Table of Contents

Preface xxiv

Volume I

Section 1
Fundamental Concepts and Theories

Chapter 1
Roles and Importance of Ethics in the Counseling Profession 1
Sussan Olufunmilola Adeusi, Covenant University, Nigeria

Chapter 2
A Current Review of Human Factors and Ergonomic Intervention With Exoskeletons 12
Thomas M. Schnieders, Iowa State University, USA
Richard T. Stone, Iowa State University, USA

Chapter 3
Positive Psychology and Aging 35
Jyoti Mishra Pandey, Government Medical College and Hospital Chandigarh, India
Shobit Garg, SMI Medical College and Hospital, India

Chapter 4
The Architect of Organizational Psychology: The Geert Hofstede's Dimensions of Cultural (Corporate and Organizational) Identity 51
Ben Tran, Alliant International University, USA

Chapter 5
A Primer for Beginners in Pharmaceutical Care: A Call-to-Action to Pharmacists 73
Marcus Vinícius Dias-Souza, Dias-Souza Faculty of Health Sciences, University Vale do Rio Doce, Governador Valadares, Brazil

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Section 2
Development and Design Methodologies

Chapter 6
The Assessment for Career Counseling Skill for Teacher at High School: A Case Study in Vietnam 96
Duyen Nguyen Thi, Hung Yen University of Technology and Education, Vietnam

Chapter 7
Solution-Focused Brief Counseling in Schools: An Alternative Approach to Problem-Solving and Counseling 109
Sladjana S. Rakich, National University, USA
Danny R. Martinez, National University, USA

Chapter 8
AR Using NUI Based Physical Therapy Rehabilitation Framework with Mobile Decision Support System: A Global Solution for Remote Assistance 127
Syed Ali Fathima S. J., Kumaraguru College of Technology, Coimbatore, India
Shankar S., Hindusthan College of Engineering and Technology, Coimbatore, India

Chapter 9
Scientific Creativity in Psychology: A Cognitive-Conative Approach 145
Christiane Kirsch, University of Luxembourg, Luxembourg
Todd Lubart, Université Paris Descartes, France
Herie de Vries, Université Paris Descartes, France
Claude Houssemand, University of Luxembourg, Luxembourg

Chapter 10
The Role of Critical Theory in the Development of Multicultural Psychology and Counseling 168
Joseph C. Chen, DePaul University, USA

Chapter 11
Multicultural Considerations in Play Therapy Caregiver Consultation 191
Kristy A. Brumfield, Immaculata University, USA
Celita J. Owens, Immaculata University, USA
Rheta LeAnne Steen, Loyala University New Orleans, USA
Renee M. Floer, Loyola University New Orleans, USA

Chapter 12
Following the Drum: Motivation to Engage and Resist 207
Jonathan E. Taylor, Troy University, USA

Chapter 13
Social Justice and Advocacy in University-Based Play Therapy Training Clinics 238
Emily C. Brown, University of Missouri – St. Louis, USA
Emily Oliveira, University of Missouri – St. Louis, USA

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 14
Buddhist Approaches to Counselling and Psychotherapy: Exploratory Discussions From Different Traditions 256
Alvin Lai Oon Ng, Sunway University, Malaysia
Ee Mun Hon, HELP University, Malaysia
Ming Tik Chia, HELP University, Malaysia

Chapter 15
Vocational Rehabilitation of Persons With Hearing Impairment: A Step Towards Inclusive Development 273
S. Z. H. Zaidi, Amity University – Lucknow, India
Divya Baveja, Amity University – Lucknow, India

Chapter 16
Psychological (and Emotional) Architecture: The Values and Benefits of Nature-Based Architecture – Biophilia 289
Ben Tran, Alliant International University, USA

Chapter 17
Considerations for Setting Up Play Therapy Training Clinics: Recommended Play Therapy Toys, Materials, and Other Professional Considerations 312
Nicola Shea Hughes-Brand, University of Central Florida, USA
Julie A. Clifton, University of Central Florida, USA
Columbus Edward Brand, University of Central Florida, USA

Chapter 18
Attention Perception and Social Cognition: Bridging the Gap Between the Physical and Perceived 349
Bobby Nisha, University of Sheffield, UK

Chapter 19
Yogic Care for Neurodevelopmental Rehabilitation: Bringing Life Into Treatment, Management, and Prevention 368
Arun Pratap Singh, Mahatma Gandhi Antarrashtriya Hindi Vishwavidyalaya, India

Chapter 20
Vojta-Therapy: A Vision-Based Framework to Recognize the Movement Patterns 383
Muhammad Hassan Khan, Research Group of Pattern Recognition, University of Siegen, Siegen, Germany
Marcin Grzegorzek, Faculty of Informatics and Communication, University of Economics in Katowice, Katowice, Poland

Chapter 21
What Cognitive Psychology Can Tell Us About Educational Computer Games 399
Michael K. Gardner, The University of Utah, USA
David L. Strayer, University of Utah, USA

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Section 3
Tools and Technologies

Chapter 22
Towards Cost-Oriented User-Friendly Robotic Systems for Post-Stroke Rehabilitation 418
Iuliu Adrian Nadas, Technical University of Cluj-Napoca, Romania
Doina Pisla, Technical University of Cluj-Napoca, Romania
Calin Vaida, Technical University of Cluj-Napoca, Romania
Bogdan George Gherman, Technical University of Cluj-Napoca, Romania
Giuseppe Carbone, University of Cassino and South Latium, Italy

Chapter 23
A Case Study of MY Psychology: Malaysia's First Online Psychoeducational Platform 462
Chong Shen Hew, MY Psychology, Malaysia
Mu Yi Hor, MY Psychology, Malaysia
Hou Huai Gary Yap, MY Psychology, Malaysia
Tin Fung Chong, MY Psychology, Malaysia

Volume II

Chapter 24
The Evolution of a University-Based Center of Play Therapy Education 476
Tiffany McNary, Georgia State University, USA
Galina Kadosh Tobin, Georgia State University, USA
Sarah D. Stauffer, Association ESPAS, Switzerland

Chapter 25
Positive Psychology Competences of Pre-School Teachers as a Tool for Understanding and Nurturing Children's Play 498
Sanja Tatalović Vorkapić, University of Rijeka, Croatia
Petra Prović, Kindergarten "Play", Croatia

Chapter 26
A Hybrid Approach for Facial Expression Recognition Using Extended Local Binary Patterns and Principal Component Analysis 517
Gopal Krishan Prajapat, National Institute of Technical Teachers Training and Research, Chandigarh, India
Rakesh Kumar, National Institute of Technical Teachers Training and Research, Chandigarh, India

Chapter 27
Using Cognitive Psychology to Understand Anticipated User Experience in Computing Products .. 545
Emmanuel Eilu, Makerere University Kampala, Uganda

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 28
Hinduism and Counseling: Karma, Women Empowerment, Grief and Death, Anger Management, Bhagavad Gita, and Psychotherapies 567
Devi Venashinee Muruges, HELP University, Malaysia

Chapter 29
Preemployment Psychological Screening of Police Officer Applicants: Basic Considerations and Recent Advances 579
Cary L. Mitchell, Pepperdine University, USA

Chapter 30
Devices for Rehabilitation 602
Jessee Moirangthem, North Eastern Hill University, India
Sateesh Reddy Avutu, North Eastern Hill University, India
Meena Gupta, North Eastern Hill University, India
Dinesh Bhatia, North Eastern Hill University, India

Chapter 31
Technology and Cognitive Empowerment for Healthy Elderly: The Link between Cognitive Skills Acquisition and Well-Being 632
Silvia Serino, IRCCS Istituto Auxologico Italiano, Italy
Elisa Pedroli, Applied Technology for Neuro-Psychology Lab, IRCCS Istituto Auxologico Italiano, Italy

Chapter 32
Multi-Modal Motion-Capture-Based Biometric Systems for Emergency Response and Patient Rehabilitation 653
Marina L. Gavrilova, University of Calgary, Canada
Ferdous Ahmed, University of Calgary, Canada
A. S. M. Hossain Bari, University of Calgary, Canada
Ruixuan Liu, University of Calgary, Canada
Tiantian Liu, University of Calgary, Canada
Yann Maret, University of Calgary, Canada
Brandon Kawah Sieu, University of Calgary, Canada
Tanuja Sudhakar, University of Calgary, Canada

Chapter 33
Stroke Rehabilitation and Parkinson's Disease Tremor Reduction Using BCIs Combined With FES 679
Sophie V. Adama, Leipzig University, Leipzig, Germany
Martin Bogdan, Leipzig University, Leipzig, Germany

Chapter 34
Modes of Delivering Psychotherapy: Investigating Technology 698
Ebrahim Oshni Alvandi, Monash University, Melbourne, Australia
George Van Doorn, Federation University Australia, Churchill, Australia
Mark Symmons, Monash University, Melbourne, Australia

Chapter 35
Hybrid Exoskeletons for Upper Limb Stroke Rehabilitation 726
Ashley M. Stewart, University of Canterbury, New Zealand
Christopher G. Pretty, University of Canterbury, New Zealand
Mark Adams, Burwood Hospital, New Zealand
XiaoQi Chen, University of Canterbury, New Zealand

Chapter 36
A SWOT Analysis of Virtual Reality for Seniors 750
Pooya Soltani, Aix Marseille University, France

Chapter 37
Neurotechnology in the Development of Cyber-Psychotherapy Systems for Inducing and Measuring Altered States of Consciousness in Transpersonal Psychotherapy 766
Raul Valverde, Concordia University, USA

Chapter 38
Positive Technology for Helping People Cope with Stress 787
Daniela Villani, Università Cattolica del Sacro Cuore, Italy
Pietro Cipresso, Università Cattolica del Sacro Cuore, Italy & I.R.C.C.S. Istituto Auxologico Italiano, Italy
Andrea Gaggioli, Università Cattolica del Sacro Cuore, Italy & I.R.C.C.S. Istituto Auxologico Italiano, Italy
Giuseppe Riva, Università Cattolica del Sacro Cuore, Italy & I.R.C.C.S. Istituto Auxologico Italiano, Italy

Chapter 39
Efficacy of Art Therapy in Treating Patients with Paranoid Schizophrenia 815
Deepali Bedi, Sukoon Psychotherapy Center, India

Chapter 40
Introductory Analysis of Human Upper Extremity After Stroke 828
Esteban Peña-Pitarch, EPSEM(UPC), Barcelona, Spain
Jordi Vives Costa, EPSEM(UPC), Barcelona, Spain
Joan Lopez Martinez, EPSEM(UPC), Barcelona, Spain
Anas Al Omar, EPSEM(UPC), Barcelona, Spain
Iñaki Alcelay Larrión, EPSEM(UPC), Barcelona, Spain
Neus Tico-Falguera, Althaia, Xarxa Assitencial Universitària de Manresa, Catalunya, Spain

Chapter 41
Social Context: Visualisation of Cooperation – Evidence-Based Medicine in Neurorehabilitation .. 845
Emilia Mikołajewska, Nicolaus Copernicus University, Poland
Tomasz Komendziński, Nicolaus Copernicus University, Poland
Dariusz Mikołajewski, Kazimierz Wielki University, Poland & Nicolaus Copernicus University, Poland

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 42
Exploring Virtual Reality for the Assessment and Rehabilitation of Executive Functions 866
Elisa Pedroli, Applied Technology for Neuro-Psychology Lab, IRCCS Istituto Auxologico Italiano, Milano, Italy
Silvia Serino, Applied Technology for Neuro-Psychology Lab, IRCCS Istituto Auxologico Italiano, Milano, Italy & Psychology Department, Catholic University of Milan, Milan, Italy
Federica Pallavicini, Department of Human Sciences for Education "Riccardo Massa", Centre for Studies in Communication Sciences CESCOM, University of Milan Bicocca, Milan, Italy
Pietro Cipresso, Applied Technology for Neuro-Psychology Lab, IRCCS Istituto Auxologico Italiano, Milano, Italy & Psychology Department, Catholic University of Milan, Milan, Italy
Giuseppe Riva, Applied Technology for Neuro-Psychology Lab, IRCCS Istituto Auxologico Italiano, Milano, Italy & Psychology Department, Catholic University of Milan, Milan, Italy

Chapter 43
Virtual and Augmented Reality Mirrors for Mental Health Treatment: Analysis and Future Directions 885
Sergio Casas, University of Valencia, Spain
Cristina Portalés, University of Valencia, Spain
Lucía Vera, University of Valencia, Spain
José Vicente Riera, University of Valencia, Spain

Chapter 44
Workforce Development and E-Competency in Mental Health Services 908
Simone N. Rodda, Auckland University of Technology, New Zealand
Max W. Abbott, Auckland University of Technology, New Zealand
Nicki A. Dowling, Deakin University, Australia
Dan I. Lubman, Turning Point and Monash University, Australia

Chapter 45
Will Patients Accept Daily SMS as a Communication to Support Adherence to Mental Health Treatment? Daily SMS: Acceptance, Feasibility, & Satisfaction 926
Bonnie A Clough, Griffith University, Queensland, Australia
Leanne M Casey, Griffith University, Queensland, Australia

Chapter 46
An Internet-Based Quantum Biofeedback and Neurotechnology Cybertherapy System for the Support of Transpersonal Psychology 940
Raul Valverde, Concordia University, Canada

Volume III

Chapter 47
An IoT-Based Platform for Rehabilitation Monitoring and Biosignal Identification 977
Volkhard Klinger, Department of Embedded Systems, FHDW Hannover, Hannover, Germany

Preface

The availability of practical applications, techniques, and case studies by international therapists is limited despite expansions to the fields of clinical psychology, rehabilitation, and counseling. Mental health is an essential part of overall well-being, but only recently is our understanding of how to treat it in the long term becoming more thorough and thus more effective. Additionally, advancements in physical therapy continue to grow with the emergence of new assistive technologies, including virtual and augmented reality, as well as a new emphasis on alternative and complementary medicine techniques, such as yoga. As dialogues surrounding mental health and physical therapy grow, it is important to maintain therapeutic modalities that ensure the highest level of patient-centered rehabilitation and care are met across global networks.

Staying informed of the most up-to-date research trends and findings is of the utmost importance. That is why IGI Global is pleased to offer this four-volume reference collection of reprinted IGI Global book chapters and journal articles that have been handpicked by the editor and editorial team of this research anthology. These volumes will shed light on critical issues, trends, and techniques in counseling and therapy by providing both broad and detailed perspectives on cutting-edge theories and developments. This reference is designed to act as a single reference source on conceptual, methodological, technical, and managerial issues and provide insight into emerging trends and future opportunities within the field.

Rehabilitation Practices and Therapy: Concepts, Methodologies, Tools, and Applications is organized into seven distinct sections that provide comprehensive coverage of important topics. The sections are:

1. Fundamental Concepts and Theories;
2. Development and Design Methodologies;
3. Tools and Technologies;
4. Utilization and Applications;
5. Organizational and Social Implications;
6. Critical Issues and Challenges; and
7. Emerging Trends.

The following paragraphs provide a summary of what to expect from this invaluable reference tool.

Section 1, "Fundamental Concepts and Theories," serves as a foundation for this extensive reference tool by addressing crucial theories essential to the understanding of rehabilitation practices and therapy. Introducing the book is "Roles and Importance of Ethics in the Counseling Profession," by Prof. Sussan Olufunmilola Adeusi (Covenant University, Nigeria), which lays the groundwork for the basic ethical framework within which rehabilitation and therapy must operate. Section 1 concludes and leads into

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the following portion of the book with the chapter, "A Primer for Beginners in Pharmaceutical Care: A Call-to-Action to Pharmacists," by Prof. Marcus Vinícius Dias-Souza (Dias-Souza Faculty of Health Sciences, University Vale do Rio Doce, Governador Valadares, Brazil).

Section 2, "Development and Design Methodologies," presents in-depth coverage of the conceptual design and architecture of rehabilitation practices and therapy. Opening the section is "The Assessment for Career Counseling Skill for Teacher at High School: A Case Study in Vietnam," by Prof. Duyen Nguyen Thi (Hung Yen University of Technology and Education, Vietnam). Through the use of a case study, this section describes specific procedures and frameworks within rehabilitation practices and therapy. The section concludes with an excellent work by Profs. Muhammad Hassan Khan (Research Group of Pattern Recognition, University of Siegen, Siegen, Germany) and Marcin Grzegorzek (Faculty of Informatics and Communication, University of Economics in Katowice, Katowice, Poland), "Vojta-Therapy: A Vision-Based Framework to Recognize the Movement Patterns."

Section 3, "Tools and Technologies," presents extensive coverage of the various tools and technologies used in these fields. The first chapter, "Towards Cost-Oriented User-Friendly Robotic Systems for Post-Stroke Rehabilitation," by Profs. Iuliu Adrian Nadas (Technical University of Cluj-Napoca, Romania), Doina Pisla (Technical University of Cluj-Napoca, Romania), Calin Vaida (Technical University of Cluj-Napoca, Romania), Bogdan George Gherman (Technical University of Cluj-Napoca, Romania), and Giuseppe Carbone (University of Cassino and South Latium, Italy), explores solutions in implementing robotics for stroke victims. The section concludes with "An IoT-Based Platform for Rehabilitation Monitoring and Biosignal Identification," by Prof. Volkhard Klinger (Department of Embedded Systems, FHDW Hannover, Hannover, Germany), which focuses on the integration of the Internet of Things into medical technology. Where Section 3 described specific tools and technologies at the disposal of practitioners, Section 4 describes the use and applications of the tools and frameworks discussed in previous sections.

Section 4, "Utilization and Applications," offers insight on and important lessons for the applications and impacts of rehabilitation practices and therapy. The first chapter in the section is "Is It Real or Not? Experiences of Synchronous Learning and Training for Counseling Graduate Students," written by Prof. Katie Koo (Texas A&M University – Commerce, USA), and it discusses synchronous learning methods and tools to train practitioners. This section includes the widest range of topics because it describes case studies, research, methodologies, frameworks, architectures, theory, analysis, and guides for implementation. The breadth of topics covered in this section is also reflected in the diversity of its authors, from countries all over the globe. The section concludes with "The Diversity Management for Employment of the Persons With Disabilities: Evidence of Vocational Rehabilitation in the United States and Japan," by Profs. Kai Seino (Toyo University, National Institute of Vocational Rehabilitation, Japan), Aoi Nomoto (Chiba University, Japan), Tomohiro Takezawa (National Institute of Vocational Rehabilitation, Japan), and Heike Boeltzig-Brown (University of Massachusetts-Boston, USA), which explores vocational rehabilitation for people with disabilities and serves as a great transition chapter into the next section.

Section 5, "Organizational and Social Implications," includes chapters discussing the organizational and social impact of rehabilitation practices and therapy. The section opens with "Play-Based Bereavement Centers for Children and Families," by Prof. Renee Turner (University of Mary Hardin-Baylor, USA), which focuses on counselor training of working with bereaved children and families. This section focuses exclusively on how these technologies affect human lives, either through the way they interact with each other or through how they affect behavioral/workplace situations. The section

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

concludes with "Cross-Cultural Decision-Making in Healthcare: Theory and Practical Application in Real Clinical Conditions," by Profs. Tomasz Komendziński (Nicolaus Copernicus University, Poland), Emilia Mikołajewska (Nicolaus Copernicus University, Poland), and Dariusz Mikołajewski (Kazimierz Wielki University, Poland & Nicolaus Copernicus University, Poland), which examines intercultural communication in healthcare.

Section 6, "Critical Issues and Challenges," covers the limitations present within the field and explores solutions that propel rehabilitation practices and therapy forward. The section begins with "Introducing Psychological Concepts and Methods to Cybersecurity Students," by Profs. Jacqui Taylor (Bournemouth University, UK), Helen Thackray (Bournemouth University, UK), Sarah E. Hodge (Bournemouth University, UK), and John McAlaney (Bournemouth University, UK), which analyzes the application of psychology practice offers to cybersecurity education. Chapters in this section examine theoretical approaches and offer answers to crucial setbacks on the subject of rehabilitation practices and therapy. The section concludes with "An Examination of Selfish and Selfless Motives: A Review of the Social Psychological and Behavioral Economics Literature," by Prof. Gabriela Carrasco (University of North Alabama, USA) and Eric Kinnamon (Alabama A&M University, USA), which explores the flaws in ascertaining selfish and selfless behavior.

Section 7, "Emerging Trends," contains chapters that look at what might happen in the coming years that can extend the already staggering amount of applications for Rehabilitation Practices and Therapy, opening with "A Happier Balance: Positive Interventions for Intentional Well-Being in Psychotherapy," by Prof. Daniel J. Tomasulo (Teachers College, Columbia University, USA & University of Pennsylvania, USA). This chapter describes the developmental history of well-being interventions and their next steps forward. The final chapter of the book addresses ethical violations and power imbalances in counselor education in the excellent contribution "Sexual Boundary Violations in Counselor Training and Supervision," by Profs. Daniel R. Cruikshanks (Aquinas College, USA) and Stephanie T. Burns (Western Michigan University, USA).

Although the primary organization of the contents in this multi-volume work is based on its seven sections, offering a progression of coverage of the important concepts, methodologies, technologies, applications, social issues, and emerging trends, the reader can also identify specific contents by utilizing the extensive indexing system listed at the end of each volume. As a comprehensive collection of research on the latest findings related to using technology to providing various services, *Rehabilitation Practices and Therapy: Concepts, Methodologies, Tools, and Applications* provides psychologists, therapists, psychiatrists, counselors, physical therapists, medical professionals, researchers, students, and all audiences with a complete understanding of the development of applications and concepts in this utterly essential field and its need for constant refinement. Given the vast number of issues concerning usage, failure, success, policies, and strategies in the operation of this field in countries around the world, *Rehabilitation Practices and Therapy: Concepts, Methodologies, Tools, and Applications* addresses the demand for a resource that encompasses the most pertinent research in technologies being employed to globally bolster the knowledge, procedures, and tools used in rehabilitation and patient care.

Chapter 1
Roles and Importance of Ethics in the Counseling Profession

Sussan Olufunmilola Adeusi
Covenant University, Nigeria

ABSTRACT

Absence of rules, guidelines, or instruction in any setting will lead to chaos. Ethics is a written law, and in this chapter, the focus is on the role and importance of ethics in counselling. Ethics is the branch of philosophy that deals with the morality of human actions. Every professional body is governed by ethics and counselling profession is not exclusive. Counselling Association of Nigeria (CASSON) does not have already established ethical codes due to several challenges but the ethical codes of American Counselling Association (ACA) and British Association for Counselling and Psychotherapy (BACP) have been very helpful. These major associations (ACA and BACP) are guided by similar ethical principles and code of ethics. Without ethics, counselling will achieve nothing or very little of her goals. Hence, the roles and importance of ethics in counselling is crucial; it sets order and guarantees a total and healthy human development.

INTRODUCTION

In every society, there are either written or unwritten laws governing the affairs of the citizens or habitants. Absence of rules, guidelines or instruction in any given setting will surely lead to chaos or disorderliness because everyone will conduct him or herself in ways that he or she desires which may infringe on the right of others. No wonder the popular saying, "where there is no law, there is no sin", which simply implies that anything goes either good or bad and basically, when it is bad no one will get punished for such misconduct.

Wherever you find human beings gather or live together there are some unwritten laws that is been transferred from generation to generation. These unwritten laws are often seen or referred to as moral way of life that guides the action(s) of people to cohabit in a friendly and acceptable manner. Unwritten law is most commonly found in primitive societies where illiteracy is prevalent and it consists of those customs, traditions, practices, norms, and other maxims of human conduct while written laws are

documented rules or guidelines designed for a group of people or profession to ensure compliance of members for the smooth running of the society or profession and when anyone errs, such any individual is punished as stated in the law.

Ethics is a form of a written law and as it relates to this chapter, the objective is on the role and importance of ethics in counseling profession.

BACKGROUND

Concept of Ethics

Ethics originate from the Ancient Greek word "ethos" which means habit or custom. According to Omoregbe (1993), there is no univocal or general consensus on the definition of ethics. Ethics is defined as the branch of philosophy which deals with the morality of human actions or as a branch of philosophy which studies the norms of human behavior. It is also defined as the branch of study that deals with what is the correct course of action for man, that is, the moral principles that govern a person's behavior or an activity. Ethics can also be seen as the study of right and wrong or ways of categorizing values that govern people's affairs or endeavors. Internet Encyclopedia of Philosophy defines ethics is the branch of philosophy that involves systematizing, defending, and recommending concepts of right and wrong conduct. Kidder (2003, p. 63) states that 'ethics is the science of the ideal human character' or 'the science of moral duty' while Paul and Elder (2006, p. 2) define ethics as "a set of concepts and principles that guide us in determining what behavior helps or harms sentient creatures".

Ekanola (1999) corroborates the definitions above by stating that ethics is concerned with philosophical inquiry about morality, moral problems and moral judgments. It was revealed that in the field of ethics, 3 aspects can be identified which are: normative-ethics, descriptive-ethics and meta-ethics.

- Normative ethics: the main focus is to make moral judgments about particular actions or kinds of actions and offer reasons to support the moral judgment made in order to show that the judgments are reasonable (example – prostitution is bad; it can lead to incurable diseases).
- Descriptive ethics answers factual questions about the moral view of individuals or groups. Basically, statements of fact are made about the moral views held by individuals, groups or society at large (example – "Sussan believes prostitution is bad", or "Christians hate corrupt practices").
- Meta-ethics: is concerned with questions about the meaning of ethical terms. It attempts to analyze ethical concepts in order to arrive at their actual meanings and logical relations.

In all, ethics is often used interchangeably with morality, though morality is the basis for ethics because it is not to describe the way people behave in practice but to state the way people ought to behave or conform which helps to bring orderliness or saneness to the society.

Concept of Counseling

The word counseling is used in many different ways by different groups. For instance, in churches, there are so called counseling for new converts, intending couples or couple experiencing challenges in their homes, and other church members but unfortunately those referred to as counselors overseeing the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

counseling sessions are not trained. Some terms like advice, guidance, assistance to mention but few are sometimes used to describe or define counseling which are not absolutely correct. Makinde (1984) defined counseling as an enlightened process whereby people help people by facilitating growth, development and positive change through an exercise of self-understanding. Counseling according to Olayinka (1999) is the process in which one person assists another person in a person to person or face to face encounter. This assistance may take many forms. It may be educational, vocational, social, recreational emotional and or moral. Counseling is a helping relationship; the relationship of trust and confidence between counselor (a trained personnel) and client; it is assistance given to the client in decisions that he must take; it is concerned more with the process of decision-making than with the quality of decision made; it is listening more than talking; it is seeing the client's whole, in all of his home relations, school relations and peer relations as these affect both the present and future. Counseling is a mutual relationship characterized by mutual respect, effective communication, genuineness and complete acceptance of the client by the counselor, and concentration on the needs, problems and feelings of the client.

In 2011, the Canadian Counselling and Psychotherapy Association Board of Directors passed a motion to adopt for use by CCPA the nationally validated definition and scope of practice for the counseling and based on their decision counseling was defined as a relational process based upon the ethical use of specific professional competencies to facilitate human change. Counseling addresses wellness, relationships, personal growth, career development, mental health, and psychological illness or distress. The counseling process is characterized by the application of recognized cognitive, affective, expressive, somatic, spiritual, developmental, behavioral, learning, and systemic principles. On this note, it is counseling is not advice given, it goes beyond mere guidance or assistance. Counseling can only be given by a professional (a trained person) while advice can be given by anyone. The aim of counseling is to enable clients to discover their own wisdom rather than have wisdom imparted to them by the counselor (because counselors are not supreme beings). The counseling process is intended to increase the client's ability to take control rather than depend on another.

Counseling Profession

A profession is a paid occupation, especially one that involves prolonged training and a formal qualification. Profession can be defined as occupation, practice or vocation requiring mastery of a complex set of knowledge and skills through formal education and or practical experience. According to Larson (1978), every profession have a professional association, cognitive base, institutionalized training, licensing, work autonomy, colleague control and code of ethics. In the light of this, counseling is a profession because it requires formal training, practical experience and other mention characteristics. The basic level required before anyone is qualified to be referred to as counselor is master's degree. A professional counselor is a highly trained individual who is able to use a different range of counseling approaches with clients. The counselor is considered to be an expert in helping people with troubles because he is skilled in applying an appropriate pattern to produce solution which may reduce the stress experienced by the client. Professional counselors maintain their skills though continued professional development and commit to behaving ethically. It is interesting to know that every profession is guided by a body (association) for the smooth running of the profession and this is where the issue of ethics comes to play.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Features of an Effective Counselor

Counselors are not super beings who have a monopoly on emotional strength and wisdom. Nor are they omnipotent, or all seeing, or all-knowing but certain attributes are very essential to be able to be an effective counselor.

Different individuals (Corey, Corey & Callan, 1984; Idowu, 1998; Olayinka, 1999) use various words or terms to describe the required and appropriate attribute of a good counselor. Such words or terms include: goodwill, integrity, ability to listen, ability to look at oneself, ability to be present for others, knowledge of the theory, humility, empathy, growth orientation, kindness, good memory of details, patience, control of ones emotions, non-judgmental, being courageous, authenticity, tolerance of intimacy, insightfulness, flexibility, self-awareness and intellectual competence.

MAIN FOCUS OF THE CHAPTER

Ethics and Counseling

According to Akinade (2005), ethics are normative in nature and focus on principles and standards that governs relationships between individuals, such as counselors and clients. Ihuah (2002) affirms that ethics or morality refers to a code of conduct by which men live. Thus, counseling ethics or ethics in counseling represents the principles which prescribe, and or regulate the behavior (affairs) of counselors and clients. In counseling profession, basically in Nigeria, there is no "proper" or already certified code of ethics by the governing body – Counselling Association of Nigeria (CASSON) due to several challenges such as the relative newness of the profession in Nigeria (though history have it that counseling in Nigeria started in the year 1959), problem of registration of the association with the government to mention but few that is been encountered by the association. Omotosho (2008) affirms that Counselling Association of Nigeria is yet to come up with categorical, well-articulated and widely publicized statements that detail a broad range of practical standards for ethical professional practices that reflect core values of this profession. Nevertheless, the counseling body in Nigeria still believes and operates effectively bearing in mind the already established code of ethics by western bodies such as American Counseling Association (ACA) and British Association for Counselling and Psychotherapy (BACP).

The American Counseling Association (ACA) is a professional organization of counselors in the United States and they set out to "enhance the quality of life in society by promoting the development of professional counselors, advancing the counselling profession, and using the profession and practice of counseling to promote respect for human dignity and diversity" while the British Association for Counselling & Psychotherapy is a membership organization and a registered charity that sets standards for therapeutic practice and provides information for therapists, clients of therapy, and the general public. These major associations (ACA and BACP) are guided by similar ethical principles and code of ethics which are:

BRITISH ASSOCIATION FOR COUNSELLING AND PSYCHOTHERAPY 2013 ETHICAL PRINCIPLES

Being Trustworthy: Honoring the Trust Placed in the Practitioner (Also Referred to as Fidelity)

Being trustworthy is regarded as fundamental to understanding and resolving ethical issues. Practitioners who adopt this principle: act in accordance with the trust placed in them; strive to ensure that clients' expectations are ones that have reasonable prospects of being met; honor their agreements and promises; regard confidentiality as an obligation arising from the client's trust; restrict any disclosure of confidential information about clients to furthering the purposes for which it was originally disclosed.

Autonomy: Respect for the Client's Right to Be Self-Governing

This principle emphasizes the importance of developing a client's ability to be self-directing within therapy and all aspects of life. Practitioners who respect their clients' autonomy: ensure accuracy in any advertising or information given in advance of services offered; seek freely given and adequately informed consent; emphasize the value of voluntary participation in the services being offered; engage in explicit contracting in advance of any commitment by the client; protect privacy; protect confidentiality; normally make any disclosures of confidential information conditional on the consent of the person concerned; and inform the client in advance of foreseeable conflicts of interest or as soon as possible after such conflicts become apparent. The principle of autonomy opposes the manipulation of clients against their will, even for beneficial social ends.

Beneficence: A Commitment to Promoting the Client's Well-Being

The principle of beneficence means acting in the best interests of the client based on professional assessment. It directs attention to working strictly within one's limits of competence and providing services on the basis of adequate training or experience. Ensuring that the client's best interests are achieved requires systematic monitoring of practice and outcomes by the best available means. It is considered important that research and systematic reflection inform practice. There is an obligation to use regular and ongoing supervision to enhance the quality of the services provided and to commit to updating practice by continuing professional development. An obligation to act in the best interests of a client may become paramount when working with clients whose capacity for autonomy is diminished because of immaturity, lack of understanding, extreme distress, serious disturbance or other significant personal constraints.

Non-Maleficence: A Commitment to Avoiding Harm to the Client

Non-maleficence involves: avoiding sexual, financial, emotional or any other form of client exploitation; avoiding incompetence or malpractice; not providing services when unfit to do so due to illness, personal circumstances or intoxication. The practitioner has an ethical responsibility to strive to mitigate any harm caused to a client even when the harm is unavoidable or unintended. Holding appropriate insurance may assist in restitution. Practitioners have personal and professional responsibility to challenge, where appropriate, the incompetence or malpractice of others; and to contribute to any investigation

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and/ or adjudication concerning professional practice which falls below that of a reasonably competent practitioner and/or risks bringing discredit upon the profession.

Justice: The Fair and Impartial Treatment of All Clients and the Provision of Adequate Services

The principle of justice requires being just and fair to all clients and respecting their human rights and dignity. It directs attention to considering conscientiously any legal requirements and obligations, and remaining alert to potential conflicts between legal and ethical obligations. Justice in the distribution of services requires the ability to determine impartially the provision of services for clients and the allocation of services between clients. A commitment to fairness requires the ability to appreciate differences between people and to be committed to equality of opportunity, and avoiding discrimination against people or groups contrary to their legitimate personal or social characteristics. Practitioners have a duty to strive to ensure a fair provision of counseling and psychotherapy services, accessible and appropriate to the needs of potential clients.

Self-Respect: Fostering the Practitioner's Self-Knowledge and Care for Self

The principle of self-respect means that the practitioner appropriately applies all the above principles as entitlement for self. This includes seeking counselling or therapy and other opportunities for personal development as required. There is an ethical responsibility to use supervision for appropriate personal and professional support and development, and to seek training and other opportunities for continuing professional development. Guarding against financial liabilities arising from work undertaken usually requires obtaining appropriate insurance. The principle of self-respect encourages active engagement in life-enhancing activities and relationships that are independent of relationships in counseling or psychotherapy.

AMERICAN COUNSELING ASSOCIATION 2014 CODE OF ETHICS

The 2014 ACA Code of Ethics replaces the 2005 edition. The new edition is the first code that speaks to the ethics of using social media with clients. It also presents new or expanded guidelines for preventing the imposition of counselor personal values, distance counseling, confidentiality, dual relationships, multiculturalism and diversity, the use of technology, recordkeeping, diagnosis, end-of life care and the selection of interventions. The ACA Code of Ethics contains nine main sections that address the following areas:

Section A: The Counseling Relationship

The section addresses client's welfare, counselors facilitates client's growth and development in ways that foster the interest and welfare of clients and promote formation of healthy relationships.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Section B: Confidentiality and Privacy

Among other things, confidentiality is core in counseling. Counselors seek to earn the trust of clients, establish and uphold appropriate boundaries and communicate the parameters of confidentiality in a culturally competent manner.

Section C: Professional Responsibility

Counselors are expected to carry out certain functions such as to open honest and accurate communication in dealing with the public and other professionals, to facilitate access to counseling services, practice in a nondiscriminatory manner within the boundaries of professional and personal competence and have a responsibility to abide by the ACA Code of Ethics. Counselors are encouraged to actively participate in local, state, and national associations that foster the development and improvement of counselling.

Section D: Relationships With Other Professionals

Counseling is not an island, counselors recognize that the quality of their interactions with colleagues can influence the quality of services provided to clients. Thus, they work to become knowledgeable about colleagues within and outside the field of counselling, develop positive working relationships and systems of communication with colleagues to enhance services to clients.

Section E: Evaluation, Assessment, and Interpretation

Counselors use assessment as one component of the counseling process, taking into account the clients' personal and cultural context. Counselors promote the well-being of individual clients or groups of clients by developing and using appropriate educational, mental health, psychological, and career assessments.

Section F: Supervision, Training, and Teaching

Counselor supervisors, trainers, and educators aspire to foster meaningful and respectful professional relationships and to maintain appropriate boundaries with supervisees and students in both face-to-face and electronic formats. They have theoretical and pedagogical foundations for their work; have knowledge of supervision models; and aim to be fair, accurate, and honest in their assessments of counsellors, students, and supervisees.

Section G: Research and Publication

Counselors who conduct research are encouraged to contribute to the knowledge base of the profession and promote a clearer understanding of the conditions that lead to a healthy and more just society. Counselors support the efforts of researchers by participating fully and willingly whenever possible. Counselors minimize bias and respect diversity in designing and implementing research.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Section H: Distance Counseling, Technology, and Social Media

Counselors understand that the profession of counseling may no longer be limited to in-person, face-to-face interactions. Counselors actively attempt to understand the evolving nature of the profession with regard to distance counseling, technology, and social media and how such resources may be used to better serve their clients. Counselors strive to become knowledgeable about these resources. Counselors understand the additional concerns related to the use of distance counselling, technology, and social media and make every attempt to protect confidentiality and meet any legal and ethical requirements for the use of such resources.

Section I: Resolving Ethical Issues

Professional counselors behave in an ethical and legal manner. They are aware that client welfare and trust in the profession depend on a high level of professional conduct. They hold other counselors to the same standards and are willing to take appropriate action to ensure that standards are upheld. Counselors strive to resolve ethical dilemmas with direct and open communication among all parties involved and seek consultation with colleagues and supervisors when necessary. Counselors incorporate ethical practice into their daily professional work and engage in ongoing professional development regarding current topics in ethical and legal issues in counseling. Counselors become familiar with the ACA Policy and Procedures for Processing Complaints of Ethical Violations and use it as a reference for assisting in the enforcement of the ACA Code of Ethics.

ROLES AND IMPORTANCE OF ETHICS IN COUNSELING PROFESSION

The followings are the roles and importance of ethics in counseling profession:

1. It establishes the ethical duties or responsibility of members;
2. It interprets the ethical codes thereby sensitizing all members and intending members about the best practices expected;
3. It reveals the role of members, prospective members and the population that is been served;
4. It helps to enhance the quality of life (or human development) in the society;
5. It promotes the development of members through research, publications and so on;
6. It provides adequate support for members against any form of uproar or challenges either with clients or other professionals;
7. It serves as the basis for processing inquiries and ethics complaints concerning member;
8. It empowers individuals to accomplish mental health, wellness, education, and career goals;
9. It encourages the practice of competence by members;
10. It safeguards the integrity of persons involved in the counseling relationship;
11. It promotes nondiscriminatory treatment of all clients;
12. It guides human conduct and appraises same.
13. It seeks to resolve the question of human morality and disciplinary procedures are set in place for those that erred.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

SOLUTIONS AND RECOMMENDATIONS

In Nigeria, it is an established fact that there is no certified code of ethics governing the Counselling Association and practice, therefore, it is recommended that:

1. The leadership of the association should not rest until a proper registration of the association is made with the government;
2. A certified code of ethics should be formulated;
3. There should be a periodic review of the code of ethics;
4. Appointment of monitoring team to monitor the implementation of the code of ethics;
5. Development and implementation of sanctions for non-compliance to the ethical codes.

FUTURE RESEARCH DIRECTIONS

To build a healthy nation, the role and importance of counseling profession cannot be overemphasized. Counseling profession in Nigeria should go beyond the four walls of educational institutions. Since the term counselor is used in various settings (especially in churches) and individuals giving the counsel are not professionals, Counselling Association of Nigeria should see to the possibility of establishing counseling centers in churches where professional counselors will render counseling services to clients. Alternatively, pastors should be encouraged to have a minimum of master's degree in counseling so as to provide counseling services in their churches.

Indigenous counseling is not new in African setting as a result, provision of counseling services is in existence in virtually all the countries in Africa. The part of culture in the formulation of ethical code cannot be sidelined and since there are similarities in culture in Africa, attempt should be made in the nearest future to harmonize counseling code of ethics in different countries in African.

CONCLUSION

In all human endeavors, the importance of counseling and counseling services cannot be over emphasized. Without ethics in counseling profession, activities will be haphazard and purposeless. There will be no goal to achieve; effort will not be appreciated, relationships will be abused and human development will be in jeopardy. Herlihy and Corey (2006) corroborate the African proverb which says "it takes a village to raise a child" and "it takes a village to create a code of ethics." It was revealed that it took more than 2 years to write, review, revise, discuss, re-revise, and finally approve and implement the ACA Code of Ethics. Therefore, it will not be out of context to say "no ethics, no counseling profession." Great effort that needs to be applauded was invested by the American and British Association for Counselling in the formulation of the ethical codes for the profession and virtually all the nations where counseling is in practice make reference to this two international bodies and follow the already established ethics for the profession.

KEY TERMS AND DEFINITIONS

Codes: Words that are presented in a systematic way to represent a message or specific information.

Counseling: Assistance rendered by a trained counselor to an individual with educational, vocational, and personal problems.

Ethics: Moral principles that are expected to guide a group of people or a profession.

Guidelines: Instructions that are given or laid down for effective execution of tasks.

Laws: Guiding rules that must be obeyed.

Moral: Instructions on what is right or wrong in a given society.

Norms: Expected behavior or approved standards in a given setting.

Principles: Rules that guide one's action or way of life.

Profession: A job that requires training (or education) and specific skills.

Role: Expected responsibility.

Chapter 2
A Current Review of Human Factors and Ergonomic Intervention With Exoskeletons

Thomas M. Schnieders
https://orcid.org/0000-0002-1269-7787
Iowa State University, USA

Richard T. Stone
Iowa State University, USA

ABSTRACT

Research and development of exoskeletons began as early as the 1960s. Recent advancement in technology has spurred a further research into the field specifically at rehabilitation and human performance augmentation. Human performance augmenting exoskeletons find use in the military, emergency services, industrial and space applications, and training. Rehabilitation exoskeletons assist in posture support and replacing lost function. Exoskeleton research is broadly broken up in this chapter by anthropometry: lower body, upper body, and extremities. The development for various anthropometry has their own unique set of challenges. This chapter provides a brief history, discusses current trends in research, looks at some of the technology involved in development, the potential benefits of using exoskeletons, and looks at the possible future improvements in research.

INTRODUCTION

This chapter provides a brief history of exoskeleton development from a human factors and ergonomic intervention standpoint. It discusses the current research with respect to the innate human-machine interface and the incorporation of exoskeletons for ergonomic intervention. Some novel exoskeletons based on their anatomical categories of lower body, upper body, extremities (hands/feet), and full body exoskeletons will be discussed. The chapter will conclude by covering the benefits of exoskeletons in

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

rehabilitation, industrial applications, and military applications, as well as discuss some of the issues faced when designing exoskeletons.

It is imperative when performing research with exoskeletons to clearly define the difference between an exoskeleton and an orthotic because the two terms often overlap in the media as well as in the scientific literature. The term orthotic, or orthosis (plural orthoses) is generally a mechanical device applied externally to the body.

Similarly, an exoskeleton is also a mechanical device applied externally to the body but whose external mechanical structure has joints that anatomically match the human body. Typically, this mechanical structure will share physical contact with the user, will enable a direct or indirect transfer of mechanical power, and has either active or passive actuation (Pons, J.L., Moreno, J.C., Brunetti, F.J., and Rocon, E., 2007). A prosthetic is a device that substitutes a missing body part (Sansoni, S., Wodehouse, A., and Buis, A., 2014).

Hugh Herr defines exoskeletons and orthoses as follows: "The term 'exoskeleton' is used to describe a device that augments the performance of an able-bodied wearer, whereas the term 'orthosis' is typically used to describe a device that is used to assist a person with a limb pathology" (Herr, H., 2009).

OVERVIEW OF EXOSKELETONS

The field of exoskeleton research, design, and manufacturing is broad and expansive. The earliest work began in the early 1960's with the Defense Department's interest in a man-amplifier. This man-amplifier was a "powered suit of armor" that can augment a soldier's lifting and carrying ability (Kazerooni, H., Steger, R., and Huang, L., 2006).

General Electric's Hardiman, developed by Ralph Mosher from the early1960s to 1971, is widely considered the first exoskeleton device. This hydraulic and electrical body suit made carrying 250-pound seem as light as lifting 10-pounds. Ultimately, the concept of the Hardiman was well received but determined too heavy and bulky for standard military use. Not only was the exoskeleton heavy (weighing in at 1500 pounds), but it was also extremely slow (2.5ft/sec) and had uncontrolled, violent movements (Ali, H., 2014).

The United States Air Force commissioned the study of a man-amplifier from the Cornell Aeronautical Laboratory in 1962. The results of their study on this master-slave robotic system showed that exoskeletons, even those with fewer degrees of freedom (DoF) than the human body, was capable of completing most desired tasks (Mizen, 1965). However, the master-slave systems currently being used were deemed impractical. The devices were overly complex and had difficulty sensing human intent making many tasks difficult to complete (Kazerooni, H., Steger, R., and Huang, L., 2006).

Throughout the 1960's and 1970's, the University of Belgrade developed several types of exoskeletons that had limited predefined motion to aid paraplegics. They were met with limited success but the balancing algorithms that were developed are still in use in many current day bipedal robots (Vukobratovic, M., Ciric, V., and Hristic, D., 1972).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

USES AND MARKETS

In today's market, exoskeletons are broadly placed into two primary functions: (1) rehabilitation and (2) human performance augmentation. The recent surge into exoskeleton design, research, and manufacturing has led to their use into other fields like firefighting, sports, and law enforcement. The number of journal and conference papers covering exoskeletons each year has grown exponentially from just over 100 in 1964 to well over 7,000 in 2016. The number of publications on the term 'exoskeleton' is most likely skewed for years prior to the 1990's where the term was more often associated with the traditional sense of the word – that is, a rigid external covering for some invertebrate animals like arthropods.

Rocon (Rocon, E. et al. 2007) and Harwin (Harwin, W., Leiber, L., Austwick, G., and Dislis, C., 1998) classify rehabilitation robotics (and by extension rehabilitation exoskeletons) into three categories:

1. Posture support mechanisms
2. Rehabilitation mechanisms
3. Robots [and exoskeletons] to assist or replace body functions

Human performance augmentation exoskeletons are classified as exoskeletons designed to enhance, or augment, the capabilities of *healthy* people. Applications vary from fatigue reduction and lifting assistance to military focused use of increasing soldiers' endurance and load carrying capacity. Other examples of human performance augmentation classified exoskeletons include emergency services, construction, material handling (Brown, M., Tsagarakis, N., and Caldwell, D.G., 2003), and weapons training (Schnieders, T.M., Stone, R.T., Oviatt, T., and Danford-Klein, E., 2017) as well as any application that requires heavy lifting or heavy gear in rough terrain that is otherwise impassable by vehicles.

LOWER BODY EXOSKELETONS

Exoskeletons that are utilized in the lower body are primarily comprised of hip joint, knee joint, and ankle joints. Among the many different challenges involved in developing an exoskeleton for lower body are the interface between human and the exoskeleton, portable energy sources, controls, and actuators. The lower body exoskeletons can be divided into two types based on application: rehabilitation and enhancement capabilities of healthy human beings.

Most lower body exoskeleton robots were first designed to assist soldiers in supporting equipment. These wearable lower body exoskeletons can significantly reduce the oxygen consumption of soldiers and support energy for walking, running and help movement and operational capability of the soldiers (Yuan, P., Wang, T., Ma, F., and Goug, M., 2014). It is important to understand the biomechanics of humans to develop designs of exoskeletons and active orthoses for the lower limbs (Dollar, M.A. and Herr, H., 2008).

The Berkeley Lower Extremity Exoskeleton, or BLEEX, is the first energetically autonomous robotic exoskeleton that was successfully demonstrated to provide the operator with the ability to carry significant loads with minimal effort over any type of terrain. BLEEX has four critical features: (1) A novel control scheme, (2) high-powered compact power supplies – hydraulic and electric actuations that have been designed to power BLEEX, (3) special communication protocol and electronics, and (4) design

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

architecture to decrease the complexity and power consumption (Chu, A., Kazerooni, H., and Zoss, A., 2005) (Zoss, A.B., Kazerooni, h., and Chua, A., 2006).

The BLEEX leg kinematics are similar to the human leg kinematics (anthropomorphic architecture). In general, BLEEX has ankle, knee, and hip joints like a person. The ankle has three DoF, just like a human ankle joint. However, only the dorsi/plantar flexion joint is aligned with the human joint. The knee has only one DoF (rotary) while the human knee has three DoF (rotary and sliding). This allows BLEEX to perform only basic flexion and extension. The hip has, like the human, three DoF. However, only the BLEEX hip flexion and extension joint is aligned with the human hip. BLEEX's final DoF is compliancy built into the front of the foot to yield similar flexibility to human toe joints (Zoss, A. and Kazerooni, H., 2006).

The BLEEX enables its wearer to carry a heavy load. It was first presented by U.C. Berkeley's Human Engineering and Robotics Laboratory supported by the Defense Advance Research Project Agency (DARPA) (Dollar, M.A. and Herr, H., 2008). The BLEEX seeks to supplement the intelligence and sensory systems of a human with significant strength and endurance with a pair of wearable robotic legs that offers a payload capacity (Chu, A., Kazerooni, H., and Zoss, A., 2005).

The HAL-5 system was developed from HAL-3. It is composed of three main parts: (1) exoskeleton and actuator, (2) controller, and (3) sensor (Uemura, M., Kamaoka, K., and Kawamura, K., 2006). Upgraded from HAL-3, the HAL-5 system utilizes a number of sensing modalities to control the EMG electrodes placed below the hip and above the knee on both the front and back sides of the user's body by connecting measurements, sensors, and the accelerometer (Herr, H., 2009) (Guizzo, E. and Goldstein, H., 2005).

In other words, the HAL-5 was updated from previous versions to include upper-body limbs, lighter and more compact power units, longer battery life, and a better body shape to fit humans more easily. This suit also includes two control systems— voluntary control and autonomous control (Guizzo, E. and Goldstein, H., 2005). Therefore, this version of the HAL exoskeleton is designed not only to help disabled patients in hospitals and the elderly, but also to support workers with demanding physical jobs, such as disaster rescue or construction (Guizzo, E. and Goldstein H., 2005).

Sarcos, an engineering and robotics firm, first developed the XOS2, a second-generation robotics suit, in 2006 after receiving a grant from DARPA. Sarcos was purchased by Raytheon in 2007.

The wearable suit enables the user to enhance human strength and agility, supports the soldier's capabilities for movement with power, and lift heavy objects (Raytheon, 2014). The XOS2, updated from a first-generation robotic suit—the XOS1 model, has the capability for a weight overload on one foot by using powered limbs. This exoskeleton can punch a bag, climb stairs, and kick a ball (Raytheon, 2014). Although these dynamic functions of the suit have been developed, an energy problem with the suit has not yet been resolved. It is limited due to a low battery density (Yuan, P., Wang, T., Ma, F., and Gong, M., 2014).

The XOS2 is a whole-body exoskeleton and does not entirely imitate the shape of humans with a much larger frame (Yuan, P., Wang, T., Ma, F., and Gong, M., 2014).

For military usage, the XOS2 needs to be reduced in size and have a simpler, more anatomic structure. The XOS2 utilizes several different sensors to minimize the amount of assistance the soldier receives. This allows for less effort by the soldier because the exoskeleton supports a large portion of the load (Yuan, P., Wang, T., Ma, F., and Gong, M., 2014)

The ReWalk, a wearable robotic exoskeleton, (Argo Medical Technologies Ltd., Yokneam Ilit, 20692, Israel) is one of the most unique exoskeletal robotic technology products that utilizes people's movements to control externally powered walking (Reinkensmeyer, D.J., Dewald, J.P.A., and Rymer, W.Z., 1999).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The ReWalk supports powered hip and knee motion to enable individuals with a spinal cord injury (SCI) to stand upright and walk (ReWalk, 2014).

The design system allows independent, controlled walking and standing while simulating the natural gait patterns of the legs (Zelig, G. et al., 2012). The pilot study found that the ReWalk is safe and tolerated well. There were no significant complications related to cardiovascular stresses, fatigue, excessive skin pressure, and muscle pain (Zeilig, G., Weingarden, H., Zwecker, M., Dudkiewicz, I., Bloch, A., and Esquenazi, A., 2012).

In the study, eight participants successfully reached different levels of walking. Although the devices have significant potential physiological benefits, they still have not attained proficiency to be a functional daily use device. One of the major issues is that functional use of the commercially available ambulation devices for paraplegics is the high-energy demands imposed.

Developed by the Wyss Institute, the Soft Exosuit consists of a combination of sensors, such as a hyperelastic strain sensor and sensors around the wearer's hips, calves, and ankles secured by straps (Soft Exosuit, 2014). This Soft Exosuit has strong commercial potential for helping spinal-cord injury patients walk or helping soldiers carry heavy loads (Soft Exosuit, 2014).

The main benefit of the Soft Exosuit is its extremely light design due to the soft material. The soft flexible materials cannot only interface with the wearer but also provide a flexible structure so assistive torques can be applied to the biological joints (Soft Exosuit, 2014).

The wearer's bone structure must sustain all the compressive forces normally encountered by the body plus the forces generated (Asbeck, A.T., Dyer, R.J., Larusson, A.F., and Walsh, C.J., 2013). Therefore, the Soft Exosuit, as a potential tool, cannot only help physical workers with hard tasks and support gait but also assist in rehabilitation and protection from injury or spinal cords from impairment from heavy physical activity (Asbeck, A.T., Dyer, R.J., Larusson, A.F., and Walsh, C.J., 2013).

Focused on Low impedance – the RoboKnee, a prototype exoskeleton, presents low impedance to the wearer and has a natural interface. To achieve transparency, the exoskeleton must successfully perform the following functions: determine the user's intent, apply forces when and where appropriate and present low impedance, i.e. "get out of the way."

A series elastic actuator is used to achieve low impedance and is attached to the lower and upper part of the leg so that it provides torque across knee providing one DoF. User intent is determined through the knee joint angle and ground reaction forces (Pons, J.L., Moreno, J.C., Brunetti, F. J., and Rocon, E., 2007).

The RoboKnee allows the wearer to climb stairs and perform deep knee bends while carrying a significant load in a backpack. The device provides most of the energy required to work against gravity while the user stays in control, deciding when and where to walk, as well as providing balance and control (Pratt, J.E., Krupp, B.T., and Morse, C.J., 2014).

Due to low energy density of batteries, the RoboKnee does not yet achieve the long-life requirement. While it is very comfortable to use, the current implementation is somewhat difficult to don and doff. While the RoboKnee enhances strength and endurance, it was not designed for enhancing the user's speed, and, in fact, it restricts the user from running (Pratt, J.E., Krupp, B.T., and Morse, C.J., 2014). A recommendation from authors was to develop exoskeleton that incorporates other joints than just the knee (Pratt, J.E., Krupp, B.T., and Morse, C.J., 2014).

Lower exoskeleton robots should have the following characteristics: (1) light weight actuation and efficient transmission; (2) ability to maintain power, actuation, and other subsystems, off the shelf components do not meet the low weight, high efficiency, and other criteria needed to accomplish their

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

design objective; and 3) examine quantitative performance results for exoskeleton devices that reportedly improve human locomotion.

To achieve the above characteristics, lower exoskeleton robots should develop computing, sensing, and control without pervasive application. Therefore, matching the structure of the exoskeleton to the wearer is one of fundamental factors: (1) alignment between joints of robot and the wearer; (2) segment running or jumping ability; (3) safety of human operator; (4) interfacing exoskeleton or active orthoses to the human body naturally.

UPPER BODY EXOSKELETONS

Upper body exoskeletons have many similar complications to that of the lower body but have their own additional slew of challenges that stem from their more varied types of upper body applications. While the primary function for most lower body exoskeletons is to bear weight and transport loads, "the main function of the arm is to position the hand for functional activities" (Rocon, E. et al., 2007). In addition to the more complicated functions being performed, the upper limb joint anatomy is complex. For example, the shoulder is located near three bones (clavicle, scapula, and humerus), and has four articulations. The calculations have involved dynamics and irregular centers of rotation (Gopura, R.A.R.C. et al., 2009).

A lot of research and development was done for using exoskeletons in the medical and rehabilitation field. While ABLE, developed at CEA-LIST Interactive Robotics Unit, was designed to have multiple purposes, its first application was in a rehabilitation project.

Further applications for industry and professional fields are in view such as intuitive telerobotics, as a haptic device for Virtual Reality (VR), and for sports training. ABLE used a circular guide for the shoulder joint, which solved the problem of singularity. The exoskeleton used a screw cable system and was able to be integrated with the motor power transmission of another robotic system without modification. The ABLE-7 axis model has lighter weight and a 3-axis open forearm-wrist, which can be used for teleoperation and virtual reality (Garrec, P., Friconneau, J.P., Measson, Y., and Perrot, Y., 2008).

ARMin is used for the rehabilitation purpose of the arm, which has four DoF and two passive DoF enabling elbow flexion/extension and shoulder rotations. It was installed with multiple sensors for position, force, and torque, so that this robotic system can combine the cooperation and motivation of the patients into the therapy activities and give the support to the patients based on their needs.

The development of ARMin is in prototyping and additional supervision from therapist needed for safety. Special mechanical design can be seen in ARMin, which includes customized module for upper arm rotation enabling small friction during rotation and patient comfort for wearing the device (Miller, C., Ruiz-Torres, R., Stienen, A. H. A., Dewald, J. P. A., 2009).

ARMin II, the second iteration, is a 7 DoF robotic system designed for therapy purposes. It can adapt to different patients' sizes with adjustments of five parts and be optimized for combining user cooperation with control strategies. The ARMin II is under evaluation and testing for further improvements (Mihelj, M., Nef, T., and Riener, R., 2007).

The Cable-Actuated Dexterous Exoskeleton for Neurorehabilitation (CADEN-7) is an anthropometric 7 DoF powered exoskeleton system that offered several advantages over other designs at the time of its development. "The anthropomorphic nature of the joints combined with negligible backlash in seven force reflecting articulations sets the CADEN 7 apart from other arms in the field (Perry, J and Rosen, J., 2006)." The CADEN-7 features low-backlash gearing, back drivable transmissions, low-inertia links,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

high stiffness transmissions, open mechanical human machine interfaces (mHMI's), and a range of motion (ROM) representing 99 percent of a human physiological ROM (Perry, J. and Rosen, J., 2006).

CADEN-7 was used in the development of myoprocessors for the upper limb based on the Hill phenomenological muscle model. Genetic algorithms were used to optimize the internal parameters of the myoprocessors using an experimental database that provided inputs to the model. Research results indicated high correlation between joint moment predictions of the model and the measured data, suggesting that the myoprocessor was sufficiently robust for further integration into exoskeleton control systems (Perry, J. and Rosen, J., 2006).

Cable-driven arm exoskeleton (CAREX) has lighter weight compared to a traditional rigid exoskeleton. Cables are used to move human upper body segments, which are powered by motors and guided by cuffs. CAREX can provide push and pull with predefined force in required direction during rehabilitation trainings (Mao, Y. and Agrawal, S.K., 2012).

The current Mirror Image Movement Enabler (MIME) robotic device was the development result from the continuous work from 1998. Early research indicated that bilateral training was more effective than unilateral training when using similar movements. A robotic controller (PUMA 560) was used to manipulate the forces needed, which therapists use for the normal therapy training.

The movements assisted by robot can be classified as 4 different types: passive, active-assisted, active-constrained, and bilateral. During passive training, the robot moves the human arm to reach the target with a defined path without human effort. During active-assisted training, humans initiated the movement using force and collaborated with the robotic device to reach the target. During active-constrained training, desired movements were defined by the robot and maximum effort of the human was needed to reach the target. During bilateral training, the target arm was assisted by the robot to do the same movement as the contralateral arm. In this study, Fugl-Meyer and EMG data were collected and analyzed for rating the improvement of the participants and the muscle engagement during the training (Lum, P.S. et al., 2006).

The SUEFUL-7 is 7 DoF upper-limb motion assist exoskeleton robot used to test electromyographic (EMG) control methods using neuro-fuzzy modifiers in assisting the motions of shoulder vertical and horizontal flexion/extension, shoulder internal/external rotation, elbow flexion/extension, forearm supination/pronation, wrist flexion/extension, and wrist radial/ulnar deviation of physically weak individuals. The use of the neuro-fuzzy modifiers allows impedance parameters to be adjusted in real time by considering the upper-limb posture and EMG activity levels (Gopura, R. A. R. C. et al., 2009).

WREX was designed and developed to assist children for daily living activities who do not have enough strength for their arms. WREX has 5 DoF and allows a wide range of naturalistic motions. The modified version for training stroke patients was called Therapy Wilmington Robotic Exoskeleton (T-WREX). The T-WREX contains an orthosis, a grip sensor and software, which enables a wide reach of the arm across the workspace, hand grip pressure detection and functional training movement simulation (Sanchez, R.J. et al., 2006).

The wearable orthosis for tremor assessment and suppression (WOTAS) provides a means of testing and validating non-grounded (i.e., wearable) control strategies for orthotic tremor suppression (Rocon, E. et al., 2007). Unlike most exoskeletons that seek to enhance intended muscle movement, the purpose of WOTAS is to dampen unintended movement, and it can operate in both active and passive damping modes. The control algorithm of WOTAS must distinguish between wanted and unwanted movement.

The Titan Arm is a lightweight upper body exoskeleton designed to closely mimic the human range of motion and assist weakened individuals regain mobility and independence. The Titan Arm provides 3

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

DOF with non-localized actuation and a ratchet based braking system that allows the Titan Arm to hold static loads without requiring force from the user (Beattie, E., McGill, N., Parotta, N., and Vladimirov, N., 2012). The Titan Arm carries most of its weight in the back-plate and can augment the user's lifting strength by up to 40 lbs. In addition, the system can provide real-time joint tracking which can be streamed to a computer for analysis.

Most upper limb rehabilitation systems have been developed for unilateral training, but the upper limb exoskeleton rehabilitation device (ULERD) can be used for bilateral training. The ULERD has three active DoF and four passive DoF. The ULERD incorporates a commercial haptic device known as Phantom Premium, as well as an inertia sensor known as MTx, to detect input signals from one arm which is held stationary. The output movement is performed by a wearable exoskeleton on the right arm (Song, Z. and Guo, S., 2011).

EXTREMITIES

Much of the literature for hand exoskeletons points towards their use in rehabilitation. However, there has also been work done looking at the use of hand exoskeletons as haptic interfaces for interaction with the virtual environments and extra vehicular activities in space. In addition, hand-based exoskeletons have been making advancements in rehabilitation.

The Hand Exoskeleton Rehabilitation Robot, or HEXORR, is an exoskeleton whose robot joints are aligned with anatomical joints of the human hand and provides direct control of these hand joints. HEXORR uses a low-friction gear train and electric motors. This combination allows for both position and torque control which is an advantage. Additional advantages which HEXORR provides is the psychologically accurate grasping patterns which is controlled with just two actuators as against some complex designs that use eighteen actuators. All these factors make HEXORR unique compared to other devices (Schabowksv, C. M., Godfrey, S. B., Holley, R. J., and Lum, P. S., 2010).

The use of EMG signals to control exoskeletons is becoming more commonplace, especially in paraplegics and quadriplegics (Au, A.T.C., Arthur, R. C., and Kirch, R.F., 2000)(Ito, K., Tsuji, T., Kato, A., and Ito, M., 1992)(Kirsh, R.F., and Au, A.T.C., 1997) (Kuribayashi, K., Shimizu, S., Okimura, K., and Tamiguchi, T., 1993). There are over 12,000 new cases of spinal cord injury per year (FSCIP, 2014) and "nearly half of these cases result in a loss of sensation or motion to the arms and hands" (Lucas, L., DiCicco, M., and Matsuoka, Y., 2004). The researchers at Carnegie Mellon University developed an effective EMG-based hand exoskeleton that enabled pinching movements in patients who lacked hand mobility with the use of a functional electrical stimulation system - a system that stimulates muscles that no longer receive signals from the central nervous system - and a low-profile lightweight exoskeleton that consisted of "an aluminum anchoring plate mounted to the back of the hand and three aluminum bands, one for each of the finger bands (Lucas, L., DiCicco, m., and Matsoka, Y., 2004)," in conjunction with steel cabling that runs along the front of each finger band, a pneumatic cylinder, and a mechanical linkage mechanism.

An exoskeleton designed for upper arm rehabilitation and hand grasp training called the IntelliArm can control the user's shoulder, elbow, wrist, and finger with 8+2 DOF. The IntelliArm builds on the research of MIT MANUS, an upper body arm exoskeleton that assisted in arm reaching movements in post stroke rehabilitation (Hogan, N., Krebs, H.I., Sharon, A., and Charnaron, J., 1995) (Krebs, H.I. et al., 1997); Reinkensmeyer et al.'s Arm Guide robot, another upper body arm exoskeleton that was used

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

to treat and evaluate post stroke patients by guiding their arm along a linear guide (Reinkensmeyer, D. J., Dewald, J. P. A., and Rymer, W. Z., 1999); and an industrial robot attached to a forearm splint called MIME, or a mirror image motion enabler, that assisted movement passively or actively (Burgar, C.G., Lum, P.S., Shor, P.C. and Machiel Van der Loos, H.F., 2000). The IntelliArm also built on the work of the ARMin, described earlier. The designs of the other rehabilitation robots that the IntelliArm built upon did not consider patients' hand posture. The researchers found that if they were to "ignore a proper control of the muscle tension of a subject's hand, the robot training may lower hand/fingers flexibility and potentially cause an abnormal muscle tone (Ren, Y., Park, H., and Zhang, L., 2009)."

A tendon driven exoskeleton that controls flexion of two degrees of freedom per finger was designed for physical therapy at the University of Salford (Sarakoglou, I., Tsagarakis, N. G., and Caldwell, D.G., 2004). A hand exoskeleton for the rehabilitation of stroke patients is the Rutgers Master II which actuates the user's fingers via four pneumatic pistons located inside the palm (Bonzit, M., Burdea, G., Popescu, G., Boizan, R., 2002).

Another hand exoskeleton designed for stroke patients is the Wrist/Finger Force Sensing module (WFFS) which is used during movements of the upper limb in chronic hemiparetic stroke patients. "The WFFS measures isometric flexion/extension forces generated by the wrist, fingers, and thumb during 3-D movements of the paretic upper limb (Mizen, N.J., 1965)." Unlike other hand exoskeletons, the WFFS can generalize 3-D movements of the hand in conjunction with the rest of the limb. This hand exoskeleton acts as a lightweight, portable, and rigid forearm orthosis of the ACT^{3D} robot. This allows for measurements of wrist and finger forces during any tasks that the ACT^{3D} normally performs.

One research focus is geared towards assisting astronauts in extravehicular activities or EVA. The current gloves used by NASA are less flexible than desired, requiring mechanical work to displace the glove and to hold the glove in any given position. This additional required work reduced EVA productivity and fatigues astronauts' hands. Work has been done to create a motorized hand exoskeleton with the ability to perform a power hand grasp and a precision finger grasp. The design consisted of a series of drivers, mechanical stops, sensor arrays, four bar linkages, DC motors, and cable driven cam systems. Human hands are particularly complex with over 25 degrees of freedom (Shields, B.L., Main, J.A., Peterson, S.W., and Strauss, A.M., 1997). The hand exoskeleton reduced the allotted degrees of freedom significantly leading to the system's primary shortcoming - the coupling of joints in the hand exoskeleton. The researchers found that if motion for one finger was attempted, the other fingers would also be forced to move, if only a little bit. Additionally, the sensor array would sometimes pick up hand motions that were not there causing undesired exoskeleton motion.

A robotic concept called Skil Mate was introduced to revitalize almost all human works skill on production sites introducing cooperation between human and robotic machines. This project was put into practice in August 1998. The aim of the project was to manufacture an exoskeletal structure to be worn by astronauts for EVA. It is designed to have no intelligence and memory but works synchronously with skilled workers. The exoskeletal structure covers the worker's arms, hands, fingers, body and legs (Umetani, Y. et al., 1999).

Much of the early literature for hand exoskeletons is geared towards their use as haptic feedback for virtual reality and augmented reality environments. VRLogic's CyberGrasp is a commercially available haptic interface for the hand that delivers a force feedback system to the fingers and hand. It utilizes pull cables with brakes on their distant end to restrict movement (VRLOGIC, 2014). A hand exoskeleton was developed at the Robotics Center-Ecole des Mines de Paris that can support bidirectional movement for two fingers. It is capable of four degrees of freedom for each finger, but can only control one at a time

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

using a pull cable (Stergiopoulos, P., Fuchs, P., and Laurgaeau, C., 2003). Another hand exoskeleton developed for haptic feedback is the LRP Hand Master. It can support 14 bidirectional and actuated degrees of freedom (Tzafestas, C.S., 2003).

The reason for building the Knee Ankle Foot Orthosis, or KAFO, was to extend the pneumatically powered ankle orthosis concept to the knee and test its performance on healthy walkers. The KAFO was built with a unilateral powered knee-ankle-foot-orthosis with antagonistic pairs of artificial pneumatic muscles at both the ankle (i.e. plantar flexor and dorsiflexor) and the knee (i.e. Extensors and flexors) (Sawicki, G.S. and Ferris, D.P., 2009).

GAIT is an exoskeleton conceived as a compensation and evaluation system of pathological gait for application in real conditions as a combined assistance and assessment methodology of the problems affecting mobility in individuals with neuromotor disorders. Interaction with the human neuromotor system to assist locomotion requires adequate design of the components, both the biomechanical and functional aspects. Robotic exoskeletons conceived as an aid to mobility are designed to be used in numerous environments (Pons, J. L., Moreno, J. C., Brunetti, F. J., and Rocon, E., 2007).

FULL BODY EXOSKELETONS

The Berkeley Lower Extremity Exoskeleton, mentioned in the Lower Body portion of this document, is just the beginning work for the University of California, Berkeley. The researchers also plan to develop an upper body exoskeleton. After they are certain that both are capable of functioning independently, they will attempt to integrate the two systems (Kazerooni, H., 2005).

Ekso by Ekso Bionics is a primarily lower body exoskeleton for individual with any amount of lower extremity weakness or limb pathology to stand and walk. The exoskeleton uses battery powered motors to drive the legs when the exoskeleton's sensors pick up intended movement. The exoskeleton can provide natural gait and assists in gait training for patients who suffer from complete paralysis and who have minimal forearm strength (Ekso Bionics, 2014). The Ekso exoskeleton is considered a Class I medical device in the United States, a Class I medical device in Australia, and a Class IIa medical device in the European Union (Ekso Bionics, 2014).

Lockheed Martin's Human Universal Load Carrier (HULC) is a hydraulic-powered, titanium, anthropomorphic exoskeleton designed for military use. It can carry up to 200lbs, march at 3 mph, sprint at 10 mph, can travel 20 km on level terrain at 4 km per hour, and can be set to a long-range mode for extended 72-hour missions (HULC, 2014). The HULC weighs in at 53 lbs., is powered by lithium polymer batteries and can integrate with armor, heating and cooling systems, additional sensors, and other custom attachments.

The U.S. Government has officially sanctioned a full body exosuit for military use. The Tactical Assault Light Operator Suit, or TALOS, is the planned future of warfare. The US Army requested white papers from academia, industry, public labs, and any interested individuals on how to design and build TALOS (Singularity HUB, 2014). There hasn't been much released on this in development suit; however, there has been speculation that TALOS will feature an already designed exoskeleton at its core (Singularity HUB, 2014). The most likely candidates currently are Lockheed Martin's HULC and Raytheon's XOS 2.

TALOS, when fully completed, will be bulletproof, weaponized, able to monitor vitals, give wearer superhuman strength and perception, have layers of smart materials and sensors, and use wide-area networking and on-board computers to provide more substantial situational awareness (ARMY.MIL,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

2014). The U.S. Army Research, Development and Engineering Command, known as RDECOM will be involved in every aspect of TALOS development.

THE TECHNOLOGY OF EXOSKELETONS

Exoskeletons are very complex machines that attempt to mimic and augment human motion. These machines typically augment human performance using a pump or other form of actuation. Sensing can be accomplished with EMG. Unlike the Pneumatic actuators in the section below, hydraulic pumps do not have a high degree of compliance. They are relatively rigid and can be made compliant only through use of complex strategies. The feature that distinguishes these artificial muscles is the way inflation and deformation is handled. At pressures of about 500kPa to 800kPa which is ideal, hydraulic operators suffer from a very bad power to weight ratio which makes them less attractive. Hydraulic operators are preferred in rare situations where the manipulator is powered underwater. In such cases, the weight problem is eliminated since the surrounding fluid is the same as the driving fluid (Daerden, F. and Lefeber, D., 2002).

The hydraulic system for an exoskeleton comprises of an oil tank, motor, oil pump, one-way valve, pressure sensor, servo valve and an actuating cylinder. The hydraulic system has an advantage that the current motion is being sensed by a sensor. The speed of the actuating cylinder can be controlled precisely by moving a spool of the servo valve, speed of the motor and the oil pump component (Patent 467004A, 2014). With hydraulic systems, high pressures can be used which aids to the reduction in size of the operating system. However, these systems are not fire proof and they are noted for leakage and high maintenance (Patent 467004A, 2014).

Electric motors are the favored option because they are simple to install, lightweight, small, generally silent, and offer a clean actuation system (Bouzit, M., Burdea, G., Popescu, G., and Boian, R., 2002).

Hydraulic actuators use pressurized fluid to transmit power to a joint. This actuator has a very large potential force and torque, but it is noisy and needs a complex apparatus to work (compressor, cooling system, etc.) (Bouzit, M., Burdea, G., Popescu, G., and Boian, R., 2002).

Pneumatic Actuators use pressurized gas to produce output force. In comparison to hydraulic actuators, pneumatic ones are lighter in weight and cheaper. Moreover, they offer a clean, non-flammable alternative actuation device (they also require a compressor or a rechargeable pressured tank). Artificial pneumatic muscles are referred to as McKibbon muscles (Bouzit, M., Burdea, G., Popescu, G., and Boian, R., 2002).

Pneumatic Actuators were largely used in automation segments of manufacturing. Lately this technology has been used by robotics as a main motion power source (Bouzit, M., Burdea, G., Popescu, G., Bonian, R., 2002). One of the most attractive features of the Pneumatic Actuator is the low weight trait. Its complaint behavior is also one of its favorable features. Compliance is due to the compressibility of air and can be controlled by adjusting the operating pressure. This is one of most important requisites when there is human-machine interaction. The compliance of the system guarantees a safe and easy interaction.

There are several types of pneumatic actuators: cylinders, bellows, pneumatic engines and pneumatic stepper motors. There is another kind called the Pneumatic Artificial Muscles (PAM). These contract on inflation since their core is very similar to a membrane which makes them extremely light-weight and spring like. Due to this nature they are widely used to power exoskeletons (Bouzit, M., Burdea, G., Popescu, G., and Boian, R., 2002).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Pneumatic Actuators are contractile and linear motion engines operated by gas pressure. Their core is made of a flexible membrane that is connected to the load on both ends by fittings and mechanical power. When the membrane is inflated it bulges and when deflated it gets squeezed. The force and motion thus generated are linear and unidirectional. The source of energy is usually air. The air pressure inside and outside the actuator is different and this aids to powering the actuator.

Magnetic brakes, as a passive technology, limit the motion by absorbing energy generated by the user. However, they are relatively heavy (Bouzit, M., Burdea, G., Popescu, G., and Boian, R., 2002).

Shape memory allows (SMA) are made from titanium-nickel (TiNi) metal and modify their shapes with a change in temperature. When heated, the wire or spring structure deforms producing very high forces. On the other hand, metal alloys can only generate small displacements (Bouzit, M., Burdea, G., Popescu, G., and Boian, R., 2002).

Piezoelectric motors convert vibrational motion into translational or rotational motion. When a piezoelectric material vibrates, frictional forces generate torque or force. Piezoelectrics are not widely used because they are difficult to manufacture and are quite expensive (Bouzit, M., Burdea, G., Popescu, G., and Boian, R., 2002).

Controls

- *Hand Held Controls*
  - Hand held pushbutton controllers are often used in conjunction with pneumatic muscles (Ferris, D.P. and Lewis, C.L., 2009).
- *Footswitch Control*
  - With this control scheme, the pressure in the pneumatic muscle is controlled based on the signal from a place in the subject's shoe (Ferris, D.P. and Lewis, C.L., 2009).
- *Proportional Myoelectric Control*
  - In this control scheme, the air pressure delivered to the artificial pneumatic muscle is directly proportional to the electromyographic (EMG) signal from a biological muscle (Ferris, D.P. and Lewis, C.L., 2009).
- *Passive Rehabilitation Controls*
  - Controls used in passive rehabilitation - without any effort from the wearer
    - Proportional Derivative (PD) controller (Lalami, M. et al., 2013)
    - Proportional Integral (PI) controller (Lalami, M. et al., 2013)
    - Proportional Integral Derivative (PID) controller (Lalami, M. et al., 2013)
    - Hybrid Assistive Limb (Combination of PD and EMG) (HAL-5) (Lalami, M. et al., 2013)
    - Exoskeleton Intelligently Communicating and Sensitive to Intention (EICOSI) controller (Lalami, M. et al., 2013)

Electromyography (EMG) can detect and receive signals from human skeletal muscle activity using electromyography. The muscle cells generate electrical signal during motion, which can be recorded and analyzed by EMG technology to study human biomechanics. This application was applied for a control method of exoskeletons using human intention for movements. EMG signals can represent the real-time muscle engagement information, which can enable manipulation of the exoskeleton in real time and simplify the control process. Gopura et al. (2009) combined Fuzzy-neuro with the EMG technique for the control process and used impedance as the intermediate controller to parameterize the real-time

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

control based on postures and EMG signals. Problems of this method are that different people react different during motion as degrees of freedom increased the complexity of rules will increase as well (Gopura, R.A.R.C. et al., 2009).

Electro-rheological fluid can turn solid in less than a millisecond with the application of a voltage. This would provide resistance to motion on a healing joint and aims to help the muscle regain strength (Casolo, F., Cinquemani, S., and Coceta, M., 2008).

THE FUTURE OF EXOSKELTONS

Lo et al. (2012) stated that the exoskeleton training using in rehabilitation could potentially enable self-therapy activities without involvement of therapist, which can reduce the rehabilitation cost. Exoskeleton training could be flexible not limited to time and location, which can reduce schedule conflicts and provide a more frequent training. The cost associated with these problems can be reduced (Lo, H.S. and Xie, S.Q., 2012).

