative behavioral interactions than in those with non-disabled siblings". The positive aspects include higher levels of empathy and altruism, increased tolerance for differences, increased sense of maturity and responsibility, and pride in the sibling's accomplishments (Powell & Ogle, 1985). The attitudes of siblings are greatly influenced by the attitude of parents so if parental attitudes are positive then positive feelings in siblings follow and this is a very important observation to be aware of while giving psycho-education to parents of ID.

According to Ntombela (1991) siblings experience emotions range from jealousy, shame, guilt, to frustration. And it gets exacerbated by the material deprivation they experience due to the increased financial responsibilities towards the disabled child. Studies report shame leading to social isolation as they feel that they cannot invite their friend's home.

The siblings may feel victimized and feel frustrated due to the parent's restrictions concerning the kind of games and outings in which their disabled child and his/her siblings may be involved, so as to protect the child from social discrimination. The chores and responsibilities assigned to the siblings as a result of parent's involvement with the child with ID are matters of concern.

ATTITUDES OF TEACHERS AND STUDENTS TOWARDS INDIVIDUALS WITH ID

The educational experience of any student is influenced by teachers' attitude so if the attitude is negative then the impact is profound. Children with ID spend most of their time with teachers in schools and vocational institutes so their attitude matters a lot. Studies report mixed messages regarding the teacher's attitude.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Though the legal mandates declare children with ID to be included in the regular classrooms, but they don't ensure their acceptance or fair treatment in schools (Marks, 1997) and some studies also indicates that inclusion can fail to result in positive outcomes in these children (Genesi, 2000; Cook et al, 2000) if social comparison is upward and discrimination persists.

A study conducted by Efron & Efron (1967) revealed that special education class teachers expressed more favorable attitudes to the intellectually disabled than do teachers of ordinary children (Rawlins, 1983). But only a small minority of teachers is in favor of integrating the intellectually disabled-into regular classes (Gotlieb, 1975; Rawlins, 1983). Studies by Scruggs et al., (1996) gives an insight into the social desirability factor indicating that although in the educational fields teachers agreed with inclusive programs for children with ID, but in practice they expressed hesitancy. Intellectually disabled children were the most rejected children in twenty regular classes for their behavior in the classrooms, playground and outside the school environment and they were very seldom chosen as 'a best friend', irrespective of the organizational or integrated settings (Johnson, 1950; Rawlins, 1983). Several studies show that specific Inclusive Education (IE) training courses improve future teachers' attitudes and self-confidence (Glumbic, Kaljaca, & Brojcin, 2004; Stella, Forlin, & Lan, 2007), as well as their abilities and self-awareness regarding abilities of ID thus creating a more positive attitude (Cologon, 2012).

Davis, Tang, Oliver and Wu (2000) found that compared to a sample of Irish children, the Chinese children were more positive towards school integration and were more willing to have social interactions and form social relationships with people who were intellectually disabled.-While in Japan, a study (SO, 2004) among middle school students indicated underestimating the intellectually disabled and even hesitation to interact with them but North American students expressed their willingness to interact and had better perception of the competencies of the intellectually disabled. (Norins-Bardon et al., 2005). While, more than 516 studies stated that more the contact with people with intellectual disability, less was the prejudice. (Pettigrew et al., 2000; Hewstone, 2003) .

Students with higher marks or higher qualifications show better attitudes towards people with disabilities than those with lower marks and qualifications (Sharma, Forlin, Loreman, & Earle, 2006; Forlin et al., 2009).

PEOPLE'S ATTITUDE ABOUT THEIR EDUCATION AND INCLUSION IN THE MAINSTREAM.

Education is the right of every child because it equips him to meet the challenges of life.

Inclusive Education (IE) or Mainstreaming as a type of education ensures the exercising of the right to a complete, and quality education for all, maximizing integration of the society and promoting diversity in knowledge sharing and experience (EADSNE, 2011). According to statistical data, Spain is one of the EU countries with the highest levels of IE. Only 0.4% of Spanish students with special educational needs (SEN) attend specific educational institutions (EADSNE, 2011; Chiner & Cardona, 2012) in contrast to 4% in Belgium, Denmark, Germany or Switzerland.

Some significant milestones in the field of education of the disabled are the Salamanca Statement and Framework for Action on Special Needs Education (UNESCO, 1994); the Declaration of Madrid in 2002; the UN Convention on the Rights of Persons with Disabilities (UN, 2006), which was signed

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

by 147 countries and ratified by 97; and the 48th Session of the International Conference on Education "Inclusive Education: the way of the future" (UNESCO, 2008).

The policies of the government of India towards the education of children with disabilities have been reflected in the enactments, schemes and through institutions established for various relevant activities. According to the NSS 58th round (Jul.–Dec. 2008), 19.68% children with ID were enrolled in grades between 1st-5th, 8.62% were enrolled in grades between 6th-8th. Some of the major policies and legislature framework in India for education of the disabled in order to alter people's mind set and reduce discrimination are the constitutional safeguards provided by the Constitution (86th Amendment) Act 2002 declaring education as a fundamental right of all children in the age group of 6–14 years, adoption of the National Policy on Education (NPE) in 1986 whose objectives include integrating the physically and mentally handicapped with the general community as equal partners, to prepare them for normal growth and to enable them to face life with courage and confidence. Concept of special education, teacher's training to deal with ID, and importance of vocational enrolment was bought up in this policy. Policies like the Integrated Education of Disabled Children (IEDC) which is the centrally sponsored scheme of Integrated Education of the Disabled Children providing educational opportunities for the disabled children in common schools, to facilitate their retention in the school system, and also to place the children in special school to common schools after they acquire the communication and the daily living skills at the functional level. Another policy developed in 1992 is the Plan of Action (POA) which postulates that a child with disability who can be educated in a general school should be educated in a general school only and not in a special school. Even those children who are initially admitted to special schools for training in plus curriculum skills should be transferred to general schools once they acquire daily living skills, communication skills and basic academic skills. The Parliament of India enacted the Rehabilitation Council of India Act (RCI Act –1992) which was subsequently amended in 2000, to establish a statutory mechanism for monitoring and standardizing courses for the training of 16 categories of professionals required in the field of special education and rehabilitation of persons with disability. Persons with Disabilities (Equal Opportunities, Protection of Rights & Full Participation) Act, 1995: The most landmark legislation in the history of special education in India is the Persons with Disabilities (Equal opportunities, protection of rights & full participation) Act, 1995 involved with providing free education up to 15 years, integrating of disabled children with regular children and setting of special school in public and private sector and providing vocational training facilities. It is welcoming to note in the developing country like India that the Sarva Shiksha Abhiyan (SSA) has been operational since 2000-01 in partnership with state governments to achieve the goal of universalization of elementary education. This adopts a ZERO rejection policy and it covers the following components under education for children with disability. They are early detection and identification, functional and formal assessment, education placement, aids and appliances, support services, teacher training, resource support, Individual Educational Plan (IEP), parental training and community mobilization, planning and management, strengthening of special schools, removal of architectural barriers, research, monitoring and evaluation of females with disability.

Across the world the right of every child to education is proclaimed in the Universal Declaration of Human Rights (1948) and was strongly reaffirmed by the World Declaration on Education for All (1990). The UN Standard Rules on the Equalisation of Opportunities for Persons with Disabilities (1993) was an important resolution for improving the educational conditions of persons with disabilities which affirms, 'Those with special educational needs must have access to regular schools which should accommodate them within a child centered pedagogy capable of meeting these needs".

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Though the mentioned legal policies and laws with few other policies have been mandatary in developed and developing nations but still there is a growing fear among parents and educationists that the children with ID would create discipline problems and decrease the growth and productivity of fellow students as a result cause hindrance to overall progress of the society. Hence, it is better to put them in separate special schools. This mind-set causes obstacles to the integrated education system. In a study among regular school teachers of Nigeria regarding inclusion of children with ID revealed that 57.4% teachers could not cope with the children with ID because of their learning difficulties. Teachers with higher years of teaching experience were found to be more favorable to exclusion (Tolu.et al, 2014)

Moreover, just bringing a child into a mainstream classroom does not indicate integration if no other supports is in place. There are children who are integrated but very lonely as nobody plays with the child. These may lead to social exclusion, isolation and psychological problems in him/her. There is a lack of community resources like health and transportation, job training programs, lack of special teachers, and special learning aids to provide the supports necessary for their success in the inclusive workplace or schools. Need for social services is high but services are less and inclusion in the work and school environments has been extremely difficult due to the diversity that exists within some countries.

Four variables like general demographics, educational background, teaching experience and perceived competence to teach the disabled affect regular classroom teacher's (RCT) attitude towards mainstreaming. Teacher's cultural background, knowledge regarding intellectual disabilities that have been gained either with one's own personal experience or formal studies seems to be the factor towards building up of positive attitude. Perceived competence i.e. the RCT's perceptions of their ability to meet the academic and social needs of the disabled children, personality characteristics such as openness to experience, empathizing, conscientiousness, intuitive, good power of observation, even tempered and having received in service training appears to have a significant positive impact on attitude towards mainstreaming.

ATTITUDES OF EMPLOYERS TOWARDS INDIVIDUALS WITH ID AND THEIR INCLUSION IN WORK

People with disabilities would be benefitted if they were employed in various skilled and unskilled tasks as it helps in skill development, increase income, decrease social isolation and leads to life satisfaction. But they face many challenges when integrating into the work force. Overcoming co-workers and employers' negative attitudes and perceptions is one such challenge. The employment rate of people with disabilities remains low despite efforts, legislation, and identified benefits of hiring people with disabilities (Stokes, 1990,Geng-qing & Qu, 2003; Ruggeri-Stevens & Goodwin, 2007;).

Despite rules and laws only 44% of intellectually disabled adults are in the labor force, either employed or looking for work, while just 34 percent are actually working, according to a survey by Special Olympics and conducted by Gallup and the University of Massachusetts at Boston. Studies by Rimrnerman, 1998 have shown that the attitudes of employers play a major role in determining the success of employing workers who have been labeled with mild and moderate intellectual disability. Employing such people reduces support and treatment costs of caring for these individuals, and allows them to pay taxes and improve their level of self-confidence and independence. Levy, Jones-Jessop, Rimrnerman & Levy reported that larger companies have been found to be more positive in their attitudes towards hiring persons with disabilities than small companies (in Rimrnerman, 1998, p.246.)

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

People from the work-force who had prior experience with ID are positive towards their recruitment and less educated corporate executives place less emphasis on the educational accomplishments of persons with disabilities and are more favorable towards hiring them. People with ID who have vocational and social skills, had greater chance of employment while executives in many companies avoid hiring persons whose ID raises concerns about their ability to integrate into the workplace. But in another study coworkers of people with disabilities mentioned contagious excitement about the job as a positive experience while working with people with disabilities (Ruggeri-Stevens & Goodwin, 2007). It is also possible that public's underestimation is the result of the strongly held stereotype that exists among some people that individuals with ID are less capable than their non-disabled peers (Ghai, 2002).

In the United States, of the 43 million people classified as having disabilities, 56% are employed compared to 88% of people without disabilities (U.S. Census Bureau, 2007). Hence, discrimination against individuals with disabilities appears to continue as a serious problem all over the world. Many intellectually disabled people work in fast food joints, and retail chains such as Walgreens, Best Buy and Safeway have stepped up to hire them. Sheltered workshop is another platform which inculcates high self-esteem and sense of purpose in life, where about 30% of ID work but they face segregation from non-disabled workers in the basic task and outcome they perform. They can legally be paid less than the minimum wage under a 1938 federal law that allows wages to be based on comparing their productivity level with that of a non-disabled worker. But disability rights groups won a victory when President Obama signed an executive order raising the minimum wage to $10.10 an hour for federal contract workers. The order includes several thousand disabled workers at sheltered workshops run by federal contractors. In comparison to other countries surveyed, India is most comparable to South Africa in terms of where they believe individuals with ID should not work but countries like Japan, Ireland and the United States were extremely positive indicating that individuals with ID could work in skilled or unskilled work set-up.

In Columbia, the Rehabilitation Services Administration (RSA) is responsible for empowering individuals with disabilities to "maximize employment, economic self-sufficiency, independence, and inclusion and integration into society". By law, the local RSA would conduct a review and assess to determine eligibility and priority for services. Provision for supported employment, on-the-job training, and other experiences using supports and realistic work settings are also reported to be available and no individual is denied individual services based on disability. Once the local RSA determines that an individual is eligible for Vocational rehabilitation (VR) services, the VR specialist develops an Individual Plan for Employment (IPE). The IPE generally include among other things, the individual's employment goals and means to achieve them. (University Legal services report, Washington, 2010)

Some of the common barriers identified in inclusion of ID to employment are the perception that individual with ID lack the necessary skills to work in a competitive employment, belief that inclusion will have a negative consequence on the environment, such as lower the productivity of other workers and create safety problem for the individual himself and others, and the presence of external obstacles such as lack of services which prevent inclusion from happening and finally, inclusion is hindered by negative attitude harbored by many individuals.

ATTITUDES OF HEALTH PROFESSIONALS TOWARDS INDIVIDUALS WITH ID

Never discourage anyone who continually makes progress, no matter how slow. – Plato

The trend towards deinstitutionalization and the movement towards community rehabilitation programs imply that more physicians are caring for mentally retarded patients in their daily practices. Medical students have positive attitudes towards people with intellectually disabled (Rutledge and Scatt, 1997) .A study on the systematic review on health care professionals and students attitude towards disability in New York indicated that one's experience with a person with disability, ones background with disability influences in becoming more comfortable with a challenging rehabilitation situation. Female health care students and professionals are found to be showing more positive attitude towards patients with disabilities then do their male colleagues (Satchidanand et al., 2009). Attitude of the medical students holds importance as they are the future professionals who would provide their service to the disabled. In a study conducted by Karl et al. (2013) to assess the effects of a clinical experience that involved caring for people with ID indicated favorable attitude among the medical students and they wanted to learn more about this group. A similar study by Khandelwal and Workneh (1986) to understand medical students' perceptions of, and attitudes towards, mental illnesses and ID, before the start of a 6-week psychiatric attachment indicated 92% regarded ID as an illness; 62% regarded it as very serious; 78% stated that they would have some problem in their family life.

Rose (1996) revealed that families are enormously affected by the perception of their health professionals' lack of information, support system and dissatisfaction with the services. In United States, a study by Doornbos (2002) suggested that 85% of the caregivers regarded communication problems with mental health professionals as the most non supportive aspect of a mental health care system, indicating that there lies incongruence between the collaboration and partnership between the two parties increasing iatrogenic burden for families. "Iatrogenic burden" was the term coined by Lefley (1996) to describe the stress felt by families from a system that most of the times reacts to them with indifference. Therefore, it is essential to generate collaboration between the health professionals and the families as often family is regarded as liability for the condition of the intellectually disabled, not that the population is unique and deserves special services themselves.

Mental health professionals clinical training programs should focus more on family coping, adaptation, and competence rather than family pathology (Mohr, Lafuze, & Mohr, 2000).Some of the barriers that prevent one from collaboration with the families include lack of insight about family stress, limited outreach to families, the lack of awareness of the needs of families, and continued exposure to a pathology.

A step was taken by National Association of the Mentally Ill (NAMI), Professional Provider Family Education Course (PPFEC) in United States which is a 10 week course developed for the purposes of educating, encouraging, and helping professional mental health providers to better understand the family's responses to mental illness and involve the family in the delivery of care, Physician's negative attitude towards individuals with ID will have deep detrimental effect on the delivery and outcomes of medical services and may influence the beliefs and attitudes of others who assist in this health care so the issue needs sensitive handling and management.

ATTITUDE TOWARDS SEXUALITY OF INDIVIDUALS WITH ID

The world worries about disabilities more than disabled people do. – Warwick Davis

Sexuality is an innate part of each and every individual. Sexual behavior develops on three levels, biological, social and psychological (McLeod, 2008). Children and young people develop physically, mentally, emotionally and sexually through exploration, observation and processing the information gathered. Sexual development is not only physiological but also changes in sexual knowledge and behaviors.

Sexual needs or rather sexual health often becomes a neglected aspect of people with intellectual disability, although the biological needs that arises among human beings tends to be the same. Individuals with intellectual disabilities are no different in this respect, and express the need and desire to form relationships, engage in sexual contact, and acquire sexual knowledge (Kelly, Crowley, & Hamilton, 2009; Konstantareas & Lunsky, 1997; McCabe, 1999; Siebelink et. al, 2006).

Some of the essential skills in which PWID may require specific educative and/or medical management are in maintenance of hygiene, general gynecological care compliance, sexually transmitted infections (STI), abuse and knowledge about prevention of unwanted pregnancies

An efficacious way of protecting child's sexuality mostly during adolescents involves education in sexuality and gender mainstreaming. This could be provided by parents, teachers and friends. They could be taught in a disabled friendly language about the distinction between proper and improper touch, knowledge about private and public behavior, age appropriate sexual issues and teaching the importance of fulfilling sex life. Studies report that both males and females with ID react differently to the experience of sexual abuse. Findings suggest that females become passive in their later sexual relationships, make poor relational decisions and submit to physical, sexual and emotional abuse easily, while males are unable to understand the act and in turn internalize the action and become aggressive in their own relationship with others (Alplott, 1999; Block, 2000 ; Jobling et al.,2000 ; Griffth et. al., 2000; Trigler & Pfeiffer, 2001). The emotional impact of engaging in sexually inappropriate behaviors and/or being charged can include shame, guilt, fear, rejection, blame, stress, loss of trust and confusion. The physical impact can include bullying, isolation, STIs, pregnancy, a loss of job/home/money/freedom, risk of harm and injury. Inappropriate sexual (ISB) behavior at the earliest stage warrant redirection and depending on the behavior, age and impact to self or others can escalate to a situation whereby professional intervention is required

Education is the mechanism to promote the decision making abilities and empower the individuals with intellectual disability, thus reducing vulnerability and inappropriate sexual expression (Aylott, 2000; Black, 2000; Lumley & Scotti, 2001 ;Nirji,1972; Ward, et al.,2001).Vulnerability to abuse among intellectually disabled can be reduced by adequate social skills training, appropriate judgment skills, and provision of practical knowledge based training in formal sex education programs(Sobsey,1988;Sobsey &Varnhagen, 1988; Watson, 1984). Differentiating appropriate sexual behavior from inappropriate sexual behavior, relation to sexuality and protective behavior to individuals was addressed in a training program in People 1st Program (PIP), a project of Family Planning Western Australia (2009) which had favorable outcome.

ATTITUDE OF THE MEDIA TOWARDS INDIVIDUALS WITH ID

The role of media in promoting prevention, detection and rehabilitation of intellectual disabilities has been grim. There has been a noticeable lack of coordination between media professionals and those working for the disabled. There is a lack of moral responsibility to help in policy formulation and implementation by the media so there are very few media efforts to address disability needs and to promote disability awareness. There is general indifference to the cause of integration of people with disabilities into mainstream society by the media. Many times in various movies individuals with ID are projected with a touch of humor and sympathy which is both unethical and immoral while few of the films have also sought to enhance the sensitivity of society towards the needs, rights, sensibilities and potential of people with disabilities.

Although, there are few television and radio programs which telecast programs to promote assistive devices available for persons with disabilities as well as on integration of children with disabilities in normal schools but the main emphasis on early intervention in the management of disabled children is not often seen as the right target. Since stigma due to negative media coverage impedes the recovery process, triggers discrimination and prejudice, and creates barriers to seeking and finding decent housing, employment, and education, it is essential to make use of appropriate advertisement, share success stories and circulate appropriate facts about the condition to remove the stigma and dogmatization that lies among the population at large to create an aura of positivity and compassion towards PWID.

CONCLUSION

Special children are the god's gift in its purest form, brimmed with innocence, nonjudgmental and generous attitude within them. They are not odd or weird; all they want is to be accepted.

The general approach towards the care and rehabilitation of the individuals with ID reflects the confused state of mind of a person who wants to be emancipated and modern while preserving age-old traditions and cultural values. Though the Government policies, legislative actions, schemes and provisions, programs for the disabled give the impression of commitment to human rights and equal opportunities across countries but the ground reality is quite different in most of the developing countries.

There is not much work done to create awareness about disability in many countries so most people continue to believe that disability is either an irreversible medical condition or an act of fate. And in both the cases the onus of care rests with the family of the disabled and not on the community at large. Though various schemes have been offered for the welfare of this population, due to lack of adequate information among the stakeholders, the PWID, their families and organizations that work for them are either unaware or cannot avail of the provisions therein and many times it is seen that the process of availing the benefits of these schemes are very cumbersome as well as time-consuming.

There are significant myths and misconceptions about disability causing the disabled to be discriminated, isolated and marginalized. The legal definitions in many countries view disability strictly from the medical and/or psychometric perspectives that reinforce a medical model of intervention rather than the much-needed community-based rehabilitation. Very interestingly though the rehabilitation programs have received recognition but they are funded because of their activities rather than achievements and in reality they are not need based but fund driven so are very cost-intensive, lacking in real goal or

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

long-term viability. Hence, these programs become counterproductive to the cause of development of rehabilitation services in the long run.

Overall, it is apparent that the general public of many countries lacks an appreciation of the range of capabilities of individuals with intellectual disabilities, and therefore has low expectations of what they can do. The world still believes that individuals with intellectual disabilities should work and learn in separate settings, apart from people without disabilities. The family is seen as the most appropriate living environment for individuals with intellectual disabilities, a function of both cultural values and availability of services. In thinking about the barriers to inclusion, there is unanimous recognition that the lack of resources and services in the community, employment and school are the major obstacles to inclusion. In addition, the world sees the negative attitudes of others, including the media, as standing in the way of inclusion.

People who perceive individuals with intellectual disabilities as more capable support inclusion in work and school, and believe that the existence of obstacles are not too large and expect few negative outcomes of inclusion.

The direct and indirect efforts made in many jurisdictions needs to be monitored on a continuous basis. These include efforts to ensure the substantive equality of people with disabilities in the field of employment, education, independent living and full societal participation. Hence, more research on this population is essential in all socio-economic levels for planning and program implementation. Also it is essential to translate research evidence into practice to bring about the change.

Recommendation

- Awareness and education programs are needed to educate the public about the capabilities of individuals with ID, and, that there is great variability that exists among people with ID. Further, it needs to be made clear that not all people with ID fall into the moderate to severely disabled category and that most people with ID are not physically distinguishable from their non-disabled peers.
- If education of the ID is to become a reality all over the World then the training of teachers has to become a top priority. The teachers need to be provided with intensive training to work with various disabilities. In-service teachers also need continued training to update their skills and knowledge of inclusive education strategies.
- It is important for the health professionals to focus more in the capabilities instead of the inadequacies in the assessment process in order to promote smooth functioning of the IEP that are to be maintained for the children .Also, ensuring that one's practice, clinic or hospital is open and welcoming to persons with intellectual disabilities, educating oneself and colleagues about the needs of individuals with intellectual disabilities, holding high health expectations for persons with intellectual disabilities and including them as partners in making decisions about their health are some steps towards a progressive mind-set.
- Specific organizations working for specific disability should develop advocacy program to sensitize the community and the administration to the needs of people with disability as a whole and not be involved in one or two specific disabilities only.
- Families and other stakeholders should be provided the necessary insight about their views and their attitudes towards their own children with ID.As families become more knowledgeable about

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the capabilities of their children with ID, they will begin to expect more from the community and take part in the community rehabilitation programs.

- A strong school and family partnership would ensure good planning taking into consideration of the student's needs and the school division's resources and policies. An effective way to attain that is to introduce self-help group of parents with intellectually disabled child. Thus parents with positive perception can help the other parents in the early stages of adjustment to develop positive and realistic expectation.
- There is a clear need to provide effective, timely, ongoing training for people responsible for the health and wellbeing of PWID. Provision of training to help parents, care givers and disability workers better identify inappropriate sexual behavior at its earliest stage may reduce the escalation, severity and repeated occurrence of behaviors that adversely impact lifestyle and opportunities of the PWID.
- In low income countries, disability is strongly linked to poverty so improving the quality of life of people with disabilities and their families should be the focus of the health care services as this would benefit a large disadvantaged section of the society.
- For the success of community based rehabilitation services, it is crucial that professionals learn from success in the developed countries, as well as from failures so need based programs should be initiated which would be viable in the long run. The activities, mission and vision of any rehabilitation program should be clearly laid down and reviewed from time to time.
- Another strategy for promoting change in attitudes could be programs such as Unified Sports which provide a dynamic model for inclusion in the community by creating the opportunity for individuals with and without ID to participate in sports side-by-side in an effort to break down existing stereotypes.
- The current societal attitudes towards people with ID partially dictate the importance the government places on the issue. There is a need for legitimization of rights of the ID with acquiring of their basic services protesting against discrimination and injustice and acknowledging their richness and the diversity.
- Role of the media is crucial in changing the myths and superstitions about PWID and giving appropriate knowledge, responsible reporting, information about care, opportunities and rehabilitation of PWID to reduce prejudice and discrimination is the need of the hour

Hindsight: *There is no doubt that the dream for discrimination free and equal education for the people with intellectual disability may require a comprehensive change in the institutional arrangements and legal provisions but the most important change has to come in our mindset, in our thinking and attitude towards the disabled to bring about the larger change.*

Chapter 90
Gratitude and Happiness in Adolescents:
A Qualitative Analysis

Rachel Gottlieb
Hofstra University, USA

Jeffrey Froh
Hofstra University, USA

ABSTRACT

Gratitude is important for social and emotional health. Research suggests that there is a relation between experiencing and expressing gratitude and happiness. The aim of this chapter is to review current research regarding gratitude development and happiness, adolescent gratitude development, and to discuss future recommendations. This chapter also discusses a study examining adolescent perspectives on the meaning of being thankful. To obtain adolescent perspectives on the meaning of being thankful, adolescents (N = 1,098) wrote essays describing what being thankful meant to them. Thematic analysis was used to identify and analyze themes within the essays. Percentiles were calculated for the most recurrent themes across essays (Appreciation = 54.07%, Family = 31.42%, Positive Emotions = 28.81%, Assistance/Support from Others = 25.99%, Friendship = 21.18%, and Downward Comparison = 16.60%). Understanding gratitude development in adolescents can aid in creating effective interventions, potentially increasing adolescent well-being and happiness.

INTRODUCTION

Gratitude is a construct that is highly valued across cultures, and in most cultures, there are different ways of expressing one's thanks. But, how is gratitude defined? There is no single definitive definition. Gratitude has been conceptualized as, "a sense of thankfulness and joy in response to receiving a gift, whether the gift be a tangible benefit from a specific other or moment of peaceful bliss" (Emmons, 2004). Gratitude has also been viewed as "a moral virtue, an attitude, an emotion, a habit, a personality

trait [and] a coping response" (Emmons & McCullough, 2003, p.377). Gratitude seems to create many positive benefits. For example, feeling grateful may remind people of a positive event, and expressing gratitude to others often strengthens relationships (Seligman, 2011). Reciprocation and helping others has also been linked to feelings of gratitude. "Gratitude opens your heart and carries the urge to give back-to do something good in return, either for the person who helped you or for someone else" (Fredrickson, 2009 p. 41).

Happy people seem to flourish more internally and externally (Lyubomirsky, Sheldon, & Schkade, 2005). While we can identify happiness in ourselves or in another, defining happiness is more challenging. What exactly *is* happiness? Happiness is defined in "terms of frequent positive affect, high life satisfaction, and infrequent negative affect" (Lyubomirsky et al., 2005). According to authentic happiness theory, happiness is the main component of positive psychology and consists of three subjective features—positive emotion, engagement, and meaning (Seligman, 2011). Similarly, the term happiness is itself a subjective measure of life satisfaction (Seligman, 2011). In comparison, Seligman's well-being theory posits that one of the central topics of positive psychology is the construct of well-being (Seligman, 2011). Positive emotion, engagement, relationships, meaning, and achievement are the measurable aspects that contribute to well-being (Seligman, 2011). Positive emotion consists of happiness and life-satisfaction (Seligman, 2011), and therefore happiness continues to play a part of positive psychology and optimal health and functioning.

This chapter has four main foci. First, the authors review previous research regarding gratitude development in adolescents in general, and more specifically, research regarding the many possible benefits that increasing gratitude can have for adolescents. Next, the authors discuss the relation between happiness and gratitude. The chapter then explores several issues, controversies, and problems related to the topic of gratitude in adolescents and provides a detailed description of unpublished research examining adolescent perspectives on the meaning of being thankful. Finally, the authors suggest applications for the future within the field of positive psychology. The aim of this chapter is to review current research as well as share new research regarding gratitude development and happiness, specifically within adolescence, and to discuss future recommendations.

BACKGROUND

Gratitude development in adults yields positive effects. In adults, gratitude is related to positive emotions and wellbeing, including the emotion of happiness (McCullough, Emmons, & Tsang, 2002). Further, there is a positive relation between gratitude and prosocial behavior (Ma, Tunney, & Ferguson, 2017), as well as a positive relation between gratitude development and subjective well-being (Emmons & McCullough, 2003). Gratitude is also incongruous with negative emotions and may even mitigate the presence of negative feelings, such as greed, envy, or anger (Lyubomirsky et al., 2005). In addition to gratitude's positive effects on positive emotions and subjective well-being in adults, research has found that gratitude has a positive relation with health: the greater the gratitude, the better the health (Singh, Khan, & Osmany, 2014). Clinical trials suggest that gratitude can lower blood pressure and improve immune functions (Emmons, 2014; Emmons & Stern, 2013). Gratitude, therefore, seems to benefit people emotionally, physically, and socially.

While gratitude research with adults has exploded since 2000 with the popularization of positive psychology (Seligman & Csikszentmihalyi, 2000), there is a need for additional gratitude development

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

research in adolescence (Froh & Bono, 2014). There have been, however, several studies that provide great insight into gratitude development among children and adolescents. In a study that asked school-aged children to describe what they were thankful for, the most common themes expressed were family, basic needs, friends, and teachers/school (Gordon, Musher-Eizenman, Holub, & Dalrymple, 2004). Some of the other themes expressed included pets/animals, God/church/religion, police/fire fighters/helpers, own life, and material objects (Gordon et al., 2004).

Two additional studies asked children and adolescents to write their greatest wish and explain what they would do for the individual who fulfilled that wish (Freitas, Pieta, & Tudge, 2011; Tudge, Freitas, Mokrova, Wang, & O'Brien, 2015). Results from these two studies suggest that children at different ages express gratitude differently. Findings suggest that adolescents are more likely to use connective gratitude, and younger children more often used concrete gratitude (Freitas et al., 2011; Tudge et al., 2015). Moreover, as children mature, they are more likely to consider benefactors and the larger community in their expressions of gratitude (Tudge et al., 2015). Concrete gratitude occurs when children repay the benefactor with something they themselves appreciate; this does not necessarily coincide with something the benefactor would appreciate (Freitas et al., 2011). Alternatively, connective gratitude occurs when an individual considers the benefactor in deciding how to repay her; the individual gives the benefactor something the benefactor would appreciate, and the repayment is altruistic (Freitas et al., 2011). Connective gratitude, therefore, reflects adolescents' ability to see beyond their own needs and wants to take the benefactor's perspective.

Gratitude has many positive effects on an adolescent's functioning. For example, gratitude in adolescents predicted higher GPAs, life satisfaction, social integration, and absorption (Froh, Emmons, Card, Bono, & Wilson, 2011). Gratitude also predicted lower levels of envy and depression (Froh et al., 2011). Another study indicated that in early adolescence, gratitude is positively correlated with positive emotions, including feeling pride, hope, inspiration, forgiveness, and excitement (Froh, Yurkewicz & Kashdan, 2009). Gratitude, therefore, seems integral for adolescent flourishing.

There are other positive aspects of adolescent development related to gratitude. In one study, middle school students' perceptions of social support (parent and teacher support) were positively related to gratitude, and although uncertain from the cross-sectional design, social support may be an antecedent for gratitude (Reckart, Huebner, Hills, & Valois, 2017). These findings were consistent with an earlier study with adolescents which found a positive relation between gratitude and social support (Froh et al., 2009). Thus, gratitude seems to buoy adolescents' social development.

Gratitude development in adolescents has also been linked to prosocial behavior (Froh et al., 2009). A recent 4-year longitudinal study, consisting of 566 adolescent participants, was conducted to examine whether gratitude was associated with changes in social behavior (Bono, Froh, Disabato, Blalock, McKnight, & Bausert, 2017). Participants completed questionnaires at 4-time points spanning 4 years (Bono et al., 2017). After controlling for social desirability, age, socioeconomic status, and gender, the authors of the study found that increases in gratitude over time predicted increases in prosocial behavior over time and that increases in gratitude significantly predicted decreases in antisocial behavior over time (Bono et al., 2017).

In adolescence, there is a positive relation between gratitude and subjective well-being (Froh et al., 2009b). In one study, an intervention group received weekly gratitude intervention sessions over a 5- week period, while the control received neutral sessions (Khanna & Singh, 2016). The intervention produced significant effects on psychological well-being, positive affect, positive feelings, life satisfaction and gratitude (Khanna & Singh, 2016). Results from another study suggested that gratitude is positively

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

related to school wellbeing and showed that gratitude's positive effect on school wellbeing was partially mediated by materialism (Jiang, Sun, Liu, & Pan, 2016).

Forgiveness and gratitude has been studied with respect to their associations with other aspects of adolescent development. In recent studies among adolescents, gratitude and forgiveness positively correlated with life-satisfaction, psychological wellbeing, and positive affect; gratitude and forgiveness negatively correlated with negative affect (Shourie & Kaur, 2016). Further, while gratitude and forgiveness were positively correlated, grateful and forgiving adolescents also reported fewer depressive symptoms, feelings of loneliness, and feelings of anger (Mary & Patra, 2015).

Researchers have suggested that there is a relation between experiencing and expressing gratitude and happiness (e.g., Margelino & Evangelista, 2015; Miller, 2006). One study found that the expression of gratitude affects the amount of happiness that both the expresser and the receiver of gratitude feel (Margelino & Evangelista, 2015). Another study found that in young adults, personality, psychological well-being, gratitude, and happiness were significantly positively correlated (Singh, Salve, & Shejwal, 2017). Additionally, psychological well-being, gratitude, and extraversion predict happiness in young adults (Singh et al., 2017). Further, life meaning, gratitude, self-esteem, attitude towards education, and positive affect had more of a positive impact on the happiness levels of very unhappy adolescents than on those of average adolescents (Proctor, Linley, & Maltby, 2010). Also, life meaning, gratitude, self-esteem, and positive affect had more of a positive impact on the happiness levels of very unhappy adolescents than on those of very happy adolescents (Proctor et al., 2010). Thus, very unhappy adolescents may experience the greatest positive gains in happiness from increasing these positive factors.

Gratitude has similarities to purpose, as both gratitude and purpose echo moral emotions (e.g., empathy and sympathy) (Malin, Liauw, & Damon, 2017). Gratitude and purpose both influence others outside of the self in a positive manner. For example, gratitude and purpose can impact prosocial behavior and strengthen relationships with other individuals (Malin et al., 2017). There are, however, slight distinctions between gratitude and purpose. A person experiencing gratitude notices and recognizes the benevolence of something beyond herself (Malin et al., 2017). Gratitude is spontaneous, whereas purpose is more future and goal-oriented; it involves acting on the behalf of something greater than oneself (Malin et al., 2017). Thus, although gratitude and purpose are not one and the same, both gratitude and purpose have a positive impact on individuals and on those with whom the individual interacts.

In an exploratory study, gratitude and the association of protective/risk factor behaviors were studied among African American adolescents (Ma, Kibler, & Sly, 2013). Results suggested that moral affect gratitude and life orientation gratitude were both related to positive family relationships (Ma et al., 2013). Moral affect gratitude can be viewed as gratitude connecting to moral behavior, which occurs when a person has concern for another human being (McCullough, Kilpatrick, Emmons, & Larson, 2001). Other researchers have suggested that gratitude is part of broader life orientation, involving the observation and appreciation of all that is positive in the world (Wood, Froh, & Geraghty, 2010). Greater life orientation gratitude was related to abstinence from risky behaviors (e.g., drug/alcohol use and/or sexual intimacy, intercourse), and greater moral affect gratitude was related to protective factors, such as academic and activity engagement (Ma et al., 2013). Thus, gratitude may have important implications regarding adolescent behavior.

Gratitude impacts many aspects of adolescent life. Research on gratitude development in adolescents has suggested that gratitude is related to forgiveness, happiness, subjective well-being, life satisfaction, prosocial behavior, and social support. Additionally, as children develop into adolescents, their expression of gratitude changes coinciding with their growth and maturity. They move from concrete to connective

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

expressions of gratitude, where the adolescent considers the gift giver's wants. These fascinating connections between gratitude and a multitude of positive aspects of adolescent development provide an abundance of opportunity for further exploration.

MAIN FOCUS OF THE CHAPTER

Issues, Controversies, and Problems

Although the amount of positive psychology research continues to grow, and specifically gratitude research, there continues to be a lack of gratitude research with adolescents. A PsychINFO literature search of abstracts including the terms "Gratitude" and "Adults" produced 203 papers. The number of papers produced was reduced to 103 for the terms "Gratitude" and "Adolescents," and even more so for the terms "Gratitude" and "Adolescence," producing only 11 papers. This suggests a need to better understand gratitude development in adolescents.

Positive Youth Development (PYD)

The developmental period of adolescence, where children begin to move into adulthood, is full of great change in the intellectual, physical, hormonal, and social realms (Arain et al., 2013). Adolescence can be a troubling time for some individuals (McCarthy, 2000). This aligns with the past definition of Positive Youth Development (PYD), which was based on a deficit model, relying on the "absence of adolescent problem behaviors" (Lerner et al., 2005). Mental health disorders in adolescents is widespread. Approximately 20% of adolescents, ages 13-18, have or will have a serious mental health disorder (Merikangas et al., 2010). Research has suggested that approximately half of Americans will meet diagnostic criteria for a psychiatric illness at some point throughout their life, and often, beginning in either childhood or adolescence (Kessler, Berglund, Demler, Jin, Merikangas, & Walters, 2005). Although individuals with these disorders are certainly not fully mentally healthy, are individuals who do not have these disorders automatically healthy and happy? Just because someone does not feel depressed or anxious, display disruptive or violent behaviors or have intense mood swings, does not mean that person is living his or her life to its fullest. At best, they can be said to be stable. But stable is not flourishing (Keyes, 2005).

Currently, research on adolescent development has made a shift from defining PYD by measuring the absence of negative behaviors to measuring the presence of positive characteristics in adolescents (Lerner et al., 2005). Examining PYD from the context of looking at increasing positive characteristics rather than decreasing negative ones promotes teaching adolescents the necessary skills to experience lives filled with positive emotions, such as joy, gratitude, hope, love, and happiness, rather than only focusing on eliminating negative symptomatology. This is a welcomed change in the definition of PYD because PYD now takes into account a more complete range of experience and emotions in adolescents.

One study, although conducted with adults, supports the notion of viewing mental health from a positive standpoint rather than just viewing mental health as the absence of mental illness (Keyes, 2005). Historically, the absence of mental illness was considered equivalent to the presence of mental health, suggesting the two are opposites. Mental health and mental illness, however, are not opposite sides of one bipolar continuum; instead, they form two distinct correlated continua. The results suggest that

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the presence of mental health is not the same as the absence of mental illness (Keys, 2005). Therefore, mental health should be explored as a separate entity.

Adolescent development must also be seen as a dynamic process. Lerner et al. (2005) discuss the importance of human development and plasticity. There is potential for change throughout the stages of development, as the relationships between the person and her biological, psychological, ecological, and historical function develop and change. Lerner and colleagues describe the bidirectional relationships between individuals and their multilevel context, which represent as plasticity (Lerner et al., 2005). Plasticity provides a hopeful view, showing the capacity for changes in human behavior, which may impact lives positively.

The Present Study

The chapter authors conducted a study measuring adolescent development from the context of looking at a positive characteristic, gratitude. The present study examines adolescent perspectives on the meaning of being thankful. During class time, adolescents were given the following instructions: "Please write a short essay about what being thankful means to you." This prompt is broader than those used in the previously mentioned studies. Therefore, the authors expected to see a broader array of responses. This study was conducted to fill in some of the gaps in empirical research to contribute to the understanding of gratitude development in adolescents and potentially to aid in creating and implementing effective interventions to increase adolescent gratitude.

Participants were students from a public high school in Long Island, New York. Students in grades 9th through 12th participated in the study. Adolescents ($N = 1{,}098$) were asked to write short essays on what being thankful meant to them. Nine hundred fifty-eight essays were analyzed. Approximately 11% of participants opted out, and 1.7% of essays could not be analyzed (e.g., illegibility.) [1]

Thematic analysis was used to identify and analyze essay themes. Specifically, we used inductive analysis, where the author codes the data without using "pre-existing coding frames" or "analytic preconceptions" (Braun & Clarke, 2006). The first author (RJG) coded the data individually. Afterward, a colleague reviewed and assessed a copy of the coded data; detailed discussions occurred when there were any disagreements, and discussions continued until an agreement was found. Coding is most often done by one individual, but it has been recommended that colleagues function as "rigorous examiners and auditors" of analysis (Saldana, 2016, p. 36-37).

Percentiles were calculated for the most recurrent themes across essays. Some essays contained multiple themes. The most recurrent themes across essays were Appreciation (54.07%), Family (31.42%), Positive Emotions (e.g., happiness, pride, joy) (28.81%), Assistance/Support from Others (25.99%), Friendship (21.18%), and Downward Comparisons (16.60%). Several other themes that appeared less frequently included Basic Needs, Not Taking Things for Granted, Counting Blessings, Acceptance, Accomplishments, and Religion.

Happiness was included in the theme of Positive Emotions. Many participants related "being thankful" to feeling happy. For example, one participant included the following statement: "Thankful is to be happy for what you are given, no matter what happens, bad or good, to be happy for living." Another participant wrote, "It's to be happy with what you have and feel good about it." A third participant used these words to define being thankful: "It means to be happy with yourself and what is around you." Such examples support previous research suggesting that gratitude is positively related to happiness (Margelino & Evangelista, 2015; Miller, 2006; Singh et al., 2017). Moreover, as in previous research

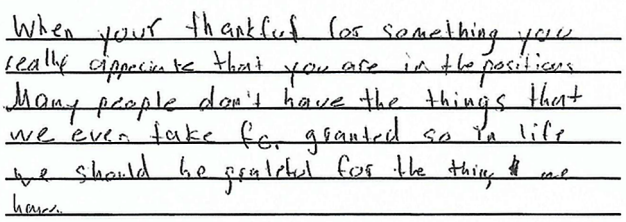
Figure 1. Appreciation and Downward Comparison Essay. This figure is an essay completed by a participant that includes Appreciation and Downward Comparison themes.



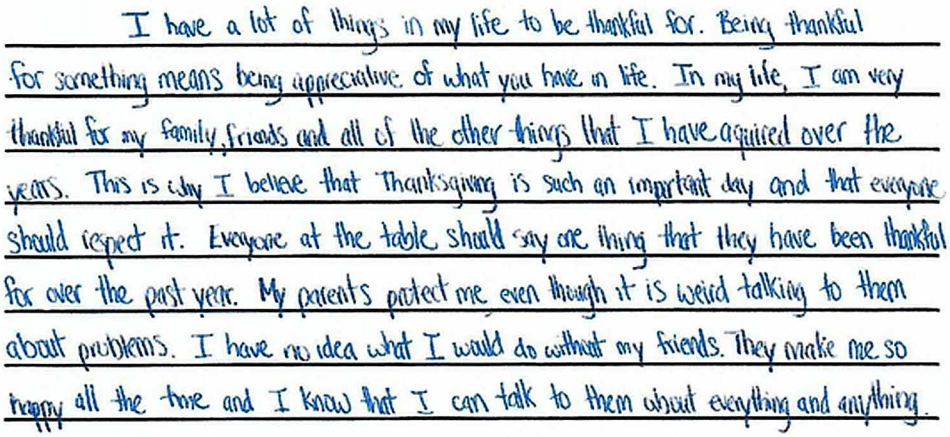
When your thankful for something you really appreciate that you are in the positions Many people don't have the things that we even take for granted so in life we should be grateful for the things we have.

with children, Family and Friendship were common themes (Gordon et al., 2004). For example, one participant included the following statement: "Motivation and support from my family is what I am most thankful for." Another participant wrote, "It is important to say, 'thank you' and 'I love you' when you meant it and to realize that the greatest things in life are the friendships and relationships you have with others, not material goods."

As previously addressed, there has been a lack of research on adolescent gratitude development and research examining adolescent development through a positive lens. Considering adolescents from a negative lens, where the absence of maladjustment in adolescence is considered healthy, does not allow society to examine adolescents who are not just "healthy" but who are also flourishing. What distinguishes the adolescents who are living lives full of positive emotions, such as joy, pride, and gratitude? What are they doing differently than adolescents who are maladjusted or than those who are not exhibiting negative symptomatology but are not flourishing?

Often, adolescents wrote that the meaning of being thankful relates to appreciation and/or to others (family and/or friends) and/or assistance/support from others. This suggests that adolescents who understand and express gratitude may be more appreciative in general than other adolescents. They may also be more aware of and appreciative of others, especially close family or friends who may provide them

Figure 2. Family, Friends, Positive Emotion, and Appreciation Essay. This figure is an essay completed by a participant that includes Family, Friends, Appreciation, and Positive Emotion (i.e., happiness) themes.



I have a lot of things in my life to be thankful for. Being thankful for something means being appreciative of what you have in life. In my life, I am very thankful for my family, friends and all of the other things that I have acquired over the years. This is why I believe that Thanksgiving is such an important day and that everyone should respect it. Everyone at the table should say one thing that they have been thankful for over the past year. My parents protect me, even though it is weird talking to them about problems. I have no idea what I would do without my friends. They make me so happy all the time and I know that I can talk to them about everything and anything.

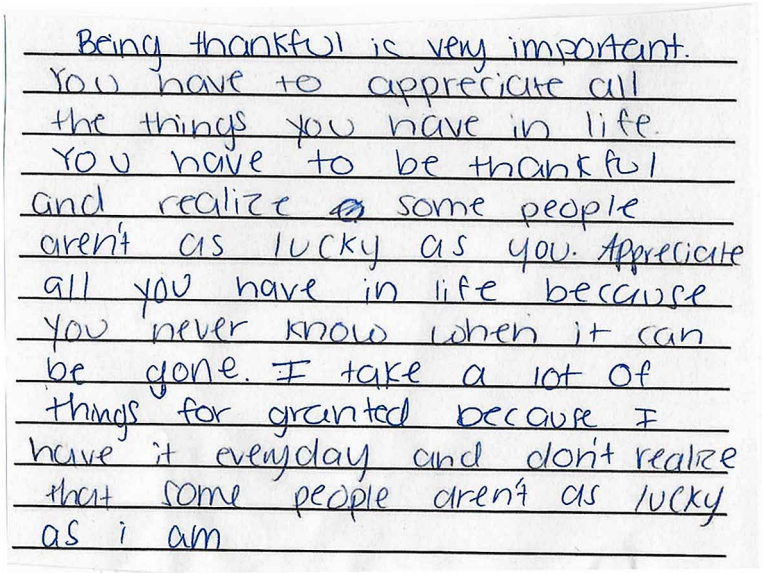
Figure 3. Downward Comparison and Appreciation Essay. This figure is an essay completed by a participant that includes Downward Comparison and Appreciation themes.

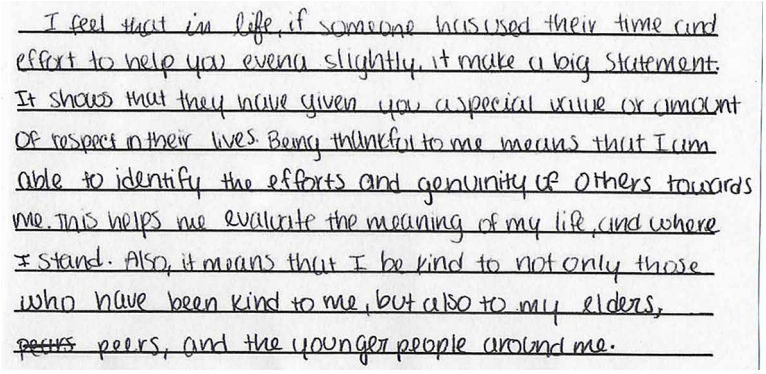


Being thankful is very important. You have to appreciate all the things you have in life. You have to be thankful and realize some people aren't as lucky as you. Appreciate all you have in life because you never know when it can be gone. I take a lot of things for granted because I have it everyday and don't realize that some people aren't as lucky as i am

with support. This is consistent with research discussed above that suggests that gratitude is related to social support (Froh et al., 2009b).

Although the present study has contributed to the growing research on gratitude development in adolescents and aids in the understanding of gratitude development in adolescents from a positive lens, it fails to examine how gender, socioeconomic status, and age moderate gratitude development in adolescents. This is particularly important considering, for example, research has shown that while girls are more grateful than boys, boys may benefit more from expressing gratitude (Froh et al., 2009b). Considering issues associated with the development of gratitude can be useful in designing programs that foster gratitude (Freitas et al., 2011). More research is needed in this area. Examining themes generated in the present study may be helpful in choosing or designing programs that promote gratitude development.

Figure 4. Assistance/Support from Others essay. This figure is an essay completed by a participant that includes Assistance/Support from Others.