Rehabilitation improvement relies on intensity of training and patients' motivation. Recent studies on exoskeleton for rehabilitation indicate that the exoskeleton can provide trainings with different levels and more frequently compared to the traditional therapist training. Experimental results also show that the exoskeleton assisted trainings are effective for activities of daily living, which could benefit the stroke patients recover from neurological and orthopedic damages (Mihelj, M., Nef, T., and Rienner, R., 2007). Games are integrated into the exoskeleton training activities. Training processes are designed as games in order to provide patients with an entertaining experience, which can improve their motivation of therapy (Housman, S.J., Le, V., Rahman, T., Sanchez, R.J., and Reinkensmeyer, D.J., 2007) (Lo, H.S. and Xie, S., 2012).

Exoskeleton are used as human assistive devices in an industrial environment by reducing the load on human body, which extend the human capabilities. In virtual reality, the exoskeleton can be used as haptic device to allow human users to interact with virtual objects by parameterizing proper force based on their characteristics. Additionally, the exoskeleton served as a master device for manipulating control systems (Rosen, J., Perry, J.C., Manning, N., Burns, S., and Hannaford, B., 2005).

In order to enhance a soldier's capability and reduce soldier's workload, exoskeletons were developed to assist soldiers with better performance for heavy weapon carrying and firing (Winder, S.B. and Esposito, J.M, 2008). Among the most critical challenge lies in the design of a controller to allow natural movement of a highly articulate prosthetic with minimal ethical and physical invasion. For the foreseeable future, the first step is to determine a mapping from EMG patterns to muscle forces; this should be a primary research focus over the next few years. This method will allow individual finger movements coordinated with the hand, wrist, and elbow, unlike anything current prosthetics can accomplish. This will significantly increase the quality of life for the wearer and the utility of any prosthetic. Furthermore, perceiving and exploiting the intricacies of low-level neural signals will open the door for deeper understanding of cortical control and other methods tapping into spinal or peripheral nerves, thus jumpstarting the field of neuroprosthetics (Dellon, B. and Matsuoka, Y., 2007).

Actuator and power supply technologies still have limitations: current actuators are unable to provide both a high power-to-weight ratio and high bandwidth while modern power supplies have insufficient energy density (Lo, H.S. and Xie, S.Q., 2012). PMA has a high power-to-weight ratio but lack bandwidth

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

while motors have sufficient bandwidth but have a poor power-to-weight ratio (Lo, H.S. and Xie, S.Q., 2012).

Current mobile exoskeleton robots rely on a lower limb exoskeleton to carry the weight of the actuators and power supply. Although this has been shown to a feasible approach with the recent success of the full body HAL-5 exoskeleton for assisting the elderly and physically weak, improvements on the weight and efficiency of the actuators and power supplies are needed to achieve better exoskeleton performance (Lo, H.S. and Xie, S.Q., 2012).

Another limitation is the singular configurations present in the exoskeletons 3 DOF shoulder complex which occurs when two rotary joints align with each other, resulting in the loss of 1 DOF. The current method used to address the problem merely shifts the configuration to an uncommon posture rather than eliminating the configuration from the upper limb workspace (Lo, H.S. and Xie, S.Q., 2012).

There is limited consideration of the interactions between the exoskeleton and the human user. The mechanical HRI location and interface area for optimal load transfer and comfort have not been considered in current exoskeletons (Lo, H.S. and Xie, S.Q. 2012).

The attachment locations of mechanical interfaces and EMG electrodes will inevitably vary each time the exoskeleton is worn. To enable better use of exoskeletons in practice, the device needs to be able to adapt to variations without long calibration downtimes.

WHAT CAN WE DO TO MAKE EXOSKELETONS BETTER?

There are few areas related to the mechanical design of exoskeletons that show promise and have largely been overlooked.

An improved understanding of walking and other movement may shed light on more effective exoskeleton leg architectures (Dollar, M.A. and Herr, H., 2008). Gait models based on actual machine elements that capture the major features of human locomotion may enhance the understanding of human leg morphology and control and lead to analogous improvements in the design of efficient, low-mass exoskeletons (Dollar, M.A. and Herr, H., 2008).

Investigation of non-anthropomorphic architectures may provide solutions to some of the problems associated with closely matching the structure of the exoskeleton to the wearer such as the need for close alignment between joints of the wearer and the exoskeleton (Dollar, M.A. and Herr, H., 2008). More research is required on recreational exoskeletons that augment running or with jumping ability (Dollar, M.A. and Herr, H., 2008).

Besides enabling technology and mechanical design there are a few issues related to the implementation of exoskeletons and active orthoses that needs further studying (Dollar, M.A., and Herr, H., 2008). Designing an exoskeleton with good mechanical strength, less weight, sufficient grip force, low power consumption, computational capability compatible to control scheme and high speed of operation (Singh, R.M. and Chatterji, S., 2012).

The design of structure is one area where an imaginative design may reduce lot of stress from weight constraint. The grip force and power consumption can be taken care by the proper choice of the actuators (Singh, R.M. and Chatterji, S., 2012).

The ideal requirements are materials for mechanical structure having mechanical strength, flexibility and weight like bone, the controller having computational capability, speed and adaptability like brain,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

actuator having high torque and flexibility like muscles, and the feedback elements having sensing capability like skin (Singh, R.M. and Chatterji, S., 2012).

EMG is a relatively new technology. It has a definite potential to be used as control signal for multifunction prosthesis. There is need to draw correlation between the physiological, physical factors and the EMG signal (Singh, R. M. and Chatterji, S., 2012). Advanced algorithms need to be developed to extract useful neural information (Singh, R. M. and Chatterji, S., 2012). One of the innovative aspects is the combined use of electroencephalogram (EEG) and electromyography (EMG) to relay information for controlling the lower-limb exoskeleton (Singh, R.M. and Chatterji, S., 2012).

WHAT ARE THE ISSUES FACED IN DESIGNING FOR EXOSKELETONS?

Current power supplies have insufficient energy density for truly mobile exoskeletons (Lo, H.S. and Xie, S.Q., 2012). Large, heavy power supplies limit portability and are one of the major factors limiting application of exoskeletons outside of clinical therapy (Lo, H.S. and Xie, S.Q., 2012) and other "grounded" applications. Some researchers have proposed interim solutions such as mounting upper body exoskeletons to powered wheelchairs (Kiguchi, K., Rahman, M, H., Sasaki, M., and Teramoto, K., 2008), but improvements on the weight and efficiency of power supplies are still needed to achieve better exoskeleton performance (Lo, H.S. and Xie, S.Q., 2012).

"A mechanism that synthesizes a human-type motion will necessarily also be complex, particularly from the control standpoint. Therefore, researchers in this area have often tried to reduce the number of degrees of freedom to as great an extent as is practical (Shields, B.L., Main, J.A., Peterson, S.W., and Strauss, A.M., 1997)."

In designing a prototype hand exoskeleton (Shields, B.L., Main, J.A., Peterson, S.W., and Strauss, A.M., 1997), researchers reduced complexity by reducing DOF to one per finger but discovered problems with this approach. "The human hand has over 25 degrees of freedom, many of which are coupled by the ligamentous structure and location of tendon insertions. This coupling was clear during exoskeleton tests (Shields, B.L., Mian, J. A., Peterson, S.W., and Strauss, A. M., 1997)," in which undesired exoskeleton motion was observed. "One obvious solution to this problem is to add more degrees of freedom to the exoskeleton. This will unfortunately also result in added complexity, weight, and bulk, not to mention a more sophisticated controller (Shields, B.L., Main, J. A., Peterson, S. W., and Strauss, A. M., 1997)."

Researchers involved with the BLEEX lower body exoskeleton took a different approach to this tradeoff. "Each BLEEX leg has 7 DOF..., but actuating all of them creates unnecessarily high- power consumption and control complexity. Instead, only joints that require substantial power should be actuated… [S]ince the primary goal of a lower-extremity exoskeleton is locomotion, the joint power requirements for the BLEEX were determined by analyzing the walking cycle…. (Zoss, A.B., Kazerooni, H., and Chu, A., 2006)" Additionally, the hip and other joints were simplified such that overall the BLEEX represents a "near anthropomorphic" design (Zoss, A. and Kazerooni, H., 2006).

Many present upper body exoskeletons overcome weight or bulk issues by being mounted to a wall or stand (i.e., "grounded"), or to a wheelchair (Lo, H.S. and Xie, S.Q., 2012). This is adequate for applications where a limited and defined workspace is involved, or where a patient requires a wheelchair. While lower body and full body exoskeletons bear their own weight, there are many applications for which a wearable, "ambulatory" orthotic or assistive device is all that is needed. Improvements in mass, power density (see above) and actuation are necessary precursors to widespread use.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The aesthetic appeal of the exoskeleton will eventually have to be addressed, at least for some applications. For example, like many current exoskeletons, WOTAS was designed as a platform to explore a specific concept and not as a final orthotic solution. While it successfully demonstrated the feasibility of mechanical tremor suppression, it was too bulky and heavy to be used day-to-day (Rocon, E. et al., 2007). "The main wish expressed by the potential users was the possibility of hiding the exoskeleton under clothing (Rocon, E. et al., 2007)."

Skin surface EMG signals are often used as a control input because they directly reflect the intentions of the user, but EMG-based control is difficult to realize due to several issues: obtaining the same EMG signals for the same motion is difficult even with the same person, the activity of antagonist muscles affects the joint torque, many muscles are involved in a single joint motion, one muscle is simultaneously involved in more than one motion, the role of each muscle for a certain motion varies in accordance with joint angles, the activity level of some muscles such as bi-articular muscles are affected by the motion of other joints (Kiguchi, K., Rahman, M.H., Sasaki, M., and Teramoto, K., 2008) and the EMG signals can vary due to muscle fatigue (Lalitharatne, T.D., Teramoto, K., Hayashi, Y., Nanayakkara, T., and Kiguchi, K., 2013).

Additional uncertainty is related to the differences between humans and machines. "The exact locations of the human joint axes of rotation cannot be known on living subjects, due to coverage of the joints. Biological joints are not ideal "single DOF" joints, but have rather complex joint surface geometries, which cause shifting axes of rotation during motion. Additionally, fixation of a robotic device on a human limb is never rigid, such that slippage between the device and the limb will occur. This will lead to further misalignment between the mechanism and human joints (Schiele, A. and van der Helm, F.C.T., 2006)," on the order of a few centimeters. Such misalignment can lead to pressure sores on the skin, long-term joint damage, joint dislocation and cartilage damage, and stumbling (Schiele, A. and van der Helm, F.C.T., 2006).

The activity level of each muscle and the way of using each muscle for a certain motion is different between persons (Kiguchi, K., Rahman, M.H, Sasaki, M., and Teramoto, K., 2008). Several solutions proposed to provide adaptive control between users: adjusting impedance (Kiguchi, K. and Hayashi, Y., 2012), myoprocessors with optimization ("gene" modelling) (Cavallaro, E.E., Rosen, J., Perry, J.C., and Burns, S., 2006), adaptive gain (Kang, H. and Wang, J., 2013), neuro fuzzy modifiers (single) (Gopura, R.A.R.C., et al., 2009).

Safety is a paramount concern with robotic systems, especially for robots that must interact with humans. Unfortunately, "there is no industry-standard approach to designing these safety-critical robot systems. Numerous safety-critical software systems have been developed and deployed in other domains ranging from aircraft flight management systems to nuclear power plants (Roderick, S.M. and Carignan, C.R., 2005)." Similar analytical methods, such as fault tree analysis, should be applied to the design of robotic exoskeletons. Some common concerns with these systems are moving the human outside their safe position range, moving the human at an excessive velocity, and applying excessive torque to the human or allowing the human to apply excessive torque against the robot.

The system reaction to fault detection must also be carefully considered. For example, upon fault detection, the system could be commanded to either halt motion or power down the affected motors. Removing power has the undesirable effect of leaving the human to bear the weight of the device, which presents hazards of its own. This approach is only appropriate in response to more severe failures (Roderick, S.M. and Carignan, C.R., 2005).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The safety requirements for mechanical design of the upper body exoskeleton include: "axes deviation of wrist flexion/extension axis and wrist radial/ulnar axis" should be satisfied, "ill effect caused by the movement of the center of rotation of shoulder joint due to upper-arm motions should be canceled out," and "the mechanical singularity should not be occurred within the workspace of the robot (Gopura, R.A.R.C. and Kiguchi, K., 2009)."

The two main aspects that need good consideration are (Schiele, A., 2007) implementation of the actuation and motor control and intrinsic mechanical and kinematic design of their structure. To ensure the human safety when using exoskeleton, mechanical constraint combined with software limitations are most popular methods. CADEN-7 used mechanical constraints to prevent the excessive movement of body segments. CADEN-7 also used a pulley in design to enable slip when limitation reached. Electrical system of CADEN-7 contained 3 shutoff switches to set electrical constraints. Gupta et al. and Gopura et al. also used mechanical stops and control limitations to ensure safety (Gopura, R.A.R.C. et al., 2009).

Chapter 3
Positive Psychology and Aging

Jyoti Mishra Pandey
Government Medical College and Hospital Chandigarh, India

Shobit Garg
SMI Medical College and Hospital, India

ABSTRACT

The present chapter will help in understanding the role of positive psychology and intervention in approaching towards a healthy aging. Aging is inevitable. The clock cannot be turned backwards. At first glance, it seems that generally the growing population enjoy what they face which is true to a certain extent but at the same time it is important not to overlook or discount the stresses they face when they start to age. How they age depends how they look at their life. Positive intervention has its effect in all ages. Taking the help of positive psychology as a primary prevention can help eliminating various effects of aging. In the same way, it can also help in reducing the exiting trouble occurring in elderly. By taking preventive steps, one can take care of the body and the mind, and that can help stave off some of the devastating illnesses associated with age and live a full, meaningful and energetic life. Elderly person must acknowledge that their roles in life will change as their former lifestyles are replaced by new schedules, approaches and relationships.

INTRODUCTION

Aging is a gradual and slow process and generates significant changes in one's life. A person completes all the responsibility that comes in their way, completes education, work, raises children, retire from work and so on. At first glance, it seems that generally they enjoy what they face which is true to a certain extent but at the same time it is important not to overlook or discount the stresses they face when they start to age. Many a times these changes can be discouraging and may lead to feelings of insecurity and loss of self-worth. How they age depends how they look at their life. Positive psychology has its significant role to play in the process of aging and helps in overcoming various challenges that they face. Elderly person must acknowledge that their roles in life will change as their former lifestyles are replaced by new schedules, approaches and relationships.

Worldwide, the population is ageing rapidly. World Health Organization (WHO), (2016) report says that between 2015 and 2050, the proportion of the world's population over 60 years will nearly double from 12% to 22%. The share of India's population aged 60 and above is projected to rise from 8% in 2010 to 19% in 2050, according to the United Nations Population Division (United Nations, 2011). This phase comes not only as an additional number to a persons' life but as a chapter with significant contributions from the surroundings. The higher the positive environmental inputs, the better the outcomes. There is a slow decline in the overall functioning of the body system as the person ages. They are more likely to experience several changes and disabilities at the same time (WHO, 2015). In 2011, approximately 22.7 million (62%) of community-dwelling older adults in the United States aged ≥65 years had at least one basic functional disability (National Center for Health Statistics, 2013).It is that life-cycle stage where individuals are forced to face life's most stressful experiences. They become more sensitive to criticism, become emotionally weak and dependent. However, there are some factors like lack of economic security, loneliness, loss of loved ones and limited social interactions that adversely affect aging process. However, positive psychology contributes significantly to the outcome of aging process. It focuses on the potentials and optimal functioning of human beings. The approach of positive psychology is not towards fixing problems, instead focuses on exploring things that make life worth living. This is not a distinct field, but rather a distinct way of viewing the human conditions. It focuses on people as having the potential to thrive given the right skills, strengths and social context (Kashdan & Ciarrochi, 2013.

It consists of interventions for promoting resilience, positive emotions, engagement, meaning, curiosity and social connectedness (Ciarrochi & Kashdan, 2013; Parks & Biswas-Diener, 2013).

The Gerodynamics/ Branching theory of aging explains about the branching behavior of an individual at the psychological, biological or social level of functioning. As an example, traumatic life events may result in lower order structures and a healthy life style may result in higher order structures, and consequently higher and lower probabilities of dying respectively. However, it may not hold true for everyone. There are exceptions. Some people are strengthened by illness, and divorce may have a positive rather than a negative effect on mental health in terms of life expectancy and quality of life for some people (Schroots, 1996). Similarly, in a theoretical continuum, with severe mental illness on the left and optimal human thriving on the right, Seligman pointed out that previous research had focused on the left half of the curve and that the right side of the curve mostly had been neglected. He focuses on more to mental health than the absence of mental illness. This field is dedicated to the rigorous scientific study of "strengths, well-being and optimal functioning" (Duckworth et al., 2005) and flourishing (Keyes & Haidt, 2003). Thus, aging with positive psychology helps a person to live a healthy life with a healthy approach.

AGING PROCESS

Tornstam (1989) suggested that the process of living into old age that is human aging visualizes a general potential towards gerotranscendence: that is a shift in metaperspective from a materialistic and rational vision towards a more cosmic and transcendent vision. This is normally followed by an increase in life satisfaction. Thus, there is a need to understand the basic requirements of elderly. This phase of aging has become much more a social phenomenon rather than merely a being a biological one. This process depends upon various components. It is a multidimensional construct where self-perception and attitude plays an essential role. The term "self-perceptions of aging" has been increasingly used to refer to adults'

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

subjective aging experiences (Kleinspehn-Ammerlahn et al., 2008; Kotter-Grühn et al., 2009; Kotter-Grühn & Hess, 2012). It is related with both positive and negative age-related experiences (Wurm et al., 2007). A study conducted in-depth interviews with adults aged 50 to 80 years and identified five major dimensions of positive and negative aging experiences. These five dimensions described aging as: (1) a natural and gradual process; (2) a period of life evaluation, philosophical reflection, or increased wisdom and maturity; (3) a period of increased freedom, new interests, and fewer demands; (4) a period of physical health difficulties and health concerns; and (5) a period of losses, including interpersonal and job-related losses (Keller et al., 1989). Another important construct is "attitude towards aging" (Bennett & Eckman, 1973). It refers to both societal as well as individual attitudes and includes affective, cognitive, and evaluative components of behavior towards older adults as an age group and towards the process of aging as a personal experience (Hess, 2006). Bennett and Eckman (1973) pointed that attitude towards aging are considered critical for older people's adjustment and survival in the process of aging. It contributes to their adaptive and maladaptive behaviors and reinforces how individuals in younger age groups view and approach their own aging process. However, negative attitudes toward older adults are quite pervasive, and that older adults' views of their own behavior often reflect the societal beliefs and stereotypes about aging (Hess, 2006; Levy, 2009). They are often based on cultural images of aging and are developed from early childhood experiences. Attitudes toward one's own aging have also been referred to as self-related attitudes (Hess, 2006) to indicate the focus of the attitudes as studies have shown that older adults have more negative views about their memory than younger or middle-aged adults (Hertzog & Hultsch, 2000; Hess, 2006). Several studies have also shown that older adults who have more positive attitudes about their own aging tend to perform better on memory tasks (Levy, 1996; Levy & Langer, 1994), are more likely to engage in positive life styles (Levy & Myers, 2004), show less decline in disablement processes (Levy et al., 2012), and live longer (Levy et al., 2002). Studies show substantial positive associations with adults' health (Wurm et al., 2007) and preventive health behaviors (Levy & Myers, 2004; WurmTomasik & Tesch-Römer, 2010). However, a large body of work documented the association between negative age stereotypes and older adults' maladaptive behavior, such as lower cognitive functioning and poorer functional health behaviors that are very much associated with the vulnerabilities of old age (Hummert, 2011; Levy, 1996, 2003).

This is a stage where one requires assistance in their activities of daily living because of their physiological decline due to the aging process. When they fail in meeting physiological needs it results in psychological decline. A study reported that among the elderly population 47.8% reported an unmet need with one or more activities of daily livings (ADLs) or instrumental activities of daily livings (IADLs). Significant adjusted correlates of unmet assistance need included greater number of ADL and IADL difficulties and lower levels of social support (Schure et al., 2015). Research has identified several factors associated with an increased risk for unmet assistance need among adults including greater number of ADL limitations, greater morbidity, dementia, lower income, younger age, and living alone (Allen & Mor, 1997, Desai et al., 2001; Kennedy, 2001; LaPlante et al., 2004; Lima & Allen, 2001; Newcomer et al., 2005; Sands et al., 2006; Williams et al., 1997). This population with an unmet assistance need have been shown to have an increased likelihood of experiencing weight loss, dehydration, falls, burns (LaPlante et al., 2004), increased number of emergency room and hospital visits (Allen & Mor, 1997), increased number of hospitalizations and nursing home placements (Sands et al., 2006), and higher mortality rates (Blazer et al., 2005).

In this process, the psychological experience of old age group leads to increased introspection, search for meaning of life and of the very existence, questions of identity and sense of privacy. It is important

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

to notice that, while the young have shorter pasts and longer futures, older people have longer pasts and shorter futures. It is a time of loss: the loss of spouse, friends, jobs, standard of living, and health. Increased psychological well-being is a significant protective factor from the occurrence of future episodes of major depression (Wood & Joseph, 2010; Sin & Lyubomirsky, 2009). Positive mental health is different from merely the absence of psychological distress (Keyes, 2002). Thus, aging process not only involves additional number to their age but various other significant factors that hinders the healthy process of aging. Therefore, increasing well-being and positive intervention might not only increase positive factors but also reduce negative states and psychopathology.

EFFECTS AND FACTORS CONTRIBUTING TO AGING

The aging population may be most aware of their new gray hairs and wrinkles, but this is just the external manifestation of aging. Changes are taking place throughout in the entire body. Poor diet, inactivity, weight gain, and a slower metabolic rate all set the stage for circulatory problems and cardiovascular disease. Blood pressure tends to rise with age, visual acuity diminishes, and difficulty seeing things, decrease hearing ability and sense of taste may become affected as well. Diabetes, obesity, and hypertension are all also reported to be higher among American Indians than the general population (Indian Health Service, 2014). There are various neuropsychological changes that take place in aging such as the slow decline in information-processing speed, dual task, task shifting, encoding, storage and retrieval of memory, deterioration in intellectual capacity. The old person finds it difficult to remember names and location. The psychomotor activity becomes very slow and they take more than usual time to complete a particular task. Dementia and Alzheimer's disease hinders their normal functioning significantly. However, some changes that have long been thought of as normal aging can be, in fact, the signs of a potential disease for example, sudden changes in personality. A common belief is that people become cranky, depressed, and withdrawn as they get older. But an analysis of long-term data from the Baltimore Longitudinal Study of Aging (BLSA) showed that an adult's personality generally does not change much after age 30. People who are cheerful and assertive when they are younger will likely be the same when they are age 80. Their findings suggest that significant changes in personality are not due to normal aging, but instead may be early signs of disease or dementia (National Institute of Aging, 2008).

Stressful life events have detrimental effects on physical and mental health in elderly (Cohen et al., 2007; Pearlin et al., 2005; Thoits, 2006). It results in various neuropsychiatric disorders that account for 6.6% of the total disability for this age group. Approximately 15% of adults aged 60 and over suffer from a mental disorder. The most common neuropsychiatric disorders in this age group are dementia and depression. Anxiety disorders affect 3.8% of the elderly population, substance use problems affect almost 1% and around a quarter of deaths from self-harm are among those aged 60 or above. Substance abuse problems among the elderly are often overlooked or misdiagnosed and mental health problems are under-identified by health-care professionals and older people themselves, and the stigma surrounding mental illness makes people reluctant to seek help (WHO, 2016). In India, in the year 2014, 7107 males and 2654 females (Total 9761) aged 60 years and above committed suicide. This comprises 7.4% of total number of suicides in the country (National Crime Record Bureau, 2014). Retirement is another phase which is inescapable. One person can see retirement as a phase of relaxation and freedom from responsibility and other can take it as stress and threat to financial condition and dependency on others. Limited social involvement is also a significant contributor. A systematic review of studies has shown

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

that in industrialized countries, limited social connectedness is associated with suicidal ideation, non-fatal suicidal behavior and suicide in later life (Fassberg et al., 2012).

Elder mistreatment is another stressful life event that may lead to psychological distress in the victims. Several cross-sectional studies have shown that older adults who were mistreated had higher levels of psychological distress than those who had no such experience (Comijs et al., 1999; Mouton, 2003). Clinical studies suggest other effects of elder mistreatment, including feelings of learned helplessness, alienation, guilt, shame, fear, anxiety, denial, and posttraumatic stress syndrome (Wolf, 2000). At least 1 in 10 older adults suffers some form of elder abuse, and many in repeated forms (Government Accountability Office, 2011). Another very important factor in elderly is the sexual relationships. A study found that sexual pleasure and the need for intimacy continue to be important for older women, but that changing sexual abilities and sexual health needs, such as the reduction of sexual desire, as well as increased painful intercourse due to menopause-associated vaginal drying, were persistent barriers to sexual fulfillment and satisfaction (Taylor et al., 2016). Cultural and social factors contribute significantly to these changes. Sexual activity in old age is perceived as a social stigma in Indian society. In Indian culture sex in later life is a taboo and a shameful act. It is a kind of suppressing id and overpowering super ego. Old people suppress their desires and avoid talking about their sexual life because of this social stigma.

Functional limitations and health problems are the additional factors that also increase the risk for isolation and the need for social support in elderly (Langford et al., 1997). A study reported negative relationship between depression and social support for both American Indian adults and older adults (Roh et al., 2014; Whitbeck et al., 2002). However, despite fewer network ties, evidence suggests that different types of social support may increase with age, for example, instrumental support in conducting activities of daily living (Van Tilburg, 1998). Women generally report higher levels of social support and social network ties than men (Antonucci & Akiyama, 1987). It was significantly associated with excellent or good self-reported health status, especially for women (Richmond et al., 2007). A study of persons aged ≥65 years reported that functional decline and death due to acute heart failure at 12 months were predicted by low baseline scores of social support in men, but no effects were seen in women (Berard et al., 2012). Social support withdrawal with age stresses a potential concern that older adults are more at risk of low social support during a time when their need is high (Richmond et al., 2007). Experimental and longitudinal studies have found that increased positive emotions lead to social, occupational, and health benefits (Lyubomirsky et al., 2005). Correlational evidence also links higher reported focus on engaging and meaningful activities to greater occupational success and higher incomes (Schueller & Seligman, 2010).

EMPTY NEST CONCEPT

Successful agers are able to enjoy higher levels of well-being in spite of deteriorations in various domains of life because they have more spiritual, social and psychological resources mainly the positive attitude and approach towards healthy life changes. A high level of life satisfaction and positivity is achieved only when the aging population utilizes the above resources and applies existential coping policies of acceptance in the life. With aging these major sources of personal meaning, such as family, work, social status, and activities start shrinking, giving rise to question of 'Why to live?'. According to the "Empty Nest" concept of aging, in early phase of life whole family lives together. As the children grow they move away from their parental nest for further education and career and then get settled with their

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

own families. Parents stay alone with their companion. They want their near and dear ones around. The situation gets worse when they lose their spouses. They already suffer from the biological changes and deterioration in their body which worsen by the addition of these environmental and emotional factors. This fatal combination gives rise to various psychiatric and psychological issues. The adverse conditions of physical and mental health can influence the elderly sense of life satisfaction (Pinto et al., 2016). Additionally, Ericksons' psychosocial theory (1959) explains old age as exemplified by integrity vs. despair. In this stage there is a question of existentialism of the self. Erikson believed that the last stage involves much of reflection of past life. As older people, some can look back with a feeling of integrity; a contentment and fulfillment, having led a meaningful life and did valuable contribution to the society. Others may have a sense of despair during this stage, reflecting upon their experiences and failures, feel guilty about the past, or feel that they did not accomplish their life goals, they become dissatisfied with life. Dissatisfaction and despair in life gives rise to many psychiatric and psychological problems. Depression, anxiety and loneliness become very common when the aging result in despair from life. This phase often leads to decrease in social activities and interaction. They prefer to stay within a very closely-knit environment, with family members, close relatives and very close friends. Many a times the youth find it very uninteresting to spend time with their elderly. This gives the elderly a feeling of being unwanted. A feeling of loneliness and sadness gradually sets in. Loneliness is highly prevalent among older persons with depressive symptoms (Van Beljouw et al., 2014). Community-based studies have identified a variety of risk factors for loneliness/isolation including widowhood, no (surviving) children, living alone, deteriorating health, and life events. Certain situational factors heighten the risk for increased loneliness. These include low socioeconomic status, marital discord, infrequent contact with friends and family, few social roles, lack of participation in voluntary organizations, physical health symptoms, and physical limitations (Hawkley et al., 2008; Santini Koyanagi et al., 2015). Apart from this, loss of loved ones, separation and retirement are also contributing factors causing isolation and depression in old age. Dealing with the issues of life changes and acceptability with positive approach and intervention helps in preventing its various devastating effects on aging.

EFFICACY OF POSITIVE INTERVENTION

Seligman (2004), proposes three pillars of positive psychology, that is: 1) study of positive emotions like checking satisfaction with the past, happiness in the present moment and the hope for the future; 2) study of the qualities/positive traits especially strengths and virtues such as: flexibility, self-control, courage and wisdom and; 3) study of positive institutions e.g. school, family, community. Similarly, searching meaning through inner and spiritual resources is a promising way of transcending personal losses and despair in old age (Wong, 1998). One way of seeing these changes can be positive approach mainly positive intervention. This is an intervention or therapy aimed at increasing positive feelings, positive behaviors, or positive cognitions, as opposed to ameliorating pathology or fixing negative thoughts or maladaptive behavior patterns (Sin & Lyubomirsky, 2009). Exercises like "Three Good Things," a gratitude exercise, outperformed the "You at Your Best" intervention, where participants are asked to describe a time in the past when they were at their best (Seligman et al., 2005). For example: The "Best Future Self" exercise instructs participants as follows:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Think about your life in the future. Imagine that everything has gone as well as it possibly could. You have worked hard and succeeded at accomplishing all of your life goals. Think of this as the realization of all of your life dreams. Now, write about what you imagined (King, 2001).

Positive interventions along with exercises are designed to promote kindness, generosity, and mindfulness (Layous et al., 2011). With aging these components can help in having a different perspective and approaches while aging. In a randomized control trials, a 7-week loving-kindness meditation workshop was shown to increase positive emotions, which in turn predicted increases in psychological, cognitive, social, and physical resources, which went on to increase life satisfaction and decrease depression (Fredrickson et al., 2008). Similarly, a meta-analysis of 51 randomized controlled studies of positive interventions of individuals who were healthy and of individuals who suffered from depression showed increase in well-being and decrease in depression (Sin & Lyubomirsky, 2009).

Ciarrochi et al. (2016) focus on two components of positive psychology interventions; Content and context -focused positive interventions. Content-focused positive interventions is defined as those that focus on altering the content of people's thinking, that reinforce the notion that a certain way of thinking is inherently good, and that tend to underemphasize or ignore the role of context. These interventions often seek to increase positive mental content or diminish negative mental content. For example, theorists have argued that positive emotions cause people to "broaden and build" (Fredrickson, 2001), optimism and grit cause people to succeed (Seligman, 2002; Duckworth& Gross, 2014), and a lack of positive thinking or the presence of negative thinking causes failure and unhappiness (Byrne, 2006; Peal, 2012). On the other hand, Context-focused positive interventions refer to situational and historical events that exert an organizing influence on behavior" (Hayes et al., 2011). It refers to influence that comes from the immediate antecedents and consequences of behavior, the historical context and the multiple groups and structures within which a person is nested, e.g., social class, culture, family group, friendship group (Bronfenbrenner & Ceci, 1994). Context-focused positive interventions help in treating the causes of behavior as largely residing within the environment. However, even contextual interventions can be done in a content-focused way. For example, mindfulness interventions can be treated as a universal way to reduce stress.

Long before positive psychology, the great philosophers (Socrates, Plato, Aristotle) and psychological thinkers (Freud, Jung, Adler, Frankl, Rogers, Maslow) articulated theories of the good life, pleasure, wholeness, purpose, health, and actualization (Duckworth et al., 2005; Ryff, 2003). In addition, empirical work existed on adaptation, resilience, thriving, spirituality, and growth (Aspinwall & Tedeschi, 2010). There are subsets of positive interventions, a self-administered without professional administration, such as "positive activity interventions" defined as "relatively brief, self-administered, and non-stigmatizing exercises that promote positive feelings, positive thoughts, and/or positive behaviors, rather than directly aiming to fix negative or pathological feelings, thoughts, and behaviors" (Layous et al., 2011). Lazarus criticized positive psychology for taking an overly simplistic approach to the complexities of human emotion and the harsh realities of human life (Lazarus, 2003). However, consistent findings suggest that stronger social relationships reduce mortality and help us cope with life stressors (Holt-Lunstad et al., 2010) Furthermore, psychological well-being in general and positive emotion in particular, appear to promote meaning-making in stressful situations, which in turn leads to more effective coping (Tugade & Fredrickson, 2004).

SOLUTIONS AND RECOMMENDATIONS

Acceptance and healthy welcome of aging can prevent various difficulties which one face during this process. Dependency on anyone makes a person handicap in dealing or adjusting with the life changes. The humans have a tendency to plan everything in advance to secure healthy and safe life. However, fails to plan a very essential aspect of life i.e. *"Old Age"*. Here are few recommendations along with positive interventions which can help a person in having a healthy approach towards aging;

- Plan aging before it comes and takes preventive measures to avoid the devastating effect of aging. For example, post retirement financial plan can prevent various psychiatric and medical conditions in an aging persons' life.
- There should be a policy of primary, secondary and tertiary management for aging population. Primary prevention should focus on a healthy lifestyle like exercise, yoga, meditation, healthy eating and sleeping habit, good interpersonal and social relations etc. In short, holistic bio-psycho-social management focusing on healthy aging. Secondary prevention should focus on early identification of factors that can further contribute to various medical and psychological complications to aging. These factors could be the unhealthy life style, personality traits, initial identification of illness and unhealthy environment etc. Tertiary prevention should focus on to decrease the impact of factors contributed to unhealthy aging, such as, psychotherapeutic psychosocial and pharmacological management etc.
- Have a good social support system as evidences report that older men and women having social support experience better health and decreased mortality (Hessler et al., 1995). Social support may play a more important role in moderating the relationship between their risk factors and poor health outcomes (Arthur, 2006).
- Existential approach to positive aging because there is no point having more time and live longer if not optimizing the appropriate conditions to live more fully.
- Positive psychotherapy is a novel and distinct therapy technique that focuses on positive emotions, engagement, and meaning rather than targeting negative states and depressive symptoms (Seligman et al., 2006).
- Internet and mobile Apps make it more convenient to take help of the online positive intervention programs (Seligman, 2002). These techniques might be less stigmatizing than other interventions that deal with difficulties and deficits. The "three good things exercise" was even integrated into Facebook through an application that provided users with tools to complete the gratitude journaling online and share with friends in their network (Munson et al., 2010).
- Targeting negative schemas with cognitive behavior therapy and tackling environmental issues mainly interpersonal with interpersonal therapy can also be useful in improving positive health in elderly.
- Having a positive and confident attitude has been identified as a protective factor for loneliness (Grenade & Boldy, 2008).

CONCLUSION

Aging is inevitable. We all will face it one day. The clock cannot be turned backwards. Our smooth skin will start wrinkling. Hands will start shaking, voice will tremble. The telomerase enzyme (which prevents cells from aging) will deplete. Prakriti (Nature) works in that way. We all want a happy ending in order to achieve that we need to plan early. We have to choose to face it and not to avoid it. How we deal with it is what makes the difference. Aging should be thought of as a spiritual journey. Positive intervention has its effect in all ages. Taking the help of positive psychology as a primary prevention can help eliminating various effects of aging. In the same way, it can also help in reducing the exiting trouble occurring in elderly. By taking preventive steps one can take care of the body and the mind, and that can help stave off some of the devastating illnesses associated with age and live a full, meaningful and energetic life.

KEY TERMS AND DEFINITIONS

Aging: A process of becoming older.
Life Changes: Change in one's life or circumstances in a substantial way.
Positive Psychology: An applied approach to optimal functioning.
Satisfaction: Fulfilment of needs.
Successful Aging: It refers to physical, mental and social well-being in older age.

Chapter 4
The Architect of Organizational Psychology: The Geert Hofstede's Dimensions of Cultural (Corporate and Organizational) Identity

Ben Tran
Alliant International University, USA

ABSTRACT

Globalization, used in the architect of the organizational psychology world, often evokes images of a shrinking world, in which accelerating flows of information and travel technology compares time and space in the relationships between world cultures, political economies and the built environment. In the world of organizational psychology, the field of organizational psychology is a byproduct of business (organizational behavior and management), psychology [clinical and industrial and organizational psychology (I/O)], and culture. The one common paramount connection between architecture and organizational psychology in the world of globalization is (or the corporate/organization) culture. Hence, the purpose of this chapter is the architect of organizational psychology, with an emphasis on culture. Specifically, Geert Hofstede's dimensions of cultural (corporate and organizational) identity, and how culture influences architecture and business in globalization.

INTRODUCTION

Globalization, used in the architectural world, is a disputed term packed with a rich and intricate array of interpretive possibilities that, once released, raise important questions about architecture, its institutions and its outcomes. Globalization, used in the corporate world, has been associated with flows of capital, labor, products, and ideas that have crossed, challenged, and blurred established national and international boundaries. Globalization, used in the architect of the organizational psychology world, often evokes images of a shrinking world, in which accelerating flows of information and travel technology compares

time and space in the relationships between world cultures, political economies and the built environment. Today the idea of the global city, once characterized by nodes of high-rise towers associated with nexuses of capital flows vying for command and control of the world economy, is being reconsidered. With the advances in electronic media and telecommunications, people can live simultaneously in both bounded urban public environments as well as highly constructed personal virtual environments. Such virtual connections permit national formations to be maintained across international boundaries, as individuals construct virtual neighborhoods that sustain a life of what theorist Benedict Anderson refers to as long-distance nationalism (Walker, 2001).

In the world of architecture, the field of architecture is of an island, with estranged connection with engineering, (material) science, geology, art, and culture. In the world of organizational psychology, the field of organizational psychology is a byproduct of business (organizational behavior and management), psychology [clinical and industrial and organizational psychology (I/O)], and culture. The one common paramount connection between architecture and organizational psychology in the world of globalization is (or the corporate/organization) culture. Hence, the purpose of this chapter is the architect of organizational psychology, with an emphasis on culture. Specifically, Geert Hofstede's dimensions of cultural (corporate and organizational) identity, and how culture influences architecture and business in globalization. Thus, this chapter will cover:

1. Identity and architectural heritage.
2. Globalization and architecture.
3. Geert Hofstede's dimensions of culture.

IDENTITY AND ARCHITECTURAL HERITAGE: HISTORICAL PERSPECTIVE

The term identity is defined in the Oxford English Dictionary (Crowther, 1995) as the state of being very like or the same as something or somebody, or the state of being closely involved with a part of something. The core meaning of any national identity is a sense of sameness over time and space. Presently it seems that everyone claims a right to identity— architecture for academic and organizations for business. Nations demands identity as if it were a necessity of life itself, a sacred objective, because it brings power by sustaining certain subjective positions and social boundaries (Saliya, 1986). Identity is a huge part of who we are, and identity is the end result of many factors combine to shape identity such as genetic, social, cultural factors, and the build environment.

Architecture can be best defined as the art and science of integrating the physical environment within a socio space-time organization. It can also be seen as a gesture and its insertion within any context should be aesthetically relevant (Vale, 1997). Aesthetics, a Greek word meaning perceptions and feelings, are the feelings that this integration process and their arrangements prompt us to have. This argument raises the question of the morality of architecture: that is considering architectural heritage in modern designs. Heritage can be understood as a pure human instinct that comes from the knowledge and benefiting ways that nature revealed though trails and experiences. Heritage sites are considered as our tangible and intangible identity and collective memory. It is sustained by remembering and what is remembered and what is remembered is defined by the assumed identity.

Architectural heritage is important and worth preserving because it is the storehouse of memories, a link with the past, and because of its universal aesthetic and historic value. In Archibald's (2004) words:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

"memory is a dynamic process of using the past to define and redefine who we are, what we believe, what we like and dislike, and the values we hold dear". Therefore, the loss of heritage as storehouse of memories will lead to a loss of memory and then a loss of identity, because, as Gillis states, identity is "something that can be lost as well as found" (Gillis, 1994). However, Loewenberg (1996) argues for adopting psychoanalysis in historic studies in order to recognize and utilize the pattern of feelings, attitudes, and behaviors that shape history. This argument is derived from the fact that "history is not the collective memory of mankind, rather, it is the reformation and reinterpretation of that memory by each historian according to his time, social circumstance, method, and subjective past" (Loewenberg, 1996).

Living in or close to historic sites, especially World Heritage sites, requires emphasizing the influence of the physical environment on identity and self-perception. In this process, the place-identity theory has provided important contributions to the field of architecture (Hauge, 2007). It proposes a new integrative model of place in both built and natural environments. The influence place has on identity is seen as a result of the interaction between people and their physical environment: people affect places and places influence how people see themselves. Relph (1976) argues that "there is for virtually everyone a deep association with and consciousness of the places… this association seems to constitute a virtual source of both individual and cultural identity and security, a point of departure from which we orient ourselves in the world". The physical features and settings of the place, together with activities and functions carried out in it, are acknowledged by Relph (1976) as a source of identity of place, for places are an integral part of human experience.

For Relph (1976), the essential quality of place was its power to order and to focus human intentions, experience, and behavior spatially. It is related to the place where people grew up, taking into account the emotional connections between human beings and their environment, in other words, their sense of place. When attachment to places develops, we start to identify ourselves with these places. Elkadi (2006) identified the term identity as stemming from the cultural dialogue between users of the place and their surrounding built environment. The places in which people have lived influence their environmental preference and affect the kind of environment they may prefer to live. Hence, the discussion of architectural heritage is now considered a popular phenomenon (Abel, 2000; Taylor, 1986).

As Aylin Orbaşlı (2000) highlights, "The interaction of human beings with the past and the present, with buildings, spaces and one another produces an urban dynamism and creates a spirit of place". Society passes on identity with a place from one generation to another, leaving a legacy in the physical environment. From this phenomenon, the present generation can gain an awareness of the cultural and environmental values of the past on which to build for the oncoming generations (Çelik, 2003). They must realize that maintaining their architectural heritage means maintaining the continuity of a culture.

Architecture, as mentioned above, is a very distinct tool for shaping identity (Abel, 2000; Çelik, 2003). Architectural heritage can be the shadow behind today's production. A nation's architectural heritage is an important part of its identity. Its components are architecture, identity, and history (Lahoud, 2008). Architecture can generate the past, prefigure the future, and articulate the present. This is how one can bridge the gap between the past and the present. The integration will lead to the creation of new buildings which are faithful to the inspiration provided by the inherited cultural heritage. Contemporary architecture in this context is understood as a reference to all significant planned and designed interventions in the historic built environment, including open spaces, new constructions, additions to or extensions of historic buildings and sites, and conversions. The central challenge of contemporary architecture is to respond to developmental dynamics in order to facilitate socio-economic changes and growth on the one hand, while simultaneously respecting the inherited built environment on the other (Rababe'h, 2010).

GLOBALIZATION AND ARCHITECTURE

Cities and regions are facing great challenges as a consequence of globalization. The term globalization was coined in the latter half of the 20th century, but the term and its concepts did not permeate popular consciousness until the latter half of the 1980s (Chris, 2006, p. 42). Serving as a buzzword of the decade, the phenomenon of globalization has attracted more significant global attention than perhaps any other issue in recent memory, yet the term is used in so many different contexts, by so many different people, for so many different purposes. Giddens defined globalization as "the intensification of worldwide social relations that link distant localities in such a way that local happenings are shaped by events occurring many miles away and vice versa" (Oncu & Weyland, 1997, pp. 1-2). In the sequence, globalization is considered a discourse of knowledge that elevates awareness of the links between various scales of life. The Encyclopedia Britannica defines globalization as the process by which the experience of everyday life is becoming standardized around that world (Adam, 2008). It is also a contested discourse exhibiting many variants, some of which are clearly more influential than others.

The tension between anti-global and pro-global forces has long existed, with two opposing forces affecting architectural globalization. One force seeks to safeguard and promulgate established indigenous architectural traditions, forms, decorative motifs, and technologies. It advocates historical continuity, cultural diversity, and preservation of identity, all symbolized by a particular architectural vocabulary, just as spoken languages and local dialects impart identity. The other force promotes invention and dissemination of new forms using new technologies and materials in response to changing functional needs and sensibilities. It places a premium on systemization, flexibility, and interchangeability (Lewis, 2002). For some, globalization entails the Westernization of the world. Some see globalization as generating increasing homogeneity, while others see it producing diversity and heterogeneity through increased hydridization. Global change represents a new class of problems that severely challenges our ability to achieve sustainable development. These problems are fundamentally nonlinear in causation and discontinuous in both their spatial structure and temporal behavior. Acting in the present age involves understanding the matrix of global and local forces, of domination and resistance, and of a condition of rapid change and great transformation brought about by the global restructuring of capital and multidimensional effects of trends and new technologies.

Trends

In an ongoing dialogue, according to Eldemery (2009) between architects and society, architects consider globalization a distinguishing trend of the present moment, whereas theorists see it either as a necessary and positive vehicle of progress and diversity or as a force of inspired homogenization and destruction. Architecture addresses our meta-physical, philosophical, and cultural identities within a material context. It challenges us to look at history and, therefore, at architecture in a new way (El-Husseiny, 2004). Architectural history is filled with movements opposing cultural and aesthetic diversity while sanctioning particularly philosophies of architecture for national and international distribution. Pro-global design sponsors include governments using architecture for symbolism, companies employing architecture for corporate purposes and product identification, and zealous, sometimes self-righteous, architects preaching their own theories.

In the early 20th century, many architects argued stridently that the modern age demanded new architecture in response to new industry, technologies, mobility, and social and political orders. Thus

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

born the International Style, epitomized by German architects Mies van der Rohe, Walter Gropius, and others (Eldemery, 2009). Today, pressure to globalize architecture primarily springs from two sources: the culture of commerce and the culture of design. The global culture of commerce is driven by changing consumer expectations, market opportunities, and business agendas (Oncu & Weyland, 1997). Their architectural manifestations include iconic, sky-scraping banking towers, chains of standardized hotels, franchise restaurants, and shopping malls full of all-too-familiar name-brand stores. The global culture of design is supported by architects who study what other architects are creating, no matter where. With skilled photographs in slick magazines and professional journals, trend-conscious designers can scan and span the global, sharing high-style concepts rendered in stylish materials. Glass, aluminum, stainless steel, copper, titanium, and natural stone are readily available, and if they cannot be acquired locally, they can be imported.

Technology

It is certainly arguable that during the past decades the world has been undergoing the most significant period of technological innovation and global restricting since the first decades of the 20th century. Cities have always been centers of civilization and vitality that, through the years, have led to human progress through material and scientific advances. Globalization is now an unstoppable historical process led by technological change and involving the dissemination of science and new technologies. Rapid urbanization has only been made possible by the introduction of modern technology as a part of the development process. Furthermore, in one of the oldest treatises on architecture, Vitruvius proposed three essential requirements for all good architecture: firmitas, utilitas, and venustas (Morgan, 1914). In order to guide the quality of a building, one should consider the technical means, the practical and functional aspects of the building, and the aesthetic results. According to Schoon (1992), Auguste G. Perret also defined architecture as "a living art that faithfully expresses and visualizes its time through the manifestation of contemporary construction techniques" (Schoon, 1992, p. 10). Complex construction and advanced building design require mastering the skills of structures and construction technology, and as Michelle Addington (2006, p. 64) mentions, "technology is often considered the handmaiden of design and, as such, is meant to be subordinate: design is the why and the what, whereas technology is the how-to".

New technologies are changing the nature of work—with its multidimensional effects—by creating new forms of leisure, including the hyper-reality of cyberspace, new virtual realities, and new modes of information and entertainment. Dramatic change and innovation have been part of modernity for centuries, as has technological development and expansion. A new global culture is emerging as a result of computer and communications technologies. Transitional forms of architecture are traversing national boundaries and becoming part of a new world culture. The new wave of technologies in electronics, robotics, telecommunications, new materials, and biotechnology has given rise to a new technology paradigm that accentuates the role of the world cities (Lo & Yeung, 1998). Thus, the adoption of appropriate technologies is a natural and unforced consequence of appropriate architecture. Together, they offer valid forms and images to take the place of models offered by industrialized nations, and as Shahin Vassigh (2004, p. 112) mentions, "the practice of architecture is a delicate balance of art and science—a creative endeavor which also requires that the architect master a broad array of technical skills, including engineering".

Place Identity

Within the last few years, globalization has become a catch phrase in architecture associated with a loss of place identity (Eldemery, 2009). There seems to be a general consensus that identity plays a significant role for the continuity of humanity's culture, otherwise, humanity will be cut off from one's past. Place identity is attracting increasing interest from both architects and planners, as well as in social-science research. The phrase place identity conveys many different dimensions such as physical size, tangible versus symbolic, and known and experienced versus unknown and not experienced. Place also includes that which influences the meaning occupants give to it through personal, social, and cultural processes (Altman & Low, 1992; Burd, 2008). Hence, place can be described in terms of many multidimensional physical and psychological environmental attributes.

Individuals' psychological sense of place identity can be understood in many ways: as an experience, a convergence of cognitions, how residents feel towards their town, or an assessment of the extent to which they agree with the sentiment "this is not the place for me". Place identity is sometimes described as an implicit psychological structure, and it is also considered a cognitive structure that contributes to global self-categorization, and social-identity processes. It emerges from involvement between people and place and it is described as the individual's incorporation into the larger concept of self. Harold Proshansky (1978, p. 152) stated that "there is no physical setting that is not also a social, cultural, and psychological setting". According to Eldemery (2009), Proshansky coined the term place identity to denote the dimensions of self that define an individual's personal identity to physical environment (Proshansky, 1978).

Proshansky latter attached the concept of place identity to belongingness. Identity, or more precisely, place identity as discussed by Proshansky, refers to conscious ties between the community and its residents as these develop over time. Hummon (1986, p. 34) reinforces the view by defining place identity as "an interpretation of the self that uses place—a significant, symbolic locale—as a sign or locus of identity." Hummon considers places environmental contexts with real consequences for people and lays a great deal of stress on ties between the place and the people. Proshansky, Fabian, and Kamminoff extended identity theory to the area of environmental psychology and proposed that place identity is a "physical world socialization of the self" (Proshansky et al., 1983, p. 62)—commonly known as biophilia (Tran, In Progress). When defining the concept of identity, Rapoport recognizes the complexity of identity formation, and his method of establishing the desired functional, and symbolic connections between an environment and people, privileges ethnicity above all other identity-constructing factors. This occurs because of Rapoport use of the culture-core concept to attempt to drive key features of tradition that need to be supported (Rapoport & Hardie, 1991). The analysis following from the use of this concept assumes that identity comes from using available cultural resources from a spectrum of cultural presentations extending from traditional to modern (Mthethwa, 2002).

Place identity is also defined precisely as a set of cognitions about physical settings. The concept of place identity underpins the collective sense of cultural identification with a particular building and its design features. This concept considers the debate around decisions with regard to buildings and the sources of architectural elements used in the design project or building. It implies that there are essential natural characteristics that identify a place and that, in effect, these are latent and without structure but can be released by a sensitive design solution. Under this criteria, a locally appropriate building or proposed project is determined by a general consensus on the building and/or proposed project with incorporation of an acceptable architectural language drawn from vernacular design aspects, including site, vernacular architectural forms, materials, and symbolism. It also considers the setting of buildings

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and the sources of architectural elements used in the design project of building. Under this, a locally appropriate building to proposed project could be determined by a general political consensus on the proposed project with incorporation of an acceptable architectural language drawn from the national vernacular language, such that materials substance, shape, texture, and color, together determining the essence of place, where place is seen as a product of physical attributes—biophilia (Tran, In Progress).

Environments for Inhabitation

The primary products of architecture are cultural artifacts we call buildings. They are intentional compositions of forms and spaces organized as structures that provide environments for humans (and other animals) to inhabit. Hence, it is worth noting that architects design many other cultural artifacts besides buildings: drawings and paintings, models, books, cutlery, cloth patterns, and the like. When they do, they are not producing architecture: rather, they are employing architectural methods to produce other cultural artifacts. By definition, architecture refers to the design of inhabitable environments. Thus, buildings are intentional compositions because they are designed by people for the purpose of inhabitation. Although for us they are a given, buildings are not required for human habitation: there are many non-designed (non-intentional) inhabitable environments in the world, uncomfortable as they may be. Nevertheless, the central role that architecture — and by extension, culture — plays in our self-identity as a species consists of two components: forms and spaces (Arango, 2011).

Forms are the physical component of buildings. They are the tangible elements that make up a building, such as its brick walls, stained glass windows, wooden columns, copper roof, stone paved paths, garden layout, and so forth. Forms can contain other forms: for example, a wall can contain a window. While they are discreet elements, they are comprised of building materials such as bricks, sand, and glass that can be considered discreet forms in and of themselves. Spaces are the voids between a building's forms. They are defined by and hey also define the relationship between these forms. Spaces are not "real" in the same sense that forms are: they are only experienced in time by the person inhabiting the building. Spaces do not exist independently of this individual experience. This leads us to an important consideration we tend to easily overlook: architects are, by definition, in the business of designing for experience. Most interestingly, forms and spaces cannot exist independently of each other. They are inextricable parts of a whole: they are the yin and the yang of architecture.

Culture and Politics in Building Architecture

Architects cannot help but be cognizant of the fact that their interventions on the environment will have a cultural impact that extends far beyond providing cover from the elements (Brand, 1994). Some architects even focus on these cultural functions as the primary force that informs and animates their work. This is because architecture is an area of practice with a long history, all architectural artifacts also exist in constant dialog — self-conscious or not — with their precedents. For example, the design of the Capitol building in Washington, D.C. can only be appreciated in full if the viewer knows the classical language and forms of Roman and Greek architecture. Without such knowledge, while one can certainly experience the building itself, much of its cultural meaning is absent from its design (Arango, 2011).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Environments for Understanding

While information architecture shares many traits with building architecture (Arango, Hinton, & Resmini, 2011) there is however one crucial difference: the objective of IA is not the production of environments for inhabitation, but for understanding. Just like architecture enables environments for inhabitation by the organization forms and spaces, information architecture enables environments for understanding by the organization of nodes and links (Arango, 2011). According to Arango (2011):

1. **Nodes Are Discreet Units of Meaning:** They consist of content elements — texts, images, videos, and the like — that jointly communicate a concept or idea. A node can be as simple as a single word, and can be infinitely complex. A web page is a node, but so are the sentences, images, and visual elements that comprise it. One of the information architect's critical responsibilities is defining a node's boundaries so that it conveys meaning optimally.
2. **Links Are Much Like Spaces:** Links define and are defined by the relationships between two or more nodes (Lynch, 1960; Passini, 1984). There are many types of such relationships. For those of us reared on the web, the most obvious example is the hyperlink, in which a node refers to a second node in such a way that clicking on the node causes the user's display to load and present the second node. There are many linking approaches that can be used to establish relationships between nodes. Some obvious ones:
    a. **Sequential:** One node follows another in sequence. For example, multiple words can be strung together to form sentences, which can in turn be strung together to form paragraphs, sections, chapters, and entire treatises,
    b. **Spatial:** The relationship between two or more nodes is defined by their geometric position relative to each other. For example, the content of two images can be compared by placing them side by side,
    c. **Hierarchical:** One node contains another. The most obvious example is a website's navigation sitemap. It is also worth noting that pages themselves are collections of nodes. Pages are thus hierarchical containers, and
    d. **Conceptual:** One node triggers conceptual associations with a second node in the user's mind, even though the second node is not itself present. This linking strategy is dependent on the user having previous knowledge of the second node (Arango, 2011).

CONCEPT OF BIOPHILIA

Wilson calls biofilia an "innate tendency to focus on life an lifelike processes" (Wilson, 1984, p. 1), an "innate emotional affiliation of human beings to other living organisms" (Wilson, 1993, p. 31), or an "inborn affinity human beings have for other forms of life, an affiliation evoked, according to circumstances, by pleasure, or a sense of security, or awe, or even fascination blended with revulsion" (Wilson, 1994, p. 360). In other words, in the biophilia hypothesis, Wilson concentrates on the fact that the creation of the human cognition "pattern" during the process of evolution was not contributed to by only the abiotic, and/or social environment, but also the biotic. Furthermore, in the first listed definition from the book Biophilia (Wilson, 1984), it is claimed that the human mind is generally focused on "life and lifelike processes".

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Thus, biophilia can be understood as "inborn affiliation with the rest of life". Defined like it has its place within the evolutionary theory of the biosphere (Lovelock & Margulis, 1973; Vernadsky, 1945). However, according to the other two definitions, the concept of biophilia can be understood to be "inborn focus on other life forms", that is a complex of cognitive evolutionary modifications of the human mind, which directs learning relationships to natural phenomena. It developed under prehistoric sociocultural and natural conditions. This is how evolutionary psychologists or human ethologists, anthropologists and sociologists understand biophilia. It is a complex, or set, of instincts (Wilson, 2002, p. 137), which sometime in the evolutionary past of humankind favored the individual at some level of natural selection.

The original cognitive rules of understanding and dealing with nature have not disappeared, even in today's world of artificial artifacts, in which we can only difficulty find natural stimuli. Biophilia, as a complex of weak rules of learning, influences our thinking about nature, the landscape and even about art, myths, and environmental ethics. The deeply ingrained cognitive rules have, in Western society manifested themselves, for example, in the popularity of zoos, preferential housing on hills with views of water or in phobias (Wilson, 1984, p. 32). Many of them are fundamentally connected to avoiding danger, or motivation for exploring, and exploiting the environment.

In traditional societies, these biophilic tendencies are functional, as humans are there to use their environment directly. In Western civilization with humans' technical capabilities, these tendencies however overload nature, for they are not correctly reflected in culture, and thus, they are not even functional. Many of today's rules for treating nature/other species are the result of a long history of intimate contact with nature, and the short period of mechanization of our environment, which have reduced this contact and at the same time, greatly changed the way we view the value of other species (Wilson, 1975).

GEERT HOFSTEDE'S DIMENSIONS OF CULTURE

Geert Hofstede is a Dutch researcher who is seen as a significant informant and researcher in intercultural studies. Hofstede's book, *Cultures and Organizations: Software of the Mind* (Hofstede, Hofstede, & Minkov, 2010), is considered an important cornerstone in the research field. A great number of business studies have taken Hofstede's theory as a framework and many other cross-cultural training programs are based on his data. In comparison with Hall's theory, Hofstede's theory is more significant on two grounds:

1. First, it departs from verbal/nonverbal communication, which is largely related to the outward expressions of the Tree Model, and hence, easier to change. Focusing on the second layer, Hofstede draws a framework of values, deep assumptions, and guiding morality that are difficult to see and very slow to change, and
2. Hofstede conducted systematic research on these values and projected them on a 100-point scale of measurement.

While with Hall's theory one can only have observation and conclude that this culture is likely to be more Monochronic than the other culture, Hofstede's theory, permits a look at a wide range of cultures with a comparative perspective and attach a number to it. Furthermore, it must be noted that Hofstede does not deal with co-cultures, because Hofstede's data mostly points at values of a dominant culture within a nation. On the Tree Model, Hofstede does not discuss the fundamental concerns, and only

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

points out the typical outward expression of these values without warning that the non-typical elements are constantly present (Hofstede, 2011).

The Hofstede model (Hofstede, 2001; Hofstede & Hofstede, 2005), according to Tran (2014) and Shaiq, Khalid, Akram, and Ali (2011), distinguishes cultures according to five dimensions:

1. Power distance,
2. Individualism/collectivism,
3. Masculinity/femininity,
4. Uncertainty avoidance, and
5. Long-term/short-term orientation (Hofstede, 2011).

Hofstede defined these four dimensions as follows (Tran, 2014):

1. **Power Distance:** Power Distance is "the degree of inequality among people that the populace of country considers as normal" (Harzing & Hofstede, 1996, p. 304). Power is a fundamental concern because human group everywhere are organized into a hierarchy. Decision makers are present in groups of any size and ethnicity. The value attached to power is called Power Distance, defined as the extent to which the less powerful members of the society accept and expect that power is distributed unequally (Hofstede, 2011).
    a. **The Typical Outward Expression of Power Distance in Society:** At the top level of the Tree Model, language appears to be the most obvious outward expression of Power and Power Distance. While English has only two pronouns you and I, some societies, especially China, Japan, and Vietnam, have more than a dozen ways of social role indication, dictating how people address each other (Yamada, 1997). In China and Vietnam, it is sometimes impossible to talk appropriately if two persons do not know the age of each other, and cannot establish a ranking relationship for communication.
    b. **The Origin of Power Distance:** Most of the high Power Distance countries are at lower latitudes and most of the low Power Distance countries are at higher latitudes. At lower latitudes, agricultural societies are prevalent and survival and population growth in these climates demands a relatively limited intervention of man with nature: everything grows. In this situation the major threat to a society is the competition between human groups for the same territory and resources. The better chance for survival exists for those societies that have organized themselves hierarchically and are dependent on one central authority who keeps order and balance. At higher latitudes, nature is less abundant. There is more of a need for human intervention with nature in order to carve out an existence. There are stronger forces supporting the creation of industry next to agriculture. Nature, rather than other humans, is the first enemy to be resisted. Societies in which people have learned to fend for themselves without being too dependent on more powerful other have a better chance of survival under these circumstances than societies which educate their children towards dependence.
2. **Individual-Collectivism:** Individual-Collectivism describes "Whether one's identity is defined by personal choices and achievement o by the character of the collective groups to which one is more or less permanently attached" (Smith & Bond, 1993, p. 38). While Hofstede does not give a generic name to this universal value like what Hofstede did with the previous value of Power

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Distance, but for the purpose of this chapter, the term Group Attachment, by Phuong Mai Nguyen, Cees Terlouw, and Albert Pilot (2006) will be adapted.

a. **The Typical Outward expression of Group Attachment in Society:** The first characteristic of Group Attachment is the perception of harmony. Although this notion is universally important in all societies, the emphasis placed on it differs along the scale of individualistic-average-collectivistic. Harmony is attached with much more significance on the collectivistic end, showcasing a strong Group Attachment and willingness to maintain order and stability, therefore, direct confrontation is considered rude and undesirable. In this sense, Hall's High Context strongly correlates with collectivism, since indirect communication also aims at maintaining harmony and avoiding direct confrontation. The second characteristic of Group Attachment is a universal notion called face, understood as public dignity of a person or a group. The desire for face goes hand in hand with the desire for harmony, since losing face leads to shame and confrontation, and thus, losing harmony. The third characteristic of Group Attachment is how interdependence is perceived in each society. Although this is a universal virtue and nobody can survive without relying on a network of reciprocal support, individuals can be expected to reach different levels of interdependence. The fourth characteristic of Group Attachment is trust. Naturally, trust is universal, and it can be further distinguished as affect-based trust and cognition-based trust. The former is more associated with collectivism and the latter is more associated with individualism.

b. **The Origin of Group Attachment:** Many factors support the guesswork: climate, population, and wealth. The latitude was the first predictor of power distance and it also plays a role in predicting the score on this value dimension. Inter-group conflicts in lower latitudes promote group dedication and attachment for survival. Countries with moderate and cold climates in higher latitudes tend to show more individualist traits where people's survival depends more on personal initiative. Population growth is also strongly related to collectivism.

3. **Masculinity-Femininity:** Masculinity-Femininity is "the degree to which values like achievement, assertiveness, performance, success, and competition, which in nearly all societies are associated with the role of men, prevail over values like the quality of life, maintaining warm personal relationships, services, care for the weak, and solidarity, which in nearly all societies are more associated with the role of women (Cummings & Worley, 1994, p. 304). In our modern days, the role of men and women are largely overlapped. Men are increasingly working in occupations which traditionally are more popular with women and vice versa. That is to say Gender is never too far from our universal concern, and we associate different traits of gender as masculine or feminine. One must not mistake this value for Gender Role, which is the outward expression in the Tree Model, indicating how a man or a woman is expected to do. Therefore, Nguyen changed the original term used by Hofstede (Masculinity-Femininity) for Gender Association.

   a. **The Typical Outward Expression of Gender Association in Society:** The outward expression of this value can be seen in two categories: gender role and social activities. Firstly, when it comes to gender roles, femininity associated societies have feminine traits prevailing among both men and women, with male roles tending to overlap with female roles: Both men and women are expected to be modest and caring, such that more men are doing traditionally female professions such as nursing and secretarial jobs, and more women are taking traditionally male profession such as police and soldiers. In masculinity associated societies, women tend to split into two groups:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

i. They stick to traditional female jobs and behavior, and
ii. They break the barrier and spreading to fields that are traditionally male dominated. Secondly, when it comes to social activities, each society can be associated with more feminine or masculine virtues.

b. **The Origin of Masculinity-Femininity:** No strong correlations have been found with outside factors which could explain why some countries have dominant masculinity. Feminine cultures are somewhat more likely in colder climates, suggesting that an equal partnership between men and women improves the chances of survival and population growth in these harsh climates.

4. **Uncertainty Avoidance:** Uncertainty Avoidance is the degree to which people in a country prefer structured over unstructured situations. Structured situations are those in which there are clear rules as to how one should behave, and planning and stability counter uncertainty. Trying to predict and avoid harm is universal and part of basic human instinct. Fear is the result of both strongly innate feeling and social learning.
5. **Long-Term/Short-Term Orientation:** Long-term orientation is when one is focused on the future. One is willing to delay short-term material or social success or even shot-term emotional gratification in order to prepare for the future. If one has this cultural perspective, the individual values persistence, perseverance, saving and being able to adapt. Short-term orientation is when one is focused on the present or past and consider them more important than the future. If one has a short-term orientation, the individual values tradition, the current social hierarchy and fulfilling your social obligations. One cares more about immediate gratification than long-term fulfillment.

Human societies have always been organized within space and time. The former is related to the relationship between human and nature, a value dimension within the framework of Trompenaars. The latter focuses on how we perceive and vision our life activities across the time spectrum. Time Orientation is a universal value that relates to how we see the influence of the past, the presence, and the future in our life: How far we plan ahead, how quick we expect our result and our reward, how important is saving and spending, and like. At the collective level, time spectrum exerts different degree of influence in different societies, creating two orientations on this value dimension: short-term and long-term Time Orientation. In a nutshell, a focus on the past and the present would lead more towards short-term Time Orientation, and a focus on the future will lead more towards long-term Time Orientation.

This value dimension is inspired by Confucianism, a philosophy of life originated in ancient China. It focuses on virtues with incredibly strong emphasis on acquiring skills and education, working hard, not spending more than necessary, being patient and persevering, and being well prepared for the future. These fundamental virtues play as cornerstones of life in all the societies under the influence of Confucianism: China, Vietnam, Korea, Japan, Singapore, and Taiwan. Not surprisingly, these are also the countries with a tendency of learning towards long-term Time Orientation. In the index table, the higher the score, the more important future exerts a significant influence in people's life (Hofstede, 2011).

Cultural models define patterns of basic problems which have consequences for the functioning of groups and individuals (Tran, 2014): 1) relation to authority; 2) the conception of self and ego identity; and 3) primary dilemmas of conflict and dealing with them (Inkeles, 1997; Kluckhohn & Strodtbeck, 1961). These basic problems can be recognized in the Hofstede model (Hofstede, 2001; Hofstede & Hofstede, 2005), and have been found in other studies such as those by Trompenaars (1993), Schwartz (1994), Schwarts and Bilsky (1987), and also the GLOBAL study (House & Associates, 2004). Culture

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

impacts the behavior of corporate and organizational identity. According to Fletcher and Fang (2006), this is the case with buying at both the consumer level as well as the industrial level, and although the impact of culture may differ to a degree between these two levels, generally there will be cultural differences in how buyer in different environments behavior or act. It is for this reason that western derived models of buyers need to be modified when doing business in developing countries. Different tastes, customers and habits are likely to result in different preferences.

Cultural models on conducting business, especially effective cultural models on business and marketing, are essentially a lesson in rhetoric. Since the study of rhetoric has been around for many years, there are a number of different definitions for the word, and the three traditional ways and one architectural cultural way, in which culture conducts business create an artistic proof for an argumentative message are with the usage of ethos, pathos, logos, and feng shui [風 水 (through the correlation and causation of biophilia)]:

1. **Ethos:** Ethos is the appeal of a message's meanings, and is also an attempt to gain the audience's support for the message argument through portraying the cultural methodology of conducting businesses resulting in the type of corporate and organizational identity the audience would be likely listen to and believe.
2. **Pathos:** Pathos is the appeal to the audience's emotions. Pathos is easiest of the four types of appeals to explain but the most difficult to use effectively in practice.
3. **Logos:** Logos is the appeal to reasons. It is probably the most involved appeal to explain and the most straightforward to apply, which is what businesses have all been taught all their professional lives in terms of making arguments: arguments should make logical sense. The appeal to the reason is exactly that: businesses illustrate why the position taken is logical in light of the evidence. In so doing, corporate and organizational identity are formed, branded, and continuously marketed through the Geert Hofstede's dimensions of cultural identity, resulting in the architecture of organizational psychology (Tran, 2014).
4. **Feng Shui (Biophilia):** Feng Shui is a Chinese philosophical system of harmonizing everyone with the surrounding environment. It is closely linked to Daoism. The term feng shui literally translates as wind-water in English. This is a cultural shorthand taken from the passage of the now-lost Classic of Burial recorded in Guo Pu's commentary (Pu, 2009): Feng shui is one of the Five Arts of Chinese Metaphysics, classified as physiognomy. The feng shui practice discusses architecture in metaphoric terms of invisible forces that bind the universe, earth, biophilia, and humanity together, known as qi. Historically, feng shui was widely used to orient buildings—often spiritually significant structures such as tombs, but also dwellings and other structures through biophilia—in an auspicious manner. In so doing, corporate and organizational identity are formed, branded, and continuously marketed through the Geert Hofstede's dimensions of cultural identity, commonly known as the architecture of organizational psychology.

FUTURE RESEARCH

Biophilia refers to the positive influence of nature on all living things due to the healing aspects of vibrant nature. Biophilia is more well-known in architecture and the architectural field. Feng shui is the Chinese art of the placement of buildings and the organization of interior spaces and furniture to create

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

a smooth flow of chi, to energize environments and to create harmony, health and prosperity in the lives and work of the users of the spaces. Feng shui has been around for some two thousand years and variations, such as Vastu, are used in many Asian countries. Buildings that possess feng shui elements and biophilic features have been found to foster higher levels of human health, well-being and productivity. These design strategies allow natural design elements and shapes to improve flow throughout the floorplan and interior space.

It has been found that in order for people to truly connect to buildings, a balance of natural elements and shapes must be present, including natural light, air, minerals, plants, animals, color, natural shapes, materials, and other organic elements. Known to encourage and improve health and well-being, these integrated natural design disciplines, are simply a superior way to design our spaces in which we live and work. While the fields of environmental psychology and industrial and organizational (I/O) psychology are not naïve about the concept and practice of biophilia, is not exactly well-known, researched, or practiced in the field and subfields of psychology. Hence, biophilia would no doubt yield educational and practical results through the interdisciplinary partnership among architecture, environmental psychology, and industrial and organizational (I/O) psychology.

CONCLUSION

While biophilia is an influential concept in ecopsychology and a practical methodology, there are arguments that it should be "taken with a pinch of salt" (Bone, 2009). The argument that Bone (2009) forwards is that biphilia can be interpreted as biologically determinist, and as such it is on conflict with what we know of our social environment (Newton, 2007), the best example being behaviorism and its theories of conditioning (Bandura, 1965). Freudian theory is often criticized for similar reasons, and as the two share a focus on the unconscious (Rosak, 1995), some criticisms can ring true for both. It is argued that this kind of determinism attempts to precede and set limits on the effects of culture on the psyche (DeCecco & Elia, 1993), whereas there is a wealth of psychology indicating that cultural and social factors are hugely influential (van der Veer, 1996). It can be argued that many aspects of both biophilia and biophobia are learned, through theories like Banduras (1965) imitation of behavior model. This expands into a cultural argument, as shown by Noe and Snow (1990), through different cultures (Hispanic & Non-Hispanic) experiencing a different level of sensitivity for the ecological concerns and natural environments, implying a cultural effect on this variable. While these criticisms of biophilia are relevant, the field has taken some steps to address them, for example, Kahn (1997) notes that cultural issues do play a role in the way we express biophilia, with it being more acceptable in some cultures compared to others.

Hence, there are three major flaws with biophilic, and other evolutionary based explanations of behavior, identified by Schlinger (1996, pp. 72-73), and these are validity and reliability, poor use and understanding of statistics and loose interpretations of data. By this Schlinger identifies that much of the data in biophilic research is difficult to replicate as the conclusions come to be researchers are hard to verify due to its overall lack of empirical research. Schlinger (1996) continues by arguing the problem with evolutionary basis for behavioral and emotional development is partly of evidence supporting these arguments due to this flaw. This is compounded by the work of geneticist Futuyama (1979), who states that the field of genetics provides no means for "investigating the inheritance of an invariant trait", which in this case is biophilia.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Futuyama argues that making these kinds of claims is pointless as they are unstable (1979), but does put forward the idea of instead of being a universal trait, traits like biophilia could be canalized in different cultures instead. This is supported by research such as that of Dobzhansky, Ayala, Stebbins, and Valentine (1977), who found that instead of behavioral rigidity in reacting to natural stimuli, which is implied by biophilia, there is a degree of plasticity, with people reacting differently to stimuli, and sometimes not at all, showing a variance in responses, that would support a canalized theory of biophilia.

The crux of this set of arguments against biophilia is that correlational data does not imply causation (Neale & Liebert, 1973) and we do not understand the reactions, for example, in animal assisted therapy to draw conclusive evidence in favor of biophilia (Melson & Fine, 2010). However, based on practice, biophilia (in relations to feng shui), through practice, has demonstrated that correlation does indeed imply causation. As such corporate and organizational identity continue to form, brand, and continuously marketed through the Geert Hofstede's dimensions of cultural identity, commonly known as the architecture of organizational psychology.

For example, the MGM Grand Las Vegas is a hotel casino located on the Las Vegas Strip in Paradise, Nevada, USA. The MGM Grand is the third largest hotel in the world by number of rooms and the largest hotel resort complex in the United States, ahead of The Venetian. When it opened in 1993, the MGM Grand was the largest hotel in the world. Originally, the main entrance on the Strip was inside the mouth of a giant lion, a play on a cartoon-like version of MGM's logo, Leo the Lion, but this entrance feature was changed to a more traditional entrance. The change, was rumored by the Asian culture, based on feng shui, where guests entering the hotel through the lion's opened mouth, symbolizes that all guests are preys and that the MGM is the predator. All who enters will lose to the house when gambling.

Hence, in 1998, a large bronze statue of Leo was added above the entrance to keep with the MGM Lion theme, while not scaring away guests. The statue weighs 50 tons, and at 45 feet (14 m) tall, on a 25-foot pedestal, is the largest bronze statue in the U.S. (MGM Grant Fact Sheet, 2016). Hence, based on practice, biophilia (in relations to feng shui), through practice, has demonstrated that correlation does indeed imply causation. As such corporate and organizational identity continues to form, brand, and continuously marketed through the Geert Hofstede's dimensions of cultural identity, commonly known as the architecture of organizational psychology.

KEY TERMS AND DEFINITIONS

Architecture: Can be best defined as the art and science of integrating the physical environment within a socio space-time organization.

Biophilia: An innate human emotional affiliation to nature and living organisms in general is proposed as an adaption to our history.

Biosphere: The biosphere is the global sum of all ecosystems. It can also be termed as the zone of life on Earth, a closed system, and largely self-regulating. By the most general biophysiological definition, the biosphere is the global ecological system integrating all living beings and their relationships, including their interaction with the elements of the lithosphere, geosphere, hydrosphere, and atmosphere.

Ecopsychology: Ecopsychology studies the relationship between human beings and the natural world through ecological and psychological principles. The field seeks to develop and understand ways of expanding the emotional connection between individuals and the natural world, thereby assisting individuals with developing sustainable lifestyles and remedying alienation from nature. Theodore Roszak is credited with coining the term in his 1992 book *The Voice of the Earth*. Roszak later expanded the idea in the 1995 anthology Ecopsychology with co-editors Mary Gomes and Allen Kanner.

Environmental Psychology: Environmental psychology is an interdisciplinary field focused on the interplay between individuals and their surroundings. The field defines the term environment broadly, encompassing natural environments, social settings, built environments, learning environments, and informational environments.

Feng Shui: A Chinese philosophical system of harmonizing everyone with the surrounding environment.

Geert Hofstede: The founding father of the five cultural dimensions: 1. power distance, 2. individualism/collectivism, 3. masculinity/femininity, 4. uncertainty avoidance, and 5. long-term/short-term orientation.

Globalization: Defined as "the intensification of worldwide social relations that link distant localities in such a way that local happenings are shaped by events occurring many miles away and vice versa".

Globalization (in Architecture): In the architect of the organizational psychology world, often evokes images of a shrinking world, in which accelerating flows of information and travel technology compares time and space in the relationships between world cultures, political economies and the built environment.

Globalization (in Corporations): Associated with flows of capital, labor, products, and ideas that have crossed, challenged, and blurred established national and international boundaries.

Identity: The state of being very like or the same as something or somebody, or the state of being closely involved with a part of something.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Individuals' Psychological Sense of Place Identity: Can be understood in many ways: as an experience, a convergence of cognitions, how residents feel towards their town, or an assessment of the extent to which they agree with the sentiment "this is not the place for me".

Industrial and Organizational (I/O) Psychology: Industrial and Organizational Psychology [also known as I–O Psychology, Occupational Psychology, Work Psychology, Work and Organization (W/O) Psychology, Industrial, Work and Organizational (IWO) Psychology, and Business Psychology] is the scientific study of human behavior in the workplace and applies psychological theories and principles to organizations and individuals in their workplace.

Place: Can be described in terms of many multidimensional physical and psychological environmental attributes.

Place Identity: Conveys many different dimensions such as physical size, tangible versus symbolic, and known and experienced versus unknown and not experienced.

Chapter 5
A Primer for Beginners in Pharmaceutical Care:
A Call-to-Action to Pharmacists

Marcus Vinícius Dias-Souza
Dias-Souza Faculty of Health Sciences, University Vale do Rio Doce, Governador Valadares, Brazil

ABSTRACT

This article describes how pharmacists are highly accessible healthcare professionals, and their clinical services are among the most accessible healthcare assistance systems worldwide considering the availability, geographic distribution and location of compounding pharmacies, clinical laboratories and drugstores. Pharmacists need to move from the focus in administrative management to patient-oriented practice, such that the access and the quality of clinical services can be improved. Pharmaceutical Care can influence pharmaceutical services to become more accessible and with a broader coverage of patients. Here is presented an approach on the implementation of effective strategies to improve the quality of Pharmacists' performance as specialized healthcare providers.

INTRODUCTION

More than half of the world population cannot access the medication they demand. Prices are often too high for patients and health systems to afford, and therefore, such expenses represent a significant part of the total healthcare budget. And it is in this context that Pharmacy profession has evolved to include the provision of services beyond the traditional role of medication dispensing. Pharmacists are highly accessible healthcare professionals given the availability, geographic distribution and location of establishments such as drugstores and compounding pharmacies. The Pharmacist is usually the first professional addressed by a patient with minor or complex health issues, commonly due to the scarcity of physicians, or even due to financial barriers to private clinical services when public healthcare services cannot address the patient's needs (Hepler, 1996; 2004; Wiley et al., 2014; Kamei et al., 2015; Penm et al., 2015; Lopes et al., 2017; Mateti et al., 2017).

Pharmaceutical services are among the most accessible healthcare assistance systems worldwide, being quite often provided without additional charges (beyond medication prices) by Pharmacists in enterprises like drugstores and compounding pharmacies; yet, some of these services are remunerated in some countries, including consultations, blood pressure measurements or preparation of healing bandages. The published experience on the traditional way that pharmaceutical services are established and offered has shown that they have historically been working relatively well for patients in conditions such as: a) common and controlled acute or chronic diseases, b) use of not many medications (like two or three formulations), c) simple therapeutic schemes, d) adequate education level to understand pharmaceutical advising on rational use of medications (Citrome, 2011; Fisher et al., 2014; Gabr & Shams, 2015; Molino et al., 2017).

In some countries, in addition to counseling patients on all technical aspects concerning appropriate medication usage, Pharmacists are allowed to prescribe some types of medications, a relevant support for patients to take decisions on self-treatment with medication. This may explain in parts why patients often seek advice in pharmacies, and frequently do not consider a physician consultation. Nevertheless, there are several challenges for providing these services for patients with limitations such as low education, difficulties on reaching the Pharmacist, the need for individualized monitoring (due to the complexity of therapy), and reports of low quality services are growing worldwide. These facts have been requiring Pharmacists to rethink the way in which pharmacy practice is performed (Lewin, 2013; Sakthong et al., 2013; Fishera et al., 2014; Malewski et al., 2014; Sakharkar et al., 2014; Abe et al., 2017; Babar et al., 2017).

Pharmaceutical services are generally designed in agreement to health policies in order to ensure access, affordability, and delivery of essential medicines to the population. Usually, they comprise medication dispensing, counseling on rational use, logistic organization of dispensing accordingly to local clinical and epidemiologic data. Strategies for the rational use of medications are than planned to promote safe and cost-effective treatments, considering regulatory and quality standards defined by local laws. Pharmacists should, therefore, develop mechanisms for regular review or new proposals of formularies, guidelines and policies regarding drug dispensing and prescribing; therefore, developing trained pharmaceutical human resources is of paramount importance, and efforts have been made worldwide to provide this improvement in different levels of pharmaceutical education, such as PharmBSc (Bachelor of Science in Pharmacy), PharmMSc (Master of Science in Pharmcy) and PharmD (Doctor of Pharmacy) (Vijayanarayana et al., 2014; Kamei et al., 2015; Nuffer et al., 2017).

Patients' needs regarding drug therapy are in continuous fluctuation (Malewski et al., 2014; Obreli-Neto et al., 2015). Thus, evidence-based pharmacy practices are the key to provide effective pharmaceutical services and improve the quality of healthcare as a whole. In this sense, Pharmacists must move from being medication dispensers with focus in administrative and logistics management, to patient-focused and clinically-oriented care providers, with more responsibility and commitment to improve their technical knowledge, but now with a humanistic view of practice (Sakharkar et al., 2014; Cho et al., 2015; Novais et al., 2017; Sakthong & Sangthonganotai, 2017).

Here, strategies to expand the access of patients to pharmaceutical services focusing in pharmaceutical care, and ways to improve the quality of such services. Data regarding patients' views and satisfaction with Pharmacists' performance as a specialized healthcare provider, and Pharmacists' perception of receptiveness and evolution of patients will be also discussed in light of evidence-based practice.

PHARMACEUTICAL CARE AS A PROCESS: AN OVERVIEW

Since the 1990s, Pharmaceutical Care (PC) has been described as an important service and element of pharmacy practice and healthcare, in which Pharmacists are responsible for the quality. PC is a pharmaceutical service designed to achieve definitive therapeutics outcomes through preventing or solving drug related problems, and is generally defined as a direct provision of drug related care by the Pharmacist through health education, in order to improve patients' quality of life when using medication. It represents a shift of practice in pharmacy from being drug product-oriented to a patient-oriented view (Hepler & Strand, 1990; Cipolle et al., 2004). As described by Hepler (1996), PC services involve:

1. Recognition and correct identification of clinical conditions requiring safe and efficient drug therapy
2. Prescribing for definite outcomes
3. Dispensing and patient counseling, involving the patient or family/caregiver in all decisions
4. Monitoring and management of outcomes
5. Documentation of all actions

PC activities include medication dispensing, providing education on drug use through patient counseling, drug use monitoring, preparation of parenteral nutrition formulations, monitoring adverse drug reaction, development of drug use guidelines, and cooperation with the healthcare team; these are offered in a mutually beneficial exchange way, in which the patient asks and consents to be supported by the Pharmacist regarding pharmacotherapeutics needs, and the Pharmacist accepts the responsibility to provide drug therapy support with competence and commitment. The Pharmacist provides this service for one patient each time, but groups can also be reached by PC services, in consultations that vary in time and frequency according to the patient's needs (Dias-Souza & Barros, 2012a; Alturkia et al., 2013; Cheng et al., 2014; Wongpakaran et al., 2017).

The steps of pharmaceutical consultations include (but are not limited to):

A. Collection and organization of patient-specific information (such as demographic data, body mass index and blood pressure);
B. Identification of health problems;
C. Analysis of all the medication being used, in order to identify potential drug-related problems (DRP) like dosage form, therapeutic schemes, administration, and drug-drug and drug-food interactions;
D. Patient counseling on pharmacological and non-pharmacological management of the disease;
E. Monitoring of the desired outcomes through clinical investigations.

In PC services, the Pharmacist work in concert with the patient and other healthcare providers to promote health, prevent diseases, and to assess, monitor, and when necessary, modify medication use, in order to assure that drug therapy regimens are adequate, safe and therefore, effective. PC services should optimize quality of life regarding the use of medication, and achieve definitive and positive clinical outcomes within realistic financial expenditures. Oriented plans for diagnostic drug use in addition to pharmacologic drug use are important for this (Morello et al., 2016; Neeman et al., 2017).

The implementation of PC depends on data collection and documentation systems that register patients' information such as demographic data and clinical history, communications with other professionals like nutritionists and the physician in charge, and data for studies on medication use profile (Maher et

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

al., 2011; Kaufmann et al., 2015; Kuhmmer et al., 2015). Also, specific equipment are needed to assess medication therapy adherence and effectiveness, clinical resource materials, and also patient education materials, as described in the previous section.

Interactions between the Pharmacist the patient (and the family and/or caregivers, when necessary) should occur to assure efficient mutual communication and cooperation, and that the decision-making process on pharmacotherapy is shared by the Pharmacist and the patient. The Pharmacist uses technical knowledge and skills to optimize drug therapy, and the patient agrees to supply personal information and actively participate in the process of care as a whole (Schmelz et al., 2010; Yu et al., 2013; Pauwels et al., 2015; Srivastava & McGuire, 2015). Nevertheless, varied barriers have been described for the implementation and success of PC services, and some of them will be briefly discussed:

- **PC Courses in Curriculum:** Many pharmacy faculties still do not give attention to social activities of Pharmacists, and PC is still often regarded as pharmaceutical assistance and vice-versa.
- **Disparity of Cultures and Believes, Fear of Change and Poor Education in Communication Skill:** The lack of training in these is the most critical issue regarding human resources in PC.
- **Counseling Guideline or Plan for Effective Patient Counseling:** This is a critical point in PC: although patients have different needs, all steps in PC must be standardized when possible, to guarantee that care will be delivered to all patients in a similar way.
- **Poor Documentation of the Provided Care and Improper Use of Registration Formularies:** For an effective follow-up, all actions must be registered and properly saved.
- **Continuity of Quality Improvement:** the lack of interest and motivation for quality improvement is very common when the Pharmacist is not properly valued.
- **Access to Effective Drug Information Resources:** some professionals have scarce training in searching for evidence-based data in articles, for example. This can be overcome with specific training in articles search platforms.
- **Access to Full Patient Information:** This happens specially when the Pharmacist is dealing with the caregiver and not directly with the patient.
- **Profession Fees to Reward Care Services:** PC services are charged in some countries. Although it is a fair practice, not all patients with real need of PC services can afford them.
- **Software for Medication Assessment Support:** To avoid handwritten formularies, software for registration of the activities are necessary.
- Space and layout within the pharmacy, inadequate private counseling area, lack of time.
- **Lack of Insurance Assistance:** Most insurance services world-wide do not cover pharmaceutical services at all.
- **Professional Resistance to Interactions with The Pharmacist:** Often, some prescribing or care professionals do not interact with the Pharmacist. A good alternative is to try a personal contact and provide scientific literature as an ice breaker.
- **Patient Interest:** Not all patients will be interested in PC. When the patient is adult and in his own, there is not much to do but to show the advantages of PC. When the patient demands family or caregiver support, it is important that the Pharmacist clearly shows how much the service can help the improvement of quality of life, promote financial savings and adequations on the use of medication.
- **Patient Literacy and Socioeconomic Status:** This is also critical for the patient that demands instructions. Memorizing is not always possible because of the load of information.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Pharmacists must collect subjective and objective information regarding the patient's general health status, past medical history, medication use history, social habits history (like alcohol use, smoking), diet, physical activities routine history, history of the current clinical condition, financial and insurance status, when necessary. To perform this, the Pharmacist should ask the patient for medical prescriptions, charts and reports, and should create health/physical assessment instruments. Some validated instruments have been published elsewhere, and often, adaptations are not required. Also, interviews with family members or the caregiver are important, mainly for pediatric or senior patients. Other healthcare providers including physicians, nurses, mid-level practitioners and other Pharmacists should also be contacted when necessary. (Hepler, 1996; Cipolle et al., 1998; Mazhar et al., 2017).

Despite pharmaceutical consultations have professional limitations such as providing diagnosis and requirements of clinical exams, the experience of patients in pharmaceutical consultations generates opinions and views for both patients and Pharmacists, which are important tolls to evaluate and optimize the quality of services and to assess the need for new services. To perform PC services, Pharmacists must have characteristics like being a caregiver, communicator, decision-maker, teacher, researcher, leader, and manager, in order to offer individualized care to patients (Hepler, 1996; Cipolle et al., 1998). Conversely, the experience reported in the literature describes lack of training in such abilities during university (Sakharkar et al., 2014; Neeman et al., 2017).

All the information is then evaluated and a drug therapy plan is developed with the patient. Based on a thorough understanding of the clinical picture of the patient and the treatment options available and affordable, the Pharmacist plans an outcomes-oriented drug therapy plan. For this, the Pharmacist considers not only clinical aspects of the disease, but also psychological and social consequences, including the complexity of therapy and alternatives to improve patient adherence (Hepler & Strand, 1990; Cipolle et al., 2004; Weiss et al., 2015).

The patient should be instructed about side effects, important negative or positive interactions with food and other medication, and eventually, of other therapeutic options and non-pharmacological complementary alternatives. The therapeutic therapy plan must be documented in the patient's pharmacy record and communicated to the patient's other healthcare providers when necessary. The therapeutic plan must be completely explained to the patient, including the responsibilities shared with the Pharmacist. Information should be provided to the patient at a level the patient will understand, thus, appropriate language should be used, avoiding, for example, detailing drug mechanism of action at a molecular level. At the end of the consultation, the patient must know how to take the medication, why it is being administered, for how long it will last, risks and benefits of the use and what other health-related behaviors can increase quality of life (Dias-Souza & Barros, 2012b; Dias-Souza & Barros, 2012c; Ross et al., 2015; Lopes et al., 2017; Mateti et al., 2017).

PC CONSULTATION: STEPS AND METHODS

Data Collection

An initial interview should be conducted with the patient/family/caregiver. In this first interview, all patient's need on pharrmacotherapy should be met. Therefore, sufficient time (often 30 to 60 minutes) should be spent to assure that questions and answers are provided without embarrassment or hurry. The patient should be comfortable with the questions, and for scientific and professional protection of both

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Pharmacist and patient, a consenting form approved by an Ethics committee should be signed by them (Cadogan & Ryder, 2015).

Standard procedures should be used to systematically record patient-specific subjective information, including health and activity status, past medical history, medication history, social history (including economic situation), family history, and history of present illness. Such records must be properly organized and kept updated. Patients' perceptions, thoughts, beliefs and feelings of the diseases should be included on the formulary. When necessary, physical assessment techniques like blood-pressure monitoring and capillary measurements of lipids and sugars should be performed (Sancar et al., 2011; Safaeian et al., 2015).

Evaluation of the Information Obtained at the Interview

The Pharmacist begins an evaluation of the subjective and objective information gathered from the patient and 1) investigates what drug-related problems are happening or can happen in the current clinical picture; 2) analyses opportunities for optimizing the safety, effectiveness, and financial aspects of the drug therapy; and 3) discuss the conclusions with the patient in the second consultation. The discussions with the patient should guarantee an appropriate understanding of the clinical picture, treatment strategies and administration schemes, and what will be necessary for an effective management (Hepler, 1996; Cipolle et al., 1998; Cipolle et al., 2004; Cheng et al., 2013; Al-Quteimat & Amer, 2014).

Preparation of the Care Plan

The Pharmacist identifies, evaluates and then chooses the most appropriate actions to improve and/or assure the safety, effectiveness, and/or cost-effectiveness of current or planned drug therapy, and to minimize the existing or potential drug-related problems. The care plan is prepared according to the desired outcome. The plan may include work with the patient as well as with other health professionals to provide therapy protocol adjustments or to modify prescribed drug therapy, implement clinical monitoring, recommend alterations on diet, add non-prescription medications or non-pharmacological treatments, or recommend a visit to a specific professional (Montgomery et al., 2008; Petrillo et al., 2011; Vijayanarayana et al., 2014).

For each problem identified, the Pharmacist should consider each of the patient's needs and determine the desirable and mutually agreed outcome and incorporate these to the care plan. The plan may include specific disease state and drug therapy endpoints and monitoring endpoints. The Pharmacist reviews the plan and desirable outcomes with the patient and with other healthcare professionals when it is necessary (Cipolle et al., 2004).

Implementing the Care Plan

The Pharmacist take the steps necessary to implement the plan, which include contacting other health professionals when necessary for any modifications on drug therapy, counseling the patient and/or the caregiver about the correct use of the medication and all problems associated to the incorrect use, coordinate the acquisition of medications and related supplies and begin the clinical monitoring. The Pharmacist should maximize patients' understanding and involvement in the care plan, guaranteeing that the parameters for drug therapy monitoring like blood pressure, molecular markers, blood glucose and

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

cholesterol testing, are made and understood by the patient, family and the caregiver (Lin et al., 2011; Hirsch et al., 2017).

The patient should be instructed on how to properly use all medications and related products when necessary. Information should be provided to the patient in an easy way to understand. All this information must be registered in the pharmacy record, as well as the steps taken to implement the plan including the appropriate baseline monitoring parameters (Austin et al., 2006, Nkansah et al., 2008).

Monitoring Outcomes and Modifying the Care Plan

The Pharmacist should review subjective and objective monitoring parameters in order to determine if the desired outcomes will be achieved as outlined in the drug therapy plan. If any problems are detected, the Pharmacist must make the required modifications with the patient, family and caregiver. As progress towards outcomes is achieved, the Pharmacist should provide positive reinforcement and update the care plan. The Pharmacist uses appropriate professional judgment to assess the need to notify other healthcare professionals involved in the patient's case about the registered evolutions (Classen et al., 2002; Brown et al., 2003; Cranor & Christensen, 2003; Malone et al., 2003; Osterberg & Blaschke, 2005; Scuffham et al., 2008; Fiz et al., 2011)

Establishing evidence-based practice is important for effective, updated and relevant PC services. Furthermore, the implementation of PC is relevant to patients because not only drug therapy will be optimized, but complex pharmacological regimens prescribed may be restructured or simplified by the Pharmacist in order to make it more understandable to the patient. This becomes even more important when we consider that a single patient may visit more than one physician in a given clinical condition and get different prescriptions, and the communication among them about drug prescription is often insufficient (Dashti-Khavidaki et al., 2013). Additionally, medication costs consume a significant proportion of patients' and public health financial resources, what makes PC services economically relevant, and different pharmacoeconomics analysis have proven that significant financial savings could be achieved by patients, institutions and health insurances (Nkansah et al., 2008; Dias-Souza & Barros, 2012b; Lewin, 2013; Cazarim et al., 2017).

Different methodologies of PC have been used worldwide, and the most explored (and published) will be presented briefly:

A. **PWDT (Pharmacists Workup of Drug Therapy):** In this method, patients are assessed by a single Pharmacist for the all medications used for any health problems that the patient might be affected by, and the DRP are analyzed for each formulation used. Therefore, if the patient has migraine and diabetes, the same Pharmacist is responsible for optimizing the drug therapy of both diseases (Hepler & Strand, 1990).
B. **TOM (Therapeutic Outcomes Monitoring):** In this method, patients are assessed by more than one Pharmacist for the medications used for each health problem that the patient might be affected by, and the DRP are analyzed for each formulation used. Therefore, if the patient has asthma and arthritis, a specialist Clinical Pharmacist in asthma and another, specialist in arthritis, shall be visited (Dias-Souza & Barros, 2012b; Dias-Souza & Barros, 2012c)

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

C. **Dáder Method:** This method was developed by a Spanish group of PC headed by Maria José Fáus-Dáder, and has similarities with PWDT in its organization and coverage of diseases, but DRP are analyzed in a different way. This method is widely used also in Latin America (Amariles et al., 2012).

PROVIDING WRITTEN INFORMATION IN PC

A critical point regarding PC is that most of the counseling offered by Pharmacists to patients is provided orally, and hardly ever the patient or the Pharmacists take notes of the information in a standardized and validated way. As a result, patients may misunderstand or forget important details like drug onset of action and side effects, leading to poor compliance problems and negative results. Doubts regarding the need for therapy may arise and complex therapeutic schemes, usually difficult to be managed by patients without professional support, also contributes to poor compliance. The use of written and/or pictorial aids and other educational approaches is still scarce in pharmacy practice, and here, I would like to encourage the reader to explore this resource to improve the access of patients to pharmaceutical services. In this sense, previous works of our group provided evidence of the relevance of written information for patient counseling and education on drug administration (Worley et al., 2007; Seybert et al., 2008; Dias-Souza & Andrade, 2010; Dias-Souza & Barros, 2012c, Khan et al., 2013).

A clinical case of chronic pain in an elderly patient had drawn our attention at first: because of the use of several medications, the patient had difficulties in administrating them correctly, and several interactions were detected in the first pharmaceutical consultation. We reorganized the therapeutic scheme and provided handwritten information in a simple and accessible language such that the elderly patient could easily understand. As the clinical monitoring followed, the evolution of the patient was positive and pain was finally under pharmacological control. We recommended physical therapy sections for the patient, and advised for a clinical-functional assessment by a Physiotherapist (Dias-Souza & Andrade, 2010).

Nevertheless, all this was directed for a single patient. How to deal with several people that simultaneously demand specific written information like this patient? And how to do this for so many possible medications – isolated or combined – in compounding pharmacies or drugstores? The answer comes in a study developed by our group, published in 2012. The development of drug use instructional cards (DUIC) for different pharmacological groups was described by the first time (Dias-Souza & Barros, 2012c).

The DUICs were developed due to a rising demand of basic advising on the correct use of medications on the pharmaceutical setting where the work was developed (a Brazilian compounding pharmacy located at the state of Minas Gerais). Using patients' complaint formularies (PCF) – a document that the good manufacturing practices (GMP) laws from the National Sanitation Regulatory Agency (ANVISA, an agency equivalent to the FDA in the U.S.A.) obligate compounding pharmacies to have in order to register any complaints from patients or clients – we have explored the most frequent drug-related problems to delineate how the DUICs should be designed. The parameters we considered were:

1. Drug-drug interactions
2. Drug-food interactions
3. Correct way and time of administration
4. Storing the dosage form
5. Experienced side effects and potential toxicity

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

After analyzing these data, we performed an extensive literature review for collecting technical information for correct drug using, regarding:

1. Most common drugs and their indication
2. Pharmacokinetics and metabolism
3. Drug-drug interactions (obtained at the drug interaction checker in Medscape website)
4. Drug-food interactions
5. Basic Nutritional Support
6. Best time of administration
7. Pregnancy, lactation and fertility impairment warnings
8. Contraindications
9. Common Clinical Adverse Reactions

DUICs were then developed for the following groups:

1. Antihistamines
2. Antimicrobials
3. Anti-hypertensives
4. Anti-lipemics
5. Proton pump inhibitors
6. Non-Steroidal Anti-inflammatory Drugs (NSAID)
7. Psychotropic drugs

After, the design was created and adjusted for the size of the document, such that it could be attached to the medication that was dispensed through the delivery service or at the counter. DUICs samples (in Portuguese) are shown in Figure 1.

We provided evidence that the DUICs not only were effective in counseling patients in a standardized way, but also improved telepharmacy services: the basic instructions provided in the DUICs could be assimilated by non-Pharmacists attendants, and some basic information about drug use could be rapidly provided for patients. Although the DUICs were planned (and are still being used) for compounded medication, the same instructional material can be adapted for industrialized medication, for which, information commonly found on package inserts has been described as poorly designed by professionals and not completely understood by patients. Also, patients often describe that written information on prescription drug labels are confusing or incomplete.

To overcome these problems, Kripalani et al. (2007) developed illustrated medication schedules for helping low-literacy patients to administrate medications correctly. The development of the cards design began by raising the needs of the patients through surveying local Pharmacists by telephone and posted emails on national pharmacy list servers, asking about the use of medication aids, visuals, or other patient education tools. Physicians with expertise in medication adherence, patient education, and literacy helped to draft the cards, using pictures to illustrate instructions to follow drug therapy schedules. A multidisciplinary team of healthcare providers then reviewed the content and format of the design draft. Twelve patients of different age and educational attainment reviewed sample pill cards to provide input into the types of pictures used, the size of the text and overall document, and the desired content. The instrument could maximize comprehension across levels of health literacy, providing only the most es-

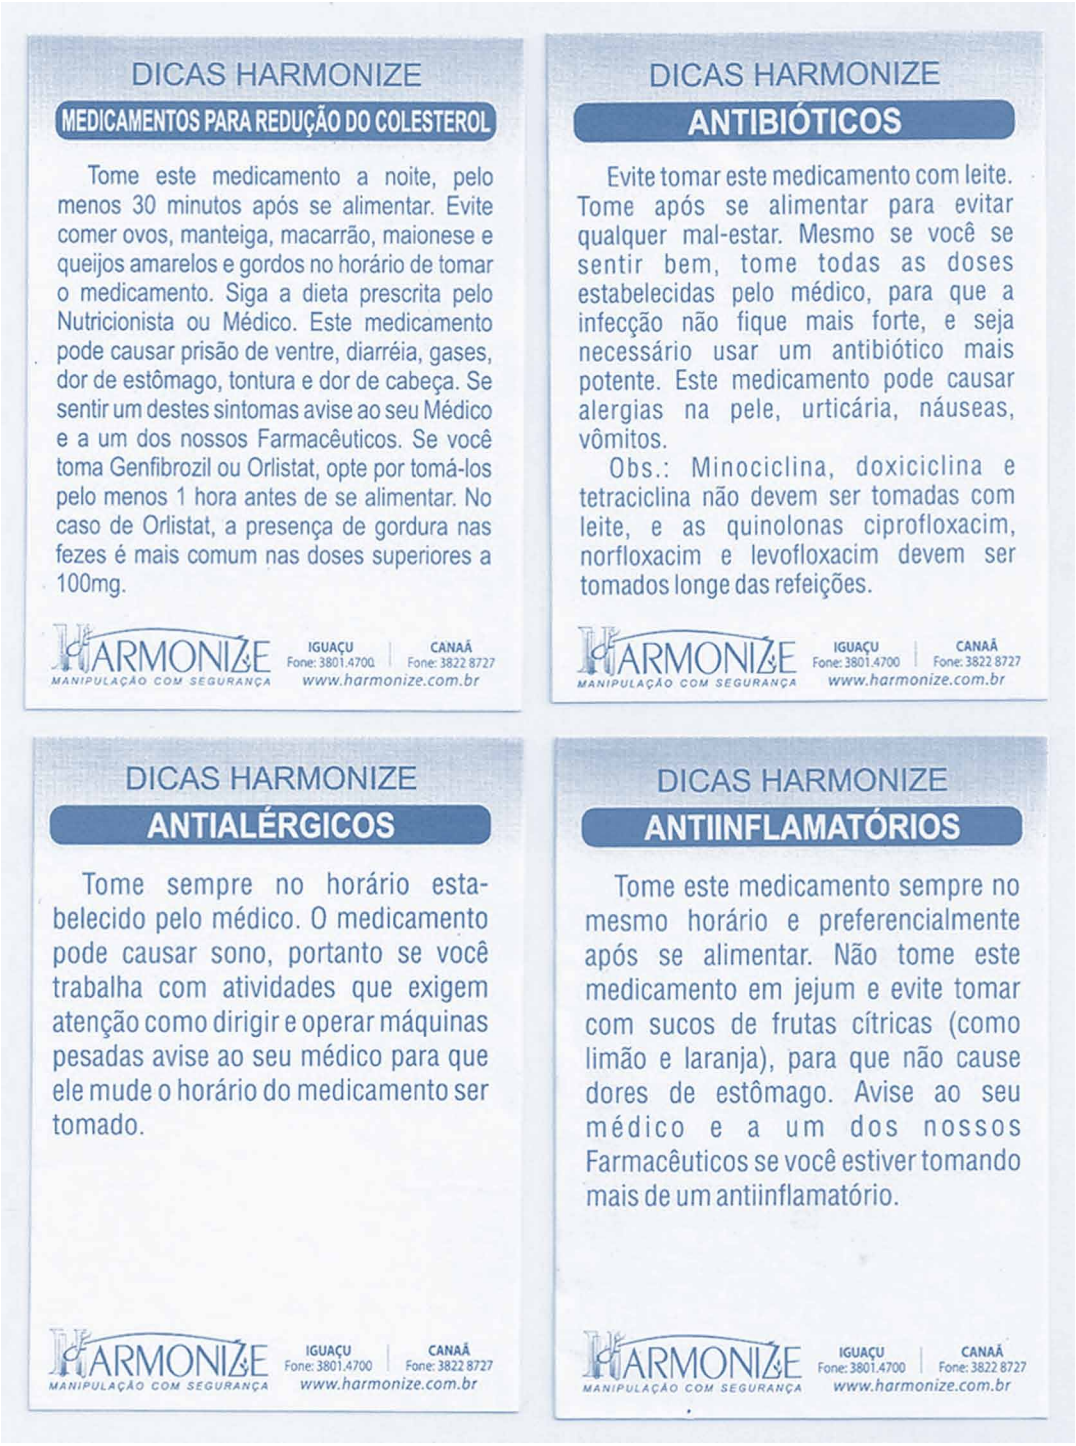
Figure 1. DUIC samples (available only in Portuguese) developed by Dias-Souza & Barros (2012c): a) antihistamine drugs; b) NSAID; c) antilipemic drugs; d) antimicrobials. DUICs are still being distributed for patients that are costumers of the compounding pharmacy where the study was conducted



EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

sential medication instructions like name, purpose, appearance, and time of administration. Patients with inadequate or marginal literacy skills, less than high school education, or cognitive impairment were most likely to refer to the card on a regular basis initially and after 3 months. Patients found it easy to understand and helpful for remembering important medication information, such as the name, purpose, or time of administration.

Kassardjian et al. (2008) validated a Pictorial Representation of Illness and Self Measure (PRISM) as a measure of suffering in patients with chronic non-cancer pain. Patients were recruited from 2 hospital pain clinics, and the majority of them was middle-aged women, in whom chronic pain is more prevalent and also more treated. For the task, patients were shown a letter size white paper with a fixed yellow circle glued in the bottom left-hand corner of the piece of paper. Patients were asked to imagine that the paper represented his/her life and that the yellow disk represented his/her concept of self. They were given a red paper disk representing their pain and asked to glue it in a location related to the "self" disk, reflecting the impact of pain into their lives. The same request was made regarding work, family, spouse/partner and recreation. Patients glued the disks onto the page in whatever order they wanted. Blind patients also completed the task, indicating that it also behaved as a tactile tool. Eight main parameters were assessed: Physical functioning, role-physical, bodily pain, general health, vitality, social functioning, role-emotional, and mental health. Higher scores in a scale of 0–100 indicated better health-related quality of life. Different situations were identified using this PRISM system: Patients reported that their close relatives were a negative influence to the treatment because they were overly controlling, or did not believe in the state of disability due to pain. Patients with high scores felt controlled by partners or family members, or emotionally distant from them. It was also reported by group of patients that their partner and family have either very little influence over their lives, or a significant negative influence. Patients found PRISM thought-provoking, and it was described by the authors as a quick, simple, and manageable tool for patients with chronic pain to complete.

A randomized blind trial comparing picture versus prose-based information pamphlets was conducted by Thompson et al. (2010). The authors compared memory, comprehension, and preference for medication information presented in a prose-based medication information pamphlet versus a pictorial-based information pamphlet. Specific information regarding methotrexate was used in this study. A total of 100 participants aged 18–65 years of age, who had not completed high school, could read English, and had no prior knowledge about methotrexate were included. Superiority of pamphlet type was assessed using immediate free recall, cued recall and comprehension. In the end, each participant was shown a card displaying both the picture and prose-based pamphlets and asked to decide which pamphlet they felt to be most visually appealing, which they would rather receive, which looked more useful, and which was easier to read. According to the statistical analysis, no differences were detected between picture and prose pamphlets in free recall, cued recall, and comprehension either immediately or after a 1-week interval, and the pictorial pamphlet was preferred over the prose-based pamphlet.

Mohan et al. (2013) conducted focus groups and interviews with Latino patients with diabetes at two safety net clinics in the USA to understand medication taking practices and perceptions of illustrated medication instructions. They explored PictureRx™, a software platform that generates illustrated, patient-centered medication lists in a daily medication schedule. The following essential information for patients is included: name, dose, frequency, purpose, and special instructions when needed. The design of PictureRx cards was evidence-based, drawing on research and best practices for the creation of patient education materials with illustrations for medication instructions and other health-related information.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Patients reported confidence in being able to take medications and expressed preference for illustrated medication instructions, which could overcome patients' difficulties on administrating the medication.

Pictorial representations of clinical scenarios for asthmatic patients and of commonly used inhalers devices were developed by Roberts et al. (2010). Initial images were developed, designed and reviewed in consultation with medical and nursing respiratory members of staff before testing it with patients. A computerized software package was developed for the preparation of personalized asthma action plans during a consultation: the health professional should select the options according to the patient's needs. Following a series of sequential screens, the professional identifies appropriate images and scenarios to build a plan. In the end, a pictorial action plan is generated, which should be printed and provided to the patient. The software package automatically checks dosages used, and maximizes inhaled therapy. When the patient uses peak flow for self-monitoring, the program calculates the personalized action levels based upon the reported best peak flow. Users can print out a picture only plan, a words only version or a plan containing pictures and words. According to the authors, the pictorial care plans are quickly prepared to be printed for the patient to take away in several formats, and the data can be stored in the patient's record.

A recent work evaluated the efficacy of a pictorial medication sheet to improve adherence in patients with heart failure and cognitive impairment (Hawkins & Firek, 2014). A total of 36 patients were enrolled. Four study visits spread over approximately four months were performed. At visit one, subjects were asked to bring in all of their regularly prescribed medication for a direct count of administered tablets. After 30 days, in visit two, another tablet count was performed, and adherence was estimated. The subject then received a customized pictorial medication sheet with brief instruction on how to use the pictorial medication sheet, that represented their actual prescribed medication regimen. Subjects were asked to use the new sheet in place of any prior medication instruction sheet they may have been using. The medication sheet included of images of the subject's current medications printed in full color and dose range, arranged in columns for morning, noon, and evening administrations. Descriptions of the medication name, indication and dose were also included. Authors reported that although medication adherence was poor, statistically significant improvements (described in tablets counting) were detected after the interventions.

Nevertheless, written information must be used properly, and should be used regardless of problems not related to the patient. A negative example in this sense was described recently: Hamrosi et al. (2013) examined and compared the use and provision of written medicine information in Australia, focusing in Consumer Medicine Information (CMI) - available for medicines as package inserts, computer prints, or leaflets - by pharmacists and consumers. The reasons surrounding readership and provision of the CMI and comparisons on its use by both consumers and pharmacists were also investigated. A total of 1000 consumers and 1100 pharmacists were interviewed by postal or telephone surveys. The authors found that 66% of consumers usually read the CMI looking for information regarding side effects and clinical use of the medication.

Reasons mentioned for not reading the CMI comprised previous experience with the medications, enough information was provided verbally from the Pharmacist, and also that the document was too long or contained too much information. Interestingly, the disparity detected by the authors amongst the types of written medicine received by patients and provided by pharmacists is strongly suggestive of incomplete/inadequate (or both) provision of pharmaceutical services. Almost 90% of pharmacists reported providing package inserts, but 88% of consumers reported receiving them when provided with written medicine information. Personalized computer-generated CMI was provided 99% of pharmacists,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

but only 37% of consumers reported receiving it. Forty percent of pharmacists and 25% of GPs (n = 45) also reported providing loose leaflets/brochures yet only 7% (n = 47) of consumers reported receipt.

TELEPHARMACY SERVICES

In this section, I would like to introduce the need and the context of telepharmacy services, a powerful tool for expanding pharmaceutical services when used correctly. According to the World Health Organization (WHO, 2010), telemedicine is defined as the delivery of healthcare services, where distance is a critical factor using information and communication technologies for the exchange of information for diagnosis, treatment and prevention of diseases, research and for the continuing education of healthcare providers, all in the interests of advancing the health of individuals and their communities. Telepharmacy, following the example of telemedicine, offers pharmaceutical services at a distance, i.e., with the Pharmacist and patient communicating through telephone, videoconferencing systems such as Skype®, or any online communication system such as WhatsApp® and social networks. Online chat services available at the website of the pharmacy are also a good alternative when affording is possible.

And why this is important? Telepharmacy technologies can improve patient access to pharmaceutical services beyond remote medication dispensing, including PC. This sort of communication is especially important when the patient cannot reach the Pharmacist due to several possible limitations like mobility issues (the patient does not have access to a vehicle), or if the patient is affected by a disease that impairs the patient to meet the Pharmacist (Garrelts et al., 2010).

Nevertheless, to use this kind of service, a Pharmacist must work exclusively on it, and must have trained people on using the system for technical support or as workmates, to make the service work in a normal flow. In this service, patients can be advised about any aspects of the medication. Also, as some are not comfortable on going to the pharmacy for several reasons (embarrassment on talking to the Pharmacist face-to-face about the health problem, embarrassment on talking about it in public), the service may make the patient more comfortable on talking to the Pharmacist through typing or by phone.

Bynum et al. (2001) assessed the effect of telepharmacy counseling and using interactive compressed video, on how to use the asthma inhaler and patient satisfaction among adolescents with asthma. The telepharmacy service provided accessible education regarding asthma inhaler techniques for adolescents.

Moser et al. (2004) found 4136 documents using the search term “telemedicine” in MEDLINE from 1964 to 2003. They reported significant correlations between publications per million inhabitants and GDP per capita. Fatehi and Wootton (2012) examined the occurrence of the terms “telemedicine”, “telehealth”, and “e-health” in the Scopus database and a total of 11.642 documents were found in 2012. They found that “telemedicine” was the most common term with 8.028 documents.

Stubbings et al. (2005) described a telepharmacy call center service that was developed at a multidisciplinary health service through collaboration among the health professionals and the health plan to care for patients with medication-related questions. Pharmacists work close to physicians, nurses, and service associates of the call center. The team answered approximately 1.200 calls daily, regarding their transition into the health insurance plan and drug therapy questions. The service improved the quality and cost-effectiveness of drug therapy regimens and significant cost savings were registered.

The group of Lam et al. (2009) reported telepharmacy-related services and outcomes in western Washington State from 2007 to 2008. Five network clinics without in-house pharmacies were remotely connected to a central pharmacy to provide telepharmacy services, and automated drug dispensing

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

system (ADDS) units, webcams, and electronic medical charts were used to provide remote medication order processing/dispensing, patient counseling, refill authorizations, and medication assistance referral services. Patient demographics, numbers of dispensed medications, patient consultations, and refill authorizations were registered, and service referrals, Pharmacist feedback and workflow changes as well. Antimicrobials were the most frequently dispensed medication, and Pharmacists described webcam-enabled interviews as an excellent method for better privacy and longer counseling.

Garrelts et al. (2010) implemented a telepharmacy service at five hospitals from a Catholic, nonprofit, integrated delivery network health system. Telepharmacy services were provided by a team of Pharmacists employed by the health system. Using a virtual private network or terminal server, Pharmacists directly accessed hospital servers and information systems to conduct their work. The time spent in routine orders of medication reduced significantly after telepharmacy services were implemented. The number of clinical interventions documented increased and annual savings reached 1 million dollars.

Sankaranarayanan et al. (2014) documented remote Pharmacist interventions for patients at eight rural hospitals in the Midwestern United States during prospective prescription order review/entry from 2008 to 2011. Remote Pharmacists' interventions were divided in three broader-level definitions: (a) interventions in interactions and potential interactions, contraindications, adverse effects, drug product selection, drug regimen and recommendations, (b) patient medication management regarding therapy review and action, and (c) health system-centered medication use process, regarding medication prescribing, transcribing and documenting, administering, and monitoring clinical results. Frequencies of intervention levels were compared by year, hospital, remote Pharmacist, and hospital pharmacy status. Frequency of interventions significantly increased each year, and differed significantly across the hospitals, suggesting that patients' needs were addressed particularly.

CONCLUSION

Strategies on expanding and improving pharmaceutical services have been presented in opportunities that are still poorly explored in daily practice: the provision of written information for patients and telepharmacy services. Written information may help patients to remember and reinforce how medication should be correctly taken, and in case of low literacy, alternatives of pictorial support were discussed. Telepharmacy services may help patients and health professionals to quickly reach the Pharmacist and solve drug-related problems, especially when there are mobility issues. The implementation of these services in PC context is not a simple endeavor; however, to overcome the technical difficulties, the Pharmacist must work together with patients, families and caregivers, generating solid services, and along with other health professionals. This team work is the key for improving and expanding pharmaceutical services.

ACKNOWLEDGMENT

The author is thankful to GPqFAR - *Integrated Pharmacology and Drug Interactions Research group* for the outstanding work developed so far. The author is also thankful to Miss A. Cristina D. Souza (specialist degree in Neuropsychology), for the relevant discussions during the preparation of this manuscript.

Chapter 6
The Assessment for Career Counseling Skill for Teacher at High School: A Case Study in Vietnam

Duyen Nguyen Thi
Hung Yen University of Technology and Education, Vietnam

ABSTRACT

In Vietnam, career counseling for students after graduating high school has limitations and advancing the career counseling skills of the high school teachers has not been highly assessed. An effort for the factor theory and measure proposal is the base for dealing with the problem. The author carried out a survey of 115 teachers belonging 40 high schools in Vietnam. As a result, the reality of career counseling skills of teachers at high schools is at the average level. This research is the base for enacting policies for the training of career counseling skills at high schools in Vietnam in the future. The result is described in the content of this article.

1. INTRODUCTION

In Vietnam, confucius culture influenced the life and psychology of high school students and their parents. Their parents always wish them to enter the university that makes the problem “master lack of workers” clearly. The ministry of Education and Training has the policies about the career counseling to improve the training career counseling and divides students after finishing High school effectively. In Vietnam, the head-class teachers anh technology teachers teach mostly the career counseling activity at High school. These groups are not trained formally about the career counseling field. Therefore, researching the reality and building the modul about training measure for career counseling skill for teachers at high school at present is very important to improve teaching career counseling and it is the base of the ministry of Education and Training proposing the policies in the next time.

2. RESEARCH OVERVIEW ON CAREER COUNSELING

In Vietnam, the career counseling is concerned and practiced at the target, content in the general education program. Especially, The ministry of Education and Training promulgated the project of whole general education programs on 19th January 2018 with particular target: "Helping students develop continuously and competence of the labourers; citizen's awareness and personality; self-study ability and self-study awareness forever, suitable career choice ability with competence and hobby; condition and circumstances of themselves to continue studying higher; studying career or taking part in labour life; correspondence ability with the changes of global background and new industrial revolution."

The career counseling is an important content in all periods of the general education program. However, some places, some schools carry out the career counseling ineffectively, the people who work in this field are mainly head-class teacher and technology teachers. Those teacher groups are not trained formally, a lower number of teachers and not enough qualification. They are not equiped with knowledge and skill about career counseling. They help students mainly by their experience. Therefore, the career counseling at High school activity has difficult and ineffecient. The qualification doesn't respond with the requirement of students and society. The students don't prepare carefully to choose a suitable job for them and the demanding of society.

The career counseling appeared in the end of 19th century in the world, as well as the creation of career theory, development career with the typical representators such as:

The authors gave many career counseling theories which have value nowadays for example: Trait and factor theory (Parsons, 1909), career development and system theory (McMahon & Patton, 2006), theory about position controlling (Krumholtz & Levin, 2004), five factor theory (McMahon & Patton, 2006), theory of personality (Holland, 1997). These theories poit out:

- In choosing career procedure, each individual must understand himself, career world and the relation between individual feature and detail work requirement to choose a suitable work;
- Choosing career of each individual only not belongs to the subjective elements but also the objective elements that are influenced by their family, friends'idea, social trend, local customs. We can't control surroundings but we may control our internal feelings and be the master of our fate;
- Emphasizing five main factors in career counseling influence to each individual's career choice decision: 1. The effort; 2. The sense; 3. The extrovert; 4. The satisfaction; 5. The pleasant with experience: Intelligent, brave, imaginative, curious, creative, different;
- Describing six kinds of typical people, six types of environmental correspondence. There are careers correspondence with each personality type and working environment. Therefore, there is the agreement between people and working environment.

The authors Schmidt (1996), Roger (1998), Vernon (2002) pointed out the career counseling activity at High school to give the advice and help students in finding career world, their competence, personality, hobby to choose the suitable job.

In the book *Counseling in school: Essential services and comprehensive programs* of Schmidt (1996) and *Handbook on career counseling* of Unesco (2002) pointed out the content of career counseling including: Providing information about career world, connecting students with labour sources, helping students aware of their hobby, value, ability and personality, encouragement, promotion and giving advice for students to choose the as well as become a whole life learners.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In the career counseling procedure, there are some author: Kidd (2006) giving the career counseling procedure including four period and author group: Gysbers, Heppner and Johnston (2009) giving five period of the career counseling procedure. The authors pointed out the contend and the way to do each period and the counselors have role to help people aware and deal with their problem.

In the career counseling skill, the presentators are Kidd (2006), Ali and Graham (1996), Gysbers, Heppner and Johnston (2009). They pointed out to get the career counseling work effectively that the counselors need their knowledge and skill such as: setting up relationship skill; understanding skill; hearing skill; sharing skill; observation skill; feedback skill; exploring information skill; analysis skill; finding psychological feature of student skill.

The authors Thang (2008) Ai (2011) and Hoa (2015). consumed the theory of development job in career counseling from the foreign authors such as personality theory and factor of Parsons; Holland's theory; Ann Roes's theory; Ginzbegr's theory; Krumboltz's theory…and reasearching about role, condition, requirement and using multiple choice in career counseling; the career counseling proceduce Qui (2007), Ai (2011) and Hoa (2014).

In summary, there were many researches of many scientists in the world and Vietnam about the career counseling project from target, content to practice procedure in career counseling in and outside High school. The authors gave the needing skill system of counselors generally. However, there weren't research project mentioned to the career counseling skill and training career counseling skill at High school in Vietnam – The essential group in helping students orientating and choosing suitable career with their competences and social requirements.

Therefore, determining the necessary career counseling skills of teacher doing career counseling and proposing the content for fostering skill program for teacher is important and meaningful for Vietnamese education system.

2.1. Career Counseling Skill of High School Teacher

There are some conception about the career counseling skill, author think: *"The career counseling skill of High school teachers is a action that teacher practice naturally base on science knowledge about the career counseling activity and biological, psychological, social condition relating to teacher to support students to improve their solving competence with difficulties in choosing job"*.

Basing on purpose, duty, content, procedure of the career counseling, it is inhervited the research on the career counseling from the authors: Kidd (2006), Ali and Graham (1996), Gysbers, Heppner and Johnston (2009), determine the career counseling skill of teacher including the following.

2.1.1. Basic Career Counseling Skill Group

1. Establishment relationship skill with students;
2. Making question skill in career counseling procedure;
3. Hearing student skill;
4. Observation student skill;
5. Feedback skill;
6. Understanding skill.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

2.1.2. Particular Career Counseling Skill Group

1. Skill for finding physiological and psychological feature of students;
2. Skill for applying multiwork in career counseling procedure;
3. Skill for using multiple-choise and device calculation the physiological and psychological qualification;
4. Skill for working in personality and group in career counseling procedure;
5. Skill for exploring, analysing, appreciating information in career counseling procedure;
6. Skill for researching about world work, requirement about labour of job market in local, nation, area and internation;
7. Skill for designing and remaining data involving in career counseling procedure.

2.2. The Appreciation Criteria About Career Counseling of Teacher at High School in Vietnam

The career counseling skill of High school teacher consists of 2 groups with 13 ingredient skills. Basing on analyzing, consuming scale about the development skill of author in country and foreign, author give the criterias to estimate each ingredient skill as following: 1. Sufficient content and structure skill; 2. Logical and proficient level of skill; 3. Flexible level of skill; 4. Effective skill (see Figure 1).

Each skill is estimated from one to four scores. To determine scale, author calculate the score of scale by the way:

Level = Maximum score – Minimum score

The distance between the scale level: (4 – 1): 4 = 0,75 marks

The minimum score of level 1 is: 1 mark

The minimum score of level 2 is: 1 + 0,75 = 1,75 marks

The minimum score of level 3 is: 1,75 + 0,75 = 2,5 marks

The minimum score of level 4 is: 2,5 + 0,75 = 3,25 marks

Four levels of scale are shown in Table 1.

Table 1. Estimating level

Skill Level	Average Score
Poor level	From 1 to less than 1.75
Average level	From 1.75 to less than 2.5
Good	From 2.5 to less than 3.25
Very good	From 3.25 to 4

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

According to the appreciation criteria and the career counseling of High school teachers, the author build the assessment tool about career counseling of High school teachers (see Appendix). This is the newest finding like the base for appreciating career counseling of High school teachers in Vietnam.

3. METHODOLOGY

A measure tool was used to collect information from 115 teachers of 40 High schools in Vietnam (see Appendix). The head-class teachers and the technology teachers are people chosen to research because they are teachinh the career counseling directedly at High school. All of the collecting datas were treated by SPSS software 22.0.

4. THE RESULT OF ASSESSMENT CAREER COUNSELING OF TEACHERS AT HIGHT SCHOOL

To appreciate the career counseling skill level of teachers in this field, we used the assessment tool for collecting information from 115 teachers of 40 High school in Vietnam (see Appendix). Results are shown in Table 2.

Table 2. Teachers estimate about doing the career counseling skill by themselves

Skill	Self-Appreciation	
	Average Score	Number
Basic career counseling skill group		
1. Establishment relationship skill with students	2.51	3
2. Making question skill in career counseling procedure	2.51	3
3. Hearing student skill	3.05	2
4. Observation student skill	3.35	1
5. Feedback skill	2.17	9
6. Understanding skill	2.37	7
Particular career counseling skill group		
7. Skill for finding physiological and psychological feature of students	2.41	5
8. Skill for applying multiwork in career counseling procedure	1.97	11
9. Skill for using multiple-choise and device calculation the physiological and psychological qualification	2.17	9
10. Skill for working in personality and group in career counseling procedure	1.97	11
11. Skill for exploring, analysing, appreciating information in career counseling procedure	2.37	7
12. Skill for researching about world work, requirement about labour of job market in local, nation, area and internation	1.91	13
13. Skill for designing and remaining data involving in career counseling procedure.	2.41	5

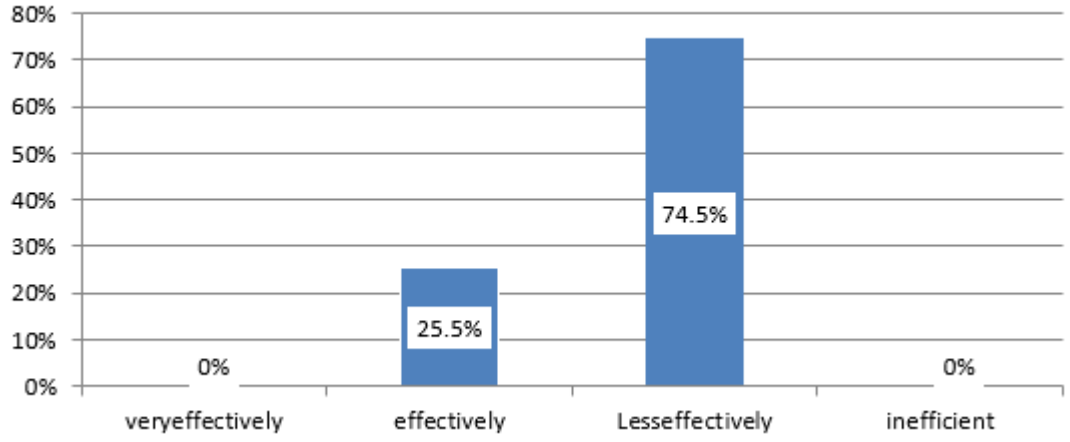
EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

According to staticstic result in Table 1, generally the career counseling of High school teacher is at the Average level. Only 4/13 skills are estimated at good level (Average score: From 2.5 to less than 3.2) and very good level (Average score: From 3.25 to 4) is "Establishment relationship skill with students","Making question skill in career counseling procedure"(Average score = 2.51); "Hearing students skill" (Average score = 3.05) and "Observation students skill" (Average score = 3.35) (see Table 2). These skills of teachers are highly appreciated because these are basic and necessary skills for teaching and other educational activities of teachers and these skills are practiced regularly by teachers in their professional activities.

Other skills are appreciated at average level (Average score: From 1.75 to less than 2.5) especially "Skill for applying multi-work in career counseling procedure", "Skill for working in personality and group in career counseling procedure" and "Skill for researching about world work, requirement about labour of job market in local, nation, area and internation" that have the lowest average score. These particular career counseling skills are very important. They affect directly to the efficiency of career counseling. So, finding the improvement measure of this skill group for teacher is very essential.

To examine the research result about teacher's career counseling skills, author research the effect of career counseling activity which teacher does. Results are shown in Figure 1.

Figure 1. The effect of career counseling



Most of teachers think that the career counseling nowadays is "Less effectively" (74,5%), few other ideas tell this activity is "effectively" (25,5%). The effect of career counseling is not high because there are many career counseling skills, especially the particular skills, teachers do them at average level as the analysis above. In reality, the teachers working is career counseling aren't trained through official program. They work on their experience and self-study. Therefore, the effect of career counseling activity is limited.

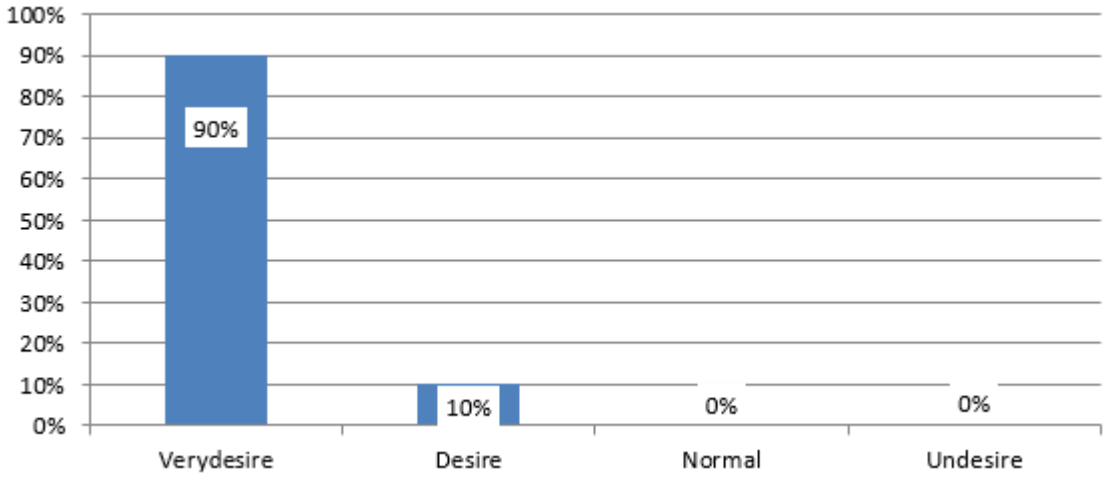
Moreover, author asked: "Did you study the training course about the career counseling skill?" 100% teachers said that they hadn't taken part in any training course about career counseling skill.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Mrs Luong has taught at Khoai Chau High school for eight years said that: "I'm a class head teacher, I often help students orient, choose career, choose subjects and the university they want. However, I teach career counseling by self-finding and support students by my experience. During eight years working at High school, I haven't taken part in any training coure about career counseling."

The questionaire survey sheet:" Do you want to join in the advanced training of career counseling course?" Results are shown in Figure 2.

Figure 2. Needing of joining career counseling course



Looking at Figure 2, we find out the needing of joining career counseling training course is very high (90% - very desire; 10% desire) because career counseling is the work teachers have to do at High school to help student solve the difficulties in choosing career procedure. However, teachers at High school are not trained the specialization and skill in the career counseling field. Therefore, the requirement of joining in the advanced training of career counseling course and the skills is completely correct.

Mr Cuong, the head of the Ho Chi Minh Communist Youth Union of Pham Ngu Lao High School said that: "Every year, when the students enroll in the university, the Head school boad members organize the career counselling for school students, especially grade 12. However, the effect of this activity is not really as good as we expected. Recently, the school has combined with inviting experts to organize consultations for students, but there are also difficulties in time, funds for expert payment. My school hope the teacher group, especially the class head teachers, technical teachers, teachers in charge of Communist Youth Union of school ... will have opportunity to participate in career counseling skills training course for high school students to be able to improve the quality and efficiency at my school."

With the career counseling situation at present, establishing program and training High school teachers about the career counseling skill is very important, especially whole ministry of education and training is rushing to prepare all need and enough condition for carring out the new general education program in Vietnam.

5. THE TRAINING CAREER COUNSELING SKILL PROGRAM FOR HIGH SCHOOL TEACHERS

Basing on the career counseling theory, the reality of career counseling skill of High school teachers and background in Vietnam now, author propose the career counseling program for High school teacher as following:

- The training career counseling skill program for High school teachers.

5.1. Scope of the Study

The teachers of Technology, the Head of Communist Youth Union at School, the class-head teacher, teachers working the career counseling at the High school in country.

5.2. Aims and Purposes of the Study

After training course, learners will be able to do the following.

5.2.1. Knowledge

- Analyse some basic knowledge about career counseling;
- Demonstrate the content of skills in career counseling;
- Analyse aims and purposes, meanings, practicing period of career counseling for High school students.

5.2.2. Skill

- Use the multiple choise sheet about hobby, competence, career trend…to appreciate students' competence;
- Guide students to know about features, requirement of job, labour market in local, domestic and internation;
- Use the skills in career counseling;
- Design and organize the career counseling lesson for High school student.

5.2.3. Behaviour

- Have active awareness in doing career counseling.

5.3. Content and Time

With the training program shown in Table 3, the teacher at the University of Technology and Education (having both professional pedagogical skills and job skills) will take part is training the main teacher group – working in career counseling at High school.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Content and time of training

Training Content	Time
1. The general issue about career counseling	10 periods
2. Career counseling theory and multiple choice	10 periods
3. Determining student's vocational competence	10 periods
4. The skills in career counseling	10 periods
5. Integration career counseling for High school student with other subjects	10 periods
6. Organize the career counseling for High school student	10 periods

6. EXPERIMENT

Basing on career counseling skill program for High school teacher, author carry out experiment training skill as following:

- **Experiment aims:** To improve the career counseling for High chool teachers, author choose to train improvement for the particular career counseling skill group of teachers;
- **Author experiment:** On 30 staffs of 6 High school in Hung Yen;
- **Place and time:** From February to March 2017 at Methodology room, Department of Education, Hung Yen University of Technology and Education;
- **Content experiment:** See Table 4.

Table 4. Content experiment

Time	Training	Skills
Day 1	The general issue about career counseling	-Skill for finding physiological and psychological feature of students -Skill for applying multi-work in career counseling procedure -Skill for using multiple-choise and device calculation the physiological and psychological qualification -Skill for working in personality and group in career counseling procedure -Skill for exploring, analysing, appreciating information in career counseling procedure -Skill for researching about world work, requirement about labour of job market in local, nation, area and internation - Skill for designing and remaining data involving in career counseling procedure.
Day 2	Career counseling theory and multiple choice	
Day 3	Determining student's vocational competence	
Day 4	The skills in career counseling	
Day 5	Integration career counseling for High school student with other subjects	
Day 6	Organize the career counseling for High school student	

* Organize experiment

The experiment of training career counseling skill for High school teacher is carried out as following steps: 1. Prepare experiment; 2. Design experiment program; 3. Appreciate before experiment; 4. Train skill; 5. Appreciate after training and finishing experiment.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

6.1. Average

6.1.1. Score

Looking at Figure 3, in general, the level of career counseling of High school teacher after experiment changed clearly before experiment (see Table 5). After experiment, most of teachers have better career counseling skill level. Particularly, some skills such as "Skill for applying multi-work in career counseling procedure", "Skill for using multiple-choise and device calculation the physiological and psychological qualification", "Skill for working in personality and group in career counseling procedure", "Skill for researching about world work, requirement about labour of job market in local, nation, area and internation" and "Skill for designing and remaining data involving in career counseling procedure" improve quickly after experiment (from average level to good and very good). Those skills are very important for teachers to do the career counseling effectively.

Figure 3. The level practice career counseling skill of teacher before and after experiment

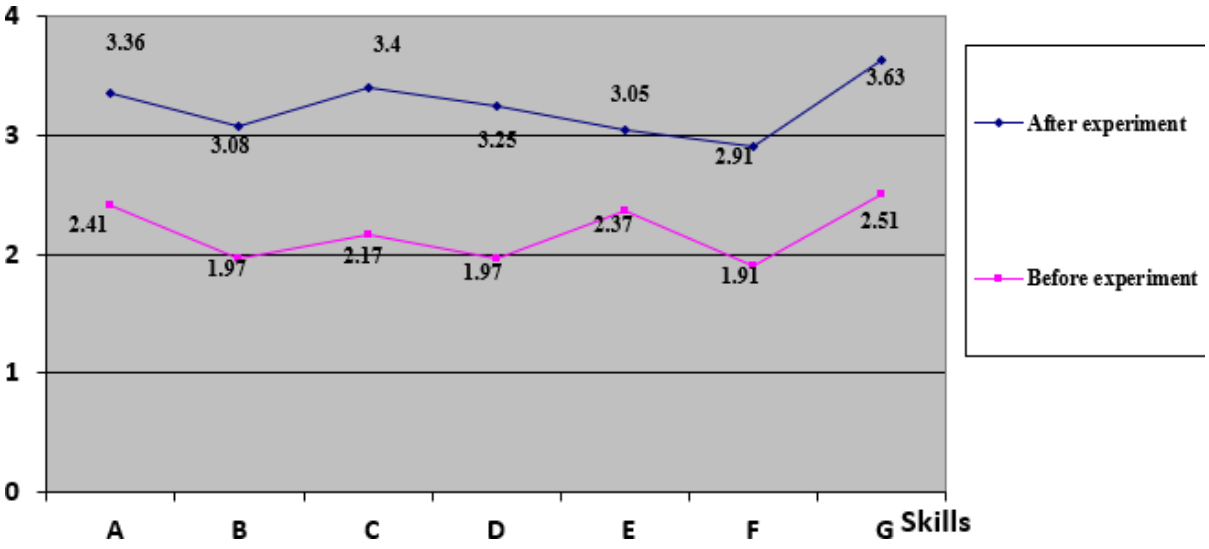

Table 5. Skills

A:	Skill for finding physiological and psychological feature of students
B:	Skill for applying multiwork in career counseling procedure
C:	Skill for using multiple-choise and device calculation the physiological and psychological qualification
D:	Skill for working in personality and group in career counseling procedure
E:	Skill for exploring, analysing, appreciating information in career counseling procedure
F:	Skill for researching about world work, requirement about labour of job market in local, nation, area and internation
G:	Skill for designing and remaining data involving in career counseling procedure

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Mrs Thuy– a teacher of Tran Quang Khai High school said that: "Before, we appreciated students by ourselves, combined with contacting their parents. There were very few tools to appreciate and difficulty in organizing the career counseling for students. After taking this training course, we have not only knowledge but also special skills in career counseling. We are provided and known how to use the tools to appreciate students. Thanks to training knowledge, I believe that the career counseling activity at my school will have new advance".

The result of experiment proved that the establishment of training program and organizing the training courses is possible and effective in improvement career counseling skill for High school teachers.

7. CONCLUSION

The career counseling is important meanings in helping High school students to choose future career. The career counseling skill of High school teacher includes the basic career counseling skill and particular career counseling skill. The result of survery about career counseling is the proposing foundation to set up training career counseling program for teachers. The experiment result proved that the content has value in training career counseling for High school teachers in Vietnam.

Chapter 7
Solution-Focused Brief Counseling in Schools:
An Alternative Approach to Problem-Solving and Counseling

Sladjana S. Rakich
National University, USA

Danny R. Martinez
National University, USA

ABSTRACT

Solution-focused brief therapy (SFBT) has become a popular methodology used in business, counseling, and other fields to help individuals problem-solve. In education, this approach is known as solution-focus brief counseling (SFBC). This chapter will review the origins of the solution-focused approach to counseling and problem-solving, present the major tenants, and discuss challenges. The chapter will also present interview data from current school counselors to examine how school counselors use SFBC in schools and provide strategies for implementation.

INTRODUCTION

You cannot solve a problem with the same kind of thinking that created it. – Albert Einstein

Solution-Focused Brief Therapy (SFBT) has become a popular approach used in business, social policy, education, criminal justice services, child welfare, and counseling (Institute for Solution-Focused Therapy, 2017). Originally used in therapeutic settings, Solution-Focus Brief Counseling (SFBC) has become common practice in education, particularly as a tool school counselors use when working with students to solve problems. To provide a foundation in the development and use of SFBC, this chapter will review the solution-focused approach to counseling and problem-solving, present the major tenants

of solution-focused brief counseling. Additionally, focus group data will be presented to examine how school counselors use solution-focused brief therapy in schools to guide students toward solutions., and several strategies for incorporating the tenets of SFBC into the school counselor's year are shared.

BACKGROUND

Solution-Focused Brief Therapy has evolved from brief psychotherapy which typically is focused on a specific problem and the development of a direct intervention to address the problem in a short period of time. The solution-focused approach further expanded the belief from brief therapy that clients can achieve successful results in a short period of time if clients could identify their strengths and apply them to the current problem (Henderson & Thompson, 2016). This approach assumes that people are willing and able to change their behaviors to obtain a desired outcome or solution. It also assumes that even when people are not doing well, pieces of the solution are present at times; thus, counseling sessions often begin by highlighting what is going well in the client's life in order to discover exceptions to the problem, what is working, what they plan to continue doing, and what goals they would like to achieve.

De Shazer et al. (2007) built upon the brief therapy framework and further expanded the theory by testing new techniques at the Brief Family Therapy Center in Milwaukee, Wisconsin during the 1980's and 90's. The appeal of this technique is that it was developed by therapists in a clinical setting. Unlike many other theoretical models that are oriented around a hypothesis or theory, the solution-focused framework evolved from a series of discoveries when researchers evaluated the effects of different interventions on client outcomes (Murphy, 2015). De Shazer noticed that when he shifted the focus of his counseling sessions from discussions about the problem that client was trying to solve to highlighting successes, noticing what improvements occurred in their lives, and identifying exceptions or times that the problem was less severe or absent, two-thirds of his clients reported significant improvements by the next session (Sklare, 2014). Shifting the philosophy of counseling from an exploration of problems to a focus on solutions appeared to effectively improve client outcomes while reducing the number of sessions needed to achieve positive results.

The solution-focused approach to problem-solving differs from the traditional problem-solving method in several ways. The traditional problem-solving process can be conceptualized as the act of defining a problem and determining the cause of the problem; then, identifying, prioritizing, and selecting alternatives for a solution, and finally, implementing a solution. Traditional approaches, even the current restorative justice approach or restorative practice, tend to be problem-focused in that they highlight the problem, discuss what is not working, and identify solutions to the problem. A problem-focused approach has been found to narrow thinking, hinder solutions, limit creativity, and trigger emotional responses (Murphy, 2015). The solution-focused counseling approach, on the other hand, takes a strengths-based approach that presumes the individual is able to identify and implement actions toward solving the problem; thus, keeps the conversation on the solution(s) rather than an analysis of the problem. The major tenets of a solution-focused approach include:

- Future-focused; emphasizes future possibilities rather than discussing past problems or problem roots
- Highlights "exceptions", or times when the problem does not occur

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Belief that the individual already knows the solution, or has the basic skills needed to create a solution
- Focus on the individual's abilities and strengths, not deficits or challenges
- Client creates goals and determines the desired outcome
- A collaborative relationship between the individual and the counselor
- Examines the perceptions of the individual in an attempt to foster hope and motivation instead of reframing thinking (i.e. changing negative thoughts into positive ones, miracle questions, scaling questions, etc.) (Institute for Solution-Focused Therapy, 2017; Skalre, 2014)

SFBT includes all of the above tenets and is typically limited to 10 sessions or less. These core features of SFBT were developed from an important assumption: effective solutions to problems did not require extensive knowledge or analysis of the problem itself (Murphy, 2015). This assumption belief is the starting point for the SFBT approach. Clients begin their counseling sessions by briefly describing a statement of the problem or why they are seeking counseling, rating their feelings associated with the problem, listing exceptions to the problem, and setting goals for what they would like to accomplish. These items serve as markers that will help the counselor determine the effectiveness of the sessions and client outcomes. The remainder of the meeting and future sessions typically consist of discussions that emphasize the positive emotions, events, and actions in the client's life. The purpose of counseling is to highlight the client's strengths and capabilities and guide them toward identifying solutions through active reflection of what is working. Solution-focused counselors believe that if clients remain positive and motivated change will occur because change is constant and inevitable (O'Hanlon & Weiner-Davis, 2003), and the role of the counselor is to keep client's moving forward towards positive change.

Solution Focused Brief Counseling in Schools

In the school setting, Solution-Focused Brief Therapy (SFBT) is referred to as Solution-Focused Brief Counseling (SFBC), and it has become a commonly used theoretical framework school counselors use to guide their counseling work with students. Solution-focused school counselors must employ great skill when applying SFBC strategies with students as many students are sent to the counseling office unwillingly and may be initially defensive of their actions rather than open to change. Additionally, school counselors' meetings with students are very brief. Many student-counselor interactions last only several minutes because of pressures from teachers and administrators to minimize disruptions to instructional time and keep students in their classes. Therapy, even brief counseling, is still perceived as something which is outside the scope of schools and roles of school counselors (American School Counselor Association, 2012). However, since schools are charged with the social, emotional, and academic development of students, a paradigm shift is beginning and approaches to counseling such as SFBC are being implemented to facilitate holistic student development.

Advantages and Challenges of Solution-Focused Brief Counseling in Schools

SFBC has gained popularity in schools because it takes a brief and practical approach to solving problems that appeals to students, teachers, and school counselors. Murphy (2016) referred to solution focus-counseling as "less talk, more action", and states that it is attractive because of the limited time to do counseling in schools. Furthermore, the process encourages innovative thinking and discussion

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

that is centered upon the individual's strengths, goals, and actions rather than the problem its causes or effects. The Solution-Focused Brief Counseling model chooses to value the individual's capabilities toward finding solutions rather than focusing on what is not working or why it is not working (Guterman, 2014). Unlike the many negative outcomes that may result for a problem-centric conversation such as "paralysis by analysis" (the inability to act due to not being able to identify the correct course of action), with skilled solution-focused questioning by the counselor, the student is empowered to create new outcomes and maintain a positive outlook that will keep them motivated toward achieving their goals.

While De Jong and Berg (2013) suggest that core features of SFBC such as respecting the student's worldview promote cultural sensitivity, Henderson and Thompson (2014) point out that because SFBC values individual responsibility over the collective family, it may not align with every student's worldview. Students from cultures that value collective problem-solving and focus on outcomes that are in the best interest of the group may not respond well to SFBC. American schools value and promote individual responsibility and accountability, and aim to teach students to make positive choices for self-improvement. School counselors must carefully consider the student's culture and worldview when choosing to use SFBC strategies and not make assumptions that any one counseling approach will be effective with all students.

Trust, mutual respect, and a collaborative relationship between the student and counselor are essential elements in the effectiveness of SFBC. However, in many counseling situations in schools there is an inherent power dynamic because adults are in elevated positions authority. This hierarchical structure within schools poses challenges to creating a collaborative environment where students can learn, grow, fail, and solve problems without judgment. Students in schools have been conditioned to seek the "right answer" and turn to the teacher or counselor to provide the answer or solution (Perry, 1979). This can lead to superficial solutions or behaviors where the student temporarily conforms to the requests and expectations of the adult either to please, receive a reward, or avoid punishment.

The primary strength of the SFBC process is that it validates the student's experience and ability for effective action. With guidance from the counselor, the student is able to determine the best course of action and implement change, think positively about the problem and future possibilities, be motivated to make a change, and believe in their own ability to succeed. In order for SFBC to work effectively, school counselors need to be well trained in SFBC. Additionally, the collaborative relationship between the student and school counselor is important to the SFBC process and outcomes. Finally, school counselors must carefully consider and plan to address barriers that may impede student success. For example, school counselors must work closely with students to mitigate the effects of the social structures and power dynamics within the school environment, and ensure students do not feel inferior to educators but rather equal partners in their journey toward change.

Deconstructing School Problems: Threats to the Efficacy of SFBC

The effectiveness of any counseling strategy or intervention is only as strong as the efficacy of its implementation. Existing school conditions may create barriers to utilizing a solution-focused approach with fidelity. American schools are designed to operate in a behaviorist model that rewards conformity to the established norm, a traditional way of thinking and problem-solving, and a desire for immediate results (Flinders & Thornton, 2013). These conditions may affect the ways in which school counselors interact with students and use SFBC.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Traditional Default Approaches

Many educators employ the same traditional techniques repeatedly even if they are not successful. Cooley (n.d.) argues that a traditional, default approach consisting of "lecturing, threatening, withholding, cajoling, persuading and sharing the dreaded facts" is typically not a successful strategy to foster solutions or change (as cited in Patterson, 2009, para 27). A school counselor may work with the student to build positive rapport, motivation, and encourage action, but these efforts may fade in light of a contending school experience where the student feels hopeless, loses confidence in their abilities, or is told what the correct course of action should be.

School counselors have been found to use two similar approaches: rational persuasion or fatalistic future discussions (Murphy, as cited in Patterson, 2009). These tactics, which have been found to be largely ineffective, include persuading students to change their opinions or actions through discussions about consequences or pointing out flaws in students' thinking. One common example is telling students with poor or failing grades that they will not be able to go to college or be doctors or lawyers because of their bad academic performance. Another example includes pointing out flaws in students' action plans and suggesting other courses of action such as telling a student that studying on their own is not going to help them improve their grades and they should go to after school tutoring.

Problem-Focused Thinking

Teachers tend to have a fixed mindset and are problem-focused (Dweck, 2016). They spend most of their instructional time posing questions to students and guiding them towards the answer. Their professional development trainings, conferences, and discussions with parents and colleagues center around identifying and analyzing problems. This mindset becomes the governing lens they use, which makes it difficult to think differently when working with students who do not respond as desired. Remaining focused on the problem often results in traditional default behaviors and creates barriers to attempting innovative approaches to solving problems.

Limited Time

Another factor that affects fidelity of implementation is time. Teachers and school counselors are time strapped. The pressure on all school personnel to demonstrate effectiveness and solve problems efficiently is high. The average student-to-counselor ratio in the United States is 482:1 (NACAC and ASCA, 2018). Time constraints and increasing workloads may affect SFBC practices by limiting the number of sessions or reducing the amount of time the counselor spend building a collaborative relationship and building student motivation and self-efficacy. Additionally, busy counselors may limit or eliminate homework, and instead, provide students with academic plans or other suggestions on how to solve the problems.

SFBC in Schools: School Counselor Thoughts, Experiences, and Strategies

Since there is little empirical research on how counselors use SFBC and the effectiveness of SFBC in a school setting, and an informal study was conducted during a SFBC professional development training. Interview data were collected on how SFBC was used in the field, what were the challenges to implementation, did the counselors feel SFBC was effective, and what additional training or resources

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

were needed to improve SFBC practices in schools. School counselors also shared tips on practices that facilitate the use of and effectiveness of SFBC in schools. Nine public high school counselors from Los Angeles served as the focus group and their thoughts and experiences are shared in the subsequent sections.

How Do School Counselors Use Solution-Focused Brief Counseling?

Counselors stated that SFBC is used in their daily counseling interactions with students. Examples provided were meeting with students to create academic plans and individual and group counseling sessions. However, after further probing asking the counselors to explain their process and student questions, it was evident that counselors often combined SFBC with other theoretical counseling approaches such as cognitive-behavioral counseling, rational emotive therapy, and restorative justice practices. Counselors also used a tradition problem-solving approach that emphasized identifying the solution to the problem, barriers to the solving the problem, and creating an action plan to implement. For example, one counselor stated:

We meet with students quarterly to review their academic progress. I start each meeting with a discussion about what went well for them during the quarter and what accomplishments they are most proud of. I ensure that everyone provides at least one example of an accomplishment to build motivation and self-esteem. Then I ask them to identify what problems they had during the quarter, how they addressed them, and what worked or did not work for them. At the end of the meeting we review their grades and I ask the student to create an action plan for the next quarter. (Counselor 2, personal communication, January 22, 2018)

In this example the counselor felt she was applying SFBC; however, the discussion reveals a blended theoretical approach. Another example of a group counseling process illustrates a similar conclusion. The counselor states:

Every year I run a group on conflict resolution. Students who have difficulties solving problems and often exhibit anger or violence in response to a conflict are referred by their teachers. The group meets once a week for 8 weeks. Rather than focusing on the reason for the referral we discuss students' strengths and future goals…students learn to identify their triggers…and respond appropriately. (Counselor 1, personal communication, January 22, 2018)

Additional probing questions revealed that the primary counseling approach used was rational emotive behavioral therapy (REBT) to identify and alter irrational beliefs about self and others and change negative thinking patterns to avoid future conflicts. While all counselors stated that SFBC was the most common counseling approach they use, their examples indicate that SFBC is often combined with other counseling orientations.

Building collaborative relationships with students through solution-focus conversations is another application of SFBC cited by school counselors. School counselors do not have much time with students during the school day to build relationships, so they must use time outside of the classroom and counseling office to develop relationships with students. During supervision which occurs before school, after school, during lunch, and passing periods (in between classes), school counselors use SFBC techniques to interaction with students and build positive relationships. In one example the school counselors stated:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

When I greet students every morning I ask them what great thing they plan to do during the day. If they cannot come up with an answer, I ask them to share something they are most proud of that occurred recently. Then I ask them to come up with how they will continue to build off the positive things that occurred in the future weeks and share with me the next time we see each other. (Counselor 1, personal communication, January 22, 2018)

This example illustrates the use of solution-focused brief counseling questioning to help students focus on goals, highlight accomplishments, build motivation and self-esteem, and presents opportunities to compliment students. These questions facilitate the development of collaborative relationships and create the foundation needed for school counselors to implement remaining SFBC tenets with students during an individual counseling session.

What Are the Challenges to Implementing SFBC in Schools?

All of the focus group school counselors stated that the greatest challenge to implementing SFBC is time. Counselors felt that many times there was an intent to use an SFBC approach, but due to the limited time they had available they would end up having a more typical problem-solving conversation that includes the questions of "what happened? What should you have done? What will you do next time?" Counselors did share that they knew this was not an effective approach to problem-solving or student development. One counselor stated:

Students already know what they did wrong [problem] and what they should have done [solution]. However, getting them to choose to do the right thing all the time is something that takes time, and when you have 800 students on your caseload there is no time for that type of counseling. (Counselor 4, personal communication, January 22, 2018)

Is SFBC Effective in Schools?

The counselor focus group unanimously agreed that while solution-focused brief counseling is effective, it is not always the best approach for every student. Counselors must use their professional judgment and often attempt a variety of strategies to determine what works best for a particular student. A counselor shared the following example:

One student I was working with the other day was referred to me after making an inappropriate statement to the teacher…I was attempting to have a strengths-based conversation and build a relationship with the student, but I quickly realized that the student was very depressed and we needed to address that first. (Counselor 2, personal communication, January 22, 2018)

This example illustrates the importance of determining the full scope of a problem prior to selecting a counseling technique to address it. School counselors are trained in a variety of therapeutic frameworks and it is common to combine strategies from different theoretical orientations. However, if school counselors do combine SFBC with other methodologies when working with a student, it may make it difficult to determine the effectiveness of SFBC. Furthermore, while the school counselor focus group expressed beliefs that SFBC was effective, they did not have or collect any data to support their beliefs.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Strategies for Better Implementation of SFBC in Schools

In preparation to work with students on a yearly basis there are specific tasks that a school counselor must do such as review student data and plan interventions, counseling groups, and schedule meetings. Furthermore, the realm of educational counseling is not consistent due to the variations of student needs, community influences, and school district and administrative expectations on the counseling team. Also, there are unique and specific differences in the way a school counselor approaches each grade level and their students which also changes year-to-year. As school counselors begin to build their repertoire for each grade level: elementary; middle school; high school; and community college they can begin to develop a plan to successfully incorporate SFBC into their counseling practices, routine tasks, and interactions with students.