I feel that in life, if someone has used their time and effort to help you even a slightly, it make a big statement. It shows that they have given you a special value or amount of respect in their lives. Being thankful to me means that I am able to identify the efforts and genuinity of others towards me. This helps me evaluate the meaning of my life, and where I stand. Also, it means that I be kind to not only those who have been kind to me, but also to my elders, ~~peers~~ peers, and the younger people around me.

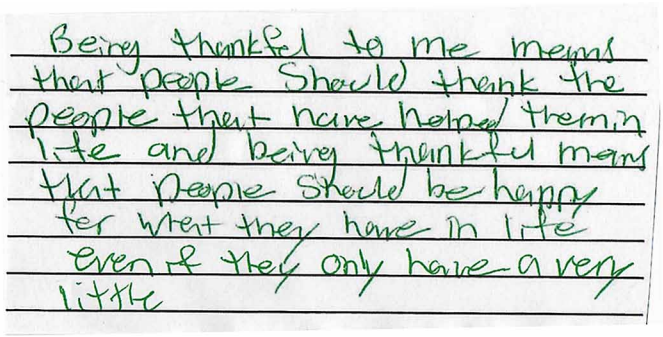
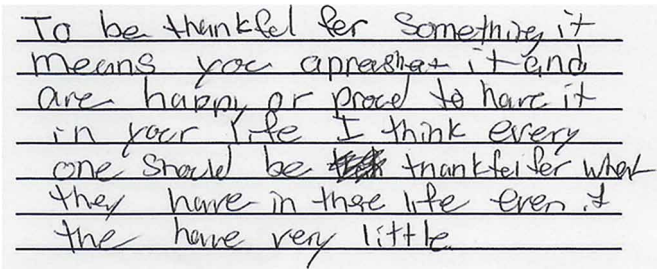
Figure 5. Positive Emotion and Assistance/Support from Others Essay. This figure is an essay completed by a participant that includes Positive Emotion (i.e., happiness) and Assistance/Support from Others.



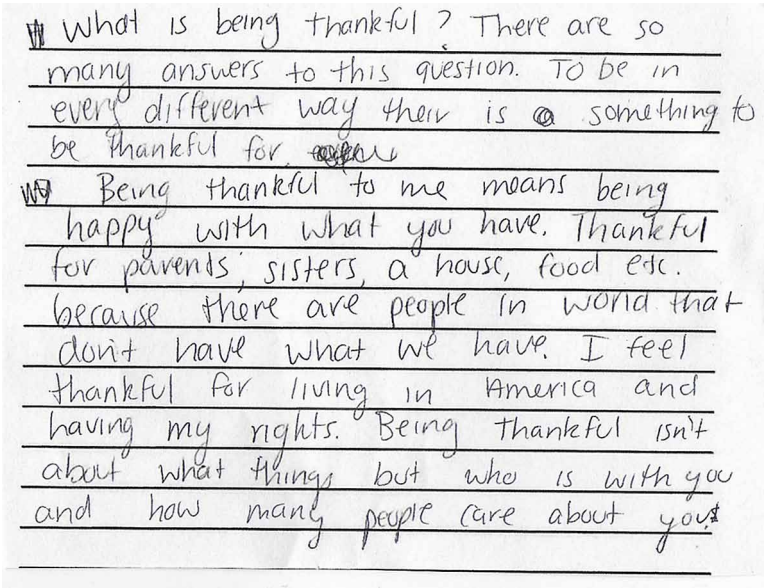
Being thankful to me means that people should thank the people that have helped them in life and being thankful means that people should be happy for what they have in life even if they only have a very little

Figure 6. Positive Emotion, and Appreciation Essay. This figure is an essay completed by a participant that includes Appreciation and Positive Emotion (i.e., happiness and pride) themes.



To be thankful for something it means you appreciate it and are happy or proud to have it in your life I think every one should be thankful for what they have in their life even if the have very little

Figure 7. Family, Positive Emotion, and Downward Comparison Essay. This figure is an essay completed by a participant that includes Family, Positive Emotion (i.e., happiness), and Downward Comparison themes.



What is being thankful? There are so many answers to this question. To be in every different way there is something to be thankful for.

Being thankful to me means being happy with what you have. Thankful for parents, sisters, a house, food etc. because there are people in world that don't have what we have. I feel thankful for living in America and having my rights. Being thankful isn't about what things but who is with you and how many people care about you.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

For example, a more in depth look at appreciation, the most common theme, may be a good place to start. A longitudinal study looking at the changes in the ways in which appreciation is experienced and expressed over time through a child's or adolescent's development might assist in developing effective interventions to help adolescents gain more appreciation and more effectively express their appreciation.

Inhibitors of Gratitude

Because gratitude has a wide array of benefits for adults and adolescents, possible inhibitors of gratitude should be explored. In our country, individuals search for happiness in a variety of ways (Emmons, 2014). Materialism is a popular form of searching for happiness; however, gratitude cannot be sustained in a highly materialistic society (Emmons, 2014). In one study, participants reported that materialism and envy inhibited the frequency of feeling grateful over time (Solom, Watkins, McCurrach, & Scheibe, 2017). When individuals believe that buying items creates happiness, they are less likely to pay attention to their own blessings (Solom et al., 2017). Therefore, materialism is an inhibitor for gratitude that should be addressed.

Individuals who lack gratitude are often characterized as having an exorbitant sense of self-importance (Emmons, 2014). These individuals are often described as narcissistic (Emmons, 2014). A key ingredient in narcissism is entitlement, and entitlement inhibits gratitude (Emmons, 2014). In a recent study, narcissism and cynicism were found to be strong inhibitors of gratitude (Solom et al., 2017). People who are narcissistic may not even be aware that they have received a gift because they feel as though that gift was something they deserved (Solom et al., 2017). When people are cynical regarding others, they are most likely to distrust the motives of others (Solom et al., 2017). People who are narcissistic, cynical, or materialistic may have more difficulty buying into gratitude interventions (Solom et al., 2017). Therefore, when planning to introduce gratitude interventions with clients, it may be beneficial to assess gratitude inhibitors, such as narcissism, cynicism, and materialism, and begin interventions targeting the inhibitors before targeting gratitude (Solom et al., 2017).

SOLUTIONS AND RECOMMENDATIONS

Scholars should continue to tackle the lack of research on adolescent gratitude development and continue to research positive characteristics of adolescent development. This will, in turn, aid in the understanding of gratitude development and in the choice and creation of effective gratitude and other positive psychology interventions to promote flourishing adolescents. The more knowledge that is gained from research on adolescent gratitude development, the more information acquired that can be shared with practitioners. Interventions could be created to increase specific areas that may increase gratitude and other aspects that are related to gratitude. Practitioners should implement the evidence-based interventions to help adolescents live lives full of positive emotions (e.g., happiness). One avenue to reach as many adolescents as possible is to provide these interventions in the school setting. Since students spend a major portion of their weekdays in school, the school setting provides ample opportunity for gratitude interventions. Teachers trained in intervention implementation would be able to intervene on school-wide, class-wide, small group, and individual levels.

Research suggests that counting blessings interventions can be beneficial when conducted in the school setting. In one study, the gratitude condition consisted of participants writing as many as five

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

things they were grateful for since the previous day (Froh, Sefick, Robert, & Emmons, 2008). Results suggested a relationship between counting blessings each school day for 2 weeks and both optimism and life satisfaction, and counting blessings daily has been demonstrated to improve overall subjective well-being (Froh et al., 2008). This intervention is easy to implement and can be done with large groups of adolescents. The second author (JJF) conducted a gratitude intervention with about 1,000 middle school students in their homerooms while practicing as a school psychologist. They were asked to count up to five blessings they were grateful for on a daily basis for 2 weeks. After the intervention, teachers followed a lesson plan using the focused conversation method of teaching (Nelson, 2001). They asked students the following types of questions: *Objective* (e.g., What specific blessings did you count?), *Reflective* (e.g., What did you like most about counting your blessings?), *Interpretive* (e.g., What are the benefits of giving thanks?), and *Decisional* (e.g., How can we practice gratitude in our lives and at school?).

Anecdotally speaking, students seemed to benefit from counting blessings. Some students reported recognizing that "life could be so much worse." One student, who was from a wealthy family, stated "I realized how good I really have it. Some kids have nothing. I just never thought about it before." This is just one of the many creative ways we think youth can be taught to experience and express gratitude. Another option is to dedicate a specific time of year (e.g., a certain month) to expressing gratitude to others. For instance, students can write a thank you card each week for a gift received, such as by another student (e.g., protecting them from a bully), an administrator (e.g., supporting a class trip to a museum), a teacher (e.g., waiting with them until their parents arrive at school to pick them up), or support staff (e.g., ensuring the heat works during the cold winter months). Given the ease of inducing gratitude, its potential for making school tasks and exercises more creative, and its benefits to individuals and their environments, gratitude interventions for youth, in our view, should be seriously considered by those interested in fostering positive youth development.

Counting blessings interventions can also be conducted in the comfort of one's own home. Seligman (2011) recommends that individuals take ten minutes before bedtime to "write down three things that went well today and why they went well." Seligman noted that although the exercise may feel uncomfortable when first starting out, most individuals who complete this exercise become less depressed and happier after 6 months (Seligman, 2011).

Another evidence based intervention is called a "gratitude visit." Froh, Kashdan, Ozimkowski, and Miller (2009a) conducted a study using this type of intervention. Students wrote letters to someone whom they did not properly thank previously. Afterward, the students were required to read their letter aloud to that person. The authors provided an example of a letter that a 17-year-old female adolescent wrote to her mother. The letter stated:

I would like to take this time to thank you for all that you do on a daily basis and have been doing my whole life… I am so thankful that I get to drive in with you [to school] every day and…for all the work you do for our church… I thank you for being there whenever I need you. I thank you that when the world is against me that you stand up for me and you are my voice when I can't speak for myself. I thank you for caring about my life and wanting to be involved… for the words of encouragement and hugs of love that get me through every storm. I thank you for sitting through countless games in the cold and rain and still having the energy to make dinner and all the things you do. I thank you for raising me in a Christian home where I have learned who God was and how to serve him… I am so blessed to have you as my mommy and I have no idea what I would have done without you.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Participants were asked to share their experience with their peers who were randomly assigned to the same condition. Results suggested that students who experienced the greatest gains from the gratitude interventions were those who were initially low in positive emotions; those students reported higher levels of gratitude and positive emotions after the intervention was administrated. Two months later, these same participants reported experiencing significantly more positive emotions compared to participants in the control condition (Froh et al., 2009a). According to Seligman (2011), a person feels happier and less depressed one month after completing a "gratitude visit." Thus, implementing a "gratitude visit" intervention may have a lasting positive impact.

One intervention conducted by Froh et al. (2014) that increased gratitude did so by training participants' benefit appraisals. Participants ranged in age from 8-11 years. Classrooms were randomly assigned to either a school-based gratitude curriculum or to an attention-control curriculum. Five sessions were taught by school psychologist interns. The first session was an introduction. Next, interns helped participants to understand the intentions behind a benefactors' helpful actions. Session 3 consisted of learning to understand the benefactor's experience of cost when providing benefits. Interns then taught participants to understand the benefits of obtaining a gift that they received from a benefactor. The final session consisted of the review and summary of the content presented to them in the previous lessons. Lessons were taught with various teaching methods, including discussions, opportunities to role play, and having participants document personal experiences in a "gratitude journal." In addition, interns highlighted the links between positive occurrences in the participants' lives and the actions of a benefactor. The structure of the attention-control sessions was similar to those of the gratitude condition regarding type of assignment but not content; content in the control sessions was neutral (Froh et al., 2014).

Two different studies were conducted using the above intervention. Results suggested that children can be taught have a greater awareness of their social-cognitive appraisals regarding their experiences as beneficiaries, which resulted in an increase in gratitude and in wellbeing. A daily intervention demonstrated these effects 2 days later, while a weekly intervention demonstrated these effects up to up to 5 months later. These two studies are good examples of gratitude development interventions that can easily be implemented into the school (Froh et al., 2014).

There are already several evidence-based gratitude interventions. These are wonderful starting points, but there remains a need for additional research on gratitude development in adolescents, so that additional effective interventions can be created and implemented. The educational environment may be an ideal venue for implementing such interventions because of the opportune access to adolescents that schools provide.

FUTURE RESEARCH DIRECTIONS

There has been a recent growth in the volume of research regarding gratitude development in adolescents; however, additional research in this area would be beneficial. One area for future research might include a focus on moderators. These could include gender, age, or socioeconomic status, for example.

One area of interest might be examining whether essay themes differ across genders. Could focusing on gender differences help determine whether interventions need to be differentiated for females and males? Results from the Gordon et al. (2004) study, examining themes of school-aged children's written responses to the question of what they are thankful for, suggest that there are differences among boys and girls. Girls expressed more thanks for family, friends, teachers, and rescue workers and helpers, pets,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

religion, and other people (excluding family, friends, and teachers) (Gordan et al., 2004). Therefore, while gender differences have been shown to exist in the themes expressed in children's perception of gratitude, research needs to be done to see if these same differences in themes exists among adolescents.

Previous research that examined mediating effects of positive and negative affect on the relation between gratitude and life satisfaction in late adolescence suggested that positive affect and negative affect fully mediated the relation between gratitude and life satisfaction (Sun & Kong, 2013). The study indicated that gratitude is associated with more positive affect in males, and females with lower negative affect scores were found to have comparatively greater life satisfaction than males (Sun & Kong, 2013). One suggestion for future research is to look at this relationship between gratitude and positive and negative affect from a qualitative standpoint. For example, adolescents (males and females) could write essays, participate in focus groups, or interviews, and researchers could take into account gender differences. Additionally, peer relationships and social support were associated with higher levels of gratitude in boys, while in girls, experiencing school violence predicted less gratitude (Choi & Yu, 2014). For both boys and girls, positive identity plays a key role in gratitude disposition (Choi & Yu, 2014). Together, these data suggest that there are several differences in the way that males and females develop gratitude, but there are also some similarities.

Although the present study looked at gratitude development in high school students in grades 9-12, future research should examine whether themes differ by age. Do themes in the essays written by students who have not yet reached 9th grade differ from those themes found in essays written by older students, for example, in the 12th grade? Previous research suggests that children at different ages express gratitude differently (Freitas et al., 2011; Tudge et al., 2015).

When examining the themes within the essays that school-aged children wrote regarding what they feel thankful for, variations appeared at different ages (Gordon et al., 2004). The older children voiced more gratitude than the younger children concerning family, friends, teachers, rescue workers, events and holidays, and life (Gordon et al., 2004). Several of these themes reference other people. The authors suggest that because younger individuals tend to be more thankful for materialistic items, the more mature sense of thankfulness for others that is demonstrated in older children may be an indication of a decrease in egocentrism and a greater interest in the importance of interpersonal relationships (Gordon et al., 2004). The authors do point out that the older children are more developed and are more capable of writing longer essays, which may have enabled them to list more things that they are thankful for than the younger children (Gordon et al., 2004).

Looking at adolescents from different socioeconomic backgrounds would be beneficial. In the present study, one of the major themes indicated was downward comparisons. Most participants in this sample come from affluent backgrounds. Previous research suggested that adolescents of lower socioeconomic status reported higher gratitude than adolescents of higher socioeconomic status, suggesting that, at times, wealthier adolescents do not feel as grateful (Choi & Yu, 2014). Perhaps participants from middle class and low socioeconomic status may define the meaning of being thankful differently than those from an affluent community. If so, interventions that foster gratitude growth would need to be differentiated for communities of different socioeconomic statuses. More research is needed in this area.

Another potential area for future research would be examining the inhibitors of gratitude and their influence in more detail. It might be productive to conduct a study with adolescents who score high on materialism or other inhibitors of gratitude. Interventions can be created to address these inhibitors (e.g., materialism). In one study, participants consisted of highly materialistic adolescents from the United States (Kasser et al., 2014). Adolescents received an intervention that was based on an established finan-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

cial curriculum, which included parental involvement (Kasser et al., 2014). Results suggested that the adolescents who were highly materialistic at the start of the study and received the intervention showed decreases in materialism and increases in self-esteem compared to a control group (Kasser et al., 2014). Once inhibitors are addressed, it would be interesting to see if these adolescents become more responsive to gratitude interventions than those who do not receive interventions targeting gratitude inhibitors. These types of studies would provide valuable information for practitioners who are an interested in increasing gratitude and other positive characteristic in adolescents.

CONCLUSION

Gratitude is a critical part of an adolescent's healthy development. The experience and expression of gratitude may promote appreciation, positive emotion, social support, and overall subjective well-being. Although gratitude has been shown to relate to positive youth development, research on adolescent gratitude development is still in the beginning stages. We have sought to review the literature on gratitude and happiness and to introduce a qualitative study examining adolescents' definitions of what it means to be thankful to expand the knowledge base on gratitude in adolescents. We also reviewed literature on evidence-based interventions to offer possible recommendations for practitioners working with adolescents in the schools that would support increases in felt and expressed gratitude as well as other aspects of positive youth development. Gratitude positively impacts areas of fundamental importance to adolescents. Thus, developing gratitude interventions in educational settings could potentially improve adolescent psychological health.

The present study has shown that when adolescents think about the meaning of thankfulness, appreciation of others (family and friends) and the assistance/support they've received from others comes to mind. Therefore, grateful adolescents may be more appreciative in general and, more specifically, to others than their peers who do not have as deep of an understanding of gratitude. One possible conclusion that can be drawn from this relation between gratitude and appreciation is that fostering a sense of gratitude in adolescents may help adolescents develop more positive feelings about their relationships. Parents can help by fostering gratitude and appreciation in the home. Parents can be mindful of their own responses and can model the expression of gratitude and appreciation for family members and for others they interact with in the community. Parents can also positively reinforce the same behaviors in their children.

The school environment is another place where gratitude development can be encouraged. Gratitude interventions could be implemented into existing school curricula utilizing implicit techniques. In English class, for example, teachers could ask questions or facilitate discussion relating to characters' experiences or expressions of gratitude within specific texts. These implicit techniques can be applied to history class as well, during lessons analyzing important events that have shaped the course of history and society. Gratitude and other positive education exercises could be implemented in art classes as well. For example, students could create positivity portfolios. Students would be asked to collect items that inspire positive feelings and emotions and look at their portfolios whenever they felt they needed an emotional lift (Fredrickson, 2009).

Across curricula, teachers could create classroom environments that would stimulate expressions of gratitude. Teachers could reinforce acts of kindness in their classrooms and model positive responses in multitudes of situations. Increased exposure to such responses and reinforcement of supportive ex-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

changes promote the development of gratitude. These practices could have a broad impact, creating a more positive whole-school environment.

Gratitude, a critical component of health for adolescents, need not be left to develop on its own. Parents, teachers, and community members can—and should!—look for opportunities to model and reinforce behaviors that reflect the expression of gratitude and appreciation. Sometimes, there are inhibitors of gratitude that must be addressed before gratitude interventions are undertaken. This will ensure the greatest effectiveness of these interventions. A solid understanding and expression of gratitude will serve adolescents well as they navigate through this trying developmental stage.

KEY TERMS AND DEFINITIONS

Concrete Gratitude: When reciprocating, the person does not consider the benefactor but, instead, gives something to the gift-giver that the person himself appreciates.

Connective Gratitude: When reciprocating, the person considers the benefactor by choosing something that the benefactor will appreciate.

Downward Comparison: Comparing one's self to others who are less fortunate.

Gratitude Visit: An intervention where a person writes a letter to someone whom he did not properly thank previously. Afterward, the person who had written the letter, reads his letter aloud to the person that he is thanking.

Happiness: A subjective measure of life-satisfaction, including high positive affect and low negative affect.

Life Orientation Gratitude: A view of gratitude as being part of a broader life orientation, involving the observation and appreciation of all that is positive in the world.

Materialism: When people place importance on material items, even believing that the gaining of material items can provide them with increased happiness.

Moral Affect Gratitude: A view of gratitude as connecting to moral behavior, which occurs when a person has concern for another human being.

Chapter 91
Cross-Cultural Decision-Making in Healthcare:
Theory and Practical Application in Real Clinical Conditions

Tomasz Komendziński
Nicolaus Copernicus University, Poland

Emilia Mikołajewska
Nicolaus Copernicus University, Poland

Dariusz Mikołajewski
Kazimierz Wielki University, Poland & Nicolaus Copernicus University, Poland

ABSTRACT

This chapter describes how people are connected to each other through a common system of encoding and decoding messages. Opening the European gate has made intercultural communication omnipresent, and this includes health care. Internationally-based tasks need new, culture-aware medical practitioners. The challenges, barriers, and solutions in the aforementioned area based on the personal experiences of the authors. The chapter concludes that in spite of personal experience, intercultural tension continues to be a major hinderance to patient healthcare services.

INTRODUCTION

Culture constitutes a complex structure that includes habitual ways of thinking, acting, and interacting. This built-in set of procedures is "the software of the mind" and can be shared, learned, and updated, but is also subject to typically gradual change. Many attempts at defining culture describe it as a non-monolythic, overlapping set of internal "scripts" defining the functioning of social norms and values: "culture involves the ideas, beliefs, values, and assumptions about life that are widely shared among a

group of people and guide much of their behavior" (Brislin, 1993). Assuming this perspective allows us to realize that people are equipped with various cultural "tools", and some of them may overlap or even cut across different cultures (national, regional, organizational, professional, etc.). It can be also shaped by many factors: family, religion, political and educational systems, art and other activities. Culture also influences our vision of the world and interactions with other people: cognition (behaviors, information) and recognition and interpretation of emotions (both our own as well as those of others). Within a particular culture, people are connected to each other through a common system of encoding and decoding messages. Messages are sent, received and confirmed through verbal and nonverbal behaviors (Kim, 1988).

The multiculturalism of the European society is deep due to the migration of people and extensive tourism. There is no doubt that opening the European gates made social interaction and mutual understanding between representatives of different cultures much easier. Intercultural communication helps us become more familiar with foreign countries, organizations, and cultures and affords new opportunities for intercultural communication (Hornakova, 2006).

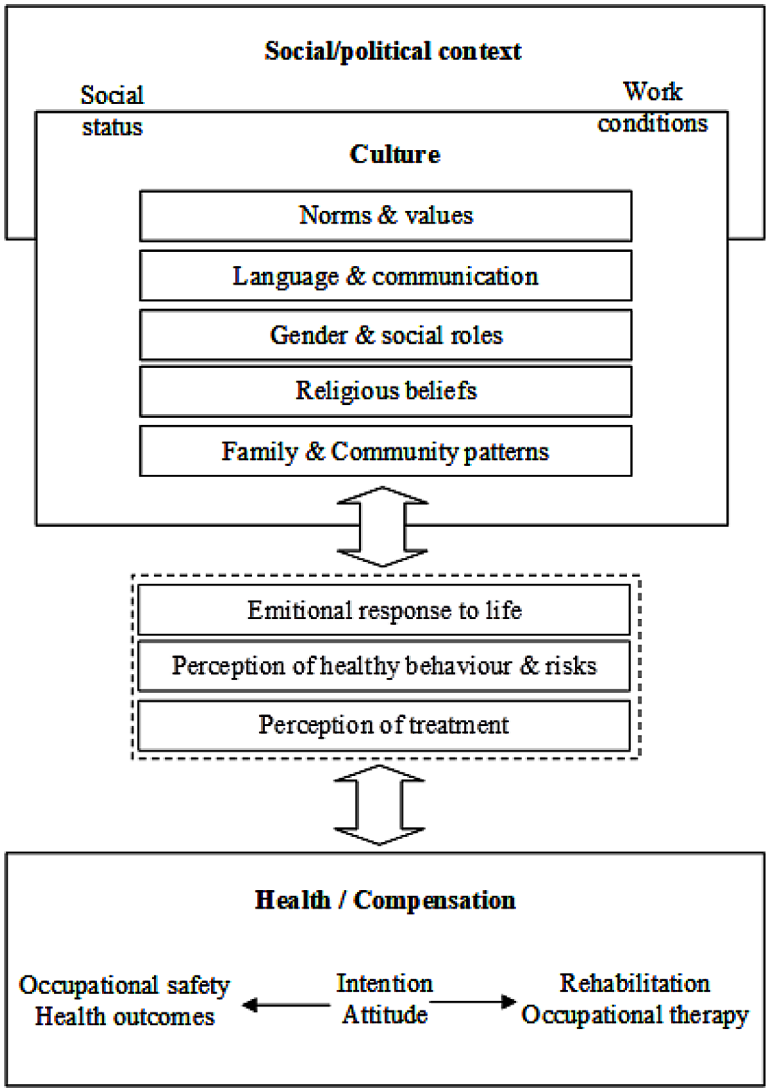
Current approaches to understanding other cultures are divided into a dissecting (superficial) model and a classifying (quantifying) one. Both these approaches have their strengths and weaknesses, but there is a clear need to develop, implement, and evaluate high-quality semi-automated education and training programs that focus on human perception and deeper understanding of other cultures without stereotyping. This way every culture can be recognized and "decoded" thanks to the cultural intelligence, even though the cultural mindset of a typical Polish person might be very different from that of a Japanese, which results in different interpretations of the same behaviour. Our aim is to think how to predict and avoid failing in inter-cultural interactions within a working health care system.

This issue is important for organizations operating in both national and international environments. The specific organizations in question are health care units and their everyday clinical practice. In times of hardship, full of social tensions and unrest, there might arise sudden and drastic cultural shifts, which often make the biases and limits of the existing models of culture more visible. They may provide only a partial view of culture and significantly influence the effects of clinical practice. Taking into consideration various perspectives and interpretation of own behavior may be thus critical. Cross-cultural decision making, culturally-aware education systems and highly-developed information gathering and analysing capabilities have become a foundational part of health care systems, which allows for implementing effective forms of treatments (higher quality of life for the patient in terms of health condition). Even those organisations that are described as most conservative and reflexively opposed to changes in the health care system are aware that medical knowledge and clinical experience are not enough to assure recovery and respect the patients' free will and choice. The ultimate therapeutic success is now measured by different standards than before, namely, by the patients' capacity to return to education/work, participation in everyday life of their family and community, and finally by the general patient satisfaction. Such a success may be achieved despite the impossibility of complete recovery.

The challenges that international medicine poses call for a new breed of culture-aware medical practitioners. We do not know if transcultural orientation is the best possible solution, but we have to take it into consideration. There is often the need for new solutions, joint research, health care or educational activities. This instigates adaptive reformulations of the progressive health care guidelines, standards, and procedures. Moreover, we do not know if institutional health care culture really can pose significant obstacles to organizational adaptation.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Cultural categories and their relations to health and compensation
Côté, 2013.



The phenomenon of non-native or foreign patients and health care staff is not limited to one country or even one continent. What is more, the percentage of non-native physicians in selected countries may in the future increase up to 30% - understanding dialects, colloquial speech, and body language may be difficult for them.

Even the most homogenous society is not a society without differences. Demographic shifts make cultural diversity an important factor in the workplace of the medical staff. Due to the diversity of patients' backgrounds, clinical specialties, approaches and diagnostic/therapeutic methods, understanding the importance of communication in health care delivery becomes the key issue. The same patients communicate with physicians, therapists, doctors, and other health care professionals from differing cultural backgrounds.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The term "health care provider" encompasses the organization and its workers, i.e. not only medical specialists, but also pharmacists, medical secretaries, medical IT specialists, the administrative personnel and others. These people may get in touch with patients (even accidentally) and influence the public relations of a particular health care provider. Thus, the term "delivery of health care" encompasses all services offered by a health care provider (not only treatment, rehabilitation and care). We should be aware that the aforementioned terms and definitions, as far as some strict regulations and procedures, may be perceived by patients as an attempt at dehumanization of the health care and a lack of an individual approach to each particular patient.

BACKGROUND: INTERCULTURAL COMMUNICATION IN HEALTH CARE AND ITS CHALLENGES

Health care workers have to learn how to communicate effectively with people from other cultures (Collier, 1989). Effective intercultural communication in health care affects patients' physical and mental well-being (Voelker, 1995). Understanding and respecting the values, beliefs, and attitudes of the patients constitutes a key element of this process (Bronner, 1994; Moore, 1992).

Interactions within the health care system are intercultural, since patients do not share the terminology, assumptions, and norms of the health profession culture (Ulrey & Amason, 2001). Setting up an effective health care system requires recognizing the importance of communication: faster and more precise diagnosis. Shortcomings in communication may lead to shortcomings in health care. Strict health care procedures are not the same as communication between two parties: the medical team and its patients. The medical jargon and lack of time make patients feel as if they were communicating with a machine (internet bot): quick procedural questions, lack of confirmation, poor understanding, weak patient-therapist co-operation.

A better ability to communicate across cultures may provide a significant market advantage, since improved communication may influence public relations and produce credentials as a patient-friendly and effective brand.

Miscommunication may, at the very least, cause dissatisfaction and stress for both providers and patients, but it can also lead to misunderstandings and costly mistakes, including misdiagnoses and violations of patients' ethical beliefs (Ulrey & Amason, 2001). A common example of this is when patients from different cultures report pain in various ways (Lee et al., 1992), and even informed consent (full information enabling them to freely make decisions about their own health care) may be culture-sensitive (Gostin, 1995).

The medical staff should learn to decode non-verbal expressions characteristic of patients from different cultures, they should study their traditions, customs, religions and lifestyles as well (Hornakova, 2006). The traditional, monocultural health care organizations contribute to the exclusion of certain social groups (Stone, 2009).

Health care is not typically a competitive market, but it nonetheless needs to advance and prove successful in its endeavours. Market decisions that are confusing or difficult to understand to the society bring infamy and may influence the reputation of the health care unit. Intercultural issues in health care may take away the attention from work-related factors and emphasize the attitude, expressions of feelings, perceptions, therapist-patient relationships and modalities of intervention in intercultural settings (Côté, 2013).

INTERCULTURAL COMMUNICATION IN HEALTH CARE: BARRIERS

We can consciously, though not always directly, assess the effectiveness of our communication with others.

There may be defined four primary cultural dimensions:

- **Patterns of Thought:** Common ways of thinking, beliefs, values, norms, and emotional attitudes,
- **Patterns of Behavior:** Common ways of behaving, speaking, etc., with intentional/unintentional, unconscious/subconscious or individual/interactive behaviour,
- **Patterns of Artifact Utilisation:** Common ways of manufacturing and using things, dwellings, tools, machines, and media,
- **Imprints in Nature:** The long-lasting imprints left by a group in the natural surroundings, (agriculture, trash, roads, etc.).

The most important factors influencing health care communication are as follows:

- Sensitivity to cultural differences where cultural sensitivity is defined as "willingness to use cultural knowledge while interacting with patients and considering culture during discussions and recommendations for treatment" (Brislin, 1993; Dennis & Giangreco, 1996; Jackson & Haynes, 1992))
- Language barriers (not only in clinical assessment, but also in translating prescriptions, etc.), including night shifts in hospital, where the number of bi- or multi-lingual personnel is limited
- Religious or spiritual beliefs, taboos, sex-role differences
- Patients' assumptions and beliefs concerning health care
- Prejudicial attitudes (sets of ideas based on stereotypes) influencing health care delivery, which is defined as "different ways that some cultural groups are treated in the health care system"
- Tensions between the patient and his/her family and the medical staff
- Disabilities, disorders, pain, stress, depression (including non-disclosed aliments and deficiencies, e.g. driver who resist diagnosing and healing eyes failure because he fears that he will lose his job
- Power differences (imbalances of power) – built into the health care structure
- Health care as a business (e.g. limitation of health care services)
- Intercultural vision of medical ethics
- Some controversial subjects: mental illness, AIDS, sexually transmitted diseases, vaccines, impotence, abortion, euthanasia, and in-vitro fertilisation
- Medical miscommunication - cultural misunderstanding resulting in medical mistakes, problems with patient use of medication, etc.

Physicians can give information about the patient's health within four general frameworks:

- **Strict Paternalism:** Reflects a physician's decision to provide misinformation to the patient when the physician believes it is in the best interest of the patient (e.g. in the case of a patient with terminal cancer)
- **Benevolent Deception:** When the physician chooses to communicate only a part of a patient's diagnosis (e.g. in the case of patients with poor prognosis)
- **Contractual Honesty:** Telling the patient only what she or he wants/wishes to hear or to know

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Unmitigated Honesty:** When a physician chooses to communicate the entire diagnosis to a patient

Cultural sensitivity and effective intercultural communication undoubtedly benefit the health care providers personally by reducing their stress levels. Patients are often too scared and sick to focus on communication, whereas the providers are pressed for time or too focused on technology (Kreps & Kunimoto, 1994). Medical staff should endeavor to reduce the effects of lapses in communication whenever possible.

INTERCULTURAL COMMUNICATION IN HEALTH CARE: SOLUTIONS

Even though both sides – the patient and the medical specialist - are responsible for effective communication, it is the latter on whom the greater share of said responsibility lies, since it is them who is expected to use their training and communicative competence to develop positive relationships that facilitate an accurate diagnosing and effective treatment of patients (Ulrey & Amason, 2001). The trust on part of the patient and his/her family significantly influences the efficacy of the health-promoting strategies that are at the doctors' disposal.

Three dimensions of intervention in the context of cultural pluralism are highlighted by authors:

- Therapist-patient relationship
- Organisational structure
- Cultural competence, i.e. set of attitudes, practices and policies needed to develop culturally responsive caring (Côté, 2013)

Lots of attention should be focused on preventing and solving issues related to intercultural communication. If hospital staff understands cultural differences, it might help avoid many conflicts that might ensue from said differences.

Cultural sensitivity in health care settings includes:

- Avoiding routine
- Using culturally appropriate language
- Having knowledge of other cultures
- Understanding culture-specific value
- Considering culture in assessment of patients
- Adapting treatment according to the cultural knowledge they have regarding a patient (Bernal et al., 1995; Dennis & Giangreco, 1996)

Intercultural communication training programs for health care providers covers cultural accommodation of the medical staff. One of possible solutions is the LEARN model:

L: Listen to the patient's perception of the problem
E: Explain your point of view
A: Acknowledge and discuss the differences and disparities in perceptions of the problem,
R: Recommend treatment
N: Negotiate treatment (Edlin 2012)

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Key issues are also: family involvement, community involvement: social support and feedback, chaplain involvement (where possible), and combating myths thanks to EBM-based therapy (but see also for role of alternative therapies as complementary medicine).

Study by Hornakova on Czech health care system showed that understanding the professional foreign terminology used in clinical practice is important for the majority of health care specialists. It is rarely possible to implement it in everyday clinical practice, and the most common way to maintain it are internet, professional literature, radio and television. Moreover, better financial prospects were much more important than higher qualifications or career development (Hornakova, 2006). Recommendations for effective intercultural communication in health care profession are as follows:

- Have enough time for each client from different culture
- Find a language for communication
- Use simple words and expressions which the patients from other cultures will understand
- Avoid medical terminology as much as you can
- Speak slowly and clearly, repeat words more often and require the same from different-culture patients
- Health care professionals should learn words for basic communication in the language of the Different-culture client and use them adequately
- Suppose possible prejudices and check the meaning of understanding
- Take your time to express yourself, do not be in a hurry
- To facilitate better understanding, smile and use gestures and visual aids in form of pictures
- Notice the non-verbal expressions of different-culture clients
- Find solutions that are a compromise, tolerate cultural varieties and ethics
- Help your clients express their feelings, ideas, opinions and needs
- Add schemes, drawings, communication cards, etc.
- Be patient and tolerant to all non-verbal expressions of different culture clients
- Verify whether the client understands the basic information you are trying to convey
- Provide the date(s) in numbers rather than words
- Listen carefully
- Encourage a client from the different culture to express their feelings, ideas, opinions and needs
- Use foreign language dictionaries and an interpreter if necessary (Hornakova, 2006)

COMMUNICATION WITH PATIENTS WITH NEUROLOGICAL DISORDERS

Stroke therapy focuses on reducing mortality, decreasing functional impairment, and increasing the patient's quality of life. Stroke may affect various levels of the nervous system and can lead to complex reception and/or perception deficits. Communication in post-stroke patients is impaired by aphasia, dysarthria, and many other syndromes. Patients with communicative disorders and special needs typically require further diagnosis and therapy aided by the speech pathologist. Medical staff and family/caregivers need obey rules related to the deficit areas, and certain possible psychological reactions and their influence on patient and his/her environment should be discussed (Pimentel, 1986). Although patient-staff communication is regarded as important, Laghorne et al. put little emphasis on it in their study in the section where they describe stroke patient care. They enumerate the following elements:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Assessment procedures: medical, nursing and therapy assessments
- Early management policies: early mobilization, avoidance of urinary catheterization, treatment of hypoxia, hyperglycaemia, and suspected infection
- Ongoing rehabilitation policies: coordinated multidisciplinary team care, early assessment for discharge (Langhorne et al., 2002)

Most of stroke units offer both acute medical treatment and rehabilitation. A stroke unit is characterized by the following features:

- Is geographically defined with dedicated beds
- Has multidisciplinary and specially trained personnel
- Has standardised protocol for diagnostic evaluation, observation, acute treatment and rehabilitation (Indredavik, 2007)

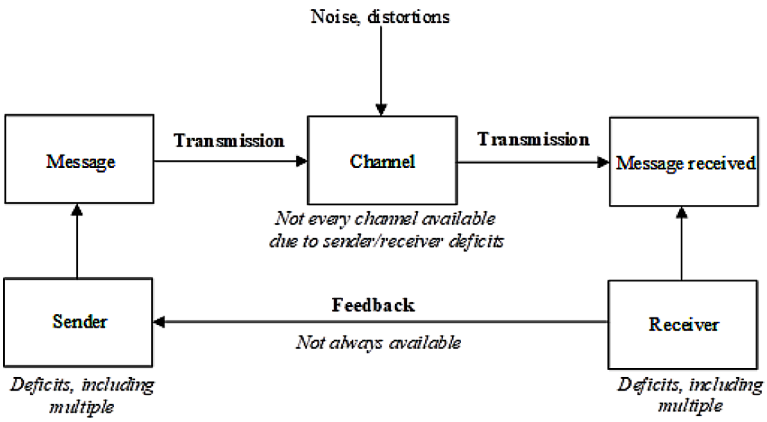
Study by Pound & Ebrahim showed that on the stroke unit, teamwork was divided between doctors and therapists on the one hand and nurses on the other, while on the general medical ward, team working was not observed (Pound & Ebrahim, 2000).

Study conducted by Pound & Ebrahim showed that tasks at the stroke unit were divided between doctors and therapists on the one hand, and nurses on the other. No such tendency was observed at the general ward.

Following figure shows adaptation of the traditional Shannon-Weaver's communication model to communication taking into consideration patient's deficit. It may be modified individually for each patient.

Sudden hearing loss in post-stroke patients (both on brain stem or cortical level) is regarded as common. It may severely impair the patient's ability to communicate (Bamiou, 2015).

Figure 2. Shannon-Weaver's communication model which takes into consideration patients' deficits
Own project based on original Shannon-Weaver's model (Shannon 1948).



EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In the case of neurological rehabilitation services, multidisciplinary team approach is advocated. Coordinated work of various specialists better stimulates patients with neurological disorders, which also improves therapy outcomes. Despite general guidelines, lack of detailed procedures makes therapists' experiences and perceptions diverse, as far as structure and composition of the team are concerned (Suddick & De Souza, 2006).

Multidisciplinary team meetings are regarded as useful form of coordinating daily work and a form of institutionalised communication. However, to be effective, the meetings need to:

- Organise and communicate in the team adequately
- Achieve a consensus in a multidisciplinary discussion
- Offer consistency in the patient management standard
- Include a teaching element for junior team members
- Improve communication between different specialists
- Have a mature leadership
- Be democratic
- Entail constructive discussion. (Ruhstaller et al., 2006)

Now such meetings are regarded as a key component of a professional's routine. As opposed to the multidisciplinary team, integrated care methods may not reduce disability, institutionalisation, or duration of hospitalization. (Sulch et al., 2002).

Multidisciplinary team in stroke rehabilitation offers:

- Improved team working
- Better understanding of patients' needs
- Enhanced SMART (specific, measurable, achievable, realistic and time framed) goal-setting
- Greater patient involvement (Monaghan et al., 2005)

Nursing staff might be considered a weak point of post-stroke therapy and communication.

Nurses often talk with patients in a functional manner, use minimal social or affective communication, avoid patients with communication difficulties. They control conversation, its topic and flow. A certain asymmetry was observed: patients responded briefly to closed-ended questions, whereas the conversation focus should be on the patient's goals, hopes, worries and future expectations. Poor communication may impair the development of communication abilities and the potential to recovery. (Gordon et al., 2009).

The International Classification of Functioning, Disability and Health (ICF) may clarify team roles and clinical reasoning for rehabilitation planning purposes. It may also aid communication within multidisciplinary therapeutic team; moreover, it may structure service provision in the conditions of mixed skills, individuals' interests, and staffing levels within teams (Tempest & McIntyre, 2002).

COMMUNICATION WITH PATIENTS WITH AND POST-CONSCIOUSNESS DISORDERS

(Re)establishment of communication is one of the main goals in the assessment and therapy of patients with disorders of consciousness (DoC). Extensive motor impairment and lack of speech are challenges for further communication. What may also be apparent is the absence of external signs of consciousness. Patients are able to process stimuli of varying complexity even in cases of being unable to respond. Unfortunately, patients with DoC are the the most severely impaired; in effect, severe motor impairment, fatigue and attention disorders, may lead to severe communication deficits in this population. Little is known about the mental life of such patients, and it still needs further research. How can be sure, if certain person is conscious and aware. (One may ask how can we not be sure whether a certain person is conscious and aware or not) Current diagnoses and assessments, based mainly on behavioral measures, are unreliable and prone to errors. Disorders of communication similar to DoC may cause discerning the disorder and lead to false diagnoses. High rate of misdiagnosis (around 40%) is observed in assessment of awareness in patients in a vegetative state (VS, called also unresponsive wakefulness syndrome, UWS) and patients in a minimally conscious state (MCS).

Predicted response to external command constitutes reliable method which allows detecting awareness in patients with DoC. Answer may have various forms, usually measured using dedicated devices (EEG, fMRI, etc.). Action or intention reflected in the predicted pattern of activity observed in the brain (the so-called neural representation) can also constitute a response. Distinction between responsive and nonresponsive patients are still beyond our recognition, but it is fundamental for diagnosis, prognosis, clinical therapy, rehabilitation and care, and even medical ethics, legal rules, and decision-making process (Owen, 2013).

Attempts of communication with the aforementioned patients constitute a major challenge; however, the activity is not without a purpose. Certain percentage of such patients can respond to commands, but we have to help them in improving existing communication channels or providing a new one.

Some percentage of patients with DoC is able to respond to commands by willfully modulating their brain activity (e.g. by selectively paying attention, depending on the stimuli). A binary yes/no answer is much better than no response whatsoever. We hope patients with DoC can selectively maintain attention to certain events in their environment, process them and understand them thanks to coherent thought. We also anticipate that these patients can formulate answers, and wilfully manifest them thanks to a novel technical solution. Brain-based communication tests with the use of functional magnetic resonance imaging showed that all patients followed instructions from commands. Patients in these tests were able to answer either yes or no. As a result, behaviorally nonresponsive patients regained ability to communicate with environment (Naci & Owen, 2013).

Functional magnetic resonance imaging (fMRI) and electroencephalography (EEG)-cover areas of basic sensory, perceptual, language, and emotional processing assessment in patients with DoC. But a positive detection of conscious awareness and possibility for communication is much more difficult (Harrison & Connolly, 2013). Even patients in vegetative state (VS) who appear to be awake do not show any signs of awareness. Yet, they can respond to commands thanks to brain-computer interfaces: willfully modulating their brain activity according to instruction (Naci et al., 2012).

Discrimination between vegetative state and minimally conscious state are essential to subsequent rehabilitation and care. Some EEG procedures are developed to do it quasi-automatically (Mangia et al., 2014).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Binary response "yes/no" to the question may elicited by performing mental imagery tasks using fMRI. Such mental imagery process produces distinct activation patterns (compared to motor imagery in controls). 3 Tesla fMRI is required to provide an appropriate signal-to-noise ratio (Liang et al., 2014).

Variations of similar technical solutions are available for different DoC patients. UWS patients are regarded as having no awareness, while MCS patients are regarded as having their conscious awareness partially preserved. Lancioni et al. described two studies with various types of response:

- Willingly imaging of single- versus double-hand closure
- Increase engaging in leisure activities, and listen to audio-recordings of family members (Lancioni et al., 2014a)

Passive and isolated patients emerged (who recovered from?) from DoC have access to the broader repertoire of responses, despite speech and motor impairment constituting a huge difficulty. Thus, intervention programs relying on assistive technology are applied, including:

- Accessing brief periods of stimulation through one or two microswitches
- Combining a microswitch and a sensor connected to a speech generating device
- Controlling through computer or radio systems and a microswitch
- Communicating through modified messaging or telephone systems operated via microswitch
- Controlling and communicating options through computer systems operated via microswitch (Lancioni et al., 2014b; Lancioni et al., 2012)

What was also described were important brain markers detected in cognitive processes and awareness in the absence of behavioral manifestation; however, which of these are available for DoC patients remains unknown.

Various solutions based on distinct paradigms may be feasible to various DOC patients. Moreover, we should take into consideration clinical usefulness of each solution – e.g. limitations in fMRI due to its:

- Huge dimensions (lack of bedside version)
- Weight
- Complex procedure (both realizing and interpreting, hardly generalizable use in clinical routine)
- Weak temporal resolution
- Cost (Luauté et al., 2015)

Quasi-simultaneous fMRI-EEG measure, increases time resolution of the measurement, is available. But it seems current form of fMRI will not be individual equipment of the patient with DoC. Comtte et al. compared four fMRI-based methods correctly and accurately interpreting the communication task, but:

- None of them showed 100% correct detection during the communication
- 25% of participants did not provide the expected patterns of activations (Comte et al., 2015)

BCI paradigms are more feasible than individual equipment. Recent advances concerning studies on magnetoencephalography (MEG) may constitute another breakthrough in BCI technology. However, we still search for patient's bedside equipment. Several limitations of BCIs are important:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Lack of awareness in itself
- Lack of spatial resolution (but computational solutions for EEG source localization still quickly develops)
- Atypical patterns of brain activity in brain damaged patients

Despite relatively quick progress – it may concern minority of DOC patients (Luauté et al., 2015).

Alternative diagnostic tools for asessment response to command are also developed. Detecting signs of consciousness in patients in vegetative state/unresponsive wakefulness syndrome (UWS/VS), minimally conscious state (MCS) is possible with the use of a breathing-controlled communication device. One of them achieves accuracy 84%. Patients with locked-in syndrome (LIS) were unable to use it (Charland-Verville et al., 2014).

Despite needs and reported efficacy, the development of the aforementioned systems is limited by many technical and clinical challenges. Such communication mode is difficult, and it also requires trained personnel. Inter-cultural communication using BCI is difficult but not impossible. It requires deep adaptation of the therapeutic team to the needs, knowledge, and previous experience of the DoC patient. Patient's family assistance seems to be very valuable.

COMMUNICATION WITH GERIATRIC PATIENTS

Caring for elderly people (especially: elderly parents) is common in many cultures, not only in the Western culture. Despite various co-occurring physical and/or mental diseases, the elderly is no different from other patients. Communication is crucial for them. Activities and interactions of elderly patients are useful for measurement of their cognitive and behavioural functioning. Study by Armstron-Esther et al. reported rather low levels of staff-patient interaction beyond expected routine of patient care. Staff did not engage patients in social activities or informal conversations while elderly patients require enjoyable and rewarding conversation (Armstron-Esther et al., 1994).

Optimal performance of medical procedures in the elderly needs adequate clinical communication with patients. Importantly, the traditional paternalistic relationship between the patient and the therapist is no longer appropriate. The optimal performance can be achieved by:

- Accuracy
- Empathy
- Efficacy
- Shared decision-making and setting common goals
- Informed consent process
- Adaptation to patient understanding (including level of education, personality, etc.)
- Adaptation to possible cognitive impairment (Giampieri, 2012)

Pain is regarded as a vital factor which influences the course of communication. The following issues were identified in pain-influenced communication:

- Nurse-to-nurse communication
- Nurse-to-patient communication

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Pain management strategies
- Environmental and organisational issues related to care
- Complex nature of pain (Manias, 2012)

Best practice for the management of pain in elderly patients is not fully covered within guidances, partly due to inconsistences and differences in the patients' profile, methods and definitions used. The problem is also influenced by attitudes and beliefs of older people influence all aspects of their pain experience (stoicism is prevalent). Therapies must be individualised and carefully monitored, and certain psychological approaches seem be useful in older population (Abdulla et al., 2013).

Conversational strategies in nurse-to-patient communication should fit the demands of elderly patients suffering, for example, from dementia. The aforementioned can be further divided into two sides of communication:

- **Nurse Conversational Strategies:** Moderating, clarifying, exploring, validating, rescuing, and general discourse markers,
- **Patients' Conversational Strategies:** Discourse markers, limited engagement, expanded responses, personalized response, self-initiated participation, disconnected or fragmented participation.

Even patients with dementia are able to participate in such adaptive conversation (Perry et al., 2005).

Patients with dementia are a special group of elderly patients. The language used by medical staff should match the comprehension abilities of residents. In effect, they become agitated (which is displayed by restlessness, strange noises, or negativism) if this language is too complex for them (Hart & Wells, 1997).

COMMUNICATION WITH PAEDIATRIC PATIENTS

Communication with paediatric patients and their caretakers is extremely difficult and requires not only sophisticated tools but also extraordinary abilities of the general practitioner. The concept of child-physician communication is based on mutual trust, knowledge and experience of the GP. It constitutes developmental intervention itself and shapes new intervention strategy in each patient.