The reality of the lack of time with students or the sudden change of caseloads will always be an issue for school counselors. This will continue to make personalization and creating meaningful relationships with students a challenge. To develop a constructive relationship between student and counselor with the above issues illustrates the essence of what needs to be done in order to lay the groundwork that will allow the school counselor to implement SFBC with fidelity. The school counselors in this focus group shared the following tips and strategies they believed would assist other school counselors to use SFBC more effectively: be proactive, pay attention to your semantics, collaborate with other school counselors, be visible on campus, partner with teachers and administration, understand the culture and diversity of the community, train parents in SFBC practices, create templates to facilitate SFBC practices, and engage in continuous training and reflection.

Be Proactive vs. Reactive

School counselors can take either a reactive or proactive approach to student development and problem-solving. With a proactive approach, the probability for success becomes more evident and measurable. The focus group school counselors suggest that all school counselors take a proactive stance when reviewing the school calendar and plan SFBC activities in advance. For example, for almost all grade levels there is a point in the school year that tests must be taken, and there are always students who will have test anxiety and other problems involving testing. In this example, school counselors can be proactive by reviewing the case loads and identifying the students who are most vulnerable to anxiety or other issues that would cause poor performance, then planning SFBC groups for these students early into the school year. A reactive approach would be when the student is sent to the counselor for exhibiting disruptive behaviors during testing or being truant on test day. In these reactive situations, counselors have limited time to promote effective problem-solving and behavior change using SFBC strategies because they must "react" to the immediate behavior.

School counselors can also be proactive by identifying and prioritizing the students they will work with using SFBC. The focus group suggested school counselors begin using SFBC first with students who are able to solve their problem or change their behavior with minimal guidance. These students are occasionally referred to as the "tipping point" students. They are found in every caseload of every counselor at all grade levels. These students could be those who are close to receiving a passing grade, making the honor roll, or achieving a milestone goal. These students can go either way depending on the type of support and guidance they receive, and this is when the school counselor can be proactive and begin meeting with these students using SFBC. As school counselors become more proactive with

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

their dealings with students they can then reach out to the educational community including parents, educators, and community members and involve all stakeholders in SFBC. By being proactive instead of reactive, school counselors have more time to implement SFBC more effectively, and the probability of success increases.

Be Careful With Semantics

In addition to paying close attention to the kind of questions school counselors ask, the way in which questions are phrased and the word choice of the school counselor must be carefully considered and align with SFBC tenets. Many of the school counselors interviewed stated that they have caught themselves using language that is leading or inadvertently telling students what to do to solve the problem. The way in which school counselors word sentences and respond to student questions impact student behaviors and the effectiveness of SFBC. Furthermore, listening to the student's language and helping change their responses is key to changing the perception of the student. One counselor made the analogy to the way a coach speaks to players, stating:

When a coach prepares a player to perform in a match or game they are not looking to hear, "I will try to win the point or game coach!" To a coach the words "will try" translate to a possible outcome, and that the action and performance of the player may not be their best effort! By changing the wording of the players to "I will win the point or game" you have now changed their mindset, and in turn, their efforts and actions. Their attitude has changed by their own words. Thinking positively encourages acting positively. (Counselor 6, personal communication, January 22, 2018)

Thus, when using SFBC to work with students on common problems such as improving attendance, grades, behavior, effort etc. school counselors begin to develop and change the paradigm of thinking and incorporating a sense of confidence with words. The words of the school counselor can encourage students engage in future-focused thinking and to think more of probable solutions rather than possible ones.

Collaborate With Other School Counselors

School counselors have varying degrees of experience, as well as different perspectives and SFBC strategies. Breaking from silos and working as a school counseling team will greatly improve SFBC practices. One counselor stated,

I wish I could tell my younger self to find a mentor or other school counselors bounce ideas off of when I was first starting out. Experienced counselors have lived through many seasons and know what to expect to some degree. The younger and newer counselors are still reacting and learning what to anticipate. Each grade level has their uniqueness and challenges that school counselors must learn and plan for. There are "emotional seasons" of the year that always cause a reaction the behavior of all students, staff, administration and the local community. Listening to how another school counselors dealt with the challenges, how they implemented SFBC, what worked and what didn't will make it easier for us to plan and respond appropriately. (Counselor 3, personal communication, January 22, 2018)

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Be Visible on Campus

Being a visible presence is sometimes the first step in building a relationship and trust with students, which is a key feature of SFBC. School counselors have many opportunities to interact with students outside of the counseling office and prior to doing any counseling work with students. A school counselor described why being visible is so important to creating the foundation for SFBC with the following:

Before counselors were expected to stay in their office but there is a vital need to be everywhere possible to be seen by students and staff. Attending events can be an extension of office sessions, and is in most cases, nonverbal. For many students, just the sight of their counselor often reinforces conversation and commitment. A greeting with a smile, wave, or warm expression can be the foundation for positivity and motivation throughout the school day. (Counselor 6, personal communication, January 22, 2018)

Partner With Teachers and Administration

The application of SFBC should not be exclusive to school counselors. All school personnel should be well versed in SFBC and use it as a problem-solving framework when working with students. To do this effectively, school counselors must partner with teachers and administrators to adopt SFBC practices schoolwide. This, however, may be challenging in some schools. One counselor provided the following summary of the relationship between school counselors, teachers, and administration:

In many cases school counselors are excluded from meetings that pertain to pedagogy in the classroom. More counselors today have not been teachers which creates an even larger gap of understanding of what happens in the classroom and the types of problems that commonly develop. Administrators tend to avoid the counseling office only until they need them and, in some cases, do not keep them informed into the management activities on site, thus leaving the counselors in a reactive mode and lost. By creating a collaborative bridge with the teaching staff and sharing with them SFBC strategies, school counselors will get insight to teaching style, expectations, and relations with the students, while teachers learn about a new dialog to have with students. (Counselor 1, personal communication, January 22, 2018)

Counselors must express interest in becoming part of the school leadership team and participating in leadership meets to foster collaboration and share insights and training on using a solution-focused approach to address many of the problems they continually address. The end result will benefit the entire school community because school counselors will have many individuals on the school campus to assist with SFBC, and they will become more confident and efficient.

Understand the Culture and Diversity of the Community

Counselors today are dealing with more diverse issues than ever before and understanding the expectations of the community is a challenge as they are all in flux. Each community has its unique features. Cultural expressions and the translation of cultural norms is a challenge that is now a nationwide issue. The technology of today and how quickly information travels puts education and educators under a microscope where they are being judged daily. These are all reasons for school counselors to spend time within the community and learn about the lives and culture of the community. Furthermore, school

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

counselors must recognize that students may belong to several communities, each with its own unique group dynamics and culture. Finally, when learning about each student's and school community's culture, school counselors should attempt to make observations that are free of biases and preconceived notions based on stereotypes. These actions will help school counselors determine the needs of the community and student, and develop collaborative relationships needed to implement SFBC effectively and to promote positive change for all stakeholders.

Train Parents on SFBC

In addition to the community, parents are a key factor in student development and success. Parents model and teach students problem-solving skills so when using SFBC techniques with students in school, school counselors should include parents in the SFBC process to continue those techniques at home. Just as school counselors mold the delivery of services using well thought out questions and SFBC strategies, parents should be trained to use solution-focused questioning and strategies with their children. If the questions and practices are consistent in their delivery, with the parents and the local community, it becomes part of the new culture and then there begins a commonality of expression and expectations. Both school and community are using the same expressions and there is better understanding of where the benchmarks are being set and the expectations of growth is now universal. There will be a shared sense of pride and excitement for their efforts.

Create Templates for SFBC

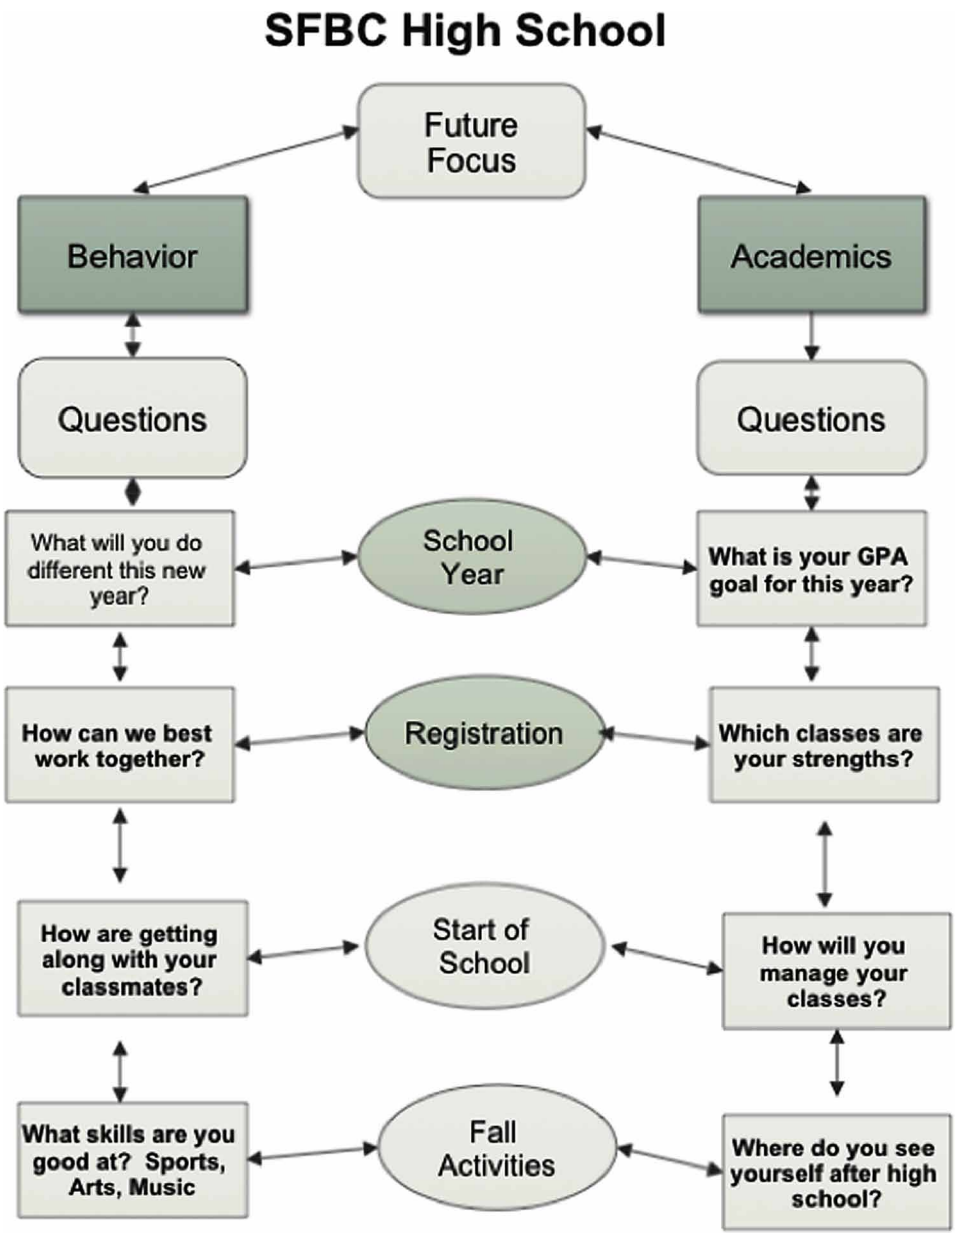
School counselors can create rubrics or templates to assess and further develop SFBC practices. Figure 1 presents a sample template that one school counselor in the focus group created to use before the start of the school year to assist with planning and implementing SFBC. This template can serve as a training and collaboration tool which could be used with teachers, staff, administration, and parents to plan and implement SFBC effectively. If buy-in is possible, such a template could be used at various schools and all levels to assist with the development of solution-focused strategies that will be inclusive of all stakeholders.

This sample template is divided in two areas of concentration, *Behavior* and *Academic*, around the SFBC goal labeled *Future Focus*. The flow of questions is developed around the school counselor's seasonal or school responsibilities which each individual school counselor should develop collaboratively. The questions are also specific to the counselor's own community, culture, and school needs. This is only one example of what the flow chart would look like. The *Behavior* section drives the questions to Future Focus in this case School Year, Registration, Start of School, and Fall Activities. The questions take into account the semantics of what the goal is to make the responses surface. The questions want to highlight the self-disclosure of strengths and abilities. a vision of the future, and the awareness that the counselor is there for support and guidance. On the *Academics* side of the chart the questions are developed the same but with a bit more emphasis on responsibility and previous knowledge by the student.

A concise and deliberate approach to incorporating SFBC into the school year will enhance the probability of effective implementation of SFBC and provide a personalized and collaborative relationship between school counselors and all stakeholders. By developing and sharing concrete examples of how to use SFBC, other stakeholders can build competency with SFBC strategies and, in turn, increase the use of SFBC as an explicit approach to problem-solving.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. A sample SFBC template



Continuous Training and Reflection

Ultimately, the key to becoming an effective solution-focused school counselor is to be well-prepared, collaborative, and reflective. If the above suggestions are followed and put into a well-organized plan, the likelihood of successfully implementing Solution-Focused Brief Counseling and generating positive outcomes is now accomplished with higher probability. SFBC is a process which requires continuous professional development and reflection to ensure consistency and improvement of SFBC strategies. As demonstrated from the sample focus group, school counselors use many strategies and approaches

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

when counseling students and working on problem-solving. These blended methodologies are acceptable practices when they are based on student needs and effective. However, school counselors must reflect on their practices to ensure they are not using traditional problem-solving approaches inadvertently or to save time because these actions may impact effectiveness of SFBC and student outcomes.

SOLUTIONS AND RECOMMENDATIONS

It's a kind of fun to do the impossible. – Walt Disney

The aim of this research was to interview practicing school counselors about how they combine theory with practice and use SFBC in schools. The insights garnered from the focus group suggest school counselors commonly use multiple methods in their approaches to counseling students and may have some misconceptions about SFBC and how to implement it with fidelity. Many school counselors continue to struggle with implementing SFBC strategies and counseling best practices given some of the realities of the school setting. Due to limited resources, time constraints, and a demanding performance-driven culture, school counselors may have difficulties using SFBC effectively with students. Some school counselors may be inadequately trained in SFBC because many counselor preparation programs continue to emphasize theoretical frameworks of therapy such as psychoanalytic and Adlerian which are not applicable in many school counseling situations (Sklare, 2014). All of the school counselors interviewed felt they would benefit from continuous professional development on SFBC and additional research to assess the alignment of school counselor practices with the SFBC framework and determine the effectiveness of SFBC.

This research serves as an important reminder that there is no singular, definitive solution or one particular approach to reaching a solution that is effective for all. While SFBC may be an effective counseling approach to problem-solving, it may not be adequate for all situations. Taking a personalized approach is needed. When selecting a SFBC approach to problem-solving with a student, school counselors have to carefully consider the key features of SFBC, advantages and disadvantages, and determine if they are able to implement it with fidelity. The school counseling focus group interviewed appeared to use a combination of several counseling methodologies when working with students rather than purely one framework. While using blended theoretical approaches is sometimes necessary in practice, careful examination should be performed by? the counselor –in the selection of the psychotherapeutic strategies to ensure that theoretical integrity to the given approach was maintained, and whether or how the approach(es) used affected the end result.

Some practitioners feel that one of the benefits of SFBC is that it combines nicely with other therapeutic models (Murphy, 2013). NASP (National Association of School Psychologists) also supports this belief and state, "SFBT is a flexible model that can be integrated with other counseling approaches or used to supplement other therapies that students receive in or outside of school." In clinical settings counselors often use multiple methods when working with their clients. Murphy (2016) argues solution-focused techniques are "valued-added techniques [that] adds value to whatever it is combined with" (p. 270). Similarly, school counselors blending SFBC with other approaches to counseling and problem-solving may be the new norm. A skilled solution-focused school counselor should be able to effectively combine models to create an individualized approach based on each student's unique needs. However, even counselors proficient in SFBC techniques can have known or unknown perceptual biases or over

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

generalizations affect their practices (Thomas, 2007). For example, one school counselor described a situation where she was working with a high school student who she felt was unmotivated to change his behavior and could not identify any future goals, strengths, or actions to address his problem. The student was labeled as "lazy" and "unmotivated" and this generalization and potential counselor bias resulted in the counselor opting to include other strategies to improve motivation rather than SFBC techniques of looking for exceptions (times when the student was motivated). When the counselor was asked if she felt that approach worked for the student, she stated that she was uncertain and that she did not know if the student was able to sustain any positive emotions that may have resulted in the counseling session because there was a lack of monitoring. It is evident that while SFBC techniques may be positive and add value to the overall counseling process, research into mixed-methods SFBC approach is needed to determine the degree of effectiveness and impact on student outcomes.

Determining effectiveness of SFBC or any counseling framework in schools becomes difficult when there is a divergence from the theoretical design and a mixture of approaches used in practice. This may result in a lack of fidelity to the implementation of a SFBT and also a lack of fidelity for the other methodologies used. To mitigate concerns, school counselors must receive ongoing training in SFBC and the other methodologies they are integrating to ensure implementation fidelity.

The focus group interviews indicated that there may be some misconceptions about the key features of SFBC. It was unclear from the interviews if school counselors were intentionally selecting particular strategies or if they were unaware of all of the elements of SFBC. Some school counselors perceive solution-focused brief counseling as something that occurs for a short period of time such as their academic planning meetings or their counseling discussions in groups. However, while brevity is a feature of SFBC, it is not the main component. Other counselors appeared to associate SFBC with staying focused on the positive and student strengths rather than deficits. While this too is a feature of SFBC, it is not the primary element. Remaining future-focused, illustrating exceptions, and highlighting student abilities to solve problems through a collaborative student-counselor relationship are also key factors of SFBC.

FUTURE RESEARCH

Determining effectiveness of the SFBC in schools becomes difficult when there is a divergence from the theoretical design and a mixture of approaches utilized in practice. While school counselors stated that they used SFBC, some of their examples reveal that the features of SFBC were applied along with other strategies, and there appeared to be a lack of fidelity to the implementation of a purely SFBC approach. Furthermore, school counselors did not collect or maintain data regarding their counseling strategies or effectiveness. The data collected was limited to number, type, and purpose of meeting. Additional research is greatly needed to evaluate SFBC effectiveness in schools.

CONCLUSION

Students face multiple risk factors that can affect their cognitive, social, and emotional development in schools. Each student's unique needs demand that school counselors use a variety of therapeutic strategies to help students problem-solve and develop. Because children face many difficulties and barriers in schools given how American homes and societal values have changed (Berns, 2010, as cited in Henderson

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

& Thompson, 2016), teaching children how to be resilient, cope, and problem-solve effectively is now a critical skill that teachers and school counselors must impart. As school counseling theory and practice continue to evolve as the discipline responds to the changing needs of students, and new methodologies, such as Solution-Focused Brief Counseling, are being developed and implemented. This chapter presented a brief overview of Solution-Focused Brief Counseling (SFBC) from the literature, how it evolved, its tenets, and the application in schools. A focus group of practicing public school counselors shared their experiences on how they use SFBC in schools and their strategies for using SFBC more effective in schools.

The SFBC framework is derived from the assumption that students can successfully solve problems without a deep analysis of the problem. In fact, the theory posits that students are capable of finding solutions on their own, and even when it is not initially evident, there are fragments of the desired solutions being implemented and times when the problem is not present. Solution-focused school counselors guide students to identifying their strengths, exceptions or times when the problem is absent, making small changes, setting goals, and focusing on desired future outcomes. By remaining oriented on positive outcomes and celebrating small success, school counselors help students become motivated to problem-solve and find that they are able to obtain positive results in a fewer sessions.

Though there may be agreement among school counselors that SFBC is an effective alternative approach to traditional problem solving and means to facilitate student development of problem-solving skills, additional research is needed. Currently, there is little empirical research on the use and effectiveness of SFBC in schools. The growing popularity of SFBC in schools presents an opportunity to further research the application and effectiveness of SFBC. Interviews with practicing school counselors presented in this chapter illustrate that school counselors use multiple counseling approaches including SFBC which may create challenges to determine the effectiveness of SFBC. While it is uncertain if the blending of strategies may be due to student need or lack of school counselor training, the school counselors felt that when school counselors ensure safeguards for fidelity are in place, combining methodologies may compliment or enrich the SFBC process.

The counselors' comments and literature on SFBC in schools noted several other barriers to implementing SFBC in schools such as time, problem-focused thinking, the lack of a team approach, school conditions, and school counselor training. The school counselors in the focus group provided several strategies to assist school counselors in promoting and applying SFBC, which include: being proactive and planning ahead, paying close attention to semantics, collaborating with other school counselors, being visible on campus, partnering with teachers and administration, learning the culture and diversity of the community, training parents in SFBC practices, creating templates to facilitate SFBC practices, and engaging in continuous training and reflection.

Integrating the work of school counselors, teachers, administrators, and parents to create a team approach using SFBC to guide student development and problem solving is a current need. Further research and outreach by school counselors might focus on sharing the benefits of SFBC and providing yearly training on SFBC practices.

In summary, when implemented correctly, SFBC has the potential to be an effective tool to teach students how to think differently about solving problems. SFBC can be used to transform problem-focused thinking and traditional approaches to problem-solving that are the normative behaviors in schools such as focusing on the problem, lecturing students about what actions to take, or administering punitive measures. School counselors must continue to develop their competencies and self-efficacy with SFBC

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

techniques and work to promote a solution-focus way of thinking with all stakeholders. The tips and strategies shared in this chapter are a starting point for incorporating a solution-focused framework into school practices and interactions with students.

KEY TERMS AND DEFINITIONS

Adlerian: Pertains to the theory and practice of Alfred Adler, whose school of psychotherapy is called individual psychology.

Miracle Question: The miracle question or "problem is gone" question is a method of questioning that a coach, therapist, or counselor can utilize to invite the client to envision and describe in detail how the future will be different when the problem is no longer present.

Paradigm Shift: Is a term to describe a change in basic assumptions within the ruling theory of science.

Pedagogy: Is the academic discipline that deals with the theory and practice of teaching and how these influence student learning.

Scaling Questions: Solution-focused counsellors use "scaling questions" to construct understandings of clients' concerns and solutions to them.

Semantics: Is the study of meaning in language. It can be applied to entire texts or to single words. For example, "destination" and "last stop" technically mean the same thing, but students of semantics analyze their subtle shades of meaning.

Silos: A system, process, department, etc. that operates in isolation from others.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Solution-Focused (Brief) Therapy (SFBT): Is a goal-directed collaborative approach to psychotherapeutic change that is conducted through direct observation of clients' responses to a series of precisely constructed questions.

Template: A preset format for a document or file, used so that the format does not have to be recreated each time it is used.

Chapter 8
AR Using NUI Based Physical Therapy Rehabilitation Framework with Mobile Decision Support System:
A Global Solution for Remote Assistance

Syed Ali Fathima S. J.
Kumaraguru College of Technology, Coimbatore, India

Shankar S.
Hindusthan College of Engineering and Technology, Coimbatore, India

ABSTRACT

This article describes how physical therapy rehabilitation promotes functional ability of the disabled people to improve quality of life using Range of Motion exercises. The conventional rehabilitation seems to be effective; however, the efficiency of the treatment sessions is not guaranteed resulting in longer recovery period. Thus, there is a need of self-motivating and engaging training solution to support rehabilitation and enhance continuous assessment of disabled patients. The proposed framework is "AR-NUI-REHAB-MDSS," augmented reality (AR) using natural user interface (NUI) based physical therapy rehabilitation with personalized exercise rendering and monitoring system for patients and mobile decision support system (MDSS) for therapists leading to a global solution for remote assistance. NUI allows human computer interaction intuitively through human body gestures. AR provides an entertaining environment for treatments with less-assistance. MDSS enables therapist to customize treatment plans at dynamic environments. Upper limb is considered as its functional recovery is significant and more challenging.

INTRODUCTION

The improvement in quality of life (QOL) for the people with disabilities due to functional impairment in any part of the human body is obtainable through physical therapy rehabilitation. It is a medical field expertise that deals with examination, evaluation, and re-mediates impairments to promote mobility and functional ability (Khalid, Sarwar, Sarwar & Sarwar, 2015). These disabilities can be physical or psychosomatic ailment due to various facts like accidents, congenital or birth disorders or aging concern (Fathima, Shankar, & Thajudeen, 2016). The improvement and restoration of movement and functional ability is achieved through performing regular and repetitive physical therapy exercises. Physical therapy treatment is a kind of Range of Motion (ROM) exercises that can be offered to any people regardless of the age based on the pain, injury or disability with the aid of Physiotherapist. Engaging in training using ROM exercises supports the patient to emend joint functionality concerning ease off swelling, stiffness and pain (Bhatia, Bejarano, & Novo, 2013). The main aim of this rehabilitation therapy is assisting individual personals to restore ability to perform their basic tasks and physical activities independently and accomplish the maximum level of freedom in all level such as physically, emotionally, socially, and spiritually in order to maintain QOL in the society (Murphy, Shea, Cooney, Shiel, & Hodgins, 2006, pp. 14-15). This can be obtained by doing certain prescribed physiotherapy exercises regularly and repeatedly and will be more effective in the early intervention of disability.

Upper limbs (hands) are the most significant part of the human body to perform any physical actions like grasping, holding, and manipulating objects that involves complex coordination of muscle activity engaging every part of a hand from shoulder to fingers (Feys et al., 1998; Alonso et al., 2014). The disabilities of upper limb can happen due to post-stroke, post-traumatic, paralysis, aging, etc. (Fathima et al., 2016). Several studies from various agencies reported that the functionality of one-third of the human body is affected by occupationally impaired upper limb (Ojeda, Moreno, Ramırez, & Rodrıguez, 2014). Achieving the functional recovery of hands is rarely possible by few days of treatment in hospitals or by undertaking oral medicines. In most of the cases, there is a need for continuous physiotherapy treatment in order to make them functionally enable; independent and improve QOL, even after their discharge from hospital (Fathima et al., 2016). The lack of impulsive stimulation during functional activities leads to the reduction in probability of retrieving the upper limb fully functional. By nature, non-affected side is exclusively used by the patient to perform upper limb activities (Kwakkel, Kollen, Grond, & Prevo, 2003). Findings from research studies indicate that the paretic arm remains without function when measured after 6 months post stroke, whereas the complete functional recovery is demonstrated only 5% to 20% (Feys et al., 1998). Thus, it is more challenging to rehabilitate upper limbs.

As the upper extremity functional recovery is quite complex, the training of moderate exercises has to be maintained appropriately. The proper rehabilitation training is very crucial to be performed by those who have impaired limbs and it is not easy to restore normal daily function (McNeill, Pokluda, Mcdonough, & Crosbie, 2004). There are many therapeutic rehabilitation approaches currently available but the notable concern is that though conventional therapy is effective, there is a lack of efficiency in the treatment sessions due to unavailability of facilities and therapists, about 60% of the day the patients were alone, in some cases only about 13% of the day patients are engaged in activity (Bernhardt, Dewey, Thrift, & Donnan, 2004), also enduring some traditional therapies continuously make patients to lose their interest and lag motivation to continue their exercises regularly, leading to longer recovery period. It is been proven that performing two to three hours of arm training a day for six weeks when started within one or two months after stroke improved motor recovery (Lawrence et al., 2001). Thus, it neces-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

sitates finding innovative ways of self-motivating and engaging training solution to enhance functional recovery of upper limb rehabilitation with minimal or remote support from therapist.

The ideal solution is to use engineering technology involving advanced computing techniques to propose a novel framework as the supplementary treatment process to conventional rehabilitation and to enable continuous onsite or remote assessment of disabled patients. While maintaining the quality treatment, the overhead cost incurred in healthcare rehabilitation can be reduced by the application of strategic information systems planning with the proper means of information sharing and quality reporting (Hung et al., 2016). Physical rehabilitation integrated with extremely interactive and immersive computing technologies and information system has the prospects to offer efficient treatment sessions that mutually benefits both patients and therapists.

This paper emphasizes on various interactive computing technologies like NUI, GR, AR and MDSS that can be adopted into the health care domain especially in the field of physical therapy rehabilitation. The importance of upper limb rehabilitation is discussed along with the literature review of NUI and AR based rehabilitation frameworks followed by the comparative study of pros and cons of different gesture technologies and limitations of the existing techniques. Finally, a novel framework "AR-NUI-REHAB-MDSS" is proposed with the explanation of essential components, the implication of appropriate technologies for the framework implementation and design methodologies with an experimental training scenario. It also highlights the beneficiaries of the system, its future scope and concludes with the significance of the proposed framework as a global solution for remote assistance.

COMPUTING TECHNOLOGIES FOR HEALTH CARE REHABILITATION

The major computing interfaces and technologies involved in the proposed framework to support rehabilitation are

- Natural User Interface (NUI)
- Gesture Recognition (GR)
- Augmented Reality (AR)
- Mobile Decision Support Systems (MDSS)

Natural User Interface (NUI)

NUI is an expansion and specialized form of Graphical User Interface (GUI) that lets the human computer interaction (HCI) through actions of common human behaviour intuitively. The natural way of interaction with systems and technologies is provided to the NUI users by human touch, senses, gestures, speech and thoughts. It can be implemented in various ways depending upon the user requirements and the purpose. NUI interaction is supported using intermediary sensing devices that are either visible or invisible. NUI has presented a new era that allows computing devices to be used in unmarked areas of applications like medical rehabilitation which had been complex previously (O'hara, Harper, Mentis, Sellen, & Taylor, 2012).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Gesture Recognition (GR)

The most natural means to interface with a computer or any system by human is through gestures and is integral to HCI. It is considered as interaction techniques that deliver a creative and the natural methods of communication between people and computing system. Any form of the body movement creates the gesture. Gesture recognition technology makes use of sensors like cameras, computer vision and mathematical algorithms for accurate interpretation of sign language and gesture motion (Karray, Alemzadeh, Saleh, & Arab, 2008). They build a strong association between machines and human in a rich manner than traditional text user interfaces, which involves major use of mouse and keyboard. Glove based systems, Stereo and Depth aware cameras, Controller based gestures are the well-known gesture based input devices. NUI using gesture interfaces have vast advantage in various fields like engineering, entertainment, health care and education (Jain, Lund, & Wixon, 2011).

Augmented Reality (AR)

Augmented Reality (AR) is an advancement of Virtual Reality (VR) that offers an integration of real world environment with virtual objects that are augmented by sensory inputs like graphics, voice, video or gestures generated by computers using NUI devices that can be viewed directly or indirectly by the user. AR technology makes use of motion sensors, computer or machine vision or special kind of markers to enable gesture recognition and to capture and interact with virtual objects in which the game sequences are processed digitally. Using AR, one can create more realistic and interesting exercise training scenarios which adopt a concrete object into the framework and facilitate patients to touch, play and interact with the virtual and real environment with the level of transparency (Alamri, Cha, & Saddik, 2010). AR technology provides patients with natural and an entertaining environment for treatment sessions with less assistance (Merians et al., 2002). It significantly increases training period by self-motivating patients' through feedback and improves engagement in training which ultimately leads to faster recovery.

Mobile Decision Support Systems (MDSS)

The advancement in mobile computing, smart communication and information technology offers an exciting prospective for a new innovative cluster of decision support systems (DSS) named as Mobile Decision Support Systems (MDSS) (Haghighi, 2013). MDSS offers access to up-to-date information and data of the information system on mobile devices and provides a provision for decision makers to make complex and critical decisions in their business anytime and anywhere at dynamic environment. This technology can be integrated in the rehabilitation framework to support therapists for continuous remote assessment of patients.

LITERATURE SURVEY

Movement impairments fundamentally requires rigorous treatments, hands on training using appropriate physical and occupational therapy for quite a few or more weeks to recover from the injury and get back to normal functionality. Unfortunately, the affected patients are receiving less therapy due to lack of facilities and financial pressure leading to return home earlier from health care centres with incomplete

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

treatment (Rathore, Hinn, Cooper, Tyroler, & Rosamond, 2002). The significant aim of Rehabilitation Engineering (RE) is the development of technology that facilitates individuals to carry out their intensive movement trainings without the expense of presence of therapist all the time but provided with their support remotely or onsite based on the requirement (Ong, Shen, Zhang, & Nee, 2011). In the field of rehabilitation applications, the introduction of the prototyped serious games using NUI is very attractive and intuitive (Rego, Moreira, & Reis, 2011).

The upper limb rehabilitation training sessions for functional recovery needs supervision of therapist on a regular and frequent basis. The frequency and duration of training period depends on the injury's severity. The development of Augmented Reality based rehabilitation training system intends to reduce the reliance on supervised therapy and motivates self-training with minimal support. The techniques of physical therapy that are currently in use are replicated as games in an augmented environment in which patient interact with virtual objects naturally. The gaming exercises are developed using marker based augmented reality technology. Usage of a gaming platform offers increased motivation to the patients, as well as an affordable rehabilitation solution. The games can be used with or without use of some assistive devices like hand held roller ball device, which changes the focus of exercise and tries to engage the patient in their training movements (Leon, Bhatt, & Al-Jumaily, 2014).

Spatial AR system designed facilitates patients with stroke to perform hand movement training exercises at health care centre or at home with less intervention of physical therapist or health care providers. The patient gains better control over AR environment in such a way that he or she feels realistic and engages in treatment session in a more intuitive way (Hondori, Khademi, Dodakian, Cramer, & Lopes, 2013). The psychological feeling of the patient is better while using the Strokeback system and speed of the rehabilitation gets improved because of the suitable leap motion controller games under Unity 3D that gives a successful technical system test and demonstrate the correct exercise and accurate scoring of the patients by animating avatars. Leap motion controller is used to capture the movements of the upper limbs which are an engaging way for the patients and is a fun in practicing therapy (Hondori et al., 2012; Tao et al., 2007). A new generation of the video game that promotes the physical activity and effect the energy expenditure (EE) is the Exergame. The researchers have brought the different Exergames which are full of the entertainment with physical activities and different types of video games. The benefits of the exergaming impact a lot on the human health and fitness (White, Schofield, & Kilding, 2011).

Interactive and intelligent rehabilitation gaming system named RehabMe makes use of Microsoft© Kinect for Xbox 360 that strives to retain patients' interest in doing their exercises. It is embedded with an assessment module using which exercise regimens are measured both quantitatively and qualitatively. The growing needs of home-based rehabilitation is facilitated using this system by enabling patients to realize an enjoyable and challenging interactive experience (Andika, Tantra, & Wai, 2012).

The medical rehabilitation for the patients suffering from shoulder injuries was proposed, that uses Hidden Markov Models (HMM) for recognition and applies a histogram-based comparison for computing the accuracy score. Microsoft Kinect for Xbox 360 sensor is used to obtain 3D coordinates of human joints. From the captured skeletal coordinates, significant features are extracted which are then quantized into 16 intermediate upper-body poses using which the temporal patterns are modelled by training an HMM for each exercise. As the patient performs his/her exercise, the system recognizes variation in the exercises promptly and accuracy score is assigned for each exercise being carried out. It also supports the patient by tracking of daily exercise routine, providing suggestions for improvements and supports therapist or medical experts by maintaining records to access whenever required (Uttarwar, Mishra, 2015).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

AR-based REHABilitation is a new approach based on AR technologies that is designed to improve the stroke patient's involvement in their treatment process. The approach takes advantage of Virtual Reality technologies and presents a natural-force interaction with the concept of tangible-object adopted into the daily environment. It also includes measurements for patient assessment. The assessment parameters are compactness of task, task completion time and hand movement speed and these are recorded by means of capturing the patient hand gestures and activities while interacting with the tangible object (Alamri et al., 2010).

COMPARISON OF EXISTING REHABILITATION FRAMEWORK

Wearable Sensors, Leap Motion Controller, Nintindo Wii, Microsoft Kinect are examples of NUI devices with gesture recognition (GR) capabilities that are useful to develop AR based applications. The comparative study of existing rehabilitation frameworks using different gesture technologies with its pros and cons are discussed in Table 1 which offers a feasibility analysis for the real-time implementation of the proposed framework using Microsoft Kinect (V2) for Xbox one.

Table 1. Comparison of existing rehabilitation framework with different gesture technologies

Technology	Pros	Cons
Wearable Sensors Wireless Sensor Network for body motion processing (Kwang, Goh, & Dong et al., 2008)	Encourage the healthy habit while wearing the wearable sensors as it has property of the fitness apps that helps to change the behavior. It's a personal technical device that helps to track the problem of the patients by wireless mode with a monitor that is inbuilt in the sensor.	Sensor technology that tracks the daily activities may not be completely accurate. It is moreover wearable sensors, which has to be fit into the user's body that makes disruption while performing exercise.
Leap Motion Controller Stroke Back System (Hondori et al., 2012; Tao et al., 2007)	A gesture is based on motion sensing interface. Easy to install and connects on Mac and windows. Number of apps with cheap rates or free of cost is available.	Hand position cannot be registered in a proper way and the gestures are of no standards so it's difficult to use in the productivity task of real time exercising.
Nintindo Wii Exergames (Leatherdale et al., 2010; Diest et al., 2014)	A work out is a fun as Wii version is simple and easy for a quick workout and could be performed whenever the user has time.	As the tracking of the game is quite frustrating so while creating the workout schedule, there is no Motivational part like other fitness games. It does not have information on the complete workout for the upper limbs and others.
Microsoft Kinect for Xbox Rehabme (Andika, Tantra, & Wai, 2012)	It is with a powerful hardware interface that is intuitive. There is a USB support and could be carried on live in any interface devices like TV, laptop, or Mobile which supports marker less skeletal and gesture tracking feature with good accuracy and with negligible delay time.	Backward compatibility is limited.

LIMITATIONS OF EXISTING TECHNIQUES

The framework using wearable sensors might cause disruptions while performing exercise, so there is a need of marker-less motion tracking NUI. Leap Motion Controller is a small NUI device used to capture only the hand gestures and it might be complex to use it in the real-time exercise development.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Nintendo Wii cannot help to capture information on the complete workout of the upper limbs. Though the existing frameworks propose solution for rehabilitation, there is always a scope for improvement in the level of motivational and transparency part of the exercise development. It is quite tricky to develop activities of daily living (ADL) exercise training scenarios for upper limbs that involves actions like touch, reach, grasp, hold, eat etc., as it requires marker-less body gesture capturing, face recognition, speech recognition and skeletal tracking for efficient exercise design.

Microsoft Kinect is a device introduced by Microsoft under the banner of Xbox gaming device which is quite innovative technology with a combination of the software, cameras and microphones that capture every movement of a human body and turns it into a fun based video game controller. It is a very much successful NUI device that integrates the skeleton tracking feature that establishes the skeleton joints position through a depth image data. Although it had a great impact in the gaming industries, its vast applications were revealed which later led to the invention of many innovative ideas using kinect's gesture and skeleton tracking feature in the field of rehabilitation (Mobini, Behzadipour, & Foumani, 2014). Microsoft Kinect for Xbox One (V2) is the subsequent version of Microsoft Kinect for Xbox 360 (V1). Kinect V1 was restricted due to its low-resolution output. Kinect V2 has a high-resolution capability camera that is much more precise in term of skeleton motion tracking, resolution, face recognition and many other features than that of Kinect V1. The feature comparison of Microsoft© Kinect for Xbox 360 (V1) with Microsoft Kinect for Xbox One (V2) is given in Table 2.

Table 2. Feature Comparison of Kinect V1 and Kinect V2

Features	Kinect (V1)	Kinect(V2)
Full skeletons tracked	upto 2	upto 6
Horizontal field of view	57 degrees	60 degrees
Vertical field view	43 degrees	60 degrees
Minimum depth distance	40 cm near mode	50 cm
Quality - color camera	640x480 @30 fps	1920x1080 @ 30 fps
Quality - Depth camera	320x240	512x424
Skeleton joint defined	20 joints	26 joints

Moreover, Patient assessment system built-in with the existing frameworks does not incorporate mobile decision support system to help therapist anywhere and anytime to provide remote assistance for the patients.

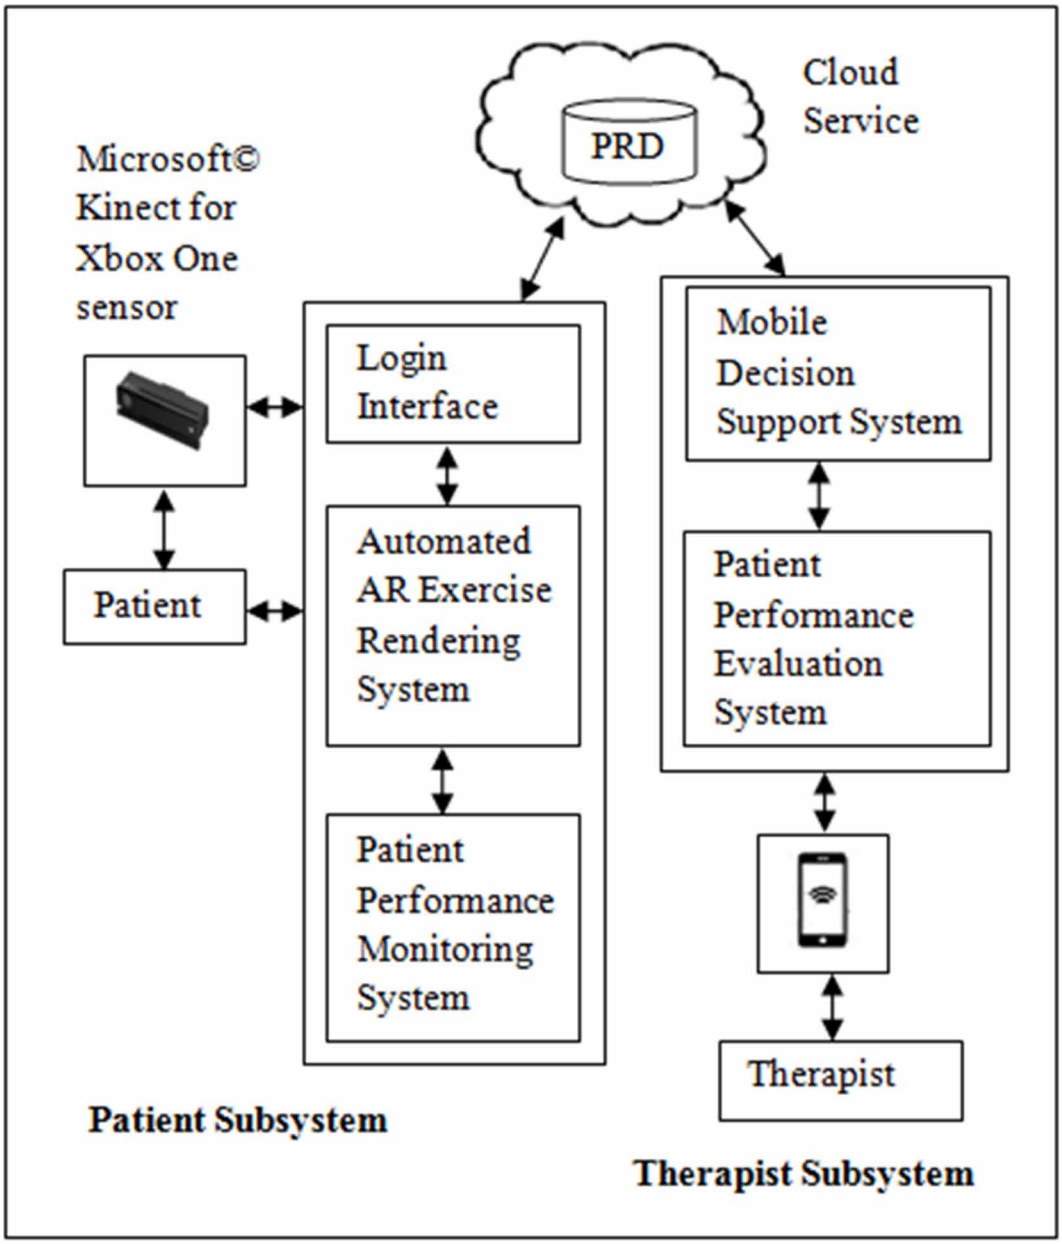
AR-NUI-REHAB-MDSS Framework

By taking the limitations of existing AR based rehabilitation systems into consideration, this paper proposes a novel "AR-NUI-REHAB-MDSS Framework", that is Augmented Reality(AR) using Natural User Interface(NUI) based physical therapy rehabilitation framework with personalized exercise rendering and monitoring system with the aim of functional recovery of upper limb for the affected patients to enhance the training on Activities of Daily Living (ADL) and Mobile Decision Support System (MDSS) for therapists. See Figure 1.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The proposed framework is basically divided into two subsystems called the patient subsystem and the therapist subsystem. The patient subsystem consists of a login interface, automated augmented reality exercise rendering system with an interface to NUI supporting device such as Microsoft Kinect (V2) for Xbox One, a marker less motion sensing device for human gesture tracking to perform exercise training, and patient performance monitoring system. The therapist subsystem comprised of patient performance evaluation system with customized data analytic techniques for hand gesture data analysis and mobile decision support system module with an interface to the mobile device through which the therapist can access the information system and monitor the patient's performance.

Figure 1. AR-NUI-REHAB-MDSS Framework



EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

FRAMEWORK COMPONENTS

Patient Rehabilitation Database (PRD)

The patient rehabilitation database stores the patient information like patient personal data, medical history, fitness condition, personalized exercise training/treatment plan, exercise monitoring and performance analysis data and therapist information. In the future, therapist or rehabilitation experts can make use of this PRD to evaluate the success of the patient versus effectiveness of the rehabilitation process. As the data generated by the application is expected to be large due to the storage of human gestures for each training session, the framework proposes to store the database on the cloud storage server for an affordable large data storage and ease of data access for further analysis and mobile applications.

Patient Login Interface

Every patient is given a login interface in order to securely access the patient subsystem. As the patient successfully login, the patient can view his/her relevant health information and can perform AR based exercise as per the personalized treatment plan.

Augmented Reality (AR) based Exercise development

AR Exercises can be designed for rehabilitating upper limb functional movements such as reach, touch, hold, release, grip and other manipulations of the objects. It allows using real world 3D objects of different shapes and size relevant for training. Microsoft Kinect for Xbox One sensor device is used as an NUI for developing AR Exercises with Gesture Recognition (GR) and to interact with the system in order to train the patient. The Microsoft© Kinect Sensor and its associated Software Development Kit (SDK) offered access and control to its powerful prevailing sensors has brought a new way of NUI for gaming environment and can be utilized especially in many research purposes. The Kinect has robust 3-Dimensional (3D) sensors for gesture and face recognition and it can be used to develop an effective rehabilitation training system (Muneshwara, Swetha, & Anil, 2014). Upper limb rehabilitation is performed using set of Range of Motion (ROM) training (Gates, Walters, Cowley, Wilken, & Resnik, 2016). Using Kinect based Augmented Reality, ROM exercises for shoulder flexion / abduction, elbow flexion /extension, hand grip and release can be designed and developed in the fun based environment.

AR based exercise training design and development for rehabilitation should consider the most basic and challenging properties listed in the Table 3.

Augmented Reality (AR) Exercise Rendering System

This involves creating an interactive and automated AR based exercise rendering system for patients. The treatment plan of a patient consists of customized list of exercises to be carried out along with the order of undertaking, training time period and count of repetitions fixed with each exercise. When the patient login to the system, the exercises are automatically rendered in the precise order for the specified period of time.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Properties of AR based Exercise design and development

Properties	Description
Simplicity	Exercises should be easily understandable by all kind of patients and their supporters.
Appropriate	The exercises should be appropriately designed to offer the anticipated training for the affected part of the body without any side effects.
Ease of use	Training sessions should be easy to perform with less effort and minimum (or) no support / assistance.
Accuracy	The sensing device interface should be properly calibrated and programmed to capture the patients' hand gestures accurately and respond to training session as expected with negligible delay.
Transparency	Patient should undertake the exercise training without the feel of treatment session.
Interesting / Motivating / Engaging	Exercise design should be interesting enough so as to motivate the patients to engage in the training with self-interest and perform the sessions repeatedly and regularly.
Personalization	Exercise parameters should be customizable based on the patient preference and health condition.

Exercise Monitoring System

While the patient performing an exercise, all the activities related to user's intuitive behavior is identified and captured by the sensing device which help to interact with system. The performance of the patient based on exercise score and ROM co-ordinate angle of hand gestures with respect to shoulder, elbow and wrist are monitored and stored in the PRD for each session. These data can be later used for patient performance analysis.

Patient Performance Evaluation System

The system evaluates the performance of the patient from the monitored data that is stored in the PRD using appropriate data analytic tools and techniques to produce a performance report in daily/weekly basis or whenever required.

Therapist Mobile Decision Support system

The therapist can access the patient information through mobile application secured with login interface. The therapist can be able to monitor the patient performance, view the training reports and can change the treatment plan for the patient accordingly through the mobile app at the dynamic environment and can provide remote assistance.

Technologies for Proposed Framework Implementation

Kinect V2 has the capability to detect all the valuable biometric data that include the facial expressions, limb weight, voice recognition and other gesture expressions. It has the fidelity to track all the fingers, the stretching and shrinking of the upper limbs of the body with high accuracy when compared to Kinect V1. Unity 3D game engine is a software development tool kit that provisions the development of simple to complex 2D and 3D games and supports excellent integration with Microsoft© Kinect (Ashley, 2015). The proposed system aims to develop exercises for the upper limb ROM training as AR game

Table 4. Proposed Framework - Implementation Technology

Requirement	Implementation Technology
Human Gesture Capturing and Motion Sensing NUI Device	Microsoft Kinect for Xbox One and its SDK
AR based Exercise Development	Unity 3D Game Engine Software
Patient Rehabilitation Database (PRD)	SQLite and suitable Cloud Storage using Infrastructure as Service (IAas)
Patient performance evaluation system involves hand gesture data analytics	Any appropriate existing data mining tool (or) customized new data mining algorithm
Mobile Decision Support System (MDSS)	Android Studio and SDK tools

play environment using Unity 3D and Kinect. The list of requirements and suitable technologies for the implementation of the proposed AR-NUI-REHAB-MDSS framework is given in Table 4.

FRAMEWORK METHODOLOGY

Patient Subsystem

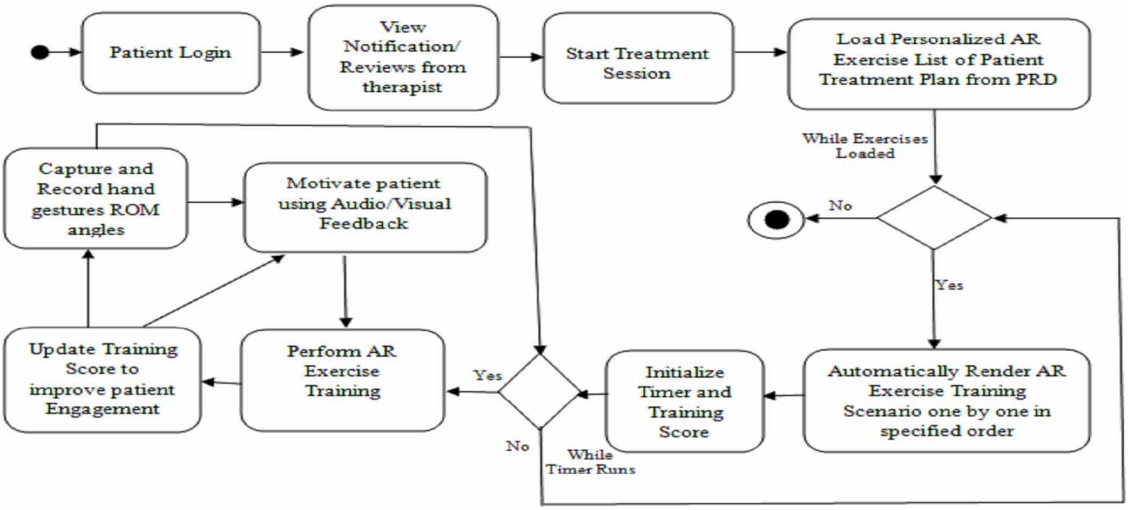
The workflow of patient subsystem is illustrated in Figure 2. As the patient logins to the system, he/she will be able to view notifications or review comments from the therapist. The patient can start the treatment session to perform exercise and the system loads the list of AR exercise training scenarios according to patient's personalized treatment plan from PRD. The system then automatically renders the AR exercise scenario one by one in the specific order as per the treatment plan. At the beginning of every exercise, the training score is initialized to zero (0) and timer is set to scheduled time. While the patient performs the exercise using Microsoft Kinect NUI device, the timer runs and audio-visual feedback will be given so as to motivate patients to involve in training effectively. To improve the engagement of the patient, training score is updated with respect to hit and miss activity of each scenario. The patient's activity is monitored and ROM angles of hand gestures with respect to shoulder, elbow, and wrist are captured by Microsoft Kinect and recorded at appropriate time frame. The necessary information regarding a particular training scenario that is required for patient performance evaluation is stored in PRD at the end of each scenario. This process of treatment session continues until the patient carry out all exercises in the treatment plan.

Therapist Subsystem

The workflow of therapist subsystem is illustrated in Figure 3. The therapist can login into rehabilitation MDSS through mobile interface. The therapist is given options to manage and monitor patients. The therapist can manage patients by view, add or update the patient profile, create patient personalized treatment plan by adding or removing AR exercises to the treatment plan. The personalization is achieved through setting or updating the exercise order, exercise parameters like count, time, hit or miss scores, instructions, scene parameters etc. based on patient profile. If the therapist wishes to monitor patient, he can review patient evaluation by generating patient performance report whenever required. The patient

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Workflow of Patient Subsystem



performance is analyzed and report is generated using appropriate data analytic process considering rehabilitation criteria. The therapist can change treatment plan based on patient performance and can send notifications or review comments to the patient.

Use Case Design

The use case diagram of the proposed AR-NUI-REHAB-MDSS framework is shown in Figure 4 that illustrates the overall design of the system.

Figure 3. Workflow of Therapist Subsystem

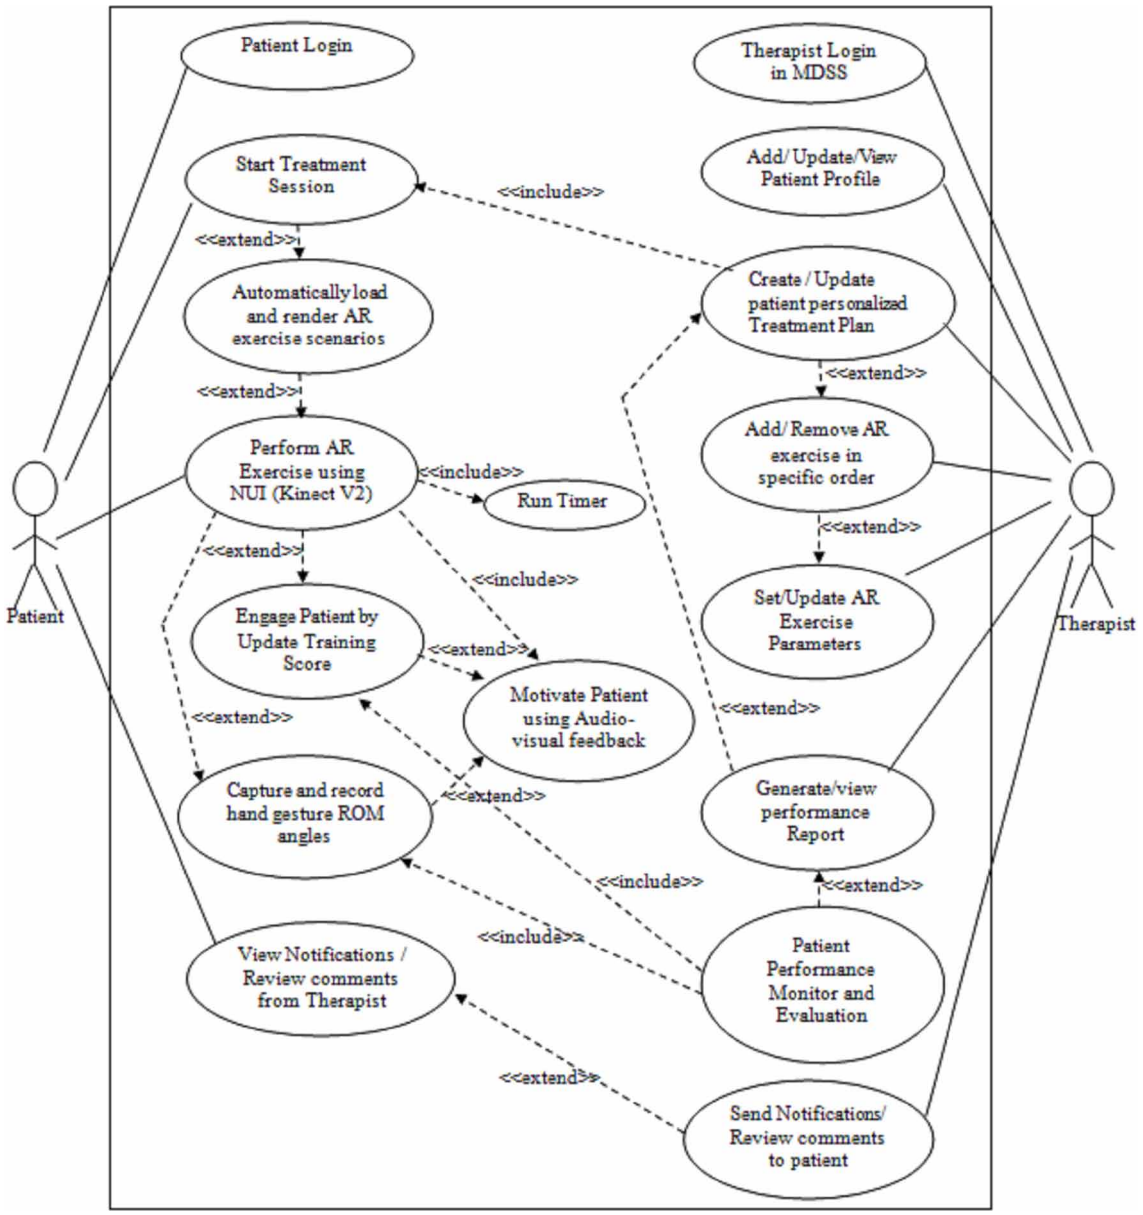
Figure 4. Use case design of AR-NUI-REHAB-MDSS Framework



Experimental Training Scenario

The experimental ADL exercise training scenario is specifically designed to improve the eating behavior of the patient with impaired upper limbs. It is implemented using Unity3D Gaming Engine software for AR exercise development and Microsoft Kinect V2, a motion sensing NUI device to interact naturally with the training scene. In this training, a virtual scene is rendered with a basket of fruits like bananas and oranges placed on the table in front of the patient. The patient is made to interact with the virtual objects in the AR environment designed with audio visual feedback to motivate and engage patients in

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

training with less assistance. The AR environment in this case refers to blending of virtual objects into real interactive scene captured using Microsoft Kinect's background camera. The training involves the movement of patient's hand towards the fruits, pick and hold a fruit at a time, move the hand towards the mouth and then release the fruit near his/her mouth. The fruit get disappears only if it is perfectly released near the mouth and Microsoft© Kinect's face tracking feature supports to achieve this task. For each correct eat action, the training score is updated and the ROM angles of hand gestures are captured. ROM hand trainings like shoulder medial rotation, hand grip, hand release, elbow flexion, and elbow extension can be given using this training scenario. The design of eating activity training scenario is shown in Figure 5.

Figure 5. Design of Eating Activity Training Scenario

BENEFICIARIES OF PROPOSED FRAMEWORK

The list of beneficiaries and benefits offered by the proposed AR-NUI-REHAB-MDSS system are given in Table 5.

FUTURE SCOPE

The implementation of the framework components has been initiated with the development of AR based exercises using Microsoft Kinect for Xbox one and unity 3D to enhance the activities of daily living (ADL) for the disabled people which involves the creation of fun based motivational gaming User Interface (UI) design and maximize the effectiveness of treatment sessions for upper limb rehabilitation. Though the study in this paper concentrates mainly on upper limb rehabilitation, the framework could be extended to any kind of physical rehabilitation involving different parts of body as Kinect device supports skeletal and gesture tracking of the whole human body. Moreover, patient's training interface

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5. Beneficiaries and benefits of AR-NUI-REHAB-MDSS

Beneficiaries	Benefits
Physiotherapist / Rehabilitation Expertise	Number of patients treated by the physiotherapist is limited by the amount of time taken for a treatment session. The framework enables therapist to handle more number of patients as it facilitates remote monitoring to keep track of patient performance, change treatment plans and can provide remote assistance from dynamic environment.
Patient	The system aims to motivate the people of all ages to engage in the training sessions effectively and can create a positive impact and enjoyable experience, which may lead to improvement in results and speedup recovery. Moreover, on an affordable circumstance, one time setup of the training environment can be done at home that makes the psychological feelings of the patient better when compared to any care centre or hospital.
Physiotherapy clinics and hospitals	AR-NUI-REHAB-MDSS framework setup at clinics or hospitals will offer an added advantage of using new emerging technologies as a supplement to traditional therapy which ensures better treatment, faster recovery, promotes more patient visit and adds value to the service as well as business.
Society / Community	It helps to build a technology enabled healthier society / community with the provision to reduce the disability rate.

could be any type of smart devices like desktop PC, laptop, television, mobiles or tablets that supports Kinect based AR environment. The PRD created from this implementation can act as the rehabilitation dataset for further analysis to improve automation process. There is a wide scope of research opportunities in this area of study for the proper implementation and deployment of computerized rehabilitation training platform following the medical standards as a global solution with therapist's remote assistance.

CONCLUSION

This paper proposed a novel framework of adopting the new emerging engineering computing technologies into the health care system in order to support and enhance upper limb physical therapy rehabilitation. As discussed, using AR therapy with simple assistive NUI devices like Microsoft Kinect exhibits to be an affordable option to substitute other form of therapies using robotics which is quite expensive, and also it can be easily integrated with conventional physiotherapy (Hondori, Khademi, & Lopes, 2012). At the same time, it promotes self-engaging and self-motivating training sessions for patients to carry out exercises in fun based environment with less assistance. In addition, the proposed framework emphasizes developing Mobile Decision Support System (MDSS) that enables therapist to perform remote patient monitoring and assistance. The integration of engineering computing technology into conventional therapy will definitely benefit both patients and therapists which will ensure better treatment and improved functional recovery.

Chapter 9
Scientific Creativity in Psychology:
A Cognitive-Conative Approach

Christiane Kirsch

Todd Lubart
Université Paris Descartes, France

Herie de Vries
Université Paris Descartes, France

Claude Houssemand
University of Luxembourg, Luxembourg

ABSTRACT

The present research investigates the cognitive and conative profile underlying scientific creativity in psychology. An innovative creativity test including both divergent and convergent thinking was used. Intelligence and personality were also measured. The sample consisted of 121 social science students. Intelligence played a major role for scientific creativity in psychology. With regard to personality, openness and negative agreeableness favored additionally scientific creativity in psychology. In future research, the profile of scientific creativity could be compared with profiles of artistic creativity and everyday creativity.

INTRODUCTION

Batey and Furnham (2006) distinguish between three major domains of creative expression: artistic, scientific and everyday creativity. Although for a long period of time creativity was considered in a domain-general way, presently, creativity is progressively considered to be specific to the respective

domain. Both approaches are not necessarily mutually exclusive. According to Lubart, Mouchiroud, Tordjman, and Zenasni (2003), the differential approach to creativity reconciles the domain-general and the domain-specific approach; it assumes that there are both domain-general and domain-specific features for creativity. Whereas according to Batey and Furnham (2006) some cognitive and personality characteristics (e.g. fluid and crystallized intelligence, openness) are supposed to have a domain general importance for creativity, according to Lubart and Sternberg (1995) other features (e.g., knowledge, risk taking) are thought to be more domain-specific. The present chapter aims to investigate the differential approach of creativity, with a specific focus on scientific creativity in psychology. The cognitive attributes and the personality characteristics that make up the profile of the scientific creator in the domain of psychology are explored.

BACKGROUND

Scientific Creativity

Although creativity intervenes in many life domains, according to Kaufman and Baer (2006), it is particularly relevant to the arts and sciences. What makes the science discipline so interesting to explore is that it uses a universal language that transcends the different sub-disciplines. Hence, according to them the role of acquired knowledge is secondary for scientific creation.

For Feist (1998), the definition of a scientist includes science students, natural scientists, social scientists, biologists, engineers, inventors and mathematicians. In the 1950s the first serious investigation of the personality profile of eminent scientists in comparison to non-scientists or their less creative peers was conducted (Roe, 1953; Cattell & Drevdahl, 1955; Terman, 1955). However, according to Feist (1993), it is only in the late 1970s and early 1980s that the psychology of science emerged. Feist and Gorman (1998) consider that the importance of this research discipline lies in a fruitful establishment of selection criteria for science students and young researchers. Presently, the personality of scientists is an already well-established area of investigation, using both psychometric tests and biographical analyses (Piirto, 1998).

Gardner (1983) was also interested in the nature of scientific creativity. According to Gardner (1983, p. 138), mathematical creativity refers to the ability to be "absolutely rigorous and perennially skeptical: no fact can be accepted unless it has proven rigorously by steps that are derived from universally accepted principles". In contrast to this approach, Einstein highlights the intuitive nature of scientific inquiry "to these elementary laws there leads no logical path, but only intuition" (as cited in Holton, 1971-1972, p. 97). In both the scientific and the artistic domains, according to Simonton (2004), chance dominates over logic in the creative process.

Creativity in Psychologists

For Simonton (2013), four different perspectives can be adopted in the analysis of creativity in psychologists. First, creative psychologists can be considered as simply showing one form of expression of high achievement in general, of people who managed to "make history" (Simonton, 1994). Second, creative psychologists can be analyzed together with eminent achievers of various disciplines (Gardner, 1993; Simonton, 1999). Third, creative psychologists can be perceived as belonging to a subgroup of

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

scientific achievers, like physicists, biologists or social scientists (Simonton, 1988). Fourth and last, creative psychologists can be perceived as a category on their own, distinguishing themselves from all other kinds of scientists, creators and achievers (Simonton, 2002). In the present research the third perspective is taken, according to which psychologists and more generally social scientists are perceived as a subgroup of scientists.

According to Auguste Comte (1855), scientific disciplines can be hierarchically organized from more objective and rational to more subjective and intuitive ones. This puts natural sciences on the top of the hierarchy, followed by social sciences and finally the arts. The lower the domains are on the hierarchy, the more emphasis they put on creativity, according to Simonton (2009). This organization was validated empirically by Simonton (2004) according to several criteria. In this respect, Simonton (2013) argues that psychology is one of the most creative scientific disciplines. According to Simonton (2009), dispositional traits as well as developmental conditions intervene differently in this hierarchy of disciplines. Research confirmed that the personality profile of a "hard" scientist is not necessarily the same as the one of a "soft" scientist. Social scientists (psychologists and anthropologists) in comparison to natural scientists (physicists and chemists) turned out to be more introverted (Chambers, 1964) and more emotional and rebellious (Roe, 1953). It follows according to Simonton (2009) that social scientists can be considered to be on the edge between natural scientists and artists. Still, especially with regard to mental health (Simonton, 1999), according to Simonton (2013), creative psychologists are more comparable to creative scientists than to creative artists. Simonton (2013) considers that the domain of psychology can be further subdivided into the scientific and the humanistic perspective and that the more humanistic oriented psychologists have a profile that is more comparable to the one of artists. Finally, Simonton (2009) argues that the dispositional traits and developmental conditions also determine the degree of success (creativity) in the respective disciplines. In this regard, his domain-regressive hypothesis assumes that the most creative scientists have the personality profile of scientists from fields that are lower in the hierarchy. This means that creative natural scientists rather display the personality profile of a social scientist. In the same line, a creative social scientist has a personality profile that comes closer to one of an artist.

Simonton (2013) made three major conclusions about the creative profile of outstanding psychologists, by directly relating them to eminent achievers from other scientific disciplines, to which they are highly similar. First, creative psychologists have high intelligence, motivation and expertise. Second, they show high productivity, a creative cognitive style and a rather introverted and independent personality. Third, in contrast to eminent artists, eminent psychologists share their relative emotional stability with creative scientists from other disciplines. They have a high probability to be first-born children, who grew up in stable and educated families. Finally, they tend to have had rather successful school careers.

Cognitive Profile of Creative Scientists

According to Feist and Gorman (1998), the psychology of science is divided into four major sub- disciplines: developmental approach, cognitive approach, personality approach, and social approach. As stated above, the present paper will elaborate on the cognitive and personality approach.

In the *cognitive approach*, Simonton (2002) found that early productivity is an essential condition of later success and recognition in a scientific career, in general and in the domain of psychology. The most creative researchers start publishing before attaining their PhD. A higher productivity rate enhances the chances to produce high quality papers. This is what Simonton (1985) calls the "constant-probability-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

of-success model". According to Simonton (2003), the enthusiasm going along with higher productivity prevents researchers from retiring. They just keep on publishing until illness or death sets a final stop to their career.

Batey and Furnham (2006) highlighted the primary role of intelligence for scientific creativity. Even if they consider intelligence as a domain-general feature for creativity, they conceive its influence to be even more pronounced in the scientific domain, regarding both fluid and crystallized intelligence. Regarding eminent psychologists, they share their comparatively high intelligence with eminent achievers from other disciplines (Simonton, 1994). It follows that a positive relationship between intelligence (logical reasoning and verbal fluidity) and scientific creativity in psychology is expected.

Personality Profile of Creative Scientists

The *personality approach* deals with: (1) establishing differences between scientists and non-scientists, (2) comparing more and less outstanding scientists, (3) comparing the personality profile of scientists from different theoretical orientations, and finally (4) predicting scientific behavior by personality. With regard to the first two points, the personality psychology of arts and sciences is usually divided into the between-group and within-group perspectives. Whereas the *between-group* perspective deals with the distinguishing features of artists and scientists from non-artists and nonscientists, the *within-group* perspective accounts for the differences between more and less creative professionals within one domain. Seeing that according to Feist (1998) non-creative artists have little chance to succeed, the intragroup variability is much smaller in arts than in sciences. In the personality approach, according to Feist and Gorman (1998), a fairly consistent profile of the scientific personality emerged from a long period of empirical research. This holds true for the comparison of scientists to non-scientists (between-group perspective) as well as for the comparison of more and less creative scientists (within-group perspective).

The Big Five model (Costa & McCrae, 1985, 1989, 1992), which gained popularity in the 80's and 90's, assumes the presence of five major personality factors: Neuroticism (N), Extraversion (E), Openness to new experiences (O), Agreeableness (A) and Conscientiousness (C). In the Big Five approach, Feist's (1998) meta-analysis revealed that scientists as compared to non-scientists are more open, more extraverted (confident-dominant) and more conscientious. Creative scientists as compared to less creative ones are more open, extraverted and less conscientious (higher expression of needs and higher psychopathic deviance subcomponents). The distinction in extraversion between more and less creative scientists applied only to the confidence-dominance subcomponent and not to the sociability component. In the Big Three personality model, Eysenck (1990) assumes the presence of three higher-order personality factors: Extraversion versus Introversion (E), Emotional stability versus Neuroticism, and Psychoticism versus Impulse control (P). In the Big Three approach, Feist (1998) found scientists as compared to non-scientists to be more extraverted and higher on psychoticism. Summarizing the Big Five and Big Three approach, Batey and Furnham (2006) consider that the profile of the scientific creator is characterized by low neuroticism (high ego-strength), low extraversion (high introversion), high openness, high conscientiousness and moderately high psychoticism (see Table 1).

Taken together, in the *between-group* perspective, as compared to non-scientists, scientists turned out to be (1) more conscientious, (2) more dominant, achievement oriented and driven, (3) more independent, introverted, and less sociable, and (4) more emotionally stable and impulse controlled (Feist & Gorman, 1998). Similarly, in the *within-group* perspective, eminent scientists in comparison to less eminent scientists were (1) more dominant, arrogant, self-confident, or hostile (social traits), (2) more

Table 1. Representation of typical profiles for creativity in different domains (Batey & Furnham, 2006, p. 409).

Trait	Artistic Creativity	Scientific Creativity	Everyday Creativity
Intelligence			
Fluid	+	+ + +	+
Crystallized	+ +	+ + +	+
Personality			
N	+ + +	- -	-
E	- -	-	+ +
O	+ + +	+ + +	+ +
A	- -	-	+
C	- -	+ + +	+
P	+ + +	+ +	+

Note. N = neuroticism; E = extraversion; O = openness to experience; A = agreeableness; C = conscientiousness; P = psychoticism. Positive and negative signs indicate the strength and the direction between the variables and range from - - - to + + +.

autonomous, independent, or introverted (social traits), (3) more driven, ambitious, or achievement oriented (nonsocial traits), and (4) more open and flexible in thought or behavior (nonsocial traits) (Feist, 1999; Feist & Gorman, 1998). Hence, according to Feist (1999), the distinction between more and less creative scientists lies in social as well as nonsocial traits. In the present research, the within-group perspective is adopted.

The higher *conscientiousness* of scientists as compared to non-scientists (Feist, 1998; Feist & Gorman, 1998) as well as the stated importance of conscientiousness for scientific creativity (Batey & Furnham, 2006; see Table 1) makes sense when considering the highly structured and systematized nature of scientific inquiry. However, in comparison to less creative scientists, creative scientists were found to be less conscientious (Feist, 1998). Hence, the actual influence of conscientiousness on scientific creativity is somehow ambiguous. Considering this fact, no assumption is presently made on the direction of the relationship between conscientiousness and scientific creativity in psychology.

Presently, the dominant, arrogant, self-confident, or hostile attitude of eminent scientists (Feist, 1999; Feist & Gorman, 1998) is referred to as *psychoticism* and *low agreeability*. Indeed, Eysenck (1993, 1995) describes individuals high on psychoticism as aggressive, cold, egocentric, impersonal, impulsive, antisocial, non-empathic and tough minded. Eysenck considers psychoticism as a normally distributed personality trait, which according to Batey and Furnham (2006) (see Table 1) intervenes significantly in scientific creativity just like low agreeableness. Even though, scientists in general tend to be more asocial and individualistic than the general population, these traits are even more pronounced in the scientific elite (Feist & Gorman, 1998). According to Simonton (2004), these behaviors can be related to their social and professional marginality. Not only do creative scientists often come from multicultural family backgrounds but they are also skilled in more than one scientific discipline. This indicates that switching between disciplines is not necessarily counterproductive. Simonton considers that the outside perspective permitted by marginality allows creative scientists to have some kind of naïve objectivity which simplifies the innovative combination of disseminated elements. Even though eminent psychologists were found to be more emotionally stable than eminent artists (Ludwig, 1995; Simonton, 2002), they

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

show still some tendencies towards psychopathology (Rushton, 1990). It follows that the influence of psychoticism and negative agreeability is hypothetically extended to scientific creativity in psychology.

The higher emotional stability and impulse control of scientists as compared to non-scientists (Feist & Gorman, 1998) is presently referred to as *ego-strength*. Indeed, according to Eysenck (1995) ego-strength is best conceptualized as emotional stability, which is the opposite on the neuroticism scale. Neuroticism, again, is assumed to have a negative impact on scientific creativity by Batey and Furnham (2006) (see Table 1). Presently, higher ego-strength is also considered to determine the driven, ambitious and achievement oriented behavior of the more creative scientists in comparison to the less creative ones (Feist, 1999; Feist & Gorman, 1998). According to Simonton (2013), creative psychologists share their comparably higher emotional stability with creative scientists. In this sense, a positive relationship between ego-strength and scientific creativity in psychology is expected.

In the present research, the autonomy, independence, introversion and low sociability of creative scientists (Feist, 1999; Feist & Gorman, 1998) are considered as *autonomy-related* personality features in reference to Oztunc (2011). Also creative psychologists embody a rather independent personality according to Simonton (2013). It follows that a positive relationship between autonomy and scientific creativity in psychology is expected.

Introversion and low sociability directly relate as well to Big Five *extraversion*, whose influence on scientific creativity is somewhat ambiguous. According to Batey and Furnham (2006) (see Table 1) extraversion plays a negative role in scientific creativity. However, especially when it comes to comparing scientists to non-scientists and more creative scientists to less creative scientists, results are incoherent. Whereas in Feist (1999) and Feist and Gorman (1998), introversion distinguished scientists from non-scientists and more creative scientists from less ones, in Feist (1998) scientists as compared to non-scientists and more creative as compared to less creative scientists distinguished themselves through comparatively higher extraversion. This latter finding however only referred to the confidence dimension (confident-dominant) and not to the sociability dimension. The relationship between extraversion and scientific creativity seems to vary according to the considered dimension (confidence/sociability). Regarding psychologists, the results are probably even more clear. Even if creative psychologists can be considered as introverted, they are still more extroverted than scientists from other disciplines (Cattell, 1963) and they lead more active and less conventional social lives, in regard to leisure activities and romantic relationships (Roe, 1953). Despite some ambiguities concerning the relationship between extraversion/introversion and scientific creativity, with reference to Simonton (2013), a positive association is expected between introversion and scientific creativity in psychology.

Openness and flexibility in thought and behavior of creative scientists (Feist, 1999; Feist & Gorman, 1998) are presently referred to as Big Five *openness to new experiences*. According to Batey and Furnham (2006) (see Table 1), openness has a domain transcendent importance for creativity. This anticipated domain general importance is extended to the subdomain of social sciences. Consequently, a positive correlation between openness and scientific creativity in psychology is expected.

Measurement of Scientific Creativity

Scientific creativity can be analysed as the ability to generate hypotheses, design experiments and proof of evidence. Before tests were available, scientific creativity of eminent scientists was sometimes measured through the number and importance of their publications. Today, specific tests are being developed for scientific creativity, but this remains rare. An example is the Creative Scientific Ability Test

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

(C-SAT) for 6 to 8 graders. The C-SAT consists of three dimensions of skills: general-creativity skills, science-related skills and skills in scientific sub-disciplines (Sak, 2010; Sak &Ayas, 2013). Presently, the Evaluation of Potential Creativity EPoC (Lubart, Besançon, & Barbot, 2011) is one of the few tests available for the assessment of scientific creativity in students and adolescents. This test specifies two aspects of the creative thinking process that are simultaneously assessed: divergent exploratory thinking (invention of multiple responses to one stimulus) and convergent integrative thinking (development of one single most creative response).

RESEARCH AIMS AND HYPOTHESES

The cognitive attributes and personality characteristics that are important for scientific creativity in psychology are the focus of the present research. Former studies investigated especially illustrious psychologists who were selected according to objective scientific outcomes (productivity and/or eminence) (Rushton, 1990; Simonton, 1988, 1994, 1999, 2002). The present study aims to extend these results to the typical social science student. As former scientific creativity tests focused solely on natural sciences, the development of a specific test for scientific creativity in psychology enlarges their domain of applicability to the social sciences. This test is a[2]n innovation in the sense that both divergent and convergent creative thinking are measured in the domain of scientific psychology. This allows investigating the creative profile in social science students, who do not yet have some kind of productivity rate. The above literature review leads to the following hypotheses.

1. *Intelligence* is expected to be a positive predictor of scientific creativity in psychology.
2. *Ego strength* is expected to be a positive predictor of scientific creativity in psychology.
3. *Introversion* is expected to be a positive predictor of scientific creativity in psychology.
4. *Openness* is expected to be a positive predictor of scientific creativity in psychology.
5. *Agreeableness* is expected to be a negative predictor of scientific creativity in psychology.
6. *Psychoticism* is expected to be a positive predictor of scientific creativity in psychology.
7. *Autonomy* is expected to be a positive predictor of scientific creativity in psychology.

METHODS

Participants

The sample of social science students included 121 participants (95 women, 24 men, $M_{Age} = 21.94$, $SD = 2.22$, age range: 19-32). The condition of participation was to be a student/graduate student in a social science discipline as well as mastering the German language. The majority were psychology students (87.6%), followed by students in education (7.4%) and students from various other social science disciplines (4.9%). The sample only included 4.13% postgraduate students (who had already acquired a Master's degree). Participants' mother tongue was German (47.1%), followed by Luxembourgish (34.7%), "Other" (13.2%) and French (5%).

Materials

In the present research a specific test for the measurement of scientific creativity in the domain of psychology was developed.

The development of the test for *scientific creativity* in psychology was strongly inspired by the EPoC (Lubart et al., 2011). Momentarily, the EPoC is applicable to three creative domains: verbal, graphic and scientific. The present test potentially enlarges its applicability to the sub-domain of social sciences and more specifically to psychology. Considering that divergent thinking alone is insufficient to measure creativity, convergent-integrative thinking is additionally taken into account. Divergent thinking was assessed by the invention of a maximum number of original and appropriate hypotheses regarding the link between "music style and personality". Convergent thinking was assessed by the invention of an ingenious psychological experiment to test one of the formerly-generated hypotheses. The rating of convergent thinking was inspired by the Consensual Assessment Technique (CAT) (Amabile, 1982, 1983). The experiments were rated by 3 independent expert judges on a 7-point Likert scale. There was no absolute criterion for the judgment; the proposed experiments were simply rated against each other. The order of presentation varied for each judge. Inter-rater reliability was.76 (Cronbach Alpha). The rating of convergent thinking was further subdivided into originality and usefulness (adaptation), with reference to the consensual creativity definition. The experiment did not only need to be original but also adapted to methodological requirements. It needed to satisfy methodological and ethical standards and to be empirically realizable.

In order to assess its convergent validity, general creative potential was measured by the Test for Creative Thinking-Drawing Production (TCT-DP) (Urban & Jellen, 1995). The TCT-DP was scored according to three different evaluation techniques that are outlined below. Lubart, Jacquet, Pacteau, and Caroff (2010) consider the *TCT-DP* as an essentially convergent-integrative measure of creative potential. According to Urban (2005), this constraint production task which is inspired by the "Gestalt" approach can be considered as culture fair. It was normed and validated in various countries and it is applicable to a variety of age and ability groups.

The traditional scoring method includes 14 criteria: continuations; completion; new elements; connections with a line; connections with a theme; boundary breaking -fragment-dependent; boundary breaking-fragment-independent; perspective; humor and affectivity; four kinds of unconventionality and speed. According to Urban (2005), these sub-scores taken separately do not meaningfully represent creativity because the "Gestalt" emerges from a synergy of individual elements. An inter-rater reliability of $\alpha = .98$ (Cronbach Alpha) was established for this scoring method in the present investigation. With reference to Lubart et al. (2010), the traditional scoring method of the TCT-DP is represented by two factor scores: the originality factor OF and the adaptation factor AF. The AF includes the number of new items added to the composition, contacts and thematic connections established between the initial graphic elements, use of unconventional, non-stereotyped content or graphic forms, creation of a humoristic or emotional atmosphere and the use of three-dimensional drawing techniques. The OF comprises the number of graphic elements used among the initial elements proposed as well as their meaningful use and the use of the element outside the frame.

In the present research, a second originality score was considered: Statistical Originality SO. It represents the statistical percentage of a given idea within the reference sample. According to Lubart et al. (2010), this score is very similar to the originality score calculated in divergent thinking tests. Thus, this adds a divergent thinking score to the overall convergent-integrative TCT-DP measure.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Finally, the third evaluation technique was inspired by the Consensual Assessment Technique (CAT) from Amabile (1982, 1983). With reference to Lubart et al. (2010), two suitable expert judges were asked to rate independently the creativity degree of the manufactured products on a 7-point scale, without receiving a prior definition of creativity. The random order of the presented drawings varied for every judge. The present inter-rater reliability (Cronbach Alpha) was $\alpha = .89$.

Intelligence was assessed in terms of logical reasoning and verbal fluency. Both scores were significantly correlated ($r = .27$, $p < .01$) and were added to yield an intelligence sum score. *Reasoning capacity* was assessed by the test of Evaluation of Logical Reasoning (B53) (Bonnardel, 1971). Inductive reasoning and spatial aptitudes are evaluated by means of non-verbal items, in which the test taker is requested to discover the logic behind a series of figures. Inductive reasoning is crucial for tasks of classification, learning, problem solving and creation. The internal consistency (Cronbach Alpha) in the present sample was $\alpha = .86$. *Verbal fluency* was assessed by the "Verbal Creativity Test" (Verbaler Kreativitätstest, VKT) from Schoppe (1975). In this test the initial letters of a word are provided. Participants have 90 seconds to find as many alternatives as possible to complement the initial letters. As two different word-beginnings are provided, the test takes 180 seconds to complete. This test was administered in German, as this was the mother tongue of the majority of participants. All invented words are acceptable as long as they are included in the German dictionary. They can either start in upper case or lower case letters and they can also include names. Foreign words are allowed as long as they have been adopted into the German language. Verbal fluency tests have at times been perceived as hybrid measures of fluid and crystallized intelligence (Lindenberger & Baltes, 1997; Salthouse, 1993).

Big Five personality was assessed through the BFI-10 (Rammstedt & John, 2007), a 10-item short version of the NEO-FFI. These 10 short statements are responded to on a five point Likert scale (1 = "disagree strongly" to 5 = "agree strongly"). There are respectively two items per Big Five dimension, which were chosen according to different criteria: (1) they meaningfully represent the opposites of every dimension, (2) they both grasp key aspects of every dimension, without being repetitive, (3) the chosen German and English items are identical, and finally (4) the item choice is based on the statistical criteria of item analyses and factor analyses. According to the authors, convergent validity as well as reliability of the scale is good (mean $\alpha = .75$).

In addition to the BFI-10, the entire dimension of *Openness to new experiences*, which includes 48 items, was assessed by the NEO-FFI (Costa & McCrae, 1992). The Openness dimension includes six different facets, which represent different spheres of experience towards which the participant can be more or less open. People high on openness are more curious towards inner and outer experiences, which become more vivid and enrich their lives. They have more intense emotions, more ingenious ideas, more unconventional values and they are more likely to question authority. Presently, the scale showed an internal consistency of $\alpha = .84$.

Autonomy was assessed by two different measurement tools, which showed a highly significant one-tailed inter-correlation ($r = .25$, $p < .01$) and were thus combined in form of a sum score. The "Trier Personality Inventory" (Trierer Persönlichkeitsfragebogen, TPF) is a 120-item questionnaire from Becker (1989). It grasps the two most important aspects of mental health and behavioural control, underlying a systemic model of personality. This model is based on theories, systemic reviews (Becker & Minsel, 1986), and factor analytic studies (Becker, 1995, 2000). Mental health is defined as the capacity to deal with external and internal psychological distress (Becker, 1989). The TPF is applicable in clinical settings and normed for adults between 18 and 80. An alpha coefficient of .78 was found in the present sample. The second autonomy scale was originally developed by Ibarra and Andrews (1993) and later adapted

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

by Dewett (2006). This scale captures the degree of management control in the working environment. The five-point Likert scale ranges from 1 (strongly disagree) to 5 (strongly agree). A Cronbach alpha coefficient of .74 was observed in the present sample.

Ego-strength was assessed by the Minnesota Multiphasic Personality Inventory (MMPI-2) (Hathaway & McKinley, 1996, 2000) through the subscale Ego-strength (Es). According to the authors, The Es-scale is a measure of adaptability, resilience, personal resources and effective life management. It stands as an indicator of general mental health, expressed by the capacity to deal with critical life situations and solve problems. People high on Es are spontaneous, have good contact to reality, a feeling of personal success and of physical health. In the present research, the scale had an internal consistency of $\alpha = .66$.

Psychoticism was assessed by the short form of the Eysenck Personality Questionnaire- Revised (EPQ-R) (H. J. Eysenck & Eysenck, 1992). It captures three major personality dimensions: Extraversion vs. Introversion, Neuroticism or "Emotionality", and Psychoticism or "Tough Mindedness". The term "Tough Mindedness" is preferred over Psychoticism, just to exclude any psychiatric assimilation. These people tend generally to be cruel, inhumane, socially indifferent, hostile, aggressive, insular, glacial, intolerant and non-considerate of danger. They tend to create distress in other people's lives through their lack of empathy, their condescending attitude and their troublemaking behavior. In the present research, the scale had an internal consistency of $\alpha = .60$.

Procedure

Data was collected by psychology students at the University of Luxembourg. The testing was individual or semi-collective. The tests and questionnaires took approximately one and a half hour to complete. First, the creativity test (TCT-DP) was administered, followed by the intelligence tests (Reasoning B53 and VCT), the scientific creativity test and the personality questionnaires (autonomy, Big Five, ego-strength and psychoticism). All participants were volunteers and were compensated for their participation with a little gadget and with the possibility to obtain feedback on their results.

RESULTS

Descriptive Statistics

Correlations and Regressions

Hypotheses will now be reconsidered separately:

1. *Intelligence* is expected to be a positive predictor of scientific creativity in psychology.
   This hypothesis was supported. Intelligence was a positive predictor of scientific creativity in psychology ($\beta = .18$, $p < .05$), especially convergent thinking ($\beta = .20$, $p < .05$) and originality ($\beta = .23$, $p < .05$).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Means and standard deviations for personality and cognitive creativity variables

Variables	*M*	*SD*	*Min*	*Max*
Scientific Creativity	13.91	3.79	3	26

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

2. *Ego strength* is expected to be a positive predictor of scientific creativity in psychology.
This hypothesis was not supported. Ego-strength was not a positive predictor of scientific creativity in psychology in either form of its measurement (see Table 3 and 5).

3. *Introversion* is expected to be a positive predictor of scientific creativity in psychology.
This hypothesis was not supported. Introversion was not a positive predictor of scientific creativity in psychology (see Table 3 and 5). There was even one positive correlation between scientific creativity (adaptation) and extraversion ($r = .16$, $p < .05$), which did not remain significant in multiple regressions.

4. *Openness* is expected to be a positive predictor of scientific creativity in psychology.
This hypothesis was supported. Openness was a significant predictor of scientific creativity in psychology, in form of adaptation ($\beta = .19$, $p < .05$).

5. *Agreeableness* is expected to be a negative predictor of scientific creativity in psychology.
This hypothesis was supported. Agreeableness was a negative predictor of scientific creativity in psychology, as measured through divergent thinking ($\beta = -.22$, $p < .05$).

6. *Psychoticism* is expected to be a positive predictor of scientific creativity in psychology.
This hypothesis was not supported. For scientific creativity in psychology psychoticism played no apparent role (see Table 3 and 5).

7. *Autonomy* is expected to be a positive predictor of scientific creativity in psychology.
This hypothesis was partially supported. Autonomy was not a significant predictor of scientific creativity in psychology in multiple regressions (see Table 5) but there was a positive correlation between autonomy and scientific creativity in psychology (adaptation) ($r = .18$, $p < .05$).

CONCLUSION

Concerning the convergent validity of the test developed to measure scientific creativity in psychology, correlations with drawing creativity scores (TCT-DP) were consecutively positive, even if they were rather low (see Table 4). It was especially the originality component of the invented psychological experiment (convergent thinking) that correlated with various scores of the TCT-DP. Indeed, the lower association with divergent scientific creativity could related to the fact that the TCT-DP is a convergent-integrative creativity test. Results would eventually be different by comparing divergent scientific thinking to a common divergent-focused thinking test. At this point it is important to highlight that even though the TCT-DP is a test about visual rendering it addresses global imaginary thinking processes that intervene in general creativity. In this sense more significant positive associations could have been expected. On the other hand, the positive association of scientific creativity task scores with different personality traits that are theoretically expected to be related to scientific creativity (openness and negative agreeableness), argue again in favor of its construct validity.

Intelligence (logical reasoning and verbal fluency) turned out to be the most important predictor of scientific creativity in psychology (see Table 5). This finding is not surprising and reconfirms the theoretical literature review of Batey and Furnham (2006) (see Table 1), according to which fluid and crystallized intelligence are essential for scientific creativity. It can be argued in reference to Mednick (1962) that for making creative research contributions, it is essential to have a large knowledge base stored in long term memory (crystallized intelligence), which needs to be used in an efficient and innovative way. This is where fluid intelligence intervenes. In the present case, intelligence was particularly

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

relevant for convergent thinking and originality. Indeed, for a long time, intelligence was assessed through convergent thinking tasks whereas creativity was essentially assessed through divergent thinking tasks, which according to Runco, Dow and Smith (2006) led to an overestimation of their difference. In this sense, the stronger relation between intelligence and convergent creative thinking is understandable. Also, the relationship between intelligence and originality is comprehensible if one considers that originality ("successful novelty") was at times considered as the core of the definition of intelligence (e.g., Gardner & Sternberg, 1994; Gregory, 1981; Spearman, 1927; Sternberg, 1985). Empirically, among the divergent thinking scores, originality was again found to have the strongest relationship with intelligence (Benedek, Franz, Heene, & Neubauer, 2012). However, according to the theory of successful intelligence (Sternberg, 2005), which includes the importance of flexible adaptation to changing situations, one could have expected a positive relationship to adaptation as well.

The present results revealed that openness was related to the adaptation of the psychological experiment to methodological constraints (see Table 5). This further corroborates the assumption that personality influences differently both aspects of creativity, which are originality and adaptation. However, the influence of openness on creativity does not seem to be necessarily predominant for the innovative aspect of a production, as hypothesized by Kwang et al. (2005). This is somewhat surprising because openness is considered as a basic exploratory tendency. Together with extraversion it belongs to the "Plasticity" dimension from De Young, Peterson, and Higgins (2002), which is closely linked to low latent inhibition (Peterson & Carson, 2000; Peterson, Smith, & Carson, 2002). In this sense, one could have expected openness to be more important for making original research contributions rather than adapted ones. However, depending on task demands, the role of openness seems to vary. Eventually, the higher cognitive flexibility that goes along with Plasticity may have enhanced the reactiveness to task constraints (adaptation). In any case, the importance of openness for scientific creativity confirmed further the domain general importance of openness for creativity. This supports not only the literature review of Batey and Furnham (2006) but also Feist's meta-analysis (1998) on the role of personality (openness) in different forms of creativity and more specifically in scientific creativity (Feist, 1999; Feist & Gorman, 1998).

Another personality trait that was relevant to scientific creativity was low agreeableness (see Table 5). It was important for generating a high number of creative hypotheses concerning the link between music style and personality. This means that creative social science students in this case were not particularly socially welcoming. This outcome seems intuitively plausible. It confirms the theoretical literature review of Batey and Furnham (2006) (see Table 1) and the empirically established low sociability or hostility of scientists in comparison to non-scientists and of creative scientists in comparison to less creative ones (Feist, 1999; Feist & Gorman, 1998). This outcome is also consistent with Feist's (1993) model, in which observer-rated hostility and an arrogant working style predicted scientific eminence. Presently, this result can be interpreted in the sense that less agreeable people can more easily overcome social barriers, which would normally hinder the invention of more unusual experiments. Indeed, disagreeable people would probably be more willing to put participants in unethical experimental conditions in order to test uncommon hypotheses. It is true that some kind of experimental designs can push the limit of moral considerations. Less agreeable people might also think less in stereotypes because in the end the link between music and personality is quite stereotype loaded.

Taken together, the creative social science student is characterized by intelligence and openness but nevertheless is somewhat disagreeable. Considering the fact that none of the above hypotheses was clearly contradicted, it can be concluded that the profile of creative social science students is coherent with the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

one of outstanding psychologists (Simonton, 2002, 2013) and that the creative profile in social sciences stays in line with the creative profile in "hard" sciences (see Table 1). However, the established profile distinguished itself slightly from the expected one, in the sense that ego-strength, introversion, psychoticism and autonomy were less involved in the scientific creative process than expected. One explanation for these discrepant results could be that the present sample did not include outstanding psychologists in contrast to former research (Simonton, 2002, 2013).

However, the meta-analysis from Feist (1998) did also include students from the social sciences (i.e., psychology) and revealed higher psychoticism on the EPQ in scientists versus non-scientists as well as higher Achievement via Independence on the California Personality Inventory (CPI) in scientists versus non-scientists and in creative scientists versus less creative scientists. The present results can seem surprising if one considers the fact that theoretically speaking the lack of empathy which accompanies psychopathological tendencies could be fruitful for inventing outlying hypotheses and unusual circumstances to test them. In the same vein, one could have imagined that autonomy and the related independence intervene in the capacity to invent creative hypotheses and research ideas in psychology. It is nevertheless understandable that the aggressiveness, hostility and ego-centricity, along with high psychoticism, are even more pronounced in creative professional psychologists (especially researchers) than in creative social science students. One could argue that exactly those specific features help creative psychologists to reach the status of eminence. The same assumption could be made about the various autonomy-related personality features and ego-strength. In outstanding psychologists, pronounced emotional stability (ego-strength) seems unavoidable in order to counterbalance the lack of impulse control (psychoticism). Indeed, it was especially found in eminent creators that both tendencies (psychoticism and ego-strength) occurred (Eysenck, 1995; Post, 1994). This unusual combination of traits did not, however, extend to creative social science students.

Regarding the fact that previous results concerning introversion/extraversion in scientists/psychologists were ambiguous, the present finding is not particularly surprising. One could conclude that the introversion/extraversion dimension does not play such a prominent role for scientific creativity. Apparently, it is possible to be a creative natural or social scientist without having the tendency to regularly withdraw from social situations. It could be argued that especially in the science discipline a healthy amount of interaction among researchers/professionals is fruitful for creative scientific contributions. This could be referred to the necessary perspective taking emphasized in constructivist theories (Järvelä & Häkkinen, 2002).

IMPLICATIONS FOR HIGHER EDUCATION FOR CREATIVE PSYCHOLOGISTS

"Without great solitude, no serious work is possible" (Picasso as cited in Cain, 2013).

Many scholars in the domain of creativity and education have developed ideas for fostering creativity in schools. Approaches vary from political and organizational ones to suggestions for changing curricula, and teacher training. Cropley (2015) for example outlines detailed strategies for designing engineering curricula. He explains that there is however another hurdle to overcome. There is a movement from generic to general learning. The constructivist approach of contextualized or generalized learning has replaced generic or decontextualized learning. Only decontextualized learning however allows the deduction of principles and applying problem-solving rules in other contexts. The learning of generic skills needed for creativity is therefore at risk. Results are students with 'pseudo expertise' according

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

to Sternberg (2003), using routinely procedural knowledge but not adaptive expertise. Sternberg (2015) states also that we are still far away from our goals, because it is the experts themselves of various fields who should first integrate and accept the knowledge on teaching for creativity, which is the hardest to achieve. Interestingly, few approaches actually describe the students themselves, other than viewing them as learning objects, and their role in the changes needed. Overall it seems that there are yet many difficulties to overcome at all levels of higher education, before creativity is an evident ingredient. According to Sternberg (2015), a university-wide belief is needed. All leaders and adults that make up the university should be convinced of a needed change and the collaboration of all parties is the aim.

Today, collaboration is also identified as an important skill for the 21st century. According to the Partnership for 21st Century Learning (P21, 2010), it is important to prepare students among other skills to become good communicators and collaborators as well as creative problem solvers. Sawyer states this as well (2012, p. 212): "today more than ever, the most important forms of creativity are" for example "big science experiments" with "cooperative activities of complex networks of skilled individuals."

The collaboration and creativity skills needed for the working world put creative collaboration in higher education at the forefront as well. This again fosters the socio-cultural research that emphasizes the collaborative character of creativity. Within this theory, individual creativity is sometimes described as outdated.

There are however contradictory results as to whether collaboration in science is at all beneficial for creativity. The results vary also with the approach taken. Gorman, Gorman, Latta, and Cunningham (1984) found with experimental methods that interacting scientists did as well on tests as the best individual of the group. Taggar (2002) found that a group with high-creativity team members depended on having high "team creativity-relevant processes". If this was not the case, the effect of the high-creativity members was neutralized.

From a socio-cultural approach, collaboration is by definition beneficial because creative achievements are seen as collaborative by nature. Within this approach, interactions of students are often analyzed. Miell and Littleton (2004) describe, for example, how collaboration enhances identity development through interpersonal connection, reflection, flexibility and motivation.

Again highlighting the possible disadvantages of collaboration, challenges have been researched in terms of personality clashes (Nolan, 1978), competition (Johnson & Johnson, 1989) and control issues (Pritzker & Runco, 1997). Feist (2006) comments that it is important that labor is divided amongst individuals with different skills. Sawyer, who views creativity as predominantly collaborative, nevertheless states (2012, p. 210): "creativity doesn't exist without the individual". According to Glaveanu (2014, p. 27): "…the cultural psychological approach is only one among other valid approaches to creativity and our task is to consider how to put these perspectives into dialogue". Clearly, an integration of the individual and socio-cultural approaches is needed.

The focus on individual personality in this study confirmed earlier findings that creative scientists exhibit openness. This personality trait can be seen as positive for collaborative learning.

Interestingly however, some of the typical personality traits found in creative scientists do not seem the most suited for collaborative study or work. For example, disagreeableness, also found in this study as significantly related to creativity, means that very creative individuals are sometimes unfriendly, suspicious, skeptical, and more likely to compete than to cooperate.

According to Feist (2006) creative scientists are also rather dominant and Eysenck (1993, 1995) cites psychoticism as another personality trait. Batey and Furnham (2006) find creative scientists to be – amongst other traits – independent. The creative scientist seems made to work naturally on their own

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

according to these findings. This is sometimes confirmed by quotes from eminent creative personalities. Physicist Albert Einstein (as cited in Calaprice, 2011) for example said that "the monotony and solitude of a quiet life stimulates the creative mind." However, scientists are also sometimes known to collaborate closely. Research by Mc Donalds, Miell and Morgan (2000) maybe clarifies this. They found that friends working together create better results than non-friends. So working together with friends might be even more important for creative scientists to overcome personality difficulties.

Another issue for which this study adds to our knowledge concerns teaching. Research shows that although teachers state that they value creative students (Feldhusen & Treffinger, 1975), in reality teachers sometimes discourage or show that they dislike students who display creative characteristics such as originality and desire for novelty (Cropley, 2001). Objective information about creative students might enhance understanding and acceptance of students by teachers. Teachers are empowered to make more knowledge-based decisions concerning creative work in classrooms.

Hennessey (2015) stresses the importance of intrinsic motivation in education. From a sociocultural perspective also Miell and Littleton (2004) explain how intrinsic motivation is strengthened through collaboration. The importance of intrinsic motivation may guide us to where a change towards creative scientific education could be initiated. Students might themselves become informed and empowered concerning creative personalities. It might be that an understanding of creative personalities encourages a creative attitude. Especially for high creative students, self-knowledge and acceptance of their personalities might fuel individual intrinsic motivation for creative thinking, indirectly benefiting collaborative work, and vice versa. For example, knowing that to be open helps to be creative might foster this attitude in students.

In summary, the demand for cooperative and at the same time innovative skills for the 21st century might be unattainable if one considers that solitude is also needed for creativity. According to the findings of this study, very creative people should also favor individual time. Hence, individual as well as collaborative scientific creativity should become part of higher education.

KEY TERMS AND DEFINITIONS

Agreeableness: "The quality of one's interpersonal orientation along a continuum from compassion to antagonism in thoughts, feelings and actions" (Costa & McCrae, 1985, p. 2).

Intelligence: "The ability to achieve one's goals in life, within one's sociocultural context" (Sternberg, 2005, p. 189).

Intrinsic Motivation: "Intrinsic task motivation is passion: the motivation to undertake a task or solve a problem because it is interesting, involving, personally challenging, or satisfying – rather than undertaking it out of the extrinsic motivation arising from contracted-for rewards, surveillance, competition, evaluation, or requirements to do something in a certain way" (Amabile, 2012, p. 3).

Openness: Sensitivity towards fantasy, feelings, aesthetics, ideas, actions and values (McCrae, 1987).

Scientific Creativity: The capacity to have novel-original and useful-adaptive ideas in the domain of natural and social sciences (Feist, 1998).

Chapter 10
The Role of Critical Theory in the Development of Multicultural Psychology and Counseling

Joseph C. Chen
DePaul University, USA

ABSTRACT

The discipline of psychology has historically been based upon Western, Eurocentric perspectives on human behavior. Critical theory has played a central role in pushing psychology out from its insularity and perceived objectivity. This chapter examines the role of critical pedagogist Paolo Freire and liberation psychologist Ignacio Martín-Baró in the shaping of a multicultural perspective within psychology that has revolutionized the way that psychologists understand and treat mental health conditions. Freire and Martín-Baró gave voice to the marginalized and disenfranchised and pushed psychologists to engage in their own conscientization of their history and complicitness in perpetuating oppression. Implications of their work are examined in light of their contributions to theoretical underpinnings, clinical diagnosis, and treatment approaches.

INTRODUCTION

A cursory review of human history is littered with examples of oppression and the resultant cycles of suffering and conflict. A significant, though minimally researched, consequence of oppressive cycles is harm to mental health. In this chapter, I examine the detrimental impact of oppression on mental health and the instrumental role of critical theory in the development of what is known as the "fourth force" and the "fifth force" in applied psychology, multiculturalism and social justice, respectively. These forces ushered in a new psychological era of understanding human behavior and mental health out from its historically individualistic focus to a more systemically and culturally-inclusive perspective that emi-

nently placed culture and sociopolitical oppression at the heart of mental health for persons of color, and championed advocacy and social action as a means toward improved mental health.

Especially influential in the development of a multicultural and social justice perspective within psychology was the sociopolitical contexts of Latin America in the twentieth century, the genesis of the work of critical pedagogist, Paolo Freire, and liberation psychologist, Ignacio Martín-Baró. Their work centrally placed the role of oppression as the backbone in conceptualizing mental health treatment by setting the foundational stage to challenge hegemonic bases of the traditional theories and schools of psychological thought; Eurocentric views of human behavior, the origins of modern psychology, were being perceived as ineffective and potentially harmful to patients of color. Critical psychologists' main argument against dominant views of Western psychology was that mental health cannot be simply viewed through a strictly individually-based condition, and that improved mental health in patients of color, in particular, must include a recognition of systemic and institutional biases that perpetuate oppressed mindsets that manifest in psychological phenomena such as internalized racism and stereotype threat. Furthermore, critical psychologists argued that improved mental health and emotional healing are inextricably linked to engaging in social action that confronts systemic injustice. This was a revolutionary paradigm shift as it upended traditional psychological perspectives of understanding human behavior, which heavily preferred both study and treatment of mental health decontextualized from the social world. Freire's conscientization was vital in ushering in the multicultural movement because the nature of his educational process involved components that mirrored the psychotherapy process: an internal transformation of the mind that fundamentally changes and alters a person's behavior and course of life. Conscientization provided a useful tool that bolstered Martín-Baró's spirited arguments against Western psychology through an unexpected pathway: to free psychologists' hegemonic views (i.e., the oppressors) by means of participatory research in understanding and validating the perpsectives of those oppressed. Martín-Baró forced an introspection within Western psychology that has upended generations of thinking on the foundations of mental health, and his work is the disciplinary bridge that has helped connect critical theory to the multicultural and social justice movement in psychology.

Oppression

Oppression is the systematic mistreatment, exploitation, and lowering in status of a group (or groups) by another group (or groups) (Charlton, 1998). It occurs when a group holds power over others in society by maintaining control of social institutions, and society's laws, rules, and norms. The dominant group subordinates the oppressed group via both "political, external, and corporal means and also through imbuing internalized, psychological devaluation of self" (Prilleltensky & Gonick, 1996, p. 30). Oppression functions at multiple levels of interactions including intrapersonal (e.g., internationalized racism), interpersonal (e.g., abuse and threats), social (e.g., dehumanizing of a group), state (e.g., institutional racism, structural inequalities), and international (e.g., exploitation of impoverished nations, world order agendas) (Holmes, Facemire, & DeFonseca, 2016). While oppression is often thought of in terms of race and culture, it also includes situations involving sex, sexual orientation, socioeconomic status, religion, and age.

The origins of oppression can be traced back about 12,000 years ago at a crucial juncture of human survival and ingenuity (Deutsch, 2006; Harvey, 1999). Humans have historically been hunters and gatherers for their survival, and life revolved around the main priority of finding and obtaining food. Individual roles within a group were all related to the pursuit of food and nourishment. However, as the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

human population grew, humans needed different and better ways of obtaining food – it was increasingly difficult to efficiently move larger groups of people. This need resulted in the development of agriculture and animal husbandry (Deutsch, 2006). These two technological advancements allowed for the accumulation of food surplus, which revolutionized the concept of time for civilization. Daily efforts at obtaining food, which had been the dominant and most time-consuming activity for survival, were no longer necessary. However, the ability to store and gain surpluses of food resulted in two consequences: 1) differentiation within specific groups and 2) warfare between different groups (Gil, 1998).

The surplus of food meant that not everyone in a group needed to be involved with the obtainment or production of food. Therefore, new roles in groups emerged that were non-food production related. Whereas group roles and heirachies were rather flat prior to agriculture and animal husbandry, because each individual was needed for food attainment, these two technological developments allowed for the development of social heirarchies and the differentiation of importance and power; members of groups were valued differently. Those who were more effective at creating food surplus were more likely perceived as more valuable whereas those who struggled with it were perceived as less valued or capable, and they subsequently became dependent on those who were more successful. Social dominance allowed for specific individuals to exert control over others, and those who were not as effective at food production either developed skills or abilities that were valued (outside of food production) or they could not develop valued abilities and were perceived as undeserving of certain privileges or were outrightly disregarded. Outside the group, conflict began as different groups began jockeying for power and resources, and stronger groups would conquer the weaker groups, resulting in more levels of inequality and hierarchy, within and between groups. Oppression can be understood as the result of competition and attainment of resources.

Oppression and Mental Health

The World Health Organization estimates that 1 out of every 4 people in the world will experience a mental health concern at least once in their lifetime, and that 40% of all worldwide diseases are psychiatric in nature (Kastrup & Ramos, 2007). Mental health issues are disproportionately observed in low-income countries where the general population is more likely to experience wider levels of power differentials and where access to any type of resources is limited (Seponski, Lewis, & Megginson, 2014). To combat worldwide mental health concerns, members of the Grand Challenges in Global Mental Health consortium through the National Institutes of Mental Health identified four themes related to addressing global mental health. One of the themes, "understand environmental influences on risk and resilience for mental, neurological, and substance use disorders", was borne out of the recognition of the effects of poverty and war, both interrelated to oppression, on mental health (Collins, Patel, Joestl, March, Insel, & Daar, 2011). The importance of this theme should not be understated: the recognition that situational and contextual factors play a vital role in mental health had not always been recognized. In fact, ignorance related to the power of these external forces has played a role in victim-blaming (Ivey & Collins, 2003), which causes further trauma and decreases the likelihood of treatment-seeking or even treatment access.

The recognition that transnational oppression impacts mental health can be traced back to the French psychiatrist, Frantz Fanon in the 1960s, who posited that social events such as colonialism and genocide had direct impact on individual mental health (Fanon, 1961, 1964; Kira, Alawneh, Aboumediene, Lewandowski, & Laddis, 2014). However, given the individualistic medical model foundations of psychology at that time, examining the relationships between sociopolitical situations, such as displacement

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and conflict, with mental health has not been adequately examined; psychology simply did not have the lens, or interest, in which to understand external forces on internal experiences. The medical model of mental health assumes that all illness and pathology are rooted in physical and organic causes (Laing, 1971). For example, depression in this model is understood as a neurological condition in which either the balance of certain neurotransmitters is disrupted or suboptimal (e.g., serotonin imbalance) or there is the presence of deficits/damage to certain brain areas that regulate mood (e.g., the limbic system). Therefore, any mental health concerns in the medical model assumes dysfunction or deficits within the individual. While this view is technically correct (i.e., something is likely "wrong" in the individual), it vastly misses the larger picture, mainly, any knowledge into the cause or origins of the physical ailments.

The medical model perspective within psychology has been influential in the development of the stress-coping paradigm of mental health treatment (Lazarus, 1966; Lazarus & Folkman, 1984), a dominant perspective that represents a more remedial perspective on treatment (i.e., ways to cope). This model recognizes that in the presence of any sort of stress, the path toward healing is healthy ways of coping, mainly through an individualistic cognitive appraisal of the stressor. While it recognizes causality between stress and the need for effective ways to cope, the model has historically ignored how stress is formed or transmitted. Instead, the focus is on individual ways of best managing symptoms including interventions such as deep breathing, exercise, positive visual imagery, and thought replacement. While this may provide temporary relief, it is ineffective when the cause of stress continues to be prevalent (Folkman, 2010). The stress-coping paradigm is akin to treating a splinter. While patients may obtain partial relief from medications, ointments, and meditative practices, their ability to fully heal is limited without the actual acknowledgement and removal of the splinter. Within psychological treatment, the lack of acknowledgement and removal of societal "splinters" results in, at best, temporal relief. The cause of the mental health symptoms is still present.

Evidence for Conceptualizing Oppression as Psychological Trauma

Posttraumatic Stress Disorder (PTSD) is a psychological condition consisting of a body of symptomology that results from experiencing or witnessing a traumatic event (American Psychiatric Association, 2013). Symptomology can vary from person to person but generally consists of intense and disturbing thoughts and feelings that persists long after the traumatic event has ended. A diagnosis of PTSD requires the presence of symptomology within each of the seven sets of criterion. The individualistic medical model perspective has had a significant impact on the diagnostic conceptualization of post-traumatic stress disorder as evidence in Criterion A, which sets the definition for trauma (Holmes, Facemire, & DaFonseca, 2016). Criterion A is diagnostically met when one of four options for experiencing trauma is met: 1) direct exposure, 2) witnessing the trauma (live), 3) indirectly, by learning that a close relative or friend was exposed, or 4) indirect exposure to aversive events, usually in the course of professional duty (such as first responders working a scene of an accident).

Based on Criterion A, the current clinical definition and diagnostic criteria for PTSD has been criticized (Kira, 2001; Kira, Smith, Lewandowski, & Templin, 2010) on three levels. First, the criteria's focus on specific traumas limits the full understanding of trauma dynamics and influences. The criteria's narrow definition is physically-focused and requires "individual exposure to actual or threatened death, serious injury, or sexual violence" (APA, 2014). Second, by definition, the diagnostic criteria are past-focused and usually in regards to a single event, which precludes any clinical recognition or treatment for those undergoing current trauma (i.e., these situations do not "exist" as trauma). Third, the individual focus

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

of treatment ignores systemic issues, which can result in victim-blaming as well as hopelessness resulting from the belief that the system cannot change. The strongest criticisms of the current definition and diagnostic criteria of trauma is that it separates trauma from culture, oppression, and racial stressors (Gilfus, 1999; Miller 2009). Individual-level understanding of trauma that ignores group-level origins is insufficient (Kira, Ashby, Lewandowski, Alawneh, Mohanesh, & Odenat, 2013). Ignoring systemic issues in defining trauma and its diagnosis has significant ramification for treatment. If patients of color do not meet the narrow criteria (especially Criteria A), they cannot receive the diagnosis, which means that any treatment services are not deemed a medical necessity, and insurance will not pay for services that are not medically diagnosable. Gilfus (1999) stated, "if we decontextualize trauma from culture and oppression, we miss potential sources of inquiry" (p. 1244). Therapy and attempts at improving mental health without understanding potential oppressive and sociopolitical contexts are insufficient.

A small but growing body of research is demonstrating a link between oppression-related trauma and mental health outcomes (Alesssi, Martin, Gyamerah, & Meyer, 2013; Holmes, Facemire, & DaFronseca, 2016; Pieterse, Carter, Evans, & Walters, 2010), with particular emphasis on subclinical criterion. Insidious trauma is defined as lower-level harmful events that occur throughout a lifetime and is inextricably linked to identity (Brown, 2013; Watson, DeBlaere, Langrehr, Zelaya, & Flores, 2016). Insidious trauma is directed at marginalized identities by those in positions of power and dominance and is manifested through phenomena such as racism, discrimination, and objectification (Root, 1992, 2001). Therefore, insidious trauma can also be understood as identity-based traumas that are experienced due to one's phenotypical or genotypical membership within certain groups. These types of trauma do not meet diagnostic criteria A; however, there is evidence that these experiences have a detrimental impact on mental health.

Overall, people of color and marginalized groups tend to experience PTSD at higher rates compared to their white counterparts (Carter, 2007; Holmes, Facemire, & DaFronseca, 2016). For example, race-related stressors within Asian American Vietnam veterans explained 20% of the variance in PTSD symptoms while controlling for variance explained by combat exposure (Loo et al., 2001). Experiences of racial/ethnic discrimination were related to PTSD within a sample of Mexican American adolescents symptoms 6 months and one year after incident exposure (Cheng & Mallinckrodt, 2015; Flores, Tschann, Dimas, Pasch, & de Groat, 2010). Discrimination uniquely explain trauma-related variance for African American college students, and both racial climate and discrimination uniquely explained trauma-related variance in Asian/Asian American college students (Pieterse et al., 2010). Hate crime victimization and heterosexist hate crimes predicted unique trauma variances up to 24% (Banderman & Szymanski, 2014; Szymanski & Balsam, 2011).

In research on gender and women, women are more likely than men to experience trauma symptoms (13% to 6.2%) despite the fact that they are less likely to report the type of symptoms as currently clinically conceptualized (Breslau, Kessler, Chilcoat, Schultz, Davis, & Andreski, 1998). The extent to which women experienced sexism in their lifetime and in the past year predicted 11% and 18%, respectively, of variance in PTSD symptoms (Berg, 2006). Sadly, 100% of the sample of 382 women in this study reported experiencing some sort of sexist behavior. Gender discrimination in refugee women predicted suicidality, psychosis/dissociation, depression/anxiety (Kira, Smith, Lewandowski, & Templin, 2010).

Research shows a strong correlation between various forms of oppression-related trauma experiences and symptoms of PTSD, even though these experiences do not meet the formal diagnostic definition of trauma. These oppression-related trauma experiences can be grouped into three distinct categories.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Internalization Processes

This is a process of assuming negative messages and beliefs, and experiencing the subsequent emotions about an aspect of one's self-identity, which can include factors such as race/ethnicity, sexual orientation, or gender identity (Holmes, Facemire, & DaFonseca, 2016). A specific example is sexual objectification, which occurs when women learn to value their worth based upon being sexual objects due to consistent external messages as well as unwanted attention and advances from others (Frederickson & Roberts, 1997). Objectification has been linked to disordered eating (Tiggeman & Williams, 2012; Tylka & Hill, 2004) and depression (Jones & Griffiths, 2015). Another form of internalization is stereotype threat, which occurs when individual are or feel they are at risk of conforming to stereotypes about their social group membership (Shih, Pittensky, & Ho, 2011). Stereotype threat has been linked to academic underachievement in African American college students (Steele & Aronson, 1995), underachievement in women chess players (Maass, D'Ettole, & Cadinu, 2008), and depression in children of color (Greene, Tullet, & Pahl, 2006).

Microaggressions

Microaggressions are subtle, non-direct forms of racial bias directed toward individuals of marginalized groups that are often unintended but are posited to occur at an unconscious level (Sue et al., 2007). These behaviors are interpersonal in nature and are often covert and implicit rather than overt and explicit, as opposed to racist behaviors, which are overt and intentional. Oftentimes, the perpetrator is not aware of oppressive nature of their microaggressive statements, though they are noticed by the individual to whom it was directed. Exposure to microaggressions is significantly correlated with depression and negative affect across all populations of color (Nadal, Griffin, Wong, Hamit, & Rasmus, 2014; Rivera, Forquer, & Rangel, 2010; Sue, Capodilupo, & Holder, 2008), and common difficulties include distress and uncertainty related to how to respond in these situations.

Sociopolitical Conflict

People groups are often displaced in the context of state-level oppression resulting from war and conflict (Mowafi, 2011). While the literature on refugee mental health is scant, a common ailment is somatization (Okasha, 2003; Choueiry & Khawaja, 2006) especially among those whose cultures stigmatize mental health. A Lebanese World Health Organization (WHO) Mental Health Survey revealed that 17% of displaced adult respondents reported at least 1 DSM disorder. Similarly, the 2009 Iraq Mental Health Survey revealed that 17% of adults suffered a mental disorder with significant portion of documented cases starting with the 2003 Iraq war (WHO, 2009). A WHO World Mental Health Study on war-related revealed trauma that being displaced resulted in a 37.7% risk of a DSM disorder compared to other traumas.

The preponderance of data showing a relationship between oppression-related trauma and mental health has forced psychology to affirm its impact. The journey to this point, though, needed a boost from the outside. Psychology, like any other discipline, is not immuned to sanctifying its original philosophies. Founding theorists and researchers are often deified, and challenging disciplinary foundations can be wrought with professional and reputational consequences. The worldwide sociopolitical movements of the 1960s and 70s helped to shepherd a time of critical psychology that changed the trajectory of the discipline.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Toward a Critical and Multicultural Psychology

Psychology has criticized itself for celebrating diversity but ignoring injustice and inequality (Fox, Prilleltensky, & Austin, 2009; Martin-Baro, 1994). It has historically focused on self-determinism and well-being with little-to-no attention paid to social justice and democratic participation (Fox, 2003; Fox & Prilleltensky, 1997). It has audaciously assumed that psychological interventions have enough power to overcome systematic inequality such as employment discrimination or health disparities. The result is the tendency to blame patients when the interventions do not work or if patients continue to report significant symptoms.

In the late 1960s, George Albee, a prevention-focused psychologist, stated that psychotherapeutic approaches, rooted in the medical model, generally ignored the emotional consequences of living in an unjust world. (Smith, Chambers, & Bratini, 2009). He would later assert that many mental health conditions are actually better understood in light of factors associated with oppression, such as poverty, racism, and other forms of prejudice (Albee, 1996). Other psychologists at the time were beginning to question and challenge some of the basic tenets of psychological philosophy (Albee, 1982; Ivey, 1971, 1973; Sue & Sue, 2016). Many of these tenets were tied to the dominant culture from which they were derived (i.e., Western European, White American) and were not frequently questioned. Especially unnerving to the psychotherapy community was the notion that clinicians, trained in dominant, Western-based perspectives of mental health, were unwittingly engaging in oppressive practices with their patients of color (Ivey, 1973). There were very few psychologists of color during this time period, and examining a patient of color's cultural background and experience was not a part of clinical practice. The realization that therapists could potentially transmit society's oppressive values due to lack of cultural knowledge began to concern a good number of psychologists, and the notion that *cultural blindness* passively perpetuated the notion that race and culture were insignificant factors began to reach a level of urgency (Sue, 1978). American psychologists were experiencing a "crisis of confidence" (Pander, 1997) triggered by the sociopolitical situation in the U.S. as well as around the world. Psychologists challenged themselves to consider how their own assumptions, biases, and general blindness to issues of race and class may contribute to oppression and mental health (Fox, 2003). Critical theory provided a needed avenue to help understand the hegemony of psychological philosophy.

Critical Theory

Broadly speaking, critical theory provides the foundation for social inquiry aimed at reducing domination (i.e., oppression) and increasing freedom for all. Critical theory is contrasted with traditional theory in that it acts as a "liberating…influence" to free all human beings and "emancipation from slavery" (Horkheimer, 1972, p. 246). Traditional theory is perceived as the dominant, hegemonic way of thinking of behaving, which is constructed by and developed from the perspective of the dominant culture. Thus, traditional theory works in service of only part of the population within any society. Critical theory challenges traditional theory by following through three criteria: explanatory, practical, and normative, meaning that it must explain the ills of current society, identify the means with which to change it, and provide norms and guidelines in which to achieve change in order to develop a society that is open to all people, not just those in dominance positions (Bohman, 1991; Horkheimer, 1993). Critical theorists identified both explicit and implicit rules and norms. Explicit rules are public and consciously known and manifests through overt displays such as laws and institutional structures. Implicit rules are implied

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and not necessarily conscious such as internal bias of preferences. The goal, therefore, of critical theory is to challenge the traditional, dominant way of thinking in the way that it oppresses others, and work towards a way for all humans to obtain freedom. With roots in German philosophy and Marxist thought, it has provided a broad basis for social movements throughout the world.

For psychologists, critical theory is attractive because its appeal lies in two interrelated functions: 1) the challenging of hegemonic assumptions, beliefs, and ways of being, and 2) the natural progression toward changing them. As an action-oriented theory, it provides avenues to apply its tenets. While critical theory has generally been discussed and studied in the broad realm of social groups and dynamics, it has served as a vital conduit for individual transformations within psychotherapeutic settings. At its heart, critical theory aims to make change at a societal level, and in order to do so, an internal process of change must also occur. This internal process is of particular importance to psychologists as it helps provide a framework for mental health treatment. Critical theorists emphasize the need to examine oppression, abuse of power, exploitation, and institutional and systemic bias as the basis for inequality in learning; understanding social environmental factors reveals the intersection between individual social roles and societal norms. Multicultural psychology was heavily influenced by liberation theorists in Latin America (Duran, Firehammer, & Gonzalez, 2008) because they provided a concept that aligned with psychological thought and they directly and unapologetically confronted the hegemony of Western psychology.

Paolo Freire's Critical Pedagogy

Freire, influential critical pedagogist, was born middle class in Brazil. However, due to some challenges in his family, he spent a significant amount of time in poverty. These experiences greatly shaped him where he learned that it was difficult to engage in study and learning if one is hungry. These experiences also helped him understand the plight of the poor, and the impact of poverty and oppression on their future chances at life. Though trained in law, he spent his career teaching in secondary schools and working with the poor in Brazil. Freire (1972) viewed education as a primary means for social change, and he believed that education is inherently political to be used as either tools of oppression or freedom. Three aspects of his work are particularly salient to the development of multicultural psychology.

Banking Model of Education

Freire described this as a model where the teacher fills the student with knowledge, as one would fill an empty vessel. He challenged this notion and described it through the lens of oppression, where the person in power is transmitting oppressive, dominant knowledge into the passive learner. He argued that because traditional education is based on the worldview of the oppressors (i.e., the dominant ideology), learning through this modality reinforces a colonialist mindset, where the dominant ideology is poured into the oppressed – they are learning through the perspective of the oppressor, which continues the cycle of oppression (i.e., a sort of self-oppression). To Freire, individuals need to take an active role in their learning, recognizing how their experiences are directly tied to the dominant ideology-influenced and -reinforced social context, and then work toward their individual and collective liberation. The goal is to develop critical awareness (i.e., conscientization), which paves the road for action. Taking action to fight oppression allows for individuals to discover learning that is relevant and appropriate to their own life situations (i.e., discover agency).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

This approach acknowledges that learning is not "neutral" (Belanger, 2003, p. 81) but contextually and individually laden with subjective bias. Freire borrowed from John Dewey, influential educational psychologist, who stated "the belief that all genuine education comes about through experience does not mean that all experiences are genuinely or equally educative…any experience is mis-educative that has the effect of arresting or distorting the growth of further experience" (1938, p. 25). Mis-educative experiences (i.e., actual problematic content learning or negative learning experiences) must first be identified. Exposure and engagement with mis-educative experiences results in a disempowering false reality; they are oppressive, and their examination, through critical reflection, is a necessary part of learning. Emancipatory learning "frees people from personal, institutional, or environmental forces that prevent them from seeing new directions, from gaining control of their lives, their society and their world" (Apps, 1985, p. 151). Because knowledge can be socially constructed (Haggis, 2003), individuals are encouraged to understand contributing hegemonic social factors, and ultimately work toward dismantling them.

The passive transmission of knowledge is actually an insidious medium to keep people oppressed by teaching values and norms detrimental to oppressed population because it perpetuates a *culture of silence*. The banking model pre-assumes hierarchy and reinforces the passive role of those in disadvantaged and marginalized social positions, and this culture keep people oppressed through their silence and developmental stagnation and instills both a negative self-image as well as sense of hopelessness. Freire realized that peasants' lethargy and ignorance were a result of being politically, socially, and economically dominated, and this type of domination breeds helplessness and social and political silence.

Conscientization

Also known as critical consciousness, conscientization aims to "intervene in reality in order to change it" (Freire, 1972). Social change cannot occur until people become aware of the systemic realities of injustice and oppression. Because many of the people Freire worked with were either illiterate or limited in their reading and writing abilities, he taught reading by helping his learners first access their own experiences through identifying themes in their stories (Ivey & Collins, 2003). He encouraged the use of all modalities in the construction of their stories and helped the learners with identifying key words that encapsulated their experiences and the contexts surrounding them. Once thematic words were discovered, he encouraged his learners to reflect upon their meaning and significance given the context of their experiences. This process, starting from experience and then reflecting upon them, served the basis of his pedagogical approach.

The reflective portion of this approach has particular strength because it allows learners to connect emotions to their experiences and also see commonalities in their story with others. Learners derive meaning from this process, which propels momentum for critical action; a fuller understanding of their story, apart from the dominant narrative, propels them to want to change their situation for themselves and others – this is the heart of critical theory. For Freire's peasants, they found common language and emotions behind their difficult experiences, and were able to identify the sources and causes of them. Once this knowledge was gained (i.e., conscientization had been achieved), they were no longer able to live in ignorance because doing so would be complicit in their own malady.

Ignacio Martín-Baró's Liberation Psychology

Martín-Baró was a Spanish-born, El Salvador psychologist and priest, who was eventually killed by the Salvadorian government for his work. He pursued Jesuit priesthood training in his early years, and was attracted to and studied psychology after his religious training. He was a daily observer of the issues related to power and oppression in El Salvador and began to push his colleagues to go beyond simply understanding oppression to actually addressing and changing it by actively engaging with the sociopolitics of the time.

Known for his intellectual prowess and passion, Martín-Baró had a "love-hate relationship" (Portillo, 2012, p. 82) with the United States. Because of his education and career (he was trained at the University of Chicago), he was intimately knowledgeable about American culture, interests, and affairs. Due to his unique position having deep understanding of both Latin American and North American perspective, philosophies, culture, and values, he was distrustful of American perspectives, even psychology. Much of his work criticized American psychology and attempted to break away from it. He was especially dissatisfied with how American psychologists held involvement with sociopolitics at a distance as he partially attributed inequalities and the perpetuation of injustice as stemming from their dispassion and uninvolvement (Martín-Baró, 1994).

Martín-Baró epitomized Freire's critical pedagogy and directly applied it to the field of psychology. Specifically, he honed in on Freire's conscientization and, in what can only be understood as a theoretical reversal, applied it not to the oppressed, as originally conceptualized by Freire, but instead applied it to who he thought was perpetuating oppression, psychologists themselves. Martín-Baró was outwardly frustrated at psychologists' passive recognition of oppression but the lack of action and change in the field to address it. He called for the critical examination of sociopolitical realities that shaped Western psychology. Two aspects of Martín-Baró's work are especially salient to multicultural psychology and counseling, and have served as important ideas in the liberation of psychology.

Conscientization of the Oppressor

Perhaps the best way to encapsulate Martín-Baró's foundational belief about the hegemony of Western psychology comes from multiracial activist and feminist, Audre Lorde, "The master's tools will never dismantle the master's house" (1984). He influenced a generation of psychologists to critique the foundations of the discipline, especially in rethinking psychologists' roles beyond academic or counseling walls into the sociopolitical realm (Fox, Prilleltensky, & Austin, 2011). A consistent question asked by Martín-Baró (1994) is for whom does psychology work?

The critical questions that psychology must formulate with regard to its activity and it follows, with regard to the role it is carrying out in society, should not be centered on where the work is done, but rather on by whom; nor whould it be looking at how something is done, so much as for whose benefit. (p. 45)

His statement confronts Western psychology and begs a disciplinary question of whether we are working for *the master*. It forces a level of both individual and disciplinary introspection that challenges "sacred cows" within psychology. Martín-Baró desired a disciplinary critical consciousness and he posited several structures within psychology that needed to be transformed.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Clinical View of Oppression

Martín-Baró viewed oppression in all its forms as a primary "pathogen" (Smith, Chambers, & Bratini, 2009, p. 160) in mental health conditions. The plight of the poor and oppressed is a direct result of oppressive beliefs and practices stemming from sociopolitical structures that perpetuate dominance. His work elevated oppression as an instrument of depression, stress, and anxiety, and has been influential in reconceptualizing trauma to be more inclusive of non-physical causes, such as race-based trauma (Bryant-Davis, 2007; Carter, 2007). This perspective continues to shape clinical understanding of PTSD and its diagnostic criteria, and has moved it out from the medical model into the sociopolitical realm.

Knowledge Is Subjective

One of Martín-Baró's greatest frustrations was his perception of sociopolitical inaction in psychologists, which he believed stemmed from psychologists being unaware of the sociopolitical structures that support certain types of knowledge. He pushed psychologists to examine power differentials and how power shapes knowledge and its value and transmission (Jiménez-Domínguez, 2009). He argued that psychological theories are actually the beliefs and values of those in dominant, oppressor positions.

Participatory Research

In the same way that Freire developed a process of teaching poor peasants to read that focused on beginning with voicing experiences and observations, Martín-Baró also developed a means for conscientization within psychologists. He stressed that to understand the presence of multiple perspectives, psychologists needed to understand the perspective of the oppressed (1986), which simultaneously reveals the ideology of the oppressor. To Martín-Baró, Western psychology was too involved with methods and metrics to quantify phenomena (i.e., instruments of research) rather than understanding the research participants themselves, which often include constructs and experiences that inherently difficult to quantify (Portillo, 2012). He felt that the tools traditionally used in psychological research was not only insufficient, it perpetuated oppression by ignoring experiences felt only by the oppressed.

Participatory research methods were the main mechanism for conscientization for psychologists. He used this method to compile reflections and experiences of those oppressed in El Salvador and compared them to the views and claims of political authorities (Martín-Baró, 1994). Highlighting these differences and understanding the vast differences in perspectives forced a process of reflection in which individuals cannot claim ignorance. "It is not the calling of the psychologist to intervene in the socioeconomic mechanisms that cement the structure of injustice, it *is* within the psychologist's purview to intervene in the subjective processes that sustain those structures of injustice and make them viable" (1994, p. 45). Participatory research methods not only brought about conscientization in psychologists, the oppressed, and the oppressors, it helped give credence to solving mental health issues at the collective and societal level.

Emergence of Multicultural Psychology and Social Justice

The work of Freire and Martín-Baró set the stage for a conceptual evolution within psychology. The discipline had gained momentum in challenging hegemonic views of the origins of psychology. In 1991, the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

momentum culminated in the announcement within the psychological world introducing multiculturalism as the *fourth force* (Pedersen, 1991) in the discipline. *Forces* in psychology are significant movements and paradigm shifts. The three previous forces are psychodynamic, behaviorism, and humanistic. These three forces represented significantly different views on human psychology and behavior, and were often developed in opposition to one another. These schools of thought tended to focus on their unique differences in understanding and treating individual psychopathology.

The first force, psychodynamic, were theories were based upon Freud's psychoanalytic approach, and predominantly focused on unconscious processes that governed behavior and emotions. It was deeply individualistic, and mental health treatment was predicated upon the individual's ability to resolve unconscious conflicts. The second force, behaviorism, was led by John Watson and B.F. Skinner, both of whom rejected the notion of Freud's unconscious mind because it was not testable, and in their efforts to solidify psychology as an objective science (a core hegemonic belief), they developed their approach to focus on only observable behavior. Behaviorism did focus on environmental factors but emphasized treatment in terms of individual learning processes, such as conditioning and reinforcements. They paid little to no attention on the importance of emotions or thought processes, and they were simply interested in shaping outcome behavior. Carl Rogers noted the lack of intimacy and coldness related to a purely scientific and hierarchical approach to emotional distress, and helped psychology understand the significance of a nurturing and caring relationship between therapist and patient in the healing process. This third force, humanistic, focused on the importance of relationships in human behavior and mental health treatment. Relational connection was posited to be essential to mental health, and this third force propelled psychology to recognize the concept of "self-in-relation", which is the belief that personality and individuality are functions of the social environment. While each of these three forces acknowledged the role of the social environment (e.g., psychodynamic theorists focused on the influence of early parental relationships and attachments, behaviorists focused on stimulus-reaction and learned behavior within social relationships, humanist focused on moment-to-moment social interactions), these were typically ancillary information that informed individual approaches to mental health.

Multiculturalism was the first force to acknowledged the importance of cultural and sociopolitical dynamics in mental health, which rapidly moved the discipline out of the confines of the 'counseling office' into the actual world in which patients live. While there is safety and security within the confines of a counseling office, ultimately patients are members of society; their emotional health is inextricably linked to their social environment. According to Pedersen (1991), multiculturalism,

Combines the extremes of universalism and relativism by explaining behavior both in terms of culturally-learned perspectives that are unique to a particular culture and in the search for common-ground universals that are shared across cultures.

It acknowledges the primary role of cultural patterns and thoughts that were already present prior to our births; we inherit these "rules of the game" (p. 6) through socialization. By the time we are mature enough to realize that people play by different rules, we may have already internalized either our rules' superiority or inferiority.

The multicultural movement allowed for four developments that better fostered mental health. First, it broadened the definition of culture beyond race/ethnicity to include sexual orientation, religion, age, sex/gender identity. It recognizes that the overarching influence of culture on all people, not just those in

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the minority or deemed "exotic". Therefore, this definition of culture includes those within the dominant culture, with a set of normative rules and practices.

Second, the multicultural perspective allowed patients to "get out of their head" by helping patients understand external factors that may influence mental health. It provided a more holistic picture of well-being and gave voice to phenomena like oppression and prejudice.

Third, it acknowledged the continuous need for a 'critical psychology' where traditional models of psychology, birthed out of Western thinking, are challenged in terms of their utility and effectiveness for diverse patients. For example, traditional Freudian psychoanalysis is both time and resource intensive, which limits its access to the privileged few. Critically examining this treatment modality allows for the creation of other modalities that are more accessible to larger groups of individuals. For example, the development of briefer treatments imbedded in the context of the community is a far cry from psychoanalysis where the norm was meeting 4-5 hours/week for years.

The influence of Freire and Martín-Baró continues within psychology as some consider that the discipline is seeing the emergence of the fifth force in psychology, social justice. While multicultural counseling tended to focus on the understanding of systemic and institutional forces on emotional well-being, especially for persons of color, social justice seeks to help patients take action in order to address societal ills that leads to oppression. This fifth force incorporates social and civic action as primary interventions for emotional healing and growth, moving beyond individual coping as a main means of healing. The social justice movement is a natural progression from multiculturalism because it helps patients take action to remedy oppression and harmful systems. In fact, Prilleltensky and Prilleltensky state that, "multicultural competence without social justice is insufficient" (2003, p. 274). The social justice scholarship in psychology is in its nascent beginnings; however, Freire's and Martín-Baró's fingerprints are evident in its discourse.

Examining Freire's and Martin-Baro's Influence to Psychology

Foundationally, psychological counseling is a healing practice (Frank & Frank, 1991; Wampold, 2001) and integral to counseling is the notion of helping. Defined by Hill (2014) as assisting others to make positive life changes through examining feelings and gaining insight, helping provides the "ingredients" (Ahn & Wampold, 2001, p. 251) to assist individuals, and it includes facilitative functions, which Hill list as helping patients to gain insight, to deal with existential concerns, to learn adaptive skills, to make decisions, to experience a healthy relationship, and to function on their own by providing feedback, support, and relief to them. The work of Freire and Martín-Baró has helped psychologists critically examine other modes of mental health treatment.

Passive Transmission of Oppressive Beliefs

In 1978, Derald Wing Sue, influential multicultural psychologist, wrote an article, "Eliminating Cultural Oppression in Counseling: Toward a General Theory". In this article, he described four perspectives of change, and posited that dominant, Western-based philosophies reside in the internal locus of control and responsibility domain of psychology. This view posits that individuals have complete control and must take individual responsibility for their wellbeing, without any recognition of external factors, such as oppression. Sue opined that this perspective becomes culturally oppressive when blindly imposed on culturally different others. This is an especially harmful phenomenon when psychologists passively

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

transmit this perspective into their patients, leaving them feeling hopeless and disenfranchised. Some in psychology have even suggested that dominant, Western-based treatments should be classified as potentially harmful (Wendt, Gone, & Nagata, 2015), with Sue suggesting that some are "handmaidens" (2015, p. 366) of the status quo and serve as instruments of oppression. These types of discussions have traditionally been rare in the psychological research, and the notion that treatment could be ethnocentric was relatively unheard of until recent times (Moodley & West, 2005; Sue, Ivey, & Pedersen, 1996). One of the strongest symbols of oppression in psychological treatment is the definition and diagnosis of PTSD. Freire's critical pedagogy allowed psychologists to see first-hand how sociocultural factors influence conceptualizations of mental health, and how neglecting these factors contributed, at the very least, to the lack of treatment options for patients of color.

Freire's banking concept of education is evident in the psychological discourse on the cultural bias and ethnocentricism of psychological theory and mental health treatment. One of the most significant debates within mental health treatment is between what is known as empirically-supported treatments, the current gold-standard based upon Western philosophies of objective quantifiable testing, and multicultural counseling, which takes the Freirian and Martín-Baróian perspective that empirically-supported treatments are oppressive in nature due to their foundational principles rooted in Western perspectives (Sue, 2013, 2015; Wendt, Gone, & Nagata, 2015). Multicultural psychology and counseling is a movement that challenges the dominant approaches to mental health treatment, and it especially seeks to avoid the culture of clinical silence in the field.

Liberation discourse involved taking a crucial eye to the process of colonialization that have had a deep impact on the identity of Original Peoples; as a result, a new narrative of healing will emerge. The mental health profession has been instrumental in fostering the colonial ideation of Native Peoples all over the world…by turning a critical eye on our professional activities of healing, we liberate ourselves, as well. (Duran, 2006, p. 1).

Conscientization and Corrective Emotional Experiences

Corrective emotional experiences in mental health treatment occur when a patient comes to understand or emotionally experience an event or relationship in a different or unexpected way (Castonguay & Hill, 2012). These are experiences, usually within the context of a therapy relationship, where patients express or disclose shameful parts of themselves and receive support and affirmation from their therapist. These experiences, especially for marginalized individuals, are extremely powerful and healing because they have historically faced denial or rejection of their experiences. To be affirmed for sharing stories of oppression, and having the horrors of those experiences validate is corrective because it resets how they psychologically and emotionally cope with them. Prior feelings of shame and disenfranchisement gives way to hope and motivated anger, which can serve as the basis for active social engagement.

Freire's conscientization process, especially his ability to help Brazilian peasants tell and understand their story, has been instrumental in multicultural psychology and counseling (Ivey, 2003). His process of helping peasants find their words, and then sharing them others was a form of validation. Then through mutual sharing, the peasants were collectively able to attach meaning to their words and experiences. Seeing others share similar meaning and experiences provides comfort as well as motivation to act for change. For many of the peasants, attaching meaning to their experiences with others is similar to a corrective emotional experience. It may have been the first time their internal experiences were validated.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Conscientization and corrective emotional experiences can be considered "disorienting events" (Taylor, 2008) that propel individuals to further investigate and understand themselves. While they have experienced a lifetime of rejection of their experiences, having them validated forces a re-evaluation of them and can lead to a new and more fuller way of understanding them.

Multicultural Competencies

The crown jewel of the multicultural movement in psychology is the development of multicultural competencies, which are a set of guidelines that set forth attitudes/beliefs, knowledge, and skills for psychologists to learn and practice in three domains of mental health work, which include 1) awareness of own cultural values and biases, 2) patient's worldview, and 3) culturally appropriate intervention strategies (Ratts, Singh, Nassar-McMillan, Butler, & McCullough, 2016). The competencies provided a strong framework not only for clinical treatment but also education for graduate students. Since education is political, psychologists are making an important stand in elevating the study of multicultural competence and its value to society.

Martin-Baro's focus on the liberation of psychology has influenced psychologists to view multicultural psychology and counseling as a means to engage in the sociopolitical sphere to addresses racism and oppression (Cross, 1971; Helms, 1985; Ivey, 1995; Sue & Sue, 2013). The development of multicultural competencies is a direct testament to the importance of recognizing narrative and story of all individuals, and to not weight or privilege only the experiences of those in power. Ivey (1995; Ivey & Collins, 2003) advocates for a liberation focus in psychology that draws from constructivist philosophy where psychologists and patients work mutually to construct meaning. This problem-posing, egalitarian approach in which both parties work together, and no one person's opinion is superior, results in learning (i.e., education) for both patient and psychologist. The multicultural competencies implies that psychologists are not experts; therefore, psychologists taking a direct, transmission-based role is not only ineffective but a continuation of dominant perspectives.

Qualitative and Narrative Approaches to Research

Western-based research typically privileges quantifiable and empirically-based modes of inquiry. While this perspective is not inherently oppressive, it presupposes that the researcher is aware of all of possibilities in which to test hypotheses. It is a reflection of the teacher/psychologist-as-expert role that Freire dismissed and found to be instrumental in the passage of oppressive ideals. Research results in this perspective is only understood in light of assumptions of the researcher and the extent of their limited knowledge base. Martín-Baró understood Freire's concern about this objective distance and power differential with research, and advocated for more intimate and potentially raw experiences. His extensive use of participatory research methods gave credibility, value, and esteem to research approaches such qualitative methodologies and narrative approaches to data collection. The multicultural psychology and counseling research is filled with rich examples of qualitative studies that have provided a more nuanced, human, and comprehensive understanding of the experiences of people of color. The participatory research paradigm has somewhat become the de facto method for those studying socially-based phenomena and sophisticated research designs have been utilized that have contributed to our understanding of race, culture, sociopolitics, and mental health.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Participatory research methods honor Martín-Baró's legacy by removing the hierarchy between research and participant by giving voice and credibility to participants' experiences. By accessing and understanding other voices, researchers themselves can elevate their importance as well as expose inherent biases and assumptions in researchers. In a sense, participatory methods 'level-the-playing field' by eliminating the top-down nature of empirical paradigms.

Social Action as a Means for Mental Health Treatment

The legacy of Martín-Baró's liberation psychology is still to be determined as psychology grapples with the notion of social justice as a paradigm shift. While the vast majority of psychologists value and understand the importance of social justice (Lewis, Ratts, Paladino, & Toporek, 2011; Vera & Speight, 2003), psychologists' specific role in it is currently being debated. Acceptance and incorporation of social justice as a core identity and function of psychology and counseling is not as universally accepted as recognizing diversity and multiculturalism (Baluch et al., 2004). Numerous scholars have advocated for a more proactive and prevention-based stance that addresses the systemic and institutional forces that contribute to oppression, which is a distinctly critical theory value. A current manifestation of the role of social justice within psychology is the social justice counseling paradigm (Lewis, Ratts, Paladino, & Toporek, 2011), which uses advocacy as a means to help the individual client through addressing problematic social, political, and economic factors (Ratts, 2009). This paradigm extends the responsibility of the therapist beyond the traditional "therapy room" to the halls of governmental institutions. Critical and liberation psychology is intimately connected to social justice (Ivey & Collins, 2003).

However, social justice is at the heart of multiculturalism in that the existence of institutionalized racism, sexism, and homophobia is what accounts for the inequitable experiences of people of color, women, gay, lesbian, and bisexual people (among others) in the United States. Moreover, discrimination and prejudice are intimately connected to quality-of-life issues for these groups of people. (Vera & Speight, 2003, p. 254)

Psychologists are slowly coming to terms with the true implications of Freire and Martín-Baró's work. While the concept of conscientization is generally accepted and lauded, many are recognizing what Martín-Baró advocated, which is the fact that conscientization is not an independent and isolated phenomenon. Social action is a logical continuation of psychological healing resulting from an internal desire to address the negative impact of dominant ideology. It becomes an outward expression of healing, and broadly involves working toward the liberation of others.

IN FINALITY

Change does not occur easily. Psychologists, for all their knowledge on human behavior and neuroscience, fully understand the notion that humans are creatures of habit. Psychologists are not immuned from this. Paolo Freire and Ignacio Martín-Baró are two of the most influential figures in helping propel psychology out from its insular position. By bringing a critical perspective and a liberation focus to the discipline, psychology and counseling are better positioned to be a source of help for those in mental and emotional distress. Their work legitimized the experiences of the marginalized and has helped birth a new

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

set of models and strategies to help people in distress. They have also unknowingly spearheaded such changes as a reformulation of a clinical diagnosis of trauma, propelling psychologists front-and-center into sociopolitical policies debates such as the role of torture, police brutality, and sexual harassment, and helping psychological governing bodies take public positions on important social debates such as conversion therapy and sexual identity. The fact that the field of psychology issues public statements demonstrates the impact that critical theory, interpreted by these two scholars, has and will continue to shape psychology and counseling. It is likely that critical psychology will continue to examine long-standing perspectives such as mental health diagnoses and treatment approaches for evidence of hegemonic perspectives that interfere with well-being for all. While humbling for a discipline and profession, the close examination and critique is needed for the social good.

Chapter 11
Multicultural Considerations in Play Therapy Caregiver Consultation

Renee M. Floer
Loyola University New Orleans, USA

ABSTRACT

The purpose of this chapter is to review the literature regarding parent consultation and to address special considerations when working across cultures and ethnicities. Understanding privacy expectations and how to meet the needs of families, without discouraging the caregivers or unintentionally breaking cultural guidelines, will be explored. This chapter is extremely important because mental health professionals must adhere to the diversity guidelines and ethical standards of practice in complex cases, with many involved caregivers at times. When consulting with caregivers from culturally diverse backgrounds, consultants need to consider the impact of culture on the caregiver, the child client, and on the consultation process.

MULTICULTURAL CONSIDERATIONS IN PLAY THERAPY CAREGIVER CONSULTATION

According to Colby and Ortman (2014) in a 2014 report of National Population Projections, more than half of the nation's children are expected to be from a minority race or ethnic group by the 2020 census. By 2060, 36 percent of children (people under 18) will be white, as compared to 52 percent today. The U.S. Census Bureau (2010) also states the Hispanic population increased by 15.2 million between 2000 and 2010, accounting for over half of the 27.3 million increase in the total population of the United States. Professionals who work with children and their caregivers must attempt to develop an understanding of various cultures and the roles of the caregivers and children within these cultures. Although there is an

increasing diversity in referrals, demographic surveys indicate that white females continue to dominate the fields of play therapy and counseling.(Haslam & Harris, 2011; Kranz, Kottman, & Lund, 1998; Phillips & Landreth, 1995; Ryan, Gomory, & Lacasse, 2002).

It is challenging, if not impossible, to summarize the breadth of information necessary when considering the specific needs of every cultural subgroup the play therapist encounters in their role as a play therapy caregiver consultant (PTCC). However, competence in working with a variety of clients is essential and ethically mandated. In fact, according to the American Counseling Association (ACA) Code of Ethics, counselors are expected to be capable of working with diverse populations and must gain training and supervision when confronted with limitations in their scope of practice, especially when confronted with underrepresented or marginalized populations (American Counseling Association, 2014).

In an investigation of play therapists' self-reported multicultural competence, subjects indicated a need for specific multicultural education as well as ongoing supervision to maximize, "attitudes and beliefs, knowledge, skills, and action" (Penn & Post, 2012, p. 3). In this chapter, we attempt to provide useful guidelines for consideration when working with culturally diverse clients and their caregivers, without assuming that there is an exact answer or a "cookbook recipe approach" all too often used in multicultural or diversity-focused chapters. We present historical and up-to-date information on multicultural considerations for the PTCC, including practical implications for practice in engaging caregivers as a culturally competent play therapist. This information is based on and extensive literature review, research gained from clinical work, and current consultation with PTCCs in the field. It should be noted that the relative lack of research on both multicultural considerations in play therapy and caregiver consultation in general are significant limitations in the scope and breadth of this chapter.

Multicultural Competence

The Association for Multicultural Counseling and Development (AMCD) published Multicultural Competencies on their website, www.multiculturalcounseling.org, which outlines specific standards and serves as a resource for counselors to increase their cultural competence (Arredondo, P., Toporek, M. S., Brown, S., Jones, J., Locke, D. C., Sanchez, J. and Stadler, H., 1996). Additionally, the ACA published Multicultural and Social Justice Counseling Competencies that offer developmental domains the PTCC can utilize to become more culturally competent (www.counseling.org/knowledge-center/competencies). These guidelines outline self-awareness, other-awareness, and rapport in addition to specific interventions. Exploring and understanding the guidelines challenges the counselor to acknowledge the pursuit of social justice while embracing multicultural competencies as a lifelong endeavor (Ratts, Singh, Nassar-McMillan, Butler, & McCullough, 2015). Of particular relevance to PTCCs, is the recommendation to recognize similarities and differences both within and between cultural groups. Finally, as a guideline for understanding client worldview, the fact that culture influences communication styles for both the caregiver and the consultant. As such, the consultant must "acquire culturally responsive cross-cultural communication skills to interact with [caregivers]" (Ratts, Singh, Nassar-McMillan, Butler, & McCullough, 2015).

In addition to the ACA and the AMCD, The Association for Play Therapy also published best practice guidelines to assist PTCCs in providing the highest level of care for their clients (www.a4pt.org/?page=Research). Concepts such as boundaries of competence, non-discrimination, and sensitivity to individual vs. group differences are all areas where cultural competence is considered a necessary skill. Concerning issues of diversity and training, best practices specify:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Play therapists actively participate in a process by which they strive to 1) become and remain aware of their own cultural backgrounds, influences, and biases including, but not limited to, religion, gender, sexual orientation, ethnicity, and race; 2) acquire and continuously seek knowledge about how cultural backgrounds, influences, and biases operate in the lives of their clients; and 3) demonstrate culturally responsive therapeutic skills. (p. 13)

Clearly, the ethically responsible PTCC must continually develop, practice, and maintain skills around cultural awareness and sensitivity.

The Importance of Play and Play Therapy

From ancient philosophy to modern scientific research, play is an integral component in learning and child development (Fisher, Hirsh-Pasek, Golinkoff & Gryfe, 2008). Play is a ubiquitous part of the lives of all children that holds no bounds. Landreth (2012) indicated that play is the "native language" of children, an innate and universal method of communication through which children converse in an open and direct way. In recent years there has been an increased consideration for physical health and nutrition through outdoor activities with national campaigns like the NFL's Play 60 and First Lady Michelle Obama's "Let's Move!". These contributions are necessary and essential elements of keeping children motivated to maintain their health through physical activity, but a focus on play as a component to mental and emotional health is missing.

In spite of the evidence of the positive developmental benefits of play, there has been a significant decline in the amount of time allotted for free and unstructured play in today's society. In one study, researchers examined filial play across cultures and found that parent subjects confirm a trend toward decreased outdoor play and increased sedentary indoor activities (Roopnarine & Davidson, 2015). Play is redefined as a trivial exercise that is a placeholder for nonacademic activities. The importance of play in the school setting has diminished as the demands of children's academic performance in school has significantly increased (Pellegrini, 2008; Pellegrini & Blatchford, 2002; Pellegrini & Holmes, 2006; Ramstetter, Murray, & Garner, 2010; Slater, Nicholson, Chriqui, Turner, & Chaloupka, 2012).

Caregiver's Concept of Play

The effectiveness of play therapy is a researched and reliable form of therapy when used with multiple populations, yet the phenomenon of play continues to be seen as an abstruse process (Ray, Bratton, Rhines, & Jones, 2001). Given that beliefs evolve in part through cultural and personal experiences, caregivers and experts may hold different beliefs about the nature of play itself (Fisher et al., 2008). The definition of play can vary across cultures, yet we use the term in a general sense. Examining other cultures' and populations' definition of play and specific play activities can yield positive feedback within the therapeutic alliance. Additionally, identifying the thematic perceptions of play in various cultures leads to a more informed approach when collaborating with caregivers. As caregivers begin to explore therapy as an option, it is imperative to understand the challenges faced by various populations that can affect their openness to play.

Caregivers' beliefs surrounding play and its purpose provide further implication to the function of play in the home. Understanding the use and typical nature of play in the home sheds light on how an introduction of play in a therapeutic setting will be received and understood. For caregivers from diverse

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

backgrounds and experiences, the PTCC must be willing to acknowledge that his or her perspective may not be aligned with that of the caregiver, and time spent exploring perceptions of play and expectations for treatment should not be hurried.

Caregivers Concept of Play Therapy and Consultation

Despite efforts by the Association for Play Therapy to educate the public about play therapy, caregivers remain largely uniformed about the importance of play in counseling with children. Shale (2004) concluded that, although parents recognized the developmental value of play therapy and perceived it as helpful, they were unclear about *what* play therapy was. This is one of many areas where culturally sensitive caregiver consultation can fill the gap of missing information and increase caregivers' comfort with the process.

Unless skilled and qualified clinicians take the time to explain what play therapy is and how techniques will be employed with their children, caregivers may simply not know or understand what play therapy is and how it can be implemented in counseling with children, adolescents, and families. These and other factors may contribute to a sobering statistic reported by Lolan (2011), who found that only 35.9% of play therapists believe caregivers are willing to participate regularly in the therapeutic process. This statistic may increase when caregivers are culturally different from the consultant (Chang, Ritter, & Hays, 2005).