The objective assessment of functional achievements in both healthy and ill children (including children with developmental disabilities) may change significantly due to such factors as: boredom, fear, hunger, thirst, etc. An easier diagnosis or even development of motor, cognitive, or social skills in young patients may be facilitated by the new generation of interactive toys. However, the use of toys as peacemakers is not always enough. The new findings on infant development are key to recent research: they allow to assess both physiological and pathological development and potential retardation, mainly through careful observation. Diagnosis and communication through gestures and toy usage is possible in 8- to 16-month-old infants, but their interpretation is not easy (Dimitrova et al., 2015). There is a need for classification of a whole range of gestures used by a particular infant. Play position, grasping, reaching, handedness, and object manipulation require knowledge shared between children and their caretakers, which would enable a proper interpretation (Miller & Gros-Louis, 2013; Olson & Masur, 2015). On the other hand, poor mobility of the upper limbs, asymmetrical performance, weak reactions to stimulus, poor coordination, or varied motor skills and general recurrent problems in adaptation of posture to the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

whole repertoire of various movements may characterise developing disorders. Videotaping may be useful for measurement and analysis of such behaviours.

Early detection and diagnosis is essential as it enables the implementation of preventive measures and therapy of pathological elements at a very early stage – every day makes a significant difference in further therapy. Effectiveness of the treatment seems to be closely connected with the proper diagnosis, communication and trust, as well as with the advanced methods, techniques and tools applied in a particular case.

The development of healthy children can be shaped by the toys used. The selection of such toys may influence the sensory, motor and cognitive development and facilitate new achievements. Toys may be useful for monitoring and measuring infants' behaviours but cannot be taken as the only determinant; therefore, more clinical tests are needed.

We present some individual and group toy-associated behaviours which are relatively easy to observe and assess:

- **Searching Behaviour for a Disappearing Toy:** In 5- to 6-month-old infants
- **Pushing a Button to Turn on a Distant Light or to Get a Toy:** In 7-month-old infants
- **Imitating Object Manipulation:** In 10- to 12- month-old infants
- **Performing the Aforementioned Actions Faster Using Various Grasp, a Variety of Objects, and Creative Thinking:** In toddlers
- **Simple Group Behaviours:** Imitating, repeating, passing a toy between children, group toy using, and cooperating during a game: in toddlers
- **Replicating Actions to Achieve Preestablished Effects:** In 19-month-old toddlers
- **Fighting Over a Single Attractive Toy:** Begins in much older children
- **Use of Musical Toys:** Can cause increased responsiveness in toddlers and children of all ages

Many of the aforementioned behaviours may be easily observed by the caretakers, but such an observation made by a stranger (new therapist, new physician) is not easy and needs to be stimulated by a person who is familiar to them.

Some toy-associated behaviours may also relate to the increased probability that a developmental disorder will occur. These include:

- Throwing blocks in 18-month-olds can be a predictor of *attention-deficit hyperactivity disorder* (ADHD) (Yoshikawa, 1997)
- Difficulties in hand-eye coordination
- Lack of manual dexterity
- Lack of recognition of causal relationships

Generally available, low-cost, fun, and functional toys facilitate diagnosis and treatment provided that they are chosen carefully. Moreover, technologically advanced solutions (games, virtual reality) are widely accepted by children.

Most of the studies concern children living in relatively wealthy Western or similar countries, and analyse intercultural factors which may change some of the observed behaviours entirely. We should be aware of the fact that there are still many threats and limitations concerning e.g. stimulation of children with epilepsy (if recognized). Diagnosis and therapy of children with developmental disorders in selected

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

countries is still scarcely accepted. We do not know exactly how will the TV or computer games influence children's behaviours in the future. Their attention span becomes shorter, hence, toys must be more and more attractive. Intra-gender comparisons are not always possible due to social roles stereotypes and task division. On the other hand, hyper-stimulation of a child should be avoided.

The recovery from the paediatric developmental disorders is still limited. Thus, it may significantly influence the health-related quality of life of both the children and their families. In selected cultures such a child may be difficult to accept – we should take it into consideration while shaping the patient-physician communication.

Communication, diagnosis, therapy and care in case of infants should be shaped through play: the execution of the requested behaviours should be covert and therefore natural. Moreover, the same toy can play an important role in exercises performed by the infant – if the therapist or the caretaker provide the children with the same communicative-therapeutic activities at home.

A variety of developmental disorders, patients' and parents' profiles or factors influencing therapy outcomes make the whole intervention patient-oriented. This kind of approach, even NDT-Bobath derived, is often called eclectic or mixed.

It is difficult to apply detailed schemas describing communication in the therapy of infants with developmental disorders. Various toys, games, and robots (even artificial animals) are used, but none particular toy guarantees therapeutic success. Instead, it is better to think about stimulators such as colour, shape, texture, movement, light or sound.

Toys may become a very useful communicative and therapeutic tool in the examination of infants, toddlers and children. The effective use of toys needs a thorough understanding of normal and pathological development of the group discussed. Appropriate stimulation may significantly enhance motor, cognitive, and social skills. It seems that neither medical specialist nor parents are trained for conscious and wise application of such knowledge in clinical practice and everyday life.

Generally, we can say that communication with young patients is far from communication with adult patients. Child therapy and end-of-life care in the paediatric intensive care units are crucial. Six domains are identified as critical to high-quality, family-centred care:

- Communication with the child and family – concerning treatment goals and plans
- Continuity of care
- Family support
- Ethics and shared decision-making
- Pain and other symptoms reduction
- Grief and bereavement support (Truog et al., 2006)

COMMUNICATION IN PALLIATIVE CARE

Relation to disease, suffering and death varies across cultures and influences the palliative care. Physician-patient communication is the central element of quality care and family satisfaction. Nonetheless, communication in palliative care seems to be a very difficult but a rather well recognized issue. There is a need for effective communication, identification of effective communication systems, and exploration of the influence and value of the contemporary communication theories, models, and frameworks in palliative care. Alleviating pain and anxiety, promoting patient's quality of life, encouraging patients

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and their families, as far as situational control should constitute general basement of patient-staff relationship (Wallace, 2001).

Terminal patients and their families usually look for better quality of life – establishing certain and adequate ways of communication may play key role in this process. The study by de Andrade et al. (2013), concerning patient-nurse communication in palliative care extracted the three basic categories:

- "Palliative care and communication - interpersonal relation between the nurse and the terminally ill patient";
- "Communication in palliative care as a strategy for strengthening the bond between the nurse and the terminally ill patient";
- "The importance of communication between the nurse and the family of the terminally ill patient under palliative care".

Communication plays a significant role in the individual assessment of the patient. Intensive care units and palliative care units are regarded as "high quality" based on various criteria. Study by Nelson et al. (2010: 809) extracted such factors as:

- Timely, clear, and careful communication
- Therapy focused on patients' preferences, goals, and values
- Care concerning comfort, dignity, and personhood of the patient
- Family care with open access and proximity to patients
- Interdisciplinary support in the intensive care unit
- Bereavement care for families of patients who died

According to the study by Seccareccia et al. (2015), key elements of communication in high-quality palliative care are:

- Building trust and kinship with patients and families
- Meeting the expectations and explaining goals of care
- Keeping patients and families informed about the patient's condition
- Validating patients' concerns and needs by means of careful listening
- Intruding the issue of death and dying in a careful and controlled manner

Despite vast research, there is still no central and widely accepted set of communication skills in palliative care. Some of them may best be described as:

- Respectful and friendly attitude towards the patients
- Initiative to discuss the end-of-life issues (Slort et al., 2011)

On the other hand, limitations stemming from the nature of treatment and physicians' work are reported as well:

- Difficulty in dealing with former doctors' delay
- Demands from patients' family

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Dealing with emotions and troublesome doctor-patient relations
- Insufficient clarification of patients' problems
- Promises that could not be kept
- Helplessness
- Too close involvement
- Insufficient anticipation of various scenarios (Slort et al., 2011)

Family meetings are regarded as a space for implementing shared decision-making and improving communication in the relation to the patient's family – medical staff, empathy, and open discussion concerning death and dying. It may improve patient's test results, reduce trauma, depression, and anxiety, improve patient's quality of death and dying (Levin et al., 2010).

DISCUSSION

Research and associated guidelines to contemporary and future clinical practice should cover at least the following issues:

- Biopsychosocial approach and holistic therapy and care gradually replace previous biomedical approach
- Differences between roles, tasks, and power of various health care professionals (physicians, nurses, physical therapists, occupational therapists, medical technicians, etc.) within a multidisciplinary therapeutic team
- Some specialist may participate in a multidisciplinary therapeutic team only temporarily, but they need a coherent view of the whole therapy
- Research, education, and clinical practice should cover not only current problems but also problems emerging in the near future
- Theory and practice may differ significantly
- Homogenous populations (including medical staff and patients – their caretakers and families) seem not to be prepared to intercultural society or approach within health care system

We described various issues that are relevant to intercultural communication within health care system. As the population becomes more culturally diversified, intercultural communication becomes more important. Communication is crucial for the functioning of health service, and is not limited to the communication between the patient and the physician.

LIMITATIONS OF CURRENT RESEARCH

- Results are often limited to physicians and nurses – we do not know their impact e.g. on long-term rehabilitation
- Results may not be universal to all health care providers
- Results for a particular population are valid for members of this population – it is difficult to compare the results for various populations

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- An increasing number of international students, immigrants, and foreign tourists may influence the results for a popular city or even the whole region

Despite common awareness and cultural education, competence within health care system is far from ideal. Possibility of being exposed to multicultural clinical settings should be sufficient to prevent from stereotypes, generalizations, and reductionism (Côté, 2013).

DIRECTIONS FOR FURTHER RESEARCH

There is a one general direction for further research: identification of intervention modalities and conceptual framework proposed by the researchers, clinicians, and organizations (both governmental and non-governmental) targeted at improving the services and care directed to the patients from different cultural backgrounds. A coherent strategy allows for improvement of the efficacy of the whole action.

The described problems have been studied by various disciplines: anthropology, sociology, medicine, cognitive science, and linguistics. Nevertheless, they need a coherent view from the practical perspective.

The detailed short- and long-term goals are more complex – a set of goals depends on many factors, including local settings. It may encompass the following ideas:

- Ways in which communication influences the delivery of medical services can be foreseen
- How much our society or family trusts physicians (or generally medical staff)
- How patients understand the importance of communication in health care situations
- Whether a more serious illness may require much interaction with a physician (or generally medical staff)
- How can health care professionals encourage more open communication
- To what extent gender is a relevant issue in the context of intercultural encounters in the medical environment
- The influence of the media on the relations between the patients and the health care staff
- Which training programmes focused on improving physicians' and staff's intercultural communication need to be implemented
- Whether appropriate facilities are provided to promote healthy behaviours among ethnic minorities
- Whether we are equipped (theoretical frameworks, intervention tools and guidelines) to provide a culturally appropriate response to disability management, return to work or rehabilitation with regard to the diversity of the workforce

Evidence in this field is limited: many studies do not provide requirements on the selection criteria (inclusion/exclusion) or keywords. Moreover, the confusion between the racial and ethnocultural categories (mixed phenotypes, national and religious labels, natives and immigrants, and economic or political migrations) (Côté, 2013) are omnipresent.

It may be difficult to assess the situation without any general plan or external support. Some communities have long histories of integration in their host country, and have developed their own social and integration structures, but some communities still live in internal isolation (Côté, 2013).

A newly implemented research may constitute an important background for training programmes which can minimize the negative results stemming from cultural differences.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

There is a discrepancy between scientific research, current knowledge, and clinical practice.

Intercultural issues concerning health care system are hardly a new topic. The population of the European Union nations becomes more diversified culturally, and there is an urgent need to develop intercultural communication skills (Hornakova, 2006). Development of intercultural therapeutic relationships seems to be the key element of the novel approach to the health care system. The growth of immigration is a real challenge to the delivery of health care services. Despite growing concerns in providing culturally appropriate heath care, intervention models, tools and training tools are still not enough in the current health care systems (Côté, 2013).

Health care specialists perceive themselves as culturally sensitive and experience less anxiety in intercultural situations. Further, reduced anxiety may lead to better quality of health care (Ulrey & Amason, 2001).

We need more evidence concerning long-term results (i.e. concerning post-graduate education of the medical staff) of such programmes. New goals need new and more precise tools, which can be the main challenge for scientists from the aforementioned areas. Certain psychological approaches may be helpful as well.

ACKNOWLEDGMENT

This work was conducted as a part of work within the InteRDoCTor project.

Chapter 92
Introducing Psychological Concepts and Methods to Cybersecurity Students

Helen Thackray
Bournemouth University, UK

John McAlaney
Bournemouth University, UK

ABSTRACT

This chapter begins with a brief review of the literature that highlights what psychology research and practice can offer to cybersecurity education. The authors draw on their wide-ranging inter-disciplinary teaching experience, and in this chapter, they discuss their observations gained from teaching psychological principles and methods to undergraduate and postgraduate cybersecurity students. The authors pay special attention to the consideration of the characteristics of cybersecurity students so that psychology is taught in a way that is accessible and engaging. Finally, the authors offer some practical suggestions for academics to help them incorporate psychology into the cybersecurity curriculum.

WHAT CAN PSYCHOLOGY OFFER TO CYBERSECURITY EDUCATION AND TRAINING?

There is a symbiotic relationship between the disciplines of computing and psychology: psychologists have helped in many ways to understand the way that computer systems are developed and used, but also an understanding of computers has helped psychologists to model and investigate human cognitive and social processes. This chapter will focus on the former; over the past 60 years, psychologists have tracked and researched the development and impact of computers and they have also been instrumental in their design and evolution. To design, develop, implement and evaluate secure sociotechnical systems students need to understand concepts and research methods in psychology. To understand the potential

risks of sociotechnical systems, cybersecurity students need to understand and consider how people perceive, remember, feel, think and solve problems, i.e. the domain of cognitive psychology. It is also important for students to consider individual differences and social behavior if effective interaction between people and computer systems is to be achieved, i.e. the domain of social psychology and individual differences. An understanding of these psychological topics enables students in cybersecurity to consider the potential capabilities and limitations of computer users and helps them to design computer systems that are more effective (usable) for a variety of user types. In addition to covering the foundation areas of Psychology, it is also important that cybersecurity students are taught evaluation methods and that they are able to consider the social impacts and ethical issues regarding the implementation and use of computer systems in organisations and society.

A review of the literature and media commentary on cybersecurity attacks shows that increasingly they involve social engineering techniques; where psychological principles are used to manipulate people into disclosing sensitive information or allowing others to access a secure system (Tetri & Vuorinen, 2013). For example, phishing emails and phone scams utilize many psychological principles relating to social influence to persuade users to open a link, such as appeals based on fear or invoking a sense of scarcity or urgency (Cialdini, 2008). However, despite the psychological nature of such cybersecurity attacks, research into the role of psychology in cybersecurity is still limited (McAlaney, Thackray and Taylor, 2016). Also, often research into the closely linked area of social engineering is conducted from the discipline of computing rather than psychology. Indeed, the call for papers for a recent conference organized in the UK by the Higher Education Academy on learning and teaching in cybersecurity listed relevant disciplines as 'STEM' and 'Computing' and the eventual program of abstracts contained no mention of psychology. Similarly, curricular guidance for the field of cybersecurity education produced by the ACM (McGettrick, 2013), contained just two uses of the word psychology and no further detail. However, within the last year the importance of psychology has begun to be recognized in the academic literature (McAlaney, Thackray and Taylor, 2016). For example, a recent article (Hamman, Hopkinson, Markham, Chaplik & Metzler, 2017) suggests the teaching of game theory in cybersecurity courses and links this to the psychological nature of many incidents. Hamman et al. propose that one of the benefits of game theory is that it fundamentally alters the way students view the practice of cybersecurity, and state that it helps to sensitize them to the human adversary element inherent in cybersecurity in addition to technology-focused best practices (p1).

The majority of psychological research that has been conducted so far in this area has focused on prevention and mitigation strategies for the targets of cybersecurity incidents with little focus on the motivation of the perpetrators (Rogers, 2010). Psychology can offer much in helping to understand the motivations of individual hackers or scammers, for example drawing on the research into individual differences, looking at factors such as self-esteem, introversion, openness to experience and social anxiety (Fullwood, 2015). Other work has shown that individual's motivations are not always related to financial gain but can be purely for entertainment or social status reasons (Rogers, 2010). In contrast, large scale cybersecurity incidents are often instigated by groups, as opposed to individuals acting alone. As such these incidents can be regarded as the result of group actions and group processes; theories from Psychology are used to help understand the formation, operation and influence of groups on their members, and these can be usefully applied to online groups (McAlaney, Thackray and Taylor, 2016). Many hacking incidents, especially those perpetrated by teenagers and young adults, have been strongly related to social group pressure and social psychological influences. For example, individuals involved

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

in the 2015 TalkTalk and 2011 Paypal hacks were instructed on how to do this by members of Anonymous, the hacktivist collective.

Psychological theories relating to disinhibition and deindividuation have been used to explain a number of behaviors online and can also be used to understand cybersecurity incidents. The perception of anonymity afforded by online communications allows individuals to take actions that would otherwise result in legal or social sanctions. Disinhibition refers to the sense that actions conducted online do not feel as real as those conducted offline which, it has been argued, can lead individuals to lose self-control (Taylor & MacDonald, 2002). Deindividuation, in which individuals lose their sense of self-awareness when they interact within a group, has been applied to online groups where individuals are often less identifiable and separated by space and time (Taylor & MacDonald, 2002). This is an under-researched area, but it would seem that in line with Social Identity Theory some individuals become engaged with online groups to an extent which would seem to be particularly intense and where they lose some sense of personal identity to social identity. In summary, theories from psychology can be helpful to understand and help to predict online behavior.

OBSERVATIONS FROM TEACHING PSYCHOLOGY TO CYBERSECURITY STUDENTS

In this section, the authors will review their experiences teaching psychological principles to a wide variety of cybersecurity students. The authors have experience teaching at undergraduate and postgraduate level (full-time and part-time) and developing cybersecurity training tools for industry. Foundation areas in Psychology which the authors consider important to introduce to students prior to discussing their application in cybersecurity are: social processes (e.g. group-working and communication); cognitive processes (e.g. perception, attention and memory), and individual differences (e.g. life experiences, gender, personality, cognitive style). Once these areas of psychology are covered, then it is easier to show how the authors apply psychological principles to cybersecurity.

Social Psychology and Cognition

The work of social psychologists can help understand the ways that technology affects social interaction, attitudes and behaviour. The authors ensure that there is a strong focus on how students can make practical use of the research findings and cover the major topics within Social Psychology (conversation and communication; group processes; interpersonal perception and attraction; social influence; attitudes, and conflict) and Cognitive Psychology (perception, attention and memory). Then the authors apply this understanding of social cognition to cybersecurity contexts and example topics covered include:

1. How an analysis of online language and communication can be used to identify fraudulent communication and how persuasive language can influence faulty decision-making regarding judgments of trust;
2. Group dynamics in cybersecurity incidents are reviewed, for example the group processes that shape the actions of both the cyber attackers and their intended target, including how group dynamics may lead to risky decisions and overestimations of skill and ability;

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

3. The psychological basis of social engineering techniques, and how these may be mitigated and prevented;
4. The role of emotion when users engage with sociotechnical systems, e.g. Frustration experienced with the technical components of a secure system have been linked to poor decision making and subsequent risky behaviour;
5. The link between cognitive load and poor online decision making;
6. New technology and organisational change is highlighted, covering issues such as the management of staff working remotely online and selection and technology enhanced training of cybersecurity personnel; and
7. The psychological elements of computer games are covered, in terms of the way gamification is used to motivate and persuade potential victims of a scam and also the authors highlight elements of addiction that may lead to poor decision-making.

Assessment and practical activities are varied and three examples are included here. The ways that online groups can influence the way their members interact and behave is addressed by asking students to devise their own scam website which aims to adopt new members to a fictitious online community. Students design experimental materials to study the links between working memory and online search strategies. Thirdly, students use and evaluate an online training package to highlight cognitive biases in cybersecurity.

Individual Differences

To illustrate individual differences in susceptibility to scams, the authors cover the following topics:

1. A psychological understanding of the cognitive deterioration in older adults and how this knowledge can be used to understand how, when and why older adults are vulnerable to financial scams;
2. How gender and personality can affect levels of online susceptibility in relation to internet dating scams;
3. How stress and cognitive style can influence poor decision making; and
4. Research from consumer psychology related to e-commerce, e.g. Individual consumer behaviour and trust in e-commerce exchanges and relations between company and consumer.

In seminars, cybersecurity undergraduates engaged well in tasks where they were asked to think from both the defence and attack perspectives. One seminar involved asking students to identify the most at-risk groups and then tailor the advice they would give to that specific group. For example, if they are advising an older adult who is unfamiliar with technology, they must think of how to explain this using simple terminology. If explaining to a child how to stay safe online, they need to use examples that children can identify with. Students were also asked to design a cyberattack that would circumnavigate their advice. The most successful exercises were highly interactive; recapping information from the most recent lecture, discussing in groups and then presenting their viewpoints to the class as a whole. It was interesting to see that despite beginning the module with a somewhat cynical attitude to the importance of psychology, after a few seminars there was an increase in interest and participation. One large consensus from the students was that there needs to be greater emphasis on education about cybersecurity at all ages and levels of experience.

Research Methods

Cybersecurity students may have limited understanding regarding the way empirical methods (an integral part of all Psychology degrees) can be used to evaluate computer systems. To address this, topics such as Experimental Design and Internet-Mediated Research are covered. Ideally students need to experience or apply methods, therefore it is helpful if the teaching experience includes case studies and practical workshops and assessed scientific reports. The authors have run workshops which compare qualitative methods (e.g. observation, focus groups) and quantitative methods (e.g. questionnaires and performance scores) to evaluate the individual's perceived vulnerabilities and this has contrasted the different methodological approaches well.

Designing an Internet-based experiment or survey requires careful consideration. Although cybersecurity students clearly have the technical skills to conduct online surveys, they often have less understanding of experimental design and what can be done with the data. There are many benefits of Internet-mediated research (for example, access to a larger population), however, many psychological and methodological issues need to be addressed by cybersecurity students and researchers. Issues the authors cover include:

1. The difficulty in ensuring that the participant is who they say they are and that they are answering in an honest way;
2. How to gain a representative sample;
3. How to construct questionnaire items to avoid bias;
4. Issues of data screening and sample attrition rates need to be considered;
5. The demographic profiles and questionnaire scores of those who did and did not take part in online experiments or surveys need consideration, and finally
6. Ethical issues, e.g. Whether informed consent can be gained online and how debriefing will take place.

Ethics

The teaching of ethics to cybersecurity students is not new. For some time, the teaching of ethics has been a requirement on degrees accredited by the British Computer Society (BCS). Since the classic text on computer ethics (Johnson, 1985), coverage of ethics has increased as computer systems become more pervasive in daily life. For example, issues of information security such as privacy, ownership, access and liability and reliability have become more important. These advances have led to the most recent edition of computer ethics (Johnson, 2009) including much work drawing on Psychology, e.g. covering the psychological and social implications of Internet use. However, despite the increasing need for ethics teaching sometimes there can be pressure on Computing departments in meeting this requirement. This is mainly due to it being a difficult area for computing staff to teach which, according to Dark & Winstead (2005), is because the area of ethics is not positivistic in nature. As psychologists the authors have been able to offer a different perspective on teaching ethics to cybersecurity students, based on the work of Dark & Winstead (2005), who discuss the use of educational theory and moral psychology to inform the teaching of ethics in computing-related fields. In their paper, they discuss ideas on moral development and the nature of morality, specifically as it relates to changes that educators may be trying to elicit within computing students when teaching ethics. The ways that a computer scientist and a psychologist teach ethics can be quite different, with the former more likely to use a positivist approach

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and the latter an approach based on educational theories. For example, a positivist approach would define what is right and what is not right (i.e. define truth) and then address what happens if one does not do what is right or does what is wrong. However, many Psychologists would disagree, saying that you cannot teach right and wrong and that although there are many laws which computing students need to know about, regarding what is wrong/right in society, there are not many things that are ethically questionable that are not illegal (and possibly vice versa!). In summary, philosophers have long recognized that it is almost impossible to 'teach' a student ethics, rather teachers need to advance students' sense of moral development and reasoning (Kohlberg & Kramer, 1969), something covered on all Psychology degrees. With this in mind, it is also important to consider the age and experience of students when designing teaching materials on ethics (covered further later). In summary, Psychologists have a lot to offer in the teaching of ethics to cybersecurity students. Some academics (Greene & Hiadt, 2002) go as far as discussing ethics purely in psychological terms, regarding the cognitive, affective and social aspects, when they state that the origins of human morality are emotions linked to expanding cognitive abilities that make people care about the welfare of others, about cooperation, cheating and norm following.

Considering the importance of individual's own behaviour around security and their understanding of the implications and consequences of behaviour, the behavioural component of morality could be of great value to teaching psychological principles to cybersecurity students; especially as learning has been shown to be aided by doing (Reese, 2011). Utilising educational games such as the Cyber Security Challenge UK has been of great value; such games set challenges for students to complete such as finding hidden data within a spread sheet. Additionally, the authors draw on students' life experiences to aid learning of the psychological materials; discussed further in the next section.

CONSIDERATION OF THE PROFILE OF CYBERSECURITY STUDENTS IN DEVELOPING PSYCHOLOGY MATERIALS

The variation between students studying different disciplines has been well documented regarding life experiences, gender and approaches to studying (Richardson, 1994). It is proposed that some of the following factors may affect the way that psychology teaching materials are perceived and understood by cybersecurity students and their level of engagement with the materials. Without wishing to generalize and stereotype students, these factors were considered in the way that materials were designed and presented with the over-arching aim to produce materials that considered and embraced individual differences.

Gender

The composition of most Psychology and Computing degree courses are significantly skewed, with females making up the majority of psychology degrees (79%) and males making up the majority (82%) of computing degrees (Higher Education Statistical Agency, 2014). There have been many attempts to explain the reasons why males and females are attracted to different disciplines and a review of these studies shows very little support for cognitive abilities being the differentiating factor; for example, similar abilities have been found when comparing students studying social with physical sciences (Halpern, 1992). Recent research has looked at personal values, interests or motivation factors to investigate what Radford and Holdstock (1995) term, 'what people want to do rather than what they can do'. Wilson (2003) used quantitative and qualitative methods to further understanding of how Computing is perceived. In

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

her paper she argues from a constructionist approach that, rather than any real difference in skill, female and male differences are a product of historical and cultural construction of technology as masculine (p. 128). For example, she notes that girls at school have been shown to be superior to boys in some areas of programming, but that they lack encouragement and interest so that by the time they reach 18 years of age they have already opted out. Wilson (2003) identifies teaching styles which appeal to female students as those with an emphasis on relational and contextual issues and co-operative learning through teamwork and group projects. While styles preferred by males are those that emphasize the formal and abstract and independent learning. Therefore, when teaching psychology to cybersecurity students (where there are usually more male students) traditional methods used in Psychology classes such as seminar discussions have not always been the most effective method. The authors have tried to use a broad range of methods, but recognize that some are more effective with the majority male cybersecurity students.

Life Experiences

Cybersecurity postgraduate courses tend to attract a significant number of mature entrants who have frequently been employed in other careers, have many life experiences or are currently working in a related industry and studying part-time. It is important for the contextual examples to link to real security incidents and to draw on the experiences of students. While undergraduate cybersecurity courses are more likely to attract direct-entry students, therefore the examples may be more closely linked to incidents publicized in the media.

It is important to consider stage of moral development and life experience of students when presenting materials on the topic of ethics. For example, an environment needs to be created that allows students to safely reflect on and explore their moral beliefs relative to the current issues in cybersecurity. The authors found that postgraduate students are more interested in the philosophical debates regarding the psychological and legal implications of Internet use, compared to undergraduate students. Issues that students have debated include: whether deviance online is different from deviance in face-to-face contexts; whether online addiction is similar in process to other addictions and how it might impact security vulnerabilities, and how a person's face-to-face and online identity might differ.

Gibbs, Basinger and Fuller (1992) suggest undergraduates' moral development is not fully developed; they are still developing an understanding of how moral issues may relate more generally to societal functioning. This could explain differences in debates between undergraduates and postgraduates. The postgraduate students were more open to different perspectives than undergraduates and his could be due to being older, and therefore having stronger convictions formed, or life experience within the industry. Thus, this could also be informative to the types of materials used to teach psychological principles; the postgraduates may find it easier to consider the bigger picture and societal implications of cybersecurity. While undergraduates may need more support in understanding the wider societal implications.

Motivation to Study and Learning Style

The motivation of students to study a particular course will clearly affect their engagement and there may be some initial resentment of cybersecurity students toward the topic of psychology; this needs to be considered and addressed. Many students choose psychology to help develop an understanding of themselves and others and to develop 'people' skills useful later in a range of careers. In contrast, from

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

our observations many cybersecurity students see the course as a stepping stone to gaining almost immediate employment in the security industry or as CPD to gain promotion.

Radford and Holdstock (1995) investigated differences between reasons why students chose Computing and Psychology degrees. Students were given a list of 60 items on the 'outcomes or benefits of Higher Education' to rank. These ranged from passing exams, learning to work with others, development as a person, develop problem solving skills etc. The results showed that the most important items differentiating the two fields were that computing students chose the development of problem-solving skills, logical thinking and increasing future earning power. While for psychology students, development as a person was important as was understanding other people, oneself and greater personal independence. They identified two key factors related to a student's choice of discipline: (i) personal development versus social relationships and (ii) thinking about and directly dealing with people versus things. The implications of this for teaching psychology to cyber students are twofold: (i) that cybersecurity students may be less open to thinking about people problems when considering online threats and security, and (ii) that it is important that students are aware of the way people use technology and their interactions with others can be as important as functionality.

A considerable amount of work has been published on the relationship between personality type and learning in Further and Higher Education, although there is relatively little focusing on students from specific disciplines. Layman et al (2006) collected personality types of students studying a software engineering course using the Myers-Briggs Type Indicator (MBTI). the authors considered this when adapting our psychology materials from those designed for psychology students, in terms of: groupwork and individual work; using lectures to emphasize concepts as opposed to factual data, and materials presented objectively as matters of fact with concise, concrete explanations.

It is important to recognize that students studying for cybersecurity courses are likely to have been taught in different ways and may approach studying in different ways, compared to those studying for Psychology degrees. From personal observation, cybersecurity students are generally more familiar with assessments which have definitive answers, while Psychology students are more accustomed to discussing the relative merits of both sides of a debate and to provide a balanced view rather than a definitive answer. This would support the extensive work by Kolb (1981) investigating learning styles and subject discipline. Depending on their background it has also been our experience that cybersecurity students can find the methodological approaches used in Psychology to be quite different from what they have previously experienced. Students from a cybersecurity background may be more accustomed to an epistemological and ontological stance which posits that understanding of phenomena is reached though objective study and experimental methods, and there is a finite set of solutions to any problem. In contrast the sub-disciplines of Psychology range from those which take a very positivist approach to those which are based largely on ideographic knowledge and social constructionism. Whilst the psychology topics that the authors have taught cybersecurity students do tend to lean more towards those which take a positivistic approach there is in general more subjectivity and uncertainty embedded with the teaching materials than they may be accustomed too. A comment that the authors frequently receive from cybersecurity students is that they find it strange that many areas of psychology have no single theory that is widely accepted as being the 'correct' one, and that instead there appears to be often be a multitude of, at times mutually exclusive, theories for any given psychological phenomenon.

CONCLUSION

We would like to conclude by reflecting on our experiences to offer some general tips for those about to embark on teaching psychological principles to cybersecurity students.

As with all interdisciplinary teaching, materials need to be adapted effectively to provide appropriate links to the other discipline. In the case of cybersecurity, psychology materials need to be linked to topics taught on other units within the cybersecurity course and to show an awareness of the professional context of cybersecurity. It is important to deliver the materials at the correct level, taking into account the relevant intended learning outcomes and educational stage. At the first year of an undergraduate degree, the emphasis needs to be on practical activities and workshops can be used to demonstrate how recommendations based on Psychology can be put into practice. Indeed, examples can be used to illustrate where Psychology has *not* been considered to great effect! At final year undergraduate level, the authors found that students appreciate more detail as to *how* research was conducted and they need to develop skills to allow them to consider different psychological methods to evaluate the security of online systems. At postgraduate level, students are interested in hearing about ground-breaking research where psychology is being applied to inform cybersecurity, but also they appreciate discussing the philosophical debates. It is important not to overwhelm students (at any level) with psychological content but to provide case studies and references to support the concepts being covered. Similar to being prepared regarding the curriculum and educational level of your intended learners, some understanding of the profile of your intended learners can assist in developing Psychology materials for cybersecurity students. For example, the style of presentation of Psychology activities can be adapted to better match the approaches to studying of cybersecurity students.

Finally, it is important to recognize that students will have a certain perception of what Psychology covers. It is common for some cybersecurity students to think Psychology is only concerned with treating psychological disorders or that it is an 'un-scientific' way of explaining human behavior. As a result, it is useful at the start of any contact with cybersecurity students to briefly cover what is Psychology and what is not Psychology and to differentiate between academic Psychology and 'popular' Psychology. This helps to contextualize the wider role of Psychologists in the many areas of modern life relating to computing and technology. This has been helped recently with TV programs such as 'Hunted' (2015) employing forensic psychologists and cybersecurity experts to hunt escapees.

Chapter 93
Why Psychology and Criminal Justice Can Only Take Us So Far:
The Value of and Need for a Social Psychological Perspective in Studies of American School Violence

Lisa Fisher
Independent Researcher, USA

ABSTRACT

Concerns about continued increases in violent behavior in American schools and schools' ability to mitigate and reduce risks abound. Psychology and criminal justice have contributed much to what we know and understand about violence in schools; however, the author argues that these dominant disciplinary perspectives also obscure some important aspects of these phenomena, namely focus on underlying cultural logics that may be impacting violence in schools. In this chapter, the author sets out to achieve two objectives. First, she provides an overview of areas of focus in current literature in psychology and criminal justice that represent the dominant framework within which school violence in the U.S. is viewed. Additionally, she examines those disciplinary perspectives in terms of specific strengths and limitations. Second, she presents and describes a series of social psychological theories and pulls those theories into a coherent framework to demonstrate the value of the social psychological lens in studies of school violence and stimulate further discussion and research on this important topic.

INTRODUCTION

Psychology and criminal justice are the primary lenses through which the problem of violence in American K-12 schools has been examined. These two disciplines have contributed much to what we know and understand about violence in American schools; however, there are also some sticking points.

Findings focused on school-based prevention efforts remain largely inconsistent (Blosnich & Bossarte 2011; Ryan-Arredondo, Renouf, Egyed, Doxey, Dobbins, Sanchez and Rakowitz 2001), and scholars and practitioners allege outdated, ineffective policies and practices (Brooks 2017; Craig 2016; Madfis 2017; Reddy, Borum, Berglund, Vossekuil, Fein & Modzeleski 2001). They also question the effectiveness of standard physical security measures such as surveillance cameras and security officers (Blosnich & Bossarte 2011; Reddy et al 2001). At the same time, concerns about continued increases in violent behavior and schools' ability to mitigate and reduce risks to students abound (Brooks 2017; Madfis 2016), especially as the FBI reports increases in school violence incidents (Blair & Schweit 2014).

It goes without saying that this is a social problem that deserves greater scholarly and practical attention, but, in light of where things stand now, I found myself asking, "have psychology and criminal justice taken us as far as they can at this point?"

As a sociological social psychologist, I am trained to examine circumstances and seek connections between phenomena by analyzing underlying social norms and assumptions that may be taken-for-granted but very much at work shaping circumstances. When examining a social problem, it is important to critically consider structural conditions, contextual circumstances, and underlying social norms and assumptions, as those shape how we define the problem, how we attribute cause, the research questions we ask, and, ultimately, the solutions at which we arrive.

When I stepped back to examine the literature around school violence, I saw an opportunity to apply the lens of sociological social psychology to critically examine these very issues. I set out to analyze topics of focus in the body of research on school violence hailing from psychology and criminal justice, social norms and assumptions that appear to be driving the trajectory of inquiry and support for the current approach, strengths and limitations evident in the body of literature, and means by which social psychological theory might provide fresh insights for this important vein of research.

TOPICS OF FOCUS IN THE LITERATURE ON SCHOOL VIOLENCE

Studies of school violence in American K-12 education are often approached through the disciplinary perspectives of psychology and criminal justice. Scholars and practitioners in these fields examine topics that vary from friendship and isolation to bullying; individual and family risk factors that may predict antisocial, violent, and criminal behavior as well as protective factors that reduce the likelihood of such behavior and means of intervening and addressing problematic behavior (for ex: Brooks 2017; Loeber, Farrington, Stouthamer-Loeber & Reskin White 2008; Langman 2009; Finley 2014). There is also a great deal of focus on mental health and topics such as stress, coping skills and mental disorders (Langman 2009; Langman 2010; Newman, Fox, Harding Mehta & Roth 2004; Vossekuil, Fein, Reddy, Borum & Modzeleski 2002).

Most of the studies examined here employ a psychological perspective but incorporate criminal justice either through examination of monitoring or punishment for violent behavior, collaborative efforts between schools and law enforcement or use of techniques such as profiling. Of interest for this chapter is not the specifics of those studies' findings or differentiation between specialized tracks of research but rather how scholars have focused their analytical attention overall.

In general, this body of research focuses on assessing and averting threat by examining individuals who are thought to present threat and designing prevention efforts. Not surprisingly, schools remain the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

primary context for these studies and prevention efforts because it is within schools that "crisis symptoms and warning behavior" (Leuschner et al 2017:70) often become apparent.

In the 1990s, a shift began from a single-source view of violence as something inflicted by dangerous individual "vectors" to a more complex, nested phenomenon (Astor et al 1999:103). Scholars incorporated frameworks such as Bronfenbrenner's (1977) ecological theory to examine nested relationships between communities, schools, families and individuals. We still see this focus evident in the literature today as studies consider the salience of macro-, meso- and microsystems to school violence (for example: Brookmeyer et al 2006, Espelage 2014). Although there is broad agreement that complex interactions of psychological, sociocultural, structural and situational factors contribute to violence (Rocque 2012), most of the emphasis has been on controlling for these factors in attempts to remove "noise" and isolate "signal" associated with individual factors. Thus, despite broader consideration of context and environment, there remains a great deal of focus on problematic individual behavior in reaction to adverse circumstances.

One of those adverse circumstances is social rejection. Studies have found that social rejection weakens connections between a student and their school community, for example during suspension and expulsion (Breunlin, Cimmarusti, Hetherington and Kinsman 2006), and is associated with problematic violent behavior by individuals who have experienced it (Kyriacou 2016; Leary, Kowalski & Phillips 2003; Vossekuil et al 2000).

Bullying, in particular, has been cited as an issue by a number of school shooting perpetrators (Vossekuil et al 2000, Madfis 2017). This has prompted more in-depth examination of the topic, including such things as types of bullies and psychological attributes of each type (Kyriacou 2016) and psychological adjustment of students who act as bullies, relying on measures like self-esteem, depressive symptoms, perceived stress, loneliness and life satisfaction (Estevez, Murgui and Musitu 2009). This line of research, which is much larger than the studies mentioned here, appears to have been undertaken in the interest of better understanding and intervening to stop these behaviors earlier in the causal chain before violence occurs.

When it comes to the day-to-day business of assessing threat in schools though, law enforcement and risk assessment experts suggest the use of behavioral threat assessments as evaluation and prospective profiling tools (Breunlin, Cimmarusti, Hetherington and Kinsman 2006; Borum, Cornell, Modzeleski & Jimerson 2010; Cornell & Sheras 2006; Fein et al 2002; Mohandie 2000; Reddy et al 2001; Toole 1999; Leuschner et al 2017).

Although these tools are widely used, the literature is chock full of scholar and practitioner concerns about a host of factors that include: judgment bias, false positives, exclusion of threats that deserve attention, utilizing assessment tools whose reliability has not been established (Reddy et al 2001), failure to consistently administer assessments (Ryan-Arredondo et al 2001), the difficulty of differentiating normal childhood aggression from more serious aggression (Bardick & Bernes 2008), and the potentially stigmatizing and harmful effects of popular assessment approaches such as profiling and guided professional judgment, which considers rates of violence within specific segments of the population (Reddy et al 2001).

To attempt to avoid these pitfalls, scholars advocate the use of multiple tools such as interviews, observation and assessment instruments as well as the involvement of administrators, counselors, teachers, law enforcement, social workers, psychologists and others who can contribute insights to cross-check findings (Bardick & Bernes 2008). A great deal of time has also gone into comparing characteristics of individual perpetrators of violence in schools, especially those who commit shootings (for example,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Crews 2017; Crews & Crews 2018; Gerard et al 2017; Leary et al 2003) in attempts to better inform the work of school, law enforcement and mental health professionals.

Despite all the effort that goes into school violence prevention, there is still an ongoing conversation in the literature about whether violence can truly be prevented and the extent to which it is or is not "random" in nature. Some attribute the persistence of this problem in schools and difficulties with prevention to American gun culture (Glassner 2010; Haider-Markel & Joslyn 2001; Lawrence & Birkland 2004). Although it is frequently popularly described as random when people have difficultly collectively processing acts of violence, scholars point out that offenders generally cite rationale and that we need to attend to those rationale, even if *ir*rational, in order to dig deeper (for example, Madfis (2016, 2017).

When you look across this body of literature, the formative influences of psychology and criminal justice are very clear. Although contextual factors such as those associated with peer and family relationships have taken on increased importance in research and praxis on violence in schools and there has been some examination of cultural influences such as American gun culture, the focus has remained on identifying, addressing and averting threat as presented by individuals.

Evidence of this is the heavy reliance on behavioral assessments designed to measure psychological adjustment and disorders. Further evidence are the standard physical security measures instituted by many schools, such as cameras, metal detectors and hiring on-premise security officers (Breunlin, Cimmarusti, Hetherington and Kinsman 2006) as well as the more punitive discipline disciplinary measures relied upon to remove students from school and place them in the criminal justice system if they exhibit problematic behavior.

The commonality of these approaches demonstrates how psychology and criminal justice, together, dominate how we view and approach the social problem of school violence. It may seem obvious why these two disciplines have led the charge in this area, but let's step back and examine this a little more critically.

WHY PSYCHOLOGY AND CRIMINAL JUSTICE?

Although we're accustomed to hearing about issues from the perspectives of psychology and criminal justice, we don't often consider why it is that these disciplines are considered uniquely suited to shed light on the phenomena of school violence. To look more closely at these matters, we must temporarily widen our focus from the social problem of school violence to social problems across American society.

The psychological perspective, in particular, dominates American societal discourse about nearly all aspects of human life, particularly in the realm of social problems. We are accustomed to psychologists studying and advising us on a wide range of subjects from child-rearing and schooling to workplace behavior, addictions, aging, decision-making, all levels and types of criminal behavior and everything in between. This incredible breadth is evident in the American Psychological Association's definition of psychology as "the study of the mind and behavior," adding that "(t)he discipline embraces all aspects of the human experience – from the function of the brain to the actions of nations…" (American Psychological Association, n.d.).

The discipline of criminal justice has also evolved to be quite dominant in American society. The most immediately visible evidence of this is the plethora of television dramas, reality TV and news cycles that focus heavily on criminal actions, perpetrators, victims, and the actions of individuals who stop and punish wrongdoers. Further evidence is our disproportionately large prison population rela-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

tive to other nations and the collective focus placed on individuals being punished for wrongdoing. In short, the discipline is about maintaining social order, which broadly incorporates "…the procedures and government organizations which focus on upholding the law. These government entities work to maintain control in the public arena, prevent and manage crime, authorize punishment for criminal activities, and offer rehabilitation." (Criminal Justice Careers, n.d.) On their own, each of the lenses of psychology and criminal justice garner a tremendous amount of credibility and power in how we view and approach social problems, but their convergence is what is most significant to our purposes here. Since many social problems are described in ways that delineate how individuals challenge cultural logics or break the codified versions of those logics present in our system of law, we have come to rely heavily on psychology and criminal justice to help us "diagnose" and understand individual thoughts, motives, intentions and actions, prevent threats and punish perpetrators in the interest of maintaining social order.

From a practical standpoint, this approach has netted us some clear and substantial benefits. Since schools faced with threats of or actualized violent behavior are likely to be forced into reactive mode, they may have limited information (and often limited resources) with which to assess and intervene when necessary. Thus, behavioral assessments that focus on identifying immediate threats may be the most efficacious tools, even if they are imperfect. Likewise, the involvement of law enforcement provides a level of reassurance and a second and physical line of defense to support schools in their efforts. In support of this approach, we also continue to see scholars and practitioners pressing on to add to and refine what we know in these areas.

As a result, the vast majority of studies on school violence still examine nuanced elements of and test different instruments for assessing individual behavior. The goal, of course, is continuing to sort out attributions and identify interventions on the basis of individual reactions to social rejection, individual stress, individual coping skills, individual mental disorders and so on.

The combined power of and collective trust we place in psychology and criminal justice lead us to assume that we are doing all we can. This assumption and high level of trust are rooted in something much deeper than the contributions of scholars and practitioners in these fields. These disciplines, as we know them, emerge from, reinforce and resonate with cultural logics about individualism and individuals being personally responsible for their behavior, good and bad, in American society.

From childhood, we are conditioned to see ourselves as individuals, assert our individuality, and view outcomes in our lives, good and bad, as the result of our individual choices. We are accustomed to hearing about individual uniqueness, for example common phrases such as, "every child is different" and "everyone deals with grief differently." The collective is often viewed as a collective of individuals, so much so that many people appear at times unwilling or unable to process social issues separately from their own personal experiences.

When it comes to understanding violent behavior, although we are generally willing to entertain how individuals are influenced within society, attributing problematic individual action to such forces is viewed as deflecting or shirking responsibility. If one is viewed as deflecting, they are not "owning up" for their actions and wrongdoings. In short, even if "the social" influences us, we come back to the idea that individuals have the choice of how they will behave and that bad choices reflect personal deficiencies and problems.

These cultural logics underlie our entire societal system and provide a framework for how we view the social problem of school violence. Not surprisingly, in a society wherein we value these cultural ideas, we are conditioned to and very comfortable employing the familiar lenses of psychology and criminal justice to focus on individual behavior and personal culpability for problematic behavior. When we do

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

so, we also discount the influence of social factors at work. I am not asserting that individuals bear no responsibility for their actions. Rather, I am suggesting the need to examine how our collective default tendencies to uncritically adhere to ideas about individual responsibility for school violence is limiting how we define the problem and what we see as feasible solutions for addressing it.

When we apply any disciplinary perspective to the study of a subject, we are limited to the confines of that lens. Our focus is drawn to some things to the exclusion or discounting of other things, thus limiting what we look for as well as what we find.

Since both disciplinary lenses being examined here bring focus to identifying, assessing and stopping problematic individual behavior, the greatest emphasis is placed on responding to problematic behavior at or near the end of the causal chain. The convergence of the lenses of psychology and criminal justice intensifies that focus to incorporate not only assessing, identifying, and diagnosing personally responsible individuals but profiling, watching, controlling and preparing for the worst in a defensive, reactive mode against dangerous, antisocial others.

Taking a watchful, cautious, defensive stance is not a bad thing. As we saw in the examination of topics in the literature, this stance has led to the creation of assessment instruments, the incorporation of multidisciplinary teams in assessment efforts, an increase in what we hope is more effective physical security in schools, and the creation of many different models for violence prevention programming.

Taken together, these measures are productive and helpful, yet there remain persistent concerns about inconsistencies in the literature and adherence to outdated, ineffective practices at the same time that incidences of and concerns about school violence are increasing (Blair & Schweit 2014). The knee-jerk reaction may be to continue down the familiar path, dig deeper and further specify what we understand about school violence and assessing and averting individual perpetrators. However, it seems we may have reached the limits of that approach for the time being and would do better to "defocus."

Anton Ehrenzweig (1971) wrote, in *The Hidden Order of Art: A Study of the Psychology of Artistic Imagination,* of the need to "defocus" and go from precise focus on specific factors to wide-angle defocused perception. This activity invites us to pause, step back from the situation, step away from our assumptions about what we think we see when we look at the phenomenon of school violence, allow all the specializations within this vein of research to blur together a bit, and open ourselves to seeing things in a new and different light.

THE LENS OF SOCIAL PSYCHOLOGY

Having "defocused," the collective of individuals that we are culturally accustomed to seeing blurs into a single collective. While not unidimensional by any means, the collective does have some common threads running through it. Some of those common threads exist in the form of taken-for-granted cultural logics. Primary among those logics in American society are ideas about individuality and self.

These logics do not necessarily impact everyone in the same way, for a host of sociological and psychological reasons; however, they do impact the collective. Their presence and influence are undeniable, and they have bearing on how we understand and approach the social problem of violence in schools.

To examine these dynamics in greater detail, I introduce three social psychological theories: Callero's myth of individualism, Mead's theory of self as a social product, and Berger & Luckmann's notions about the social construction of reality. First, I describe the major tenets of each theory, then I weave them into an overall framework and apply that framework to the study of school violence.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Myth of Individualism

Callero (2014) examines the cultural value placed on individualism, the notion that each individual has worth and is self-directed, in American society. Evidence is not only found in "..literature, music, film and television…but also reinforced in many subtle and ubiquitous ways…" (18) as "…a guiding principle for many of our social institutions…" (22)

As examples, Callero cites our capitalist system of economy, which focuses on individual achievement, property ownership and competition; the labor market wherein workers are viewed as personally responsible for their own employment often regardless of the economic and employment landscape; religious institutions that emphasize personal relationships with God; and an educational system premised on individual evaluation and achievement (22-24). It is likely that you read that list and thought to yourself, "Yes, what's your point? Those things make sense!"…which suggests just how powerful, normalized and taken-for-granted these cultural ideas are.