Caregiver perceptions of play therapy are colored by a number of factors, which contribute to the overall counseling experience (Crane, 2001). Caregivers' educational level, the circumstances that caused them to seek counseling, and whether or not participation is voluntary can all affect the counseling process. Previous experiences with counseling may also influence caregiver perceptions regarding the therapeutic process in general. Other important factors include the family's socioeconomic status in relation to the perceived "worth" of counseling. Finally, caregivers' thoughts about play and the value of play for children can have a direct impact on what they think about the therapeutic use of play as a tool for addressing their parental concerns (Brumfield & Christensen, 2011; Muhammad, 2009). After considering all of the above factors and their potential influence on the counseling experience, it becomes clear that the therapist's ability to explain play therapy and to engage with caregivers is of utmost importance.

Cultural Misrepresentation in Research

Direct accounts of caregiver attitudes regarding play are limited in the research. In a phenomenological study of African American parents' perceptions of play therapy, Brumfield and Christensen (2011) found "… African American parents' perceptions of play, counseling, and play therapy revealed information consistent with two main themes: (1) value of play, and (2) receptivity to counseling. Parents identified *developmental learning* and *release* as two of the main values surrounding play." It appears evident from their findings that African American parents' perceptions are consistent with the idea that play is central to childhood development and release. This implies that there is time delegated for this activity, since it is recognized as important.

Historically, however, researchers have published accounts without sensitivity to cultural differences. Bracey (2012) discussed the prominence of a deficit-based or ethnocentric perspective, the tendency to overgeneralize African American families, and the tendency to pathologize and misinterpret cultural norms as influencing parenting practices in the research history of this population (Boykin & Toms,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

1985; Cain & Combs-Orme, 2005; Carter-Black, 2003; Dodson, 1995; Gomes & Mabry, 1991). For example, researchers studying children from low-income African American families found that they engage in less significant amounts of pretend play in comparison to other groups. Additional researchers indicated that middle-income children in preschool and the early primary grades engage in more pretend play than low-income (often African American) children (e.g., Rosen, 1974; Smilansky, 1968; White, 1978). Further, while addressing the negative hypothesis regarding pretend play in this population, McLoyd (1985) stated the assumption that low-income children engage in less frequent, lower-quality pretend play or play that is characteristically unimaginative and desultory, and is widely accepted in the available literature (Lovinger, 1974; Murphy, 1972; Singer, 1973; Smilansky, 1968). It is crucial to note the disparaging research. With a staggering amount of focus on deficits rather than strength-based assumptions, combating these popular subgroup issues when addressing caregiver perception is of significant importance.

Play Therapy through a Culturally Sensitive Lens

It has become a putative notion that African American families do not seek counsel from mental health workers or agencies; however, there is limited exploration into this perceived phenomenon. Brumfield and Christensen (2011) noted specific factors that facilitated or encouraged African American parents to pursue counseling, which pertained to how reliable the referral source was, as well as the perceived support parents experience from their family, community, and society, in general. Similarly, in a study examining counseling with Hispanic families, Kossak (2005) suggested that Hispanic clients are more willing to consider and adhere to services when they have a sense of being understood and have developed trust in the counselor.

Bridges, de Arellano, Rheingold, Danielson, and Silcott (2010) have identified many reasons why members of the Hispanic population are less likely to receive mental health services, including: not understanding the value of the services to language barriers, limited financial resources, social consequences of accessing care, lack of culturally responsive practices, immigration status, and the use of alternative healers and methods to treat mental health concerns (Bornsheuer & Polonyi, 2010; Bridges et al., 2010; Costantino, Malgady, & Primavera, 2009; Garza, 2004; Garza & Watts, 2010). Careful consideration needs to be taken when discussing cultures' preferred methods of treatment in all populations, and the Hispanic population is no exception. Garza and Watts (2010) stated that, historically, Hispanics have eschewed unwanted attention and the social stigma that often accompany mental health treatment. Additionally, they found that Hispanic individuals typically prefer addressing problems within the boundaries of the family. It is a common cultural practice to seek help from the primary care physician for physical conditions, but is less common to address mental health issues as they arise. Cultural values that can incite Hispanic families to engage in therapy have been identified in a previous study that examined filial therapy and Hispanic values. Garza and Watts (2010) proposed four Hispanic values that, when interfaced with play therapy, help facilitate effective culturally responsive treatment: (1) the importance *offamilismo* (family), (2) *respeto* (respect), (3) *personalismo* (personal relationships), and (4) *confianza* (trust). PTCCs should keep these in mind when working to engage Hispanic families.

Caregivers can have a hard time understanding the benefits of play therapy; what it is, or how it can be helpful. They may find it difficult distinguishing play therapy from play at home or at school. To address this issue, the Association for Play Therapy (2015) clarifies the difference for potential clients and caregivers stating, "Play therapy differs from regular play in that the therapist helps children to address

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and resolve their own problems." Working with a child may not require a heavy concentration on cultural sensitivity during the act of play, but collaborating with parents without acknowledging the norms of that culture can impede the alliance. Hinman (2003) suggested that Hispanic parents may expect a problem-focused approach from the therapist and that any deviation from that will need clarification in order for the parent to have a better understanding of the therapeutic process. Explaining the function of play and play therapy in ways that families will understand and based on cultural correlations can increase their openness to the process of play therapy.

In addition to being agents of consent for clients who are minors, parents and primary caregivers play an integral part in the efficacy of play therapy and counseling with children and adolescents (Axline, 1993; Cates, Paone, Packman, & Margolis, 2006; Kottman, 2011; McGuire & McGuire, 2001; Post, Ceballos, & Penn, 2012; Timberlake & Cutler, 2001; VanFleet, Sywulak & Sniscak, 2010). The ability to *engage caregivers* in the process of play therapy from intake to termination is often daunting for the novice PTCC. Newly trained therapists may not feel adequately prepared for systemic work or may be otherwise intimidated by interactions outside of the individual work with the child (Cates et al., 2006; LeBlanc & Ritchie, 1999; Lolan, 2011; Post, 2014; Ray, Bratton, Rhine, & Jones, 2001, Steen, 2010).

Adding a diversity aspect to the PTCC relationship may further intimidate beginning therapists and delay the development of a therapeutic alliance with the caregivers. Fortunately, according to the literature, this reluctance is transient. Researchers found as many as 90% of play therapists are comfortable working alone with caregivers (Haslam & Harris, 2011). Play therapists acknowledge the value and importance of including caregivers (Cates et al., 2006; LeBlanc & Ritchie, 1999; Lolan, 2011; Post, 2014; Ray, Bratton, Rhine, & Jones, 2001, Steen, 2010) and even specifically cite parent consultation as a necessary aspect of treatment (Ray, 2011; Scotelkorb, Swan, & Ogawa, 2015). While educating caregivers on the process of play therapy, the PTCC must model open discussion and be patient with a variety of cultural norms in order to help facilitate their engagement.

Involving Caregivers

In non-dominant cultures, individuals frequently utilize internal and collaborative resources and supports such as church and family (Bethea-Whitfield, 2005; Boyd-Franklin, 2003; Dixon & Vaz, 2005; Harley, 2005). A consequence of these cultural factors is the perception of the PTCC as an outsider and an increased possibility that counseling only becomes an option when the situation becomes extreme—resulting in increased frustration for caregivers PTCCs need to be aware of this potential frustration so that caregiver needs can be adequately addressed. Further research found that parents from non-dominant cultures seek referrals from schoolteachers, school counselors, church leaders, and medical professionals (Brumfield & Christensen, 2011). Providing play therapy educational brochures or information sessions at parenting groups, churches, school meetings, or other events where caregivers congregate can increase awareness and decrease frustration. During consultation, clinicians can demonstrate understanding by acknowledging the feedback caregivers may have already received from other stakeholders and allowing room for diverse perspectives.

Ray (2011) identifies six play therapist attitudes that are essential in working with parents: (1) respect for the parent's role, (2) respect for the parents' knowledge of the child, (3) affection for the parent as a person, (4) patience, (5) clear focus on the child as the client, and (6) therapist as expert. With culturally diverse caregivers, it may be important to be more overt in the expression of respect for the caregiver's role and knowledge. The consultant should be careful to avoid blame or judgment, which are likely to

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

result in defensiveness, mistrust, and ultimately caregiver disengagement. The consultant may need to empower clients to share their own stories if they've had prior experiences suggesting their perspective was unwanted or unwelcome. It may take more time in order to establish rapport with caregivers who are reluctant or uncertain about the process, and the competent consultant will respect this need for increased time. In order to facilitate caregiver empowerment, Holcomb-McCoy and Bryan (2010) recommend PTCCs recognize the inherent power differential that exists between consultants and caregivers, diminish their own role as experts, and include consultees as mutual experts in the process.

PTCCs should be intentional as they help caregivers brainstorm potential goals and action steps for themselves and their children, specifically addressing methods for countering any oppression or micro-aggressions they are currently experiencing. Further, caregivers should be encouraged to take responsibility for their own learning and to make connections in their own communities. Empowering caregivers in this way will increase their confidence and empower them to develop tactics that can meet their individual needs (Brumfeld & Christensen, 2011).

Children are very perceptive, and their affect is often influenced by their caregivers' verbal and non-verbal cues (Timberlake & Cutler, 2001). For this reason, ongoing caregiver consultation is essential. If caregivers are skeptical or concerned about counseling, then children may share such skepticism and concern. On the contrary, if caregivers are excited about and open to the process, then children are likely more engaged (Carmichael, 2006). Overall, it is safe to assume that most caregivers truly want what is best for their children and that they are willing to cooperate with the PTCC (Brumfield & Christensen, 2011; Crane, 2001; McGuire & McGuire, 2001; VanFleet et al., 2010; Wachtel, 1994). Involving the parents is essential.

Guidelines for Competent Practice

Culturally Specific Skills

PTCCs working with caregivers from non-dominant or underrepresented cultures must maintain an awareness of the client's need to trust that the clinician is qualified, and has experience working with diverse children and families. This reassurance is particularly necessary if the clinician does not resemble the client phenotypically. The ability of both parties to see eye to eye in order to develop the trusting relationship that is key in caregiver consultation. Despite the fact that PTCC may view cultural differences as the "problem" (Holcomb-McCoy & Bryan, 2010), most helping professionals acknowledge that the client as an expert on his or her own life and/or experiences. The PTCC can honor those experiences in many covert ways, particularly through the implementation of a few familiar basic helping skills and the core conditions (Steen, 2010).

There is support in the literature for the application of multicultural competence to play therapy and counseling children (Gil, 2005; Hinman, 2003; Jayne, Stulmaker, & Purswell, 2013; O'Connor, 2005; Penn & Post, 2012; Ritter & Chang, 2002). However, the PTCC's level of cultural awareness may interfere with their working relationships. PTCCs who are unable to understand traditional family interaction patterns in culturally diverse family and cross-cultural communication styles will be unable to adequately address caregiver concerns (Cain & Combs-Orme, 2005; Holcomb-McCoy & Bryan, 2010). The PTCC should be aware of any cultural differences in play behavior and parenting style in order to increase the perceived usefulness of feedback given to caregivers, improve interpretation and diagnosis, and avoid misunderstandings or errors in communication.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Additionally, there is a great deal literature focused on the role of culture in the process of consultation. Frequently the PTCC conceptualization of an identified problem stems from cultural differences. For example, the culturally unaware therapist might determine that a child's problem is related to various demographic factors such as membership in a marginalized racial group, coming from a socioeconomically disadvantaged household, or parents' marital status (Holcomb-McCoy & Bryan, 2010; Ingraham, 2000, 2003; Tarver-Behring & Ingraham, 1998). In a qualitative study of low-income African American mothers, Kalyanpur and Rao (1991) identified three aspects of negative experiences with professionals; disrespect, focus on deficits, and discounting parenting style differences, which are likely related to preconceived notions based on these demographic factors.

The PTCC should also consider the overrepresentation of certain non-dominant or minority groups in special education populations and be sensitive to the academic needs of the child or adolescent client concurrent with any social, emotional, or behavioral needs that might be present. It should also be considered that some children may be the recipients of numerous multidisciplinary services, and caregivers may be overwhelmed with the well-intentioned support from a bevy of providers.

Franklin and Boyd-Franklin (1985) contend that traditional African values and beliefs have been transmitted from generation to generation and continue to influence African American parenting. Perceptions of play are intrinsically tied to the values and beliefs that influence parenting. Some parents embrace play as essential, whereas others are less impressed by the fact that play could be a contributing factor in childhood development (Roopnarine, Shin, Jung, & Hossain, 2003). The idea is not to convince those caregivers who believe the latter, but to have an understanding of how what they believe is affecting their child's development. Corresponding with all therapeutic approaches, it is imperative to have a comprehensive background of the caregivers, as this relationship directly affects the child. Although trans-generational influences undoubtedly affect parenting, environment, socioeconomic status, and personal experiences also have a significant impact. Examining those domains in correlation to play is complex, as a lack of research exists in this specific area; however, implications can be made based on existing research (Boykin & Toms, 1985; Cain & Combs-Orme, 2005; Carter-Black, 2003; Dodson, 1995; Gomes & Mabry, 1991).

Caregiver as Expert

Caregivers may feel powerless or question their parenting abilities when they have to seek outside help (Vernon & Clemente, 2005). This powerlessness can come across as anger or resentment for the children, other family members, the counselors, or the referring agencies (Timberlake & Cutler, 2001). Throughout their clinical experience, the authors have observed that often, when children are in crisis, so are their caregivers.

A caregiver consultation model to be used in conjunction with child-centered play therapy has been proposed that encompasses key components of the relational approach most frequently cited by PTCCs subscribing to a specific therapeutic orientation. The five components include: 1) forming and maintaining the caregiver–therapist relationship through demonstration of core relationship conditions, 2) demonstrating present awareness to listen and respond, 3) respecting caregivers as experts on their own children, 4) sharing relevant knowledge, and 6) teaching therapeutic skills (Schottelkorb et al., 2015).

Holcomb-McCoy and Bryan (2010) propose an advocacy and empowerment approach to caregiver consultation. They encourage consultants to recognize and acknowledge the almost daily challenges encountered by most families of color and those from lower socioeconomic backgrounds. The caregiver

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

should be considered appropriately in the context of culturally diverse and historically oppressed backgrounds. The consultant should validate the strengths demonstrated for survival under these circumstances. This model suggests four components of caregiver consultation, including: 1) statement of the problem; 2) the consideration of cultural, familial, and political factors that are influencing the problem; 3) the development of critical consciousness; and 4) the use of problem-solving strategies (p. 265). Using these strategies should facilitate engagement with caregivers of diverse and oppressed backgrounds.

DISCUSSION

Models for Culturally Competent Engagement

We suggest the following general guidelines for culturally competent caregiver consultation: 1) explain the process clearly and thoroughly, allowing time for questions should they arise; 2) give caregivers a tour of your space, as well as culturally relevant audio-visual and/or reading materials. 3) determine a predictable and consistent schedule for consultation meetings (weekly, monthly, as needed); 4) consider your space: Do your decorations, magazines, waiting areas, and child therapy areas all paint a picture of inclusiveness; 5) typical attending skills used in counseling (active listening, showing empathy/understanding); 6) caregivers want resources and it is the job of PTCCs to provide them.

Many PTCCs find comfort in approaching work with caregivers from a theoretical standpoint similar to that used in therapy. In the first decade of this century emerged a prevalence of three models of caregiver consultation: conjoint behavioral consultation, Adlerian parent consultation, and values-based consultation (Bornsheuer & Polonyi, 2010; Holcomb-McCoy & Bryan, 2010). More recently, child/caregiver-centered approaches have been suggested (Schottelkorb et al., 2015). These strategies can be broken into two main categories: psychoeducational and relational.

Psychoeducational Approach to Play Therapy

In psychoeducational caregiver consultation, the primary goal is teaching caregivers, imparting information, or sharing ideas. These PTCCs typically ascribe to cognitive behavioral or behavioral theories, whereas those in the latter are more likely humanistic (i.e., person-centered, existential, gestalt).

The psychoeducational approach can be problematic if the consultant is insensitive to cultural factors. Holcomb-McCoy and Bryan (2010) specifically note the potential conflict between African American caregivers and certain behavior modification techniques. These behaviorally informed strategies may also overlook psychosocial factors such as cultural values, family dynamics, patterns of social interaction, and learned coping mechanisms. PTCCs must be careful to consider that Hispanic and Asian families traditionally involve extended family members, such as grandparents, in family and child-rearing decisions more than their European counterparts. Learned coping mechanisms are sometimes misunderstood as resistance, or even pathologized and diagnosed, rather than considered in the context of necessary adaptations to surviving in hostile environments. The overrepresentation of certain non-dominant cultures for various diagnoses (e.g., African American and Latin American children diagnosed with emotional and behavioral disorders) warrants caregiver consideration prior to assuming accuracy of past records. A behavioral approach may also miss the source of perceived maladaptive behaviors such as frustration, anger, or insecurity due to culturally related environmental factors.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Relational Approach to Play Therapy

In relational approaches, the relationship between caregiver and consultant is the identified change agent, and information or interventions are not deemed sufficient (Holcomb-McCoy & Bryan, 2010). The relational approach assumes that a warm and caring relationship, wherein the PTCC demonstrates unconditional positive regard for the caregiver, will provide the atmosphere for growth and change in the caregiver and, by extension, in the child client. Unfortunately, the underpinnings of such humanistic approaches assume that each participant in the relationship (caregiver and PTCC) has the ability to elude prejudices, assumptions, and preconceived notions. Another typical core belief in humanistic approaches is the role of the caregiver, rather than the consultant, as expert. This may conflict with cultural beliefs that value deference to authority figures and see relationships as hierarchical (Holcomb-McCoy & Bryan, 2010). This may also be the case for some Asian caregivers to expect the PTCC to give direction and provide "coaching", rather than take a more egalitarian and/or supportive stance. Conscious and unconscious perceptions may cause African American clients to anticipate racial prejudice and discrimination from white therapists. These assumptions may be the cause of resistance or reluctance to share openly in consultation or even in early termination of the counseling and consultation relationship (Boyd-Franklin, 2003).

KEY TERMS AND DEFINITIONS

Caregiver: Primary adult responsible for caretaking for the child or adolescent client. This term may refer to a biological, adoptive, or foster parent; a legal guardian; a grandparent or other family member; or any other person with whom the counselor, therapist, or clinician regularly consults regarding the child client's treatment.

Cultural Competence: Counselors who engage the lifelong process of developing cultural and diversity competence through trainings, readings, and advocating for social justice.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Multicultural: Relating to any of the various components of an individual's or group's cultural identity. Including but not limited to race/ethnicity, gender, sexual/affectional orientation, age, religious affiliation, socioeconomic status, and disability status.

Play Therapist: Person who is training in play therapy and practices working with children and their families. This person understands that children communicate through play and use toys to express themselves.

Play Therapy Caregiver Consultant (PTCC): The competent play therapist must include the caregiver in the play therapy process via consistent consultations. These consultations allow an alliance to form, offer support and parenting assistance to the parent, and ultimately help adjust the system, as needed to a more functional form.

Chapter 12
Following the Drum:
Motivation to Engage and Resist

Jonathan E. Taylor
Troy University, USA

ABSTRACT

This chapter provides an overview of motivational theory from adult education, psychology and educational psychology, spanning nearly 60 years. The first half of the chapter focuses on the motivational theories in terms of their developmental genesis, while later sections examine the relationship between motivation and learning resistance and engagement. Final sections suggest conclusions regarding the importance of studying learning resistance as a construct over and beyond motivational theory and position learning resistance scholarship as a learner-centered, positive approach to adult learning.

INTRODUCTION

Taylor (2014) defines learning resistance as "a state in which a learner is not open to learning in a specific learning situation as demonstrated through either active rejection or passive disengagement" (p. 60). Defined this way, resistance has, as its more positive opposite, *engagement.* Learning engagement, or rather, engagement with the learning *situation* (though not necessarily acceptance of the learning *content*) is considered a "psychological process, specifically the attention, interest, investment and effort students expend in the work of learning (Marks, 2000, pp. 154-155). While resistance and engagement fit nicely together, conceptually speaking, motivation is less easily "snapped to grid" within the resistance-engagement continuum. Reeve (2015) defines motivation both in a technical manner as "those processes that give behavior its energy and direction" (p. 9), and also in a more colloquial sense by saying that motivational study is for understanding why people "do what they do" (p. 8). It would seem then, that motivation plays a role in both resistance and engagement. Taken together, the latter two definitions of motivation connect firmly with the former two of resistance and engagement and provide a simple yet compelling reason to examine motivational theories in the pursuit of a more complete understanding of learning resistance.

Accordingly, the purpose of this chapter is two-fold. First, it will examine a somewhat extensive collection of motivational theories with the purpose of providing a somewhat linear accounting of mainstream motivational theory as it has progressed over the past six to seven decades. Over and beyond that, it will use this as a framework for exploring the nature of the relationship motivation has with learning resistance. The analysis provided in the latter sections of this chapter address these issues on the macro level. It is intended to add clarity to the construct of learning resistance so that it may more effectively be brought to bear on the highly practical task of fostering learner engagement in every-day learning contexts.

MAINSTREAM MOTIVATION

Motivation has been addressed in the literature to such an extent as to make it difficult to distill the information into some type of concise summary while still achieving accuracy and remaining thorough. Indeed, the suggestion has been made that such a large number of theories and constructs can appear to be "fragmented and diffuse" (Pintrich, 2003, p. 667; Murphey & Alexander, 2000) and could possibly hinder progress in the field (Pintrich, 2003). There are many ways to arrange a discussion of motivational theories, and in previous scholarship they have been arranged according to the psychological, theoretical framework from which they hail, such as behaviorist, cognitive, social cognitive, and socio-cultural (Perry, Turner, & Meyer, 2007); centered around how they have dealt with a specific aspect of motivation such as self-beliefs (Schunk & Zimmerman, 2007); focused on individual frameworks (Anderman & Wolters, 2007; Illeris, 2002); and a variety of other more or less effective approaches. While reviews of the literature have been largely cross-theoretical, ample literature exists on most all the individual theories of motivation. An effort has been made in this chapter to provide an overview of the most well-known and mainstream theories of motivation and should not be considered exhaustive.

It must be noted at the outset that in order to present the material in some sort of linear order for the ease of the reader, certain connections between concepts and constructs have been omitted. It seems that no matter how one arranges the material, many concepts can be linked back and related to different theories, and doing so with perfect attention to detail leads to a very difficult body of work to summarize. An example of such connections would be those that exist between locus of control, as used in attribution theories (Weiner, 1979, 1985; Weiner, Frieze, Kukla, Reed, Rest, & Rosenbaum, 1971) and social cognitive theories (Rotter, 1954; Bandura, 1986). A tremendous number of such relationships exist between many of the theories but for the purpose of clarity, only a limited number of cross-references will be provided and it will be left to the reader to spot such connections between constructs, terminology, and theories. A succinct and orderly global integration of motivational theory in a limited amount of space requires that such liberties be taken.

The Distinction and Role of Emotion in Motivation

Before looking directly at motivation it is important to delineate the related concepts of emotion and motivation. There has been a growing emphasis in the sciences on the role of emotion in cognition over the past ten years (Damasio, 2012; Immordino-Yang, 2011). Reeve (2015) defines emotion as "the synchronized brain-based systems that coordinate feeling, bodily response, purpose, and expression so to ready the individual to adapt successfully to life circumstances" (p. 342). He goes on to point out that emotion acts as (a) one source of motivation, and (b) a sort of formative assessment of how well one's

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

motivation is serving one's goal of adaptability to life events. He further identifies four parts of these "systems" as *Feelings, Bodily Arousal, Sense of Purpose*, and *Expressive Behaviors* (p. 342). These components interact and produce emotions which influence the levels of motivation any individual has in a given situation.

Damasio (2003) in a very creative work addresses emotions from a neurological perspective and weaves it together with some of Spinoza's philosophical ruminations on the same topic. Damasio's work is particularly useful when examining the role of emotion and feeling in resistance to learning because he makes a clear distinction between the physiological emotion and the more cognitively-based feeling. Spinoza made a theoretical distinction between emotion and affect and Damasio essentially uses the word feelings to represent the Spinozian concept of affect.

In his work, emotions are considered:

…complicated collections of chemical and neural responses, forming a pattern; all emotions have some kind of regulatory role to play, leading in one way or another to the creation of circumstances advantageous to the organism exhibiting the phenomenon; emotions are about the life of an organism, its body to be precise, and their role is to assist the organism in maintaining life. (Damsio, 2003, p. 51)

Feelings are defined in contradistinction as "the perception of a certain state of the body along with the perception of a certain mode of thinking and of thoughts with certain themes" (p. 86). The key point here is that while the terms are often used interchangeably, there is a distinction that is very useful not only in understanding learning resistance, but also in mitigating it. Simply put, emotions can be used to refer to the unconscious, neurobiological response, while feelings are the cognitive assignments we make to those feelings. This is undoubtedly a much more complicated dynamic and there is a great degree of highly detailed information explaining the interworking of these two. However, the most noteworthy application of the distinction between emotion and feeling is that human beings have some ability to cognitively assign, that is, to think about and make a decision about, just what a given emotion we experience might mean. This can be more easily grasped when thinking about a more concrete exemplar - ancient war drums. Most would agree that hearing a beating war drum does not lead one to pick a side in a given conflict. A beating war drum merely helps one march more energetically on whichever side was chosen to begin with. The neurobiological experience set off by the auditory sensation of the drums causes one to "feel" more energy toward a given end, and step more quickly. Perhaps Shakespeare knew something of this when he wrote Timon's words, "follow thy drum…" (Shakespeare, 1936 [1623], p. 1066). So while there are physical emotions that might be outside the control of the individual learner, there is some capacity in that learner to channel that emotion in a certain direction and the totality of that channeling is feeling – how that individual feels about it. Damasio's (and Spinoza's) distinction is a valuable one because it allows for some cognitive control within an emotional domain. Acknowledging the cognitive aspects of what we commonly refer to as emotion and affect interchangeably, provides space for the practitioner to more scientifically influence and direct what would otherwise be almost entirely unpredictable. I will be using the term affect and feelings interchangeably in this chapter.

The motivational theories outlined in this section will be addressed according to the following categories: physiological theories, behaviorist theories, cognitive and social-cognitive theories, socio-cultural theories, humanistic theories, and psychoanalytic theories. These different theories and models are derived from multiple fields, such as educational psychology, adult education, cognitive psychology, and others, and are included in this overview because of their influence and contributions in the field of

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

learning and student motivation. While they certainly are not inclusive of all motivational theories and models in the literature, they do represent the mainstream conceptions of learning motivation. Again, having a general understanding, at the conceptual level, of human motivation, will ultimately facilitate a greater understanding of learning resistance and a more adept ability to mitigate it in the learning context.

Physiological Theories

Physiological theories, like all theories of motivation, rely on certain underlying theoretical perspectives. In the case of physiological theories, that perspective is biological. Among those considered in this section are drive-reduction theory, arousal theory, and the evolutionist perspective.

Drive-Reduction Theory

Drive theory, writ large, was introduced by Woodworth (1918) and in its simplest form, is physiologically based (Reeve, 2015). Drive-reduction theory states that a physiological need induces an aroused tension state (drive) which motivates an organism to satisfy such needs (Myers, 2007). The primary purpose of physiological drives and the subsequent motivation to reduce the drive is to maintain homeostasis in the physical being. One of the more well-known drive theories is Hull's (1943; 1953), and Freud's (1942) psychoanalytical theory, which is addressed under the psychoanalytical section because it is a great deal more complex than the basic drive theories.

This theory was derived through the rise and fall of what was known as *instinct theory,* and while serving to adequately explain physiological drives such as hunger, it seems to have been largely ignored in terms of any helpful applicability to educational psychology. Nonetheless, drive theories are being mentioned here because they have explanatory power for at least some aspects of learning resistance.

Arousal Theory

Arousal theory developed over time to explain the fact that certain motivated behaviors, in and of themselves, served to increase arousal. Animals which are well-fed tend to leave shelter and explore their surroundings. Such risks are merited by the animal's gain in resources. If arousal is caused by a physiological need, and the ensuing motivation serves to reduce that drive, the behaviors directed to reduce those drives conceivably should not then cause more arousal. According to arousal theory, human motivation, rather than aiming to eliminate arousal, actually seeks to maintain optimum levels of arousal (Myers, 2007). For more in-depth information on arousal theory see, Butler (1954), and Zuckerman (1979). Arousal theories are interesting in this discussion because they seem to be closely related to both states and traits of interest, both of which are empirically connected to learning resistance (Taylor & Lounsbury, 2016).

While the term *evolutionist perspectives* does not refer to a specific motivational theory, it bears mention because it arises from evolutionary psychology, which has its roots in Darwin's evolutionary theory. Many theories such as the original instinct theory, drive-reduction theory, and even arousal theory, are evolutionist theories in that the proposed explanation for the need for arousal, drives, and motivation are stated in terms of their relation to the development and survival of the species. What makes a motivational theory an evolutionist theory is the explanation of the purposes of the phenomena and mechanisms, rather than the phenomena and mechanisms themselves.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Behaviorist Approaches

Behaviorism, as a theoretical framework, adheres to a strictly interpreted scientific view of psychology. The exclusive focus, at least of radical behaviorists, is observable, external behavior. Since internal processes cannot be observed in any objective manner, they are summarily dismissed. More moderate lines of behaviorist thought allow for internal cognition but choose to focus on the more concrete observable behavior due to the many limitations of attempting to analyze internal, unobservable processes. The self-report, while holding a prominent place in psychological research, has largely been avoided within the ranks of behaviorist research. In this section, reinforcement theory will be discussed along with its connections to the Law of Effect (Thordike, 1913) and the general implications for motivational theory and research from a behaviorist perspective.

Reinforcement theory, which dominated the literature until the 1960s, is the most well-known behaviorist perspective related to motivation (Perry, Turner & Meyer, 2007; Stipek, 1996). Derived from Thorndike's (1913) *Law of Effect,* the theory posits that reinforcement is the predominant mechanism for establishing and maintaining behavior (Perry, Turner & Meyer, 2007). Conversely, punishment is the primary way to decrease or eliminate behavior. An increase or decrease in behavior then, represents both learning and motivation (Mook, 1987). Stipek (1996) points out that most motivational researchers find behaviorist approaches, when standing alone, to be too simple to explain the complexities of human motivation, a task Stipek claims requires a recognition and emphasis on cognitive processes.

The debate over the years, like so many academic period debates, was framed around a false-dichotomy, a dynamic that virtually ensured a process that ultimately prevailed but which did so very inefficiently. Trying to argue that either behaviorism or cognitive (or social) theories are more "true" or accurate is something akin to arguing over whether apple pie consists of apples or sugar or flour. Of course, this type of debate is the result of a form of theoretical reductionism which, while sometimes useful, can also miss the whole point of the exercise. While behaviorist approaches have had a strong emphasis in the study of motivation, the focus since the 60's has been directed more toward the cognitive and social aspects of motivation. This has been aided by advances in technology, such as PET scans, that permit much more rigorous examinations of the human brain as it processes information. The following sections provide an overview of the cognitive and social-cognitive views of motivation.

Cognitive and Social-Cognitive Theories

Unlike behaviorists, cognitive psychologists contend that the human mind can be studied scientifically (Anderson, 1990). Cognitive models acknowledge the role of external motivation and reinforcement but believe that the "degree to which students can be motivated by a reinforcer depends more on their expectations of reinforcement than on whether they have been similarly reinforced in the past" (Perry, Turner, & Meyer, 2007, p.329). Cognitive theories, therefore, value intrinsic motivation more so than extrinsic motivation (2007). It is also useful to note, when examining all of these theories in such close proximity, that there was a noticeable shift sometime around the late 60's, from grand theories to more narrowly-defined micro-theories that focused less on the global and universal aspects of motivation and more on the situated, contextual aspects of motivation (Reeve, 2015). The developmental history of cognitive theories roughly corresponded with this shift and this noticeable when looking closely at many of the theories.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Cognitive and Social-Cognitive theories represent the largest share of motivational theories, largely because (among other reasons) the research trends in several of the fields from which the theories are drawn, most notably psychology, were favorable to the cognitive approach at a time when motivation was also of interest. There could be many reasons why research trends develop, and they are outside the purview of this paper, but one thing is certain, it cannot be refuted that cognitive and social-cognitive theories have been a deep well for the explanatory waters of motivational thought. Because of this vast number of theories, the section describing them will be noticeably longer than many of the others.

The theories that will be discussed in this section are as follows: achievement motivation theories, such as expectancy-value theories (both classic and contemporary); attribution theory; social cognitive theory; goal theory; multiple goals perspective; goal setting theory; cognitive dissonance theory; learned helplessness theory; reactance theory; effectance motivation; affect control theory; and self-determination theory.

Achievement Motivation Theories

Achievement Motivation Theories are a group of theories which have in common the desire, at some level, to display competence (Elliot & Church, 1997). While this desire is played out differently and/or represented from different angles in the following theories, it is a common thread in all of them.

Effectance

Motivation. Effectance Motivation Theory is not strictly an Achievement Motivation theory, per se, but it fits most clearly here in this section. First written about by White in 1959 and later more fully developed by Harter (1978), effectance motivation refers the intrinsic drive one feels to either pursue a new activity or to continue in an ongoing pursuit simply because of the elation of success at that task or other tasks in the past. This, of course, is similar in some ways to the notion of self-efficacy, which is addressed below, but is a more global reference to particular type of motivation rather than one factor embedded within a larger theory. Individuals who accomplish something take away a sense of excitement and energy that makes them more prone to continue in that activity or engage in other activities that might also lead to success and accomplishment, thereby facilitating another dose of this elation.

Expectancy-Value Theory

Expectancy-value theory (Atkinson, 1957; Atkinson & Feather, 1966; Atkinson & Raynor, 1974) was, according to Schunk & Zimmerman (2007) “a breakthrough in the study of achievement motivation” (p. 352). Simply put, Atkinson’s theory focuses on two distinct but related views that are necessary for one to be motivated. The first is the belief that one can attain a particular objective (has the ability or means to attain it), and the second is that one places a significant enough value on the outcome of that objective. If someone feels that they can accomplish a specific task but does not place any value on doing so, it is unlikely that that they will attempt to accomplish it. On the other hand, if that same person places a high value on a particular outcome, but feels that there are not means to actually accomplish that objective, than that person is not likely to feel motivated to make the (futile) attempt. In this case, two different causes provide for the same outcome.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

A further intricacy of this theory is that achievement behavior is embedded in a conflict between hope for success (approach goals), and fear of failure (avoidance goals) (Schunk & Zimmerman, 2007). These two factors vary from person to person depending upon whether an individual's drive to accomplish and succeed outweighed the risk that that same individual could also fail. The expression of the mathematical outcome of this dynamic produced the Resultant achievement motivation (2007). The significance of approach vs. avoid goals is that the motivation one has to succeed at a task cannot be viewed in isolation. It must be placed side-by-side with the motivation one has to avoid failure (2007). Another way of saying this is that our general way of speaking about motivation in the classroom has the wrong cast to it. While many teachers tend to think they need to motivate their students, this carries with it the assumption that learners are either motivated or not. Avoidance and Approach goals, among other things, draws our focus toward the reality that our students are motivated one way or the other in every learning experience. There is no motivational vacuum, per se. When faced with a group of learners, some may be motivated to learn and some, perhaps many, might be motivated to resist learning. If this is true, then we need to demotivate as well as motivate our students. The fact that writing or reading that phrase sounds odd, speaks loudly to the problem with our general colloquial handling of the motivation concept.

Despite the usefulness and durability of this theory, research results were problematic (Kuhl & Blankenship, 1979; Cooper, 1983; Ray, 1982). The strict view that approach and avoidance drives determined levels of motivation was lacking in mainstream educational psychology studies, but despite these problems, the wider literature on learning resistance and training transfer in the workplace do provide empirical evidence that avoidance goals are at least general motivators in learning contexts (Taylor, 2014). More contemporary achievement theories were proposed to address the weaknesses of this theory overall.

Contemporary Expectancy-Value

Expanding on earlier models, Eccles and Wigfield (Eccles, 1993; Wigfield, 1994; Eccles & Wiggield, 1995; 2002) used data from a large sample of adolescents to identify four psychometrically distinguishable components of achievement values, which include attainment value, intrinsic value, utility value, and cost (Anderman & Wolters, 2007). In this model, attainment value refers to the value one places on the attainment of the outcome (goal). Intrinsic value relates to the level of enjoyment one has while actually being engaged in the activity. Utility value refers to perceived usefulness of the task, and cost reflects the more negative side of the activity in that it points to what one has to give up in order to engage in the task and attempt to reach the goal and achieve the desired outcome.

A fifth dimension, sensation value, has been suggested by Anderman, Noar, Zimmerman, and Donohew (2004). Sensation value, based on an information processing perspective (Byrnes, 2001), is used to describe the "level of sensation, novelty, complexity, or physical stimulation" which may serve to increase interest by "high sensation-seeking individuals" (Anderman & Wolters, 2007, p. 374). The idea that certain individuals have an elevated need for sensation was originally posited by Zuckerman (1979) and seems to support this fifth dimension.

Interest is another perspective on values which is examined in some detail by Renniger (2000), and Schraw and Lehman (2001). These scholars identified two types of interest: personal or individual interest, and situational interest. Personal interest is used to indicate an ongoing state of interest in a specific area of focus or domain, while situational interest is used to refer to a more context-specific interest. Perhaps one of the most noteworthy applications of making the distinction between these two types of interest is that some claim that it is possible to design learning situations in a way that might elicit situ-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

ational interest (Schraw, Flowerday, & Lehman, 2001; Schraw & Lehman, 2001). The idea of situational interest is closely related to environmental learning resistance (Taylor, 2014; 2016).

Contrasted with personal and situational interest is a distinct type of interest referred to as *state* interest (Krapp, Hidi, & Renniger, 1992). State interest is used to recognize the fact that at any given time an individual may or may not be in a state of interest. Anderman and Wolters (2007) provide a cogent explanation of how the state of interest is related but distinct from personal and situational interest by writing that "When individuals are in this state of interest, it may represent the activation of some ongoing personal interest, or it may be the result of a situationally interesting context, or some confluence of both influences" (p. 375).

This focus on interest and its relationship to motivation brings to mind a similar but converse construct discussed and researched by Sawin and Scerbo (1995); Taylor, Kass, Vodanovich, and Stanny (2000); and Kass, Vodanovich, and Callender (2001) which focuses on a distinct *lack* of interest referred to as either state boredom or trait boredom (also known as boredom proneness). State boredom has been defined as "a state of relatively low arousal and dissatisfaction which is attributed to an inadequately stimulating environment" (Mikulas & Vodanovich,1993, p. 3), while trait boredom, or boredom proneness is defined as "…experience[ing] varying degrees of depression, hopelessness, loneliness, and distractibility. Common tasks are perceived as requiring effort, with dissatisfaction with one's work and psychological well-being" (Farmer & Sundberg, 1986, p. 14). The constructs of state and trait boredom are mentioned here because they seem to address the same set of issues from the opposite direction than that of interest.

The academic relationship between interest and boredom roughly parallel that of looking at motivation on the one hand versus resistance on the other. While both approaches are useful, and looking at interest might seem more positive, it does make sense, if one wishes to be learner centered, to look into the specific reasons a given learner might actually be bored.

Attribution Theory

Another cognitive theory of motivation is attribution theory (Peterson & Schreiber, 2012; Weiner, 1985, 1986), a theory that takes into account an individual's emotional experiences as well as their motivation. Attribution theory was originally developed by social psychologists (Heider, 1958) to explain the social-psychological dynamic involved in assigning meaning and cause to specific events and behaviors. Simply put, when individuals are exposed to a certain behavior, such as another individual cutting in front of a line, an attribution is made as to why that behavior occurred (the line cutting). The first individual would either make a dispositional attribution (the person is rude) or a situational attribution (that person must be having an emergency). While the former attribution connects that behavior to the line-cutter's personality or way of being (disposition), the latter attributes the behavior to external circumstances and thusly relieves the line-cutter of much of the responsibility for the behavior. It was Wiener that tied this established psychological theory back to education and learning. According to this theory, an individual makes attributions about those goals, achievements, and failures that have been set, obtained and experienced. According to Weiner, both one's attributions (dispositional vs. situational) and one's emotions share a reciprocal and symbiotic relationship which significantly influence the choices one makes. Since the attributions that one makes about a particular failure (for instance) - whether that failure was the result of internal factors (dispositional) such as low ability, or external (situational) factors, such as environmental interference, etc. - affect the way one feels about that activity, these feelings will in turn, influence motivation in the future.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Wiener adds complexity to his ideas by designating three different dimensions along which such attributions might be considered. *Locus* refers to, for lack of a better word, the location of the cause in terms of whether it is internal or external; *stability*, is used to identify whether the attributed cause is considered to be more or less permanent, or merely a local phenomenon which might change often over time; and *controllability* simply refers to whether or not the cause is under the control of the individual making the attributions. Locus as used here is related to Rotter's (1954) locus of control, and controllability is similar to Bandura's (1986) ideas of self-regulation. These three dimensions when examined in connection with one another allow for a startling number of combinations. One example of such a combination of dimensions would be as follows: If a student fails an examination, she may make an internal-stable-uncontrollable attribution, an example of which would be that she believes that the reason for her failure was low aptitude. Low aptitude, in this case would be an internal attribution (dispositional, to borrow from the original psychological theory); a stable attribution in that aptitude, as innate potential rather than level of knowledge or education, is, in her mind, relatively fixed and unchangeable; and an uncontrollable attribution in that one cannot presumably help having low aptitude. This example of internal-stable-uncontrollable represents only one of many potential combinations. Given this set of attributions, that learner is unlikely to remain motivated to engage in that situation. It is understandable that she would not wish to waste her resources in a pursuit that is destined to be without return.

Conversely, if a given student in the same situation believer that the exam failure was the result of an external problem (construction noise in the hallway), is unstable in that the construction will be of a limited duration, and controllable in that he can wear earplugs or request that he be permitted to take the test in a different location the next time. In this case, an attribution of external-unstable-controllable would leave lots of space for sustained motivation because there is room for the perception that future investments of energy will not continue to result in failure.

Boiled down, the primary substantive contribution of this theory is that it requires the motivational researcher (or practitioner wishing to motivate) to recognize affect when considering motivational theory or practice. Affect cannot be distilled out of any effective and accurate explanation of human motivation (Meyer & Turner, 2002) nor can it be disentangled from any form of learning (Illeris, 2007, 2011; Taylor, 2014).

Of course, Weiner was not alone in the inclusion of affect in motivational studies. Many others before and after him examined some aspect of the relationship between affect and motivation (Kagan, 1994; James, 1890; Zajonc, 1980; Thorndike, 1913; Zeidner, 1998; Lazarus, 1991; Schacter & Singer, 1962). Rosenberg (1998) identified three distinct levels at which affect could be evaluated, which he designated as traits, moods, and emotions. While traits are more reflective of stable, long-term differences between individuals, moods reflect an affective engagement which is less stable and permanent than traits but much longer lasting than the third category, emotions, which Rosenberg used to describe very transitory, situationally-driven psychological states. (For a more in-depth discussion of these levels, consult Kagan, 1994 for traits; Forgas, 2001, and Linnenbrink & Pintrich, 2002 for moods; and Forgas, 2001, Linnenbrink & Pintrich, 2002, and Schutz & DeCuir, 2002, for emotions). In a replication study (Weiner, 1986), the concept of using attributions for student ability and effort and to predict outcome emotions and future success was reexamined and results maintain the relationship between affect and motivation (Peterson &Schreiber, 2012) . Social Science theories such as *Affect Control Theory* (given rise by the work of a sociologist, Walter Reckless in 1973), also address that attributions that individuals make.

Learned Helplessness Theory

In 1967, Seligman and Maier discovered that dogs that were repeatedly given aversive stimuli that they were unable to escape, eventually gave up and stopped trying even once the ability to avoid the stimulus was provided. This dynamic was labeled learned helplessness and has been used for many years to understand human depression and its effects. This is not, in the strictest sense, a theory of motivation. It does however, provide useful illumination regarding how motivation might be elusive for those whose life experiences have led them to believe that the conditions of their suffering are not controllable. Applications for the classroom are easy to make. Students who believe they cannot influence the outcome of their success, no matter what they do, suffer significantly reduced motivation. Learned helplessness shares a relationship with attribution theory in that attributions are made regarding the controllability of the situation. Bandura's theories discussed below also share this commonality.

Social Cognitive Theories

Like achievement motivation theories, social cognitive approaches refer to more than one precise theory (Perry, Turner, & Meyer, 2007). This can lead to confusion because additionally, *Social Cognitive Theory* is often referred to as a single theory and refers to the work of Bandura (1986). In this chapter, when *social cognitive theories* (plural) is used, it can be considered a reference to the collection of theories which have come to be recognized as being social cognitive theories. When *social cognitive theory* (singular) is used, it can be taken to mean the work of Bandura and his associates (Bandura, 1986, 1997, 2001; Badura & Walters, 1963).

Social cognitive theories are an extension of Rotter's (1954) earlier social learning theory, and "incorporate constructs concerning individual's expectations and values, but expand the original cognitive framework by highlighting how students reconcile the personal and social to make judgments about self, likely outcomes, and values associated with tasks and outcomes" (p. 331). Bandura (1986) refers to *triadic reciprocality* in which the reciprocal interactions between behaviors, environmental factors, and personal elements are framed.

They also have the distinction of differentiating learning from performance and enactive versus vicarious learning (2007). Two of the most important constructs within social cognitive theories are self-efficacy and self-regulation. Both of these constructs fall under the realm of individual beliefs about competence and control (Schunk & Zimmerman, 2007). Competence beliefs are defined as "students' perceptions about their means, processes, capabilities to accomplish certain tasks" (p. 349). Control beliefs, on the other hand, are "student's perceptions about the likelihood of accomplishing desired ends or outcomes under certain conditions" (p. 349). Self-efficacy is a competence belief which refers specifically to peoples' beliefs about their ability to learn and perform activities at certain levels (Bandura, 1997). Self-efficacy is differentiated from self-concept, which has a more global and less domain-specific connotation, and from one's actual level of ability, which, of course, does not always reflect one's perceived ability. Self-efficacy can affect individuals across a wide array of learning contexts in a variety of ways (Bandura, 1997; Pajares, 1996; Schunk, 1995; Schunk & Zimmerman, 2007). It has been shown to influence which learning activities an individual chooses and which are avoided (Schunk & Zimmerman, 2007). Additionally, it can affect how much effort is expended, how persistent one is, and how much one actually learns (2007).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Self-regulation, or personal agency, is a control belief and another strong component of social cognitive theory, which refers to the perceived level of control (agency) one has in a given context. One's perceived agency is necessary along with an adequate level of self-efficacy in order for one to be motivated to engage in a task. Kadhiravan (2012) found that self- regulation in adolescents was significantly related to their achievement motivation. Students with high achievement motivation in turn feel the need to master difficult task, thus promoting effective regulatory capabilities. There are many things which can aid in boosting self-efficacy but perhaps the most important is that of mastery experiences, or highly successful experiences in the particular domain.

One must also consider the role and influence of gender when examining achievement motivation theories. Females are found to have higher achievement motivation when compared to that of males and showed better usage of self-regulated learning strategies being able to assess one's own performance and outcomes (Kadhiravan, 2012; Shekhar & Devi, 2012).

Goal Theories

Like many motivational theories, goal theories are referred to in the literature as a loose collection of related theories as well as a single unified theory (goal theory). Goal theory takes into account important relations claimed to exist among the goals, goal orientations, expectations, conceptions of ability, social and self-comparisons, achievement behaviors, and attributions (Linnenbrink & Pintrich, 2002; Pintrich, 2000; Schunk & Zimmerman, 2007). Goal orientation, perhaps the most important construct in goal theory, refers to one's purpose and focus when engaged in an achievement activity, or the purposes for engaging in the activity in the first place. (Anderman, Austin & Johnson, 2002; Pintrich, 2000; Schunk & Zimmerman, 2007). Two distinct types of goal orientations are mastery goals, which focus on the acquisition of knowledge, and performance goals, which focus on attempts to demonstrate competence by performing at a level greater than that of peers (Elliot & Harackiewics, 1996; Pintrich, 2000; Schrunk & Zimmerman, 2007). Other types of goal orientations are learning, task-involved, and task-focused goals, which are conceptually similar to mastery goals, and ego-involved, and ability-focused goals which are likewise similar to performance goals (Shcunk & Zimmerman, 2007).

There is much debate about the importance and effects of these different types of goals, but there appears to be some consensus that mastery goals are more desirable (Schunk & Zimmerman, 2007) because they "focus students' attention on processes and strategies that help them acquire skills and improve their competencies" (Schunk & Zimmerman, 2007, p. 358). Kaufman and Dodge (2009) found that mastery goals are both positively and significantly associated with feelings of relatedness to the professor and the value of the course.

One important distinction between these two types of goal orientations which is a possible contributor to the greater motivational benefit of mastery goals, is the relationship between the attainment of mastery goals and the enhancement of self-efficacy and the subsequent increase of positive affectation in the individual. When one achieves a mastery goal, a greater level of self-efficacy is experienced which, in turn, brings with it positive emotion. A higher level of positive emotion, along with the increase in self-efficacy, will serve to further motivate the individual in future activities. Performance goals, on the other hand, fail to facilitate these positive effects since the individual is comparing his achievement with another individual rather than comparing his or her most current achievement with her own past achievement. Both performance-approach and performance-avoidance goals may result in a barrier to feelings of relatedness (Kaufman & Dodge, 2009). Put another way, social comparison, brought about through

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

performance goals, does not facilitate enhanced learning strategies and techniques, the development of which would require routine critical self-assessment rather than the assessment of the achievement of others. There is support for many of the predictions of goal theory (Pintrich, 2000; Schunk & Zimmerman, 2007), perhaps the most important of which, in the educational setting, is that students with mastery goal orientations "demonstrated better cognitive monitoring, and use of learning strategies" (2007, p. 358).

Multiple Goals Perspectives

Others have adopted multiple-goals perspective on motivation (Pintrich, 2000, 2003; Elliot, 1999; Linnenbrink & Pintrich, 2002). In this approach an approach-avoid dimension has been added to both the mastery and performance goal orientations, creating a mastery-approach, mastery-avoid orientation; and performance-approach and performance avoid orientation. These additional approach-avoid designations refer to whether the individual is actually striving to "approach" the mastery goal, or "avoid" the opposite, or whether the individual is attempting to approach the performance goal, or avoid the opposite. In other words, in a mastery goal orientation, if the individual is attempting to obtain high standards, that individual could be said to have a mastery-approach goal orientation, while, on the other hand, if the individual was more concerned with not failing to meet high standards, therefore avoiding the task, that individual would be identified as having a mastery-avoid goal orientation. The same could be said for performance orientations. If one is most concerned with out-performing others, one is said to have a performance-approach orientation, while a performance-avoid orientation is assigned to one who is primarily concerned with avoiding any chance of performing in a way that is inferior to one's peers. While research has, to some extent, validated the benefit of mastery-performance goal orientations, there is little research on mastery-avoid orientations (Schunk & Zimmerman, 2007). Research on performance approach and avoidance goal orientations has had mixed results (Wolters, Yu, & Pintrich, 1996; Kaplan & Midgley, 1997; Wolters, 2004; Middleton & Midgley, 1997).

Up until this point, only goal orientations have been discussed. Another different but related construct is goal structure. While goal orientations refer to the personal goal orientations set by individuals, goal structures refer to the learning environment (classroom) structure in terms of its contribution to the learners within that environment choosing one goal orientation or the other. Anderman, Patrick, Hruda, and Linnenbrink, (2002) concisely describe this relationship by writing that "a central tenet of goal theories is that students' adoption of personal goals is influenced, at least in part, by the goal structures present in and promoted by the classroom and broader school environment" (p.244). When applying goal theories of motivation to the learning context, it is essential that goal structures be included in the analysis.

Motivational Systems Theory

Ford (1992) proposed a much more comprehensive motivational theory, taking into account goal content, and proposed that human motivation is a combination of three components, goals, emotions, and personal agency beliefs. In distinguishing between goal content and goal processes, Ford draws attention to the differences, respectively, between the consequences of a specific goal, and the specific processes one sets up by which to obtain that goal. When viewing motivation as the interaction of goals, emotions, and personal agency beliefs, one can develop a large number of possible combinations from which an equally large number of motivational explanations can be made.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Self-Determination Theory

Self-determination theory (Deci, 1980; Grolnich, Gurland, Jacob, & Decourcey, 2002; Ryan, Connell, & Deci, 1985) centers, to some extent on the difference between intrinsic and extrinsic motivation with a strong focus on the preference for the intrinsic. Three basic innate psychological needs, according to the theory, are competence, autonomy, and relatedness. Schunk and Zimmerman (2007) compared competence to White's (1959) need for "mastering the environment (Schunk & Zimmerman, 2007, p. 359). Autonomy refers to the similar construct personal agency and could be considered a feeling of internal locus of control. Relatedness draws in socio-cultural views (discussed later in this paper) and acknowledges the human need for connection and the subsequent internalization of social values. According to Beachboard, Beachboard, Li and Adkison (2011), increased relatedness to peers and faculty and higher ordered thinking were found to substantially predict educational outcomes.

Although not related to self-determination theory, the psychological theory of reactance illustrates the importance of individual autonomy. *Reactance Theory* (Brehm, 1966) describes the motivational force one experiences to resist a perceived loss of freedom. The common expression of this is what is so often colloquially referred to as reverse psychology. When one engages in reverse psychology he or she is playing on the internal motivation of the subject to want to do the opposite of what has been suggested. In these circumstances, it is the desire of the individual to demonstrate autonomy that results in the motivated behavior opposite of that suggested.

Research by Ryan (1993) has shown that when individuals believe that they have control over their environments, they achieve higher and are more resilient in the face of environmental challenges. Perhaps one of the most unsettling aspects of this theory is the implications of school and other formal learning environments (primary, secondary, undergraduate, graduate, and workplace training), what was earlier referred to as goal structures, and how that environment influences student motivation. Schunk and Zimmerman (2007) report that factors such as rewards, punishments, threats, deadlines, surveillance, and evaluations, cause intrinsic motivation to diminish. While empirical evidence on this effect is a bit more complicated than that (see Ryan & Deci, 2000), there is evidence to suggest that these structures are harmful to a learner's motivation. If this theory were to be accepted as an accurate explanation of student motivation, it would seem that the current educational system, at least in the U.S., is destined for failure or, at best, mediocre progress.

Socio-Cultural Theories

Socio-cultural theories, while inextricably tied to the work of Lev Vygotsky (1978), more broadly speaking, examine human motivation from a perspective which acknowledges the validity of the internal cognitive process but also accounts for the external social dynamics, and view the internal and the external as existing in a type of symbiotic relationship wherein each influences the other and neither can exist without the other. There are those that take a more limited view of internal cognition but for the purposes of this discussion, the more mainstream views will be provided. While there do not seem to be many coherent, stand-alone theories specifically addressing motivation within socio-cultural approaches to learning, motivation is, nonetheless, accounted for and addressed. In the following paragraphs, ideas such as the Zone of Proximal Development, Scaffolding, and co-regulation (models of co-regulated learning) will be discussed.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Two key constructs in socio-cultural theories are *participation* and *appropriation* (Perry, Turner, & Meyer, 2007). These constructs when taken together, indicate a learning dynamic in which people, rather than being mere products of their environments, create, or co-construct their environments (2007).

The Zone of Proximal Development (ZPD) refers to the area that exists between the child's current ability or development and the level of ability or development that the child could achieve with support and guidance (collaboration) with more capable peers (Woolfolk, 2008). Vygotsky claimed that cultural tools, including material as well as psychological tools, play a significant role in learning. Brophy (1999) promoted a motivational version of the ZPD, suggesting that teachers and learning contexts can serve to support students in ways that may facilitate, within the students, motivation to attempt certain learning goals for which they might not have on their own been motivated. Wood, Bruner, and Ross, (1976) coined the contemporarily popular term scaffolding to refer to all of the assistance, including clues, reminders, encouragement, examples, etc., which is provided to a learner in an attempt to foster that individual's learning independence. Models of co-regulated learning, include an "arena of co-regulation" which encompasses motivation, enactment, and evaluation, all within learning communities of support (McCaslin & Good, 1996; McCaslin & Hickey, 2001).

There is some dissension in the field over whether to focus on the internal processes of the learner in the context of the community, or on the participants work with others in the learning community to co-construct knowledge. This controversy seems to have served, to some extent, to stunt the creation of socio-cultural motivation theory. While many still try to conduct research and attempt to apply generalizations, Perry, Turner, and Meyer (2007) claim that one's "perspectives on motivation, posit beliefs, values, and expectations may be so tightly bound to the context in which they are co-constructed as to make notions of internalization and generalization, which are essential for self-regulation, irrelevant.

Humanistic Theories

Humanistic theories are centered most squarely upon the work of Abraham Maslow (1954) and Carl Rogers (1963). Generally speaking, humanistic theories "discuss individuals' capabilities and potentialities as they make choices and seek control over their lives" (Schunk & Zimmerman, 2008, p.351). Most noteworthy in humanistic theories is Maslow's (1954) *hierarchy of needs*, and Roger's (1963) *actualizing tendency* (related to Maslow's *self-actualization*), *positive regard*, and *positive self-regard*.

Abraham Maslow

Maslow (1954) believed that human beings have a number of motivations which are hierarchically arranged. Each level of the hierarchy, beginning at the bottom level, must be satisfied and fulfilled prior to the individual becoming motivated by the next level. These levels, beginning with the lowest level (that which must be fulfilled first) are: physiological needs; safety needs; belongingness and love need; esteem needs; and self-actualization, respectively.

While this theory has a great deal of face-validity and is useful when interpreting and understanding many human motivational needs and choices, it has been criticized for its proposed strictness of order (Myers, 2007) and many have been quick to point out that one may be self-actualized while starving to death. An example of this would be Ghandi, to name an individual, and faith martyrs to name a larger group.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Carl Rogers

Rogers agreed with much of what Maslow had to say and believed that the fundamental motivational drive for human beings was growth and the idea of achieving wholeness, the innate pursuit for which he designated the term actualizing tendency. According to Rogers, people have a need to have the feeling of being accepted, respected, and liked, feelings which, when summed up, are referred to as positive regard. Additionally, individuals have the need for positive self-regard, which is derived from personal experiences. Human beings strive, according to Rogers, to see a consistency between what they hope to be and what they feel that they are.

In particular, many adult educational theories and approaches are based in, or derived from humanistic thought such as Knowles (1970, 1980, 1984) andragogical principles and self-directed learning approaches (Tough, 1967, 1971; Knowles, 1970, 1980, 1984; Brockett & Hiemstra, 1991).

Psychoanalytic Theories

Psychoanalytic theory, based originally upon the work of Sigmund Freud, has been expanded over time to adjust for some of the inadequacies of the theory in its original form. Psychoanalysts now consist, most prominently of Neo-Freudians, and while subscribing to the explanatory power of the triadic mind, namely the id, the ego, and the super ego, have distanced the theory from Freud's almost exclusive view of the id (unconscious) as a reservoir of primitive, sexual drives.

One of the primary purposes of psychoanalytic theory is to bridge the gap between an individual's subconscious and conscious thoughts. In this way, the unconscious thoughts that were causing the individual to have emotional and psychological difficulties, can be brought to the forefront of the conscious mind and then be more adequately dealt with. Despite the tension between the psychoanalytic perspective's significant influence and contribution to the field of psychology and its notoriety in the same field, it does have something significant to contribute to the motivation canon.

Classic

The traditional psychoanalytic explanation for behavior and personality was proposed by Freud (1959). An in-depth discussion of Freud's ideas will be avoided in this context, but a brief mention of the general premise of the psychoanalytic perspective will serve to assist one in understanding contemporary revisions and uses of the theories. Freud believed the mind was segmented into three parts, the id, the ego, and the super ego. The id consisted of libidinal drives not consciously known to the individual. According to Freud, these drives were base and largely sexual in nature. More contemporary, or Neo-Freudians, consider this orientation to sex overstated at best and, at worst, erroneous. The ego contains our partially conscious perceptions, thoughts and judgements, and acts on what has been called the *reality principle* to curtail the drives and impulses and direct behavior in a more realistic way which will provide a greater level of health, success, and long-term happiness. The superego refers to the internalized subjective norms and acts as an individual's "conscious" in regulating behavior (the use of conscious here refers to the idea expressed when one has a "clear conscious" or "guilty conscious," rather than the opposite of unconscious).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

While much has been learned about human thought and many of Freud's ideas have been discarded in the face of better, more accurate explanations, the psychoanalytical perspective is still strong in contemporary psychology and is driven primarily by its recognition of the interaction of conscious and unconscious feelings and perceptions, rather than a purely primal, sexual unconscious. Of particular note, in terms of motivational psychology, is the idea of innate, libidinal drives, which an individual feels a natural sense of need to fulfill. One of the more noteworthy scholars writing from a more modern psychoanalytic view is the French psychoanalytic philosopher Lacan (2007).

Contemporary

Illeris (2002), relying on a qualitative research method which he refers to as "biographical research" (2002, p.204), integrates a psychoanalytic framework into a life-span motivational theory. In his typology, he addresses four primary phases of human learning which are, respectively, childhood, youth, adulthood, and mature adulthood (Illeris claims to be using Giddens' term (1993) mature adulthood). In this context, childhood lasts from birth to the onset of puberty and youth lasts from puberty until the "preconditions for a more or less stable adulthood are established" (2002, p.207). Adulthood lasts from the end of youth until the *life turn*. The life turn refers to the point at which ones' end of life is perceived as a realistic future event and is accepted or at least begun to be accepted and related to (Jensen, 1993, as in Illeris, 2002). This is a very fluid event which can take place anywhere between 45 and 65 (Illeris, 2002). Mature adulthood then, lasts from this time turn until the end of life. According to Illeris, children seek to "capture their world," youth, to "construct their own identities," adults to "pursue their life goals," and those in mature adulthood to "seek richness and harmony" (pp. 208-222).

This theory is similar to Maslow's (1954) theory in that it does not explain the mechanisms of motivation, instead merely explaining what it is that humans are motivated by, in a specific sense. In contrast to this, many of the theories mentioned thus far in this paper, such as expectancy-value theories, provide some basis for how one comes to be motivated by any given process or phenomenon. In the case of Illeris' theory of motivation and his stage typologies, he is using the elements of basic psychodynamic theory and human development to explain the mechanisms by which those in these different stages come to be motivated by the posited factors. The significance of this theory is that while all humans may have the underlying mechanism for motivation, each group is motivated by a significantly different set of factors. This type of variation serves to support specialized study and attention to those in each of these stages in addition to overarching, general motivational research. It could perhaps be said that the complex intertwining of psychoanalytic theoretical mechanisms and stage-contextualized motivational drives acts to create such diversity between the stages that each stage could be said to have its own mechanism, rather than just a different motivational objective. Either way, it does seem to credit the importance of a specialization in adult motivation, which is something that will be discussed later in this chapter.

ADULT LEARNER MOTIVATION

There has been some contention over the years regarding the difference, or lack of difference, between adult and non-adult learners (e.g., Brookfield, 1986; Hanson, 1996; Hartree, 1984). This is a significant debate because an entire field is predicated upon the belief/assumption that there is, indeed, a difference. The resolution of that controversy, while meaningful, is not necessary for our purposes here. However,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

one particular aspect, motivation, is highly relevant to this discussion and so must be addressed, at least in brief. There is an underrepresentation of research examining motivation among adult learners.

While the majority (though not all) of mainstream motivational theories explored in the preceding sections have been empirically tested in the context of childhood, they almost universally address the basic physiological, psychological, sociological facets of human beings, and as such are highly relevant to adult learners. Wlodkowski (2011) stands out in the field of adult education in that he has addressed motivation as it pertains to adult learners rather prolifically. His work has been of great value to the field, but does tend to hug the contours of adult education scholarship in a way that results in large volumes of important motivational theory being omitted.

He points to adult responsibility as the "cornerstone of adult motivation" (p. 96), and indeed that statement seems to be the cornerstone of his book. It is difficult to argue the logic of this assessment and I won't do so here. However, it is important to realize that while adults are generally oriented toward being responsible for their own actions, they don't necessarily feel responsible in any given learning moment to actually learn something. This is easily seen when thinking in terms of mandatory workplace and formal educational training contexts in the adult learning arena. Further, adults are faced with many situations in life in which they may choose to take on the responsibility of earning a certificate and/or diploma but this also is no guarantee that they will take responsibility to engage and learn during all moments in the process. It is in these "moments," however, that the professed teacher of adults must have the greatest conceptual grasp of all of the many facets of human motivation.

Beyond Wlodkowski, there are others who have contributed to the field of study. Scholars in the field of adult education have not been as prolific regarding motivational theory as have been those in other fields but there is, nonetheless, a modest collection to examine.

An examination of such literature would be incomplete without discussing the theories of Knud Illeris (2007; 2011), but for organizational purposes his ideas were addressed in the previous section. In the following paragraphs, Adult learning typologies (Houle, 1988), EPS (Boshier, 2005), Barriers to learning (Merriam & Baumgartner, 2007), self-directed learning motivation (Garrison, 1997), and the work of Zemke and Zemke (1995) will be examined.

Many adult education scholars have focused on the specific *things* that motivate adults, and by doing so have demonstrated, most likely inadvertently, their recognition that the adult learner may be subject to the same underlying psychological principles and mechanisms of motivation as are non-adult learners. This would cast adult learning, as a field of scholarship, as more of a context-specific investigation of learning, rather than an independent exploration of adult learning as a fundamentally distinct phenomenon. This has implications for questions related to the distinctions between mainstream educational psychology and adult education which, as mentioned in the above section, is an interesting but unnecessary facet of the discussion in this chapter.

Houle's Typology

Cyril Houle (1988) posited three different learning orientations into which all adult learners can be categorized, which are goal-oriented learners, activity-oriented learners, and learning-oriented learners. The names assigned to the three categories are all rather self-explanatory and refer to, respectively, those who engage in a learning activity in order to achieve some separate (other than learning for the sake of learning itself) goal; those who engage in a learning context for the sake of the activity itself and the social aspects of that context; and those who set out to expand their knowledge for the sake of

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

that knowledge itself. This typology is useful because, complex psychological theory aside, it leads an educator to realize that differences exist in terms of the motivations one has, conceivably even in the most homogenous groups, and to attempt to identify what the motivations might be for the individual learners in his particular context.

Education Participation Scale

Boshier (1991), constructed a forty-eight item Education Participation Scale (EPS). This scale, later reduced to forty-two items, is arranged into seven factors each containing six items. The seven primary factors are as follows: communication; improvement of verbal and written skills; social contact; educational preparation; professional advancement; family togetherness; social stimulation (escaping boredom); and cognitive interest. A cursory glance will reveal that these factors represent a more elaborate, or less-reductionist reflection of Houle's typologies.

Barriers

Conversely, there is substantial literature in the adult education field on the reasons adults do not participate. The two most commonly asserted barriers are lack of time and lack of money (Merriam, Caffarella, & Baumgartner, 2007). Johnstone and Rivera (1965) clustered reasons adults do not participate into two categories containing ten different barriers. The two categories were external (situational) and internal (dispositional). In a counterpart to the EPS, which looked at participation, Darkenwald and colleagues have developed a Deterrents to Participation Scale (DPS) which revealed six factors of non-participation which included lack of confidence, lack of course relevance, time constraints, low personal priority, cost, and personal problems (Darkenwald & Valentine, 1985).

Reference to Motivation

While motivation has managed to escape the spotlight in the field of adult education, it has been recognized through the years by many of its prominent scholars. Malcolm Knowles acknowledged that "most [adult learning] motivations are internal rather than external" (1984, p. 12); that the "readiness of an adult to learn is closely related to the developmental tasks of his or her social role" (1980, pp. 44-45); and that adults need to know why they need to learn something (1980). Garrison (1997) includes a motivational dimension in his model of self-directed learning, even though he remained vague about what that motivation might look like and suggested more research be conducted in that area; and Zemke and Zemke (1995), claimed that "when the conditions are right, adults seek out and demand learning experiences… the key to using adults' "natural" motivation to learn is tapping into their most teachable moments: those points in their lives when they believe they need to learn something new or different" (p. 32).

IMPLICATIONS FOR LEARNING RESISTANCE SCHOLARSHIP

Over and against the theoretical overviews of mainstream motivational theory, a number of important implications come into focus. I will address only two of the more significant implications in the final sections of this chapter.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Motivation Is Connected to Both Resistance and Engagement

It is impossible to address resistance to learning without also examining motivation. One of the many difficult facets of the resistance to learning construct that needs to be addressed is the nature of the relationship between motivation and resistance to learning. It seems inherently clear that there is a connection between the two, and it could seem as though the two might be, on some level, different sides of the same thing. That is, resistance might just be the absence of motivation. A closer examination, however, seems to reveal that motivational factors contribute to both resistance *and* engagement. An understanding of Goal Theory for instance, can more accurately direct us to "unmotivate" learners with regards to their avoidance goals while, simultaneously motivating them toward their approach goals. That is, learners are motivated to resist just as they are motivated to resist. The common one dimensional view of learning motivation has teachers everywhere working merely to motivate learners to "get with the program," rather than working to more deeply understand the learners' various motivations to avoid learning and resist. Viewing motivation as an explanatory backdrop for the resistance-engagement continuum (rather than just viewing it in connection with either resistance or engagement alone) can give rise to many different conceptualizations of the teaching-learning dynamic and practical applications for the teaching process.

Low Motivation Mediates Learner Resistance

Of course, there is no new revelation here. One might have suspected as much before laboring through the long pages of the previous sections. But having a feeling about something and being able to articulate it substantively are two different things. When I first began looking at motivation, I was asking, 'how is motivation related to resistance to learning?' It is my assertion that motivation, or rather, low motivation, mediates the causal relationship between all learning resistance predictor variables and resistance to learning behavior and cognitions. Preliminary results from some early studies seem to provide some evidence for this dynamic but future investigation is required (Taylor, 2010; 2016). An in-depth discussion of mediation modeling will be avoided in this context but to clarify the use of the word "mediates" the following guideline provided by Baron and Kenney (1986) should be helpful.

A variable functions as a mediator when it meets the following conditions: (a) variations in levels of the independent variable significantly account for variations in the presumed mediator (i.e. path a), (b) variations in the mediator significantly account for variations in the dependant variable (i.e. path b), and (c) when Paths a and b are controlled, a previously significant relation between the independent and dependent variables is no longer significant, with the strongest demonstration of mediation occurring when Path C is zero. (p. 1176)

In this case, it is suggested that the independent variable is any one of the constructs discussed elsewhere in the resistance literature, such as *boredom,* the dependent variable (outcome) is the resistance behavior or cognition, and the mediator is low motivation. Using the Baron and Kenny (1986) criteria of mediation, that low motivation can be said to be a mediator if: (a) variations in the level of boredom in an individual result in a significant variation in the level of motivation, (b) variations in motivation significantly account for variations in resistance behavior(s) or cognition(s), and (c) when motivation is controlled for in analysis, the previously significant relationship between boredom and the resistance behavior(s) and cognition(s) is no longer significant.

Studying Learning Resistance Beyond Motivation Is Both Positive and Important

Another early question was, given the relationship between motivation and resistance to learning, and the extensive focus on motivation in educational psychology, why is it important to formulate a model of resistance to learning*?* This is related to the question of why one should focus on what can seem like a negative dynamic (learning resistance) rather than a more positive approach based on human strengths (positive psychology). In keeping with this dichotomy, each of these parts will be addressed in this section.

Learning Resistance Is Important

First, when studying motivation, one is often studying the underlying mechanisms by which human motivation is powered. This indeed is a helpful enterprise for many reasons, not least among them the opportunity to understand such mechanisms in a way that will allow the would-be motivator to more successfully and efficiently develop motivational practices and programs. Simply put, we apply more efficiently and successfully what we understand more deeply and clearly. There are however, practical limitations of this line of study in that one must often engage in great effort to usefully apply the knowledge.

Motivation, often a supremely practical phenomenon, suffers the same natural theory-practice gap as does any other element or factor subjected to scholarly examination. On the other end of the spectrum, in the anecdotal realm, teachers, coaches, business owners, managers, and parents, dedicate great focus to understanding the practical, day-to-day components of motivation. In these cases, what motivates takes precedent over an understanding of why it motivates. Again, simply put, the pragmatic is in most cases not subject to the theory-practice gap for the fundamental reason that it is created and recognized in action (in situ) while embedded in a physical context. And herein lies the connection to the approach chosen here to examine the overall dynamic from the resistance end – it is at once both learner-centered and pragmatic.

Learning Resistance Is Not Deficit-Based

Second, choosing to examine teaching and learning from a learner resistance perspective, is simply not based on a "deficit model." However, it is a reasonable assertion, at least on the surface, and should be answered. The rise of positive psychology has brought with it, like almost all things, both good and bad, useful and problematic. While shifting the focus to human strengths, and away from the places where human beings were demonstrating weak or damaged behavior, and/or behavior of which greater society disapproves, it also brought with it a pendulum swing to the other side of balance where only human strengths can be looked at, and all other approaches are potentially negative and marginalizing.

At a closer look, however, that situation cannot be applied to the present case for at least one clear reason. The conception of learning resistance provided in this chapter is, as I have already pointed out, not about negative behavior, per se. Rather it is about a lack of openness and engagement in the learning process writ large. In fact, many times the resistance that learners invoke in a given learning situation is well-merited and represents rather sound decision-making. Brookfield (2006) pointed this out while weighing in on the subject some years back (though he was defining resistance in a slightly different way, perhaps).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In this case, it is the lack of openness that is the problem, not the behavior that indicates its presence. In this case, there is no a priori assumption that something is "wrong" with the learner to begin with. There may be, in fact, an assumption that something is wrong with the *environment*. Looking at learning resistance is about attempting to find out what is going on, from the learner's perspective, and seeing if anything can be done about it.

Going further, specifically because of, rather than despite the direction it approaches from, learning resistance scholarship is highly learner-centered and practical. Learning resistance scholarship starts with the individual learner, asks what that individual learner is doing, asks the individual learner why she or he is doing it, and then sets out to rectify the situation and create a more efficient learning environment.

Trying to improve everything that is going well in a learning experience, and choosing to boost the individual strengths of the learners in a given learning situation, is not the same thing as attempting to address the learner's actual difficulty in the first place. When a student engages in learning resistance in the classroom, there is always a reason. Some of these reasons may be deemed more legitimate by some than others, but it would be difficult to deny the presence of a reason to being with. To mitigate learning resistance is to give voice to the learner and to address the specific reason that the learner is consciously or unconsciously, closing off to the given learning experience. Because of this, it is both learner-centered, as well as practical.

Finally, to add the power of anecdote, one might consider that when visiting a restaurant and having a particularly serious problem while attempting to dine, anything short of the manager acknowledging and addressing the specific problem would come across as somewhat less than helpful and probably a little marginalizing as well. Hearing the manager prattle on about all of the positive points of the experience would most likely not satisfy the customer.

Meeting the learner where they are, connecting with the learner, and helping the learner shift to a place where the material can be critically and openly reflected upon, is an intensely leaner-centered and service-oriented way to give voice back to the learner.

As such, the line of scholarship itself simply must not be confused with the given ways that resistance mitigation skills might be evoked (negatively) from time to time. What the ability to mitigate learning resistance is, and how one uses that ability are two distinct things, much like how the power of education and how it is used are different things.

The development of a comprehensive understanding of learning resistance and the motivational theories to which it is connected represents a complex integration of these two realms of investigation. While each of the two approaches is useful and important on its own merit, a combination of the two into something which will provide specific practice-related implications and detailed plans of action, while at the same time being based upon the great and empirically honored canon of motivational research can only serve to advance the progress of academic and practitioner alike. The combined strength of these two approaches could provide invaluable support to the world of professional training and development in a way that neither of the two formerly mentioned approaches could on their own.

CONCLUSION

When looking at all of these motivational theories together a number of observations are salient. First, nearly all of the theories are related in some way or another (with some exceptions), drawing from many of the same concepts and factors but viewing them in different light and placing them in different levels

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

of prominence. This assessment serves to bring to the forefront the impossibility of reducing the concept of human motivation into one concise generalizable theory (a pursuit driven by theoretical reductionism). It may be that the best way to view these theories is as "different lenses, each of which may be particularly capable of revealing certain features" (Rosen, 2006, p. 53).

Second, motivation is linked to both engagement and resistance. While traditionally teachers and trainers speak of ways to motivate their learners/students, meaning motivate them to learn. Less is said about specifically seeking out the valid motivations learners may have for avoiding the stress of learning and attempting to demotivate learners in those particular areas. Seeing motivation as a bi-directional dynamic by viewing it as a backdrop for a continuum that stretches between resistance and engagement, provides a way of speaking about and addressing these issues more fully and holistically.

Third, resistance to learning, no matter which construct of the given model is utilized, is likely mediated by low motivation. That is to say, each of the potential causal factors cause resistance behaviors and cognitions because of the state of reduced motivation produced from that causal factor.

Fourth, learning resistance research is not based on a deficit model of human learning. Focusing on learning resistance as one (of many) points of departure when facilitating learning is a very learner-centered approach in that it comes alongside the learner, attempts to understand the learner's world, and moves in a collaborative manner with the learner from resistance to engagement. Acknowledging learner resistance respects and promotes the dignity of the individual learner.

Fifth and last, despite the close connection with motivation, resistance to learning is important to address because of its real-world, pragmatic, and anecdotally recognizable features. Put another way, motivational theory represents an underlying mechanism (or, more accurately, mediation) for a much more visible set of constructs and behaviors. In an organizational setting it would be a great deal more practical and beneficial to address overconfidence among employees and related corrective measures, than to discuss in-depth, theoretical motivational constructs.

KEY TERMS AND DEFINITIONS

Emotion: Physiological response to stimulus.

Feeling: Totality of feeling and cognitive assessment/assignment of that feeling in relationship to the context.

Learning Engagement: The intentional mobilization of emotional, physical, emotional, and cognitive resources toward learning in a given situation.

Learning Motivation: Processes that give rise to energy and direction for learning engagement.

Learning Resistance: A state in which a learner is not open to learning in a specific learning situation as demonstrated through either active rejection or passive disengagement.

Learning Resistance Approach (LRA): An approach to fostering learning that attempts to understand, from the perspective of the learner, the many potential reasons why that learner might fail to engage in a learning situation, and then seeks to address those concerns through curricular, and instructional changes.

Chapter 13
Social Justice and Advocacy in University-Based Play Therapy Training Clinics

Emily C. Brown
https://orcid.org/0000-0002-2376-0497
University of Missouri – St. Louis, USA

Emily Oliveira
University of Missouri – St. Louis, USA

ABSTRACT

This chapter examines how university training programs and clinics can help play therapists develop social justice advocacy competency. Developing social justice advocacy can help play therapists understand social inequalities and oppressive systems, experience empathy with clients, and integrate advocacy action into their work. Training programs can help facilitate social justice advocacy for students through curriculum focus, service learning, and continuing education opportunities that promote awareness and empathy. Play therapy services offered in university clinics also offer opportunities for interns to increase understanding of social justice advocacy through client interactions and clinical supervision. Clinic directors promote social justice advocacy through managing just organization procedures and coordinating advocacy and outreach initiatives.