Given that individualism "…privileges the individual over group, private over public and personal over social" (22), the power of individuals is celebrated and the power of social forces is deemphasized (157). This makes sense to us because the message is so clearly and consistently reinforced within our larger social system that any deviations from this focus may seem downright nonsensical. However, Callero cautions that such an approach, which focuses so heavily on individuals, is inadequate for understanding human behavior.

He argues, "the idea that the person and the group are independent and completely distinct entities is a serious oversimplification of the relationship between one's self and one's society. In truth, the social world sustains our individuality as much as individuals sustain society…The artificial separation of self from society, with the belief in the primacy and superiority of the autonomous actor, is the myth of individualism." (Callero 2014:27)

Callero provides a vignette, which he attributes to Saul Alinsky, to illustrate how the cultural value of individualism shapes our thinking about the relationship between self and society as well as how we interpret our experiences within it. Paraphrased, it goes something like this: Three friends are walking alongside a river and see a body floating in the water. They act quickly to remove the person and try to resuscitate them only to see another person in the river and then another and another. The friends continue to spot and act to help the people, until one of the friends quickly runs upstream. The other two shout after their friend and urge the person not to abandon their efforts to help individuals.

Callero explains that the friend who ran upstream did so because they wanted to try to identify the root cause of the problem, which turned out to be a broken bridge railing that was leading cars and pedestrians to fall into the river. As soon as the friend identified the problem, they took action to alert motorists and pedestrians, which then solved it.

The moral of the story is this: Focusing only on the drowning people was helpful and met the *immediate* need but insufficient to solve what was actually a structural problem. Callero (2014) further explains that, had the problem continued, individualist solutions would have likely been posed, for example suggesting more swimming lessons in the community or organizing counseling services for those affected. However, those solutions, while helpful and targeted, would not have lent to truly alleviating the risk to individuals or solving the problem.

When it comes to school violence, we can use Callero's theory to consider ways that the lens of individualism is lending to our understanding of the social problem of school violence as well as our beliefs about viable solutions of stopping it. Much like the actors in the vignette, we see the actors involved in

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

violence prevention in schools intervening where immediate action is needed. Teachers, administrators, school psychologists, counselors and resource officers interview students, conduct assessments when problematic behavior is observed and take action to promote the physical security of school environments. Just as in the vignette, these actions are helpful and meet the immediate needs presented; they are also very specific actions that can be targeted at very specific needs. Yet, they are insufficient to solve the problem of violence in schools because the problem stems from social forces outside of, yet impacting, schools and all other social institutions.

With the exception of prevention programming, school violence continues to be treated as a problem that is most effectively addressed on an individual level. This prevents or intervenes to stop people from becoming "victims" in the most immediate sense (just as the friends in the vignette stopped people from drowning). But the work of prevention remains reactive, arduous, and constant. It also carries with it an opportunity cost, as those engaged in the work of intervening are unable to dedicate resources to what are likely to be more ultimately impactful structural solutions.

Callero's argument helps us to better understand how the lens of individualism functions to shape our understanding of the relationship between individual and society as well as our interpretation of violence in schools. Mead's theory of self as a social product takes that one step further.

The Self as a Social Product

Common understandings of "the self" in American society reflect the psychological perspective that selves are unique and independent; however, Mead asks us to consider a different notion of self, one that is a social product.

Mead is regarded as a seminal figure in the field of social psychology, which is first and foremost concerned with the effect the group has on the experiences and conduct of individual group members. For Mead, "…mind and self are, without remainder, generated in a social process" (Mead 1934: xxiii). Interpreting Mead's theory, Huebner & Joas, who annotate his work, explain, "It is only in a social process that selves, as distinct from biological organisms, can arise – selves as beings that have conscious awareness of themselves. (It is not) merely the process of being aware of one's self that is social: the self that one becomes conscious of in this manner is itself social in form" (Mead 1934: xxxii).

Although he views the self as a social product, Mead is not arguing that individuals have no agency. Of this, Huebner & Joas, explaining Mead's theory, say "the individual is no thrall of society. He (sic) constitutes society as genuinely as society constitutes the individual…Through society the impulsive animal becomes a rational animal, a man (sic)" (xxxiii).

Given his definition of self as a social product, Mead argues that behavior must be examined *within* the social process, as it can only be truly understood when examined alongside the behavior of the larger social group (Mead 1934). This is "...(because) the whole is prior to the part …," as explained by Huebner & Joas (Mead 1934:7). Thus, Mead argues that society shapes the individuals who inhabit it, since society exists prior to the individual, but the relationship between the individual and society is dynamic and co-constitutive such that each sustains the other.

When it comes to school violence then, we can apply Mead's theory to examine ways that the prevalent notion of self as unique and independent is leading us to focus on individual behavior and individual culpability. We emphasize those things, and deemphasize the powerful social forces at work and the larger social context within which people learn to view violence as a viable option and/or employ violence for asserting their power to deal with problems.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Applying Mead's theory, we can also see the essentiality of examining behavior within a social context. For Mead, the self is literally "built" and constituted within social context as people learn about cultural values and learn to employ those values to navigate their society. Thus, individuals who use violence learned to function that way as a result of social interaction; they are products of a violent social context. It is not enough to profile or list characteristics of offenders if that information is not placed within social context. This does not necessarily lend to the dismissal of individual culpability. Instead, Mead's theory lends to considering a much broader array of information and a much larger social context.

To examine how it is that such powerful cultural logics about individualism and self can be largely invisible to us, I incorporate Berger & Luckmann's (1966) social construction of reality.

Social Construction of Reality

Berger & Luckmann (1966) argue that social order and, thus, the ways that we define and understand reality are produced by human beings through complex means. In this view, people create and come to understand reality through a process involving externalization, objectivation and internalization. First, people create social order through their actions (externalization), experience the created reality as objective (objectivation), and then internalize and understand it as subjective experience. Thus, "(s)ociety is a human product. Society is an objective reality. Man (sic) is a social product" (Berger & Luckmann 1966, 6).

The process of the social construction of reality is largely transparent to those who participate in it (Berger & Luckmann 1966). In social psychology, this is sometimes referred to as the 'fish in water' effect; everything the fish does occurs within and depends on the water, but the water is taken-for-granted. We can apply Berger & Luckmann's theory to view the community of people acting to prevent school violence as a social world.

From the perspectives of those in this social world, their experiences congeal into a taken-for-granted, internally-logical schema. When older members of the social world (or, in this case, those with more experience doing the work of preventing violence in schools, whom Berger & Luckmann refer to as "parents") teach their ways and beliefs to the younger members (those seeking more information about or being institutionalized into their role addressing the social problem of school violence, referred to as "children" in the theory), "(t)he objectivity of the institutional world 'thickens' and 'hardens' not only for the children, but (by a mirror effect) for the parents as well. The "There we go again" (of routine actions) now becomes "This is how these things are done.'" (Berger & Luckmann 1966, 4-5).

For objectivation and internalization to occur, there must be clear delineation of the doctrine and beliefs of the social world, which requires direction and teaching about the nature of the social reality. As the doctrine and ways of the social world are shared and repeated, they take on even greater credibility to those who teach them as well as those who learn them. To the individuals who inhabit the social world, the facts are undeniable and powerful.

Applying this more directly to school violence, those who inhabit the social world of the institution of education have defined the problem of school violence through the disciplinary lenses of psychology and criminal justice. Those who participate in this social world, such as teachers, administrators, counselors, school psychologists, and school resource offers, create the social order based on the views available to them through the lenses of psychology and criminal justice. The teachings include a specialized language and specific tools for sense-making in this context, including behavioral threat assessments and means of enforcing physical security measures when violence is threatened or occurs.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Participants experience the social order as objective reality and are generally unaware of the way it impacts their interpretation of the phenomena associated with violence in schools. Another factor rendering the social world invisible to inhabitants is the fact that its internally-logical, for example the behavioral assessments and other tools relied upon to do the work of violence prevention were created within that same context and, therefore, already reflect and further reinforce its truths.

Those who are trained within the social world adopt and become invested in its ways and truths, too. As they then train others, they pass on the truths, and, as Berger & Luckmann (1966) say, the world "… attains a firmness in consciousness…and it can no longer be changed so readily" (4-5).

THE THREE SOCIAL PSYCHOLOGICAL THEORIES CONVERGED

Here, I offer an account of how Callero's myth of individualism, Mead's theory of the self as a social product, and Berger & Luckmann's social construction of reality converge. First, I overlay the lenses to provide a different view of the current approach, which has been architected through the disciplinary lenses of psychology and criminal justice. Second, I delineate the ways that this new theoretical framework allows us to conceive of an alternative path forward for studies of violence in schools.

A Social Psychological Analysis of the Current Approach to Preventing School Violence

The social world of the institution of education and those who work within it to prevent violence in schools is shaped not only by the lenses of psychology and criminal justice but that of individualism and the notion of unique selves, which resonates with and reinforces the view afforded by the other two lenses. Those within this social world are so accustomed to viewing phenomena through the lens of individualism that they rarely notice the lens is at work filtering what they see and how they interpret meaning and experience.

The inhabitants of this social world rely on cultural notions of individualism and conceptions of student selves as unique, independent beings, some of whom display pathologic violent tendencies and must be dealt with as individuals in order to protect school communities. Logics, composed of the specialized language and meaning within the social world, congeal into a body of knowledge that exerts formative influence on all present and future thought and action within the social world. Logics also shape how past events are interpreted and remembered. The details of observations and the results of individual assessments are recorded within this framework.

These understandings shape how the inhabitants of the social world define the problem of violence in schools and what they conceive as effective solutions, which lends to a specific trajectory of thought about the right and correct ways to define and approach the problem. This begins with defining the steps and procedures necessary to prevent violence, which incorporates operationalizing notions of threat, intervention, prevention and punishment with an intense focus on individual actions and individual culpability. To do this work, inhabitants of the social world must place themselves largely at or near the end of the causal chain, as this is primarily where the teachings and tools on which they rely equip them to intervene.

Inhabitants view these means of operating in their social world not only as representing the most feasible means of addressing violence in schools but the *only* feasible means of doing so, given their tools

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and methodologies. After all, many of their efforts to identify and avert threats are successful. They're able to stop some of the would-be offenders from acting and stop innocent people from becoming victims in the most immediate sense. Thus, participants press on in their respective roles.

Refinements and innovations are sometimes conceived and enacted to improve tools and methodologies either through research or practical measures. However, even these are limited within the logical confines of the social world and often, at best, result in incremental gains.

If suggestions for refinements to tools and methodologies push the limits or fall outside of the logical framework of the social world, they are likely to be rejected, as they do not mesh with its ways and truths. In this way, the practitioners and even some of the scholars who step into this social world collaboratively sustain and insulate it from change. Within the larger societal framework of job specialization, those outside of this social world accept the insulation, assuming they should defer to the specialists and experts in this regard.

Within the social world described, it is not surprising that participants should go about violence prevention at or near the end of the causal chain where specific problematic behaviors occur. That is where violence has already happened or is about to happen. It is, thus, the only point at which individual behavior can be clearly and specifically observed, assessed, defined and punished, which is what the inhabitants of this social world are trained to do. Those within the social world are very committed to sustaining it, as they have been socialized into this world, are invested in it, have contributed in large and small ways to its very form, and, as a result, urge that we must stay the course.

Focusing intensely on the most visible manifestations of violence in schools at or near the end of the causal chain lends to identifying problematic behavior and punishing those who exhibit it, but, like the friends pulling bodies from the river, we won't necessarily get to the cause of the problem because we are operating with a limited vantage point.

An Alternative Path Forward

The efforts of direct prevention in schools cannot stop, at least not in the foreseeable future, and individual perpetrators will continue to be held responsible for their actions. However, we can also use the lens of social psychology to at least conceive of an alternative path forward that may take us closer to achieving the goals of not only preventing violent acts but *reducing violence* in schools. Preliminary steps on that path hinge on broader consideration of our larger social context, which requires us to reframe the social problem of violence in schools.

In this chapter, I have argued that our cultural notions of individualism and unique, independent selves are powerful underlying social assumptions that have bearing on how we understand and approach the social problem of violence in schools. When we remove the lenses of psychology and criminal justice to view this problem, the lens of individualism, which is foundational to that of psychology and criminal justice in the American context, remains. Without concentrated focus on assessing, diagnosing, averting and punishing, the multi-dimensionality of individualism comes into sight.

As an idea and philosophy, individualism operates to lend to the production of individuals who believe they have worth, control their own circumstances and should act in their own interests. Thus, individuals who do not believe their interests are served by the collective might see their best or only viable option as taking initiative to act in what they believe *are* their best interests.

Relating to school violence, this could mean perpetrators who feel wronged or isolated within the collective, using the lens of individualism and independent selves, may view it as their personal responsi-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

bility to take action and achieve justice for wrongs committed against them. Previous studies suggest that perpetrators of violence may rely on cultural scripts about masculinity to solve problems with which they are confronted (Kimmel & Mahler 2003; Madfis 2016, 2017; Mai & Alpert 2000; Newman et al 2004). Perhaps individualism and cultural notions of self are *additional* cultural scripts relied upon by those in crisis to remedy problems and reclaim the self-efficacy and personal dignity essential to individualism.

This does not excuse acts of violence, but it does offer a tenable explanation, from the perspective of perpetrators, within this social context and should be explored further. Some may argue that this is just human nature, think: fight or flight responses, but it is also possible that this is punctuated by tenets of individualism that encourage individual agency. Common phrases such as, "You have no one to blame but yourself," and "You teach people how to treat you" come to mind here. These phrases provide concrete examples of the internalized tenets of individualism that maintain focus on individual selves, individual agency and personal responsibility for negative circumstances in one's life.

Callero (2014) provides another example germane to considering how the ideas within individualism may influence individual actions in negative ways. He tells a story about the life and demise of Ted Kaczynski (infamously known as the Unabomber), who retreated to wilderness living and plotted and carried out a series of bombings in the U.S. Callero argues that, in a society that prizes and focuses on instilling the value of individualism, we will also, at times, produce radical individualism, which he calls "individualism gone wrong."

Considering the well-supported findings about perpetrators' feelings of social rejection being cited as rationale for committing violence in schools (for example, Breunlin, Cimmarusti, Hetherington and Kinsman 2006; Kowalski & Phillips 2003; Kyriacou 2016; Leary, Kowalski & Phillips 2003; Madfis 2017; Vossekuil et al 2000), it could be that the behavior of those *who reject* evidences "individualism gone wrong," as they mock and belittle others in attempts to punctuate and elevate their own status and self-worth.

A third example that may suggest "individualism gone wrong" is offered by Kravetz (2017), who examined the dynamics of social contagion to understand the social forces behind a series of suicides in Palo Alto, CA. Kravetz defines social contagion as "…the ways in which others influence our lives through catchable thoughts, emotions and behaviors" (author's note, x), which he argues are neither inherently negative nor inherently positive but contribute to the spread as well as the alleviation of social problems.

In the case of this suicide cluster, Kravetz reasoned that it was the particular culture of Palo Alto as a place of high achievement and innovation as well as extreme social pressure to succeed, all of which stem from the philosophy of individualism, that contributed to the problem. After the first suicide, word spread about the deceased and their life and circumstances, and the phenomena spread to lend to the deaths of eight other students in a four-year period. Following his analyses, Kravetz (2017) wrote, "(g)iven the infectiousness of thoughts, the stickiness of the most subtle of emotions, and the transmissibility of others' behaviors…(we must) take better stock of the invisible forces that sway us…" (author's note, xii).

Explaining the insights gained from Nicholas Christakis, director of the Human Nature Lab at Yale, Kravetz states, "(i)t's difficult to quantify how much of what we do is achieved by our own volition versus what we unknowingly pick up from others…We can't comprehend the number of social contagions that we pick up in a given day, let alone across a lifespan...(but) decades of research shows that social contagions are so powerful that they shape the landscape of every domain of our lives. And this hidden system of influence…connects us all." (29). Key to all of this is the idea of social connectedness.

Future studies should examine whether and how cultural ideas about individualism, incidences of "individualism gone wrong," and mechanisms of social contagion could offer explanatory power in stud-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

ies of violence in schools. The concept of social contagion may also shed light on why some individuals decide to commit violence while others do not. This concept may also be useful to explore how we come to collectively view the threat of violence in schools and appropriate means of responding, which then have bearing on the actions taken by educational institutions and law enforcement.

By examining these social forces, individual culpability is not removed; however, it is moderated. And it is that moderation that will free up some of our focus to more broadly consider the relevance of the larger social context to violence in schools.

CONCLUSION

Overall, the current focus on individuals, as viewed through the lenses of psychology and criminal justice, detracts from the ability to see and address the big picture of violence in schools. This is because attention is primarily drawn to only the most visible manifestations of violence, as that is where these disciplines' tools equip them to look. But, as I have argued here, the problem of violence in schools does not originate in schools; it only manifests there.

Limiting our vantage point to the assessment and identification of would-be offenders in school environments, taking action to punish offenders and remaining in a defensive stance of "violence prevention" are unlikely to net us the results we seek, which are reduced rates of violence of schools. This is why psychology and criminal justice can only take us so far and why there is a need for more research and praxis on this topic to adopt the lens of sociological social psychology.

The comments of Spokane County Sheriff Ozzie Knezovich after a school shooting in September 2017 offer poignant insight on applying that lens. Knezovich provided commentary on social forces that he believes are to blame, namely the ubiquity of violent behavior in media. He decried the media's practice of reporting heavily on school shootings and said it lends to a "school-shooting culture," which was believed to be a factor in the actions of the teen perpetrator. Knezovich continued, "This young gentleman got sucked into a counterculture, a culture of violence…And you media, you're to blame for it. You keep using headlines. You keep giving them names."

When asked about the teen's access to the firearms used in the shooting, Knezovich said, "…I carried a gun all my life. I hunted, I shot. My friends and I, when it's hunting season back home, when I was in high school, every one of those rigs has a gun in the gun rack. Why? We went hunting on the way home. None of those guns ever walked into school. None of those guns ever shot anybody. You start glorifying cultures of violence. You glorified gang culture. You glorified games that are actually giving points for…killing people. A gun did not change, we changed." (Spokesman, n.d.)

Knezovich's comments suggest that American society shoulders collective accountability for the violence in our society and, ultimately, in our schools. He argues that social fascination with violent images has created a culture of violence, and he differentiates that culture from that which he knew as a young man, which involved more access to weapons and more freedom with how they were used but less inclination to use them against other people. By sketching out this picture, Knezovich, in effect, offers a theory about how these social influences come together to lend to heightened collective fascination with violence in American society and increase individuals' inclination to look to violence as a viable means of problem-solving. Knezovich's comments also indirectly suggest the value of multidisciplinary collaboration in this field, which is echoed in the literature (for example, Harris & Harris 2012).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

There may be particular value in converging the lenses of social psychology and criminal justice. Together, these perspectives provide an interesting framework for viewing social problems. Social context is elevated in importance; individual actions are examined in context; evidence is likely to be sought from a broader array of sources at micro-, meso- and macro-levels; individual diagnoses are no longer sought; and solutions are likely to more effectively address the collective as well as affected individuals because of the collaborative focus on the social order and the many and complex factors that contribute to sustaining it.

Of course, social psychology, like all disciplines, has its limitations. Adopting a broader vantage point may obscure, at least temporarily, specific individual-level factors that warrant closer attention. But that's exactly the goal…to redirect focus to the collective and broaden what we look for, what we are able to see, and what new solutions come into view when we examine the phenomenon of school violence.

Schools are and should remain an important context for studies and prevention efforts; however, the onus is not on schools alone. Recalling the notion of positive social contagion, Kravetz (2017) calls for us to "…spread a catchable sense of personal responsibility for one another in a world that demands so much of it." (author's note, xii, emphasis added). American society as a whole is implicated in this social problem and, therefore, must be considered as a whole as we reassess the field of possible actions and solutions.

Chapter 94
Status of Play Therapy Research

Sue C. Bratton
University of North Texas, USA

Alyssa Swan
University of North Texas, USA

ABSTRACT

With today's focus on evidence-based treatment (EBT) for children, play therapists are ethically responsible to identify and deliver effective interventions as well as synthesize the considerable body of play therapy research to support their practice and to advocate for play therapy as an evidence-base practice. Play therapists' ability to articulate research findings is particularly important as they consult with the adults in children's lives who make decisions regarding children's wellbeing including parents, teachers, school administrators and other professionals. This chapter aims to present an up-to-date comprehensive review and synthesis of contemporary play therapy research with a focus on studies employing randomized control group designs in order to provide play therapy practitioners with a guide to understanding and utilizing the substantial research base for play therapy.

STATUS OF PLAY THERAPY RESEARCH

With an increased focus on evidence-based treatment (EBT) for children, play therapists are ethically bound to identify and deliver appropriate and effective interventions. In addition, play therapists are charged with the responsibility of understanding and using the considerable body of play therapy research to support their practice and to advocate for play therapy as an evidence-base treatment for childhood disorders that interfere with children's day to day functioning. Play therapists' ability to articulate research findings is particularly important as they consult with the adults in children's lives who make decisions regarding children's wellbeing including parents, teachers, school administrators and other professionals.

National focus on the shortage of adequate mental health services for children (Center for Disease Control, CDC, 2013; Mental Health America, MHA, 2013; President's New Freedom Commission on Mental Health, 2003; U.S. Public Health Service, 2000), along with the evidence-based movement has heightened attention on disseminating information about EBT's for treating childhood mental health

disorders and resulted in several texts (Baggerly, Ray, & Bratton, 2010; Chorpita, et al., 2011; Reddy, Files-Hall, & Schaefer, 2016; Russ & Niec, 2011; Silverman & Hinshaw, 2008; Weisz & Kazdin, 2010) and websites (California Evidence Based Clearinghouse, CEBC, 2016; evidencebasedchildtherapy.com, 2015; Society of Clinical Child and Adolescent Psychology, SCCAP, 2016; National Center for Education and Evaluation, NCEE, 2016; SAMHSA National Registry of Evidence-Based Programs and Practices, NREPP, 2016) aiming to guide professionals to provide child interventions with evidentiary support. Although, with the exception of Baggerly et al. (2010) and evidencebasedchildtherapy.com (2015), these sources have paid little attention to play therapy interventions for children despite decades of research that supports the evidence base for play therapy.

Despite increased advocacy and research foci on providing EBT's for children over the past two decades, the number of children who go untreated continued to increase over this millennium (CDC, 2013; MHA, 2013; NCCP, 2014; U.S. Census Bureau, 2015). One possible explanation is the lack of currently recognized EBT's that are responsive to the developmental needs of children (Weisz & Kazdin, 2010; Bratton, 2015). Play therapy is widely recognized as a developmentally responsive mental health intervention for children (Landreth, 2012; Schaefer, 2011), yet continually criticized for lack of empirical support (Phillips, 2009; Russ & Niec, 2011). Our goal for this chapter is to respond to this misperception by presenting a comprehensive review of the evidence base for play therapy. Through synthesis of contemporary meta-analytic and systematic reviews and summaries of individual play therapy outcome studies meeting criteria for methodological rigor and treatment protocol, this chapter provides play therapy practitioners with a guide to understanding and utilizing the substantial research base for play therapy.

Contemporary Meta-Analytic and Systematic Reviews

Responding to previous lack of recognition of play therapy as an EBT, contemporary play therapy researchers have developed and disseminated a) comprehensive systematic reviews of outcome research (Bratton, 2010; Bratton, 2015; Bratton, Landreth, & Lin, 2010; Bratton & Ray, 2000; Landreth, 2012; Landreth & Bratton, 2006; Ray, 2011; Ray & Bratton, 2010; Ray & Bratton, 2015; Ray & McCullough, 2015), b) meta-analyses of controlled research studies (Bratton et al., 2005; LeBlanc & Ritchie, 2001; Lin & Bratton, 2015; Ray, Armstrong, Balkin, & Jayne, 2015), and c) online searchable play therapy research database (evidencebasedchildtherapy.com).

Meta-analyses and systematic reviews of controlled outcome studies are widely recognized as two of the most robust methods of evidentiary support for identifying evidence-based practices (Rubin, 2008). Researchers have conducted four meta-analytic reviews of play therapy in the 21st century. Bratton et al. (2005) conducted the largest meta-analysis of play therapy research to date which included a total of 93 controlled outcome studies spanning five decades. Play therapy, including filial therapy, demonstrated a large overall treatment effect (.80). Bratton and colleagues reported moderate to large treatment effects across presenting issue and target outcomes. LeBlanc and Ritchie (2001) reviewed 42 outcome studies from the same time period as Bratton et al. and found a moderate treatment effect (.66) for play therapy including filial therapy. Both Bratton et al. (2005) and LeBlanc and Ritchie (2001) identified parental involvement and duration of treatment as significant factors impacting children's treatment outcomes. Bratton et al. (2005) further pointed out that early studies in the field of play therapy were limited by lack of scientific rigor and recommended that contemporary play therapy researchers adhere to stringent research designs, sound methodology, and reporting guidelines.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Additionally, two meta-analyses (Lin & Bratton, 2015; Ray et al., 2015) were recently published focusing exclusively on the efficacy of child-centered play therapy (CCPT) approaches. Utilizing rigorous hierarchical liner modeling (HLM) methods, Lin and Bratton (2015) investigated the overall treatment effect of CCPT approaches including child-parent relationship therapy (CPRT)/filial therapy from a total of 52 controlled outcome studies published between 1995 and 2010. Findings demonstrated a statistically significant overall effect size of .47, indicating a moderate treatment (Lipsey & Wilson, 2001) effect for CCPT intervention. Using random effect model methodology, Ray et al. (2015) conducted a meta-analysis on the efficacy of CCPT conducted in elementary schools and included a total of 23 controlled outcome studies from 1975 to 2011. Results demonstrated a statistically significant effect sizes for outcome variables, including externalizing problems ($d = 0.34$), internalizing problems ($d = 0.21$), total problems ($d = 0.34$), self-efficacy ($d = 0.29$), and academic progress ($d = 0.36$).

In effort to further explore the empirical support for play therapy, researchers have conducted several comprehensive systematic reviews. Due to space limitations, we include reviews published since 2010. Bratton (2010) reviewed 51 school-based play therapy intervention outcome studies published 1990 to 2009 conducted by mental health professionals ($n = 30$) or specially trained and supervised paraprofessionals ($n = 21$) and concluded that school-based play therapy demonstrated beneficial effects for a range of childhood disorders. Bratton reported that 75% of the investigations reviewed were conducted since 2000 which indicated a 100% increase compared to the previous 5 decades of research published on school-based play therapy. Ray and Bratton (2010) reviewed 25 experimental and quasi-experimental studies published 2000 to 2009 investigating impact of play therapy conducted by a mental health professional. Compared to their previous review of six decades of play therapy research (Bratton & Ray, 2000), Ray and Bratton (2010) concluded that methodological rigor and research productivity made considerable increases during the 21st century. Bratton (2015) conducted a systematic review, limited to randomized controlled trials (RCTs) in play therapy, and found 24 RCTs published since 2000 that met stringent inclusion criteria. Bratton offered a thorough review of strengths and limitations of the research base for play therapy and concluded that play therapy had strong evidentiary support to condone its use as an effective mental health intervention for children.

In 2015, Ray & McCullough in association with Association for Play Therapy (APT) published an evidence-based practice statement for play therapy, providing a comprehensive review of play therapy research and categorizing play therapy research into an evidentiary hierarchy pyramid from most credible research design (meta-analyses and systematic reviews) to least credible research design (case reports). Ray and McCullough reviewed 42 outcome studies published between 2000 and 2015, of which 21 were randomly controlled trials, 5 were quasi-experimental studies, 5 were single-case designs, and 11 were repeated measures single group designs.

The most comprehensive review of contemporary play therapy outcome research studies to date is accessible from an online data base at evidencebasedchildtherapy.com. The data base includes studies published 1995 to present and was created by Bratton, Dafoe, Swan, Opiola, McClintock, and Barcenas (2015) in association with the Center for Play Therapy (CPT) at the University of North Texas to provide a continually up-to-date means of accessing and disseminating the evidentiary support for play therapy as well as to serve as an international clearinghouse for play therapy research. As of this writing, the database includes 96 published studies, representing a total of 3,937 child participants. Of which, 73 studies were conducted by U.S. researchers and 23 studies were produced by researchers outside of the U.S. Publication patterns reveal a considerable increase in publications from 33 outcome research studies published 1995 to 2005 to 63 outcome studies published since 2006. The search and sort features allows

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

viewers to examine the effects of play therapy by theoretical model, setting, research design, presenting issue/outcome variable, publication year, and author. To date, one-half of the included studies employed the gold standard in research methodology, randomized controlled group design (n = 48), with remainder of outcome studies investigating play therapy's effects using non-randomized controlled designs (n = 20), repeated measures single group designs (n = 19), and single case experimental designs (n = 9). Majority of studies are research investigations of the efficacy of CCPT (n = 44) and CPRT (n = 31), which is a CCPT model in which CPRT-trained therapists instruct and directly supervise parent and other significant caregivers, e.g. teachers and mentors in CCPT principles and skills. Other theoretical models represented include Adlerian play therapy (n = 3), cognitive behavioral play therapy (n = 3), sandtray play therapy (n = 3), activity play therapy (n = 4), theraplay (n = 3), gestalt play therapy (n = 2), and other/eclectic play therapy approaches (n = 3). A database sort by outcome variable reveals studies investigating play therapy's effectiveness on global behavior problems (n = 45 studies), externalizing problems (n = 39), internalizing problems (n = 31), caregiver-child relationship (n = 31), socio-emotional functioning (n = 16), self-concept (n = 12), trauma/attachment (n = 9), academic/language (n = 6), and development (n = 4).

Four additional reviews were conducted, narrowing systematic literature search to focus on specific theoretical models of play therapy. Landreth (2012) and Ray (2011) provided comprehensive research reviews of published and unpublished studies in their respective texts focused exclusively on CCPT approaches, independently concluding that CCPT research demonstrates sound evidence for its effectiveness with a variety of childhood disorders and presenting concerns. Landreth (2012) included 53 CCPT and CPRT studies 1995 to 2010 and Ray (2011) included 62 CCPT studies 1947 to 2010. Bratton et al. (2010) focused on CPRT, a filial play therapy intervention, in a comprehensive literature review of 32 controlled outcome studies published from 1995 to 2009. According to the APA standard for EBT's (Silverman & Hinshaw, 2008), Bratton et al. (2010) concluded that CPRT met criteria to be recognized in the "promising" or "probably efficacious" ranking categories as an EBT for childhood disorders. More recently, Ray and Bratton (2015) conducted a systematic review of 13 school-based CCPT studies that met stringent criteria for experimental research design and concluded that CCPT resulted in positive outcomes for academic achievement, disruptive behaviors including aggression and ADHD, internalizing behavior problems, speech, and functional impairment across diverse populations of children.

Several conclusions can be made from the results of these meta-analyses and systematic reviews regarding the research base and efficacy of play therapy. Research findings support play therapy as a developmentally responsive and viable intervention for a range of childhood disorders in real-world settings, particularly in schools. Play therapy demonstrates beneficial effects on childhood outcomes in relatively few number of sessions (10-13 sessions on average). Involving caregivers in children's play therapy treatment produces stronger outcomes, i.e., filial therapy/CPRT methodology. Authors reported notable improvements to contemporary play therapy research methods including larger sample sizes, manualized treatment protocols and procedures to ensure treatment fidelity, standardized assessments of child outcomes, and randomization to treatment groups. Despite communicating encouragement in the advancement in quality and quantity of play therapy research, authors unanimously called for the advancement of play therapy research by employing more stringent research methods and increasing productivity in order to elevate the credibility and dissemination of play therapy research.

Individual Outcome Studies

For the purpose of reporting on the current status of play therapy research, we conducted a comprehensive online and offline review of controlled outcome research studies published since 2000 to identify studies that demonstrated methodological rigor. Randomized controlled trials (RCT's) are typically referred to as the "gold standard" research design to determine treatment efficacy (Nezu & Nezu, 2008). Thus, in effort to conduct a rigorous systematic review of the play therapy literature, we decided to only review studies that used random assignment of participants to treatment groups. Inclusion criteria which further refined our search included: a) intervention was identified as play therapy, b) participants were children between the ages of 2 and 12; c) studies were published since 2000; d) studies were conducted by researchers in the United States; e) studies were published in English in a peer-reviewed journal or book; f) studies reported child outcome variables and used standardized assessments; g) studies provided descriptive information about the play therapy intervention and participants, and as noted previously, h) intervention used a randomized, control group design. Although studies conducted by non-U.S. research teams were excluded for the purpose of this review, there is a growing body of play therapy research being conducted internationally.

Studies coded as using randomized group assignment included block and stratified randomization to control for extraneous variables such as school or location in the case of multiple research sites, classroom environment, and to accommodate participants' schedules. The primary reasons for excluding studies from the final review was lack of random assignment to treatment groups and failure to meet the requirement for the intervention to be identified as "play therapy." Consistent with previous meta-analyses and systematic reviews of play therapy research, we restricted studies to those that used the term "play therapy" to describe the experimental treatment and appeared to meet the definition provided by the Association for Play Therapy (APT). APT defines play therapy as "the systematic use of a theoretical model to establish an interpersonal process wherein trained play therapists use the therapeutic powers of play to help clients prevent or resolve psychosocial difficulties and achieve optimal growth and development" (APT, 2016). Due to filial therapy's historical and current recognition as a play therapy intervention (L. Guerney, 1983; O'Connor & Schaefer, 1994, Schaefer, 2011), we included studies using child-centered filial therapy methodology.

Twenty-six studies meeting criteria are summarized in Table 1. We coded studies according to theoretical model/intervention type and control group type. Intervention models included 11 individual CCPT, 5 group CCPT, 8 child-centered filial therapy using the CPRT model, 1 individual Adlerian play therapy (AdPT), and 1 group sandtray play therapy. Consistent with previous systemic reviews of play therapy research (Bratton, 2015; Ray & Bratton, 2010), there remained a noticeable absence of research on other play therapy interventions using theoretical models traditionally used in child therapy, for example, Gestalt, Jungian, ecosystemic, prescriptive, existential, experiential, cognitive-behavioral, and theraplay (O'Connor & Braverman, 2009; Schaefer, 2011). Although the majority of studies reviewed utilized a no treatment control group (i.e., waitlist/delayed start control; n = 14), a noticeable shift in 21st century play therapy research is employing research designs that include active control (n = 8) or comparison treatment groups (n = 4).

We reported only original study data in instances where studies used duplicate participant data including follow-up studies. All but one investigation reported treatment providers' training, a significant improvement from Bratton et al.'s (2005) review. Except for CPRT studies in which paraprofessionals (i.e., parents, teachers, mentors) provided intervention under the direct supervision of a CCPT and CPRT/

Table 1. Experimental Play therapy research – randomized controlled studies

Study	Intervention Model/ Control Group Type # Sessions Frequency; Length Setting *Treatment provider	Sample Age Ethnicity Sex	Child Outcome Variable/ Target Problem	Findings
Baggerly & Landreth. (2001)	Modified CPRT / WC 10 play sessions 1/wk; 20 min School *CPRT-trained 5th- grade mentors	N = 29 Behaviorally at-risk students Age: 5-6; M=5.7 76% Cauc, 14% AfAm, 10% Lat 58% male	Internalized Behavior Problems; Self-esteem	Compared to the waitlist control, teachers and parents of experimental group children did not report statistically significant differences between groups across time. Results indicated positive trends in the adjustment of children who received the 10 weekly play sessions facilitated by peer mentors trained in modified CPRT. Further analysis of the experimental group's scores pre to post showed that according to parent report, children demonstrated statistically significant improvement in externalizing and delinquent behavior problems and child demandingness. *Companion study to Robinson, Landreth, & Packman, 2007.
Blanco, Muro, Holliman, Stickley, & Carter (2015)	CCPT / WC 16 sessions 2/wk; 30 min School	N = 59 Academically at-risk 1st graders Age: 6-7; M=6.5 69% Cauc, 17% Lat, 7% AfAm, 2% Asian, 5% other 53% male	Academic Achievement; Anxiety	Compared to the waitlist control group, children in the CCPT group demonstrated statistically significant increase in early achievement scores (YCAT). Additionally, children in the CCPT group demonstrated statistically significant lower mean scores on anxiety. Compared to the waitlist control group, children in the CCPT group demonstrated no significant difference on achievement test scores (WJIII ACH) between the groups.
Blanco & Ray (2011)	CCPT / WC 16 sessions 2/wk; 30 min School	N = 41 Academically at-risk 1st graders Age: M=6.4 46% Cauc, 34% Lat, 17% AfAm 63% male	Academic Achievement	Compared to the waitlist control, children in the CCPT group demonstrated statistically significant improvement on a standardized achievement test which indicated an increase in children's overall academic abilities with a medium effect size. Post hoc analysis showed that both groups demonstrated statistically significant improvement from pre to post test, however the treatment effect for the CCPT group was twice as large as the control group.
Bratton et al. (2013)	CCPT / AC 20 sessions 2/wk; 30 min Head Start school	N = 54 At-risk, low-income Pre-K students Age: 3-4; M=4.1 42% AfAm, 39% Lat, 18% Cauc 67% male	Clinical Disruptive Behaviors	According to teachers who were blinded to treatment groups, the CCPT group demonstrated statistically significant improvements and large treatment effects on disruptive behaviors, attention problems and aggression, compared to the active control (Mentoring) group over three points of measure; 78% of children in CCPT moved from clinical levels of concern to more normative functioning following treatment in 1 or more areas of concern.

Table 1. Continued

Carnes-Holt & Bratton (2014)	CPRT / WC 7 play sessions 1/wk; 30 min Community agency *CPRT-trained parents	N = 61 Adoptees Age: 2.5-10; M=5.7 47% Cauc, 15% Lat, 9% AfAm, 18% other 55% male	Attachment Difficulties; Clinical Comorbid Behavior Problems	Statistically significant findings and large treatment effects on all measures indicated the effectiveness of CPRT over the WC on 1) reducing adopted children's externalized behaviors and global behavior problems, and 2) increasing parental empathy as measured by objective raters blinded to the study.
Ceballos & Bratton (2010)	CPRT / WC 7 play sessions 1/wk; 30 min Head Start school *CPRT-trained parents	N = 48 At-risk, low-income PreK students Age: 3-4; M=4.3 100% Lat 56% male	Clinical Comorbid Behavior Problems;	Statistically significant findings and large treatment effects on all measures indicated the effectiveness of culturally-adapted CPRT over the WC on 1) reducing children's externalized and internalized behavior problems, and 2) decreasing parent-child relationship stress. 85% of children in the CPRT group moved from clinical levels of concern to more normative functioning. Cultural considerations discussed.
Cheng & Ray (2016)	Group CCPT / WC 15-16 sessions 2wk; 30 min School	N = 43 Kindergarten children Age: 5-6; M=5.1 44% Lat; 33% Cauc; 23% AfAm 70% male	Social-Emotional Functioning	Compared to the waitlist control group, children in CCPT group demonstrated statistically significant increases in parent reported total social-emotional functioning, social competence, and empathy with medium effect size. Teacher reports did not reveal statistically significant differences between groups.
Danger & Landreth (2005)	Group CCPT / AC (groups of 2) 25 sessions 1wk; 30 min School	N = 21 Speech-delayed PreK students Age: 4-6; M=4.9 81% Cauc; 19% Lat 86% male	Expressive Language; Receptive Language	Compared to the active control group (speech therapy), the CCPT group who also received speech therapy demonstrated non-statistically significant improvement from pre to post test with large treatment effects on receptive and expressive language and a small treatment effect on anxiety.
Fall, Navelski, & Welch (2002)	CCPT / WC 6 sessions 1/wk, 30 min School	N = 66 Special Educ. students Age: 6-10,; M=8.3 98.5% Cauc 64% male	Behavior & Social Problems	Case manager reports showed a statistically significant decrease for anxiety and social behaviors. Teachers' rating did not show statistically significant difference for classroom behaviors, anxiety, or social problems. No effect sizes were reported. Results also showed no statistically significant difference for self-efficacy.
Flahive & Ray (2007)	Group Sandtray / WC (groups of 3) 10 sessions 1/wk; 45 min School	N = 56 At-risk 4th-5th graders Age: 9-12 62% Lat, 9% AfAm, 28% Cauc 52% male	Comorbid Behavior Problems	According to teacher reports, children in the experimental group demonstrated statistically significant improvement on total behaviors with medium effect size. Parents' reports did not demonstrated statistically significant differences on overall behaviors with medium effect size. Parents and teachers' report demonstrated statistically significant differences on externalizing behaviors with medium effect sizes.

Table 1. Continued

Garza & Bratton (2005)	CCPT / COMP 15 sessions; 1/wk; 30 min School	N = 29 Behaviorally at-risk students Age: 5-11; M=7.4 100% Lat 59% male	Comorbid Behavior Problems	According to parents who were blinded to children's treatment group, culturally-responsive CCPT demonstrated a statistically significant benefit (large treatment effect) on externalizing behavior problems compared to the COMP treatment (empirically-supported manualized guidance intervention). CCPT demonstrated a medium beneficial treatment effect on children's internalizing problems, although not a statistically significant difference. Cultural considerations discussed.
Jones & Landreth (2002)	CCPT / AC 12 sessions 3/wk; 30 min Diabetic Summer Camp	N = 30 Insulin dependent children Age: 7-11; M=9.4 87% Cauc; 3%AfAm; 7% Lat 57% male	Diabetes Adaptation; Behavior Problems; Anxiety	According to parent report, children in the CCPT group demonstrated a statistically significant improvement in diabetes adaptation compared to the AC (Diabetic camp activities). At follow-up, there was no statistical significant between group differences, but the CCPT group continued to show greater improvement. Both groups reported decreased anxiety and improvement in behavior problems.
Jones, Rhine, & Bratton (2002)	Modified CPRT/ COMP 20 play sessions 1/wk; 20min School *11-12th grade CPRT-trained mentors	N = 26 Behaviorally at-risk PreK to K Age: 4-6; M=5.4 96% Cauc 57% male	Comorbid Behavior Problems	Parents who were blinded to children's treatment group reported CPRT group children demonstrated a statistically significant decrease in internalizing and total behavior problems, compared to the COMP group, PALS®, which used a manualized curriculum. According to blinded raters' direct observation, CPRT mentors demonstrated a statistically significant improvement in empathic interactions with their child of focus compared to PALS® mentors.
Meany-Walen, Bratton, & Kottman (2014)	Adlerian PT / AC 16 sessions 2/wk; 30 min School	N = 58 Students with disruptive behavior Age: 5-9; M=6.4 48% Lat, 33% Cauc, 19% AfAm 79% male	Clinical Disruptive Behaviors	Compared to the AC (Mentoring), 1) AdPT participants demonstrated a statistically significant and moderate to large decrease in disruptive behavior as reported by independent raters and teachers blinded to children's group assignment; and 2) teachers reported a statistically significant decrease in stress in their relationship with students receiving AdPT.
Morrison & Bratton (2010)	CTRT / AC 16 wks Daily center time play Head Start school *CPRT-trained teachers	N = 52 At-risk, low-income PreK students Age: 3-4; M=3.9 56% Lat, 31% AfAm, 13% Cauc 58% male	Clinical Comorbid Behavior Problems	Compared to the AC (Conscious Discipline®) across three points of measure, teacher-adapted CPRT (CTRT) demonstrated statistically significant benefits and large treatment effect on children's externalizing behavior problems and moderate effect on internalizing problems; 84% of CPRT group children moved from clinical to normal functioning.
Ojiambo & Bratton (2014)	Group CCPT / AC (groups of 3) 16 sessions 2/wk; 30 min Ugandan orphanage school	N = 60 Ugandan orphans Age: 10-12; M=11.2 100% African 50% male	Comorbid Clinical Behavior Problems	According to teachers and housemothers who were blinded to treatment groups, Group CCPT demonstrated statistically significant improvement and moderate to large treatment effects on children's internalizing and externalizing behavior problems compared to the AC (Mentoring). Majority of children participating in CCPT moved from clinical concern to normal functioning following treatment.

Table 1. Continued

Packman & Bratton (2003)	Group CCPT / WC (groups of 3) 12 sessions 1/wk; 1 hr School for Learning Differences (LD)	N = 24 Students diagnosed with LD Age: 10-12; M=11.4 92% Cauc; 4% Lat, 4% AfAm 75% male	Learning Differences; Comorbid Behavior Problems	According to parent report, Group CCPT demonstrated medium to large treatment effects on all outcome measures compared to the WC. The CCPT group demonstrated statistically significant improvement on internalizing problems as well as overall behavioral functioning compared with the WC. Between group differences were not significant for externalizing behaviors.
Ray et al. (2013)	CCPT / WC 12-16 sessions 2/wk; 30 min School	N = 37, Clinically impaired children Age: 5-8; M=6.3 38% Lat; 32% AfAm; 30% Cauc 78% male	Functional Impairment;	Phase I: CCPT demonstrated a medium treatment effect on children's functional impairment when compared to the WC, although between group differences were not statistically significant. Phase II (both groups received CCPT): within group difference indicated that children in both groups showed statistically significant improvement with large effect sizes as a result of CCPT.
Ray, Schottelkorb, & Tsai (2007)	CCPT / AC 16 sessions 2/wk; 30 min School	N =60 Students with ADHD symptoms Age: 5-11; M=7.5 35% Lat, 17% AfAm, 45% Cauc 80% male	ADHD;	According to teacher report, the CCPT group demonstrated statistically significant improvement on student characteristics, emotional lability, and anxiety/ withdrawal over the AC (Mentoring) group. No significant between group differences were found on children's ADHD symptoms. Post hoc within group analysis revealed that both groups demonstrated statistically significant improvement in ADHD, student characteristics, anxiety, and learning disability.
Schottelkorb et al. (2012)	CCPT / TF-CBT 17 sessions 2/wk; 30 min. School	N = 31 Refugees with trauma symptoms Age: 6-13; M=9.2 67.7% AfrAm; 16.1% Middle Eastern; 9.7% Asian; 6.5% Other 55% male	PTSD Symptom Severity	Results indicate both interventions, CCPT and TF-CBT (SCCAP evidence-based treatment for trauma symptoms), demonstrated a statistically significant reduction in PTSD symptom severity in a subset of study children who met stringent criteria for PTSD; findings indicate both treatments are equally effective for this population
Schumann (2010)	CCPT / COMP 12-15 sessions 1/wk; 30 min School	N = 37 aggressive K – 4th graders Age: 5-12; M=7.3 38% Lat, 24.4% AfAm, 37.8% Cauc 86% male	Aggression; Global Behavior Problems	According to parent and teacher report, Both CCPT and the COMP group (Second Step®, a SAMHSA evidence-based treatment) demonstrated statistically significant improvements in aggression, externalized problems, and internalized problems. Results indicate the effectiveness of both interventions for children identified with aggressive behavior. Qualitative feedback from parents was more positive for CCPT.
Sheely-Moore & Bratton (2010)	CPRT / WC 7 play sessions 1/wk; 30 min Head Start school *CPRT-trained parents	N = 23 At-risk, low-income Pre-K students Age: 3-5; M=4.2 100% AfrAm 62% male	Clinical Behavior Problems	Statistically significant findings and large treatment effects on all measures indicated the effectiveness of culturally-adapted CPRT over the WC on 1) reducing children's global behavior problems, and 2) decreasing parent-child relationship stress. Cultural considerations discussed.

Table 1. Continued

Shen (2002)	Group CCPT / WC 10 sessions 2-3/wk; 40 min Taiwanese school	N = 30 Children at-risk for maladjustment following earthquake Age: 8-12; M=9.2 100% Taiwanese 47% male	Clinical Anxiety; Suicide Risk	Compared to the WC group, the CCPT group demonstrated statistically significant decreases in their overall anxiety, physiological anxiety, worry/ oversensitivity, and suicide risk. CCPT demonstrated large treatment effects on anxiety, worry, and oversensitivity and small to medium effect on reducing suicide risk.
Smith & Landreth (2004)	CTRT / WC 7 play sessions 1/wk; 30 min Preschool for Deaf *CPRT-trained teachers	N = 24 Deaf & hard of hearing Pre-K children Age: 2-6; M=4.1 33% Cauc; 42% Lat; 25% AfAm 54% male	Behavior Problems; Social-Emotional Functioning	Compared to the WC, 1) children whose teachers participated in teacher-adapted CPRT (CTRT) made statistically significant improvement in behavior problems and social-emotional functioning, and 2) CPRT-trained teachers demonstrated statistically significant gains in their empathic interactions with students according to direct observation by independent raters.
Stulmaker & Ray (2015)	CCPT / AC 15 play sessions 2/wk; 30 min School	N = 53 children who exhibited clinical or borderline levels of anxiety Age: 6-8; M = 6.5 45% Cauc, 21% AfAm, 19% Lat, 13% Biracial, 2% Asian 68% male	Clinical Anxiety	Compared to active control, CCPT demonstrated statistically significant decrease in worry and overall anxiety; treatment effects were large. Children in active control group increased their levels of anxiety and worry.
Yuen, Landreth, & Baggerly (2002)	CPRT / WC 7 play sessions 1/wk; 30 min Community agency *CPRT-trained parents	N = 35 Behaviorally at-risk immigrants Age: 3-10; M=6.4 100% Chinese Canadians 54% male	Comorbid Behavior Problems; Self-Concept;	Compared to the WC, the CPRT group demonstrated statistically significant improvements in 1) child behavior problems, parent-child relationship stress, and parental acceptance according to parent report, and 2) parental empathy according to raters blinded to treatment groups. CPRT group children also reported greater gains in perceived competence and social acceptance

Note: Control group type denoted by WC = waitlist control/delayed start, AC = active control, COMP = comparison treatment
AfAm = African American; Asian = of Asian descent living in U.S.; Cauc = Caucasian/European American; Lat = Latino/Hispanic
*Denotes play therapy intervention delivered by parent/teacher/mentor under direct supervision of a CPRT-trained play therapist

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

filial therapy-trained play therapist (noted in Table 1), researchers reported treatment was provided by doctoral or master's level play therapists or advanced play therapy graduate students under the supervision of a professional play therapist. All studies were conducted in the United States or by U.S. research teams. Only 3 studies failed to report the use of manualized protocols; 12 followed CCPT protocol (Ray, 2011), 8 adhered to CPRT protocol (Bratton, Landreth, Kellam, & Blackard, 2006), 2 followed Group CCPT/Activity Therapy protocol (Ojiambo & Bratton, 2014), and 1 used AdPT protocol (Kottman, 2009). The majority of studies published since 2010 reported procedures for fidelity checks to ensure treatment integrity. Unless specified, active control and comparison groups participated in the same intensity and duration of intervention as the experimental group.