INTRODUCTION

According to the *Play Therapy Best Practices: Clinical, Professional, & Ethical Issues* published by the Association for Play Therapy (APT, 2016), training programs should include a focus on diversity issues. This is imperative as play therapists are serving increasingly diverse clients. Currently, almost half of children in the United States are racial and ethnic minorities, and it is estimated that more than 64% of children will be from racial and ethnic minorities by 2060 (Colby & Ortman, 2015). Mental health

practitioners need cultural competence to respond to the needs of children and families in an increasingly diverse society, and the need for multicultural play therapy has been addressed in the play therapy literature (e.g., Davis & Pereira, 2014; O'Connor, 2005).

In addition to developing multicultural competence, mental health practitioners provide social justice advocacy to better serve clients. This is an intentional practice of seeking to meet the needs of disenfranchised clients based on an awareness of privilege, social inequality, and oppressive systems. Social justice advocacy can help clinicians understand and address the effects of social equalities and oppression on well-being. One framework for the integration of multiculturalism and social justice is provided in the Multicultural and Social Justice Counseling Competencies endorsed by the American Counseling Association (ACA; Ratts, Singh, Nassar-McMillan, Butler, & McCullough, 2015, 2016). To facilitate the development of these competencies, mental health training programs are tasked with providing education and supervision for mental health practitioners (Ratts et al., 2016). Play therapy training programs also need to provide multicultural training and awareness for play therapists on issues of diversity and social justice (Parikah, Ceballos & Post, 2013). Specifically, Parikah and colleagues (2013) recommended play therapists engage in "empathy training, activities that increase dialogue and immersion, the use of case studies, and role play . . . to increase their empathy and challenge their [belief in a just world], which may lead to an increase in their [social justice advocacy]" (p. 250). Parikh and colleagues (2013) suggested social justice advocacy attitudes could help play therapists enhance empathy in relationships with children and integrate advocacy into their work.

Despite recognition of the need for social justice advocacy training for play therapists, APT's (2016) guidelines have little to no information on advocacy, outreach, or social justice work. Therefore, this chapter provides university based play therapy training clinics with information on furthering social justice advocacy competencies in training programs with recommendations for training, clinical services, advocacy, and outreach efforts.

TRAINING PLAY THERAPISTS FOR SOCIAL JUSTICE ADVOCACY

Mental health practitioners recognize cultural competence and social justice as components of ethical practice (ACA, 2014; APA, 2017; NASW, 2017). Social justice includes understanding issues of oppression, privilege, and equality and taking social action for equity (Lee, 2012). Mental health practitioners use this understanding to provide social justice counseling considering "the impact of oppression, privilege, and discrimination on the mental health of the individual with the goal of establishing equitable distribution of power and resources through social advocacy" (Chang, Creather, & Ratts, 2010, p. 84). These principles and practices are rooted in a belief in a just world where all people have access to resources needed for physical and mental health. This professional call for social justice is embodied through advocacy actions with and for clients at various systemic levels.

To prepare mental health practitioners for multicultural and social justice counseling, training programs need to increase students' self-awareness, knowledge, and skills to take action (Ratts et al., 2016). Training that encourages advocacy action may be particularly salient given potential gaps between social justice advocacy perceptions and practice. Steele, Bischof, and Craig (2014) found many counselors believed social justice advocacy was important but fewer reported engaging in social justice advocacy action. Therefore, additional professional development and training may be needed to prepare mental health practitioners for advocacy action. Play therapy training programs can help address this through

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

curriculum and continuing education. All of these training efforts help prepare students for clinical work in a university based play therapy training clinic and in future practice.

Graduate Coursework

Play therapists can develop social justice advocacy perceptions and practices when engaged in classroom instruction across the curriculum. Providing opportunities for reflection, experiential learning, and application helps students develop as social and advocacy-oriented practitioners (Hill, Harrawood, Vereen, & Doughty, 2012). To facilitate knowledge on counseling children in the training curriculum, instructors are encouraged to include case study examples of children. Instructors can also help play therapy students gain knowledge through a systems approach to client conceptualization and treatment planning. As students reflect on case examples, they should consider experiences of oppression, ecological factors, and therapeutic needs for children and families.

Even in classes that traditionally focus on adult clients, instructors could help play therapists develop social advocacy by incorporating examples of the impact of parental behaviors or mental illness on children and families. For example, discussing parental addiction and incarceration in an addictions course can help foster students' advocacy knowledge and skills when providing play therapy for families with these experiences. Case examples in psychopathology or diagnostic courses can include childhood examples of mental illness. Infusing discussions of childhood adversity and trauma across coursework can help play therapists gain perspective on systemic barriers and marginalization experiences connected to discrimination, poverty, homelessness, immigration, or mental illness. Also, students should develop an understanding of inequities in educational settings to more fully understand systemic barriers faced by school-age clients. Students should be encouraged to reflect on their developing awareness through class discussions and journaling for increased personal insight and growth.

Play therapy training programs offer play therapy specific coursework, such as Introduction to Play Therapy or Advanced Play Therapy courses. Assignments in these courses offer opportunities for experiential learning to develop multicultural and social justice counseling skills. APT (2010) provides a sample syllabus of an introductory play therapy course that recommends teaching practices in the course that help students "1) become and remain aware of their own cultural backgrounds, influences, and biases . . ., 2) acquire and continuously seek knowledge about how cultural backgrounds, influences, and biases operate in the lives of their clients, and 3) demonstrate culturally-appropriate therapeutic skills" (p. 3). These guidelines demonstrate the process of developing cultural competency. Within an introductory course, students can reflect on the influence of their culture on personal childhood play, cultural and diversity considerations when selecting materials for the playroom, and cultural implications when working with children experiencing adversity and oppression. Reflective practices in the course should help play therapy students explore biases and assumptions that can hinder empathy (Parikh et al., 2013). Students should also have opportunities for experiential learning, such as role play and providing practice play sessions with a "normal" child (APT, 2010). With this work, play therapy students could also reflect on cultural influences in the relationship established with the child and have opportunities to practice clinical conceptualizations from a systems perspective to prepare for social advocacy.

To help play therapists develop a systems perspective, graduate instructors can introduce Ecosystemic Play Therapy (O'Connor, 2016). Ecosystemic Play Therapy is a metatheory that requires play therapists to recognize and respond to the contextual systems of the child and family. This approach could help play therapists learn to consider how the child's presenting problems are linked to difficulties in vari-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

ous systemic levels (e.g., individual, caregiver, school, community, medical, judicial) and to develop treatment goals that meet client needs in these systems. Within this approach, students should be taught appropriate advocacy roles and personal and professional boundaries (O'Connor, 2016). Introducing this content and systems perspective can help play therapists understand the impact of various systems on children and learn to intervene for and with clients for social justice and advocacy work.

Graduate coursework in filial therapy is also recommended in university play therapy training to prepare play therapists for social justice advocacy work with families. Indeed, the preface for Landreth and Bratton's (2006) filial training text states mental health professionals must "empower parents to become therapeutic agents with their own children" (p. viii). Filial therapy has been implemented with families from diverse racial and cultural groups and with various presenting problems. For example, research supports filial therapy interventions with various trauma histories, including abuse (Costas & Landreth, 1999), family violence (Smith & Landreth, 2003), parental incarceration (Harris & Landreth, 1997), and foster care (Carnes-Holt & Bratton, 2014). These vulnerable children with trauma histories are often involved with child welfare and social service agencies, and play therapists need an understanding of these experiences and systems for social justice advocacy. Teaching filial therapy approaches to play therapists provides them with advocacy skills and knowledge that can be used to equip and empower caregivers with needed support and resources.

Service learning offers another opportunity to prepare play therapists for social justice counseling and advocacy through application of play therapy skills. Service learning should provide volunteer service opportunities in the community that are beneficial to participants and students (Baggerly, 2006). In addition, service learning activities include reflective practices for students to synthesize learning across contexts. Parikh et al. (2013) suggested activities that increase immersion could help play therapists develop empathy and gain new perspectives towards social justice advocacy. Several examples of play therapy service learning opportunities are found in the literature. These include play therapy at a federally funded preschool (Thanasiu, Rust, & Walter, 2018), play therapy at an elementary school with a play buddy program (Smith-Adcock et al., 2012), group play therapy services at an after-school care center (Baggerly, 2006), and an 8-week filial group for urban preschool parents (VanderGast, Post, & Kascsak-Miller, 2010). Graduate students provided play and filial services for high poverty children and families in each of these service learning examples. These examples highlight the mutually beneficial design of service learning activities that promote student learning and meet community needs. When designing service learning opportunities, course instructors and clinic directors should infuse social justice advocacy opportunities within communities where no cost play therapy services may be most needed.

Continuing Education

Universities can also provide play therapy training through continuing education opportunities. Since play therapists need continuing education in multicultural issues (APT, 2016), university based play therapy training clinics can offer training and help develop social justice competency for play therapists working in the community. For example, training clinics can host a summer play therapy conference. At the conference, affiliated program faculty can provide play therapy professional development for school counselors and community partners. Professional development with a social justice focus could include education on using play therapy to foster resilience for children and families from diverse cultural backgrounds or on advocacy approaches given disproportionate rates of adverse childhood experiences for children of color and children living in poverty (Sacks & Murphy, 2018). Clinic directors should use their

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

awareness of community needs to inform topics of focus. For example, community needs assessments (such as those conducted by the United Way or other non-profit agencies) may highlight mental health or wellness needs of children and families. Clinic directors could connect professional development to this data to help mental health practitioners and play therapists respond to community needs. These efforts help integrate social justice and advocacy into professional development offered by the university based play therapy training clinic.

PROVIDING PLAY THERAPY SERVICES

Play therapy training clinic directors seek to provide exceptional clinical training experiences for students and play therapy services for clients. Promoting social justice advocacy in the play therapy training clinic involves careful reflection on organizational procedures and clinical supervision practices that affect the learning and experiences for students and clients.

Organizational Procedures

When providing play therapy services in a university based play therapy training clinic, one strategy for promoting social justice advocacy is to provide services at an affordable rate or through a sliding scale. Providing services using a sliding scale fee is common practice in university training centers (Aubrey, Hunsley, Josephson, & Vito, 2000). The sliding scale fee is typically set based on the client's income and number of people in the household. When clinics offer services at a reduced rate or pro bono, they enable access to play therapy for marginalized populations without creating a financial barrier. University based counseling clinics or play therapy training clinics often serve populations that belong to a lower socioeconomic social class bracket. When fees for services are adjusted to a level that is commensurate with the client or families' ability to pay, client attendance and outcome are not impacted (Clark & Kimberly, 2014). Some practitioners may argue against setting differential or sliding scale fees; however, the literature suggests that differential fees set according to income do not influence client attendance (Clark & Kimberly, 2014) or treatment outcomes (Aubrey et al., 2000) in any way. Therefore, offering a differential fee scale is a social justice approach to alleviate a financial burden to play therapy services for some clients.

Some strategies for supplementing fees in a university based play therapy clinic for clients with limited access to financial resources or in rural communities include eliciting gift funding from donors, applying for grant funding at the local, regional, state or federal level, or developing agreements with state agencies. Gift funding can be elicited by reaching out to the university foundation or advancement office as well as alumni from graduate programs. Previous or current faculty may be additional sources of gift funding to support play therapy services for low-income families in the training clinic. Clinic directors can also apply for grants from agencies such as the department of Health and Human Services, local and state Mental Health Boards, professional organizations, or private foundations to supplement fees for play therapy services in a university based training center. Finally, some state agencies such as Child Protective Services, departments of Child and Family Services, or state or local programs for children with disabilities may be able to support children by paying for play therapy services at a university based play therapy training clinic. Clinic directors can reach out to these partners and organizations to

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

establish funding agreements, and this is a social justice advocacy approach given the potential to reduce financial barriers to play therapy services.

Clinic directors should also ensure play rooms at the clinic have diverse toys and toys that represent a variety of potential life experiences for children who may have experienced trauma (O'Connor, 2005). This is needed in social justice play therapy given disproportionate rates of adverse childhood experiences experienced by children of color and children living in poverty (Sacks & Murphy, 2018). For example, play rooms can include handcuffs, police cars, guns, and phones when working with children of incarcerated parents or victims of crime (Brown & Gibbons, 2018). Play rooms can be equipped with ethnically diverse dolls, foods, and dress up clothes to allow for expression for children of any culture (Davis & Pereira, 2014). Understanding individuals within their contexts and environments is a component of multicultural and social justice counseling (Ratts et al., 2016), so playrooms should be equipped with various toys connected to the child's related systems levels (O'Connor, 2016). Play therapy training clinic directors can help ready playroom materials for interns by considering diverse experiences of potential clients.

Before the intake session, clinic directors can develop culturally responsive organizational procedures that respect the diverse needs of clients. Culturally competent organizational procedures include offering cultural skills training for the administrative staff answering the phones in the training clinic, asking caregivers about therapist expectations and preferences, and offering intake forms in other languages (Whealin & Ruzek, 2008). Care must be taken in university play therapy training clinics to match children with play therapists with the experience and training to connect with diverse children and families. For example, if a child with a disability is referred to the training clinic for play therapy services, best practice would suggest that the child be matched with a practitioner who has experience or training in working with individuals with disabilities. Altogether, play therapists should be actively considering how diversity is connected to the experiences of the child and caregivers. It is important for children and caregivers to trust the play therapist's appreciation for the client's culture. Clinic directors can ensure multicultural training is a prerequisite for clinical experiences.

Clinical Skills and Supervision

Training clinics are likely the initial setting where graduate students provide play therapy services for actual clients. Therefore, interns will be providing play therapy with varying levels of competence and familiarity related to diverse demographic factors (e.g., ethnicity, nationality, religious orientation). For example, play therapists may have an initial encounter with children who are refugees in the university training clinic. In this scenario, play therapy interns should consider personal assumptions or perceptions about refugee status, build knowledge on the potential refugee experiences of oppression and advocacy needs faced by children and families, and review the literature on play therapy with refugee populations (e.g., Schottelkorb, Doumas, & Garcia, 2012) to apply this knowledge and skills with clients. All of this clinical work should be done with an awareness of social justice advocacy.

Evaluating clinical skill development is a crucial component of university play therapy training connected to clinical services. As students provide play therapy services in university clinics, instructors and supervisors must provide feedback on their clinical skills. One approach to documenting skill development is through a skills checklist form to provide formative and summative evaluation data. Training programs can include social justice advocacy skills on these program checklists to monitor the development of these skills.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Social justice advocacy competencies for play therapists include skills and actions needed for working with and on behalf of individuals, family systems, institutions, communities, and beyond (Ratts et al., 2015). Examples of these competencies are included in the Multicultural and Social Justice Counseling Competencies (Ratts et al., 2015). However, many of the recommended social justice focused conversations are beyond the scope of children receiving play therapy, so conceptualizing these competencies for play therapists requires using a family systems approach to clinical services. Ackerman (2017) provided a model for integrating social justice advocacy in child welfare that may prove helpful to play therapists when working with marginalized populations. Based on these recommendations, specific competencies for social justice advocacy should include the ability to initiate conversations with guardians about ways "culture, stereotypes, prejudice, discrimination, power, privilege, and oppression" may influence presenting problems and counseling relationships (Ratts et al., 2015, p. 11). Play therapists should be ready to explore with guardians the relationships children have with family, friends, and peers. Play therapists also need skills to empower children and caregivers to identify supportive adults at school, daycare, or other relevant settings who can address inequities in those settings (Ratts et al., 2015). Play therapists may need to provide information for supervisors to be able to evaluate competency for social justice advocacy skills as some of these actions may occur during phone consultations rather than video recorded sessions in the clinic.

All interns providing play therapy in the training clinic receive clinical supervision from an individual trained in supervision methods and skills. Clinic directors and affiliated program faculty often provide supervision for play therapists or for doctoral student supervisors who provide supervision for interns. Ideally, supervisors should have play therapy knowledge and experience to supervise play therapy interns in the university play therapy training clinic. Offering group supervision from a Registered Play Therapist-Supervisor (RPT-S) is recommended if individual supervisors are not trained in play therapy. Supervisors help play therapy interns understand privilege, marginalization, and the need for establishing supportive relationships with culturally diverse children, families, and communities (Ratts et al., 2016). Additionally, multiculturally competent play therapy supervision provides space for supervisors and supervisees to explore personal culture and views on play in a supportive environment (Drewes, 2008).

One model of social justice supervision recommends supervisors engage supervisees in Goodyear's (2014) pedagogical processes of modeling, feedback, direct instruction, and self-directed learning in each of three key areas: supervisory power relations, reflective practice, and advocacy skills (Asakura & Maurer, 2018). To foster the development of social justice advocacy, play therapy clinical supervisors should directly address issues of culture and power in the supervisory dyad, discuss supervisee's values and biases that influence perceptions and advocacy behaviors, and explore strengths and areas for growth as advocates (Glosoff & Durham, 2010). Additionally, supervisors can use questionnaires or structured measures, such as the Social Justice Advocacy Scale (Dean, 2009) and Social Justice Scale (SJS; Torres-Harding, Siers, & Olson, 2012), to help play therapists explore social justice advocacy readiness and reactions to such instruments (Glosoff & Durham, 2010; Parikh et al., 2013). Play therapy supervisors help prepare play therapists to be social justice advocates.

ADVOCACY AND OUTREACH EFFORTS

There is a strong need for advocacy and outreach efforts in university based play therapy training clinics in order to both advocate for play therapy services and to advocate for marginalized populations.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Advocacy involves using one's voice or standing to institute change (Wright & Jaffe, 2014). Advocacy is important in all aspects of mental health training, particularly when serving children who often lack the platform and power to change oppressive systems that are affecting them (Wright & Jaffe, 2014). Clinic directors have various ways in which they coordinate and provide social justice advocacy through promoting access to play therapy services, establishing community partnerships, and modeling best practices for child advocacy.

University programs increase access to play therapy services in school and clinical settings across their communities through the training of future play therapists. Social advocacy includes ensuring clients are aware of and have access to services within social institutions. University based play therapy training clinics provide access to services for clients when social institutions do not have a trained play therapist. Therefore, clinic directors should work to make other mental health providers aware of the play therapy services offered at the clinic. Clinic directors can promote awareness of services for marginalized populations by ensuring stakeholders have information about the training clinic and play therapy services. Providing flyers about play therapy services to local schools and non-profit agencies, such as those serving children and families experiencing poverty, neighborhood violence, relocation, or parental absence, may help disenfranchised families know about available low-cost play therapy services in the university training clinic.

Child Advocacy Efforts

Successful child advocacy includes efforts that seek to institute a positive change for children (Wright & Jaffe, 2014). There are different levels of advocacy depending on the population or system of professional focus. Advocacy for a particular child or small group of children is considered micro or case advocacy. Play therapists may engage in this advocacy by becoming an advocate for a child in a classroom or helping a guardian seek changes for their child. Community or group based advocacy is known as mezzo advocacy (Wright & Jaffe, 2014). Examples of mezzo level advocacy include leading a training on trauma for all educators in a school setting or advocating for a community through work at a university based play therapy training center. Advocates that work at the macro level seek to address a concern that affects a large group at the state, national, or international level. Before engaging in advocacy, it is important for clinic directors to identify end goals to appropriately identify advocacy targets (Wright & Jaffe, 2014).

Once a problem or concern has been identified for advocacy, clinic directors can determine resources necessary for an advocacy plan. The development of a coalition of allies is one way to help distribute the workload of advocacy within the organization and to recruit other professionals to help with the project. This could take the form of a board or committee, and is typically an alliance of individuals, organizations, or other like-minded individuals who are acting towards a common goal (Wright & Jaffe, 2014). Play therapy training clinic directors could be involved with a regional coalition of child and family mental health providers. Such groups could meet monthly or quarterly to discuss trends and support social change in the community. If seeking to start a coalition, clinic directors should identify potential partners (e.g., partnering school counselors, referral agency staff, program alumni, play therapists, and other faculty) and develop objectives for the coalition.

Elements of child advocacy include engaging allies, utilizing media, and blending micro and macro advocacy to institute change (Wright & Jaffe, 2014). Although there are various approaches to child advocacy described in the literature, organizational advocacy is the primary focus here given the scope of professional responsibilities for university based play therapy training clinic directors. Organization

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

advocacy includes efforts by an individual within an organization (typically with a professional role) that aim to change practices for working with children or families.

Wright and Jaffe (2014) provided six steps for successful child advocacy developed from their professional experiences and practice in child advocacy. Following is a description of each step and potential application of each organizational or political advocacy step for university based play therapy training clinic directors.

Step 1: Knowing Your Issue

Knowledge is power when it comes to advocacy. Individuals cannot advocate for a population or change without fully understanding and knowing the important aspects of the situation. Advocates should be able to effectively and succinctly describe the issue to stakeholders, decision makers, gatekeepers, and others directly involved (Wright & Jaffe, 2014). For play therapy training clinic directors, this step involves determining which level of advocacy is most relevant (e.g. micro or macro) and the specific needs of the clients and potential clients in the center. For example, play therapy training clinic directors can use community data to identify a need in the community for access to mental health care for marginalized populations, including children. Based on the evident needs in the community, play therapy training clinic directors could determine a need to provide filial therapy groups to underserved caregivers in financial need in the community at no cost.

Step 2: Research for Background and Impact

Step 1 and Step 2 go hand-in-hand since research is necessary in order to have knowledge on the issue. The research step involves systematically gathering information to support the advocacy plan and to educate others about the issue. It is important to not only research the background of the issue but also the impact change could have on the community. Research can take the form of surveys, focus groups, previous research studies, interviews, census data, or demographic data (Wright & Jaffe, 2014). Following the example from Step 1, this step would involve researching funding sources at the community, state, or federal level that target services for children and that support your advocacy plan. The clinic director or group may need to research funding opportunities that support services for children and families.

Step 3: Preparing Effective Materials

Once the issue has been identified and research has been gathered, organizational advocates can prepare materials to distribute the information to decision makers, gatekeepers, team members, and allies. The development of a summary sheet is a succinct way to distribute the information to key stakeholders (Wright & Jaffe, 2014). Information can be shared in a variety of ways, including email distribution, town hall meetings, social media, or focus groups. The way that information is shared is not as important as ensuring that key stakeholders receive the information (Wright & Jaffe, 2014). Continuing the example provided in previous steps, the clinic director could prepare funding proposals or letters of intent, including proposed budgets, requesting financial support for clinic services or materials and submit these to potential funders.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Step 4: Making Meetings That Work

Organizational advocates can next plan strategic meetings focused on accomplishing the advocacy plan. It is important that the individuals involved in the meetings are key stakeholders (i.e., decision makers or gatekeepers with access to decision makers) who can help put the advocacy plan steps into motion. It is during this step that the work from the previous steps will pay off, as advocates who are knowledge about the plan, have researched both the issue and the impact of the solution, and have developed effective materials will be more successful at making the meetings work (Wright & Jaffe, 2014). For this step, the play therapy training clinic director would schedule meetings with potential donors of funding sources to present the materials. They may also meet with potential partners in the community to strategically develop partnerships, including referral sources or agencies that provide similar services.

Step 5: Conducting Strategic Follow-Up

In order to stay on the radar of decision makers and gatekeepers, organizational advocates must schedule strategic and appropriate follow-ups. Also, advocates need to understand the steps necessary for decision-making and action to reach the advocacy goals. Actions in this step include following up and providing updates to other key stakeholders, including fellow advocates and allies, on the progress of the project (Wright & Jaffe, 2014). Following the example, the clinic director could follow-up with the funding source on the decision of the funding or keep the funder appraised of the process of the application for funding or request for funding.

Step 6: Reinforcing Successful Advocacy Outcomes

Reaching step six implies that the advocacy plan has been either fully or partially successful. During this step the advocate works to ensure that lasting bonds are created with key stakeholders and that the advocacy project goals are reached. One way to maintain positive relationships with stakeholders is to thank them in a meaningful way. This could be as simple as a card or as elaborate as a press release. It is important to tactfully determine the appropriate way to thank stakeholders as some may require a public display of gratitude, via a press release or social media, while others may be embarrassed by such a public display and may wish to remain anonymous. It is imperative for future work together to determine the best way to recognize the key stakeholders for their work on the advocacy project (Wright & Jaffe, 2014). For example, play therapy training clinic directors may submit an announcement to the university marking team or campus news to publicize grant funding. Touting successes can generate awareness of play therapy clinical services and thank donors.

Altogether, these steps demonstrate the potential for university play therapy training clinic directors to engage in organizational advocacy within their roles and responsibilities. Training clinic directors may already be tasked with fundraising and developing community partnerships. Following these steps for child advocacy (Wright & Jaffe, 2014), university play therapy training clinic directors may be more cognizant of strategic social justice advocacy efforts that may expand play therapy services to marginalized children in the community.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Outreach Efforts

With awareness of the impact of oppressive systems on families and children, play therapy training programs and clinics may develop outreach efforts. Outreach efforts work to address the barriers experienced as a result of societal inequities while also highlighting the societal problems that impact children and families (Ratts et al., 2016). Clinic directors can further outreach efforts by integrating clinic services and programs into their local community. To help understand the needs of the community, clinic directors could invite members of the community to serve on the clinic's advisory board or could join community organizations. Another strategy for integrating the clinic into the community is to provide workshops or professional development opportunities to local educators, school counselors, or mental health providers. Clinic directors could also use the location of their clinic in the community to provide preventative outreach opportunities to families in the community. For example, directors could partner with local child care centers and preschools to provide outreach filial therapy groups for guardians to learn play therapy skills as a preventative and social justice strategy. Finally, training programs can work with schools and community mental health agencies to develop practicum or internship placements to provide play therapy services as center outreach and with center supervisors, especially in rural areas lacking supervisors with play therapy experience or the RPT-S credential.

Another example of how training clinics can facilitate outreach is through the development and use of mobile play therapy kits or portable play rooms. An example of this work occurred in Ferguson, Missouri as students and faculty provided a social justice outreach response by taking mobile sand trays and symbolic figurines into the community during a time of violence and community mourning (Bray, 2014). Students and faculty set up counseling tents to provide space for community members to talk and create scenes in sand trays, and community members were able to communicate their feelings and have space to be seen and heard. Community members were also provided information about free or low-cost counseling services in the university based training clinic or other local mental health agencies (Bray, 2014). This outreach work provided a way for students and faculty to be involved in social justice action in the community.

Finally, university based play therapy training clinics could coordinate play therapy outreach opportunities that offer mobile play therapy activities in the community. Outreach play therapy teams engage children and adults in brief play interventions, allow individuals opportunities for self-expression through play, and provide participants additional information about clinic services. Training clinics could assemble mobile play therapy kits with activities such as sand trays, story stones, or art making activities to engage individuals at community events or agencies. These mobile play therapy outreach efforts would require recruiting a team of students and faculty who have play therapy training. Ideally, the team members would be completing clinical coursework in the affiliated training program or be able to count the hours as direct client contact towards the Registered Play Therapist credential or licensure. It is important to ensure that all students and faculty interacting with individuals in the community on behalf of the clinic are carefully trained in play therapy and mobile play therapy techniques and under supervision while completing outreach interventions. To ensure appropriate outreach training, the training clinic director might host a targeted training for the team to learn the techniques that will be used. Potential settings where mobile play therapy outreach teams could have an outreach table or booth include back to school fairs at partnering schools, community mental health or health fairs, university sponsored events, and community events such as festivals with an area designated for children. Bringing play therapists from the clinic into the community increases visibility and access to services.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Case Example

Dr. Ana Griffin, Clinical Director of a university based play therapy center, was aware of the high rates of trauma exposure for children in a local school district that frequently hosted interns and employed graduates of the training program. Dr. Griffin met with school district administrators about available clinic services. Based on the mental health needs described by school district leaders, Dr. Griffin viewed expanding clinic play therapy services as a priority. Fitting with her professional role, she approached the steps to organizational child advocacy by gathering additional data from school district stakeholders (including administrators, counselors, teachers, and parents) about the needs of children. In addition to learning more about the prevalence of some trauma experiences, she learned that distance to the university clinic, transportation, and misinformation about mental health were reported barriers for services. With this knowledge, she researched grants that could expand play therapy services into schools during the school day to address distance and transportation concerns and prepared a funding proposal to purchase play therapy materials needed for expanding school-based services. Dr. Griffin also met with her advisory council and school district leaders to develop strategies for providing information about mental health to caregivers, and the team identified several outreach strategies, including running ads about the play therapy clinic in the local newspaper and hosting mental health focused parent workshops at schools, the library, and several churches across the region. The school leaders also planned to include professional development for teachers about mental health and provide teachers with strategies for talking about mental health concerns with caregivers during meetings or over the phone. Dr. Griffin organized a meeting with several community partners, including leaders from the county public health department, school district, child social services, and a few potential funding donors. At this strategic meeting, she presented demographic data on the community, mental health needs, strategies for addressing some of these needs, and a proposed budget. In the weeks following this successful meeting, she contacted donors and followed up with identified leaders on the various initiatives (e.g., workshops, professional development, advertising for clinic services). After six months, she secured a $10,000 donation to expand play therapy services in the schools and community. Dr. Griffin's leadership and partnerships with the school district stakeholders brought micro and mezzo level changes through increased play therapy services via interns at schools and affordable services at the university clinic. Also, this advocacy facilitated change for children and family systems as more caregivers received critical information about mental health through clinic outreach efforts.

IMPLICATIONS FOR CLINIC DIRECTORS

It is important to acknowledge these efforts to develop social justice advocacy take time and collaboration to implement. Although clinic directors may primarily interact with their program's graduate students in the clinic setting, the training for social justice advocacy work begins prior to clinical practice. Therefore, clinic directors need to build collaborative relationships with course instructors so that social advocacy is being promoted across the curriculum before play therapists see their first clients. To promote these efforts, clinic directors can share resources or ideas for class activities and service learning as outlined. Also, there may be varying attitudes and perceptions about the importance of professional social justice advocacy (Steele et al., 2014), so clinic directors may face resistance to proposed recommendations for

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

a social justice advocacy curricular emphasis. Regardless, clinic directors can consider ways to partner with other faculty to further social justice advocacy before clinical interactions.

Clinic directors must also consider their resources and gather support for policy or practice changes in the clinic that further services to marginalized populations. Grounding these efforts in data is an important component of effective practice. Clinic directors could collect data (e.g., client demographic information, student perceptions of preparedness on social justice work, and clinic program evaluation data) to identify areas for social justice advocacy focus. Given the various responsibilities and demands on the clinic director's time, clinic directors may invite clinic workers or doctoral students to help plan play therapy continuing education events or organize outreach efforts at the onset of this work. Inviting doctoral students to help with these efforts also provides leadership and advocacy opportunities and can allow for easier implementation of large projects. Additionally, developing an advisory council that involves various stakeholders (e.g., community members, faculty, students, play therapist supervisors, representatives from partner agencies) provides guidance and accountability for social justice advocacy efforts as well as strengthens support for the training clinic. Involving these various stakeholders can help social justice advocacy development become a program initiative beyond the training clinic setting.

If serving marginalized children and families with a commitment to social justice advocacy, clinic directors need to be prepared for some of the barriers that may limit access or continuation of play therapy treatment. For instance, guardians may have difficulty arranging or bringing children for play therapy services due to access to transportation, communication methods, work schedules, language, or finances. With these barriers, clinic directors may notice premature termination of play therapy services. If clinic directors are committed to social justice advocacy, then they should consider how their clinic is accessible and approachable for diverse clients and families to potentially mitigate some of these barriers. There may need to be changes in policies and practices as clinic directors consider ways in which the play therapy training clinic can best serve marginalized populations.

Clinic directors are responsible for ensuring the best treatment for clients and optimal training experiences for play therapists. One training clinic procedure for monitoring client satisfaction with therapeutic services is using a self-report rating scale that measures client outcomes during therapy and the quality of the therapeutic alliance. Examples of these type of measures are the ORS (Outcome Rating Scale) and SRS (Session Rating Scale) (Duncan et al., 2003; Miller, Duncan, Brown, Sparks, & Claud, 2003). There are two versions of the rating scales designed for children (CORS/CSRS) and young children (YCORS/YCSRS). The CORS/CSRS has been normed for children ages 6 to 12 while the YCORS/YCSRS has been designed for children below 6 years of age (Bertolino, 2018). These evaluation procedures may need to be adapted when providing play therapy based on developmental level or other cultural factors of children. Given the developmental level of children, parents or guardians are likely better informants about child progress and behaviors outside of the playroom. If evaluation procedures are in use, clinic directors should review these report forms to monitor the effectiveness of play therapy for all clients.

Additionally, these types of evaluation procedures need to be considered from a social justice perspective. Ratts et al. (2016) outlined the importance of conceptualizing implications of power and oppression in the counseling relationship for various domains, including that of the privileged counselor and marginalized client. Regardless of theoretical approach to play therapy, there is an inherent power differential involved in play therapy given the play therapist's privilege of age, and many clients will have other marginalized identities. If using an evaluation procedure such as the CORS/CSRS or YCORS/YCSRS (Duncan et al., 2003; Miller et al., 2003) as a standard practice in the university training clinic, clinic directors should acknowledge that these evaluation forms may not provide accurate clinic data.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Instead, they offer a tool for feedback that should be considered within a social justice paradigm. Children may not be ready or able to provide feedback about the work of the play therapist, and these types of procedures may not be congruent with the principles of some approaches to play therapy.

CONCLUSION

University based play therapy training clinics are critical settings for play therapist social justice advocacy development. Clinic directors can integrate social justice advocacy principles into the mission and work of the training clinic through play therapy training, clinical services, and outreach efforts. Just as suggested for play therapist social justice advocacy development, clinic directors can begin the process by reflecting on their personal social justice competence and advocacy action. Engaging in this reflective practice can help clinic directors determine priorities and create action plans for furthering the emphasis on social justice advocacy. Ultimately these efforts can help play therapists meet the needs of all children and families that can be served through university based play therapy training clinics.

KEY TERMS AND DEFINITIONS

Advisory Council: A group of stakeholders who provide guidance and support for a program or initiative.

Advocacy: A practice of using one's voice to institute change at an individual, institutional, systemic, or political level.

Cultural Competence: The ability to recognize and understand personal culture and the complex ways this intersects with the client's culture and can influence the therapeutic relationship. Cultural competence includes recognizing and responding to different cultures and is a lifelong endeavor.

Marginalized Populations: Groups and communities which are discriminated against and excluded from mainstream social, economic, cultural, or political life based on a cultural identity or difference. Examples include, but are not limited to, race, religion, age, gender, or financial status.

Mobile Play Therapy: An approach offering play therapy outside of traditional office settings. The play therapist takes materials to client settings.

Multiculturalism: The development of a philosophy that encourages an understanding of diverse cultures along the lines of race, ethnicity, gender, social class, religion, age, or level of ability.

Outreach: The provision of services or activities to individuals with limited access or knowledge of services.

Service Learning: Activities that involve students in community experiences that benefit others, usually involving volunteer work followed by active reflection of the experience.

Social Justice: The concept of fair distribution of resources to all individuals.

Social Justice Advocacy: Intentional actions to meet the needs of disadvantaged groups and institute change based on an awareness of privilege, social inequality, and oppressive systems.

Chapter 14
Buddhist Approaches to Counselling and Psychotherapy:
Exploratory Discussions From Different Traditions

Alvin Lai Oon Ng

Sunway University, Malaysia

Ee Mun Hon
HELP University, Malaysia

Ming Tik Chia
HELP University, Malaysia

ABSTRACT

Three authors from differing Buddhist backgrounds share their approaches to using Buddhism in psychotherapy. The authors argue that Buddhism itself is fundamentally a psychotherapy approach because it is essentially a prescription to end discontent and misery. This chapter provides basic points on how Buddhism can be used in counselling by discussing how different Buddhist traditions might approach counselling. This chapter also brings up reflections on how practice may differ according to experience in the fields of counselling and clinical psychology. Overall, the chapter is subdivided into six parts: (1) introduction; (2) basic tenets of Buddhism relevant to psychotherapy; (3) case study illustrations of applied Buddhism in counselling and psychotherapy; (4) discussion on reconciling differing Buddhist schools of thought in the practice of counselling and psychotherapy; (5) discussion on compatibility of Buddhist principles with applied Western philosophies and therapeutic approaches; and (6) suggestions of future directions given the current research literature patterns.

INTRODUCTION

This chapter looks at the application of Buddhist principles within the practice of counselling and psychotherapy. The three authors who contributed this chapter are mental health workers with different backgrounds and approaches to Buddhist practice as well as upbringing. The main angle of this paper is to discuss the applications of Buddhist principles in the helping professions of counselling and psychotherapy by exploring and discussing illustrated examples from each individual author's journey as mental health workers.

The chapter begins with a general introduction to the chapter coupled with personal introductions of the three authors as a primer for the later discussion of case studies using Buddhist approaches to counselling. These introductions aim to provide some familiarity to the reader concerning the authors' backgrounds to be able to relate better to the case studies being brought up in the middle of the chapter. This introduction also touches on how religious aspects of psychotherapy has the potential for a wider reach into the larger community, especially for lower socio-economic status groups who tend to have less access and exposure to professional mental health providers.

The introduction would then lead to a brief discussion of basic Buddhism that underlies the use of its principles within the practice of counselling and psychotherapy. Given the presence of both Theravada and Mahayana traditions in this chapter, Pali, and Sanskrit terms will be used to explain certain Buddhist concepts. A short background into the spiritual development triad (*Silā-Samādhi-Paññā* / Morality-Mind Cultivation-Wisdom) within Buddhism sets the stage for concepts discussed in this section. Main concepts to be introduced are the Four Noble Truths which includes the Eightfold Noble Path; the Five Precepts of lay Buddhist practice; the concept of the Four *Brahma Viharas* (Divine Dwellings), the concept of the Three Evils – *Lobha, Dosa, Moha* (Greed, Hatred and Delusion) and lastly, the concept of *Paticca Samupada* (Dependent Origination). These Buddhist concepts are central to the practice of Buddhism that are, in turn, applied directly in attitude, behavior and observation for the improvement of individual well-being though conduct, reflection and meditation practice, regardless of cultural traditions. The mechanisms of how these concepts help with gaining insight and wisdom for better well-being will be summarized.

The brief introduction into the tenets of Buddhism will be followed by a note on Buddhism in Malaysia, describing a short history and context to which this chapter can be better understood, especially with regards to the very diverse understanding and practice of Buddhism in the country (i.e. cultural, linguistic, historical and education level). References to articles of interest will be given so as to maintain the scope of this chapter without having to digress to other discussions on the development and practice of Buddhism in Malaysia.

Following from the description of Buddhist concepts are three case studies using Buddhist principles within counselling and psychotherapeutic practice by the three authors respectively. Given their diverse backgrounds and Buddhist practice, the authors will discuss their approaches from the Buddhist traditions of Mahayana, Vajrayana and the Theravada schools of thought. These cases that are discussed come from each authors' personal experiences and are based on multiple cases combined to mask any identifiable information to protect the identity of the clients.

After the case studies, the chapter compares Buddhist principles to similar concepts within Western philosophy such as Stoicism, and contemporary applied therapeutic practices such as Acceptance and Commitment Therapy (ACT), Reality Therapy (RT) and Rational Emotive Behavior Therapy (REBT).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

This comparison would spell out the compatibility of using Buddhist thought within Western counselling practice given the similarities in approach to the improvement of mental well-being.

This chapter ends with a very brief review of current trends in research literature to point towards suggestions of future directions in the development of applied Buddhist practice in the field of counselling and psychotherapy. A rehash of the discussion on using Buddhist principles in methods of psychotherapeutic intervention within the larger communities will be added in to reinforce the relevance of applied philosophy for social well-being.

PERSONAL BACKGROUNDS

Overview

The three authors of this chapter have different beginnings from which they developed their understanding of Buddhism. AN comes from an English-speaking background Theravada tradition, while EM and MC are Chinese-literate and lean towards the Mahayana traditions of Buddhism. This background presentation serves to provide a frame of sort towards the understanding of the approaches to counselling and psychotherapy cases later in the chapter.

AN

AN is a clinical psychologist by training with a professional doctorate in clinical psychology from Murdoch University, Western Australia. He practiced as a clinical psychologist and a postgraduate trainer in clinical psychology for 11 years at Universiti Kebangsaan Malaysia (National University of Malaysia) before moving on to focus more on teaching and research at Sunway University where he is at the time of publication. He currently does not provide clinical consultations per se but is still much into the field of clinical psychology through research and his role as the Vice President of the Malaysian Society of Clinical Psychology (MSCP) which he founded in 2010 as the Founding President. He was also a consultant psychologist, appearing weekly on a breakfast radio show to provide discussions on mental health topics and to answer public questions about mental health issues for two years from 2015 to 2017. AN is also a sought-after speaker and consultant for various issues pertaining to mental health management.

With regards to Buddhism, AN credits his meditation practice and study of Buddhism as part of his work principles in applying clinical methods in helping people solve personal problems. AN attended Buddhist Sunday school at the Buddhist Maha Vihara in Kuala Lumpur since the age of 10. He attended a Buddhist monk novitiate program there when he was 16, under the tutelage of Venerable M. Mahinda and his preceptor, Venerable K. Sri Dhammananda Maha Thera. Growing up with Buddhism primed his venturing into meditation classes while he was on his clinical internship at a hospital in Perth, Western Australia. He met a renowned meditation teacher, Venerable Ajahn Brahmavamso then, and continued to practice meditation, occasionally joining meditation retreats in the Theravadin tradition of Buddhism.

To AN, Buddhism should be used as practical wisdom that is relatable to the general public. The practice of Buddhism personally is more to philosophy of the good life that is principle-based rather than something that is religious or spiritual. He believes that spirituality is a personal thing. Therefore, when it comes to applying Buddhist principles in therapy or counselling, he approaches it from the pragmatic perspective that is through experiential learning, which is to extract out the knowledge and answers

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

from the client in providing insights to problems. This approach also encourages the client to learn as a teacher, rather than as a student. The empowerment that comes from realizing something useful, that can be taught or shared with others is more likely to be sustainable, compared to just a personalized learning. A wider perspective is obtained in that clients are better able to realize they belong to a system that is interconnected, and that there are many factors at play that contribute to their well-being in relation to others. In terms of philosophical leanings, AN also applies Taoist principles of balance and flow, as well as Stoic principles of acceptance. Both philosophies have much in common with Buddhist practice.

EM

EM is a registered counsellor, with a Master's degree in Counselling, and Bachelor degree in psychology from HELP University. Her foray into counselling began as a psychology intern at Universiti Malaya Medical Centre where she spent two years and then two more years as an intern counsellor at a number of centers including private universities, government hospital, vocational boarding center, primary schools and a refugee center. EM is currently practicing in a mental health specialist clinic, providing therapy sessions to individual clients. She is certified in Choice Theory and Reality Therapy (CTRT), which she actively uses in her practice. When working with clients, EM stresses the importance in exploring their strengths and resources in supporting their needs, by incorporating and applying different techniques and tools in helping them solve problems.

EM's approach to helping her clients in counselling is inspired by her yoga practice and meditation as well as her study of Buddhism. She was exposed to formal Buddhism at a tender age of 5 where she attended Buddhist Sunday School at the Jetavana Monastery in Kuala Lumpur led by abbot Venerable Zheng Kong. As a teenager, she became more active in engaged Buddhism where she attended a Buddhist youth camp when she was 13 years old and a Dharma camp when she was 15 years old, organized by Blia Yad Malaysia Subdivisions, under the tutelage of Venerable Hui Xian. Since then, she has been an active volunteer at Buddhist camps for children and youth. EM encountered mindfulness practice while she was on internship at a hospital, which inspired her to join Hatha yoga classes. She practices weekly meditation and Hatha yoga, with a yoga teacher whose spiritual approach is within the Mahayana Buddhist tradition.

To EM, Buddhist teaching is daily wisdom and a philosophy of life, where it's learning progresses a person towards a better self and a better life. The practice of Buddhism is through experiential learning that varies according to individuals, depending on their understanding of and connection with Buddhism. When it comes to actively applying Buddhist principles and ideas into therapy sessions, it is important to firstly understand the client's cultural background as well as their perspective of Buddhism. This would help facilitate knowledge and insights from Buddhist practice to help the client gain further understanding and new learnings about their situations in order to help him/her manage their challenges. These gains are usually internalized and help empower the client to become more adaptive in life, especially when acting according to the understanding of systemic consequences of one's action that is dynamic and constantly interacting with many other factors around them. Self-awareness of this continuous interaction could bring clients more contentment in their lives. EM also incorporates Taoist philosophy in her approach. She believes in the balance between Yin (energy of being) and Yang (energy of doing). Individuals proportionally have more energy of doing to conduct activities and roles on daily basis, it is equally important to have some time and space to nourish their energy of being for manifestation of emotional, physical and psychological health.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

MC

MC is currently pursuing a Master's degree in counselling and practicing as an intern counsellor at a Buddhist temple and also at a Christian church. At the temple, he provides individual counselling and play therapy services, while also acting as a trainer / facilitator for children and youth at Buddhist camps and as well as a trainer for the social workers. At the church, he assists the pastor in running separate groups for grief support, and special children. He also helps out in mission work. MC applies Person-centered, Satir Model and Mindfulness-Based Stress Reduction (MBSR) in his counselling sessions. He believes that clients are better able to explore their strengths and work out solutions by themselves, when their emotions are stabilized.

In terms of Buddhism, MC is an active practitioner and derives his methods from his regular meditation to help his clients to create self-awareness and relaxation through guided meditation and mindfulness-based intervention. Born into a Taoist family, MC used to participate in Taoism temple activities and is exposed to many types of Taoism ceremonies.

MC became a Buddhist at the age of 18 after participating in a Buddhist monks' novitiate program at Fo Guang Shan Centre, Malaysia. Since then, he participated in Buddhist monk novitiate programs in different countries and under different Buddhism traditions. As such, he has a wide exposure to the diversity of Buddhist traditions. He studied and practiced Mahayana Buddhism under Venerable Hui Nian from Singapore for three years and Theravada Buddhism under Venerable Uttamasara from Myanmar as well as meditation under Venerable Kassapa from Sri Lanka. MC explored Christianity for one year before continuing his spiritual journey in Vajrayana Buddhism. He practices Vajrayana prostrations daily and abides by the practices under Venerable Nubpa Rinpoche from Nepal.

To MC, the teachings in Buddhism helps improve self-awareness and provides guidance in improving daily life. One concept from Buddhism that MC relies on heavily is the concept of impermanence. He contends that the truth of impermanence helps us to be more aware of personal attachments that lead to problems, and that it is important to realize the need for letting go or detachment.

Relevance to the Community

The three authors may be from different backgrounds but the type of approaches they use from Buddhism are pragmatic and directly relevant in addressing challenges in daily life. While there are generic approaches that are easily applicable to the general public, some may be more suitable for individuals who actually believe in more Buddhist-centric thoughts and rituals. These will be expounded in the later sections of this chapter.

BASICS TENETS OF BUDDHISM RELEVANT TO PSYCHOTHERAPY

Buddhism originated from the search to end suffering. As such its philosophy and teachings are already aligned with well-being. Siddhartha Gautama's insights to his emotional troubles as a pampered prince led him to renounce the worldly life and seek methods to end his sufferings once and for all. His success in finding the answers to his questions about the eternal cessation of suffering resulted in him being called the Buddha, or "the Awakened / Enlightened One". Buddhism is basically the teachings of the Buddha Gautama that provides practitioners with the methods to manage and ultimately stop suffering.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The Four Noble Truths

The main teachings of the Buddha are summarized into what is commonly called the Four Noble Truths. These truths provide the way in which suffering can be better understood so that it can be conquered. The First Noble Truth makes the acknowledgement that suffering exists. The Second Noble Truth states that there are causes of suffering. The Third Nobel Truth states that there is an end to suffering. This leads to the Fourth Noble Truth that provides the means to end suffering, which is also commonly known as the Middle Way, or the Noble Eightfold Path.

The Middle Way / Noble Eightfold Path

While the first three Noble Truths state that there is suffering, causes of suffering and the end of suffering, the Fourth Noble Truth details the way to end suffering with a prescription of eight qualities to develop as a practitioner. These eight qualities are:

1. Skillful thought
2. Skillful speech
3. Skillful action
4. Skillful livelihood
5. Skillful effort
6. Skillful mindfulness
7. Skillful stillness
8. Skillful understanding

The concept of skillfulness within this prescription is whatever that brings adaptation in beneficial ways and that avoids harm, while maintaining peace. It is taught in Buddhism that when one has skillful understanding of their circumstances, cognitions and behaviors, one is also likely to be skillful thus amounting to adaptive daily discipline that in the long run, reduces suffering. So Buddhist practitioners are constantly reminded to refer to this basic teaching to calibrate their attitudes and behaviors towards a balanced lifestyle where extremes are avoided while wisdom is cultivated via mindful practices such as meditation and following precepts.

The guidelines for the reduction of suffering as suggested in the Noble Eightfold Path can be divided into a triad of sort that is to be observed for spiritual development in Buddhism. This is commonly known as *Silā-Samādhi-Paññā* (Morality-Mind Cultivation-Wisdom) where moral attitudes and behaviors (e.g. speech, action, livelihood, and effort) would facilitate the cultivation of mental faculties (e.g. mindfulness, and stillness) that result in wisdom (e.g. understanding, and thought). The wisdom that is mentioned here refers primarily to the realizations that help stop suffering.

The morality part of practice in Buddhism is also known as s*ilā,* which is set out as daily precepts for lay Buddhist practice for personal training in the cultivation of moral qualities of the Middle Way (e.g. speech, action, and livelihood, effort). For lay Buddhist, five precepts are prescribed for daily practice as the most basic qualities to cultivate in pursuing the goal of Buddhism. These five precepts are:

1. To abstain from killing
2. To abstain from stealing

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

3. To abstain from sexual misconduct
4. To abstain from false and unskillful speech
5. To abstain from intoxicating substances

The idea of observing these precepts is to provide the practitioner with a regulation in daily life that improves overall morality, which is in line with the Noble Eightfold Path. Abstaining from the five immoral actions prevents one from a lot of trouble, shame and guilt, which would hinder personal practices of mindfulness and observing peace, thus increasing suffering. The other side of these five precepts is that while abstaining from unskillful behaviors, the practitioner is also encouraged to engage in behaviors of the opposite, which are:

1. To promote kindness and compassion
2. To promote generosity
3. To promote trustworthiness and responsibility
4. To promote honesty and pleasantness
5. To promote health and well-being

The above five prescriptions to promote goodness are likely to result in well-being in others as well as the individual who does them. These plus the abstention from the listed five immoral behaviors would reduce suffering and improve well-being. So the basics of Buddhist practice are fundamentally designed for well-being and to minimize any suffering – similar to "the Good Life" preached by ancient Greek philosophers such as the Epicureans and Aristotle.

The mind cultivation part of practice in Buddhism is termed as s*amādhi,* which is usually translated into English as "concentration". However, being practitioners and amateur scholars in Buddhism, we are more inclined to use the term "stillness" because meditation requires the individual to be still and to observe the processes that occur in the mind without adding any other efforts to it. "Concentration" seems too forceful a word to use to describe an activity that is meant to be relaxing and natural.

Nevertheless, the concept of *samādhi* is, in essence, the training of the mind to be able to perceive with strong awareness, the natural processes that arise and dissipate within it. The reason for this training is to develop a level of awareness within the self in relation to the interactions with one's senses to the point of understanding perspectives in life that can help to manage daily challenges that typically bring not just dissatisfaction, but a whole gamut of emotions that disturbs the peace of stillness.

The practice of meditation is said to be the exercise for the mind, which is somewhat parallel to what physical exercise does to the body. There is no such thing as good or bad meditation because every effort to remain still and observe processes within and without strengthens the individuals mind to be better able to be clear and sharp in perceiving information. Without any disturbance that is brought about by the results of immoral activities, the meditator is better able to remain still and have a strong awareness of the processes in the present moment. A strong mind built from meditation is better able to obtain the wisdom to understand perspectives that can help solve problems of discontentment and misery.

As such, moral practices provide the foundation to a light heart that allows the mind to be clear for wisdom to arise from effortful meditation practice. This is how the triad of spiritual development is connected. One has to practice a moral code, in order to improve mindfulness practice which then results in wisdom that can help overcome suffering.

Divine Dwelling (*Brahma Vihārā*)

The concept of *brahma vihārā* (divine dwelling) is usually used as a metaphor for good qualities that are to be cultivated by the Buddhist practitioner to facilitate better *samādhi* practice. These qualities are *mettā* (loving-kindness), *karunā* (compassion), *muditā* (sympathetic joy) and *upekkhā* (equanimity). The idea of developing these qualities comes from the immediate effect of having them, which is a general feeling of well-being, that aids cognitive and affective functioning for meditative practice.

These qualities are called Divine Dwelling because they reflect how a divine being would be and are goals that a practitioner should seek to achieve. Given that these are highly revered qualities, having them would also improve one's social standing, which then provides a more nurturing environment for the practitioner thus, reducing the likelihood of any suffering which may arise.

For example, a person who has developed loving-kindness well would come across as very warm and friendly, therefore putting people at ease, and having strong compassion would also improve empathy and care towards others. These two qualities are significant enough to be very attractive and therefore are protected from harm. Sympathetic joy is also known as vicarious joy where one rejoices with others when something skillful is demonstrated. Having such quality would give someone the impression of being supportive and nurturing. Equanimity is usually expressed as calmness and nonthreatening. So, in terms of well-being, these four qualities when cultivated exude an attractive resonance that also affects others positively.

Three Evils

While there is encouragement to develop qualities of divine dwelling as described above, Buddhists also put effort into avoiding the Three Evils, which as *lobha* (greed), *dosa* (hatred) and *moha* (delusion). Greed is expecting from the world what it cannot give you, thus increasing discontentment and hence suffering. Hatred is a strong dislike for something or someone that is usually brought on by rumination, thus increasing suffering. Delusion refers to the tendency for people to expect permanence when the truth is that every conditioned thing is impermanent. This is tied to greed where expectations of the impossible brings about suffering. Therefore, to reduce suffering is to live with less greed and hatred and to have better ability to embrace impermanence (*anicca*).

Dependent Origination

Simply speaking, the concept of dependent origination (*paticca samupada*) is the law of how suffering is caused and how it is ended, by a chain of causes. The key to the end of suffering is to be able to identify the causes that lead to suffering and to systematically stop them. Through insight that is usually facilitated by regular meditation practice and reflections of observed processes, the individual is able to detect the causes and conditions that bring about suffering, and so learns from it to prevent any further future suffering by the same causes and conditions. These causes and conditions are basically what the Three Evils are about. The law of dependent originations reminds the practitioner of the consequences of actions that occur from chains of previous actions. The insight from this law can help the practitioner decide on making changes to stop suffering and improve well-being.

While karma (or *kamma*, in Pali) is a large part of Buddhist belief, it is not necessarily beneficial to be accepting of current miseries as purely karma and to resign by nothing but just suffer. One of the reasons

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

why meditation practice is important in Buddhist practice is that it internalizes the scholarly points of its teachings through practical realization, rather than an intellectualization of knowledge. Meditation is about being in the present and observing the rise and fall of phenomena occurring in the mind, and to some extent, the physical body. The basics of dependent origination applies where any addition to a chain of actions would lead to more natural consequences of whatever was added. For example, if there is already misery, and guilt is added – the misery becomes worse. In this case, guilt itself causes bad karma – propagating the cycle of shame and guilt. Therefore, to change from discontentment to contentment, there has to be a start to a chain of actions that leads to contentment. Therapy would then focus on working towards encouraging more skillful and beneficial actions to bring about better circumstances for well-being, and the cessation of suffering.

Basic Tenets but Different Traditions

These are the basic tenets of Buddhist teaching that form the bases of practice towards personal and communal well-being. Nevertheless, they may not be known or practiced by people who declare themselves to be Buddhists in Malaysia. This is due to the diversity of traditions and practices that come under the name of Buddhism, given its historical development and cultural assimilation throughout the centuries since its founding. The next section briefly discusses the context within which Buddhism is practiced in Malaysia.

Before that, it is important to name the main traditions of Buddhism. There is Theravada, Mahayana, Vajrayana and Zen of Ch'an. Some would argue that there are only two divisions where Vajrayana and Ch'an are forms of Mahayana. Nonetheless, this chapter will not make any arguments as to which division is more precise. The authors will contend with just talking from the perspectives of Theravada, Mahayana and Vajrayana. In short, the Theravada tradition, which is also called the Hinayana tradition is the predominant school of thought for Buddhism in India, Sri Lanka, Myanmar, Laos, Cambodia and Thailand. The Mahayana tradition is found in China, Vietnam, and South Korea. The Vajrayana tradition has many similarities with Mahayana practices and in some cases, are the same but only differentiated by the former being of Tibetan origins. Zen or Ch'an is usually found in Japan and Vietnam. While traditions may differ in customs and rituals, all of them are based on the basic Buddhist teaching, or *Dhamma* (*Dharma* in Sanskrit) as described above.

BUDDHISM IN MALAYSIA

Buddhism has had a long history in the South East Asian region. There are archaeological sites in the north parts of Malaysia identified as belonging to Hindu-Buddhist communities dating back to the fifth century. Currently, Buddhism is the second most prevalently declared religion in Malaysia, after Islam. Majority of people who consider themselves Buddhist in the country are ethnic Chinese and they tend to follow the Mahayana Buddhist school of thought. A smaller segment of Buddhists is from the Theravada tradition – these tend to be the English-speaking ethnic Chinese, the ethnic Thais, Sinhalese, Indians, and Burmese (Myanmar) communities. Among the ethnic Chinese in Malaysia, many practice a combination of Taoism, Buddhism, and Confucianism but would consider themselves Buddhist when asked what their religion is. More recently, in the past 20 years, the Vajrayana tradition has been growing with new centers opening around the country.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Generally, Buddhist devotees from all traditions in Malaysia have established many centers for missionary and scholarly activities, with many coordinating multiple charity organizations and community welfare centers. Some of the Mahayana based centers are branches of very established global Buddhist organizations from Taiwan. These centers also respond to natural disasters such as floods. Some of these centers also provide mental health services. Few of these centers, usually temples and hermitage focus on the development of Buddhist monastics. As such, Buddhism is a very established religion with many organizations that work to develop its practice within the community at many different levels, from lay devotees, to intellectual scholars to monastics. Malaysia is a hub for Buddhist scholars of diverse denominations and languages in South East Asia given the number of publications that have been churned out over the years.

Given the diversity of beliefs and practices of Buddhism in Malaysia, we should be careful in applying personal understanding of the tenets or impose the more streamlined and basic teachings of Buddhism on whoever who calls themselves Buddhist. Much of Buddhist practice in the lay community are infused with rituals and supernatural beliefs, that are not necessarily the intellectual teachings of Buddhism but have many pragmatic benefits to the believers. As such the next section illustrates how diversity is acknowledged in the approaches to using Buddhism in counselling and psychotherapy.

CASE STUDIES USING BUDDHIST APPROACHES IN COUNSELLING

The Theravada Buddhist approach to practice is typically based on personal efforts in self-development in the cultivation of mind towards the cessation of suffering and ultimate enlightenment. Self-reliance is a main focus of the Theravadin practitioner. However, this differs from the Mahayana Buddhist school of thought where spiritual development is more of a systemic effort that usually involves the belief that wellness is a mutual communal concept. Therefore, approaches in counselling between the two schools of thought in Buddhism can be simplified into independent (Theravada) and interdependent (Mahayana). In the case studies below some are presented in a more individualistic approach to personal practice towards well-being while another case highlights a more relational approach to applying Buddhist principles. There are also hints of practice that are relevant to individuals who believe in supernatural powers of rituals. Without any declaration from the authors in terms of who contributed to which case, it is virtually impossible to tell which one is leaning towards Mahayana or Theravada approach. Nevertheless, it should be noted that regardless of tradition, the approaches used in psychotherapy are not identified as Theravada or Mahayana because there is no qualitative demarcation between the two traditions in their applications.

Case 1: Mr B

Mr. B was a 39-year-old corporate lawyer who was recently divorced after three years of marriage. He was the one who initiated the divorce after finding out that on top of being emotionally abused on a daily basis by his former wife, she was also cheating on him with another man. Mr. B presented as depressed with the tendency for self-blame for his situation. He was a devoted husband although he received verbal and emotional abuse from his wife who, according to him, kept insisting that he was never good enough. He felt trapped in his relationship but after realizing that his former wife was also cheating on him, he decided to call it quits and somehow reluctantly asked for a divorce. He had, in his mind, the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

perception that a good husband should stick with his wife through thick and thin, regardless of how he is being treated because he should practice compassion at all times. So, he viewed himself as a failure in being a husband as well as being someone to uphold the Buddhist qualities such as loving-kindness and compassion. This led him to feel a lot of guilt and shame with the thought that if only he did a bit more, she might have accepted him better.

Mr. B kept saying that he must have had bad karma from his past lives that led to how he was treated by his former wife. He had concepts of karma where his guilt and thoughts of being punished led to depression. He expressed the need to perform some kind of ritual cleansing to rid himself of the so-called curse due to bad karma. While Mr. B tried performing some cleansing rituals and blessings with the aid of a familiar monk, his relief was short-lived as he still kept ruminating about how silly he was to allow his wife to manipulate him and that he had lost his confidence in being a lawyer.

The therapist discussed Mr. B's understanding of Buddhism where the misconceptions of punishment and sin in the law of karma had helped him understand that all these while he was adding on the "bad karma" to himself by ruminating. Applying the concepts of the three evils – guilt itself is a form of hatred (*dosa*) towards the self which is also latched on to the idea of permanence (a delusion) – once there is understanding that there is impermanence and that there is no greater punishment than what we do to ourselves. Furthermore, he also realized that his wife was no longer with him and therefore there was no longer any manipulation. He realized that he was still living in the past. When given some guided meditation instructions on the present moment, Mr. B's regular practice helped him let go of the guilt and shame and move on to a more adaptive mindset. This included his realization that his attachment to the past was what made his misery somewhat permanent, when in actual fact, it was not. While there were still frequent relapses towards self-blame and guilt, the improved mindfulness in Mr. B helped him to be better able to gently reframe his automatic reactions to a more beneficial set of beliefs so he could move on from his mistakes.

Case 2: Madam T

Madam T was a 60 year old retired Chinese woman, who was referred by her psychiatrist for follow up treatment for depression. She had been on anti-depressant for three years prior to her visit. At the initial presentation, the client seemed to attribute her depression to hardships in the past. She acknowledged that she was not ready to let go of past troubles as well as her current ones. For this, she was brought through the discussions of the four Brahma Vihara (Divine Dwellings) of loving-kindness, compassion, sympathetic joy and equanimity, by the counsellor. After relating these qualities towards herself and her situation, Madam T was better able to be kinder to herself, and to rejoice in her own efforts through the years, as well as the efforts from her children and grandchildren. By doing this, she formed better relationships with her family members and improved in her overall emotional well-being.

As the therapeutic relationship strengthened, Madam T eventually disclosed a traumatic and miserable memory from her past. She shared that she was nearly molested by her biological father in her formative years as an adolescent, and she had a troubled marriage to her abusive husband who used her past as a threat throughout their marriage. Nevertheless, she worked hard to financially support her family of origin as well as her own family. The couple only owned their own home late in their lives. Over the years, she has lost siblings and parents-in-laws whom she was close to. Madam T was involved in family conflicts over the selling of their previous family home as coerced by her husband and spent more time in her children's homes. This led to relationship difficulties with her children and grandchildren.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Madam T was conflicted because her Buddhist perspective sees devotion to family in her multiple roles as wife, mother and grandmother as very important in maintaining harmony in her life, but she was not able to cater to everyone's needs. At the time Madam T broke down in the session and spoke about her emotional pressure for the first time. She was very ashamed of sharing this part of her struggles and was anxious that her personal disdain towards her roles might go against her Buddhist beliefs. She believed that she was depressed because she had not done well enough in her roles and responsibilities, and she was being punished for that reason.

Similar to the other sessions discussion on loving kindness, compassion, sympathetic joy and equanimity, Socratic dialogues and discussions related to Buddhist principles helped Madam T feel that she can begin to love herself more compassionately prior to taking care of others. She was better able to gently validate and affirm her own feelings, actions and thoughts, which led to better self-acceptance and reduced depressive feelings. The therapist encouraged Madam T to reflect on how she felt about being unconditionally accepted in the therapy session, and this helped her to be more accepting of who she was and helped her believe she had an active choice to make changes for the better. Madam T had been desperately seeking reciprocal love from others that made her feel overwhelmed and confused whenever her family members did not seem to appreciate her love and care. When Madam T obtained the insight that the only person's behavior she could control was herself, she was able to let go of her expectations and practice the qualities of the four Brahma Viharas, and thus had much less blame and anger. Eventually, Madam T found some closure for her past in that she recognized it was the best she could have done then, but in the present, she has the power to make the changes she wants. She regained the sense of self-confidence and motivation to be more involved in the activities that she enjoys in her daily life, while also spending quality affectionate moments with her children and grandchildren in their house while maintaining healthy boundaries with them.

A Side Note to Case 2: Mahayana Buddhist Application of the *Brahma Viharas* (Divine Dwellings)

Following from the above case study under a Mahayana approach. This subsection explains how the *Brahma Viharas* would have been related to Madam T above. As mentioned under the basic tenets of Buddhism, the four sublime states of mind called *Brahma Vihara* (Divine Dwelling) are ideal individual practice. The *Brahma Viharas* provide guidance for challenging situations, and help individuals to regain a sense of peace, heal emotional wounds and revive joy in their lives. These four states of mind are incompatible with the negative emotion of hate. Individuals have the seed of Brahma Viharas that comes from nature rooted in their mind and heart. However, individuals do not easily discover the seed when they are shaded by the surface of what is happening and are occupied with hatred, anger, jealousy, and dissatisfaction. Through repetitive mindful self-awareness and practice, individuals can cultivate more energy to develop these sublime states of mind as a dominant perspective of mind, which is close to Brahma-like (boundless-like) state of mind. The core ideology of Brahma Viharas in Buddhist scripture of "*Āgama Sutra*" is based on continuous practice of self-purification in loving-kindness, compassion, empathetic joy and equanimity apparent to significant immediate environment to selfless immeasurable pervading of loving-kindness, compassion, empathetic joy and equanimity towards living and non-living beings in the universe (Liao Tuo, 2014).

Loving-kindness (*mettā*) describes an unconditional love that includes caring, acceptance and forgiviness towards every creature in the universe. In the Mahayana Buddhist perspective, because of one's own

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

desires and confusion-driven behaviors, they become trapped in the life and death cycle of suffering. With this profound, gentle and kind of love to embrace all these beings, individuals deliver a deeper blessing by hoping that all living creatures will achieve a true sense of happiness and well-being. The ultimate meaning of love is love without possession. Absent from the idea of having, the act of showing and giving loving-kindness is a happiness and comfortable existence.

Compassion (*karuṇā*) describes a willingness to open one's eyes and heart to experience the emotions that bring pain and an intention to soothe the suffering. All beings are afflicted by emotions, confusion and suffering from birth, old age, sickness and death. Feeling of pain, sadness and distress can be overwhelming. Little did individuals realize that the suffering and sorrow they experience arise from their minds. With a little more kindness and compassion, individuals could be better at distinguishing themselves (solely as a person existed in the world) from the suffering and emotions. With a rich sense of experiencing suffering, compassion reconciles individuals to their life, to appreciate what they have, to have strengths to overcome life challenges, and to contribute whenever they could to others. A peaceful mind is the best way to eradicate misery and achieve liberation.

Sympathetic joy (*muditā*) describes the joy that individuals feel towards achievement of others (and also themselves). This joy empowers them to be freed from perceived hardships in life. When something happens according to individuals' wish, they feel happy and satisfied. At other times when others achieve certain accomplishments or have done good deeds, rejoicing with them and encouraging further accomplishment brings up good feelings in the one rejoicing, even when it was not them who directly contributed to the success. This type of joy brings a serene calmness that leads individuals to a contemplative state of mind (equanimity). Study has shown that a human brain tends to activate different processes when they feel different emotions (Etkin, Egner & Kalisch, 2011). A mind that is serene and peacefully aware can eventually allow individuals to obtain wisdom to be freed from afflictions and achieve true happiness by avoiding the causes of suffering. This is very much related to the next *Brahma Vihara.*

Equanimity (*upekkhā*) describes the abandonment of own desires, expectations and confusions in order to experience peace and stillness of mind. Life is two-sided, the end of birth is disintegration, and the end of gathering is separation. When experiencing life's journey which moves between contrasts of rise and fall, success and failure, loss and gain, individuals can feel how they respond with hope and fear, happiness and sorrow, satisfaction and disappointment. Mahayana Buddhist perspective encourages the concept of moderation. When individuals practice equanimity, they gradually give up the idea of possession, the thought of "mine". Individuals who has a mind of equanimity can empathize and accept more with who or what that stands out differently contrary to the pictures in their mind as they thought. When individuals demonstrate the invaluable good and accumulation of innumerable merits in generosity of the Brahma Viharas, the art of practicing loving-kindness, compassion, empathetic joy and equanimity is fulfilling and truly happy in itself. Followers of Buddhism believe that the evil actions will fall into the hell realm and the virtuous actions will lead to the good path and higher realms eventually.

Case 3: Mr. H

Mr. H was a 33-year old man who presented as depressed due to financial hardship and relationship issues with his family members. He had volatile emotions, which made him easily agitated, and had trouble sleeping for a few months prior to seeing the therapist. After an intake session, the therapist had an agreement with Mr. H that there was a pressing need to help him calm down and to get enough sleep given his presenting symptoms. Managing his relationship issues were secondary at that time. So,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the therapist helped by teaching Mr. H some mindfulness activities, including relaxation exercises to practice for better skills in improving his ability to be calmer. One of the mindfulness activities, was to recite "Om Mani Padme Hung" repeatedly. In Tibetan Buddhism or Vajrayana tradition, this recitation also helps to produce good karma, on top of bringing calmness and focus. These mindfulness activities helped Mr. H to be calmer, and as a result, become more aware of his feelings and thoughts. Once he was better at noticing his feelings and thoughts, the therapist went through sessions of guided breathing technique and body scan to help the client to reduce his anxiety and tension. Mr. H was taught to be aware without passing judgement to the sensations of his body that arise and fall. Regular practice of these techniques helped Mr. H become more aware of his immediate thoughts and feelings. Once this was achieved, the therapist discussed the concept of impermanence with Mr. H and related it to his thoughts and feelings. This discussion helped Mr. H realize that the sensations he feels are constantly changing and are not permanent. This helped him understand that he does not have to be attached to his feelings – be it pleasant or unpleasant. He learnt to treasure the pleasant ones and sit out the unpleasant ones until they went away. This realization of letting go of control helped Mr. H reduce his agitation and he slept much better. This became his preparation to work on his relationship problems with his family members.

Reconciling Different Traditions in Buddhism on Psychotherapy Approaches

While there are tendencies of both schools of thought – Theravada and Mahayana Buddhist traditions to have generally different approaches in their counselling methods, the essence of both traditions originates from the basic teachings of Gautama Buddha, called the *Dhamma* (or in Sanskrit, *Dharma*). The Mahayana Buddhists, being more communal in practice, employs concepts of the *Bodhisatta* (*Bodhisattva* in Sanskrit, e.g. *Kuan Yin*, *Maitreya* and *Manjushri*) and a pantheon of lesser gods and goddesses, saints as well as spiritual protectors of the Dharma for spiritual practices. So, it seems as though it is more complicated with various sutras to be read and rituals to be carried out for a better well-being outcome in practice. Similar traditional rituals and beliefs, though not as elaborate, can be seen in Theravada traditions depending on which country they are practiced in. Theravadins do not highlight the practices related to Bodhisattas and the extended pantheon that is seen in the Mahayana tradition, but focuses more on ritualistic chanting for protection, precept-observing behaviors as basic customs for lay Buddhists.

Both traditions teach meditation as mental cultivations towards better wisdom in dealing with life and death. However, the means by which meditation is taught may also differ between traditions, with Mahayana Buddhist more likely to refer to their sutras and koans, while the Theravadins have *vipassanā* (insight) and *samatha* (calmness) meditations based in the *Satipattanā Sutta* (the Buddha's purported manual on meditation). Either way, both traditions recognize meditation as part of the spiritual practice, on top of observing moral precepts, to achieve wisdom.

Though it is beyond the scope of this chapter to discuss the origins of these practices, it should be noted that these concepts are pragmatic methods for engaging individuals in spiritual practice at different levels of understanding. Ultimately, the basic tenets of Buddhism are reflected in these practices that have long histories of development to suit the needs of the cultures they are assimilated into.

With regards to the examples above, it would have been very easy for either tradition of Buddhism to employ each other's approaches e.g. Theravada using *Brahma Vihara* focus and Mahayana using *paticca samupāda* focus in psychotherapy. So, in essence, there is nothing actually to reconcile. Much of the practice, in the authors' opinion, is in the language of therapy, which can be very diverse.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Given the age of rapid globalization, there has been many instances of cross-overs between Buddhist traditions in practice, especially in the West, where different denominations of Buddhist practitioners have been exchanging notes and developing mutual practices based on the scriptures, and applying them to modern day challenges in pragmatic ways. Therefore, in this case, reconciliation of traditions is automatically happening already in spiritual and intellectual practice. What is important also is how traditional Buddhist approaches are compatible with mainstream Western psychotherapy methods. This will be briefly discussed in the next section.

THE COMPATIBILITY BETWEEN BUDDHIST APPROACHES AND WESTERN TECHNIQUES OF COUNSELLING AND PSYCHOTHERAPY?

From the case studies given, there are many parallels to what we know as cognitive therapies. Much have been written about these parallels with many authors arguing for the compatibility between Buddhism and Western Psychotherapy. In some cases, to the point of duplicity of Eastern and Western philosophies in their applied approaches to improving mental health.

In terms of Western psychotherapy, the end of the millennium has seen a boom in mindfulness-based intervention that originated from Buddhist meditation practices. The treatment of borderline personality disorder (BPD) also highlighted the importance of insight and mindfulness that stem from Buddhist teaching. Older concepts of therapy such as Rational Emotive Behavior Therapy (REBT) has very close reasoning to Buddhist tenets. The more current "Third Wave" therapies are very much "Buddhistic" in nature – i.e. Acceptance and Commitment Therapy (ACT) and Self-Compassion Movement.

To illustrate an example of parallels, we compare Buddhist approaches with Choice Theory / Reality Therapy (CTRT). One aspect of the Buddhist approach in psychotherapy is to return the sense of choice to the individual. There is much encouragement in Buddhism to look inwards for a deeper understanding of self and its habits, and then make an informed choice to make changes for betterment. These steps are guided by the precepts and Eightfold Noble Path. Nevertheless, the main point is that the individual has to "walk the path themselves" in order to reach their goal. This is in line with CTRT where the main believe is that the only person's behavior they can control is their own. What individuals perceive from the external world is merely information and they decide what and how they want to respond to it, as said by Glasser (2011, p.5), "Nothing we do is caused by what happens outside us. If we believe that what we do is caused by forces outside us, we are acting like a dead machine, not living people." Also in line with the Noble Eightfold Path of Skillful Understanding, CTRT posits that once you have an understanding of how suffering happens, you can choose to prevent it, by also acting in ways that leads to preferred outcomes. Skilled practitioners know how to replace unskillful actions with more skillful ones. In CTRT, the awareness is active and it leads to more adaptive behavior.

Given that the *Dhamma* is meant to reflect the universal truth, it is not surprising that there are many parallels in approaches from Western psychology towards the management of personal suffering. Ancient Greek philosophies, especially Stoicism has many instances where their reasoning resembles that of Buddhism. Given that Western Psychology originated mostly from Greek and European philosophies, there is much compatibility between it and Buddhist approaches. Some scholars even argue that these philosophies have come full circle, or at least they have traveled all around between India and Greece during ancient times where the nature of exchanges made it difficult to tell of their origins.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

There are more discussions to be had and descriptions of parallels between Buddhism and Western psychotherapy but it would be beyond the scope of this chapter. These can be found in many literatures already. The idea of mentioning parallels here is so that there is some acknowledgement of how relevant Buddhist teachings are in promoting mental well-being within the psychotherapy situation.

THE (MIDDLE) WAY FORWARD: FUTURE DIRECTIONS FOR BUDDHISM IN COUNSELLING AND PSYCHOTHERAPY

This chapter so far has touched on Buddhist approaches in counselling and psychotherapy in general. Much more has to be studied systematically with regards to methodology and outcomes before more comparisons can be made with more established Western cognitive therapies. However, this can be a very difficult task given the limited research to being with that show specifically Buddhism-based approaches are scientifically efficacious. Furthermore, there are many overlaps between techniques in Buddhism and Western psychotherapy. The whole idea of technique itself may be a questionable concept or term that may require its own investigation. It is difficult to ascertain how a Buddhist approach might look like minus the Western formula of psychotherapy. What this chapter has demonstrated so far was the use of Buddhist concepts within Westernized psychotherapy settings. Perhaps investigations should also look into situational difference of the Buddhist approach. For example, how would monastics members of the Buddhist clergy use their teachings as means of directly propagating well-being in troubled individuals who go to them for help. This would be relevant especially when individual insecurities revolve around afterlife, supernatural beliefs and religious intellectual confusion.

Many evidence have been largely anecdotal rather than based on rigorous randomized control trial-type research. Much of the studies that are related to Buddhist approaches have been largely on mindfulness-based cognitive therapy (MBCT). These researches have established MBCT's efficacy as part of the "Third Wave" of psychotherapies. Nevertheless, there has been recent criticisms towards MBCT as being misapplied outside of the overall context where the morality aspects of behavioral change have not necessarily been applied. These criticisms come from how mindfulness was extracted from Buddhist practice of *samādhi* for its strong effect on improving focus and self-understanding but had neglected the *silā* or morality side, coupled with respect for cultural customs that facilitates the practice of mindfulness. Therefore, more research beyond just mindfulness-based interventions are needed, partly also to address the criticisms towards MBIs as missing the context for mindfulness, which is part of the spiritual development triad – which needs moral development as well.