A large number of participants (total of 1087 with a mean of 42 participants per study), among the 26 studies reviewed, provides foundation to make several conclusions about play therapy based on the results of reviewing these studies. Outcome research indicated that children's participation in play therapy resulted in positive outcomes for externalized problems, disruptive behaviors, aggression, attention problems, internalizing problems, anxiety, academic achievement, speech problems, trauma symptoms, social emotional functioning, self-concept, co-morbid behavior problems and functional impairment. Table 2 provides a cross-reference of studies by target outcome variables.

Table 2. Cross-reference of Table 1 studies by target outcome variables

Child Outcome Variable/Target Problem	Studies
Internalized Problems including Anxiety	Baggerly & Landreth, 2001; Blanco et al., 2015; Ceballos & Bratton, 2010; Flahive, & Ray, 2007; Garza & Bratton, 2005; Jones et al., 2002; Morrison & Bratton, 2010; Ojiambo & Bratton, 2014; Packman & Bratton, 2003; Fall et al., 2002; Jones & Landreth, 2002; Shen, 2002; Stulmaker & Ray, 2015
Externalized Problems including Disruptive Behaviors, Aggression, ADHD	Ojiambo & Bratton, 2014; Bratton et al., 2012; Carnes-Holt & Bratton, 2014; Ceballos & Bratton, 2010; Flahive & Ray, 2007; Garza & Bratton, 2005; Meany-Walen et al., 2014; Morrison & Bratton, 2010; Ray et al., 2007; Ray et al., 2009; Schumann, 2010
Comorbid/Global Behavior Problems including Functional Impairment	Carnes-Holt & Bratton, 2014; Fall et al., 2002; Flahive & Ray, 2007; Jones et al., 2002; Packman & Bratton, 2003; Ray et al., 2013; Sheely-Moore & Bratton, 2010; Yuen et al., 2002
Trauma/Attachment/PTSD	Carnes-Holt & Bratton, 2014; Schottelkorb et al., 2012
Academic Achievement/ Speech Disorder	Blanco et al., 2015; Blanco & Ray, 2011; Danger & Landreth, 2005; Smith & Landreth, 2004
Social-Emotional Functioning	Cheng & Ray, 2016; Fall et al., 2002; Smith & Landreth, 2004
Self-Concept/Competence	Baggerly & Bratton, 2010; Yuen et al., 2002
Diabetes Adaptation	Jones & Landreth, 2002
Other Target Outcome Variables	Studies
Caregiver-Child Relationship Stress	Ceballos & Bratton, 2010; Sheely-Moore & Bratton, 2010; Yuen, Landreth & Baggerly, 2002
Caregiver Empathy	Carnes-Holt & Bratton, 2014; Jones et al., 2002; Smith & Landreth, 2004; Yuen et al., 2002

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Play therapy appeared effective across cultures including race, ethnicity, and gender. Majority of outcome studies included a diverse sample of ethnicities. Across the 26 studies, over 60% of the participants were non-Caucasian (27.3% Latina/o, 17.7% African American, 14.56% other/biracial/or international population, and 0.56% Asian American), 63% were male, and the vast majority of participants were identified as low-income. Play therapy's successful application across cultural groups is a unique feature of this intervention and is likely a factor of the large number of studies conducted in real-world settings, primarily low-income schools (n = 21). Participants' ages ranged from 2.5 to 13 years indicating play therapy's responsiveness to young children through preadolescence. In view of the shortage of EBTs for young children (Weisz & Kazdin, 2010), it is important to note that over 60% of studies reported a mean age of 6 and younger.

Findings also indicate that play therapy can be used as short-term intervention. The number of play sessions ranged from 7 to 25, with a mean of 13 and a mode of 16. The most frequently occurring format was 30-minute sessions conducted twice per week over approximately 8 weeks (total of 16 sessions) to conform to the needs of the school setting. Only 3 studies reported greater than 17 sessions. These findings represent a noticeable discrepancy from the meta-analytic results of Bratton et al. (2005) and LeBlanc & Ritchie (2001) who reported similar findings indicating optimal number of sessions ranging from 30 to 40 sessions. For the CPRT/filial therapy studies, we indicated session number as the total sessions in which children participated in CCPT-based therapeutic play sessions with their caregivers (mean = 7 sessions) in accordance with CPRT treatment manual and protocol (Bratton et al., 2006). Unless otherwise specified, caregivers and mentors participated in 10 two-hour group CPRT training sessions in addition to conducting 7 play sessions with their child.

The majority of included studies did not report direct caregiver (i.e., parent or teacher) involvement as a component of treatment (n = 16). This finding is due to the large number of school-based CCPT studies following CCPT protocol. Consistent with the foundational philosophical principle of CCPT, that children inherently possess the capacity to experience inward healing and develop coping strategies given the context of a safe and accepting therapeutic relationship, play therapy research supports that children are capable of demonstrating change in emotional and behavioral functioning without direct systemic intervention. Among EBT's recognized for young children under the age of 5 years old, there is a considerable dearth of early mental health interventions that do not require full parental participation (Weisz & Kazdin, 2010; SCAPP, 2016). This finding that young children are capable of change in therapy without direct intervention with caregivers addresses a gap in available EBT's for young children and, furthermore, positions play therapy as a particularly suitable intervention in school settings where it may be difficult to engage parents (Ray et al., 2015). However, the findings from the eight CPRT/filial play therapy studies included in this review, along with meta-analytic research results (Bratton et al., 2005; LeBlanc & Ritchie, 2001) and systematic literature reviews (Bratton et al., 2010; Bratton, 2015), demonstrate that including caregivers in the play therapy process results in stronger outcomes in fewer number of sessions than traditional individual play therapy.

Several well-designed play therapy outcome studies were omitted from this review based on failing to meet the inclusion criteria we established, due to: a) lack of randomization resulting from legitimate constraints of conducting clinical research in real world settings (e.g., Ray, Blanco, Sullivan, & Holliman, 2009; Shen, 2007); b) measuring caregiver-child variables without reporting child outcome variables (e.g., Lee & Landreth, 2003; Ray et al., 2007). Summaries of these studies and others omitted from the present review including studies employing non-randomized control group, single group, and single case experimental designs can be viewed at evidencebasedchildtherapy.com. Similar to previous

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

literature reviews (Bratton, 2010; Bratton, 2015; Ray & Bratton, 2010; Ray & Bratton, 2105), we did not include RCT studies that failed to identify child intervention as play therapy, e. g. Parent-Child Interaction Therapy (PCIT; Eyberg, Nelson, & Boggs, 2008), Incredible Years (IY; Webster-Stratton, C., Reid, M., & Hammond, M., 2004), and Child Parent Psychotherapy (CPP; Lieberman, Van Horn, & Ghosh Ippen, 2005) and that had not been included in major contemporary texts on play therapy approaches (O'Connor & Braverman, 2009; Schaefer, 2011). Empirically-supported, play-based interventions that did not meet the criteria established for this review can be found in Reddy, Files-Hall, and Schaefer (2015) and Russ and Niec (2011).

Although individual studies included in this review demonstrated beneficial outcomes on a variety of childhood outcomes, play therapy research noticeably lacks replication and follow-up studies. Replication of well-designed studies targeting specific populations and outcomes, preferably by independent research teams (Chorpita et al., 2011), are needed to further confirm the efficacy of play therapy. Follow-up studies are essential to evaluate maintenance of therapeutic gains and provide information regarding adequate length of treatment relative the sample population. Furthermore, none of the studies reviewed involved multi-site sampling which could increase sample sizes and allow for greater generalizability of findings.

CONCLUSION

In today's climate of managed care and cost-control, mental health professionals are facing more pressure than ever before to deliver evidence-based intervention. In addition to the increased pressure from managed care systems to engage in evidence-based practice, play therapists are also challenged to serve as advocates for the profession in order to promote play therapy as an effective intervention for children who present with myriad difficulties that interfere with their day to day functioning. The current status of play therapy research demonstrated through this chapter's careful review of the most rigorous contemporary studies as well as meta-analytic and systematic reviews of the play therapy research literature indicates that play therapy can be considered an evidence-based approach for responding to the mental health needs of children. Although, as in all research, limitations exist, the body of research findings reviewed for this chapter shows that play therapy is a developmentally responsive and culturally sensitive intervention for children that has extensive scientific evidence to support its efficacy in a variety of settings and across a broad range of presenting concerns and childhood disorders. The empirical support for play therapy's effectiveness across diverse populations of children and its application in real-life settings are particular strengths. It is our hope that play therapists will use the research summaries provided in this chapter to support and defend their own practice as well as advocate for the profession of play therapy as they interact with adults who make decisions regarding children's holistic wellbeing.

KEY TERMS AND DEFINITIONS

Child Parent Relationship Therapy (CPRT): A filial play therapy approach in which a CPRT-trained mental health professional trains and directly supervises parents/caregivers in the principles, attitudes and skills of child-centered play therapy (CCPT).

Controlled Outcome Research: Research conducted to study treatment effectiveness using a control group design and examining pre to posttest differences, at a minimum, to measure between group differences over time.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Early Mental Health: A term that conveys the holistic view of young children's cognitive, emotional, social, and behavioral functioning, typically between the ages 2 to 9 years old.

Evidence-Based Treatment: A mental health approach that has been recognized by a governing body as an approach with rigorous controlled outcome research to support its effectiveness.

Filial Therapy: A play therapy approach based on the principles of child-centered play therapy (CCPT) that fosters parents/caregivers to become therapeutic agents in their children's lives.

Meta-Analysis: A research method used to investigate overall treatment effectiveness for a particular intervention by combining treatment effects on specific outcomes across multiple controlled research studies employing the target intervention.

Play Therapy: A developmentally-appropriate mental health intervention for children in which play is acknowledged as children's natural medium of communication and play therapists strive to provide an environment for children in which they can feel fully heard, understood, and unconditionally accepted by returning responsibility, encouraging children's self-directed process, facilitating creativity, and utilizing therapeutic limit setting and choice giving.

Randomized Controlled Trials: Experimental research studies using random group assignment to determine the effectiveness of a treatment compared to a control group by examining pre to posttest differences to measure between group differences over time.

Chapter 95
User Needs and Limitations of Existing Mobility Devices: A User Perspective

Yiannis Koumpouros
Technological Educational Institute of Athens, Athens, Greece

ABSTRACT

The use of gait assistive devices, although can provide precious help can also have limitations or adverse consequences. The performance of daily activities is partially restrained by a series of factors having to do with the assistive device limitations or the limitations emerged from environmental causes. Valid and reliable assessment tools to classify and clarify their limitations or users' satisfaction do not exist. An extended literature search was performed for some of the most commonly mentioned assistive device limitations or dissatisfaction reasons and identified the most appropriate tools to be able to study such limitations and conclude in valid outcomes. A study was conducted in a rehabilitation hospital using the IPA, EQ5D and SF-12 tools. The size of the sample combined with the uncertainty related to the satisfaction of normal distribution prerequisite, led to use several statistical analysis tools and methodologies. A summary of the results from both the literature review and the real case study on a mixed group of mobility aid users are presented in the paper.

INTRODUCTION

The use of gait assistive devices, although can provide precious help for the elderly (Cetin, Muzembo, Pardessus, Puisieux & Thevenon, 2010) or the mobility-impaired, can also have limitations or adverse consequences. Studies show that 30% to 50% of people prescribed with a gait assistive device abandon their device soon after receiving it, mainly because they do not meet the needs of individuals. In one survey, almost half of the reported problems were associated with the difficulty or risk to use the prescribed device (Bateni & Maki, 2005). Another study reveals that 58.3% of knee osteoarthritis patients abandon the mobility aid due to adverse outcome and feeling of stigmatization (Akinbo, Sokunbi & Ogunbameru,

DOI: 10.4018/978-1-7998-3432-8.ch095

2008). According to (Lezzoni, Rao & Kinkel, 2009) the vast majority of persons with multiple sclerosis (MS) own more than one type of mobility aids. Persons with MS appear to "mix and match" different devices to suit their specific mobility needs. Canes and crutches are prescribed for people with moderate levels of mobility impairment, and walkers are prescribed for people with generalized weakness, poor lower-limb weight bearing, debilitating conditions, or poor balance control, while wheeled walkers are favored for patients with Parkinson disease (Minor & Minor, 2013).

Some of the most commonly mentioned assistive device limitations or dissatisfaction reasons, as mentioned by users and health scientists, are: (1) handling the rollator gait assistive device (Brandt, Iwarsson & Ståhl, 2003; Hallén, Orrenius & Rose, 2006), (2) the weight of the device (Brandt, Iwarsson & Ståhl, 2003; Hallén, Orrenius & Rose, 2006; Hill, Goldstein, Gartner & Brooks, 2008), (3) the brake-use of rollator devices (Thomas et al., 2010), (4) users are prone to falling because of the dependence on memory to activate the rollator's parking mechanism, (5) the inability of the current rollator to effectively park when the braking mechanism is engaged (Siu et al., 2008), (6) social stigmatizing (association with aging and physical decline) (Hallén, Orrenius & Rose, 2006) (Hill, Goldstein, Gartner & Brooks, 2008; Thomas et al., 2010; Resnik, Allen, Isenstadt, Wasserman & Iezzoni, 2009), and (7) upper-extremity pathologies because of the extended use of walking aids (i.e. tendonitis, osteoarthritis, and carpal tunnel syndrome) (Bateni & Maki, 2005).

It is evident from the above that the performance of daily activities by device-assisted walkers is partially restrained by a series of factors having to do with the assistive device limitations or/and the limitations emerged from environmental causes. Nowadays, there is no valid and reliable assessment tool able to identify and classify the limitations of walking aids or the users' satisfaction. One of the most common instruments used in the bibliography is the Quebec User Evaluation of Satisfaction with assistive Technology - QUEST 2.0. QUEST 2.0 was designed to measure the level of satisfaction attribute to assistive technologies. It does so by using variables that are scored in terms of perceived importance and satisfaction (Demers, Weiss-Lambrou & Ska, 2000; Demers, Monette, LaPierre, Arnold & Wolfson, 2002; Koumpouros, Karavasili, Papageorgiou & Siavelis, 2016). However, being a generic assessment tool, some potential items, relevant to specific pieces of technology or delivery systems, are absent. For example, for gait assistive devices, the information extracted is limited to describing the satisfaction level of the user in terms of certain aspects (dimensions, safety feeling, effectiveness, etc.) (Demers, Weiss-Lambrou & Ska, 2000). Thus, it cannot be used to point out specific problems or limitations to be exceeded. In our study, we tried to identify the right tools in order to measure the limitations of the most commonly used mobility aids (rollator, frame walker and crutches) from a user perspective.

METHODOLOGY

The study was conducted in a Greek rehabilitation hospital, and utilized semistructured individual interviews for data collection, using a combination of already valid and reliable tools.

Patient Selection

In order to understand the user needs of assistive gait devices and get an impression about their limitations, we interviewed 20 people (8 males and 12 females) depended on mobility aids. The participants were grouped in two main categories: (1) rehabilitation group (the ones that were undertaken rehabilita-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

tion at the time of the study), and (2) the elderly group (the ones aged over 65 years old and did not need rehabilitation). 9 of the participants were currently engaged in rehabilitation and the rest 11 where older adults. According to the inclusion criteria, all subjects should fall under the following categories: (1) being users of a mobility aid for at least four weeks, (2) had no or moderate mental impairment [scored more than 17/30 at the Mini Mental State Examination - MMSE], and (3) had a moderate motor impairment [subject is unable to stand up and sit down unassisted on a standard chair (standardised 100% leg length) without problem, 5-chair stand >16,7 sec and gait speed >0.6 m/sec unassisted].

Tools Selection

Since there is no single tool able to capture the desired data of the current research study, we conducted a thorough survey of the literature in order to identify the most proper ones. Three questionnaires (the Impact on Participation and Autonomy - IPA, the EuroQol EQ-5D - EQ5D and the 12-item Short Form Health Survey - SF-12) were finally chosen from a wide variety of tools, as considered to best match the goals of our research, which are to understand gait-assistive-device user needs and get an impression about the limitations of their mobility aids. Our choice was based on the fact that the EQ5D and the SF-12 are among the most commonly used and the most widely evaluated measures of Quality of Life (QOL). The IPA questionnaire was mainly chosen because of the extensive variety of the described aspects of daily activities, analyzing not only the mobility dimension but also the whole spectrum and needs of the mobility aid users. The advantage of comments by the user on every separate dimension was also taken into consideration since data that could not have been foreseen were allowed to enter, especially data that could lead to a detailed description of problems/limitations of the used mobility aids. The main advantage of generic instruments is that they are suitable for use across a broad range of health problems and that they can also be used with healthy populations to generate normative data that can be used to compare different patient groups (University of Oxford) (for example, as in our case, patients undergoing rehabilitation and elderly people). Disease-specific questionnaires were excluded from the beginning since some of the volunteers would be considered a healthy population and the rehabilitation group did don't face with only one specific disease. Apart from the QUEST 2.0 (which does not fulfil the needs of detailed and extended users' evaluation of mobility aids), there is no other valid and reliable assessment tool able to identify and classify the mobility aids' limitations and the user's satisfaction. Moreover, although QUEST 2.0 could provide valuable data, in our case (three different categories of mobility aids used by the volunteers) could probably lead to collecting insufficient data for all categories of mobility aids. Concluding, information on user needs and limitations of the used mobility aids was extracted from a combination of the three questionnaires. EQ5D, SF-12 and IPA (in this order) are of gradually increasing complexity and specification, all including at least one sector referring to mobility issues but without being narrowed to it.

Tools

EQ5D Questionnaire

The EuroQol EQ-5D is a two-part, generic, preference-based measure of Health-related quality of life (HRQOL) developed by a multidisciplinary consortium of investigators from five European countries (EuroQol, 1990). As a generic tool, rather than being aimed at one particular disease or treatment, it is

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

designed for use across a wide range of health interventions (Brooks, 1996). The revised version of the instrument, which has become the most widely used HRQOL instrument for obtaining health state utilities (Whynes, McCahon, Ravenscroft, Hodgkinson, Evley & Hardman, 2013), addresses five domains: mobility, self-care, usual activities, pain/discomfort, and anxiety/depression. A dimension for which there are no problems is said to be at level 1, while a dimension for which there are extreme problems is said to be at level 3. The second part of the EQ-5D consists of a vertical 0 to 100 Visual Analog Scale (VAS), with 0 and 100 representing the worst and best possible health states, respectively. The EQ-5D is a self-report easily completed questionnaire (Stahl, Jansson, Jonsson, Svensson, Lundback & Andersson, 2003; Nilsson, Wenemark, Bendtsen & Kristenson, 2007; EuroQol, 2007). Validity and reliability of the instrument has been tested among the general population and a variety of clinical conditions and for countries inside and outside the European Union (De Smedt et al., 2013; Ware Jr, Kosinski & Keller, 1996; Soer, Reneman, Speijer, Coppes & Vroomen, 2012; Hurst, Kind, Ruta, Hunter & Stubbings, 1997; Yfantopoulos, 2001; Kontodimopoulos, Pappa, Niakas, Yfantopoulos, Dimitrakaki & Tountas, 2008; Papadopoulos, Ikonomakis, Kontodimopoulos, Frydas & Niakas, 2007).

The SF-12 Short Form Health Survey

The SF-12 Health Survey (Ware Jr, Kosinski & Keller, 1996) is a multipurpose short form survey with 12 questions, all selected from the 36-item Short Form Health Survey (SF-36 Health Survey) (Ware, Snow, Kosinski, Gandek & Institute, 1993). The SF-12 and the original SF-36 health survey have been translated into several languages by the International Quality of Life Assessment Project (IQOLA) (Hoffmann et al., 2005). The SF-12, as a brief and reliable measure of overall health status, is often included in substantial population health surveys (Vilagut et al., 2013). The 12 items instrument is summarized in two indices exploring the physical health (physical component summary - PCS-12) and the mental health (mental component summary - MCS-12) (Pezzilli et al., 2006). The benefit of reduced administration time and the ability to validly measure physical and mental components makes the SF-12 a reliable outcomes tool (Globe, Levin, Chang, Mackenzie & Azen, 2002). The SF-12 is weighted and summed to provide easily interpretable scales for physical and mental health. The data obtained with the SF-12 has been developed, tested and validated in several studies (Utah Department of Health, 2001; Gandek et al., 1998; Fong et al., 2010; Kontodimopoulos N., Pappa, Niakas & Tountas, 2007; De Smedt et al., 2013; Globe, Levin, Chang, Mackenzie & Azen, 2002; Rubenach, Shadbolt, McCallum & Nakamura, 2002; Lim & Fisher, 1999; Vilagut et al., 2013). However, for the purpose of our study, since we are looking for the needs of gait assistive device users and the limitations of their mobility aids, we focused on the item-by-item qualitative information that can be extracted, rather than the overall scaled data that can only provide general (physical and mental) health status information.

IPA Questionnaire

The outcome measure “Impact on Participation and Autonomy - IPA” was developed in 1999 by (Cardol, de Haan, van den Bos, de Jong & de Groot, 1999). According to the developers, it is a generic outcome measure that can be used in populations or with individuals with a range of diagnoses. Rather than focusing on ability or capacity, the IPA questionnaire focuses on autonomy and participation of people with chronic disorders. The IPA questionnaire examines autonomy as opposed to dependency, by measuring several aspects of participation. Participation, can be defined as “the involvement of an

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

individual in life situations in relation to health conditions, body function and structures, activities and contextual factors" (Cardol, de Jong & Ward, 2001) or as "persons' own lived experiences of their involvement in a life situation" (WHO, 2001). That is a new concept in the context of the World Health Organization's classification of health outcomes and has replaced the concept "handicap" (WHO, 1980). The IPA questionnaire quantifies limitations in participation and autonomy and examines the extent to which these limitations are experienced as "problematic". The IPA has been validated in several cases (Sibley, Kersten, Ward, White, Mehta & George, 2006; Cardol, de Haan, de Jong, van den Bos & de Groot, 2001; Vazirinejad, Lilley & Ward, 2003; Kersten, Cardol, George, Ward, Sibley & White, 2007).

PROCEDURE

The volunteers were officially informed about the purpose and the procedures of the research through a written form and were also asked to sign a consent form. At the next step, they were given the questionnaires above: the IPA, the EQ5D, and the SF-12. The questionnaires were given in random order to prevent any order effect. The subjects completed the forms following the clear guidelines, with the presence and, if required, with the explanations/assistance of a physical therapist. Whenever needed, the assisting physical therapist would either read or explain the questions to the volunteer, avoiding using other phrases than the ones used in the questionnaire. As far as the IPA questionnaire is concerned, wherever the tool foresaw open-ended questions (in the form of comments), the assistant reviewed the previous questions (for which the comments were asked). Maximum completion time of the three questionnaires was approximately 35 minutes.

STATISTICAL ANALYSIS

For the purpose of statistical analysis, the Statistical Package for Social Sciences (SPSS, version 20) was used. The size of the sample (N=20) combined with the uncertainty related to the satisfaction of normal distribution prerequisite, led to use of non-parametric tests such as Wilcoxon–Mann–Whitney and Kruskal-Wallis non-parametric ANOVA in the event of comparison between groups of participants with quantitative measurements.

In cases where values are discretional, for the purpose of patients' groups' comparison Exact (Significance) Tests for Contingency Tables were used. In the event of multiple comparisons, a Z-Test was used for comparing whose results are noted on the respective tables. Statistical significance for all the above tests was determined at p=0.05.

RESULTS

The current section presents the results of the measurements that took place in a rehabilitation center in Greece. The five domains of the EQ-5D were answered by the participants regarding the level of significance for each one of them. Figure 1 presents the findings from the EQ-5D questionnaire.

The mean scores of the EQ-5D VAS [Kruskal Wallis chi-square ($df = 2$, $N = 20$) = 0.31, $p = 0.86$] are presented in Table 1.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. EQ-5D dimensions

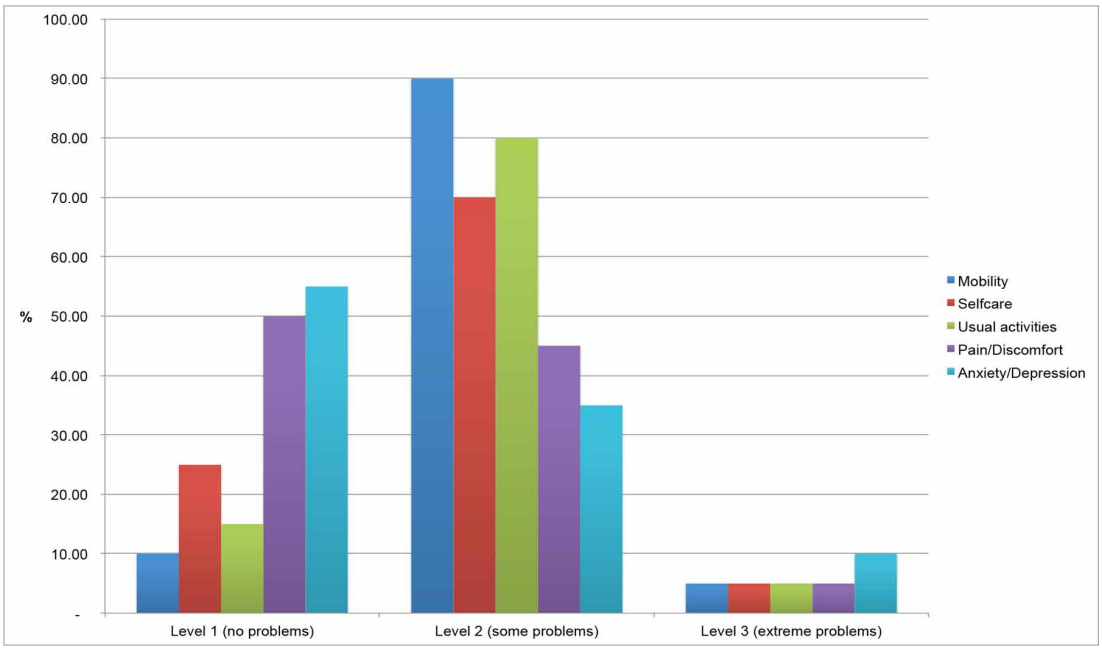

Table 1. Means and standard deviations of EQ-5D VAS scores in three walking aids groups (N=20)

Mobility Aid	Mean	N	Std. Deviation
ROLLATOR	67,14%	7	9,94%
CRUTCHES	62,50%	4	15,00%
FRAME WALKER	63,89%	9	25,47%
Total	64,75%	20	18,53%

Table 2 presents the category frequencies of the SF-12 items. All participants answered the SF-12 questions taking into account their health status as it was the last 30 days (when supported by the mobility aid).

Table 3 presents detailed data on the category frequencies of SF-12 questions for the two groups of participants (rehabilitation patients group and elderly group) per walking aid. Table 4 presents the analytical findings on the means and standard deviations of IPA subscales for both groups per walking aid.

Note (for Table 3 and 4): Values in the same row and subtable not sharing the same subscript are significantly different at $p< 0.05$ in the two-sided test of equality for column proportions. Cells with no subscript are not included in the test (this category is not used in comparisons because its column proportion is equal to zero or one). Tests assume equal variances (tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction).

Detailed frequency distribution of the IPA questions is presented in Table 5 and 6.

The referred comments from the frequency distributions of the IPA open questions were coded and categorized into six main domains (see Figures 2, 3 and 4).

During the past four weeks, how much did pain interfere with your regular work (including both work outside the home and housework)	Not at all	11	55,0%
	A little bit	3	15,0%
	Moderately	5	25,0%
	Extremely	1	5,0%

DISCUSSION

Even though no significant differences in the mean scores of the EQ-5D VAS were found among users of different types of mobility aids [Kruskal Wallis chi-square (df=2, N=20)=0.31, p=0.86], participants that use a rollator as a mobility aid (N=7) characterize their health state with relative higher scores than the ones that use the other two mobility aids (crutches N=4, frame walkers N=9) (see Table 1). An explanation to this could be that those using a rollator may have comprehended their health situation (as a lifetime status), while the others (using crutches or frame walkers) are in a psychological situation that cannot still accept their health status. Persons belonging in the latter category are on the edge of independent living, and this may be a criterion of continuous thoughts about their health status and agony about not being entirely independent of mobility aids. That is also in line with the fact that 90% of the subjects face depression and anxiety symptoms (Figure 1).

Tests assume equal variances (tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

According to the findings of Table 2, the vast majority of mobility aid users (95%) reported limitations in moderate activities (such as moving a table, pushing a vacuum cleaner, etc.), while 65% of them were "limited a lot". Moreover, a high percentage (85%) of the users reported having limitations at climbing several flights of stairs, and 70% were limited in work or other activities as a result of their physical health condition.

According to the data of Table 3, no significant differences were noticed for the selected items. However, as seen at the SF-12, item 7, problems regarding social activities were least frequently mentioned by rollator users (N=5, 71.4%), and more frequently by crutches users (N=2, 50%) and frame users (N=3, 33.3%). Another interesting finding is the 2b item of the SF-12 (limitations when climbing several flights of stairs), where rollator users that answered "not limited at all" are significantly more than frame and crutches users giving the same answer. The results revealed that both groups present similarly high percentage of limitations when climbing several flights of stairs (elderly group N=9, 81.8% and for the rehabilitation group N=8, 88.9%), as it was anticipated due to their overall health condition. However, the elderly (N=3, 27.3%) reported being "limited a lot" significantly less frequently than the rehabilitation participants (N=5, 55.6%).

Table 4 shows that all participants score high rates (0=very good, 1=good) at "social life" subscale, with the elderly group scoring significantly higher rates (M=0.190) than the ones from the rehabilitation group (M=0.46). At the remaining subscales, group differences are not significant. Both groups score high rates at the "social life" and "autonomy indoors" subscales. On the mobility type-based grouping, frame-walker users score significantly higher rates at "autonomy outdoors" subscale (M=0.60) than the rollator ones (M=1.27). No significant differences between the two groups were noticed for the remaining subscales.

According to the findings of Table 5, as it was expected, mobility aid users report severe limitations in activities including outdoor transportation (1d, 3e, 1c), indoor role fulfilment (3a, 3c, 3f) and job-related problems (8a, 8b, 8e). Rollator users reported more significant difficulties in moving around the house. 57.1% of them stated having fair chances of getting around in the house, while all crutches users and 88,9% of frame walker users state to have "very good" or "good" chances of achieving it. The vast majority of the participants (95%) claimed to have "very good" or "good" chances of getting up and going to bed whenever they decide to. Depending on the mobility aid, frame users have significantly better chances of answering "very good" at the IPA_2c question than rollator users. Although 95% of all participants have "very good" or "good" chances of going to the toilet when they wish or need, significant differences appear between rollator users and frame users. As seen at IPA_2d, rollator users have 14.3% chances of answering "very good" at the question, while the respective percentage for frame-walker users reaches 77.8%. For question IPA_3a (my chances of contributing to looking after my house the way I like are), most of the answers for frame-walker users (44.4%) and rollator users (42.9%) were "fair", and no other significant differences for the two groups were found.

More than half of the participants (55%) mentioned difficulties when attempting other activities while using their mobility aid. These difficulties mostly affected frame-walker users (88.9%), while rollator and crutches users were affected at a percentage of 28.6% and 25% respectively. Insecurity while walking on uneven surfaces was mentioned from 50% of the sample. This sense was reported by 71.4% of rollator users, while frame walker users and crutches users reported it as a percentage of 44.4% and 25% respectively. Difficulties in transferring objects were mentioned from 40% of the sample. This restriction mainly concerned frame walker users (77.8%), while for rollator users it affects only 14.3% of them. On the other hand, 55.6% of the rehab group reported the same difficulty. Sit-to-stand transfers are reported

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

as a difficult task or as an insecurity-causing task by 25% of the sample. Insignificant differences exist between mobility aid groups and rehabilitation/elderly categorizations. Finally, crutches users (15%) were the only group that mentioned "sense of insecurity while walking on slippery surfaces, independent of the group they were belonging.

No significant differences were found at "autonomy outdoors" subscale scores of the IPA questionnaire between the three answer categories of the SF_12_2b item, despite the interesting differences observed. These differences describe smaller autonomy level (M=2.00) for those who answered: "Yes, limited a lot" compared to those who answered "No, not limited at all" (M=0.80). Referring to the correlations between 3a and 3b (agreement or disagreement in both questions 3a & 3b of SF-12) and the question 10 of IPA, this was also found insignificant (p=0.08). Mobility aid users that answered "Yes" at both 3a and 3b questions mentioned a lower level (35% scored "2" or "3" at IPA_10 item) compared to those who answered "No" at both 3a and 3b questions (0% scored "2" or "3" at IPA_10 item). That means that those who accomplished less than they would like and were also limited in their work or other activities as a result of their physical health had worse chances of living life the way they want to.

Even though it is significant for a group of older adults with mobility impairments to use the frame walker, it has been observed a difficulty to take the stairs or go up and down on a slope while using the walker. That may occur because of two primary reasons: (1) they are physically too weak to accomplish the previously mentioned functions, and therefore they need assistance from another person, and (2) the design of walkers themselves is not functional for the previous activities. Our results are in line with another study that recommends an improved walker design for older adults (Cherng-Yee Leung & Po-Chan Yeh, 2008).

Apart from all the above, many other issues are related to the dangers associated with mobility aids. For example, it is possible that the act of lifting the mobility aid (referring to walking frames) can lead to instability in the same way that lifting the foot can cause the Centre of Mass (COM) to fall toward the unsupported side during unassisted gait. By suddenly reducing the Base of Support (BOS), lifting the device could create a state of imbalance in which the COM lies outside the BOS limits. Moreover, the tendency of the walking frame to tip increases with the magnitude of the applied horizontal force and with the height of the walker (Bateni & Maki, 2005). When it comes to gait speed, the use of any walking aid, in particular walkers, results in slower gait speed and requires considerably more energy and cardiovascular fitness than walking unassisted (Martins, Frizera-Neto, Urendes, dos Santos, Ceres & Bastos-Filho, 2012). Also, as mentioned by (Cetin, Muzembo, Pardessus, Puisieux & Thevenon, 2010), with a fixed frame walker, Physiological Cost Index (PCI) was higher in a weakened elderly individual due to heart rate increase and lower walking speed. Several studies have found that use of a mobility aid is a prospective predictor of increased risk of falling in older adults or is associated with falls and related injuries. Furthermore, it appears that frame-walker-related injury can occur as a result of contact and/or "catch" of the mobility aid with environmental objects, such as carpets and doorframes that would not usually be considered obstacles (Bateni & Maki, 2005). Fall-related injuries among older adults are also associated with substantial social and economic costs (Solway, Brooks, Lacasse & Thomas, 2001; Beaupre, Jones, Johnston, Wilson & Majumdar, 2012; Stevens, Thomas, Teh & Greenspan, 2009). There is little evidence to suggest whether the use of a walking aid alone leads to this risk or if it is related to the decreased level of physical function, increased frailty, and poorer general health that users of walking aids may have. However, inappropriate walking aid prescription, inadequate training of the user and un-prescribed use of walking aids are likely to exacerbate the problem (Thomas et al., 2010).

According to the findings of the research, it is crucial to provide new technological solutions to support the needs and overcome most of the problems faced by mobility aid users. Apart from the underlying pathology, mobility aids have been proved crucial for the everyday living of their users. The adoption of some technological innovations could enhance the performance and the acceptance rate of the already existing mobility aids. To this end, several new functionalities could be proved valuable for the mobility aid users. More specifically, sit-to-stand support seems to be crucial for most of the users, while a mobility aid that could enhance the safety feeling when moving around slippery and uneven surfaces is also considered critical. Apart from the above, according to open-ended interviews we had with the participants, another critical issue identified was to support them in navigating in unknown spaces. Functionalities that could support them to reach the mobility aid when it is at a distance could also provide great support. Finally, providing help when it comes to climbing stairs is valuable, whereas the existence of sitting support while walking is also considered extremely helpful.

The functionalities above can be implemented using the latest robotics and human-computer interaction techniques. In this direction, there are some recent examples of experimental prototypes that utilized audio-gestural controls, navigation functionality and an actuated robotic rollator (Koumpouros et al., 2017a; Efthimiou et al., 2016; Fotinea et al., 2014). However, further research is required in the above directions in order to conclude in marketable products (lightweight, low cost and highly aesthetics) that can support mobility aid users more efficiently and intuitively. A critical point in the development and further enhancement of mobility aid devices is the successful evaluation of all phases (research, design, development, market entering). However, as already stated in the Introduction section of the paper, no single instrument can capture the subjective satisfaction of the end users. A recent effort in this direc-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

tion proposes a newly developed tool called PYTHEIA with encouraging results (Koumpouros, 2016; Koumpouros et al., 2016; Koumpouros, Papageorgiou & Karavasili, 2016).

Although our sample size can be considered adequate for reasoning, it is rather small, thus limiting the statistical power of our study. In order to generalize the findings a more significant sample is necessary. Moreover, the study was designed in only one center. A multi-center or even multi-country approach would add significant value.

CONCLUSION

The current study attempted to reveal mobility aid user needs and limitations of the most commonly used mobility aids. The user evaluation of assistive devices has been proved to be very challenging (Koumpouros et al., 2017a; Koumpouros et al., 2017b; Efthimiou et al., 2016). A bibliographic survey followed by a real case study on a small size of the population with specific characteristics (mobility aid users, rehabilitation patients or older adults, independent of any associating disease). From the beginning of our searching a necessary assumption was made: the concept of "user needs", being mandatorily unable to be separated from every single dimension that could claim a portion of existence in every individual's needs spectrum will have –as mandatorily- to be described as a multi-dimensional, broad and complex field. Trying to reach conclusions on the relationships between all these complex data (social, psychological, mental, and biological) that will come up whenever entering this field would be a duty that exceeds the capabilities -although not the interests- of this attempt. We attempted, instead, by using three different valid questionnaires that try to extract from very general to precise information, to cover many aspects of self-perceiving ones' mobility and overall condition. Using multi-dimensional questionnaires helped us consider the full spectrum of user needs and at the same time to correlate data from different dimensions (e.g. mobility limitations and social life). From the EQ5D questionnaire very general limitations on physical, mental and social functionality can be confirmed and classified. The SF-12 questionnaire includes some targeted questions from which user needs can be specified in more details, exploring in a more detailed level the physical and mental dimensions of QOL. Finally, the more extended IPA questionnaire, has a range of specified questions which cover nine different aspects of participation and autonomy (such as mobility, activities in and around the house, etc.) and also has predicted open-ended comments for each different aspect, allowing user-derived information and ideas on needs and limitations (in general and also in specific for mobility aids, if they exist) to enter the form. Recent studies reveal the lack of appropriate instruments to measure and assess the subjective opinion of users of assistive devices (Koumpouros, 2016) while proposing new tools to this direction (Koumpouros, Papageorgiou & Karavasili, 2016; Koumpouros, Papageorgiou, Karavasili & Koureta, 2016). It is evident that there is a great need for better, more intuitive and adaptable mobility aid devices capable of covering the needs of their end users in the modern era.

ACKNOWLEDGMENT

I would like to thank the physical therapists P. Siavelis, D. Alexopoulou, and the physiatrist A. Karavasili, working in the rehabilitation hospital Diaplasis in Kalamata, Greece, that helped in the recruitment process and collection of the data from the participating patients in the study. The work leading to the presented results has received funding from the European Union under grant agreement n°600796.

Chapter 96
An Examination of Selfish and Selfless Motives:
A Review of the Social Psychological and Behavioral Economics Literature

Gabriela Carrasco
University of North Alabama, USA

Eric Kinnamon
Alabama A&M University, USA

ABSTRACT

Current behavioral economics/game theory and social psychology literature have been captivated by the idea of altruism and egoism. In large part, these two disciplines have tried to determine the foundation of selfish and selfless behavior, without much result. The current chapter examines the root issues associated with this inquiry and argues for a shift in attention towards factors associated with cooperation. As such, empirical research from both disciplines is presented to show the advancements in relation to identification of these factors. Additionally, the authors offer a possible solution to the fractured literature in the form Weber, Kopelman, and Messick's (2004) dual process model in an effort to merge findings from both disciplines in an attempt progress this line of research.

INTRODUCTION

The topic of selfish and selfless behavior has captured the interest of philosophers, academics, researchers, and practitioners across a variety of disciplines, including biology, mathematics, sociology, psychology, economics, and political science. As a species, we have pondered the antecedents to, benefits of, and meaning behind selfish and selfless thoughts and behaviors. This duality is exemplified by Ayn Rand "greed is good" vs Louis Blanc "to each according to his needs". Why have so many dedicated so much time to these two motives? Perhaps it is because as humans we have encountered both motives

in our own lives and have found them appealing and valuable. Additionally, it is common for humans to seek information out about a situation in order to understand and predict behavior and outcomes. As such, we are frequently evaluating our own and other people's intentions. Thus our ability to recall past experiences and form predictions of human behavior allows us to also postulate about the benefits and risks inherent in both strategies.

The original intent of this chapter was to provide a review of the literature in selfish and selfless motives and behavior. However, there is a great deal of information from a variety of disciplines that at times seems to contradict itself. In part, this is due to the use of multiple terms for the same process or variable. Thus, the authors of this chapter will first provide a list of terms and their definitions that will be used throughout. These terms and definitions are important as they may help clarify some of the inconsistent results in the cross-discipline literature.

Following the definitions, this chapter will examine selfish and selfless motives and behavior by reviewing the social psychological and behavioral economics literature. In particular, the chapter will examine factors that influence selfish (i.e., non-cooperative) vs. selfless (i.e., cooperative) behavior in both disciplines. The authors will then discuss how the selfish/selfless literature in both disciplines can be synthesized by a dual process model. Finally, the authors will briefly discuss how the literature in this area may benefit business management, politics, and social issues.

BACKGROUND

In order for selfish or selfless behavior to occur there must be at least two individuals, the target of the behavior and the executor of the behavior. Additionally, selfish or selfless behavior can only occur within the exchange of a resource (e.g., time, money).

Social Dilemmas

According to Van Lange, Balliet, Parks, and Van Vugt (2014) a social dilemma is a situation whereby non-cooperation, or a selfish action, is beneficial for the individual in the short-term; however, non-cooperation by the group will be detrimental for the group members in the long run. The dilemma occurs when an individual is forced to choose between their own well-being now (i.e., selfish behavior) or work with the group in a long-term (i.e., selfless) investment of the resource. Similarly, Dawes and Messick (2000) goes further by suggesting that the dilemma occurs when "reasonable and rational" decisions at the individual level lead to less benefits, thus coaxing the individual to act "unreasonably and irrationally" (p. 111). Social dilemmas have been a pervasive issue addressed in religion, philosophy, natural and social sciences, politics and business.

Mixed Motives

Social dilemmas present a problem because of mixed motives. Mixed motives are dueling or inconsistent motives that have the potential to influence an individual in seemingly unpredictable ways. In the case of social dilemmas, an individual must choose between actions based on pure self-interest or actions with the group in mind. According to Van Lange et al.(2014) mixed motives are based off of three main

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

arguments: individuals are driven to do well for oneself, the outcome of a situation is, in part, based on others' actions, and non-cooperative behavior on an individual's part opens up the door for possible retaliation from others (p. 13). Thus, an individual's actions in a mixed-motive situation take into account the potential outcomes, the individual, the group, and the exchange between the individual and group.

MAIN FOCUS OF CHAPTER

Issues, Controversies, Problems

A great deal of literature and research has gone into understanding how individuals will behave in these situation. Of particular interest is whether individuals will behave altruistically or egoistically. Unfortunately, the literature does not provide a clear answer on the basis of altruistic or egoistic behavior. The authors of the current chapter suggest that a major issue preventing clarity in the literature is ambiguous terminology. As such, this chapter will first identify and define some of the more commonly used terms in the literature.

Definitions

1. **Prosocial Behavior:** According to Dovidio et al.(2006), prosocial behavior includes a broad range of actions that benefit other individuals outside of the agent, or executor. According to Dovidio et al.(2006) there are various types of prosocial behavior including helping, altruism, and cooperation.
2. **Helping:** Dovidio et al.(2006) define helping as "an action that has the consequence of providing some benefit to or improving the well-being of another person" (p. 22). It is important to note that the intent of the executor is not a significant factor in the definition but that there is a difference in power between the two parties involved, such that the target and executor in a helping relationship are "not equal partners" as the executor has a resource the target needs (p. 27).
3. **Altruism:** The distinguishing trait between helping and altruism is the intent behind the prosocial behavior. While altruism is still decidedly prosocial behavior it is based on the ultimate well-being of another person, outside of the executor (Batson, 1991; Dovidio et al.,2006). As such, Dovidio et al. (2006) defines altruism as a helpful act that, "is carried out in the absence of obvious and tangible rewards for the helper" (p. 26).
4. **Cooperation and Non-Cooperation:** Dovidio et al. (2006) suggest cooperation is based on group members participating in various forms to achieve the group's common goal. Thus, cooperation is an exchange between group members for the benefit of the overall group. Non-cooperation, then, is when an individual, or group of individuals, choose to not participate in the group exchange. This lack of cooperation impacts the group and promotes self-interest.
5. **Egoism:** According to Dovidio, Piliavin, Schoeder, and Penner (2006) egoism occurs when an individual in focused on his/her own welfare. Dovidio et al.'s definition is broad and intent based. Being egoistical, therefore, does not preclude an individual behaving positively towards another person. In fact, there is an long-running and ongoing debate on whether egoism is at the base of prosocial behavior (Batson, Ahmad, and Stocks, 2011; Dovidio et al., 2006).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

While social psychological literature focuses on terms such as altruism and egoism, prosocial and self-interest, and selfish and selfless, the behavioral economics literature relies on terms such as cooperation and non-cooperation. Although these labels are often used interchangeably we suggest that these terms imply different phenomenon and should be used according to the appropriate context.

The terms altruism/egoism and selfish/selfless all imply intent and allow for a subjective evaluations of the agent as either good or evil. Additionally, by using these judgment-based terms, we are in effect implying that one behavior is preferred over another.

In a similar vein, the use of self-interest/prosocial behavior also is prone to subjective evaluations; however, the intent of the action appears to be clearer in these terms such that we are focused on the self or the group. The self-interest and prosocial terms are similar to the cooperative and non-cooperative terms used in the behavioral economics literature

The behavioral economic literature's use of cooperative and non-cooperative behavior focuses on the outcome. While this type of research does commonly vary factors in the research design, the dependent variable is consistently behavior. Consequently, the behavioral economics literature allows us a largely unbiased view of the factors that influence cooperation versus non-cooperation. As such, we will use the terms cooperative/non-cooperative for the remainder of the chapter.

The remainder of the chapter is an attempt to identify the major factors in both behavioral economics and social psychology that impact cooperative behavior. Each of these disciplines has strengths and weaknesses in this literature. For example, the behavioral economics literature presents an opportunity to examine decisions in a variety of scenarios. These scenarios help explain what structural and situational factors influence cooperation. Unfortunately, traditional game theory has focused on rational choice and expected utility models that have not addressed varying motives behind decisions. The social psychological literature attempts to addresses factors such as motives, values, identity, and the impact of group forces on the individual. Unfortunately, the social psychological literature has not adopted a unifying model or strategy for examining decision making in different scenarios.

Thus, the authors begin by examining factors associated cooperation in behavioral economics and game theory then follow up with an examination of factors related to social psychology and cooperation.

Behavioral Economics/Game Theory: Factors Influencing Cooperation

Both behavioral economics and game theory are in the business of examining decision making. However, while behavioral economics integrates the fields of economics and psychology, game theory involves the use of models, or strategic games (Osborne, 2004). These strategic games allow us to examine individual and group preferences, choices, and, ultimately, behaviors in a variety of interactive situations. Strategic games consist of one or more players, or decision makers, who are given a set of actions they can take in the game. Each player is also assumed to have a set of preferences, or ideal outcomes with respect to how other players and he/she will respond in the game. Thus, once a player understand the rules and potential outcomes of a strategic game, his/her future actions are to some extent based on the expectations formed of the other players.

Parks (2015) identifies the two modern approaches to cooperation in social dilemmas as the "economic" approach and the "sociability" approach. According to the author, the economic approach, "assumes that humans are inclined against cooperation" while the sociability approach, "assumes that humans are inclined towards cooperation" (p. 527). The behavioral economics and game theory literature provides mixed findings on whether humans are inherently cooperative or non-cooperative. Instead, the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

behavioral economics and game theory research provides us with rich literature addressing the factors that increase and diminish cooperation. While the literature in this area provides a variety of factors, we have narrowed down the focus to two major areas of interest: game structure and individual differences.

Cooperative Games: Game Structure

It is important to note that cooperative and non-cooperative behavior can be influenced by the type of strategic game he/she is playing. Although there are a variety of strategic games (see Osborne, 2004), Parks (2015) distinguishes between three social dilemma games of particular importance: the Prisoner's Dilemma Game, the public goods game, and the common pool game.

In all three instances the player must choose between maximizing their own utility (i.e., proself behavior) and cooperating with the group to maximize the group's outcome (i.e., prosocial acts). An individual's preferred set of actions, or game strategy, varies for each game as each game reflects a different set of possible payoffs. These payoffs are based not only on the individual's action but also the action of the other players in the game. Thus, each individual player has an opportunity to affect each other's payoffs through his/her actions.

Prisoner's Dilemma

In the Prisoner's Dilemma Game, each player can either cooperate with the other player or make a selfish decision and save himself/herself. Because the player's outcome is in part dependent on the choice made by the other player, each player optimal choice should be to forego the cooperative route and be selfish.

Public Goods Game

In a public goods game, players contribute a certain amount of money to a group fund. Any money not allocated to the group remains as a payoff for the individual. However, group members can receive a bonus if the group fund meets a threshold. Thus, it benefits the players in the group to cooperate by allocating funds to the group.

The Common Pool Dilemma

The common pool dilemma is similar to the public good game in that individuals will benefit when the group works together. In this scenario group members can harvest from a group resource but must manage their size of their harvest so as to not overuse and deplete the resource. Group members can harvest large quantities thus gaining more resources than other group members; however, depletion of the resource ends the game and prevents further harvesting. It is in the group members' best interest to cooperate by maintaining the resources adequately replenished while simultaneously harvesting from the pool.

The manner in which these games are structured and framed reward (or punish) certain strategies. Thus, cooperation or non-cooperation is, in part, based on the structure of the game employed.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Game Information

According to Parks (2015), "in the typical social dilemma, information is sparse". However, information can be manipulated in experiments. Moreover, the amount and type of information provided to participants has been shown to influence cooperation or non-cooperation.

For example, players will modify their behavior depending on the amount of information regarding the resource pool in a public goods game. In fact, proselfs are more likely to maintain consistently high consumption of the group resource regardless of whether the group resource was being depleted (Brucks and Van Lange, 2007). This is untrue for prosocials which attempt to protect the group resource unless prosocial learn that other members are not cooperating, in which case prosocials abandon their cooperative behavior.

Information can also take the form of other player's previous behavior. Boone, De Brabander and Witteloostuijn (1999) found that players, who were originally proself in a one-shot Prisoner Dilemma game increased their level of cooperation when the game extended into rounds. These authors surmise that players understood the benefits of cooperating in these repeated games.

On a similar note, Ockenfels and Werner (2013) asked players in a dictator game to estimate the amount typically transferred to recipients by other dictators and the amount expected by recipients using scales with varying midpoints (i.e., low midpoints vs. high midpoints) before sending their recipient any funds. The results from this study indicated that dictators who viewed a scale with a higher midpoint and who guessed the average amount expected by the recipient sent on more money, on average, to their recipient. This suggests that the manner in which the information is framed will affect the degree an individual cooperates.

Individual Factors

In addition to game structure factors, the literature also identifies certain factors related to the individual that influence cooperation. Individual factors include, among other things, values and personality traits. Both values and personality traits are considered to be stable phenomenon that influence behaviors. Values are beliefs that individuals have regarding the worthiness of a particular object, person, or idea. Personality traits are aspects of an individual's unique characteristics that remain fairly stable through time and situations. While some will argue that individual differences are important in the decision making research, the literature has provided conflicting results. Research in this area has examined whether different personal value systems and personality traits will sway an individual to cooperate or not cooperate.

Social Value Orientation (SVO)

SVO can be defined as an individual's tendency in evaluating his/her own self-interest and the interest of other people (Balliet, Parks, and Joireman, 2009). SVO is thought to be a relatively stable value that dictates to what degree individuals are proself or prosocial (Bogaert, Boone, and Declerck, 2008; Haesevoets, Folmer, and Van Hiel, 2015). However, the relationship between SVO and cooperation is dependent on the game structure and situational factors.

For example, Haesevoets, Folmer, and Van Hiel (2015) examined whether scores on social value orientation, social dominance orientation and right-wing authoritarianism would predict behavior across games. The authors found only weak to moderate relationships between behaviors across games based

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

on these beliefs. The authors conclude that behavior in one game is insufficient to predict behavior in another game. Similarly, Balliet, Parks, and Joireman's (2009) meta-analysis on social value orientation in social dilemmas found only weak to moderately strong relationship between social value orientation and cooperation in social dilemmas. This relationship was moderated by the game structure (i.e., public good dilemma vs. resource dilemma) and whether the participants were paid or not paid based on their decisions.

Personality Traits

Boone, De Brabander and Witteloostuijn (1999) examined how four personality traits (i.e., locus of control, self-monitoring, sensation seeking, and Type A behavior) influenced cooperative/non-cooperative behavior in five different Prisoner Dilemma scenarios. Two of the scenarios were one-shot situations, where participants either did not receive information regarding the other player's past behavior (i.e., game #1) or did receive information regarding the other player's past behavior (i.e., game #2). The remaining three scenarios included multiple rounds where players made simultaneous choices. In game #3, players knew there was a total of 12 rounds to play, in game #4, players were unaware of the number of rounds to be played, and in game #5, players were notified that 12 rounds would be played but the payoff matrix was modified to reinforce cooperation.

Boone et al, (1999) found that individuals high in internal locus of control were more likely to cooperate than individuals high in external locus of control, high in self-monitoring, and high in sensation seeking were more likely to cooperate consistently than individuals who scored low on these traits. While not statistically significant, the authors also found that individuals low in Type A behaviors were more likely to cooperate in these scenarios than individuals high in Type A behaviors.

Other research on traditional personality traits such as the components of the Big Five personality traits (i.e., Openness, Conscientiousness, Agreeableness, Extraversion, and Neuroticism) are less straightforward.

For example, Hirsch and Peterson (2008) found that certain aspects of Agreeableness and Extraversion have an impact on cooperative/non-cooperative behavior. In their study, Hirsch and Peterson used a repeated Prisoner's Dilemma scenario, where players participated in 10 trials with the same partner. In this study, players who scored high on the withdrawal aspect of Neuroticism or scored high on the enthusiasm aspect of Extraversion were more likely to cooperate with the other player. The authors suggest that the Neuroticism-withdrawal and Extraversion-enthusiasm components trigger punishment and reward systems, respectively, and thus influence cooperation.

Koole, Jager, van den Berg, Vlek, and Hofstee (2001) found main effects of Agreeableness and Extraversion on cooperative behavior. Moreover, these researchers also found that the structure of the game impacted cooperation/non-cooperation in conjunction with these measured personality traits.

Koole et al, (2001) examined cooperation in a public goods game between players and simulated others. In addition to measuring Agreeableness and Extraversion, the researchers also manipulated the feedback players received regarding the use of resources such that some participants were told that the resources were being used reasonably (i.e., sustained) or overused (i.e., rapid depletion).

Interestingly, Koole et al. (2001) found a quadratic trend that reflected an increase of resource use in the first trials followed by a decreases of resource use in the future trials. In line with the idea that personality traits can influence cooperation/non-cooperation, Koole et al.(2001) also found that individu-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

als high in Extraversion were less likely to cooperate than individuals low in Extraversion. As expected, individuals high in Agreeableness were more likely to cooperate than individuals low in Agreeableness.

In fact, both the main effect of Extraversion and main effect of Agreeableness on cooperation were further explained by three-way interactions between Personality (i.e., Extraversion or Agreeableness), resource use feedback, and the quadratic trend. In fact, these researchers found that players with high Extravert scores in the sustained-use condition consumed more of the resource than players with low Extravert scores in the same condition. Likewise, players who scored high on Agreeableness were more likely to cooperate, or consume less of the resource, than players who scored low on Agreeableness in the sustained-use condition.

Additionally, players with high Extravert scores in the rapid-depletion condition used the resource consistently throughout the rounds while players with low Extravert scores first increased then decreased their consumption of the resource. Players in the rapid-depletion condition who scored high on Agreeableness were more likely to maintain a consistently low consumption rate of the resource when compared to players who scored low on agreeableness in the same condition.

Both personality traits and value systems are considered to be static qualities that should, in theory, lead to consistent behavioral outcomes across situations. The inconsistent results in the literature does not generally take into consideration the possibility that these personality traits and values are dynamic and inclined to change. In their proposal for synthesizing economics and personality research, Borghans, Duckworth, Heckman, and ter Weel (2008) argue that personality traits do change in time.

Another possibility, as evident by the Koole et al. (2001) research is that the mixed findings on the impact of personality traits on cooperation/non-cooperation may be further clarified by examining the interaction between personality, or individual traits, and the situation.

Whereas behavioral economics has examined the structural and individual factors that influence cooperation and non-cooperation, very little has been done to examine the impact the group's influence on the individual has on the process. This is where social psychology can provide some insight into cooperative versus non-cooperative behavior in groups.

Social Psychology: Factors Influencing Cooperation

Psychology is the scientific study of human behavior both internal (e.g., emotions, thoughts, beliefs) and external (e.g., overt behavior). Psychology, in general, focuses on the individual. Social psychology, a subfield in psychology, is interested in examining the exchange between the individual and the group. In particular, social psychology proposes that other people, real or imagined, will have an impact on individual's emotions, thoughts, and behaviors. Similarly, social cognitive psychology examines how cognitive processes, such as information storage, retrieval, and recall, will be influenced by other people.

It is easy to imagine how another individual may force or manipulate an individual into modifying their behavior; however, social psychology and social cognitive psychology explain more than these obvious examples of social forces on individual reactions. In fact, both social psychology and social cognitive psychology suggest that individuals modify their behavior on their own, without direct influence from other people, when other people are around or even suspected to be around. Consequently, even the mere idea of another person is sufficient to have an impact on an individual.

Why do we grant such power to other individuals?

A major tenet in both social and social cognitive psychology is that we are not single agents living in a vacuum. Our internal behavior, decisions, and overt behavior are, in part, based on the environment.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Although not traditionally viewed as such, other humans are elements of the environment and thus have the potential to impact human behavior.

Group Factors

Social Motivation

As such, we are motived to seek out other individuals and form groups, participate in interpersonal activities, and maintain in good standing with society. This is the premise behind social motivation (Forgas, Williams, and Laham's, 2005). Consequently, humans are thought to hold other individuals, and the group, in high regard because of our innate need to affiliate with other individuals.

Baumeister and Leary (1995) theorize that individuals have a need to belong which is characterized by the need:

1. Frequent interactions with others, and that
2. These interactions elicit a sense of attachment which can be represented by a need to continue the relationship, emotionally involvement, and perceived stability (p. 500).

These authors clearly identify this as a need, not a drive, and suggest that this need must be met in order to attain psychological and physical well-being. The need to belong theory is well regarded and accepted in social psychology. The subsequent theoretical and empirical work that stems from this theory suggest that it benefits us to behave positively towards the group as our membership can be revoked.

Interdependence

The need to belong strongly suggests that affiliating ourselves with others is adaptive. We function easier in a group and benefit psychologically and physically from the interactions. Thus, interdependence occurs when individuals in the group are impacted, physically and psychologically, by the other group members' behaviors. As such, group members come to realize that behaving positively towards the group will, in the long run, benefit them as well. Van Lange et al.(2014) point out that an individual realizes that his/her outcomes are, in part, based on the group's behavior. Consequently, interdependence is functional in so much as our own survival and maximum potential are impacted by the group and its other members. Thus, the individual's efforts should be focused on benefit the group, as well as maximizing their own individual outcome.

Interestingly enough, a set of people in a group begin to function as an entity with the overall group's well-being in mind. As such, rules and norms are developed and enforced in an effort to maintain the group working effectively. Norms, then, are behavioral guidelines established by the group for the benefit of the group and its members. Norms can take the form of scripts and schemas. Scripts are a delineated outline of expected behaviors that an individual adheres to when in a particular social situation, such as the set of behaviors a person performs when eating out or entering an elevator. Social schemas are a set of predetermined and generally agreed upon traits and expected behaviors associated to a categorical stimulus, such as an accountant, athlete, or academic. We use schemas to predict the utility of and behavior from the individual. Norms provide us information regarding procedures, allow

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

us more predictive power in our social interactions, and can provide a sense of security from ambiguous stimuli, forces, or processes.

For the most part, norms are considered beneficial for the group, in that they maintain order, and for the individual, in that they provide clarity. It is important to remember, however, that norms are a means of enforcing group behavior from an individual. It is equally important to remember that groups are dynamic entities and, as such, are bound to change. Consequently, the norms formed in these groups are also bound to change.

The authors of the current chapter suggest that cooperative and non-cooperative behavior can be considered a norm.

Norm of Reciprocity

Once such norm is the norm of reciprocity, which states that individuals are prone to reciprocate others' behaviors. According to Gouldner (1960) the norm of reciprocity is based off of two principles: (a) individuals will help individuals that have helped them in the past and (b) individuals will not harm individuals that have helped them in the past (p. 171).

In respect to group behavior, then, individuals are expected to reciprocate cooperative and non-cooperative behavior exhibited by other group members.

There is research to support the idea that individuals attempt to modify behavior of others when they deviate from the script. Gintis, Bowles, Boyd, and Fehr (2003) call this strong reciprocity. According to the authors, strong reciprocity is a schema that promotes personal cooperation with others and the punishment of those who are non-cooperators. Fehr and Fischbaher (2004) and Fehr and Rockenbach (2004) review literature suggesting that strong reciprocity is evident at the neural level such that the brain responds to cooperators and punishment of defectors in a positive manner and inequitable outcomes in a negative manner. These reviews points to the enforcement of cooperative norms in human behavior.

Individual Factors

Goals

Human behavior is thought to be driven by goals. Goals are a desired outcome or objective that can manifest either consciously or automatically but will, inevitably, influence an individual's behavior. We are thought to have a hierarchy of goals that are activated at different times and in different situations. Ultimate goals are the end goal while instrumental goals are benchmarks used to reach the ultimate goal.

There is a potential for these goals to contradict or overpower each other. Huang and Bargh (2014) propose the idea that that goals themselves are "selfish" in that activation of a goal motivates the individual to complete the goal without much thought to other factors. In fact, Noval (2016) found that by reducing an individual's focus on the desired outcome, she was able to also decrease unethical behavior.

Goal activation and completion are dependent on the individual and the situation. For example, Batson (1991) claims that, "both egoistic and altruistic motives may evoke a variety of behaviors or no behavior at all. A motive is a force. Whether this force leads to action depends on the behavioral options available in the situation, as well as on the strength of both the motive and of congruent and conflicting motivational forces present at the time" (p. 9).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In respect to cooperative and non-cooperative behavior, we suggest that identifying the active goal will help determine the course of action an individual may take. However, the context in which the individual finds himself/herself will determine which goal is activated.

Contextual Factors

For the purposes of this chapter, context is more than the situation. The context of a situation is the phenomenon that is developed from the exchange between the individual, the group, and the environment. The context is not merely the situation but rather the interpretation of the situation by an individual.

The self is a term used in psychology to understand the individual, his motives, and his actions. It represents the malleable knowledge an individual has about himself. The agent self is a component of the overall self that acts as the executor of the individual's will. Thus, the concept of the self is important to our current conversation as it the self is the starting point of an individual's identity. Additionally, the individual's active self-dictates which goals are activated.

For example, Frimer, Shaefer, and Oakes (2014) manipulated whether individuals saw themselves as an agent ("self as executor") or an actor ("watched self"). Frimer et al, found that individuals modified their goals based on whether they were in an actor mode or an agent mode, with actors agreeing with more prosocial motives and agents agreeing with self-interest motives.

The importance of the context on cooperative/non-cooperative behavior is becoming evident in the literature (Fortat, Denant-Boemong, and Funaki, 2012, Henrich, Boyd, Bowles, Camerer, Fehr, Gintis, and McElreath, 2001; La Barbera, Ferrara, and Boza, 2014). Lozada, D'Adamo, and Fuentes (2011) argue that altruism is not only intrinsically rewarding but also based on the social context. The authors point out the importance of the individual and the collective group in influencing cooperation within an organization. Similarly, Dovidio et al. (2006) point out that prosocial behavior is defined by society, thus a "given behavior is not inherently or universally prosocial (or antisocial for that matter)" (p. 21). A behavior is deemed prosocial or antisocial by society, which is susceptible to change. Thus, any behavior can be regarded as positive or negative. It is important to note this as it speaks to the dependence of prosocial, or cooperative/non-cooperative, behavior on the context.

We suggest that the context is the crucial component in understanding cooperative and non-cooperative behavior. Importantly, a context can be learned, primed, or at least manipulated in settings. As such, organization behavior can be modified according to the context presented to the individuals.

We briefly identify three major factors we believe have an impact on cooperative/non-cooperative behavior in a group or an organization. These factors are: group identity (i.e., in-group/out-group), trust, and procedural justice. At the core, these three factors reflect the importance of the context, or the individual's perception of the group, its function, and its reliability.

In-Group and Out-Group Identity

In-group/out-group bias are two theories that often get grouped together; however, it is important to note that they are two distinctive theories. These two theories are closely related and are two sides of the same coin. In-group bias, also called in-group-out-group bias, in-group bias, intergroup bias, or in-group favoritism bias is a theory that purposes individuals favor or more highly regard the individual's in-group positively. Out-group bias is also known as out-group homogeneity effect or out-group homogeneity

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

bias. Out-group bias purposes that individuals in the out-group will more likely to be categorized and stereotypes/overgeneralizations will be attributed to them.

Individual group membership is a fluid item, hierarchical, has varied strength, and is a perception of the individual. The individual does not have to be 'part' of the team, but they perceive themselves to be part of the team (e.g. sports fans that consider themselves or identify with a certain team or club). Some identities are relatively fixed such as an individual's race, age, or gender where other can change with time or situational context. While going to school an individual will identify with individuals in the school, but more closely related to those in their own class. After graduation and many years have passed the 'all alumni' identity will get stronger for that institution and 'class of 2010' identity will fade. What is important about in-group bias is the positive aspects individuals give to the members of their in-group and similarly out-group derogation of the out-group being a threat to the in-group. Literally, in-group members are better, nicer, more trust worthy, and individuals are more likely to share resources with then those in the in-group then those in the out-group. Social identity theory posit that a portion of the individual's self-concept (and thus self-esteem) is derived from their group memberships. So the individual is not being magnanimous when they perceive their in-group to be more trustworthy, they are part of the trust worthy group and are themselves more trustworthy. When the group does well, they are part of the good. Realistic conflict theory (also known as realistic group conflict theory) is a theory that posit that the intergroup conflict that arises between the in-group and out-group are a result of conflicting goals or finite resources (i.e. limited resources or fixed pie scenario). This theory would suggest you would see less cooperation and more competition with individuals in the out-group versus those in the in-group.

On the flip side of the coin regarding out-group bias, the in-group is heterogeneous, the out-group is homogeneous. We are unique but they are alike. This thought pattern can lead to stereotypes and ethnocentrism which can modify the cooperative behavior with out-group individuals.

Optimal Distinctiveness Theory

At the very least, what we can take away from this is the importance the group has on the individual. In some cases, the group conformity does overwhelm the individual but the individual can also go against the group. It should be noted, however, that the individual and the group work in unison. In the optimal distinctiveness theory, Marilyn Brewer (1991) suggests that individuals attempt to find a balance between the group identity and the individual identity such that individuals are motivated to seek the optimal balance of the two extremes of in-group distinctiveness and in-group assimilation in order to maintain group membership. In a nutshell, individuals all want to be special, but individuals don't want to be different from the group. Optimal distinctiveness theory is especially interesting, an individual will only be as different as the group allows so they can remain a part of the group. So non-conformist will adhere to their non-conformist peers' conformity. So those social 'rebels' that dress in goth, dye their hair weird colors, or have unusual hairstyles, will conform to their in-groups standards. Thus they won't dress in a traditional prom dress out of fear of being expelled/teased/rejected by their peers for not being a non-conformist.

Trust

From an interpersonal perspective, trust is the ability to depend or rely on another individual. Trust in an individual is based on the principle of reciprocity such that your behavior will be reciprocated in kind and you will not subject to unnecessary harm. In essence, an individual makes themselves susceptible to others' actions but anticipates equal treatment. Trust can take many forms, according to Dunning and Fetchenhauer (1991) trust can manifest in the beliefs we have of others or actions towards others.

Interestingly enough, the literature makes a strong general assumption that humans should not be trusted. This assumption crosses sociological, psychological and economic literature. In fact, Dunning and Fetchenhauer (1991), and others, go so far as to argue that trusting other individuals is irrational.

Nevertheless, trust is a crucial component examined in the behavioral economics and social psychological theories and research. While trusting may be considered irrational, it occurs quite frequently in the literature. The literature is riddled with examples of trust being a core issue in group decisions. For example, Yamagashi and Cook (1993) examined the effects of trust, group dynamics (i.e., group-generalized structure vs. network-generalized structure), and dissemination of group member actions on average contribution in multiple trials. These authors found that an individual's general level of trust, which was measured prior to participating in the study, was related to the average amount contributed such that those high in trust contributed significantly more than those low in trust.

Yamagashi and Cook also found a trust X structure interaction such that individuals with higher trust in the network-generalized exchange structure contributed on average more than individuals low on trust in the same structure and more than both trust types in the group-exchange structure. This interaction is important, in light of the main effect of trust the authors also found, because this speaks to the importance of context. According to the authors, the group-exchange structure is susceptible to free loading and thus even individuals high in trust will be weary to trust others in this situation. Thus, Yamagashi and Cook state that "the relationship between trust and generalized exchange varies depending on the structure of the generalized exchange situation.

Procedural Justice

Procedural justice looks to the fairness in group processes and social interactions. If a group executes suitable procedural justice, then members in the group are treated fairly and equitably. Thus, procedural justice ties into both in-group and out-group identity and trust.

Additionally, seeking equity through procedural justice may be a motive unto itself.

Batson (1991) argues that some motives may be neither egoistic nor altruistic and uses the advancement of justice as an example, which he calls "upholding a principle of justice" (p. 9). Batson, Ahmad, and Stocks call this "principlism" or "upholding a moral principle" (p. 106).

In either case, focusing on a principle such as procedural justice has the benefit of creating group cohesion (i.e., in-group bias), setting a goal for the group, and reinforcing trust with the group members.

One common thread amongst in-group/out-group, trust, and procedural justice is that these reflect the interaction between the group and the individual.

The individual seeks information from the group in order to determine whether they are vulnerable or protected, whether the group has a reasonable sense of justice, and whether they will be treated equitably.

SOLUTIONS AND RECOMMENDATIONS

Dual Process Models

Thus far the behavioral economic and social psychological approaches, while similar, have remained fairly distinct from each other in this chapter. Luckily, Weber, Kopelman, and Messick (2004) address how these two fields can be integrated through the lens of a dual process model in their seminal review of decision making in social dilemmas. This dual process model outlines how individuals can process information and select appropriate situational rules using either shallow processing based on heuristics or a more complex and adaptive approach.

According to Weber et al. (2004), the individual assesses the situation, or context, before choosing a set of rules to follow. In assessing the situation, the individual takes into consideration situation cues and personal identity. This information allows the individual to determine which rules are appropriate the individual in a particular situation. The shallow process is analogous to quick decisions based on automatic processing and behavior whereas the more complex processing requires more conscious thought. According to the authors, we move from the shallow processing, which requires less energy and less deliberation to a more conscious and considered processing, when

1. Two or more conflicting values are made salient,
2. An individual is confused about the norms or rules required in a particular situation, or
3. The situation itself is "vague, ambiguous, or unpleasant" (p. 286).

Weber et al.(2004) suggest that individual differences such as social motives, personality, and personal history and situational factors such as task structure, decision structure, and perceptual factors will are important factors in assessing the situation. As been noted earlier in the chapter, behavioral economics and game theory have taken exceptional steps in addressing similar situational and individual factors that influence decision making. Add to that information acquired by social psychology regarding social influences in cooperation and this model has the potential to have strong predictive power in the realm of cooperative behavior.

FUTURE RESEARCH DIRECTIONS

Both behavioral economics and social psychology have amassed a treasure trove of empirical literature that helps to explain cooperative behavior in individuals and groups. With the introduction and integration of dual process models in the literature it is highly likely that a clearer picture of the factors influencing cooperation will develop. The impact of the current and future research in this area has the potential to influence business management, political, social, and educational realms.

According to Parks (2015) the literature on cooperation in social dilemmas may help dissuade the "lone wolf" phenomenon, whereby individuals refute the potential effectiveness and efficiency associated with groups. That is not say that individual work may in some instances be more productive than group work; however, humans have traditionally not functioned well in solitude. In fact, humans are considered both social and cultural animals that prosper in groups. As such, it would benefit us all to understand

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

when cooperation would benefit the individual and the group. Additionally, we should examine how factors related to the individual, the group, and the context impact cooperation.

For example, we find more direct and effective methods of reducing depletion of resources (e.g., community office supplies, travel funds, energy consumption) in the workplace by understanding how individuals perceive these resources. Additionally, we may find ways motivate potential voters to participate in local and federal elections by understanding the impact of social value orientations on social issues. Similarly, by understanding how social value orientations and personality influence community action for individuals from different cultures and socioeconomic statuses.

CONCLUSION

On a final note, although the literature continues to debate whether humans are inherently selfish or selfless, we might be better served to synthesize the theories and literature in both behavioral economics/game theory and social psychology. Both disciplines have focused on different perspectives based on their unique strengths and weaknesses. While consolidating the literature may initially prove difficult, the benefits would certainly outweigh the costs. Additionally, the literature in both domains may progress to future questions, such

1. To what degree can cooperative behavior be learned and fostered, and
2. What the long term effects of cooperative behavior are for the individual and the group.

Chapter 97
A Happier Balance:
Positive Interventions for Intentional Well-Being in Psychotherapy

Daniel J. Tomasulo
Teachers College, Columbia University, USA & University of Pennsylvania, USA

ABSTRACT

This chapter describes how intentional well-being interventions integrate the development of character strengths and activation of positive emotional resources while reducing risks and alleviating symptoms of depression and poor health. The emergence of these interventions reaches back nearly half a century and each layer of development has led to a more robust platform for implementing these approaches. Now, based on the evidence-based principles of positive psychology, these positive interventions help to cultivate hope through a more balanced approach to well-being than traditional deficit-oriented methods of psychotherapy. This chapter looks at the history of development of these interventions and their likely next phase of development.

INTRODUCTION AND HISTORY

The history of psychology has been to create interventions and practices, which while alleviating suffering, did little to enhance well-being. However, not being depressed isn't the same as being happy, and the rich area of research initiated by positive psychology has enhanced our understanding of what it takes to feel good—and what intentional well-being interventions can do to help balance out the traditionally deficit-oriented methods of psychotherapy.

About fifty years ago, psychologists began developing evidence-based theories and practices about happiness that are now gaining momentum. From the human potential movement of the 1960s through the current proliferation of professional societies and discipline-specific journals and degree-granting programs, there has been a greater push for research on the effectiveness of positive interventions. In the nearly twenty years since positive psychology was labeled and formally initiated, a plethora of research from every corner of the world has been published in peer-reviewed journals.

Martin Seligman, former president of the American Psychological Association, made his 1998 presidential term a transformative platform for the development of positive psychology (Seligman & Csikszentmihalyi, 2000). In its first 20 years, this new sub-field of psychology has become a highly comprehensive, evidence-based perspective (Seligman, 1992, 2002, 2011; Seligman, Ernst, Gillham, Reivich, & Linkins, 2009; Reivich, Seligman, & McBride, 2011). Through these contributions, Seligman promotes a science that gives well-being a prominent position. His goal is not to usurp the work of psychologists and psychology, but rather to add to the ever-increasing knowledge of human behavior. Seligman's work has been crucial in initiating change within the field. Prior to these advances, the goal of psychologists and other purveyors of psychotherapy has been to relieve the burden of emotional distress. However, this new research invites us to now include ways to promote sustainable well-being. Although the current practice of psychotherapy is significantly better than placebos, and in many instances better than medications (Castonguay, 2013; Leykin & DeRubeis, 2009), traditional psychotherapy can no longer be accepted as a sufficient treatment protocol. The need and research to support the effectiveness of these new interventions is at a tipping point. Positive interventions to promote intentional well-being are now necessary additions to the therapist's toolbox.

Seligman was influenced by and has built on the work of many pioneers who have come before him, and the contributions of some of his predecessors are particularly worth noting. Specifically, the work of humanistic psychologists Carl Rogers and Abraham Maslow—both of whom also served as presidents of the American Psychological Association—stand out. Rogers and Maslow positioned psychology at the center of a major transition in society and became part of what was known as the human potential movement. At a time when the theories of Freud (1977) and Skinner (1972)—psychoanalysis and behaviorism, respectively—dominated the academic and clinical literature, Rogers and Maslow made a push for a more positive approach to individual therapy and to conceptualizations of human nature. Rogers's "client-centered therapy" (1951) helped psychology move away from the medical model and a disease orientation by promoting that psychologists refer to the people they work with as "clients" rather than "patients." Abraham Maslow (1954, 1962) theorized that people have a hierarchy of needs, and argued that as more basic needs (food, shelter) were satisfied, there would be a natural tendency to move toward full personal potential, which he called self-actualization. These two approaches reflected a departure from the psychoanalytic and behavioral models and were major influences on the culture. One important shortcoming of this "third way" proposed by Maslow and Rogers, however, is that although the human potential movement drew a very wide range of thinkers and followers, very few of them carried out evidence-based research on these emerging ideas. As a result, the humanistic theories did not have a substantial empirical base (Seligman & Csikszentmihalyi, 2000).

Despite this shortcoming, the work of Rogers and Maslow opened the way for other psychologists to develop alternatives to psychoanalysis and behaviorism. Albert Ellis and Aaron Beck are two of these psychologists. Both Ellis and Beck were trained in psychoanalysis, but found those methods to be unsatisfactory for many of their clients, particularly those struggling with depression. Albert Ellis (1962) had been writing about the ways humans think about situations and how our beliefs change as a result. He proposed the A-B-C model, designed to help understand beliefs that occur in response to life events and the resulting consequences. In this model, A = "Activating event," the thing that causes us to respond; B = "Beliefs" about the causes of the event; and C = "Consequences," emotional and behavioral results of these beliefs. There usually are direct connections between beliefs and consequences and there often are patterns in how these connections occur. The A-B-C model is important in the history of positive interventions because it made beliefs a subject for scientific study. Aaron Beck (Beck

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

et al., 1961; Beck, 1967; Braff & Beck, 1974), the father of cognitive behavior therapy (CBT), was also interested in beliefs. He noticed depressed patients had automatic thoughts about themselves, the world around them, and the future. By identifying these situational automatic thoughts and challenging patients to think differently, Beck could demonstrate that a person's core beliefs and consequent feelings could change. The interested reader is directed to a wonderfully articulated workbook integrating CBT with psychodramatic theory and practice by Tom Treadwell and his colleagues (Treadwell, Dartnell, Travaglini, Staats, & Devinney, 2016).

Seligman's research on helplessness built directly on the work of Ellis and Beck. Behaviorism had argued that in each situation the opportunity to gain a reinforcer or avoid an unpleasant stimulus would predict the organism's behavior. But in Seligman's research, an organism exposed to a helpless situation that it cannot control creates a perceived absence of control over the outcome in another situation. Seligman termed this "learned helplessness." Through a series of experiments (Seligman & Maier, 1967; Seligman, 1975), he demonstrated that dogs that were shocked without an opportunity to escape the pain gave up, failing to take advantage of subsequent opportunities of earning a desired reinforcer. The work of Ellis and Beck flew in the face of psychoanalysis and behaviorism and helped shift therapeutic approaches toward helping clients gain control of their own lives by taking control of their beliefs. In a similar way, the results of Seligman's experiments challenged the existing mechanics of behaviorism and allowed for a connection to be made between the dogs who had no control and depressed clients. Seligman hypothesized that a perceived inability to control the outcome of a condition or situation can activate a sense of helplessness, which in turn can lead to depression. This was revolutionary and led to Seligman writing the trade book: *Learned Helplessness: On depression, development, and death* (1975), which changed the way psychologists around the world begin treating depression.

Not all the dogs became helpless, however, and this needed to be understood. Some of the dogs (about one-third) that were studied did not become helpless and overcame the learning of the original experiment, finding ways out of the situation. The dogs' behavior provided speculation about how humans might overcome helplessness. One possibility was to understand how people explained what had happened to them. This was dubbed attributional style or explanatory style. Attributional reformulation (an explanatory style of the situation) was created to account for people's optimistic or pessimistic reaction styles to difficult situations. Seligman had capitalized on Ellis's and Beck's work with his own experiments and demonstrated that people could choose how they think. This was revolutionary. He then began to focus on explanatory style and our ability to change it. Demonstrating that individuals with a pessimistic style could learn to be optimistic, he made the transition from understanding the mechanics of helplessness to teaching people how to be optimistic (Peterson, 2000). He eventually published another groundbreaking book, *Learned Optimism: How to Change Your Mind and Your Life* (Seligman, 1992), which deepened the public's understanding of explanatory style. In this work, he skillfully outlined the patterns through which people could become optimistic. He could demonstrate more positive and optimistic ways people could think, primarily by studying people with high levels of optimism, including successful insurance salespeople.

Seligman showed that successful people's thinking patterns and behaviors could be taught. Optimistic people have a specific thought pattern when it comes to bad events because they view negative events as temporary hurdles, see these bad events as isolated occurrences, and believe that with effort and skill the bad events' effects can be dealt with and overcome. Optimistic thinkers largely are more immune to depression and have better physical health and greater, more sustainable achievement. The pessimist, in direct contrast, will respond to setbacks by experiencing a sense of helplessness. Pessimists believe nega-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

tive events are permanent and compromise everything they do; they believe they bear sole responsibility for the event's occurrence. As simple as it sounds, this was a huge boost for positive psychology. Prior to this, psychologists were battling thoughts as givens instead of variables. Seligman's work on optimism helped establish a theoretical and empirical base for his positive psychology platform as president of the American Psychological Association in 1998 (Seligman & Csikszentmihalyi, 2000; Seligman, 2002). He suggested that psychology include a model of building strengths—promoting mental health, rather than only treating mental illness.

In the same timeline as Seligman's *Learned Helplessness*, another researcher (Fordyce, 1977) had pioneered a series of happiness interventions, such as increasing socialization, becoming more active, and deepening one's relationships. He found students trained in a variety of 14 different approaches demonstrated fewer symptoms of depression and were, in general, happier than a control group. Deci and Ryan (1985), along with a few others (e.g., Fordyce, 1977; Csikszentmihalyi, 1976, 1990; Diener, Emmons, Larsen, & Griffin, 1985) moved the theoretical into the empirical, substantively ushering positive psychology to its current position. Evidence-based interventions demonstrating effective changes toward increased well-being and flourishing are now the standard (Seligman, Steen, Park, & Peterson, 2005). Indeed, the fact that we have this current focus in positive psychology is a direct outgrowth of more than two decades of empirically validated treatments and research studies. Positive and transcendent experiences are now investigated with rigorous scientific methods and robust results.

While Seligman was unraveling the dynamics of depression, another researcher, Mihaly Csikszentmihalyi, published *Flow*: *The Psychology of Optimal Experience* (Csikszentmihalyi, 1976/1990). It was groundbreaking on many levels because it was considering a very different type of human experience. It offered up an experience that many people could relate to but did not fully understand. Perhaps it could be said that Csikszentmihalyi did for flow what Sigmund Freud (1977) did for dreams: He identified and analyzed something most people experienced, but that no one had yet studied. Csikszentmihalyi brought a powerful, positive, and mysterious experience closer to our understanding. When flow happens, external or internal demands cannot be reached. A person has entered an altered state of consciousness and the usual rules of engagement with one's surroundings have changed drastically.

Flow has been in the global consciousness since the book was released. Back then it was revolutionary—shocking, even—both to label a universal experience and to identify its features. But now "flow" is woven into our popular language and culture. We have heard about it, read about it, and want it in our lives.

In his own words, Csikszentmihalyi said that flow is "being completely involved in an activity for its own sake. The ego falls away. Time flies. Every action, movement, and thought follows inevitably from the previous one, like playing jazz. Your whole being is involved and you're using your skills to the utmost" (1990, p. 1). At a presentation at the European Positive Psychology Conference (EPPC) in Moscow (EPPC June 26, 2012), Csikszentmihalyi added a nuance to this definition. He spoke of flow as a more transcendent experience as it begins: "You are at this blessed moment when this feeling is about to come." In his book, Csikszentmihalyi (1990) identifies some specific features of the experience of flow. Flow tends to occur, he argues, when the following statements hold true:

- The event is freely chosen
- The goal is clear
- There is a high degree of focus
- A loss of self-consciousness occurs by engaging in the action
- Time is distorted

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Feedback on performance is immediate and concrete
- There is a sense of control in the situation or activity
- The challenge is high, but there is balance between ability and the task
- Bodily needs are less noticed
- There is effortlessness in the activity because it is intrinsically rewarding

It is the balance between the challenge and our skill that keeps us engaged in flow. When the balance is off, we experience the other end of the spectrum: boredom or anxiety. Flow is a very enjoyable experience marked by a sense of timelessness and engagement, and something about the experience makes us want more of it. Once we have experienced a flow moment in our lives, we usually crave it again. It certainly makes intuitive sense that we would want to repeat such an enjoyable experience. But this craving may also be one of the most important features of positive psychology since it shows that positive emotional experiences can initiate an upward spiral (Fredrickson & Joiner, 2002; Fredrickson, 2001). Such an upward spiral can counteract depression's downward pull. Even more important, this may be the essence of what makes positive changes sustainable (Frederickson, 2001).

Just as Seligman's work has inspired ongoing research, so has Csikszentmihalyi's. The flow experience was initially described as an individual phenomenon. Walker (2010)[1] suggests that well-being may exist on a continuum, finding that when comparing solitary vs. co-active or interactive social flow, the two social conditions were more enjoyable, with interactive social flow being the most pleasing. Co-active social flow occurs when we are part of a group doing something, from watching TV with friends to participating in a foot race. Interactive social flow is enhanced through social interdependence. This occurs when we are part of a collectively competent group where there is complementary participation and a surrender of the self to the group. People participating in this have surrendered the self and acquired a collective sense of purpose and meaning, such as might happen on a successful athletic team.

Many of the indicators for social flow are like the well-known attributes experienced in solitary flow, but with some interesting additions. There is emotional communication throughout the group as members are participating—an emotional broadcast and resonance within the group and external observers. Members feel joy, elation, and enthusiasm throughout the group performance. Finally, rituals are put in place to institutionalize social flow. The participants want to find ways to make it happen again. In other words, doing things together is better than doing things alone.

The two important works we have examined from Seligman (1975) and Csikszentmihalyi (1976), which were published within a year of each other, together created a paradigm shift in understanding human nature. By delineating the conditions under which depression can be alleviated and flow can be activated, psychology charted a new, albeit tentative, direction—the science behind well-being and human flourishing. These pioneers initiated a research platform for positive psychology that continues to thrive today. For Seligman, using Ellis's A-B-C model and Beck's cognitive therapy helped him shift from learned helplessness to learned optimism. The publication of these trade books (*Helplessness: On Depression, Development and Death* (1975) and *Learned Optimism (1990*) took the science of psychology out into the public arena. While the research for both landmark works was stellar, the description of it in a more accessible form inspired people to change. Seligman's work on optimism has served as a foundation for positive interventions, residing at the core of the Penn Resiliency Program (PRP) for the prevention of depression (Seligman, Ernst, Gillham, Reivich, & Linkins, 2009), and finding its way into education (Reivich, Gillham, Chaplin, & Seligman, 2005) and the military (Reivich, Seligman & McBride, 2011).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Classically, psychologists were taught to diagnose what is wrong and use techniques to promote change. Then, once the presenting symptoms are gone, therapy is over. Does this work? Yes. Does it work well? No. To illustrate the ineffectiveness of the current approach, consider that the prevalence of depression is increasing in the USA (Pietrzak, Kinley, Afifi, Enns, Fawcett, 2012) and researchers estimate up to 80 percent of people with depression relapse (Kuyken, Hayes, Barrett, Byng, Dalgleish, Kessler, & Causley, 2015). Once people get out of their depression, they do little to stay out of it. They stop moving away from their pain, stop taking medicine, and stop working to feel better or move toward something good in their life. Once people feel bad enough, they'll seek treatment again—but the cycle continues. With all the resources available to treat something as ubiquitous as depression we would expect better results. Traditional psychology and medicine were designed to do only half the job, which lends itself to this cycle.

Seligman, (2002, 2011) originally proposed that the science behind happiness be targeted toward three domains: positive emotions, engagement, and meaning. Expanding this, Peterson (2006) proposed that positive psychology look at what makes for positive experiences, traits, relationships, and institutions. Instead of looking at what happens when things go wrong, positive psychology asks a different question: What happens when things go right? (Gable, Reis, Impett, & Asher, 2004). What has evolved is a psychological construct that identifies five scientifically measurable components: positive emotions or pleasure, engagement, relationship, meaning and achievement or accomplishment. This approach to well-being is commonly referred to by PERMA, the acronym created by the first five letters of these elements (Seligman, 2011).

The creation of positive interventions that can be tested for effectiveness is central to this effort to measure and manage the understanding of well-being. A meta-analysis of randomized control studies of positive interventions shows that they tend to improve well-being while decreasing depression (Bolier, Haverman, Westerhof, Riper, Smit, & Bohlmeijer, 2013). A positive intervention is an intentional act that has the goal of increasing happiness. Seligman, Steen, Park, and Peterson (2005) have identified this emphasis in positive psychology by declaring, "The causal efficacy of happiness has focused our research group on one practical matter: interventions that build happiness" (p. 414). The application of positive interventions is important because among other benefits, research shows happier people live longer (Danner, Snowdon, & Friesen, 2001); are kinder (Otake, Shimai, Tanaka-Matsumi, Otsui, & Fredrickson, 2006); are more successful (Lyubomirsky, King, & Diener, 2005); and have better relationships (Scinta & Gable, 2007). The results of these studies and many others have prompted Seligman, Steen, Park, and Peterson (2005) to note: "…the efficacy of psychological interventions [is] in many ways the bottom line of work in positive psychology" (p. 432).

At the base of these intervention is a strength-based approach originated by the publication of *Character Strengths and Virtues: A Handbook and Classification* (Peterson & Seligman, 2004). It was designed to offer a compendium of what is right and virtuous in human beings and was created in direct contrast to balance out the *Diagnostic and Statistical Manual*'s list of what is wrong.

The development of a character strength survey by the VIA Institute on Character (viacharacter.org) allowed people to learn their strengths to develop them and to begin using their top ones in new and different ways. Peterson and Seligman's (2004) research classified character strengths and virtues into 24 categories organizing them into six types. The character strength survey based on this research has radically changed how character strength is understood and used around the world, particularly when it come to the use of character strengths to activate experiences of flow, and other positive experiences. (Park & Peterson, 2009**;** Peterson, Ruch, Beerman, Park, & Seligman, 2007, Niemiec, 2013).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The six virtues followed by their 24 character strengths are:

1. **Wisdom and Knowledge:** Creativity, curiosity, open-mindedness, love of learning, perspective, innovation
2. **Courage:** Bravery, persistence, integrity, vitality, zest
3. **Humanity:** Love, kindness, social intelligence
4. **Justice:** Citizenship, fairness, leadership
5. **Temperance:** Forgiveness and mercy, humility, prudence, self-control
6. **Transcendence:** Appreciation of beauty and excellence, gratitude, hope, humor, spirituality

The advent of this classification of character strengths created a platform onto which positive interventions could be added to promote positive psychotherapy. While the complete list and analysis of these interventions is beyond the scope of this chapter the interested reader is referred to the work of Tayabb Rashid, (2015) and his colleagues (Slade, Brownell, Rashid, & Schrank, 2017) who have offered a comprehensive view of these interventions, and to the work of Gander, Proyer, Ruch, and Wyss, (2012) who have shown how these interventions can enhance happiness while reducing depression. There is also a thought-provoking article on how character strengths may be used in the future to assess and understand the cause and correction for mental illness (Seligman, 2015).

This effort, spearheaded by Peterson and Seligman's work, was not the first attempt in creating a more positive approach to psychotherapy. In 1968 Nossrat Peseschkian, a psychiatrist working in Germany, proposed "positive psychotherapy" as a theory and collection of interventions that promoted well-being. Heavily influenced by the humanistic movement, Peseschkian took a positive view of human nature (Cope, 2014). Inspired by personal encounters with prominent psychotherapist and psychiatrists, such as Viktor Frankl, Jacob L. Moreno, Heinrich Meng, the teachings of the Bahá'í Faith, and transcultural observations in more than 20 cultures, Peseschkian began searching for a combined method that was both integrative and culturally sensitive. This humanistic, psychodynamic therapy was built on a positive conception of human nature, which includes a holistic approach to well-being, containing spiritual aspirations and influences (Cope, 2014). This early version of positive psychotherapy (as there is a newer one that will be discussed below) was built on the principles of hope and moderation as a representation of social identity and consultation. This pioneering effort, like other initiatives of that time, offered inspiring views of approaches to therapy without broad evidence-based support.

The principle of hope is a worldview founded on the idea that every person is good by nature (EAP, 2011). In addition, every person is endowed with different capabilities and potential. Each person is seen as having the major virtues of love and knowledge, and through these virtues various interventions are used to motivate the process of healing. The major goal of the therapeutic process is balance, helping the client to actualize his or her abilities.

The second principle is that of moderation, as a representation of social identity. The encouragement is to develop all areas equally, with the distribution of energy to be balanced when tending to the body, work, relationships, and the future (Peseschkian, 2012).

The final principle of Peseschkian's positive psychotherapy is consultation. This is the essence of the therapeutic process and employs a five-stage process. In this manner, the client is led to address his conflicts based on symptoms. But the interventions here are framed in non-pathological ways, and the examples drawn from daily life situations or what Peseschkian referred to as "micro-traumas" of daily living (Peseschkian, 2012, 1998).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

This five-stage process involves observation, taking inventory, situational encouragement, verbalization, and broadening of goals. During the observation phase, the client is taught to see his or her problems more precisely. The taking inventory phase emphasizes the distinctions between *I*, *you*, and *we* in discerning and understanding what happens during daily life encounters. The essence of situational encouragement is to then look at the history of how conflicts have been successfully resolved. Finally, the expansion of goals places the emphasis on a future perspective (Peseschkian & Tritt, 1998).

This version of positive psychotherapy is a culturally sensitive method (Peseschkian Foundation, 2016), the premise being that each person is impacted by the cultural environment where he or she developed, influenced by the family they are born into, and altered by the individuals they've encountered along the way. Yet the underpinning of the goals of this approach to positive psychotherapy is transcultural, meaning that goals and interventions are universally human. The tools of the therapist involve using words of wisdom, humor, storytelling, and introducing moments of surprise through the session.

However, with the advent of Seligman's positive psychology the empirical basis for psychotherapeutic interventions blossomed, and positive psychotherapy (now abbreviated as PPT) evolved as a way to access the positive resources of clients in addition to treating symptoms of psychopathology. With this approach, there is a more direct emphasis on character strengths, positive emotions, and meaning (Rashid, 2015).

Growing out of his work at the University of Pennsylvania, Seligman began focusing on the use of positive intervention in a psychotherapy environment and began showing very promising effectiveness (Duckworth, Steen, & Seligman, 2005). Tayyab Rashid has furthered the research base of this form of positive psychotherapy separate and apart from Peseschkian's work (Seligman, Rashid, & Parks, 2006). The use of positive interventions in a structured way engages clients in activities and events that utilize the activation of positive emotions as a foundation for change.

This version of positive psychotherapy is based on three assumptions that are like Peseschkian's, but have some important differences derived from the research on positive interventions. First, clients inherently desire growth, fulfillment, and happiness, not just the avoidance of depression and anxiety. This simultaneously includes the need to reduce symptoms while increasing well-being. Second, positive resources such as strengths are viewed as just as real as symptoms and disorders. Their acknowledgement, activation, and encouragement are central features in PPT as they have been shown to directly promote well-being. The classification of character strengths is a major addition to the use of interventions for intentional well-being in psychotherapy. It provides an empirical foundation for positive psychotherapy, which had not yet been developed during Peseschkian's pioneering work.

Finally, effective therapeutic relationships can be formed through conversation and the use of positive resources, not just thorough analysis of weaknesses and deficits (Seligman, Rashid, Parks, 2006; Rashid & Ostermann, 2009).

By including strength-based positive interventions into the practice of traditional forms of psychotherapy, a more robust dynamic than removal of symptoms is introduced into sessions. This is important since research shows that the experience of positive emotions broadens a person's repertoire of thought and action, which in turn facilitate well-being. This dynamic has been researched and articulated by Barbara Fredrickson (2004, 2009) and is known as the 'broaden and build' theory of positive emotions. Further, understanding character strengths and being able to use your own and spot them in others has been central to advances in psychotherapy. Christopher Flückiger (2008) and his colleagues have developed a procedure, resource priming, where facilitators of psychotherapy take 5 minutes before their sessions to focus on the strengths of their individual clients. The result is that the priming leads to resource activation whereby participants focus on the positive perspective of their behavior, which in turn leads

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

to better progress in therapy as measured by greater reduction in symptoms and higher levels of well-being. Such a simple initiative has also been shown to foster a stronger practitioner-client relationship and greater sense of accomplishment and mastery by the client.

Research on the use of positive interventions have shown that participants in studies not only show greater improvement when these methods are used, and their improvement continues beyond the use of the interventions. (Bolier et.al., 2013;) People who gain the tools to alleviate suffering and learn how to thrive are less likely to relapse. They learn how to get out of a bad place, stay out, and engage in activities to feel better. Brief exposure to these interventions has demonstrated a decrease in depressive symptoms with an increase in well-being with sustainable results. (Sin & Lyubomirsky, 2009).

Consider one of the studies in positive psychotherapy conducted in a group therapy format (Seligman, Rashid, & Parks, 2006). Forty mild to moderately depressed University of Pennsylvania students were divided into a treatment group and a non-treatment group. The treatment condition consisted of two groups of 8-11 participants seen for six weeks for two-hour sessions. Each session was half a discussion of the exercise assigned from the previous week and half an introduction to the new exercise. The participants carried out homework assignments and reported back each week on their progress. The first week, participants were asked to take the VIA survey (mentioned above) and use their top five strengths more often in their day-to-day lives. Week two involved the participants writing down three good things that had happened during the day and why they thought they had occurred. The third week, participants were asked to write a brief essay on what they want to be remembered for the most; a biography of having lived a satisfying life. The next session involved composing a letter of gratitude to someone they may never have thanked adequately, and then reading that letter to the person, personally or by phone.

During the fifth session, the members were asked to respond very positively and enthusiastically each day to good news received by someone else (known as Capitalization with Active Constructive Responding (Gable, Reis, Impett, & Asher, 2004). The final session involved savoring daily events in their lives that they normally did not take the time to enjoy and journaling about how the experience differed from their normally rushed schedules. Time was also spent during this last session on tailoring the exercises for the participant's use following the end of the study.

Each intervention consisted of the use of five top strengths from the character strength survey, three good things that happened and why, a written biography of having had a satisfying life, a letter of gratitude, and enthusiastically responding to someone else's good news are all well-known and established positive interventions, as is the savoring and planning for future exercises following the end of the study. When used in this weekly series format, the results were notable.[2]

As one might expect, the group PPT participants did better than the no-treatment group on assessments of depression and satisfaction with life. But there is a powerful finding beyond this positive change. The gains made by the PPT groups were maintained with no other intervention by the researchers throughout a one-year follow-up, while the baseline levels of depression for the non-treatment group remained unchanged.

Six sessions and twelve hours, with no booster sessions during the year. This is very unusual in the study of depression and highlights how the use of these exercises involved self-maintaining features that served the participants beyond the intervention.

THE FUTURE OF HOPE

Before looking at what positive interventions in the future may entail, it is helpful to revisit one of the key pieces of research upon which positive psychology grew.

The latest research by Maier and Seligman (2016) revisits the original work on learned helplessness. This body of investigation is the research foundation that generated the inquiry leading to learned optimism—and the eventual development of the field of positive psychology. Back then, now more than fifty years ago, their research showed that once animals learned that nothing they did mattered, they stopped trying to escape—even when escape was possible. Maier and Seligman have now concluded that their original hypothesis that animals could learn that their actions do not affect outcomes, was incorrect.

Through a series of intricate studies, Maier and Seligman have demonstrated the original conclusion was the opposite of what they now hold to be true. By investigating the neural circuitry that regulates our fight/flight and fear/anxiety responses, it was discovered that both escapable and inescapable shocks activate the dorsal raphe nucleus (DRN). Further, they found that when the ventromedial prefrontal cortex (vmPFC), a part of the brain associated with risk processing, detects that shocks are escapable, it inhibits the DRN and turns off the effects of the shock. Passivity, giving up, is now understood to be a default reaction to extended aversive events. Nothing was "learned" about helplessness. What is learned is the possibility of control. In their own words:

Rather, passivity is an unlearned, default response to extended aversive events. Animals overcome this passivity by learning control, and the expectation of control mediates future responses to aversive events.

The circuit created between the DRN and vmPFC has been identified by Maier and Seligman as the hope circuit, noting that hope is likely the best defense against helplessness.

Extrapolating from this research, overcoming the default response to passivity it is the expectation of control that determines future responses. It is the anticipation of having control that facilitates the ability. Toward this end, the use of imagination to generate future scenarios of control, or reclaiming a sense of control from prior inhibition through reframing past occurrences is a fertile ground for new interventions. The first of these interventions has begun to show up in the research that highlights a connection with a future self through writing (Peters, Flink, Boersma, & Linton, 2010; Hershfield, Cohen, & Thompson, 2012), immersive virtual reality (Hershfield, Goldstein, Fox, Yeykelis, Carstensen, & Bailenson, 2011), and the creation of 15 year older future-self interactive avatars on Facebook (Gelder, Luciano, Kranenbarg, & Hershfield, 2015). The results show those who engage in various future-self conditions show fewer negative behaviors and more virtuous activities.

Research also demonstrates that control over past conditions for future benefit is possible by recasting and refocusing the experience through the lens of potential positives that may have been eclipsed by a negative or traumatic experience (Calhoun & Tedeschi, 2006; Tedeschi, Calhoun, & Groleau, 2015). Such interventions, either through future projection or untangling from past inhibitors through recasting offer a greater sense of control and hope in embracing the future.

Finally, new methods and efforts to reach underserved populations are emerging such as techniques for working with people with intellectual disabilities (Tomasulo, 2014) and people experiencing episodes of psychosis (Slade, Brownell, Rashid, & Schrank, 2017).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The International Positive Psychology Association (IPPA) is supporting the effort to extend the type and impact of new interventions and in 2017 the Positive Clinical Psychology Division held their first avant-garde clinical intervention contest. The virtual gratitude visit (VGV) was selected as an exemplar.

NARRATIVE ENACTMENT: THE VIRTUAL GRATITUDE VISIT (VGV)

Expressing gratitude as a positive intervention has been central to the positive psychology movement. The gratitude visit, where participants write and deliver letters of gratitude to people they feel they have not properly thanked, was one of the first positive interventions studied (Seligman et al., 2005). In the initial report, when compared to other interventions, those who performed the gratitude visit were found to be the least depressed and the happiest of all the participants. As discussed by Tomasulo (2014), gratitude has also been found to enhance self-esteem (McCullough et al., 2002), life satisfaction (Kashdan Uswatte, & Julian, 2006), prosocial behavior (Wood et al., 2008), and better interpersonal relationships (Algoe et al., 2008; Tsang, 2007). It was also found to directly influence the capacity to broaden and build positive emotions (Fredrickson, 2004, 2009) and was noted by Lyubomirsky, Sheldon, and Schkade (2005) as one of the main interventions that can lead to sustainable happiness. But not all gratitude exercises are the same and there have been some surprising results of such. Boehm and Lyubomirsky (2009) studied participants who savored positive events by writing in an gratitude journal five things they were grateful for either once a week or three times a week, and then compared them with a control group that did not keep journals. Pre- and post-measures on well-being revealed that gratitude journaling worked better once a week rather than three times a week or in the control group. In fact, the once a week approach was the only condition in which improvement in well-being was noted. The authors theorize that the success of a positive intervention depends not only on what the intervention is, but also how it is delivered. Expanding on the method of delivery is where the VGV finds applicability. New research by O'Connell, O'Shea, and Gallagher (2017) focuses on the enhanced power of expressing gratitude to others. They compared a gratitude journal group to a similar group that, in addition, verbally expressed their gratitude. The researchers found the expressive group did better than gratitude journaling alone or the control group. In the expressing-to-others group, negative emotions and depression decreased, which provided greater emotional balance. The authors concluded that other-oriented gratitude is enhanced when it is outwardly expressed. It is the deliberate verbal expression to others that has relevance to the VGV.

There are three ways the traditional methods and research of a gratitude letter and visit can be re-envisioned and restyled with the VGV. First, most evidence-based interventions concerning gratitude involve writing and/or reading through the use of journals, letters, and sharing of the same. As O'Connell et al.'s (2017) article highlights, expressive writing is only one means by which a therapeutic improvement can happen. The VGV uses an enactment of feelings of gratitude in a role-play with an empty chair. Importantly, the VGV format liberates the technique from a written procedure, as the enactment with the empty chair is unscripted. This unscripted enactment has the potential to reap the benefits of expressing gratitude toward others, yet can be accomplished without them present. Drama therapy (Tomasulo & Szucs, 2016), psychodrama (Fong, 2006; Yazdekhasti, Syed, & Arizi, 2013), and role-playing (Nikzadeh & Soudani, 2016) are all methodologies that have shown to offer therapeutic gains (Kipper & Ritchie, 2003), and delivering gratitude with such enactment methodologies is worthy of further investigation. Additionally, the usefulness of the VGV as a non-reading and non-writing intervention could have tremendous value for the more than 775 million adults in the world who are illiterate (Wiki-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

pedia, n.d.). Interventions that can address the need to deliver the advantages of expressing gratitude to these individuals deserve research and application attention. People with concomitant intellectual and psychiatric disabilities who have no or low literacy are a primary clinical interest to the author, and the use of VGV in this context for the interested reader can be found elsewhere (Razza & Tomasulo, 2005; Tomasulo, 2014; Tomasulo & Szucs, 2016).

Second, the delivery of a gratitude letter as originally intended involves the availability of a live recipient. As the VGV uses role-playing with an empty chair to enact a gratitude visit, the intervention can include others who are unavailable. Using this empty chair approach may be helpful in four ways:

1. The person one has gratitude for may no longer be living and an enactment would be one way to activate the positive effects of the relationship.
2. The person may be alive, yet unavailable. As an example, it may be a person from childhood who has moved or a friend one has lost contact with.
3. As internal family systems have shown, there may be "parts" of ourselves that we have gratitude toward (such as a time when we had more resilience, grit, or joy in our lives). An enactment with these parts may be helpful in activating strength from another memory point in time. Role-playing allows this type of intra-psychic exploration of gratitude to take place.
4. Expressing gratitude toward God through an enactment may be particularly helpful.

Research by Rosmarin, Pirutinsky, Cohen, Galler, and Krumrei (2011) has shown (as others have) that gratitude is significantly correlated with religious commitment. But their research also found that the relationship between these two variables is fully mediated specifically when gratitude is directed toward God. They looked at 405 adults of varying religious backgrounds through an online survey and used gratitude questionnaires that measured both religious and non-religious expressions of gratitude. These results were then compared to measures of religious commitment. (Religious commitment was determined by a person's degree of belief in God, importance of religion, and religious identity). Happiness, satisfaction with life, positive and negative affect and physical and mental health were measured using well-known scales or adaptations of them. They found that general gratitude was predictive of all the outcome variables. This means that gratitude in general, as other studies have shown, works very well. What was interesting in this study is that the degree to which a person is religiously committed enhances the effect of the gratitude. As the authors put it, "We propose that religion facilitates gratitude through a religious lens…"[3]

With the VGV, using an unscripted monologue of God-directed gratitude toward an empty chair highlights this specific intention. It has also been demonstrated that when there is spiritual content in an enactment, mental health, happiness, and joy can be positively affected (Yazdekhasti, Syed, & Arizi, 2013).

Finally, a VGV performed in-vivo in the therapist's office allows for both immediate feedback about its effectiveness and integration of the experience with the therapist. Accordingly, the client may be inspired to continue the work with more traditional positive clinical interventions beyond the session. In fact, recent research by Shahar, Bar-Kalifa, and Alon (2017) has shown specifically that the use of empty chair role-playing will help do just that.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

VGV Technique

(This description is taken largely from the article by Tomasulo, 2014). For this technique, two chairs are arranged, one for the protagonist and the second the (auxiliary) empty chair for the unavailable/other. The protagonist arranges the chairs in a way that symbolically depicts the relationship; that is, are the chairs close? Far apart? Side by side? One behind the other? The chairs' arrangement sets the emotional tone for the encounter. The protagonist then sits in his or her chair and expresses gratitude toward the imagined unavailable/other in the empty chair. Following this, the protagonist reverses roles and becomes the auxiliary. In doing so, the protagonist responds as if the gratitude had just been expressed to him or her. This auxiliary role is then relinquished and the protagonist returns to the original chair, saying a closing remark to the empty chair. This ends the enactment.

The empty chair technique with a role reversal has the potential to activate several therapeutic elements. First, it allows for an unscripted expression of gratitude. There is no reading or writing involved. This would be a significant shift in how gratitude is studied and delivered. The research on expressing gratitude in written form demonstrates the power of expression. The VGV extends the method of expression, which appears to be both a necessary and natural extension of the ways gratitude can be used effectively in a clinical setting.

Second, the understanding accrued by reversing to the other role employs elements of empathy and learning of the other through theory of mind (Goldstein & Winner, 2012). This role-reversal allows for an amplification of the positivity of gratitude and integration as it is experienced as both sender and receiver. This learning helps to facilitate what Moreno referred to as a catharsis of integration:

Mental catharsis is here defined as a process which accompanies every type of learning, not only release and relief but also a catharsis of integration (Moreno, 1953/1993, p. 206).

Inspire to Rewire: Use of the VGV in Group Therapy

As a member of a group using a VGV, a member can not only enact his or her gratitude, but also witness the expression of gratitude by others. Thus, even in an audience or participant/observer role, a client may derive benefit. Group therapy has traditionally provided a dynamic, low-cost treatment opportunity. By adding the VGV to the toolbox for group therapists, the collective well-being of the group can be enhanced.

There are several reasons this approach is a valid and fruitful avenue for future research. First, psychodramatic role-playing has been shown to be effective within a wide variety of clinical conditions (Kipper & Ritchie, 2003; Hurley, Tomasulo, & Pfadt, 1998).

Second, at its core, the VGV is a narrative, which is one of the most pervasive and promising elements of positive interventions. As discussed by Tomasulo and Pawelski (2012), stories play a significant role in both psychological research and application. The expression of gratitude is a narrative of the benefits of the relationship. Several key positive interventions use participants' narratives as components of the research (Danner, Snowdon, & Friesen, 2001; Pennebaker, 1997, 2004; Seligman et al., 2005). Furthermore, three of the first five positive interventions reported on by Seligman and his colleagues (Seligman et al., 2005) involved the use of autobiographical narratives: the gratitude visit, you at your best, and three good things in your life. Storytelling was also a central feature in the teaching of positive psychology as Seligman and Chris Peterson began their first course with "serious introductions," where each

person tells a story about being his or her best self, and Paul Zak (Future of Storytelling) has articulated the biochemical changes that take place during an engaging story.

Other major positive intervention programs and research use storytelling as a central element in the means to deliver or facilitate the intervention. In fact, the Penn Resiliency Program (PRP), the world's most widely researched program for the prevention of depression (Seligman, Ernst, Gillham, Reivich, & Linkins, 2009), includes storytelling as a central component. Jonathan Haidt (2006) believe there is great power in the use of story as a vehicle to extend empathic understanding. They believe the development of empathy using story may be part of the core dynamic inherent in why stories and psychodramas work.

Finally, a positive emotional enactment, as would be demonstrated by a VGV, has the power to activate *elevation* as defined by Haidt (2003) as an emotion elicited by witnessing virtuous acts of human goodness. Watching others express their gratitude is such an act, and there is direct evidence that elevation can uplift depressed clients (Erickson & Abelson, 2012). Through the established elements of elevation and clinical role-playing in groups, a VGV can elicit a positive emotional response simply by watching others express their gratitude. It is elevation that makes the expression of a positive emotional experience in a group setting an important feature for psychodramatists to amplify in enactments. The research on elevation shows that we are wired to notice human goodness. Haidt (2006, 2003) notes there are three main features of elevation: First, we are drawn to those scenes and stories that are elicitors, such as acts of courage, kindness, loyalty, or any other act of human goodness. Second, there is often a phenomenological and physiological reaction, such as a calm/relaxed, a warm/open/pleasant feeling in the chest, sometimes getting "choked up." Finally, we are motivated by the elicitors to emulate and self-improve. Haidt (2003) noted that the motivational tendencies that elevation produces include merging with, opening to, and helping others. Psychodramatists are in a particularly good position in a group to use the methods of enactment to take advantage of the natural benefits of elevation. In Haidt's words, we "inspire to rewire."

CONCLUSION

To summarize:

- A VGV uses an unscripted enactment with an empty chair to express gratitude.
- It uses a role–reversal with the empty chair to integrate the emotional experience.
- It extends the method by which the positive intervention of a gratitude visit is delivered.
- Since an empty chair is used, gratitude can be expressed to individuals no longer alive.
- The empty chair also allows for an encounter with other stronger parts of the self.
- It can be used with people with low or no literacy.
- It can be used for spiritual growth by expressing gratitude toward God.
- It is an intervention that can be delivered face-to-face with the therapist during the session.
- In a group, it can benefit the protagonist and members due to the phenomenon of elevation.
- A VGV is a narrative intervention, a storytelling approach, amplified through role-playing.

As recent research and publications have confirmed (Slade, Brownell, Rashid, & Schrank, 2016), the need to extend positive interventions, particularly to difficult populations, is necessary.

The history of positive psychotherapy has a rich ancestry and a very hopeful future. Clinicians are encouraged to examine which of these interventions thy can begin to fold into their current practice. Using the character strength survey (via character.org) as a free assessment tool during an intake might be the easiest and most direct way to signal to the client that the approach in therapy will be one to not only alleviate suffering, but also enhance well-being. This is an exciting time for psychotherapists as the range of tools available to use, and the need for research for new positive interventions, creates a powerful opportunity to practice a method that helps to prevent relapse and offer greater hope. As practitioners, our future and our clients are limited only by our imagination, and, as Albert Einstein has suggested: "Imagination is everything. It is the preview of life's coming attractions."

Chapter 98
Foundations and Future of Well-Being:
How Personality Influences Happiness and Well-Being

Vidya S. Athota
University of Notre Dame, Australia

ABSTRACT

This chapter begins by exploring subjective well-being and its origins dating back to ancient thinkers such as Aristotle. It discusses two main forms of subjective well-being; eudaimonic and hedonic well-being. The chapter then delves into the roles of personality, emotional intelligence, positive emotions, economics and religion in influencing subjective well-being. Measures of well-being are discussed as well as the notion of the Hedonic Treadmill and how it operates with the Set-point Theory of happiness. In addition, this chapter also presents the latest research from neuroscience and discusses how neuroscience potentially challenges personality and set-point theories. A few practical steps for subjective well-being are also discussed. Overall, this chapter covers the historical and contemporary theories of subjective well-being and explores a new positive direction on the association of personality, health and subjective well-being.

INTRODUCTION

The pursuit of happiness and wellbeing has recently gained attention among academics despite being a subject of inquiry since ancient times. Aristotle, in his book *Nicomachean Ethics*, spent a great deal discussing *eudaimonia*, which translates as 'happiness' or 'well-being'. The Aristotelian concept of eudaimonia has provided a mechanism for recent theories on wellbeing and positive psychology. The association between personality, health, and well-being has relationship with moral philosophy and positive psychology. Traditionally psychology has focused on the negative side of human behavior patterns.

Whereas, recent theories on well-being argue for new ground, based on human strengths. Furthermore, the study of personality traits has provided further clarity to the mechanisms of wellbeing. In addition to personality, this chapter also takes into account concepts from moral philosophy, neuroscience, and positive psychology in addressing wellbeing. Overall, the goal of this paper is to describe various approaches to wellbeing.

BACKGROUND

Subjective Well-Being

The concept of subjective well-being refers to an individual's evaluation of overall life satisfaction and feelings (Kesebir & Diener, 2008; Marks & Shah, 2005; Seiligman & Csikszentmihalyi, 2000). It includes positive and negative evaluation of cognitive, emotional, economic and social aspects of one's life. Interventions such as positive thinking, exercise, eating well and spirituality help to promote subjective well-being (Ryff, 2014). Life satisfaction (including pleasure and enjoyment), personal development (engagement in life, social cohesion, curiosity and resilience), and general social wellbeing (positive attitudes and belongingness in social activities) are important dimensions of subjective well-being (Marks & Shah, 2005). Well-being and happiness is also associated with success in various domains of life (Lyubomirsky, King, & Diener, 2005).

Origins of Research on Well-Being

The underpinnings of well-being are ancient and have existed since Aristotle's times. For Aristotle, the essential philosophical roots of *eudaimonia* (happiness) were not about feeling good or satisfying hedonistic appetites, but rather practicing and acting according with virtue, (i.e "activity of the soul in accord with virtue" (p.11) and exercising unique human potential (Ryff, 1989; 2014). Aristotle banded virtues such as courage, temperance, patience, friendliness, and honor that can lead to *eudaimonia*. Similarly, philosophers Socrates and Plato, were in tune with the good life as the result of practicing virtuous living. Aristotle was the disciple of Plato and Plato was the disciple of Socrates. Similar to Aristotle, Plato suggested that desire and doing good things leads to happiness (Plato, 1999). In addition to Aristotle's *eudaimonia*, ataraxia which is aimed at finding happiness within, existed among Greeks (Leahey, 2000). Similar to Aristotle, other Stoic philosophers endorsed happiness as the result of leading a virtuous life. The current notion of subjective well-being in positive psychology is slightly contrasted with Aristotle's *eudaimonia* despite its underpinnings of ancient views on happiness.

The research on subjective well-being in positive psychology has focused on the hedonic view of well-being. Yet the Aristotelian concept of *eudemonia* has been used by recent scholars on wellbeing (e.g. Seligman, 2002). The positive psychology notions of 'flourishing', 'wellbeing' and 'happiness' are also used in the Aristotelian view of *eudemonia*. Seligman has contributed to positive psychology through utilizing ideas from moral philosophy. Living well in terms of intellectually, and morally is associated with happiness (Spieker, 1999). A healthy life is acting virtually and employing excellence in physical and mental activities leading to sustainable happiness. Based on this tradition, practicing excellence in virtues leads to a state of well-being.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Peterson and Seligman (2005) proposed 24 signature strengths which are further grouped in 6 virtue clusters (Seligman, Steen, Perk & Peterson, 2005); they are, Wisdom and knowledge (creativity, curiosity, open-mindedness, love of learning, perspective and wisdom); Courage (Authenticity, Bravery, Persistence, Vitality/Zest); Humanity (Kindness, love, social intelligence); Justice (Fairness, Leadership, Teamwork); Temperance (Forgiveness, Modesty, Prudence, Self-regulation); and Transcendence (Appreciation of beauty and excellence, Gratitude, Hope, Humor, Religiousness). Some of these signature strengths (e.g. Justice, Courage) are inspired by Aristotle's book Nicomachean Ethics and theological roots (e.g. Temperance and Transcendence). Overall, Aristotle's view of *eudemonia* is a subjective view and current theories are more accommodative of a prescriptive view of wellbeing and happiness (Kesebir & Diener, 2008). Both the subjective and prescriptive views are important based on their positive influence on human wellbeing.

Table 1 Classification of 6 virtues and 24 character strengths

Virtue and Strength	**Definition**
1. Wisdom and knowledge	Cognitive strengths that entail the acquisition and use of knowledge
Creativity	Thinking of novel and productive ways to do things
Curiosity	Taking an interest in all of ongoing experience
Open-mindedness	Thinking things through and examining them from all sides
Love of learning	Mastering new skills, topics, and bodies of knowledge
Perspective	Being able to provide wise counsel to others
2. Courage	Emotional strengths that involve the exercise of will to accomplish goals in the face of opposition, external or internal
Authenticity	Speaking the truth and presenting oneself in a genuine way *Not* shrinking from threat, challenge, difficulty, or pain
Bravery	Finishing what one starts
Persistence	Approaching life with excitement and energy
Zest	Interpersonal strengths that involve "tending and befriending" others
3. Humanity	Doing favors and good deeds for others
Kindness	Valuing close relations with others
Love	Being aware of the motives and feelings of self and others
Social intelligence	Civic strengths that underlie healthy community life
4. Justice	Treating all people, the same according to notions of fairness and justice
Fairness	Organizing group activities and seeing that they happen
Leadership	Working well as member of a group or team
Teamwork	Strengths that protect against excess
5. Temperance	Forgiving those who have done wrong
Forgiveness	Letting one's accomplishments speak for themselves
Modesty	Being careful about one's choices; *not* saying or doing things that might later be regretted
Prudence	Regulating what one feels and does
Self-regulation	Strengths that forge connections to the larger universe and provide meaning
6. Transcendence	Noticing and appreciating beauty, excellence, and/or skilled performance in all domains of life
Appreciation of beauty and excellence	Being aware of and thankful for the good things that happen
Gratitude	Expecting the best and working to achieve it
Hope	Liking to laugh and tease; bringing smiles to other people
Humor	Having coherent beliefs about the higher purpose and meaning of life
Religiousness	

Source: Seligman, M. E. P., Steen, T. A., Park, N., & Peterson, C. (2005), Positive psychology progress: Empirical validation of interventions. *American Psychologist*, 60, 410-421. (p. 412)

The Influence of Moral Philosophy on Well-Being

It is evident that the current theories on well-being have integrated ancient Aristotle's *eudaimonia.* As Aristotle suggested that "living well and doing well "are important aspects of *eudaimonia* (happiness or wellbeing) (p. 3), Seligman (2011) similarly states, "if we want to flourish and if we want to have well-being, we must indeed minimize our misery; but in addition, we must have positive emotion, meaning, accomplishment, and positive relationships" (p.57).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Forms of Well-Being

As discussed above, there are two main forms of well-being; eudaimonic and hedonic well-being. Eudaimonism is based on Aristotle's view of virtues and Hedonic well-being refers to pleasure orientation. There is conceptual overlap between Aristotle's *eudaimonia* and current theories of psychological well-being. Philosophical theories of happiness provide underpinnings to recent positive psychology theories.

Ryff (2014) utilized philosophical, developmental and clinical psychology to put forth her concept of well-being that contains six key components; autonomy, environmental mastery, personal growth, positive relations with others, purpose in life, and self-acceptance. These components have their foundations Rogers, Maslow and Jung theories (See Figure 1). Ryff has tried to address the question "What constitutes essential features of well-being?" (p.11). Ryff has substituted Aristotle's virtues with dimensions of psychological well-being; purpose in life, autonomy, personal growth, environmental mastery, positive relationships, and self-acceptance. Life satisfaction was strongly associated with Environmental mastery and self-acceptance (Ryff, 1989). Ryff also integrated concepts from Aristotle' *eudaimonia*, mental health and life span development to propose positive psychological functioning.

Figure 1. Ryff's (2014) core dimensions of psychological well-being
Source: Ryff, C.D. (2014). Psychological Well-Being Revisited: Advances in the Science and Practice of Eudaimonia, Psychther Psychosom, 83, 10-28. (Page 11)

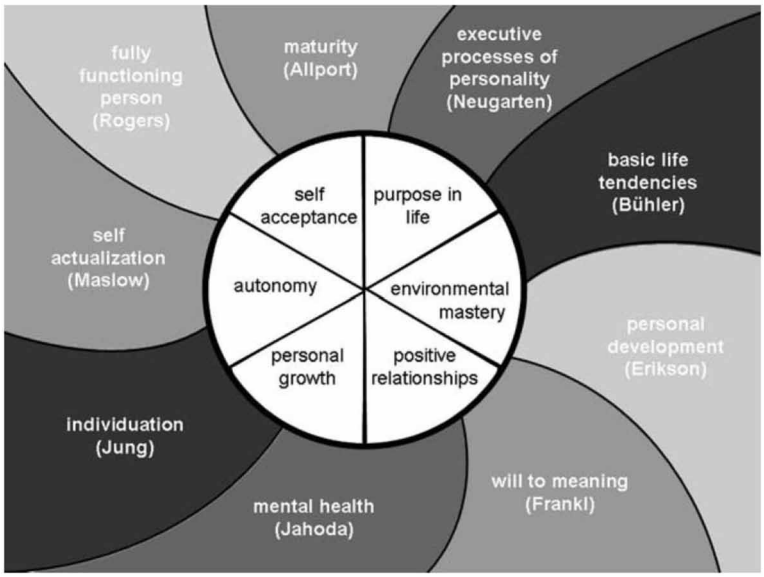

Table 2 outlines definitions of Ryff 's (2014) model of psychological well-being that includes six key components; autonomy, environmental mastery, personal growth, positive relations with others, purpose in life, and self-acceptance.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Definitions of theory-guided dimensions of well-being

Autonomy High scorer: Is self-determining and independent; able to resist social pressures to think and act in certain ways; regulates behavior from within; evaluates self by personal standards.
Low scorer: Is concerned about the expectations and evaluations of others; relies on judgments of others to make important decisions; conforms to social pressures to think and act in certain ways.
Environmental mastery
High scorer: Has a sense of mastery and competence in managing the environment; controls complex array of external activities; makes effective use of surrounding opportunities; able to choose or create contexts suitable to personal needs and values.
Low scorer: Has difficulty managing everyday affairs; feels unable to change or improve surrounding context; is unaware of surrounding opportunities; lacks sense of control over external world.
Personal growth
High scorer: Has a feeling of continued development; sees self as growing and expanding; is open to new experiences; has sense of realizing his or her potential; sees improvement in self and behavior over time; is changing in ways that reflect more self-knowledge and effectiveness.
Low scorer: Has a sense of personal stagnation; lacks sense of improvement or expansion over time; feels bored and uninterested with life; feels unable to develop new attitudes or behaviors.
Positive relations with others
High scorer: Has warm, satisfying, trusting relationships with others; is concerned about the welfare of others; capable of strong empathy, affection and intimacy; understands give and take of human relationships.
Low scorer: Has few close, trusting relationships with others; finds it difficult to be warm, open, concerned about others; is isolated and frustrated in interpersonal relationships; not willing to make compromises to sustain important ties with others.
Self-acceptance
High scorer: Possesses a positive attitude toward the self; acknowledges and accepts multiple aspects of self, including good and bad qualities; feels positive about past life.
Low scorer: Feels dissatisfied with self; is disappointed with what has occurred in past life; is troubled about certain personal qualities; wishes to be different than what he or she is.

Causes of Well-Being

Individual Differences

The study of psychological well-being has been an important aspect of personality and health psychology. Even though well-being was and has been the main area of interest for Aristotle and the study of positive psychology, empirical and longitudinal studies point out that personality provides effective scientific foundation to subjective well-being (Steel, Schmidt, & Shultz, 2008; Diener & Lucas, 1999). Diener and Lucas (1999) suggested that subjective well-being is the result of personality traits. There is a relationship between subjective well-being and personality traits (Steel, Schmidt, & Shultz, 2008). Personality plays a significant role in predicting subjective wellbeing (DeNeve & Cooper, 1998).

The Big Five personality traits known as Extraversion, Neuroticism, Agreeableness, Conscientiousness and Openness (see Table 3) have been linked to much research on well-being. Research suggests that individuals who score high on conscientiousness and low on neuroticism maintain health-promoting behaviors (Bogg & Roberts, 2004). Similarly, the same personality traits (high conscientiousness and

Table 3. The big five personality factors

Big Five Dimensions	Facet
Extraversion	Sociable, Assertiveness, Energetic, Outgoing, Activity, Excitement-seeking, Enthusiastic, Warmth
Agreeableness	Warm, Trusting, Altruism, Compliance Modesty, Tender-mindedness
Conscientiousness	Competence, Keep things in Order, Dutifulness, Achievement striving, Maintain Self-discipline, Deliberation
Neuroticism	Anxious, Irritable, Self-consciousness, Impulsiveness Vulnerability, Less-confident
Openness	Curious, Imaginative, Aesthetics, Wide interests, Unconventional

Source: John, O. P., & Srivastava, S. (1999). The Big-Five trait taxonomy: History, measurement, and theoretical perspectives. In L. A. Pervin & O. P. John (Eds.), *Handbook of personality: Theory and research* (Vol. 2, pp. 102–138). New York: Guilford Press.

low in neuroticism) predict healthy sleep patterns (Duggan, Friedman, McDevitt, & Mednick, 2004). Research also points to positive correlation between agreeableness and conscientiousness (DeNeve & Seligman, 2002; Lucas, 2008). Therefore, agreeableness and conscientiousness influence health behaviors.

Conscientious individuals by trait exhibit self-control, diligence, goal-oriented behavior, life satisfaction and positive health behaviors (Friedman, 2000; Israel & Moffitt, 2014). Therefore, individuals who score high on Conscientiousness are likely to live longer. Research also suggests that Extraversion is positively associated with subjective well-being and Neuroticism is negatively associated with subjective well-being (Lucas, 2008) and greater happiness (Cost & McCrae, 1980). All these associations point to personality playing a "substantial role" in predicting subjective wellbeing (Diener and Lucas, 1999). Individuals who score high on Extraversion positively respond to social interactions and Neurotic individuals intensely respond to negative experiences. Neuroticism has been associated with poor mental health such as depression (Enns aa& Cox, 1997) and increased mortality (Shipley, et.al. 2007). Generally, individuals with high Extraversion and Conscientiousness, low Neuroticism are associated with wellbeing (Ryff, Keyes & Shmotkin, 2002). Individuals with high conscientious report positive mental well-being due to their sense of confidence (Löckenhoff, Sutin et al., 2008). Life experience plays a pivotal role in providing stimuli for personality traits and influencing well-being (Larsen and Ketelaar, 1991). Based on the empirical evidence personality is a better predictor of long-term subjective well-being (Steel, Schmidt, & Shultz, 2008).

Type A and Type B Personality Factors

Individuals with Type A personality are defined as competitive, ambitious, impatience, aggressive, hostile and show physical tenseness; whereas individuals with Type B personality are defined as easy going, less hostile and relatively leading calm lives (Caracciolo & Molinari, 1986). Individuals with Type B personality maintain effective social support and lead reasonably relaxed lives. Therefore, Type B individuals have more well-being orientation compared to Type A personality individuals. Their "upright" and "laid back" nature has a direct influence on subjective wellbeing:

- **Emotional intelligence:** Emotional Intelligence can further shed light on the association of personality, health and well-being. Both from the trait and emotional perspective, emotional intelligence sheds further understanding of subjective well-being. The ability to understand, manage own emotions is an integral part of emotional intelligence (Mayer & Salovey, 1997; Salovey,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Mayer, & Caruso, 2002). Moral emotions have significant influence on wellbeing. They are the result of concern for conscious response to right and wrong (Kroll, Egan, Erickson, Carey, & Johnson 2004). Recently Athota and O'Connor (2014) established a moral component of emotional intelligence. According to Salovey and Mayer (1990), emotional competence is an ability to understand and control emotions, both in the self and in others. Responding to empathetic emotions avoids psychological conflict and positively influences experience of wellbeing. Goleman (1995) suggested that emotional control (expressing emotions at the right time to the right degree) is the bedrock of character, which has similarities to Aristotle's *eudaimonia* concept. Research also suggests that positive emotions play an important role and act as a buffer to deal with tough situations in life and promote subjective wellbeing (Kahneman & Krueger, 2006; Seligman, 2002). Responding to empathetic feelings also influences psychological wellbeing (Pizarro & Salovey, 2002). New paradigms for emotional intelligence are still evolving (MacCan & Roberts, 2008). Further empirical work is needed in specifically targeting subjective well-being;

- **Positive emotions:** The importance of flourishing through positive emotions and activities is encouraged (Fredrickson, 1998; Ryff, 2014; Seligman, 2011). Positive emotions have been associated with longevity (Danner, Snowdon, & Friesen, 2001). Positive emotions are directly associated with overall success and health (Lyubomirsky, King, & Diener, 2005). Health benefits include fewer colds (Cohen, Alper, Doyle, Treanor, & Turner, 2006), reduced risk of cardiovascular disease (Boehm & Kubzansky, 2012) and mortality (Chida & Steptoe, 2008). Positive emotions influence overall cognitive abilities, that help individuals to utilize their ideas effectively (Fredrickson, 1998) and increase personal resources like mindfulness, social support and decrease illness symptoms (Fredrickson, Cohn, Coffey, Pek, & Finkel, 2008). Positive emotions have the ability to influence the cognitive aspect and biochemistry of individuals. Therefore, induced positive memories can also have a potential positive effect on health;
- **Religiosity:** According to Divine Command Theory, happiness is achieved through divine laws and morals given in sacred texts. The philosophical foundations of this theory have conceptual overlap with Aristotle's concept of *eudaimonia.* Professor Andrew Clark and Dr. Orsolya Lelkes in their longitudinal study in 2005 found that religious people maintain higher wellbeing. Specific activities such as church going and prayer provide a buffer against stressful events of life and leave a positive impact on life quality. Individuals with intrinsically motivated religious beliefs like Mother Theresa, operate with empathy. Research suggests that empathy helps to understand the needs of others and promotes positive social interaction (Eisenberg, Shea, Carlo, & Knight, 1991; Haidt, 2006; Pizzaro, 2000). Furthermore, the Sermon on the Mount by Jesus of Nazareth makes an association between virtues of humility, compassion and happiness (Matthew 5, New International Version). Research also points to moral emotions resolves emotional conflict and facilitates altruistic behavior (Kroll, Egan, Erickson, Carey, & Johnson 2004). Belief in positive religious teaching helps in dealing with existential crisis as well as terror management. Overall, subjective well-being is enhanced through participation of religious practices and prayers (Diener et al. 1999).

Measures of Well-Being

Despite the popularity of the concept of subjective well-being, evidence points to measures of subjective well-being in its early stage. One of the main reasons is that well-being is a multidimensional concept

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and there are potential challenges in measuring well-being. The existing research has relied on self-report scales. Well-being is generally associated with life satisfaction, using the Life Satisfaction Index. (Neugarten, Havigburst, & Tobin,1961); Fordyce Emotions Questionnaire (Fordyce, 1988); and Subjective Happiness Scale (Lyubomirsky & Lepper, 1999). The Ryff Scales of Psychological wellbeing (Ryff & Keyes, 1995) utilized theory-guided dimensions of well-being to measure self-acceptance, positive relations with others, autonomy, environmental mastery, personal life and personal growth. Despite a few available scales, the qualities of self-reports also need to be improved (Kahneman and Krueger 2006; Schwarz and Strack 1999). A battery of advanced longitudinal and experimental measures are needed to measure experiences, biological traits, and cognitive abilities. Caution must be exercised in measuring wellbeing as Daniel Kohonmen indicates that there are different ways of achieving well-being. Some caution must be exercised in measuring well-being.

Hedonic Treadmill: Heritability and Well-Being

Research suggests that genetics plays an important role in wellbeing. Over all our hedonic methods make individuals happy to an extent. Genetics factors have been found to play role in subjective wellbeing. Research conducted among fraternal twins at University of Minnesota found that genetics play an important role in the experience of happiness. Lykken and Tellegen (1996), in their 10-year longitudinal twin study found that genetic factors generally influence 44 -52% of subjective well-being. Approximately 10% of well-being is due to life circumstances and 40% of well-being is due to general attitude influence subjective well-being. Recent research also points out that 80% of wellbeing is the result of genes (Nes, Roysamb, Tambs, Harris, and Reichborn-Kjennerud, 2006). Therefore, long-term well-being is the result of internal characteristics (Steel, Schmidt, & Shultz, 2008).

The notion of the Hedonic Treadmill operates with the Set-point Theory of happiness. According to this theory, individuals have fixed or average range happiness and well-being in response to their experiences. Brickman and Campbell (1971) suggested that an individual's state of happiness depends on inbuilt psychological mechanisms. Despite positive and negative experiences and circumstances, adaptation occurs quickly, and people can get back to their original state of nature within two months (Suh, Diener, & Fujita, 1996). Brickman and Campbell described this a *hedonic treadmill*. Research also suggests that lottery winners and accident victims are not going to be forever happy or sad (Brickman, Coates, & Jahoff-Bulman, 1978). The definition by David Myers (1992) provides further clarification, "The point can- not be overstated: *Every* desirable experience—passionate love, a spiritual high, the pleasure of a new possession, the exhilaration of success—is transitory" (p. 53). Earlier personality theories also supported this notion of a set point (Costa and McCrea, 1980).

Challenge to Traditional Set-Point Theory of Happiness

The Set-point theory was challenged by Easterlin (2005). Easterlin (2005) suggested that some tough experiences are life changing and leave permanent scars. Recent development in the theories of personality also suggests that personality can change, this points to some kind of hope for misery (Davidson & Lutz, 2008; Lutz, Slagter, Dunne, & Davidson, 2008). Hope can play a pivotal role in promoting psychological well-being (Valle, Huebner, & Suldo, 2006). The Hedonic Treadmill concept still complements personality theory despite of recent research development. Recent development in neuroscience

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

has the potential to pause a challenge to the influence of traditional personality and set-point theory on subjective well-being.

Brain science explains that human experiences significantly influence neural activity in the brain (Ramachandran & Oberman, 2006). There are 100 billion neurons in the human brain. Each neuron makes 1000 to 10,000 contacts with other neurons in the brain. Vence, Roberson, McGuinnies, and Fazel, (2010) suggest, "the process by which the brain and nervous system produce morphological and structural changes in the brain in response to environmental stimuli" p. 29). Positive feelings are the result of brain activity in the left side of the pre-frontal cortex and negative feelings are due to the brain activity in the right side of the brain. Compassionate meditative experiences significantly influence changes in brain activity due to increased activity in left pre-frontal cortex (Lutz, Slagter, Dunne, & Davidson, 2008). Therefore our positive and negative experiences, emotions and actions immensely influence neurons in our brain (Davidson & Lutz, 2008). Professor Richard Davidson from the University of Wisconsin-Madison, a leading neuroscientist, suggests that changes in the brain are possible through training the mind. These recent neuroscience findings may challenge traditional set-point theory and provide further hope for increased wellbeing or happiness.

Well-Being through Meaning

Victor Frankl, in his book, *Man's search for meaning*, suggested that a will to meaning is the key to leading a satisfied life. Frankl invented *Logotherapy,* which means "therapy through meaning'. Frankl's personal experience in a concentration camp gives him an authentic position to comment on human misery. Helping suffering people was the primary source of Frankl's motivation to find meaning in life. Meaning does not come easily but a deeper understanding of the human condition and creating hope through helping creates meaning. Instead of focusing on psychological afflictions, meaning can be found by focusing on the positive side of human strengths. One's ultimate meaning of life is unique to one's own life and situation. Therefore, meaning cannot be invented but must be discovered according one's own values.

Economics and Well-Being

The concept of subjective wellbeing has also become a subject of interest for economists, sociologists and policy makers in order to improve quality of life. Subjective wellbeing of individuals is valuable at an individual level as well as societal level (Diener & Seligman, 2004). Research has established the association between happiness and income (Diener and Suh, 1997; Kahneman and Krueger, 2006; Rojas, 2007; Zhou, 2012). The influence of income on people's feelings and behavior is complex. The extent of individual's happiness to income is limited, both positive and negative experiences of wealth eventually fade with time (Diener, Lucas, & Scollon, 2006). Kahneman and Deaton (2010) examined whether money influences happiness and wellbeing among 1,000 US residents. An annual income of up to $75,000 influenced health, emotional well-being and subjective well-being. It was concluded that wealth is associated with satisfaction but happiness is not guaranteed. Low income negatively influenced emotional well-being and subjective well-being (Kahneman and Deaton, 2010).

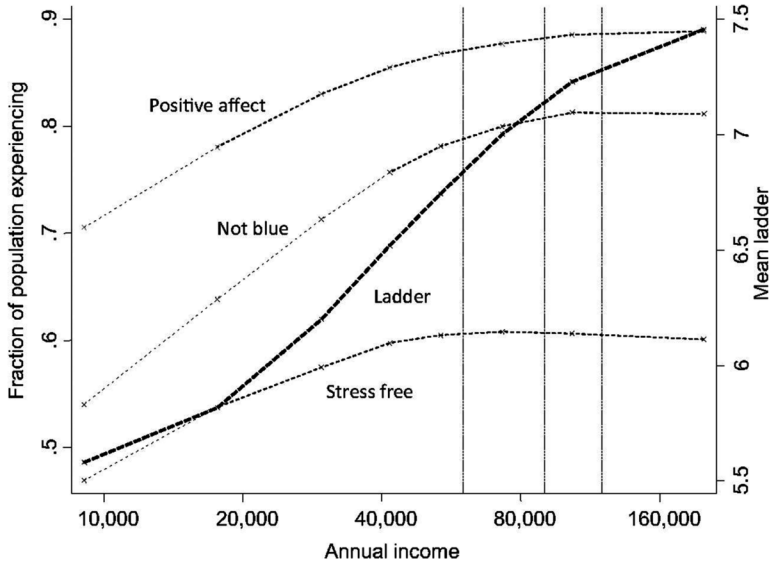
Figure 2. High income improves evaluation of life but not emotional well-being (Kahneman and Deaton, 2010)
Note: Positive affect, blue affect, stress, and life evaluation in relation to household income (Kahneman & Deaton, 2010)



Practical Tools for Health and Well-Being

According to World Health Organization (1946), Health and well-being is holistic, where complete achievement is of physical, mental and social well-being. Despite personality and genetic explanations for well-being, some practical tools can be employed to enhance well-being. Research suggests that positive health habits can be very beneficial in influencing subjective well-being.

Positive habits such as healthy nutrition, physical exercise, social relationships and resting well are important to enhancing well-being. Healthy nutrition involves a diet that consists of 45% to 65% carbohydrates, 20% to 35% healthy fats, 10% to 35% protein. Physical exercise that involves walking, aerobic exercise and swimming can also be very useful. Strong social relationships also play an important role in enhancing well-being. Furthermore, it is also important to have enough rest and holidays to rejuvenate health and wellbeing.

Using Technology to Your Advantage

In the age of technology, where facebook, emails, apps…etc. constantly demand our attention, it is important to use them positively and set up healthy boundaries in order to protect our health and well-being. Research suggests that individuals who score high on Extraversion and Neuroticism are likely to practice excessive internet usage (Widyanto & McMurran 2004; Wolfradt & Doll 2001).

Recent devices such as a wrist step count like Fitbit can help to track physical activity and sleep habits. There may be some health benefits in using technology like this.

In her book, *The How of Happiness: A New Approach to Getting the Life You Want,* Sonja Lyubomirsky (2007) suggested 12 activities to enhance happiness "express gratitude, cultivate optimism, avoid overthinking and social comparison, practicing acts of kindness, nurturing social relationships,

developing strategies for coping, learning to forgive, increasing flow experiences, savoring life's joys, committing to your goals, practicing religion and spirituality, and taking care of your body." (p. 2-3). These can help as a proactive measure to protect health and well-being. Purposeful engagement of various activities that promote growth and self-realization assist in living healthy lives (Ryff, 2014). Further advances in well-being research ought to be done on how personality can be changed, and in the influence of change on health and well-being. Each of us is different with our unique values and manual for health and wellbeing. Further empirical research is required on the role of values in health and wellbeing.

CONCLUSION

In this chapter we have reviewed the association between personality, health, and well-being as well as the foundational conceptual links with ancient philosophy and positive psychology. The ancient concept of happiness from Aristotle's *eudaimonia* and current theories of positive psychology provide mechanisms for wellbeing. Ancient and modern views of happiness and subjective well-being contrast yet conceptually overlap in their applications. It was found that certain personality traits are effective predictors of subjective well-being. Personality theories have further provided a set-point theory of happiness and well-being. The new developments in neuroscience is challenging the set-point nature of well-being.

Chapter 99
Sexual Boundary Violations in Counselor Training and Supervision

Daniel R Cruikshanks
Aquinas College, USA

Stephanie T Burns
Western Michigan University, USA

ABSTRACT

Professional boundaries represent the sets of behaviors and interactions that are considered appropriate and ethical between people in professional relationships. These can be defined by considering the roles of the people involved, the scheduled times for these interactions, and the designated places for them. Boundary violations happen when interactions deviate markedly from the social conventions of professional relationships. Sexual boundary violations happen when sexual behavior is introduced into the training relationship. Because of the inherent power differential, sex in trainer-trainee relationships is considered unethical and harmful. This chapter will discuss sexual boundary violations in counselor training including incidence rates, perceptions of trainers and trainees, ethical and legal implications, how sexual boundary violations begin, solutions and recommendations, and suggestions for future research.

INTRODUCTION

Counselor training is different from other professional disciplines as it revolves around interpersonal relationships, deals with sensitive personal information, and involves self-reflection and self-exploration. Consequently, counseling trainers are likely to find themselves with deeply personal knowledge of their trainees. In addition to coursework, counseling trainees are required to complete a practicum and an internship where they develop their counseling skills in a clinical environment with clients under the direct supervision of an experienced trainer. Clinical supervision focuses on the development of the

trainee's clinical skills while at the same time ensuring the safety and wellbeing of the client (Goodyear & Bernard, 1998; Kozlowski, Pruitt, DeWalt, & Knox, 2014). In clinical supervision, the trainer meets with the trainee to discuss their work with their clients as well as their own issues in working with these clients. Similar to other aspects of counselor training, clinical supervision can become quite personal as the trainee deals with their own personal and professional development. Indeed, some have suggested that the clinical supervisory relationship shares many similarities with the counselor-client relationship (Bartell & Rubin, 1990) or even the parent child relationship (Friedlander, Dye, Costello, & Kobos, 1984).

The purpose of this chapter is to describe the problem of sexual boundary violations in counselor training, to discuss risk factors and barriers, to provide tools to assist in decision-making, and to offer suggestions for further research. By the end of this chapter, the reader should be able to define professional boundaries and, specifically, sexual boundary violations. More importantly, however, the reader should have tools that can be used to aid in effective decision making about whether and when a specific situation constitutes a threat to the integrity of the professional relationship in counselor training.

BACKGROUND

Counselor educators and counseling supervisors as trainers have a great deal of power over their trainees. Power has been defined as "the ability to get one's way in a social situation" (W. French & Bell, 1995, p. 303). Trainers are granted special privileges as members of the community place their faith in the trainer's distinctive skill, knowledge, and experience. Trainees need the trainer, which gives the trainer power over trainees (Peterson, 1992). Five types of power have been identified (P. French & Raven, 1959): (a) reward power (trainers provide something that is valued by the trainee); (b) coercive power (trainers can inflict punishment on the trainee); (c) legitimate power (trainer gets their power from their title and credential); (d) referent power (trainee holds the trainer with high regard); and expert power (trainee thinks they need the trainer's information or expertise).

Thus, trainees are vulnerable to potential abuses of power by trainers through dual-role relationships and boundary crossings, which can eventually lead to sexual boundary violations. Dual-role relationships are defined as occurring when "one person simultaneously or sequentially plays two or more roles with another person" (Kitchener, 1988, p.207). Unlike counselor-client relationships, trainer-trainee relationships often include inevitable overlapping roles that are necessary for trainee development (Kitchener, 1988). Therefore, trainers need to evaluate power differentials and establish boundaries in the dual-role relationships undertaken during the course of training.

Establishing boundaries better ensures autonomy for those with diminished power in the relationship and mitigates harm (Austin, Bergum, Nuttgens, & Peternelj-Taylor, 2006). Professional boundaries are defined as "the parameters that describe the limits of a fiduciary relationship" (Gabbard & Nadelson, 1995, p. 1,445) and provide a framework for understanding appropriate versus inappropriate behaviors. Professional boundaries distinguish "the 'edge' of appropriate behavior" (Gutheil & Gabbard, 1998, p. 410) with one side deemed appropriate and the other side deemed inappropriate.

Boundary crossings are unusual and diverge from common practice. They can be benevolent, limited, and acceptable departures from common practice, but always have the potential to turn ego-centric, extended and unacceptable. Boundary crossings attempted by trainers and trainees should be considered against motivations, contexts, and intents for departing from common practice (Glass, 2003). Boundary violations "reflect exploitation of the supervisee, a supervisor's loss of objectivity, disruption of the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

supervisory relationship, or the reasonable foreseeability of harm" (Gottlieb, Robinson, & Younggren, 2007, p. 241). Boundary violations of a sexual nature are referred to as sexual boundary violations and can include a broad range of behaviors including leering looks, sexually suggestive comments or jokes, flirtation and seduction, suggestive touch/hugging, asking out on dates, and sexual contact. These behaviors range from mild sexual behaviors that may make the recipient feel uncomfortable to consensual and nonconsensual sexual contact.

INTERPRETATIONS OF SEXUAL BOUNDARY VIOLATIONS BY TRAINERS AND TRAINEES

A survey of trainers and graduate level trainees found that the majority thought consensual sexual relationships between the two groups raised ethical concerns, increased conflicts of interest, elevated abuses of power, and compromised objectivity (Stites, 1996). Sixty-seven percent of female graduate students and 87% of male faculty members believed it to be unethical to engage in a supervisory relationship with a trainee when the two were sexually involved. Among the female clinical psychologists surveyed by Glaser and Thorpe (1986), 97.5% judged sexual contact coercive in a working relationship. Brown (1993) found that a majority of clinical psychologists viewed sexual contact as coercive (72%) and unethical (89%) during a working relationship.

Almost all (95%) female members of the American Counseling Association indicated their belief that sexual contact exemplified professional misconduct and was destructive to professional relationships and trainees (Thoreson, Shaughnessy, & Frazier, 1995). In a study that compared members of the National Association of Social Workers (NASW) with members of the American Mental Health Counselors Association (AMHCA), approximately 7% of participants reported seductive behavior from a trainer during their training (Barnett-Queen, 1999). Interestingly, members of the AMCHA were more likely than members of the NASW to report sexual boundary violations. While Barnett-Queen (1999) concluded that social work must be a safer discipline than professional counseling, it could be that social work trainers are more likely to be female than counselor educators. Boundary violations were reported by 33% of graduate-level psychology trainees and resulted in harm to the trainee, the supervisory relationship, relationships with other trainers, and clients (Hardy, 2012).

Gibbs, Sigal, Borowitz, Orosy-Fildes, and Ivy (1993) surveyed psychology educators and found that 52% reported knowing of at least one sexual relationship between a colleague and a trainee and 24% had knowledge of a colleague's sexual harassment of a trainee. Respondents' most common reaction (34%) was to remain silent about a colleague's sexual relationship with a trainee (Gibbs, Sigal, Borowitz, Orosy-Fildes, & Ivy, 1993). The second most common response (22%) was to talk directly with the colleague. Other responses included telling the dean (18%), another faculty colleague (15%), or the department chair (8%). In a study by Hardy (2012), most respondents (48.8%) described awareness of a peer's supervisory boundary crossing experience, which most often (62.5%) had a negative effect on the peer. Peers who knew of a supervisory boundary violation involving other trainees kept silent 72.5% of the time.

Thornton (2003) reported that counselors found personal relationships between counselors and clients as the least acceptable relationship, while relationships between trainers and trainees were rated as more acceptable. Further, they perceived social relationships with clients and trainees as the most acceptable, business relationships with clients and trainees as moderately acceptable, and romantic relationships with clients and trainees as the least acceptable (Thornton, 2003).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Hardy (2012) had psychology graduate trainees rate the impact of boundary crossings. The trainer self-disclosing details about their own sexual behavior, not holding required supervision meetings, exploiting trainees to do parts of the trainer's job, recruiting study participants who do not meet inclusion criteria, giving clients incorrect diagnoses, requesting the trainee lie about their sexual orientation, and having the trainee tell clients untruthfully that they were in recovery all were rated as the most problematic. Surprisingly, a majority of trainees reported problems with trainers wanting to do personal counseling with the trainee or turning supervision sessions into personal counseling sessions. This behavior took away from the supervision of counseling with clients and forced the disclosure of serious personal information. Most respondents reporting a boundary violation said it occurred during practicum (Hardy, 2012). The most frequent boundary violations reported by subjects in the study were sexual in nature. Respondents stated that boundary crossings and boundary violations eroded trust in the training relationship and led trainees to withhold information.

Because they need to complete training requirements, trainees may feel obligated to stay in bad training relationships. Most (67.9%) graduate trainees reported no training in boundary crossings and boundary violations (Hardy, 2012). Trainees taking more ethics courses and having an increased familiarity with the code of ethics were more likely to report boundary crossings and violations during training. This suggests that those who have not received ethics training are less likely to recognize boundary crossings and boundary violations when they happen, which make them more vulnerable to these acts. Ethics training is especially important given that one third (35.7%) of study respondents reported previous personal histories of boundary violations in other life contexts. Half of the participants with previous personal histories of boundary violations stated feeling vulnerable in supervision and 70% reported an increased level of awareness and vigilance about boundaries in supervision (Hardy, 2012).

Reports of Sexual Boundary Violations by Trainees

Sexual contact (either genital stimulation or intercourse) with at least one trainer was reported by 3% of male and 17% of female doctoral psychology students (Pope, Levenson, & Schover, 1979). The researchers reported that 6% of females and of 20% males in the same population admitted to having sex with their own trainees or clients post-graduation. Robinson and Reid (1985) found that 48% of female psychology doctoral students experienced some form of seductive behavior during their training. Seductive behaviors included flirting, joking and excessive attention came most often from educators (86%) as compared to clinical supervisors (50%). Sixty-percent of those who reported being the targets of seduction were married and 28% had children. Interestingly, trainees in clinical programs were more likely to be subjected to seductive behaviors than those in non-clinical psychology programs. Fourteen-percent of Robinson and Reid's (1985) respondents reported having sexual contact during their role as trainees. The most likely trainees (76%) to have had sex with a trainer were younger than 24 years old. Glaser and Thorpe (1986) found 17% of female clinical psychologists reported sexual contact with at least one of their trainers. Thirty-one percent of those reported sexual contact with more than one of their psychology trainers. A time analysis revealed that the more recently the respondent had graduated, the more likely they were to have had sex with a trainer.

Thoreson, Shaughnessy, Heppner and Cook (1993) found that 7.3% of male members of the American Counseling Association (ACA) acknowledged having sexual contact with a client or trainee during the professional relationship. Another 21% had sexual contact after the professional relationship had ended. In a subsequent study of female members of the ACA, Thoreson, Shaughnessy and Frazier (1995)

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

found that just over 5% had sexual contact with a trainer during training. Another 3% admitted to sexual contact with a trainer after the training relationship ended. Importantly, 82% of respondents in this study were master's level professionals who were far less likely to have engaged in sex with trainers as compared to doctoral level professionals. Less than 1% of participants acknowledged having sexual contact with their own trainees during the training relationship. When asked about sex after the termination of the professional relationship, nearly 5% of female respondents admitted to sexual contact with former trainees or clients.

Very few female members (6%) of the Association for Counselor Education and Supervision (ACES) reported sexual contact with trainers (Miller & Larrabee, 1995). For those who said that they had entered the relationship willingly, female respondents were more likely in retrospect to see the experience as having been coercive and harmful to them. In another study, 30% of female members of the ACES reported being subjected to seductive behaviors during their training as compared with 18% of males (Cruikshanks, 2000). Females also were far more likely than males to have been invited out on dates by trainers (13% vs 2% respectively) and far more likely to have had sex with trainers (5.5% vs 0% respectively) (Cruikshanks, 2000). For this study, participants responded to a range of items designed to measure the experience of sexual feelings (see Table 1). Although both male and female trainers acknowledged having some degree of sexual feelings about trainees, male trainers were far more likely to experience erotic feelings about their trainees than were females.

Table 1. Percent of respondents who reported "Rarely," Occasionally," or "Frequently."

Item #	Items Hypothesized to Measure Experience of Sexual Feelings about Counseling Supervisees.	Male	Female	Total
14	I wonder if supervisees' behaviors toward me are flirtatious or seductive sexual invitations.	78	55	67
15	I wonder if counseling supervisees fantasize about me sexually.	47	28	38
16	I am jealous of counseling supervisees' spouses or significant others.	11	6.7	8.9
17	I am tempted to invite counseling supervisees out socially.	27	47	37
18	I wonder how it would be to touch counseling supervisees in a sexual manner.	43	5.6	25
19	I seriously consider sexual involvement with counseling supervisees.	7.9	2.2	5.3
20	I am sexually aroused by discussion of supervisees' clients' sexual issues.	52	27	40
21	During supervision, I find myself privately fantasizing about having sex with supervisees.	26	4.5	16
22	I wonder what it would be like to kiss passionately counseling supervisees.	30	6.7	19
23	I wonder how counseling supervisees look nude.	42	4.5	24

Zakrzewski (2006) found 9.2% of psychology students had experienced sexual advances and/or sexual contact with graduate school educators. Women experienced 89% of the sexual advances and 78% of the sexual contacts. Supervisors accounted for 11% of the sexual advances and contacts in graduate school. A quarter of graduate students acknowledged knowing of sexual advances and/or sexual contact between trainers and trainees (Zakrzewski, 2006).

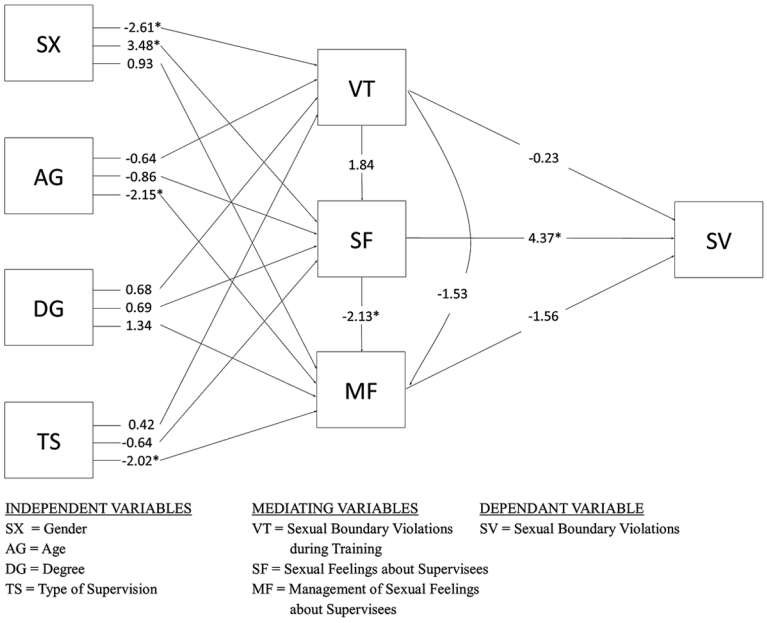
POSSIBLE MEDIATING VARIABLES IN SEXUAL BOUNDARY VIOLATIONS

In an effort to understand the factors that lead to sexual boundary violations in training, Cruikshanks (2000) surveyed members of the ACES about their experiences during their training as well as their current practice and tested a model designed to describe a possible path to sexual boundary violations (see Figure 1). He suggested three possible mediating variables (Experience of Sexual Boundary Violations During Training, Experience of Sexual Feelings, and Management of Sexual Feelings) and tested them relative to four independent variables (Gender, Age, Degree Level, and Type of Supervision). The hypothesized model fit the data well.

*Figure 1. The model hypothesized to describe the path to sexual boundary violations in counseling supervision. Path coefficients indicated by * are significant t values, p<.05.*



As expected, females were more likely than males to have experienced sexual boundary violations during their training. Those who experienced sexual boundary violations during their training were no more likely than others to become perpetrators post-graduation. Males were far more likely than females to experience sexual feelings (SF) about their trainees. Older participants (AG) were less effective at managing sexual feelings (MF) than their younger counterparts. There were no differences based on degree type (DG).

Regarding the hypothesized relationship between type of supervision (TS) and managing sexual feelings (MF), those who were primarily counselor educators providing clinical supervision were more likely to have acknowledged sexual boundary violations than those who provided clinical supervision exclusively in the field. This finding suggests that professional boundaries are more easily blurred on campus where trainers are more likely to have dual-role relationships with trainees.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The most important finding revealed by this analysis was the strong relationship between the experience of sexual feelings (SF) and sexual boundary violations (VB). While males and females scored similarly on the management of sexual feelings scale (MF), males scored much higher on sexual feelings (SF), and scores on (SF) were strongly related to sexual boundary violations (VB). This analysis revealed that the more a trainer thinks about their trainee sexually, the more they have sexualized their relationship and the more likely they are to violate sexual boundaries and engage in sexually inappropriate behavior.

SEXUAL BOUNDARY VIOLATIONS IN TRAINING

Training is fiduciary as the trainee trusts the trainer to provide appropriate legal and ethical guidance and to use their power and control to work in the trainee's best interest and to protect the trainee from harm (Gottlieb et al., 2007). Trainers are moral role models demonstrating to trainees' behaviors that are reasonable, fair, and ethical (Hardy, 2012). Trainers are gatekeepers who control the trainee's entrance into the profession by granting grades, evaluations, and recommendation letters (Gu, Veach, Eubanks, Leroy, & Callanan, 2011). Trainers transition the trainee to a professional role and provide authentic feedback for skill development. When dual-roles are taken with trainees, they can feel exploited and unable to make autonomous decisions. Trainees likely modify their behaviors to increase rewards and avoid punishments (Dziech & Weiner, 1990).

Kitchener (1988) created three guidelines to predict whether dual-role relationships are more or less likely to be harmful: (a) incompatible expectations increases the potential for harm, (b) neglecting role responsibilities increases the potential for harm, and (c) holding professional power and authority increases the potential for harm. Ladany and Lehrman-Waterman (1999) found that the trainer's ethical behavior significantly impacts the supervisory relationship and trainee satisfaction. They found the trainer's adherence to ethical guidelines explained over 47% of the variance in the perceived supervisory working alliance for trainees (Ladany & Lehrman-Waterman, 1999).

Therefore, trainers need to first contemplate how dual-role relationships develop and then how those power differentials will impact the trainer-trainee relationship. Pearson and Piazza (1997) developed five categories to classify dual-role relationships: (a) circumstantial dual-roles that develop by accident, (b) structured professional dual-roles that develop out of the regular requirements of the job, (c) shifts in professional roles due to organizational or developmental career changes, (d) personal and professional roles conflicting, and (e) the predatory professional who abuses those with less power to meet personal needs.

The Approach Inhibition Theory of Power includes 12 propositions outlining how individuals in high power and low power positions generate cognitive, affective and behavioral responses (Keltner, Gruenfeld, & Anderson, 2003). The 12 twelve propositions include: (1) elevated power increases the experience and expression of positive affect; (2) reduced power increases the experience and expression of negative affect; (3) elevated power increases sensitivity to rewards; (4) reduced power increases sensitivity to threat and punishment; (5) elevated power increases the tendency to construe others as a means to one's own end; (6) reduced power increases the tendency to view the self as a means to others' ends; (7) elevated power increases unconscious social thoughts; (8) reduced power increases controlled social thoughts; (9) elevated power increases the likelihood of approach-related behavior; (10) reduced power increases behavioral inhibition; (11) elevated power increases the consistency and coherence of

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

social behavior; and (12) elevated power increases the likelihood of socially inappropriate behavior. Ultimately, power can shift focus to reward seeking behavior and unconscious thought processes that can increase the potential for boundary crossings.

ETHICAL AND LEGAL IMPLICATIONS OF SEXUAL BOUNDARY VIOLATIONS IN TRAINING

Malpractice is negligence in the performance of professional obligations for trainers who are licensed, certified, or registered by state statute to perform services (Bednar, Bednar, Lambert, & Waite, 1991). Tannenbaum and Berman (1990) suggest that trainers are liable to clients for damages for every act or omission of the trainee. Further, the counseling training relationship encompasses the four elements required for malpractice claims: (a) a legal duty of care exists to the trainee through professional ethical codes, (b) standards of care exist that should be practiced in training, (c) harm can come to trainees from trainers, and (d) the immediate cause of the trainee's injury can be found in the professional relationship (Bednar et al., 1991). There are three types of harm that can be charged by trainees in malpractice claims against trainers: (a) physical injury or death, (b) consequent injury (the trainer has prompted behavior in the trainee that leads to the trainee's loss of income or licensure), or (c) subjective injury (pain and suffering inflicted on the trainee by the trainer) (Bennett, Bryant, Vanderbos, & Greenwood, 1990).

In addition to ethical and legal obligations, training also occurs in the context of academic settings. Keith-Spiegel, Whitley, Balogh, Perkins, and Wittig (2002) note that trainers have obligations in six major areas: (a) classroom management including the behavior of trainees; (b) classroom learning environment including profanity, criticism of colleagues, and oppression; (c) assessment of trainees including fair grading, letters of recommendation, and academic dishonesty; (d) office hours and direct interactions with trainees; (e) conflicts of interest and interprofessional relationships; and (f) responsibilities including continuing education and upholding confidentially.

The American Association of University Professors' (American Association of University Professors, 2009) policy discourages and warns of abuses of power and the importance of professionalism, but does not forbid sexual relationships with trainees. The AAUP states that the institution of higher learning is accountable for developing, implementing, and enforcing institutional policies including ethical codes of conduct. A majority of universities have clear policies on sexual harassment, but only 57% of higher education institutions have a consensual sexual relationship policy (Sullivan, 2004). Policies concerning consensual sexual relationships between trainers and trainees at higher education institutions have attempted to ensure: (a) that professional conduct standards are upheld to maintain the school's mission of education, (b) the protection of trainees and third parties (impact on other trainees and colleagues), (c) that the appearance and standing of the school are maintained, and (d) the avoidance of legal culpability (Hutchens, 2003). Most universities (82%) have policies stating that consensual sexual relationships are inappropriate when the trainer is in a supervisory capacity with a trainee because the power imbalances can be viewed as a form of sexual harassment (Dziech & Weiner, 1990). Legally, trainees can charge sexual harassment at any time no matter who initiated the sexual relationship, parents can charge the trainer with unprofessional behavior no matter who initiated the sexual relationship, and trainees not directly involved can charge unequal treatment (Little & Thompson, 1989).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Richards, Crittenden, Garland, and McGuffee (2014) found that all universities had loopholes permitting consensual sexual relationships between trainers and trainees. Even when trainers entered into banned consensual sexual relationships, the policies that were put in place were dismissed to quietly ignore the offense. Most university policies have a reporting requirement, but they fail to provide specific processes to report consensual sexual relationships, which leads to confusion and increased liability. Most university policies reviewed stated that consequences would be enacted for engaging in consensual sexual relationships, but they neither defined specific consequences nor provided a range of options, such as beginning with a written warning and ending with termination (Richards, Crittenden, Garland, & McGuffee, 2014).

REALITIES OF SEXUAL BOUNDARY VIOLATIONS

Bellas and Gossett (2001) offered suggestions as to why sexual boundary violations in training continue to affect the learning environment negatively. First, unlike female trainers, most male trainers view trainees as a potential pool of romantic partners. Second, unlike female trainers, most male trainers feel justified in their ability to remain objective and keep supervising the trainee after beginning a sexual relationship with them. The characteristic counseling trainer who commits sexual boundary violations is a middle aged or older male who is married or recently divorced (Thoreson, Shaughnessy, Hepener, & Cook, 1993). They are more likely to be faculty in counselor training programs than clinical supervisors in the field (Cruikshanks, 2000), and they are more likely to have dual-roles with their trainee (e.g. student, advisee, supervisee, and graduate assistant) where it is more difficult to maintain clear and distinct professional boundaries (Heru, Strong, Price, & Recupero, 2004).

Trainers and trainees in consensual sexual relationships felt that they were intellectually compatible and had a shared lifestyle. For many trainers and trainees in sexual relationships, race/ethnicity, sexuality, and age felt more challenging than their status as trainer and trainee. Negative reactions from others were more pronounced when multiple social boundaries were crossed. Further, they found that trainees deferred to the trainer when it came to hiding the relationship or being open about the relationship (Bellas & Gossett, 2001). Half of undergraduate trainees tried to hide their sexual relationships with trainers, while graduate trainees did not hide their sexual relationships with trainers. Trainers hid relationships with undergraduate and graduate trainees equally. Avoidance of gossip was a motivation for secrecy for both groups while trainers hid relationships for professional reasons and trainees hid relationships for fear of disapproving family members.

Both groups were rarely concerned about the reactions of other trainees. This is surprising since sexual involvement with trainees can adversely impact the trainer's and trainee's relationship with other trainees and trainers. Other trainees may feel the trainee involved with the trainer will receive preferential treatment by the trainer and their colleagues. Colleagues may feel compelled to evaluate favorably or negatively a trainee involved with a trainer. Other trainees and colleagues will wonder if the trainee is privy to confidential information (Fitzgerald, Weitzman, Gold, & Ormerod, 1988).

Bellas and Gossett (2001) found that most trainers and trainees advised others not to pursue romantic relationships as trainees are in a vulnerable position. Trainees who ended sexual relationships with trainers cited power and control issues in the relationship (Bellas & Gossett, 2001). If the sexual relationship ends before the trainee graduates, everyone involved is vulnerable to retribution and may find themselves continuing to be required to interact with the other person.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

HOW SEXUAL BOUNDARY VIOLATIONS BEGIN

Since little exists to guide trainers in establishing appropriate boundaries with trainees both groups struggle to understand appropriate relationship boundaries (Richards et al., 2014). Sexual boundary violations often begin as minor boundary crossings, which are repeated and then evolve. Although not well studied in counselor training, the evolution of sexual boundary violations has been well documented in counselor-client relationships and serves as a cautionary tale for trainers. Errors in technique, judgment, and assessment occurred in minor nonsexual boundary crossings, which later led to sexual contact (Gabbard, 1996). Sexual relationships most often began with nonsexual hugs initiated by the counselor and the client obliged, sensing that the counselor needed support (Gabbard, 1996). Other times the sexual relationship began with an insistence on the mutual use of first names, the counselor sharing personal problems (sexual abuse as a child, issues with the counselor's relationships), and telling clients that the counselor loved them (Gabbard, 1996). Smith and Fitzpatrick (1995) found that counselor self-disclosure that sought to meet the counselor's needs most frequently preceded counselor-client sexual relationships. Once parity had been created in the relationship, clients usually demanded increases in the counselor's self-disclosures, which led to physical touching and later to sex. Gabbard (1996) reported that most counselors who had sex with clients were (a) in love with their clients, (b) surrendering to a client's desires to be loved to wholeness, or (c) needy and vulnerable due to situational stressors such as divorce or grief.

When clients experience sexual boundary violations with counselors (Pope, 1988), they can experience any or all of the following issues: (a) ambivalence, (b) guilt, (c) hollowness and seclusion, (d) confusion, (e) lack of trust, (f) role reversal, (g) emotional instability, (h) repressed rage, (i) suicidal risk, or (j) cognitive impairment. Clients who were sexually abused as children or were raped experience similar symptoms (Pope, 1988). Counselors without a fulfilling personal life and wellness strategies may look for gratification from their professional relationships (Gabbard, 1996). Therefore, unchecked emotional needs impede ethical decision making and lead to boundary crossings and later sexual boundary violations (Falender et al., 2004).

Because trainers were clinicians first, the dynamic from a minor boundary crossing to a sexual relationship can be seen in training settings. Trainers often find it difficult to act empathically without falling into personal relationships with trainees (Bernard & Goodyear, 2004) and dual-roles are often unavoidable during training (Gottlieb et al., 2007). The risk of boundary crossings increases as the number of dual-roles increases (Burian & Slimp, 2000; Gottlieb et al., 2007). As trainees professionally mature, the training relationship can evolve into mentoring, which increases the possibility of boundary crossings (Johnson & Huwe, 2002). In recent years, the advent of social media has created a whole new way for people to connect, which has raised new questions about moving down the path toward sexual boundary violations (Budz, 2014). With Facebook, LinkedIn, and other social media sites, concerns are increasing about whether and when it is acceptable to connect socially with trainees.

Boundary crossings can begin with trainer and trainee private drives (e.g., isolation, need for approval), professional drives (e.g., independent licensure, generativity) (Burian & Slimp, 2000), cultural factors (e.g., collectivistic cultural view), emotional unawareness (Falender et al., 2004), and transference and countertransference. Dziech and Weiner (1990) proposed that trainees with past abuse or trauma issues and trainers with relationship separation or loss are the most likely to be involved in sexual relationships. Trainees sexually involved with their trainer often have difficulties setting appropriate boundaries with clients (Bonosky, 1995). Female counselors who did not have sexual relationships with trainers during graduate school admitted to sexual contact with clients 6% of the time (Fitzgerald et al., 1988). That

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

number jumped to 23% for female counselors admitting to sexual relationships with trainers during graduate school (Fitzgerald et al., 1988). Male counselors in the study with and without sexual relationships with trainers reported having sexual contact with clients 23% of the time (Fitzgerald et al., 1988).

The biggest boundary crossing issues are the use of self-disclosure and dual-roles (trainer, researcher, meeting at professional functions, and/or dissertation committee membership at the same time). Examples of trainer self-disclosures include attire, décor, dialect, mannerisms, and statements that unconsciously reveal religious affiliations, political persuasions, and family members (Smith & Fitzpatrick, 1995). Trainer self-disclosure, such as sharing examples from their own experience to illustrate how to address issues in clinical practice, is beneficial when it enhances the trainee's professional development. Trainees reported that socializing with the trainer, trainer self-disclosure, and sharing car rides, were the most helpful boundary crossings (Matazzoni, 2008). Trainees stated there were improvements in the working alliance when the trainer disclosed applicable counseling experiences, but they stated the working alliance was injured by unrelated disclosures (Matazzoni, 2008). Self-disclosures that meet the needs of the trainer for comfort, compassion, or egotistical gratification resulting in the trainee meeting the trainer's needs are inappropriate and unethical (Hardy, 2012). Even after simply sharing a car ride with a trainer, the trainee experienced role confusion in trying to decide if the relationship had shifted from evaluator to friend (Matazzoni, 2008). Using first names, loaning money, borrowing money, accepting gifts (Bowman, Hatley, & Bowman, 1995) and using social media blur professional boundaries. When a trainer has a dual-role relationship with a trainee, they may unintentionally offer preferential treatment to the trainee. This can negatively impact the training process, skew trainee evaluations, and negatively impact peer relationships for the trainee. Therefore, minor boundary violations are multifaceted and can cause negative experiences for the trainee, peers, clients, and colleagues.

As such, all boundary crossings must be contemplated because they are subtle first steps towards boundary violations (Gutheil & Gabbard, 1998). Considerations in boundary crossings include professional ideologies, trainer-trainee rapport, cultural considerations, and the trainee's experiences of trainer behaviors (Gutheil & Gabbard, 1998). Trainees may interpret the same faculty behavior (pat on back, hug, or taking a small gift) from the level of a minor boundary crossing (Knapp & VandeCreek, 2006) all the way up to a major boundary violation (Barnett, 2007). Trainees injured by boundary crossings mistrust and avoid the trainer, resulting in lost educational opportunities (Burian & Slimp, 2000; Heru et al., 2004). In the face of boundary violations, trainees may avoid the trainer, become unmotivated, have difficulty developing a strong working alliance, and model the questionable behavior of their trainer when they become trainers themselves (Heru et al., 2004).

SOLUTIONS AND RECOMMENDATIONS

Maintaining appropriate ethical boundaries is the trainer's responsibility no matter the actions or requests made by trainees (Gutheil & Gabbard, 1998). Because they favor building relationships with peers more so than their trainers, boundary setting should not be difficult (Anderson & Carta-Falsa, 2002). Trainees deal with boundary crossings in several different ways: compartmentalize (establish boundaries about each role: trainer as professor, trainer as clinical supervisor), discuss the issue (process the boundary crossing itself, the impact the boundary crossing has on the relationship, and resolutions), comply (say nothing out of fear of repercussions), consult with third party (talk with chair about issues), restrict

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

self-disclosure (keep things from the trainer), and avoidance of the trainer (Gu et al., 2011). There are several solutions and recommendations for dealing with sexual boundary violations in counselor training and supervision. These can include self-reflection, discussions with trainees, contracts, policies, and decision making models.

First, trainers need to self-reflect in a number of different ways to raise awareness of power differentials that could lead to exploitation or harm and the trainer's own unconscious motivations (Glass, 2003). One area of self-reflection needs to focus on the stigma of human sexuality. Sexual boundary violations are often attributed to the trainer's or trainee's defects (childhood sexual abuse, trauma, psychopathology, or counter-transference) (Hoppe, 2013). The Human Sexuality Model (Koenig & Spano, 2003) encourages normalizing sexual feelings that occur in training relationships to increase awareness of sexual attraction. Dailey (1981) categorized sexuality into five interrelated components: sensuality (including physiological responses, need for skin stimulation, orgasm, and fantasy), intimacy (including candidness, familiarity, and affiliation), identity (including biological sex, gender identity, gender role identity, sexual orientation), reproduction (including genital physiology, contraception, sexually transmitted diseases, childbirth, and abortion) and sexualization (including using sensuality to manipulate others). By not viewing sexual feelings in training relationships as predatory behaviors, trainers and trainees can focus on suitably managing sexual feelings to mitigate harm. The model assumes that (1) because it is a human relationship, training will encompass sexual motivations, (2) openly discussing sexuality in training normalizes sexual dynamics, (3) working with sexuality in training allows trainees to improve their work with clients, and (4) broaching sexuality in training is focused on cultivating the trainee's clinical skills. Three guidelines are offered for broaching sexuality in training: (1) trainers must be competent in knowledge, attitudes, and values about sexuality, (2) counseling skills are the foundation for incorporating sexuality into clinical practice (e.g., confrontation, self-reflection, empathy, exploration of taboo subjects, and normalizing behavior), and (3) the trainer is accountable for starting sexuality dialogues and focusing those dialogues on professional counseling relationships. This model presumes that the trainer is looking to protect trainees and avoid sexual boundary violations. A word of caution is advised in the intent of the disclosure. If a trainer is disclosing an attraction to a trainee stating that the conversation is a "teachable moment" when in reality the trainer is either grooming the trainee or determining the trainees' openness to a sexual relationship, then the trainer is a predator seeking a sexual boundary violation with the trainee.

Another area for trainer self-reflection is the Ethical Acculturation Model (EAM), which integrates personal ethical standards and values with professional ethical standards and values. The first level (maintenance) acknowledges that individuals keep the ethics and values of their culture of origin when evaluating professional behavior. Therefore, family values, ethnicity, nationality, religious beliefs, and role models influence professional behavior. The second level (contact and participation) focuses on how the individual embraces the ethics, norms, and values of their profession (Handelsman, Gottlieb, & Knapp, 2005). Based on an individual's high or low level of maintenance and high or low level of contact and participation, the individual is placed into one of four categories of ethical acculturation. An individual high on both maintenance and contact and participation is considered to be using an integration strategy. This ideal resolution blends the full union of personal and professional identities so the individual adopts the ethical values of the profession while maintaining many of their personal values. These individuals see codes of ethics, state laws, and other professional boundaries as a natural augmentation to their personal values (Handelsman et al., 2005).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

An individual high on maintenance and low on contact and participation is considered to be using a separation strategy. Individuals operating from this model use personal values to make professional values, but are not invested in the values of the profession. These individuals likely are misinformed about and/or resent the ethical/legal constraints placed upon them by the profession. An individual low on maintenance and high on contact and participation is considered to be using an assimilation strategy. Individuals operating from this model are completely enmeshed with professional standards and have lost their personal values. This results in simple obedience without a moral basis that can lead to naive utilizations of the profession's ethical principles (Handelsman et al., 2005). An individual low on maintenance and low on contact and participation is considered to be using a marginalization strategy. These individuals do not connect to personal or professional values and ethics. Operating from this model can lead to being careless about legal and ethical obligations and downplaying the significance of legal and ethical obligations. Trainers will need to self-reflect on their level of ethical acculturation and how that impacts their decision making processes about boundary crossings to best avoid boundary violations.

Barnett, Lazarus, Vasquez, Moorehead-Slaughter, and Johnson (2007) suggested six questions that trainers should answer when considering boundary crossings. These can serve as a third means of self-reflection for trainers: (a) Does the trainer's behavior serve the trainee's best interest? (b) Is the behavior acceptable to the trainee's history, culture, and values? (c) Is the trainer openly willing to discuss their behavior with any colleague? (d) Is the behavior exploitative? (e) Does the behavior serve the trainer's needs more than the trainee's needs? and (f) Is the behavior consistent with the intent of the profession's code of ethics?

Trainers should periodically and openly discuss boundary issues with trainees to encourage the exploration of dual-role relationships and to assess the trainee's reactions (Gottlieb et al., 2007). One way of doing this is to use contracts in training settings. Contracts can reduce liability and litigation by listing responsibilities, outlining rights, revealing the process of trainee evaluation, noting trainer expectations, charting the trainee complaint process, setting mutually agreed upon goals, and stating the times and locations of training (McCarthy Veach & LeRoy, 2009). Further, trainees will struggle with even the smallest of boundary crossings (e.g. trainer self-disclosure, sharing car rides, and eating together) so trainers need to discuss boundary crossings with trainees (Kozlowski et al., 2014). Open discussions about boundary crossings demonstrate to the trainee that boundary crossings are suitable topics for discussion, their views on boundary crossings matter, and that healthy boundaries are maintained (Kozlowski et al., 2014). If a boundary crossing is harmless, there is no danger in engaging in a discussion. If the trainer is hesitant to discuss a boundary crossing, consultation with another trainer may be warranted (Kozlowski et al., 2014).

In addition to the trainer having their own guidelines, departments and universities also need to lend direction to policies on boundary crossings and boundary violations. Counselor training programs should provide a clear policy statement in their student handbooks that addresses sexual relationships between trainers and both their current and former trainees (Fogg & Walsh, 2002). This would allow for both trainers and trainees to establish clearly defined boundaries based on the departmental policy. Bellas & Gosset (2001) further suggest that each university have a consensual sexual relationships policy that clearly (a) states those governed by the policy, (b) behaviors required by trainers, and (c) the specific consequences for trainers who don't maintain prescribed behaviors. The University of Iowa was lauded as having the best consensual sexual relationships policy, which included: (a) explanations of individuals categorized as trainers and trainees, (b) prohibited relationships, (c) examples of prohibited relationships, (d) processes for disclosing and filing complaints, and (e) a confidentiality statement (Bellas &

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Gossett, 2001). Once consensual sexual relationships policies are created, trainers and trainees need training on how to implement the policies (Bellas & Gossett, 2001). Further, the policies must be easily accessible by both trainers and trainees. Lastly, the department needs an administrator with whom they can confidentially consult during the disclosing and complaint filing process (Bellas & Gossett, 2001).

Beyond department and university policies, codes of ethics often make explicit directives regarding training boundaries, but they are not always a definitive guide (McWilliams, 2004). Non-essential dual-roles can be avoided until training ends (Younggren & Gottlieb, 2004) by using decision-making models and consulting respected colleagues (Hardy, 2012). Gottlieb (1993) proposed a decision-making model for dual-role relationship problems. First, the trainer is instructed to evaluate the potential for power issues by considering (a) the current role, (b) the contemplated role, and (c) how power issues could make current and contemplated roles incompatible. Next, the duration of the relationship is considered along with the ability to clearly and specifically end the relationship. However, Gottlieb's model ignores the impact of dual-role relationships on other people.

The Social Dual-Role Relationship Decision-Making Model takes a conservative stand and suggests ending or postponing dual-role relationships that have more than a minimal risk of harm to maximize the benefits of social interactions and minimize the potential for harm for trainees (Burian & Slimp, 2000). First, a decision tree (Figure 2) asks the trainer to scrutinize three main issues: relationship motives, power differentials, and types of social activities. The trainer is first encouraged to examine motivations for a dual-role relationship. The motivations are ranked to reflect (a) the highest priority; professional needs of trainees and trainers. For example, if a trainer and trainee conduct research together, some of their meetings might occur over lunch or after normal business hours. These meetings might also happen in non-professional settings and include some socializing. However, potential harm is reduced if all activities remain focused on the mutual professional benefit of conducting the research study.

The lesser priority is (b) the personal needs of the trainee, which pose greater potential harm. For example, a trainer has a class at a satellite campus. A trainee who usually takes classes at the main campus asks the trainer for a ride each week from main campus to the satellite campus to attend the trainer's class. The trainer may have a primary motivation to reduce air pollution and not see this request as a potential for a dual-role relationship. However, the trainer should consider all possible consequences of the arrangement and use the decision tree to assist them in determining how the power differences, location, and timing of the decision could affect the trainee, trainer, colleagues, and other trainees. Lastly, (c) the personal needs of the trainer should not be taken into consideration until the trainee has graduated.

Dual-role relationships should not be kept secret from colleagues and other trainees. Further, trainers on their own may have difficulty examining their own behavior (Koocher & Keith-Speigel, 1998). Trainers are encouraged to discuss their motivations for dual-role relationships with unbiased colleagues. Thus, it is important to clarify the primary reasons for entering into any dual-role relationship with a trainee. Trainers should fully inform directors and chairs of their decision to engage in dual-role relationships with trainees. After identifying motivations, the trainer next considers power differentials with the trainee. If the trainer could directly or indirectly impact the trainee's completion of a class or program of study or could write letters of reference, a dual-role relationship is best postponed until power differentials are more equal.

The last consideration is the location and timing of the dual-role relationship. Social relationships occurring at training sites are the least problematic. For example, meeting for lunch in the department break room is less risky than meeting at a local bar in the evening. Meeting at work appears less secretive and conflicting and allows colleagues to also appropriately socialize with the trainee. It also allows more

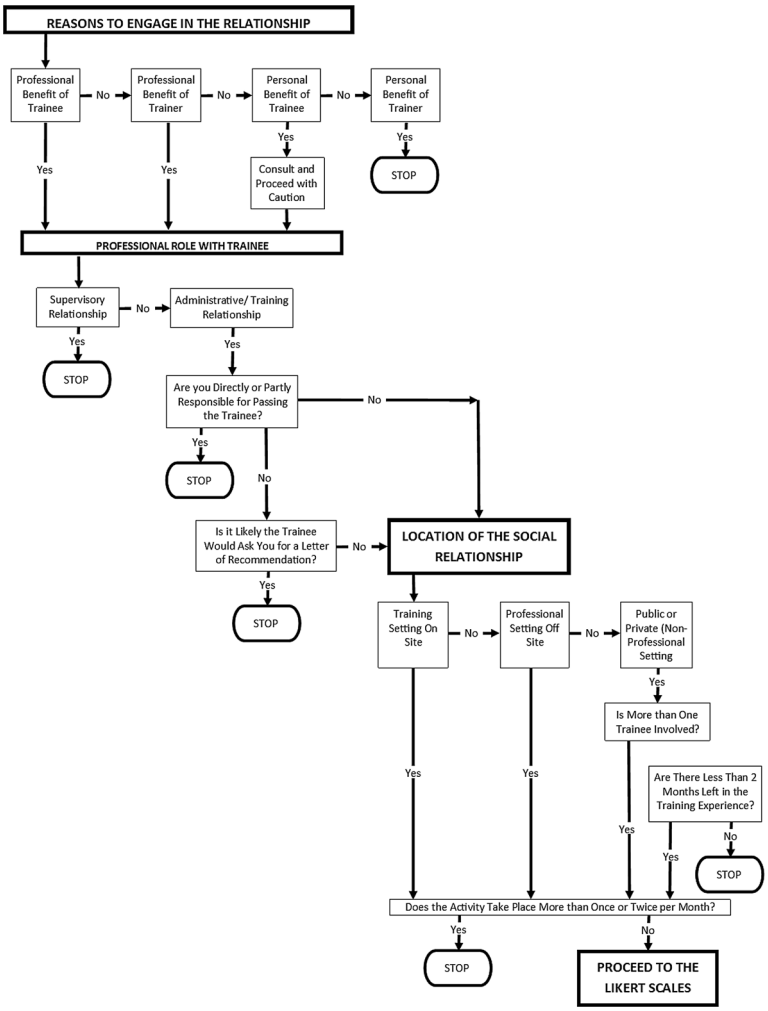
Figure 2. Social dual-role relationships during training: Decision tree



trainees the opportunity to join in the socializing and reduces favoritism. Additionally, trainers think about the frequency of socialization and consider that contact once or twice per month is less potentially harmful than three or more contacts a month.

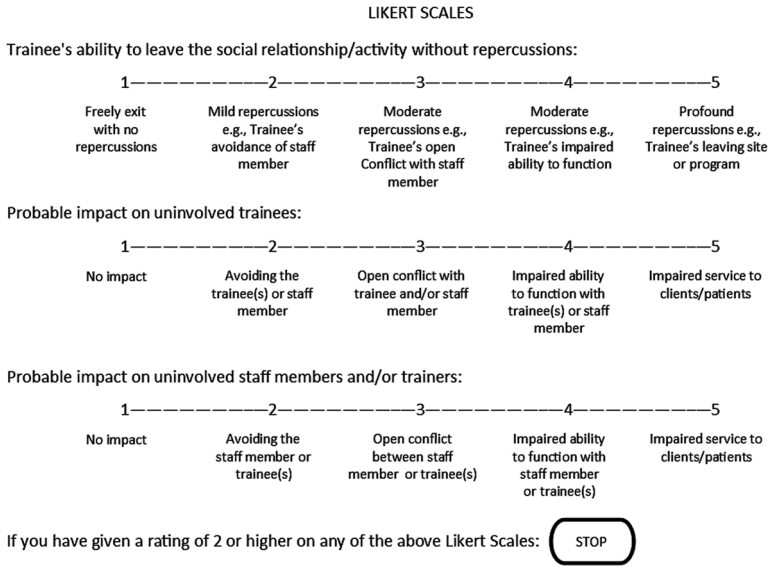
The trainer must evaluate the proposed dual-role relationship in the context of the decision tree and then discuss the decision making process openly with a colleague.

If at the end of those two processes the trainer has not come to a "Stop" in the decision tree, they are directed to evaluate the dual-role relationship through three concerns. These are rated on a Likert scale where (1) is the least potential for harm and (5) is the most potential for harm (Figure 3). The trainer's evaluations of the three concerns are processed with at least one colleague. The first concern examines the "Trainee's ability to leave the social relationship/activity without repercussions." If the trainee could experience some repercussions for leaving the social relationship/activity, it is best to refrain from the dual-role relationship or wait until after graduation. The second concern examines the "Probable impact on uninvolved trainees." If other trainees could experience some discomfort from the dual-role relationship/

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

activity (creating conflict or competition with peers), it is best to refrain from the dual-role relationship or wait until after graduation. The third concern examines the "Probable impact on uninvolved staff members." If other colleagues could experience some discomfort from the dual-role relationship/activity (conflict or avoidance among colleagues; will the trainer be viewed as objective and credible), it is best to refrain from the dual-role relationship or wait until after graduation. Self-reflection, discussions with trainees, contracts, policies, and decision making models offer several ways to deal with sexual boundary crossings and violations in counselor training and supervision.

Figure 3. Social dual-role relationships during training: Likert Scales



FUTURE RESEARCH DIRECTIONS

Considering that counseling trainers are supposed to be experts in mental wellness and caring for others and that sexual boundary violations are unethical, the rate of sexual boundary violations with trainees is unacceptable. Male trainers are more likely to violate sexual boundaries then female trainers and there is some evidence suggesting that males tend to sexualize professional relationships in ways that females are less likely to do. These differences need to be understood better so that training can more reliably reduce the rates of sexual boundary violations.

As recently as 2005, online social media would not have been a concern in the helping professions, but this has changed dramatically opening a whole new area of potential concern. What is the impact of social media on training boundaries? Should trainers connect with trainees on social media? In her preliminary research, Budz (2015) suggested the possibility that when trainers and trainees connect on social media, there is a greater risk for sexual boundary violations. She identified the need to investigate this further and to develop guidelines for trainers and trainees.

Evidence suggests that ethics training can help reduce the likelihood of sexual boundary violations, but simply pointing to the ethical codes that prohibit such behavior is not sufficient in preparing trainers and trainees to deal more effectively with sexual boundary violations. Prior to the 1980s, many counselor training programs did not include an ethics course in their curriculum. Some evidence has suggested that even with ethics training in the curriculum, it often fails to address concerns about sexual boundary violations in professional relationships. What is the best way to train counseling professionals to deal with sexual ethical dilemmas? Are there specific ethical interventions that would be more effective in developing professional competence in dealing with sexual ethical dilemmas? In this chapter, we offered Burian and Slimp's (2000) model designed to assist trainers in negotiating decisions about behaviors in their training relationships. We believe that this is an excellent tool for trainers, but more research needs to be done to test this and other ethical interventions to determine how effective they are.

Lastly, more research is needed to understand the barriers to effective training in sexual boundary violations during counselor training. Are trainers simply uncomfortable talking about sex and sexual attraction in educational and clinical supervision settings or, are they simply unaware of the importance of this problem and, thus, not even aware of the need to address this area? Given the preponderance of evidence of the ongoing problem of sexual boundary violations in training for over forty years, the challenge for researchers now is to focus more on evidence based practices that will reliably reduce, if not eliminate, the problem. In so doing, we hope see an improvement in the wellbeing of our future counselors, their clients, and their own trainees.

CONCLUSION

In counselor training, trainers may have the role of professor, mentor, graduate research supervisor, dissertation chair, advisor, and/or clinical supervisor. Similarly, trainees may have the roles of student, mentee, graduate or research assistant, and/or supervised clinician. Ultimately, entering into a sexual relationship with a trainee is the decision of the trainer. Given that trainers are always in a position of power over trainees, there is never a time when the trainee is in a position to fully consent to such relationships. Even in cases when the trainee believes that they are initiating the relationship, the trainer bears the burden of responsibility for the well-being of the trainee. Effective ethics training should include sexual boundary violations. In addition, trainers in educational and clinical settings need to provide training in boundary crossings and boundary violations to trainees. These frank discussions about sexual boundaries, the consequences of sexual boundary violations, and decision making models for managing boundary crossings may reduce the likelihood of sexual boundary violations to ensure the safety and well-being both of trainees and their clients.

KEY TERMS AND DEFINITIONS

Dual-Role Relationships: Occurs when a trainer has more than one role in the training of the trainee at the same time (e.g. professor and clinical supervisor).

Boundary Crossings: Occur when the trainer departs from the strictest definition of their professional role, but is not acting unethically. Boundary crossings can be helpful and/or hurtful to a trainee.

Boundary Violations: Are inappropriate professional behaviors that challenge professional ethics, are not in the trainee's best interest, and/or will likely result in harm.

Power: Trainers have power over trainees because trainers (a) have something of value; (b) can inflict consequences; (c) hold a title or credential; (d) are held in high regard; and (e) are experts.

Professional Boundaries: Distinguish between professional and personal relationships. Boundaries are used to acknowledge power differentials in order to determine appropriate behaviors given the context to ensure the safety and optimal development of the trainee.

Sexual Boundary Violations: Are inappropriate professional behaviors that challenge professional ethics, are not in the trainee's best interest, and/or will likely result in harm. They can range from mild sexual behaviors that may make the recipient uncomfortable to sexual harassment and ultimately to consensual and nonconsensual sexual contact with a trainer.

Trainee: A counseling student or supervisee.

Trainer: An educator or supervisor of counselors.