CONCLUSION

This chapter has presented a basic view of Buddhism in relation to how its teachings can form part of the psychotherapeutic process in helping individuals improve their mental health. Much of the Buddhist approach is cognitive in nature and can easily be intellectualized without actual realization. However, when delivered in a more experiential manner, the tenets of Buddhism can be applied to daily challenges in life that are rife with personal attachments, inaccurate assumptions of permanence and aversive events. The main teachings of Buddhism serve to help individuals understand the nature of suffering or discontentment and how, by understanding the nature, taking steps to stop the causes and conditions that

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

bring about the misery that suffering and discontentment lead to. Given that Buddhism is in essence a manual for freedom from suffering, it is argued by the authors that it is basically a psychotherapy practice. While Western psychotherapy uses organized techniques developed over the last two centuries by psychiatrists and psychologists, Buddhism is largely infused into social lifestyle as a religion or spiritual practice, which has overshadowed its value as a mental health system of knowledge. Much of the practice of Buddhism has been demonstrated by ritualistic activities than actual internalization of its basic teachings that are meant for personal betterment. This is not to say that the rituals are not beneficial, but the deeper understanding of the basic underpinnings of what the Buddha taught can be very effective and practical in promoting mental health. It is hoped that this chapter highlights Buddhist philosophy as something more than just a spiritual identity but also a tool for overall well-being.

Chapter 15
Vocational Rehabilitation of Persons With Hearing Impairment:
A Step Towards Inclusive Development

S. Z. H. Zaidi
Amity University – Lucknow, India

Divya Baveja
Amity University – Lucknow, India

ABSTRACT

This chapter focuses on the importance of vocational rehabilitation of persons with hearing impairment to attain the goal of inclusive development and rights of equal opportunities and participation. It deals with the definition of hearing impairment, in terms of ILO and prevailing legislations, the process of vocational rehabilitation, and importance of follow up. The chapter gives special emphasis to different approaches of evaluations of residual capacities, skill training models, and status of employment market along with the scope of entrepreneurial development. It also deals with various issues and challenges in the process of vocational rehabilitation of persons with hearing impairment.

INTRODUCTION

Ears are delicate and have complex mechanisms for many functions and not for just hearing per se. A well-functioning ear can make you hear very soft sounds over a wide range of frequency as well as withstand very loud sounds. It can also discriminate between sounds of varying pitch and intensity and locate the source of a sound. Various reasons of damage to ear like disease process, any physical trauma, exposure to excessive noise, drugs or simply the process of aging, may result in malfunction. This further may result in varying degrees of deafness which is also known as 'Hearing Impairment'.

Hearing impairment may be understood as a partial or complete inability to hear from one or both ears at a desired or even enhanced frequency. It may be congenital or acquired, and temporary or permanent. Hearing impairment is one of the most frequently experienced sensory deficits in the human population, and it affects more than 250 million people worldwide. Its consequences could be reduced capacity to understand speech sounds, communicate, and delay in language development, educational and economic backwardness, social isolation and stigmatization (Singh, 2015). The various types of hearing impairment are described in Table 1(Nagaraja, 2002).

Table 1. Description of hearing impairment

<table>
<tr><th>Degree in *dB</th><th>Types of Loss</th><th>Onset</th><th>Course of Nature</th></tr>
<tr><td>Normal 0-25</td><td>Conductive Hearing Loss</td><td>Pre-lingual Congenital or before 4-4.5 years</td><td>Gradual</td></tr>

<tr><td>Profound 91 +</td></tr>
</table>

*dB-Decibel

All previous legislation that were enforced to protect the rights of the disabled have included certain disabilities under them. The International Labour Organization defined a disabled person as ‘an individual whose prospects of securing, retaining and advancing in suitable employment are substantially reduced as a result of a duly recognized physical, sensory, intellectual or mental impairment’ (ILO, 1983).The Persons With Disability (Equal Opportunities, Protection of Rights, and Full Participation) Act, 1995 covered 7 such specific disabilities viz. Blindness, Low Vision, Hearing Impairment, Mental Retardation, Mental Illness, Leprosy-cured and Locomotor disability. Hearing impairment has been defined in the 1995 Acts ‘loss of 60dB or more in the better ear for conversational range of frequencies’ (The Persons With Disability Equal Opportunities, Protection of Rights, and Full Participations Act, 1995). However, this Act has been revised and replaced by Rights of Persons with Disability Act, 2016. This new Act of 2016 includes 21 conditions under ‘Disability’ including the 7 conditions that were covered by earlier Persons with Disability Act 1995. Further, the new Act has also expanded the definition of hearing impairment by including both ‘deaf’ and ‘hard of hearing’ persons. As such, hearing impairment has been defined as follows:

A - *‘Deaf’ means persons having 70 dB hearing loss in speech frequencies in both ears, and*
B – *‘Hard of hearing’ means persons having 60 dB to 70 dB hearing loss in speech frequencies. (Rights of Persons with Disabilities Act (2016)*

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

PREVALENCE OF HEARING IMPAIRMENT

Census of India 2011, reported that out of the population of 1,210 million, about 26.8 million persons are 'disabled' which is 2.21% of the total population (Statistical Profile of Disabled Persons in India, 2016). Figure 1 presents the statistics related to the persons with disability. As one can see, hearing impairment accounts for 19% of the disabled population and is the second biggest type of disability.

Figure 1. Distribution of various disabilities

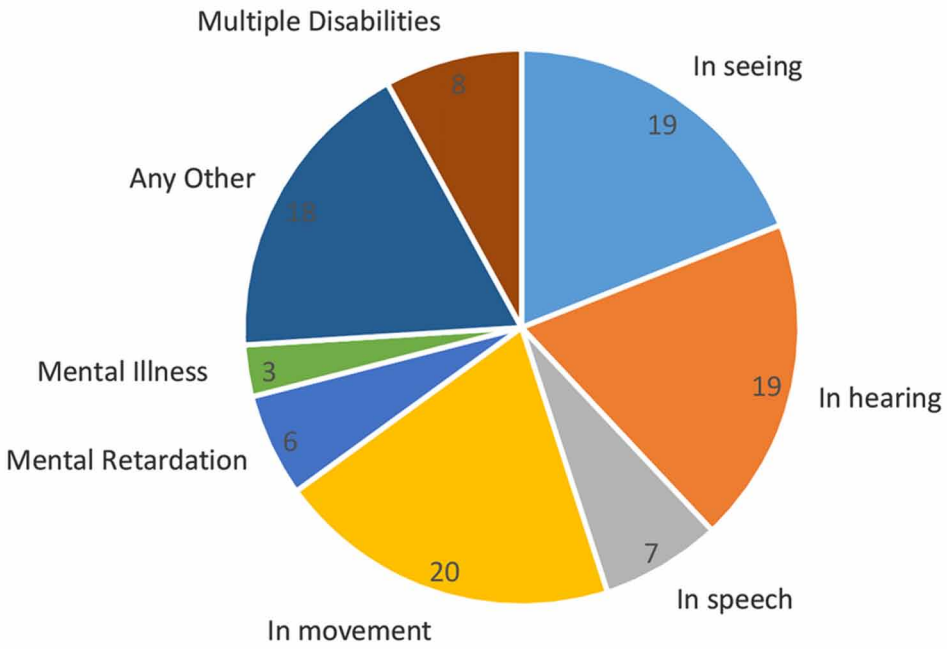

Table 2 presents an overview of the number of persons with disabilities in India, as per the Census 2011 data. Further analysis of the Census Report revealed that though there has been an appreciable improvement in the literacy rate of the general population of India, yet the literacy rate of persons with disability is still considerably low in comparison to the general population which further imposes limitations in their empowerment.

Table 2. Disabled persons in India, census 2011

	Persons	Males	Females
Number (In crores)	2.68	1.5	1.18
Percentage (out of Total Population)	2.21%	1.24%	0.97%

Data from Statistical Profile of Disabled Persons in India, 2016.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3 presents the data on the literacy status of the disabled population as compared to the general population of India. The poor literacy rate among persons with disabilities is resulting in their limited participation in the workforce as one of the reasons. As per one estimate, about 3 million persons with disabilities belonging to working age are currently not working on regular basis. Analysis of reports available on employment status of persons with disabilities (Statistical Profile of Disabled Persons in India, 2016) revealed that the participation of such group in the main workforce is marginal for various reasons including lack of opportunities, lack of basic education, employable skills and the prejudice attached to their employability and productivity resulting in non-utilization of huge workforce who have full potential to be integrated in main working stream provided suitable training and opportunities are extended.

Table 3. Literacy status of disabled population in comparison to general population

	Literate		Illiterate		
	General Population	Disabled	General Population	Disabled	
Total Persons	74.04%	55%	25.96%	45%	
Males	Over 80%	62%	Less than 20%	38%	
Females	65.46%	45%	35.54%	55%	

Data from Statistical Profile of Disabled Persons in India, 2016 and Population of India Census 2011

VOCATIONAL REHABILITATION

Decent work is one of International Labour Organization's (ILO) primary goal for everyone, including Persons with Disabilities. When we promote rights and dignity of Persons with Disability we are empowering individuals, strengthening economic security and in reaching society at large (Shenoy, 2011). Vocational rehabilitation is defined as enabling individuals with either temporary or permanent disability to access, return to, or remain in, employment (British Society of Rehabilitation Medicine, 2000). This definition echoes the one proposed by the ILO which is "Vocational Rehabilitation is a process to enable a disabled person to secure and retain suitable employment" (International Labour Organization, 1998). It is to be understood as a step in the continuous efforts towards the social rehabilitation of any disabled individual, where the aim may be to minimize the functional and psychological, socio-cultural or financial consequences of the disability.

In principle, as explained by ILO (2004), it should cover all services and efforts that contribute in ensuring equality of opportunity in work for people with disabilities and in leading to their integration or reintegration, whichever applicable, to society. It may include vocational guidance, career counselling, vocational training, placement and ergonomic modifications of select jobs to make them disabled-friendly and need-based psychosocial interventions.

The goal of vocational rehabilitation is fostering self-reliance, independence and feelings of self-worth. When given appropriate opportunities, individuals with hearing impairment can become economically productive and contributing citizens of the country. In the time when 'inclusive development' is being emphasized as the right way toward sustainable development, focused efforts for the empowerment of

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the disabled are essential. The inclusive development consists of ensuring that all marginalized and excluded groups are stakeholders in development processes design, implementation, monitoring and evaluation. It strives to ensure that all sections of the society, including the disabled are valued equally as rights-holding citizens and contribute to the country's developmental issues and strategies. It is based on three principles: accessibility, participation and non-discrimination (International Disability and Development Consortium, 2005).

Economically speaking, nations are battling the global economic crisis, unsteady unemployment trends and inequality. In making efforts for economic growth, it has to be ensured that benefits reach everyone. The inclusive development also focuses on making more comprehensive strategies which will reduce inequality and include diversity.

MODELS FOR REHABILITATION OF INDIVIDUALS WITH HEARING IMPAIRMENT

Disability and Rehabilitation can be explained using various perspectives and models. Few of them are briefly discussed.

Religious-Moral-Spiritual Model/Conventional Model

- It understands disability as a punishment received by an individual or his family by some external force due to any wrong deeds done by the disabled person or someone else in the family in current life or in a previous reincarnation.
- Sometimes it is also attributed to evil spirits for which exorcism or faith healing may be tried, thus putting the disabled in danger and further isolation.
- Rehabilitation efforts are thus done by undoing the so-called sins, pleasing supernatural power, charity in conformity to religious faith or otherwise.

All such efforts have been done to either please supernatural powers or to show sympathy and humility towards persons inflicted with disabilities and not because the disabled is taken as an equal partner of the society. Additionally, the people who help or give charity act as 'pitiful' donors and expect gratitude from the disabled person.

Medical Model

- May also be referred to as the Biological-Inferiority or Functional-Limitation Model.
- Views that disability is a result of the disabled person's physical and/or mental limitations, being largely unrelated to one's social or geographical environment.
- It places the source of the problem within the impaired person and suggests that solutions may be found by treating the physical limitations through medicines, surgical procedures, and fitment of aids and appliances.
- In rehabilitation efforts, the focus is on finding the 'cure' for the disability, and when that inevitably fails, then providing 'care' for the 'incurable' disabled person, consequently, justifying institutionalization and/or segregation.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Psychosocial Model

- It understands disability as a consequence of any environmental, social or attitudinal barriers that may prevent people with impairments from participating maximally in society, therefore removing these is posited to improve the lives of disabled people.
- It seeks solutions outside the disabled person, in his environment.
- Focus on 'equity' rather than on 'equality'.
- It changed the way in which disability was attributed, and has had a huge influence on rehabilitation efforts in terms of anti-discriminatory legislation.
- Rehabilitation efforts are also aimed at changing the psychosocial environment of the disabled person so as to reduce or overcome the barriers in the society. If the problem lies within the environment, then the environment must be changed to cause a solution. For example, if a wheelchair user cannot board a bus limiting his functioning, the bus may be modified to include ramps; or if a hearing impaired cannot hear announcements, the infrastructure may be modified to include important announcements visually on screens.

Economic Model

- It narrows the complex issue of disability to the limitations and restrictions a disabled person can be expected to have, with inferences drawn as to whether and till what extent "flawed" people may be productive.
- Disability is defined by the disabled person's inability to participate in work, with further assessment of the degree to which this impairment may affect an individual's productivity and consequently the economic burden or impact on the individual, his employer and the state. This view may further reinforce the prejudiced beliefs of employers that disabled persons are less productive than their counterparts.
- Policymakers, from this view, assess the distribution of benefits to those who are disabled and hence are unable to participate in work 'fully'.
- Employers may employ less productive disabled persons to enjoy benefits of an image of an organization with community values, for economic reasons and not because of recognition of their rights. Also, they may pay disabled people less.

APPROACH TO VOCATIONAL REHABILITATION WITH PERSONS WITH HEARING IMPAIRMENT

Vocational rehabilitation is based on the multi-disciplinary support consisting of experts from different fields of specialities like neurologists, ENT surgeon, clinical psychologist, speech pathologist, audiologist, special educator, special vocational instructor, communication instructor, placement counsellor, and employment provider. It aims at finding a suitable income generating activity in which person can be suitably inducted and flourish. It is a process involving following steps:

1. Assessment
2. Fitment of assistive devices

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

3. Communication training
4. Career counseling
5. Skill Training
6. Job placement
7. Follow up

Assessment

Assessment is a process of evaluating the residual capacities of an individual with the objective of unfolding his assets and extent of limitations. It has to be done by an interdisciplinary team mentioned above. A medical specialist evaluates possibilities of organic involvement, the location and extent of the damage, possibilities of correction, and introduction of intervention to arrest any further impairment. He/she may also advise the various work situations which may or may not be convenient and suitable for persons with hearing impairment. The clinical psychologist conducts the detailed assessment to evaluate the mental processes, developmental status, intellectual level, personality correlates, attitude, adaptability etc and prepare a psychological profile. The profile prepared by the clinical psychologist becomes the basic guidelines for providing vocational guidance and counselling in later stages. It also helps in selection of suitable careers and support in enhancing adjustment process in workplace and attitude towards employment, employer, and colleagues etc.

Some popular psychological tests used by Clinical Psychologist are given below:

1. Leiter International Performance Scales or LIPS (Roid & Miller, 1997)
2. Wechsler Intelligence Scales for Children or WISC (Wechsler, 1991)
3. Wechsler Individual Achievement Tests or WIAT (Wechsler, 1992)
4. Universal Nonverbal Intelligence Test or UNIT (Bracken & McCallum, 1998)
5. Vineland Adaptive Behavior Scales (Sparrow, 2011)
6. Carolina Picture Vocabulary Test for Deaf and Hearing Impaired Children (CPVT; Layton & Homes, 1985)
7. Bender Visual Motor Gestalt Test, Second Edition (Bender Gestalt II; Dumond & Willis, 2008)
8. The Halstead-Reitan Battery - performance type tests, (e.g., trails, categories, grip strength) (Reitan & Wolfson, 1985)
9. Draw A Person Test (DAPT; Short, DeOrnellas, & Walrath, 2011)
10. House Tree Person Test (HTP; Buck, 1971)
11. Reynolds Adolescent Adjustment Screening Inventory: RAASI (Reynolds, 2001)
12. Meadow-Kendall Social-Emotional Assessment Inventory for Deaf & Hearing Impaired Students (Meadow, 1980)

In addition to the above, there are many rating scales based on observational techniques for evaluating the mental status, emotional reactions, and adjustment processes. Some of the above-reported tests are having separate norms and specific guidelines for administration on hearing impaired population. Although some of them may not have Indian norms specifically yet they can be used in day to day rehabilitation practice as they are not used to diagnose any specific condition but to assess psychological variables and for profiling their assets, liabilities and residual capacities to arrange their skill training and job placement.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Audiologist assesses the extent of hearing loss and level of Disability. Audiologist's role is also in assisting the ENT Surgeon in exploring the possibilities of the fitment of hearing aids and the possibilities of major surgical intervention. The speech pathologist is a specialist who provides Speech therapy to enhance language development, vocabulary, and verbal expression/communication. Sign language instructor may also be associated here, in planning the speech training with special reference to developing the functional conversational skills required for acquiring a vocational skill and discharging the duties at the workplace.

Assessment to unfold the suitability of the hearing impaired person for induction informal/non-formal education program leading to different certifications is conducted by the special educator. A specific educational need of the individual to facilitate the development of lesson plan, study material, teaching aids, periodical assessment procedure, individualized examination pattern to assure acquiring of functional literacy and preparedness for induction in formal education imparting recognized courses are evaluated.

The special vocational instructor is responsible for evaluating the trainability of the individual for any specific vocation. Special vocational instructor under the guidance of clinical psychologist observes the person with hearing impairment in the real job setting. A series of job samples consisting of operations required in performing a particular job is given to the individual and the performance on these job samples are rated through different rating scales. The vocational instructor also assesses the work traits on the basis of behavior shown by the individual on workstation. Some of the important work traits are endurance, comprehension, safety consciousness, adaptability, fatigue, stress tolerance, resistance, adjustment with colleagues, work environment, regularity, punctuality etc. The profiles prepared by the vocational instructor are used in the selection of a suitable skill set and placement area for the individual.

Fitment of Assistive Devices

Success in vocational rehabilitation requires effective communication skills on the continuous basis. Hearing aids which have been traditionally used since many years have undergone tremendous improvement and upgradation. Based on the recommendation of ENT surgeon and audiologist, the individual being prepared for vocational rehabilitation is provided with suitable hearing aids properly adjusted with frequencies recommended by the experts. They are also trained to adjust with hearing aids and go for periodical maintenance/repair of their device depending upon the financial background and availability of funds. Hearing aids are also provided to individuals under various government schemes either free of cost, or with subsidized rates.

Communication Training

Communication is usually considered to a mean of conveying the message and feelings through words. Words play a very limited role in communicating the message of various types provided the sender is suitably trained and the receiver is suitably sensitized. In the process of communication training, the trainer may use sign language, lips reading or combination of both. However, he would also train his client on job-specific communication skills like sign for tools, sign required for receptionist, signs required for sales and marketing, and for many such job profile/requirements.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Career Guidance and Counselling

Career guidance and counseling is a very important component of vocational rehabilitation where a career counselor tries to match the job profile and profile of the individual and help the client in choosing a career best suited to him. In case of persons with hearing impairment, career guidance and counselling is still more important to prevent the individual from sticking up to the point of no return in the course of his career advancement. In Indian scenario, having limited opportunities the role of career guidance and counselling is not only to provide the information about the jobs available but also to collect the employment market information, explore the future market scenario, conduct job identification studies in the area in which persons with hearing impairment can be trained and placed. Such studies are needed to be based on local employment market from which the persons with hearing impairment belong to and not on the hypothetical basis for the jobs which may not be existing in the area of their normal residency. Beside the career-related information, the career counselor should also be well versed in communication skills to minimize the communication gaps between the client and the information.

Skill Training

Skill training refers to the organized and systematic efforts to train a person suitably so that he may develop ability required for performing a job, operation and earn his livelihood. Skill training also involves the adaptation with different work environments to meet out the vocational challenges. It could be arranged in formal mode by admitting the persons in an institute of different levels depending upon his educational background, the severity of communication problem, aptitude and other psychological parameters, or in non-formal mode, where the training is arranged as per the individual need and his psychosocial profile. All the formal training institutes starting from Industrial training Institute (ITI), Polytechnic to upgraded professional institutes like College of Engineering, Indian Institute of Technology (IIT), National Institute etc. and governed by government have certain seats reserved for persons with hearing impairment provided the applicant is otherwise eligible for admission and has functional conversational ability and could qualify the entrance examination/assessment test. However, in spite of having the reservation of seats and other support systems, the representation of persons with hearing impairment in formal training institutes based on inclusive education and training system has been extremely marginal, mainly because by and large, they do not possess the basic educational qualification required for the higher level of vocational training. Hence, the only alternative left out for the majority of persons with hearing impairment is undergoing non-formal training in places like Vocational Rehabilitation Centres (VRC), other training centres, Vocational Training centres (VTC) run by different Non-Governmental Organizations(NGOs) and apprenticeship training in different workshops. The main principle of arranging such non-formal training is modular-based practical oriented training having minimum involvement of language, and verbal inputs. However, the certificate granted by NGOs and other organizations for non-formal training may endorse the level of skill attained but lack the approval of any regulatory authority.

In order to ease the above limitation, the government of India has launched short-term training programs with the name of Modular Employable Skill Scheme (MES) (Ministry of Labour and Employment, 2008) which has now been transferred to state government. MES is based on short-term operational based training in different vocational skills required in the employment market. The theoretical component of the training is 10% while 90% is practical and workshop training. It is a tri-partite program involving

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

recognized training institutes who would be organizing the day to day training activities, employers who would be appraising the organization with changing employment market and the need for their industry. Employers would also support in skill mapping and in conducting the skill test on completion of training, and regulatory council like National Council of Vocational Training (NCVT)/State Council of Vocational Training (SCVT) will award the certificates to successful candidates. The most popular and employable skill sets for persons with hearing impairment include data entry operator, networking and hardware professionals, fashion technology, fine arts, photography, ceramics related activities, assembly line activities, food craft, printing technology, architectural draftsmanship, horticulture and gardening, interior decoration, and furniture making etc. The above list is only illustrative and not exhaustive. The success of individuals in attaining the skills directly depends upon motivational level, aptitude, family support, and infrastructure facilities (modified workstations and tools) and sensitivity and training of instructional staff. Recently, Planning Commission has identified 20 high growth sectors where the requirement of skilled workforce would be in plenty during years to come and wherein Persons with different physical limitations including hearing impairment can also be trained.

The priority list of 20 high growth sectors is as per following:

1. Automobile and Auto Components
2. Banking/Insurance and Finance services
3. Building and construction industries
4. Chemical and Pharmaceuticals
5. Leather and leather goods
6. Retails
7. Educational and Skill Development Services
8. Electronics and Hardware
9. Food Processing
10. Furniture and Furnishing
11. Gems and Jewellery
12. Healthcare
13. Handloom and Handicraft
14. Business Process Outsourcing
15. Software Service/Hardware Assembly
16. Real Estate
17. Textile/Garments
18. Tourism Hospitality and Travel
19. Transportation and Logistic
20. Packing (Planning Commission of India's report on 12th Five-year plan, 2013)

Job Placement

Placement can be defined as an activity which not only supports the individual in finding an income generating engagement but also sustaining in it and progressing in future. Placement for persons with disabilities has always been a great challenge and a rewarding experience too. Because of change of disability models, the placement scenario has also undergone the drastic change. The concepts like sheltered employment, protected employment or welfare factory etc. have been redefined mainly because

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

of the growing concern about the rights of persons with disabilities, their working abilities, commitment, proven sincerity and of course, expenses required to set up an exclusive workshop or industry for persons with disabilities. Advancement in technology has also brought a revolution in trainability, and employability of persons with disabilities. Persons with hearing impairment in spite of their good physical fitness, motivational level and ability to perform well have not been the first choice for many employers because of their own (employer's) inability to establish effective communications. In order to assure the equal opportunity to persons with disabilities in the employment market, the government of India has identified thousands of jobs available in public and private sectors that can be performed by persons of different types of disabilities. The list of jobs also includes those for the hearing impaired workforce and range from routine jobs to jobs requiring the high level of skills, scientific knowledge, and administrative abilities. All the employers, particularly in government sectors, are governed by different Acts assuring job reservation and placement support. They do not impose any restrictions for employers to recruit persons with hearing impairment even on those jobs which may not be in the list of identified jobs because the identification exercise can never be updated at a pace comparable to the change in employment markets. Beside job reservation and identification of jobs, there are many agencies of the government of India and state government exclusively functioning to promote and arrange placements for them. The organizations like Special Employment Exchange, Vocational Rehabilitation Centres (VRC) for handicapped (now known as National Career Service Centre for Differently Abled), model career centres run by state government and placement divisions working under national institutes for different types of disabilities register the persons with hearing impairment and arrange their placements in different government and private sectors. The preparation for competitive examinations known as Pre Recruitment Tests has also been a point of concern for candidates with hearing impairment. Government agencies like VRC (National Career Service Centre for Differently abled) in collaboration with various banks, staff selection commissions, NGOs have been organizing the pre-recruitment training for briefing them about the knowledge and skills required for qualifying the competitive examinations.

The continuous shrinking and cuts in salaried employment globally have also imposed additional limitations in arranging salaried employment for persons with hearing impairment and with this universal phenomenon, the only alternative left out is to encourage the person with hearing impairment towards self-employment activities. Self-employment as the name suggests means taking up or setting up a program by an entrepreneur individually or in partnership by producing and marketing an item or extending services on fixed or negotiable financial returns in the form of yield or income. Self-employment has not been a preferred mode for many years for various reasons such as lack of awareness of market needs, lack of skills to produce or market a particular item, lack of finance, lack of management skills, lack of marketing skills and salesmanship, and on the top of all, lack of risk taking capacity or entrepreneurship. But now the scenario is changing. There are many government agencies and NGO initiatives focusing on entrepreneurial skill development among person with disabilities which also include hearing impairment at every stage. National Handicap Finance and Development Corporation (NHFDC) set up by the government of India is addressing the issue of financial requirement of self- employment projects of PWD in a big way through its wide net of channelizing agencies functioning in grass root level. NHFDC not only provides the finances in the form of the loan on a highly subsidized rate of interests but also supports pre self-employment vocational skill training to facilitate smooth implementation of project. Central and state government also encourage physically challenged entrepreneurs by procuring their product on the priority basis. There are many persons with hearing impairment who have set up their

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

units of garment making, furniture making workshops, laundry work, automobile service centres and washing plants, gents and ladies' parlors to name a few.

Follow Up

Follow up is the extension of placement activities especially in the sector of placement of PWD. Follow up involves frequent visit of the workplace by the professional member of placement agencies, interaction with employers, supervisors and colleagues and sorting out issues if any. The effective follow up enhances the confidence among employees, employers and co-workers. It also gives a very important feedback to placement agencies as to what extent the persons with hearing impairment has been placed suitably and what changes may be required in future placement efforts. It also gives an insight into the real work challenges and requirements to modify the pre-placement skill training, orientation program and advocacy. In fact, effective placement and follow up open the avenues for future placement and possibilities of success for other candidates. In case of persons with hearing impairment, the follow up is particularly very important in the enhancement of communication between the employee with hearing impairment and his colleagues which ultimately reduces the fear of being isolated of which such persons have been serious victims, which may lead to dropouts, discontinuation and high attrition rate.

Issues and Challenges

Inspite of commitment of government of India, and the United Nation Convention on Rights of Persons with Disability, 2007 Article 27 which recognizes the rights of persons with disability to work on an equal basis with others, this includes the opportunity to gain living by work freely chosen or accepted in the labour market and work environment that is open, intrusive and accessible to persons with disabilities,the representation of persons with disabilities particularly hearing impaired in national workforce is far from satisfactory to the extent that even the quota reserved for this category of candidates could not be filled in many organizations. Private sector companies that are not governed by the reservation policy and are open and flexible in employment recruitment process could also not be assured respectable representation of the persons with hearing impairment in their workforce.

Various studies conducted by different national and international agencies and also individual experiences of employers, recruiting agencies and hearing impaired persons reveal following issues that need to be addressed to assure reasonable sustainable vocational rehabilitation to persons with hearing impairment.

1. The huge gap between the resources, infrastructure and manpower and the number of persons with hearing impairment to be employed in sustainable employment activities.
2. The training and educational requirements of children with pre-lingual deafness and post-lingual deafness are different. Children with pre-lingual deafness are mostly congenital having no understanding of words, meaning and are primarily trained by sign language with visual training aids, whereas children with post-lingual deafness are the victims of acquired deafness. Many of them after the development of their language and having good vocabulary may be communicated with amplified equipment supported with the sign, but there are hardly any vocational training institutes that can bifurcate the training module as per the onset and typology of the hearing loss. This leads to more or less permanent gaps in communication, acquiring of vocational skills and job performance.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Employers also may not be equipped enough to appreciate the difference between pre-lingual and post-lingual hearing impaired persons and may undervalue the efficiency of the employees for no fault of both.

3. The area/domain of vocational training is mostly focused on urban-based employment opportunities while the sizable numbers of persons with disabilities are residing in rural or semi-urban areas having very little opportunities of post-training placements resulting in either non-utilization of skill acquired or underutilization of the trained manpower. For example, desktop publishing and other printing related training can only be utilized in industrial or metropolitan cities and there would hardly be any use of placement in rural areas no matter how well the hearing impaired person has been trained.
4. The workplace, nature of occupation and employer's perception also play an important barrier and causative factor in the feeling of being discriminated resulting in discontinuation of the jobs.
5. No matter what social security schemes any government may frame, accessibility and effectiveness of scheme would directly depend upon the basic education level, awareness, risk-taking attitude, independence and family support in case of persons with hearing impairment. They are trailing behind in almost all the above parameters. Their basic education is still not compatible with the educational level of their counterparts in open employment. They are not aware of various social security schemes, legislation and not easily approachable because of their scattered and remote living vicinity. The skill sets are not being upgraded frequently mainly because of lack of trained instructors required for imparting and upgrading the skills.
6. In spite of the fact that self-employment is perhaps the only long-term solution for the continuous shrinking of salaried pay employment opportunities, yet persons with hearing impairment by and large are not very keen to go for self-employment ventures and there is hardly any facility available exclusively for them for entrepreneurial development. This lack of motivation towards self-employment has many a time proved to be the main cause of failures of many governments sponsored schemes promoting self-employment.
7. The assistive devices are either beyond the easy approach of common hearing impaired persons due to its scarcity/short of supply or beyond financial reach. The devices provided by different agencies either free of cost or in subsidized rates have not been very long lasting and require continuous maintenance and repair which may not be available or accessible easily.

SOLUTIONS AND RECOMMENDATIONS

1. There cannot be a second opinion that no one would disagree or show any resistance to the efforts of assuring full participation and integration of persons with hearing impairment with mainstream workforce but some deep-seated biases and stereotypes about their efficacy, productivity and employability are still persisting which require intensive desensitization and advocacy by showcasing their employability through various media.
2. Intensive training of school teachers of so-called normal schools and vocational instructors in communication skills for both pre-lingual deaf students and post-lingual deaf students would ease the problem of attaining basic education required for acquiring marketable vocational skills.
3. Area-based employment market and job surveys would help in providing vocational guidance and career counselling with special reference to the locality and usual residency.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

4. Accessibility to the social security schemes and awareness about rights of the person with hearing impairment may elevate the motivational levels and drives toward vocational independence.
5. Effective implementation of different legislations and accountability of its implementing agencies would also be helpful in the integration of persons with hearing impairment with the workforce.

CONCLUSION

Vocational rehabilitation of persons with hearing impairment is not only an important step in the entire management of persons with hearing impairment but the ultimate outcome of entire rehabilitation exercise. In a country like India, where more than 26 million persons are inflicted with hearing impairment, they cannot be left unattended particularly when they possess all the qualities, abilities, personality traits and potential to become a productive member of workforce par excellence to their fellow citizens, provided suitable education and training is inculcated, positive attitude and accommodative environment is created and advancement in technology in skill development and training and job-related assistive devices are made available.

KEY TERMS AND DEFINITIONS

Acquired Disability: Getting some disability after birth.
Advocacy: The act of speaking up for others.
Anxiety: Fear reactions for unknown reasons.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Assistive Listening Device: Equipment like hearing aids that help in listening by amplifying the pitch/tone.

Audiogram: A graphic status obtained from electronic equipment depicting hearing thresholds.

Audiometer: Electronic equipment measuring the threshold of hearing.

Barrier-Free Environment: A physical environment where any person with any physical limitations such as those of locomotion, vision, or hearing can live and function independently.

Communication: The process of conveying one's thoughts and feelings through gestures or words.

Communication Disorders: A condition that is characterized by the inability to use a communication medium to successfully convey to others, one's thoughts, feelings, beliefs, etc.

Counselling: It is a professional technique to help an individual in understanding and solving his problems of different natures.

Disability: A status caused by physical or mental impairment and resultant functional limitations.

Evaluation: A process of assessing assets and liabilities of an individual objectively to the extent possible.

Hearing Impaired: A person who cannot hear the sound even those with amplified pitch/tone, and whose hearing threshold is higher than the normal hearing threshold.

On-the-Job Training: Arranging skill training in real shop floor or actual working conditions.

Open Employment: Placement of an individual in salaried employment without any special consideration, relaxation, and by open competitions.

Self-Advocacy: Speaking up for oneself.

Sign Language: A method of communication by using different symbolic signs by using fingers and facial expressions in place of words.

Social Exclusion: Excluding persons due to a range of reasons determined and influenced by culture, communities, attitudes, etc.

Social Inclusion: Including all persons regardless of any dividing factors to the social fabric of life. There are various types of inclusion; full, partial and mainstreaming. It is a process that requires deliberate actions.

Social Model of Disability: First introduced in 1976, the model seeks to place responsibility on society to enable inclusion and to actively engage in eradicating barriers that subscribe to exclusion of people with disabilities.

Special Vocational Instructor: A vocational instructor who is trained for imparting vocational training and transferring the skills to persons with disabilities.

Vocational Evaluation: Assessment of an individual to evaluate his physical and mental potentials/abilities to acquire specific skills related to different vocations.

Work Study: A method of analyzing different operations involved in performing a specific work sample.

Chapter 16
Psychological (and Emotional) Architecture:
The Values and Benefits of Nature-Based Architecture – Biophilia

Ben Tran
Alliant International University, USA

ABSTRACT

Wilson calls biofilia an "innate tendency to focus on life and lifelike processes" (Wilson, 1984, p. 1), an "innate emotional affiliation of human beings to other living organisms" (Wilson, 1993, p. 31), or an "inborn affinity human beings have for other forms of life, an affiliation evoked, according to circumstances, by pleasure, or a sense of security, or awe, or even fascination blended with revulsion" (Wilson, 1994, p. 360). The research in this area is indicating that bringing elements of nature into the workplace, whether real or artificial, is beneficial in terms of employee outcomes. Nevertheless, although investigation into the benefits of biophilia for individual well-being is relatively new, there is clearly mounting evidence that biophilic design can have a positive impact, from reducing stress and anxiety, to improving the quality and availability of respite from work and in increasing levels of self-reported well-being.

INTRODUCTION

Natural objects, shapes, and processes, according to Joye (2007a), have often acted as a source of inspiration throughout the history of architecture. Perhaps the most obvious example of this inspiration is ornament, which often contains representations that are closely similar to, or reminiscent of, the animal and plant world. Besides such literal imitations, some architects, notably Antoni Gaudí i Cornet, drew lessons from the structural forces governing natural structures, resulting in efficient and economically built architecture (Sweeney & Sert, 1960). Recently, there seems to be a renewed interest in the relationship between nature and architecture (Feuerstein, 2002). More specifically, such architecture makes use of digital design software which allows one to easily recreate the curvy shapes and geometry that are characteristic of natural entities (Lynn, 1999); namely, biophilia.

Biophilia is the deep-seated need of humans to connect with nature. It helps explain why crackling fires and crashing waves captivate us, why a view of nature can enhance our creativity, why shadows and heights instill fascination and fear, and why gardening and strolling through a park have restorative healing effects (Ryan, Browning, Clancy, Andrews, & Kallianpurkar, 2014). Biophilia, as a hypothesis, may also help explain why some urban parks and buildings are preferred over others. Research scientists and design practitioners have been working for decades to define aspects of nature that most impact our satisfaction with the built environment. Furthermore, as new evidence emerges, the relationships between nature, science, and the built environment are becoming easier to understand traditional wisdom and new opportunities.

The design patterns have been developed from empirical evidence and interdisciplinary analysis of more than 500 peer-reviewed articles and books (Ryan et al., 2014). The patterns have a wide range of applications for both interior and exterior environments, and are meant to be flexible and adaptive, allowing for project-appropriate implementation. From a designer's perspective, biophilic design patterns have the potential to re-position the environmental conversation to give the individual's needs equal consideration alongside conventional parameters for building performance that have historically excluded health and well-being. Therefore, this chapter affirms the importance of natural form as a perennial source of inspiration for architecture. Hence, the purpose of this chapter is on the psychological (and emotional) architecture, with an emphasis on biophilia (or the nature-based) and the values and benefits of biophilia. In fact, the main conclusion of this article is that, nature-based forms and organizations in architecture are valuable for human emotional and cognitive functioning in the workplace.

This chapter serves several purposes. First, it is one of many other chapters in this book related and interrelated to topics of architecture, biophilia, and psychology. Second, this chapter challenges and encourages researchers and practitioners to critically question and analyze the situation at hand to prepare for and address the situation in the future from an interdisciplinary paradigm, balancing strengths and weaknesses among disciplines. Third, this chapter introduces the claim that the existence of a correlation and causation of biophilic architecture may have on the psychological and emotional functionality of the workplace, which in turn may be hard to understand by someone who is not familiar with this topic or interdisciplinary topics.

This claim, while it may not necessarily be innovative, is the same claim that architects have been hypothesizing, but often lacks and continues to lack empirical research data to support the claim (Green, 2012); hence, the development of the Leadership in Energy and Environmental Design, or LEED. Fourth, this chapter highlights the weaknesses inherited within the topic itself, there exist a lack of interdisciplinary partnership between the fields of architecture (lacks the strength in research and research methods to yield valid empirical data) and psychology [lacks the interest in researching the practice of biophilia and its correlation and causation in the workplace (often leaving the responsibility up to industrial and organizational psychology and environmental psychology)]. However, there exists a miscommunication, and sometime a lack of communication between, the fields of architecture and psychology (both industrial, organizational, and environmental psychology). This lack of interdisciplinary and communication partnership often resulted in the claim that:

1. There is no relationship between architecture and psychology.
2. The relationship is disjointed.
3. The relationship is confusing.

EDWARD OSBORNE (E. O.) WILSON AND BIOPHILIA

Jana Krčmářová's (2009) study shows a parallel with American ecologist Edward Osborne Wilson (commonly known as E.O. Wilson). Wilson's concept of biophilia and the thoughts and development of the environmental movement in the United States. In the 1980s, Wilson came forth with the idea that human perception of, thought about, and behavior towards nature are in many cases guided by irrational psychological mechanisms, which in the past were adaptive. According to Krčmářová (2009), Wilson claims that human relationships to other species, or the value that we attribute to them, are still today influenced by the history of ecological relationships with them over the course of evolution of humans. Thus, Wilson came forth with an interesting view on environmental ethics, or the value, which human assign to other species, ecosystems or generally to natural phenomena (Krčmářová, 2009).

According to Krčmářová (2009), Wilson considers these values or assumptions for their acceptance to be a certain extent innate and selected upon. Wilson further claims that humans are equipped with brains and minds which presume contact with nature and only with this contact can humans develop normally. With the loss of direct contact with other species or life in general, psychic deprivation and degradation of the human mind occur. Wilson not only calls for recognizing the necessity for human contact with other species, but also for acknowledging the psychological and ethical heritage, which humans have acquired in the course of co-evolution with other parts of the biosphere.

Concept of Biophilia

Wilson calls biofilia an "innate tendency to focus on life and lifelike processes" (Wilson, 1984, p. 1), an "innate emotional affiliation of human beings to other living organisms" (Wilson, 1993, p. 31), or an "inborn affinity human beings have for other forms of life, an affiliation evoked, according to circumstances, by pleasure, or a sense of security, or awe, or even fascination blended with revulsion" (Wilson, 1994, p. 360). In other words, in the biophilia hypothesis, Wilson concentrates on the fact that the creation of the human cognition "pattern" during the process of evolution was not contributed to by only the abiotic, and/or social environment, but also by the biotic. Furthermore, in the first listed definition from the book Biophilia (Wilson, 1984), it is claimed that the human mind is generally focused on "life and lifelike processes". Thus, biophilia can be understood as "inborn affiliation with the rest of life". Defined like that it has its place within the evolutionary theory of the biosphere (Lovelock, 1972; Lovelock & Margulis, 1974). However, according to the other two definitions, the concept of biophilia can be understood to be "inborn focus on other life forms", that is a complex of cognitive evolutionary modifications of the human mind which directs learning relationships to natural phenomena. It developed under prehistoric sociocultural and natural conditions. This is how evolutionary psychologists or human ethologists, anthropologists and sociologists understand biophilia. It is a complex, or set, of instincts (Wilson, 2002, p. 137), which sometime in the evolutionary past of humankind favored the individual at some level of natural selection.

The original cognitive rules of understanding and dealing with nature have not disappeared, even in today's world of artificial artifacts, in which we can find natural stimuli. Biophilia, as a complex of weak rules of learning, influences our thinking about nature, the landscape and even about art, myths, and environmental ethics. The deeply ingrained cognitive rules have, in Western society manifested themselves, for example, in the popularity of zoos, preferential housing on hills with views of water or in phobias (Wilson, 1984, p. 32). Many of them are fundamentally connected to avoiding danger, or motiva-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

tion for exploring, and exploiting the environment. In traditional societies, these biophilic tendencies are functional, as humans are there to use their environment directly. In Western civilization with humans' technical capabilities, these tendencies however overload nature, for they are not correctly reflected in culture, and thus, they are not even functional. Many of today's rules for treating nature/other species are the result of a long history of intimate contact with nature, and the short period of mechanization of our environment, which have reduced this contact and at the same time, greatly changed the way we view the value of other species (Wilson, 1975a).

History of Biophilia

According to Preheim (2001), it is estimated that humans share the planet with between ten and one hundred million other species (Wilson, 1993). Surprisingly, humans have given names to approximately 1.4 million species, only a fraction of the total (Wilson, 1993). Humans have, however, brought about the extinction of an estimated 10% of the species that existed before humanity arrived on the planet, and it is predicted that another 20% will be lost in the next thirty years (Wilson, 1993, p. 36). One scholar has noted that "[t]he extinction event now taking place rivals the five great extinctions that have occurred in the earth's geologic history, only this time it is humans, not asteroids, that are the cause" (Preheim, 2001, p. 1053). Humanity has begun to recognize this catastrophe and, in some cases, has taken action. The Endangered Species Act (ESA) is one immediate, and potentially powerful response to the extinction of species in the United States (Preheim, 2001).

Unfortunately, the failure of the judiciary to interpret the ESA more expansively has limited the Act's ability to preserve species (Preheim, 2001). This failure is reflected in the court's inability to properly account for humanity's intrinsic connection with nature when determining what constitutes "harm" under the ESA. The inherent connection that humanity maintains with nature, christened "biophilia" by the Harvard biologist Edward Wilson, provides the impetus for an argument that courts should rethink the way in which they have interpreted the ESA. Simply stated, the intrinsic affiliation with nature that exists within the human species calls for an expansion interpretation of the ESA. This expansion would result in a definition of harm that recognizes that species must be protected from the potential, albeit conceivably uncertain, harm that habitat destruction can effect. This Note argues that biophilia provides the foundation for judicial expansion of the definition of "harm" under the ESA (Preheim, 2001).

According to Preheim (2001), the first section contains an overview of biophilia. The doctrine of biophilia intricately demonstrates humanity's connection with the natural world and this connection is a key element of the ESA. The first section also contains an extensive discussion of the recognition afforded biophilia by other disciplines. This recognition is indisputable. The judiciary, by failing to incorporate this theory into the legal decision-making process, is an isolated outpost detached from the realities of the scientific community. The second section provides a detailed discussion of relevant case law under the Act. The ESA provides that no one shall "harm a species that has been listed as endangered or threatened. Much of this section focuses on what constitutes "harm: to a species as defined by the ESA, the Department of the Interior, and courts.

The Supreme Court's decision in Babbitt vs. Sweet Home Chapter of Communities for a Great Oregon is perhaps the most important case in this area of law, and, consequently, this section contains an extensive discussion of Sweet Home. The Sweet Home court failed re recognize biophilia and, in so doing, permitted an overly narrow definition of "take" under the ESA. Had the Court recognized the intrinsic connection between humanity and nature, it would have concluded that "harm" to a species

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

can occur in a myriad of ways far short of "significant habitat modification or degradation that actually kills or injuries wildlife" (Preheim, 2001, p. 1055).

The third section, according to Preheim (2001), provides a synopsis of the history of the ESA, including an examination of the legislative history and underlying purposes of the Act. When enacting the ESA, Congress recognized humanity's connection with the nature as a primary purpose for protecting species. While the theory of biophilia was not developed until well after the enactment of the ESA, the belief that humans have an intrinsic connection with the natural world was certainly an extensive part of the dialogue that occurred within Congress prior to passage of the Act. The fourth section finally provides an overview of the limits of biophilia and discusses the new endangered species paradigm that will invariably result from the adoption of biophilia. The very purpose of the ESA provides courts with the latitude they need to introduce biophilia into the legal world, yet, an unconstrained ESA is certainly not the end goal of the biophilia paradigm. Rather, the recognition of biophilia creates a definition of "harm" that includes potential future harm to species, and also incorporate anthropogenic harm into the decision-making process.

This definition also precludes a balancing approach to endangered species protection, based largely on the central purpose of the ESA, and also precludes non-environmental interests from satisfying standing under the Act. The ESA recognizes that species are vitally important, both for biocentric as well as anthropocentric reasons. Biophilia provides a compelling anthropocentric reason for protecting species that should be incorporated by the judiciary. The end result of this incorporation includes not simply increased protection of endangered species, but also an enduring enrichment to humanity (Preheim, 2001).

BIOPHILIA OF ARCHITECTURE: THE PSYCHOLOGY OF ARCHITECTURE

Humans' mental processes, according to Salingaros (2006, 2008), enable human to interact with and adapt to our environment. Humans' instinctively crave physical and biological connection to the world. The human perceptual mechanisms through which these processes work establish our relationship and response to both architecture and the built environment. The basis for this interaction is human nature itself: the end result of the evolution of our neural system in response to external stimuli such as the informational fields present in the natural environment.

Hence, humans, seeking shelter from the elements, are compelled to construct buildings and cities. Historically, the form of those structures arose from within the material logic of their immediate surroundings, and from the spatial ordering processes of their minds through necessity. Utilizing what was at hand to give structure to existence, people instinctively constructed places that provided the constituent information, form, and meaning that their sense of wellbeing required. Design decisions occurred as a natural extension of the neurological processes that make human alive and human.

Not consciously aware of the nature of these processes, according to Salingaros (2006, 2008), humankind simply built its buildings and cities in this manner without question for millennia. Over the course of time, however, the relationship to the physical began to assume a greater complexity through applied meaning: local mythology, symbolisms, and social structures. As the process-of-building was usurped by the process-of-design, architecture as a tectonic expression of innate human ideas about form, space, and surface became more difficult to grasp. Human's relationship to the physical world was further complicated with 20th-century advances in technology and industrialization. This is clearly evident in the practice of architecture today. Following several centuries of refinement and addition to

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the traditional vocabulary of architecture, the design process, once the exclusive domain of the Master Builder, has taken root in a different soil altogether. As architecture shifted from the domain of craft into the intellectual property of the University, the study of architecture began to align itself with other academic disciplines, although incompletely.

While architecture mimicked the academic realm of philosophy, it reinvented itself as a new discipline detached from its own evolution. Over time, architects effectively disconnected themselves from their history, which was henceforth treated more like archaeology: as interesting, but irrelevant to present-day design concerns (Salingaros, 2006, 2008). In the years that followed, architectural design, and the study of design methodologies, were all but served from those processes that had served for millennia to render the built environment as something intrinsically human. Hence, according to MacKerron and Mourato (2013), there are at least three reasons for thinking that experiences of natural environments will be positively related to health, wellbeing and happiness.

First, there appears to be direct pathways by which such experiences affect the nervous systems, bringing about stress reduction and restoration of attention. The existence of such pathways—biophilia—has plausible evolutionary explanations: an innate human emotional affiliation to nature and living organisms in general is proposed as an adaption to our history (Wilson, 1993). Affinities with more specific habitats, including savanna and forest, have similarly been postulated on the basis that these habitats would have provided our hominin ancestors with the greatest reproductive success (Falk & Balling, 2010; Han, 2007). Second, natural environments may be lower in environmental bads that have significant negative impacts on physical and mental wellbeing, which in turn could affect happiness. Adverse health effects of noise and air pollution are well documented. Chronic traffic noise exposure in urban environments can cause severe sleep disturbance, hearing impairment, tinnitus, and raised stress levels, leading to high blood pressure, coronary heart disease, stroke, and possibly immune systems and birth defects (Day, 2007; Gouveia & Maisonet, 2005; Passchier-Vermeer & Passchier, 2000; Welsch, 2006). Third, natural environments might increase happiness by facilitating and encouraging—for practical cultural and/or psychological exercise, recreation and social interaction (Barton & Pretty, 2010a; Morris, 2003).

Researchers have pursued both observational and experimental evidence on the links between physical or mental wellbeing and the natural environment. Observational studies have related averaged wellbeing measures to aggregate environmental characteristics between geographical regions (Engelbrecht, 2009; Mitchell & Popham, 2007, 2008; Vemuri & Costanza, 2006). Researchers have also compared individuals' SWB reports or medical records with the proximity of their homes in natural environments, or with alternative indicators of local environmental quality (Brereton, Clinch, & Ferreira, 2008; de Vries, Verheij, Groenewegen, & Spreeuwenberg, 2003; Kaplan, 2001; Maas, Verheij, de Varies, Spreeuwenberg, Schellevis, Groenewegen, 2009; Rehdanz & Maddison, 2008). Experimental and quasi-experimental studies have investigated physiological and psychological effects of exposure to images of different environment types (Berto, 2005; White, Smith, Humphryes, Pahl, Snelling, & Depledge, 2010) or to short-term interventions bringing subjects into contact with nature (Barton & Pretty, 2010b; Hartig, Evans, Jamner, Davis, & Gärling, 2003; Ryan, Weinstein, Bernstein, Brown, Mistretta, & Gagné, 2010). Researchers have also related health outcomes to frequency of healthcare-seeking behavior to views of nature in controlled institutional settings (Moore, 1981; Ulrich, 1984).

PSYCHOLOGICAL BENEFITS OF NATURE-BASED ARCHITECTURE

Different psychological subfields study the human relation with nature. For example, according to Joye (2007a), evolutionary psychologists argue for the existence of cognitive modules that are specialized in conceptual and perceptual knowledge about natural entities. Such cognitive devices are claimed to have evolved to handle the survival-related challenges and opportunities that were present in the natural settings in which human ancestors lived (Mitchen, 1996; Pinker, 1994). Scott Atran (1995) argues how cross-cultural similarities in human folkbiologies support the existence of such a system. In particular, Western and non-Western individuals seem to classify nature in similar ways and consistently ascribe essences to the taxonomic types of folkbiologies. Atran's (1995) view is consistent with literature on category-specific deficits, in which people are reported to have deficient perceptual and conceptual knowledge about the category of living things. One of the interpretations of the causes of such deficits is that, under evolutionary pressures, specific neural areas have become specialized in information about living entities (Caramazza & Shelton, 1998).

Perhaps the psychological field that has most profoundly studied the human (affective) psychological relation with natural entities is environmental psychology. This research area draws on numerous empirical studies and is, therefore, less speculative than the just-mentioned modularity thesis. One of the central issues of environmental psychology is how different types of settings can trigger different affective states in individuals. Two important proposals have been advanced with regard to the specific process underlying these emotional states. In the preference matrix, developed by Stephen and Rachel Kaplan, the occurrence of such states is to a large extent the result of cognitively assessing whether a certain informational features are present in a setting (Kaplan & Kaplan, 1989). This contrasts with a central tenet of Roger Ulrich's (1983) psychoevolutionary framework.

According to Kaplan and Kaplan (1989), affective responses toward environmental settings are not mediated by cognition but stem from a rapid, automatic, and unconscious process by which environments are immediately liked or disliked. These fast affective reactions are claimed to be rooted in human evolutionary history and are essentially adaptive: they motivated the organism to quickly undertake actions that contributed to its well-being and survival. Hence, according to the psychoevolutionary framework, survival chances further increased if these emotional reactions had an inherited component: no precious time and energy had to be spent learning what kinds of environments were either beneficial or harmful (S. Kaplan, 1987, 1988; Ulrich, 1983). With regard to the neutral origin of these affective states, some researchers attribute an important role to subcortical areas, especially the amygdala. This is because these structures are also involved in modulating stress-related hormones, it provides an explanation of why certain types of settings have a different influence on autonomic stress responses (Joye, 2007a; Parsons, 1991).

Aesthetic Preference and Structural Landscape Features

The literature states that, in regards to character of the settings or elements that can trigger such immediate affective states, these reactions can be provoked by some typical structural landscape features. Although coming from a different research field, geographer Jay Appleton was one of the first to propose a model addressing this issue (Appleton, 1975). According to Appleton's prospect-refuge theory, human beings' preference for landscapes correlates with two environmental qualities: prospect and refuge. The

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

notion of prospect refers to settings or landscape elements that facilitate obtaining information about the environment.

A typical example, according to Joye (2007a), is a hill which aids to visually access and inspect the surrounding area. Furthermore, refuge points to settings that can provide shelter and protection. Ulrich's psychoevolutionary framework lists some other visual cues that are associated with immediate positive affective reactions: complexity, gross structural properties, depth properties, ground surface and texture, absence of threats, and deflected vista (Ulrich, 1983). The predictors in Rachel and Stephen Kaplan's preference matrix overlap to a certain extent with the variable listed by Ulrich. The Kaplan's model (R. Kaplan & Kaplan, 1989; S. Kaplan, 1987, 1988) describes two types of postures toward the environment.

The Aesthetic Appeal of Natural Contents

In addition to the previous structural landscape features, the field of environmental psychology also studies the natural contents that contribute to the aesthetic qualities of settings; namely, calm water features and vegetative elements. The explanatory framework, again, is essentially evolutionary. These elements are liked because they contributed to the survival and reproduction of early humans. Flowers, for example, signaled the presence of food sources and were cues for future foraging sites. They also helped in differentiating between different vegetation types, because plants that are not blooming often look quite similar (Orians & Heerwagen, 1992). Trees protected against sun and rain and offered early humans prospects on the surrounding landscape and retreats from predators (Appleton, 1975; Orians & Heerwagen, 1992; Summit & Simmer, 1999).

These benefits can explain why vegetative elements and settings containing vegetation still cause aesthetic or liking reactions. Different empirical studies, according to Joye (2007a), show that individuals consistently prefer natural, vegetated landscapes over urban settings without vegetation. When urban environments are mutually compared, highest preference is associated with urban settings containing some vegetation, especially trees, or a water feature (Smardon, 1988; Thayer & Atwood, 1978; Ulrich, 1986). Such phytophilia is also clear from the observation that non-natural environments often contain actual vegetative elements or decorative references to natural contents (Eibl-Eibesfeldt, 1989; Heerwagen & Orians, 1986). Although empirical research on preferential reactions toward flowers is scare, some studies shout that these elements are indeed associated with positive aesthetic reactions (Haviland-Jones, Rosario Wilson, & McGuire, 2005; Todorova, Asakawa, & Aikoh, 2004).

Naturalness and Stress Reduction

Besides causing liking responses, natural elements are also found to contribute to the restoration of human individuals. Two major interpretations of restorative responses have been proposed. The first, attention restoration theory (ART), was developed by the Kaplans (R. Kaplan & Kaplan, 1989). Essentially, ART interprets restoration as the recovery of directed attention or the ability to focus. This capacity is deployed during tasks that require profound concentration, such as proofreading or studying. Natural settings have been found to be ideally suited to restore or rest directed attention (Hartig, Evans, Jamner, Davis, & Gärling, 2003; Hartig, Mang, & Evans, 1991).

The second major interpretation of restoration is a part of Ulrich's psycho-evolutionary framework. In this view, restoration applies to a much broader context than attentional capacities (Parsons, 1991; Ulrich, 1993; Ulrich, Simons, Losito, Fiorito, Miles, & Zelson, 1991). More specifically, Ulrich un-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

derstands restoration as stress reduction, and stress can occur when directed attention is not fatigued. Within Ulrich's model, restorative responses are explained by the fact that early humans were often confronted with threatening and demanding situations. When the treat has vanished, the individual is in need of restoration from the stress that has been caused. The benefits of such restorative responses are "a shift toward a more positively toned emotional state, mitigation of deleterious effects of physiological mobilization, and the recharging of energy expended in the physiological arousal and behavior (Ulrich, 1993, p. 99). These restorative responses typically occurred in natural unthreatening settings.

THE VALUES AND BENEFITS OF NATURE-BASED ARCHITECTURE

Although there is solid empirical evidence that humans hold positive affiliations with a specific set of landscapes and natural elements, this does not preclude that some natural features or occurrences also cause more negative and even aversive in humans (Mineka & Öhman, 2002; Van den Berg & ter Heijne, 2005). Another issue is that the experimental outcomes are sometimes difficult to integrate into a coherent, overreaching conceptual framework. Other issues are that differences in nature appreciation are often left in the dark in these discussions (Van den Berg, 2004), and it is still a matter of debate on which sense the genetic component of these (positive affiliations should be understood (Cummins & Cummins, 1999). Nonetheless, whatever the outcome of these matters, the general picture emerging from the previous concise review is that humans are partly hardwired to emotional affiliation with certain classes of natural objects. Some researchers have argued about the affective relations with natural elements and landscapes in terms of biophilia (Kellert & Wilson, 1993; Wilson, 1984). Although the theoretical merits of this term have been questioned (Joye, 2007b), in the reminder of this report the notions biophilic and biophilia will nevertheless be used as synthetic concepts.

The occurrence of biophilic responding stands in sharp contrast with the observation that there is increasingly less contact with nature in Western technologically oriented societies. Wolff, Medin, and Pankratz (1999) found that such an evolution has nontrivial effects on cultural expressions of nature. In particular, they made a historical study of the word use in dictionaries and found that, from the 20th century onward, the use of (folk)biological terms devolved, and their application lost precision. In contrast, several nonbiological terms evolved during this period. Apart from being associated with an impoverishing conceptual framework for natural objects, it is also plausible that reduced contact with nature can be accompanied by a reduced knowledge of the rich variety of forms characteristic of natural entities.

A probable artistic or creative consequence is that the formal curriculum of artists and architects becomes narrower. The reason is that natural form can be considered as a creative or compositional grammar, which can be used for creating artwork, or, as Kellert states, "The aesthetics of nature can function as a kind of monumental design model" (Kellert, 1997, p. 36). The loss of this monumental design model has its architectural counterpart in modern urban settings, which are increasingly governed by Euclidean geometry and stripped of ornament, patterning, detailing, and color. By encouraging architects to integrate natural forms and patterns in their work, they are motivated to study nature's shapes and compositional rules, and this can enrich their creative curriculum.

Integrating Structural Landscape Features in Architecture

Doubts regarding structural landscape features being meaningfully applied to the built environment were raised, for this is a more difficult issue than applying well-defined natural contents to architecture, because the former features are of a more abstract nature. Furthermore, only very few researchers have addressed this issue and proposed clear guidelines on how to successfully integrate these qualities in architectural settings. First, turn to the type of setting that contains an ideal mix of these structural landscape features, namely the savanna. As evident strategy to imitate savannas is to integrate photographs or projections of savannas in (interior) spaces. Second, more architectural method consists of mimicking key structural features of savannas.

Another structural feature that positively correlates with landscape selection is mystery. Some claim this property can be conveyed by specific design elements: "When appearing around concerns, attached to walls, and hung from ceilings, interesting objects, architectural details or motifs, graphics, video displays and artifacts can create a little mystery and surprise in the workplace" (Hase & Heerwagen, 2000, p. 30). However, the most straightforward way to apply mystery to an architectural setting is by deflected vista. This can be realized by letting the architectural trail bend away, which can lead to curiosity of what might lie beyond the bend, thereby encouraging explorative behavior. Another mode of mystery is called "enticement". Essentially, this notion refers to the situation is which a person is in the dark, from where it can see a partially visible and enlightened area or setting. Such enlightened regions draw attention and trigger explorative behavior. Although mysterious settings can be aesthetically appealing, too much irregularity or surprise can have the result that the layout of the building becomes confusing and nontransparent, ultimately leading to orientation and way-finding problems. Legibility can be enhanced by integrating signalizations and distinctive markings, by offering views on the outside, and by making the building shape more regular (Evans & McCoy, 1998).

Imitating Natural Contents in Architecture: Biomimicry

Imitating natural contents in architecture can be achieved by providing views on the outside environment, by integrating vegetation in built settings, by hanging nature pictures on the wall, by nature-orientated screensavers, and so forth. These interventions are what Keller (2005) called indirect experiences of nature, and they come quite close to the design interventions from the field of evidence-based design (Ulrich, Zimring, Quan, Joseph, & Choudhary, 2004; Van den Berg & Van Winsum-Westra, 2006). It is this sense that the modern built environment sometimes imports some of the icons of habitability that are typical of ancestral habitats. The result is that even architecture that is characterized by non-natural forms can be consistent with the current argument. An alternative to literal imitations is to create architectural designs based on schematic imitations of natural elements. These would no longer be copies but artistic interpretations that still contain some global visual similarities with regard to the original natural object.

One of the central claims of the current study is that such constructions will be accompanied by affective states that are similar to those evoked by real natural contents. Orians and Heerwagen (1992, p. 572) expressed it as follows: "An evolutionary-ecological approach to aesthetics suggests that the incorporation of trees and tree forms, actual or symbolic, into the built environment should have a strong positive impact on people… We predict that the presence of these 'symbolic trees' is associated with positive response to built environments." Further reasons why architectural imitations of nature could trigger biophilic responses are more empirical in nature. First, it can be pointed out that research

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

on environmental preferences often uses simulations of nature. The results that are obtained with these stimuli are close to the responses associated with real nature, which suggests that realness does not play a decisive role. Second, symbolic representations of nature have been used throughout the history of art of aesthetic enhancements, which suggests that these can trigger biophilic responses. Third, research indicates that preferences for natural settings can be statistically predicted by underlying geometric characteristics, which lends plausibility to the claim that geometric abstractions from nature can cause the associated affective effects (Hägerhäll, Purcell, & Taylor, 2004).

THE PSYCHOLOGICAL AND EMOTIONAL VALUES AND BENEFITS OF NATURE-BASED ARCHITECTURE: MENTAL HEALTH

The biophilia hypothesis was originally referred to (Wilson, 1984) as an innate tendency to focus on life and lifelike processes, meaning that individuals gain the most satisfaction from processes that mimic the nature of life on many levels, be they cognitive or emotional. Since then, the biophilia hypothesis has been applied to many areas of life, including mental health (White & Heerwagen, 1998). This is largely due to refinements in the theory by people like Wilson (1993) where Wilson stated that biophilia was complex set of learned behaviors and processes based on our connection to nature. These learnings are split into biophilia which are positive learning and approach behaviors and biophilia which are negative learning with avoid behaviors (Ulrich, 1993). Wilson claims the opposite of writers like Fisher (2003) who believe our connection to nature is replaced by technology, but argues that our biophilic feelings atrophy and are integrated into our cultural systems as exemplified by zoos and nature based attractions.

In terms of one's emotions and the reactions of others in a consistent manner (Struening, Perlick, Link, Hellman, Herman, & Sirey, 2001), in contemporary society is clear, biophilic, and biophobic tendencies are a marker of culture (Wilson, 1993) and if one takes the assumptions made by various commentators (Foucault, 1964; Horwitz, 2002; Rind & Yuill, 2012) that mental health is a product of its culture, the connection is even clearer. The problems of mental health are shown to be increasing the world over (Desjarlais, Eisenberg, Good, & Kleinman, 1995), while biophilia as a hypothesis can answer this to a degree, it provides many other answers, namely to do with the origin of many of these conditions that we are experiencing.

Fears and phobias are a cornerstone of mental health (Agras, Sylvester, & Oliveau, 1969) forming the root of many more severe mental health problems (Horwitz, 2002) and altering the way we go about our lives (Kessler, 2003). Biophilia has two main implications for mental health, the first of these being treatments of both biophobia based conditions, but also of other mental health issues (Ulrich, Simon, Losito, Fiorito, Miles, & Zelson, 1991). There are a number of writers who claim the effectiveness of biophilic elements in treatment (Melson & Fine, 2010) such as plants added to setting or animal integration, often at the same time. For this particular application of the biophilia hypothesis, there is an effort to make evidence empirical with well documented studies occurring as opposed to anecdotal evidence (Melson & Fine, 2010). A primary example of this is Melson's 2001 study into dearousal of stress and anxiety patients, his study used therapeutic interviews combined with playing with or watching animals.

Melson found that the animal influences allowed for the levels of stress of anxiety to decreases in the individuals, while also allowing them to learn positive nurturing techniques to apply to themselves as calming mechanisms (Melson, 2001), and suggested that this is at least in part to do with our affiliation to positive animal influences in our biophilic past. Other researchers have confirmed the dearousal

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

concept even before Melson. Golletz (1995) showed that biophilia helped to induce relaxation through a passive positivity from natural stimuli, in this case being pictures and sound effects pitted against verbal relaxation or silent resting. The nature stimuli used by Golletz (1995) allowed or a measurable reduction in anger and anxiety through self-reporting methods, showing a perceived difference in natural to human based stimuli, at the very least. With this in mind, Gullone (2000) points out that biophilia allows as to consider out mental health in a more complex way and as such think of more cures, but it has wider implications for the mount of pathologies that are now open to diagnosis (Gullone, 2000), which leads us to the second implication of biophilia on mental health.

As shown above, our environment can greatly influence our mental health, and when considered in the context of our environmental crisis, the implications are dire. It is argued that climate change itself effects our mental health in two distinct ways (Berry, Bowen, & Kjellstrom, 2010), firstly, is physical changes, through changes to the amount of sunlight we get effecting serotonin and other mood regulators (Lambert, Reid, Kaye, Jennings, & Esler, 2002) and lifestyle alternations correlating with increased stress (Norgaard, 2006). Secondly, these changes begin to weaken our sense of community (Berry, Bowen, & Kjellstrom, 2010), with the argument being made that our physical environment and its effects on us are symbiotic with our social environment (Spaargarden & Mil, 1992). In terms of the biophilic implications of this, Maller, Townsend, Pryor, Brown, and St. Leger (2006) suggest that this can be used in a collaborative effort of developers, health and social services as a way of honing our biophilic nature, through more open and greener spaces, into a more positive mental health structure, lest as Wilson (1993) fears, we lose the biophilic part of our mind through lack of stimuli in our everyday lives and lose the part of us he termed our spirit.

FUTURE RESEARCH

In habitat theory, savannas are claimed to be the settings in which early humans spent a substantial part of their evolutionary history, and these seem to display an ideal mix of the previously discussed structural landscape features and natural contents (Van den Berg, 2004). This type of biome can be broadly described as low to intermediately complex settings, having a relatively even and grassy ground surface dotted with scattered trees or tree groups. Savannas contains a high degree of biomass and meat, and these are relatively easily accessible for terrestrial beings. Furthermore, the openness of savannas facilitates detecting predators and game and is conducive of movement and a nomadic lifestyle (Orians, 1980; Orians & Heerwagen, 1992). The aesthetic preference for savanna-type landscapes has been the subject of a few empirical studies.

Balling and Falk (1982) found that young individuals preferred savannas over other biomes without ever being exposed to the former type of landscape. The researchers hypothesize these findings could well indicate an innate (aesthetic) preference for savannas [Synek & Grammer, 1998 (Coss, 2003, for contrasting findings)]. Consistent with the savanna hypothesis, research indicates that people tend to prefer tree shapes characteristic of high-quality savanna: These typically have a low trunk, a broad canopy, and a moderate canopy layering (Orians & Heerwagen, 1992; Sommer & Summit, 1995). Inquiries into the evolution of artists' work (John Constable) show an increase of conspicuous savanna features over time (Heerwagen & Orians, 1993). Furthermore, studies indicate that when artificial changes are made to plants and trees, these increasingly come to resemble savanna-type vegetation (Heerwagen & Orians,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

1993). Finally, areas that are created for recreational or aesthetic purposes often resemble savannas (Orians, 1980).

Within the field of landscape aesthetics, the savanna hypothesis is often taken for granted and has remained mostly undisputed. Nevertheless, Joye (2007a) find it troubling that almost no attention is paid to discussions in the field of paleoanthropology. For example, Wilson (1993) argues how humans' references for nature, savannas in particular, are remnants of paleohominid and early Homo evolution in this type of biome, a view shared by many in the field of habitat theory and landscape aesthetics. In this view, Potts (1998) sketches a more complex view that is supported by scientific environmental analyses. Based on evidence during the evolution of early hominids, there was quite some variation in the environments that were inhabited, ranging from forests to savannas to open-canopy woodlands.

Nonetheless, it could be countered that the true value of the savanna hypothesis does not have any bearing on the finding that humans adapt to and display positive affective affiliations with natural environments. As Kahn (1999, p. 39) points out, "The evolutionary account can hold, but the savanna hypothesis needs to give way to a broader account of genetic predispositions to inhabited landscapes". Furthermore, when it comes to architecture and biophilia, almost no attention is paid to discussions in the field of psychology, specifically environmental psychology, sense and perception in psychology, and health psychology as an interdisciplinary field of study and research.

CONCLUSION

The great management theorist, Abraham Maslow (Maslow & Mintz, 1956), was examining the aesthetics of the workplace, and their impact, as long ago as the 1950s. Maslow's studies found that the quality of office design influenced office workers, with aesthetically pleasing spaces having a positive impact on energy levels and well-beings (Grant, Christianson, & Price, 2007; Tran, 2015). Furthermore, research shows that the presence of natural elements indoors can evoke the same benefits as the outdoor environment (Ryan, Weinstein, Bernstein, Warren-Brown, Mistretta, & Gagné, 2010), supporting the case for biophilic office design. Furthermore, across Europe, research has shown that the simple presence of natural elements in the work environment can act as a buffer against the negative impact of job stress and positively impact general well-being (Velarde, Fry, & Tveit, 2007). Hence, in the work environment, the benefits of nature have also been recognized, with research in Norway, finding that natural elements within an office space, such as plants, can prevent fatigue when completing tasks that demand high concentration or attention (Raanaas, Horgen-Evensen, Rich, Sjostrom, & Patil, 2011).

Similarly, Cooper and Browning (2015) found that across countries, the presence of natural elements was consistently associated with higher reported levels of happiness at work, in comparison to work environments void of nature. In addition, employees working in offices with both internal and external green spaces along with plenty of natural light reported higher levels of well-being, in comparison to those working in environments without these natural features. Cooper and Browning's (2015) study reported levels of well-being and productivity that were 13% and 8% higher, respectively, for those EMEA office workers in environments containing natural elements. However, despite the benefits that natural light and space can provide, it was found that 30% of workers do not work in environments that provide these sense of light and space. Findings such as this should urge organizations and designers can be built or modified to provide light and space and in turn increase levels of well-being and productivity within the workforce.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The work environment is already an established part of the expected psychological contract between employer and employee and has even become a differentiator for employer brands. Consider the biggest firms in the technology sector—Facebook, Apple, Google—these are all at the vanguard of providing great working environments, of which many are linked to nature through biophilic design and the campus layout of the main offices. With this backdrop of increased awareness amongst employees about leading companies' approach to designing work environments, it is possible to envisage biophilic design as a crucial component in "the war for talent"—how companies attract and retain the most skilled, productive workforces with great competition. Although Cooper and Browning (2015) found over three quarters (77%) of respondents reporting that the design of an office would not affect their decision to work for that company, it is likely that as the awareness of the positive impact of good design grows, Cooper and Browning (2015) will see a decrease in this figure and more people holding a greater expectation of office design that is stimulating and provokes positive feelings.

This is because humans need to be connected to nature can be satisfied through biophilic design in two ways: either a direct or a symbolic connection to nature. Direct connections are sought through natural elements being incorporated into the workplace. But if these are not available individuals can have symbolic connections with nature that differ in that they are mimicries of the natural environment. When design mimics the patterns, forms and textures of nature, this can provide these symbolic connections. The importance of nature contact in the workplace is evident, yet, if organizations are not equipped to provide this contact directly, then it seems that symbolic connections are the ideal and necessary substitute. The findings of Cooper and Browning's (2015) study have identified a common deficiency of nature in the workplace. Of the 3,600 EMEA office workers investigated in this research study, 42% reported having no natural light, 55% reported no natural elements being present, and 7% said they had no view of the outdoor world.

Ultimately, the research in this area indicates that bringing elements of nature into the workplace, whether real or artificial, is beneficial in terms of employee outcomes. Nevertheless, although investigation into the benefits of biophilia for individual well-being is relatively new, there is clearly mounting evidence that biophilic design can have a positive impact, from reducing stress and anxiety, to improving the quality and availability of respite from work and in increasing levels of self-reported well-being. There are clear links between these findings and areas of organizational psychology which merit biophilia as a consideration within organizations' wider well-being strategies. Hence, when it comes to the well-beings (the psychological and emotions) of humans due to architectural design, when it comes to architecture and biophilia, architects must consider the field of psychology, specifically environmental psychology, sense and perception in psychology, and health psychology as an interdisciplinary field of study and research., when designing to increase the values and benefits of nature-based architecture—biophilia.

KEY TERMS AND DEFINITIONS

Aesthetic Preference: Aesthetic judgements arrived at by people on the basis of a number of factors. Judgments of aesthetic value clearly rely on our ability to discriminate at a sensory level. Aesthetics examines what makes something beautiful, sublime, disgusting, fun, cute, silly, entertaining, pretentious, discordant, harmonious, boring, humorous, or tragic.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Architecture: Architecture is both the process and the product of planning, designing, and constructing buildings and other physical structures. Architectural works, in the material form of buildings, are often perceived as cultural symbols and as works of art. Historical civilizations are often identified with their surviving architectural achievements.

Biophilia: An innate human emotional affiliation to nature and living organisms in general is proposed as an adaption to our history.

Edward Osborne Wilson: Wilson is the founding father of the concept of biophilia and the thoughts and development of the environmental movement in the United States. In the 1980s Wilson came forth with the idea that human perception of, thought about and behavior towards nature are in many cases guided by irrational psychological mechanisms, which in the past were adaptive.

Evidence-Based Architecture (Design or EBD): A field of study emphasizing credible evidence to influence design. This approach has become popular in healthcare to improve patient and staff well-being, patient healing, stress reduction and safety. Evidence-based design is a relatively new field, borrowing terminology and ideas from disciplines such as environmental psychology, architecture, neuroscience and behavioral economics.

Folkbiologies (Folk Biology or Folkbiology): The cognitive study of how people classify and reason about the organic world.

Imitating Natural Contents in Architecture (Biomimicry): Biomimetics or biomimicry is the imitation of the models, systems, and elements of nature for the purpose of solving complex human problems.

Integrating Structural Landscape (or Landscape engineering): Landscape engineering is the application of mathematics and science to shape land and waterscapes. It can also be described as green engineering, but the design professionals best known for landscape engineering are landscape architects. Landscape engineering is the interdisciplinary application of engineering and other applied sciences to the design and creation of anthropogenic landscapes.

Landscape Aesthetics (Landscape Architecture): The design of outdoor public areas, landmarks, and structures to achieve environmental, social-behavioral, or aesthetic outcomes. Landscape architecture is a multi-disciplinary field, incorporating aspects of botany, horticulture, the fine arts, architecture, industrial design, soil sciences, environmental psychology, geography, and ecology.

Mental Health: Mental health refers to how we feel, think, behave and manage our psychological lives.

Psychoevolutionary Framework [or Evolutionary Psychology (EP)]: A theoretical approach in the social and natural sciences that examines psychological structure from a modern evolutionary perspective. It seeks to identify which human psychological traits are evolved adaptations.

Structural Landscape: Work involved in the construction of external landscape features, and non-habitable structures including the following: 1. Retaining walls of any material that do not form part of a habitable building, 2. Fencing irrespective of the construction material, driveways, paths and other paving of any material, 3. Cabanas, pergolas, decks and non-habitable shelters, 4. Ornamental ponds, water features and other structural ornamentation.

Chapter 17
Considerations for Setting Up Play Therapy Training Clinics:
Recommended Play Therapy Toys, Materials, and Other Professional Considerations

Nicola Shea Hughes-Brand
University of Central Florida, USA

Julie A. Clifton
University of Central Florida, USA

Columbus Edward Brand
University of Central Florida, USA

ABSTRACT

When setting up a play therapy training clinic, there are many considerations to explore regarding designing a therapeutic space, selecting toys and other materials, exploring the rationale for the toy selection and examining the cultural considerations in play therapy settings. This chapter will review the different types of play therapy clinics and the specific toys recommended based on the fourteen primary play therapy theoretical orientations. General considerations will be reviewed when utilizing art media and other materials, books and bibliotherapy, puppets and puppet theaters, sandtrays and miniatures, and psychotherapeutic games. Recommendations will be made for establishing community and university-based play therapy training sites offering clinical and mock play therapy services. Suggestions will be made regarding the importance of establishing play therapy laboratories in the classroom setting when providing graduate play therapy instruction. Additional recommendations will be made for the 2019 Play Therapy Best Practices published by the Association for Play Therapy.

INTRODUCTION

Considerations for Setting Up Play Therapy Training Clinics: Recommended Play Therapy Toys, Materials, and Other Professional Considerations

There are many unchartered, yet important, considerations for setting up a play therapy training clinic given the limited available literature. In the process of researching factors to consider when setting up a university-based or a community-based play therapy training clinic for this chapter, the authors reviewed the play therapy literature; reflected upon over their 25 years each of clinical practice in multiple settings including university-based, community out-patient, school-based, in-home counseling, hospital, residential, and inpatient /psychiatric care; and considered their teaching experiences at multiple universities, both at Approved Centers of Play Therapy Education, as defined by the Association for Play Therapy (APT), and universities lacking the approval status.

This chapter will highlight considerations for setting up university-based and community-based play therapy training clinics due to the limited available research on this important topic. Much thought and research are required in order to create an appropriate therapeutic space for providing play therapy services. Play therapy clinics need to create spaces that accommodate various cultural considerations, clinician's theoretical orientations, and even technological considerations. Clinicians must carefully select, acquire, and organize toys and materials in the play therapy room based on evidence-based practices, including the use of art media and other materials, books and bibliotherapy, puppets and puppet theaters, sandtrays and miniatures, and psychotherapeutic games. Specifically, this chapter is divided into five sections: 1) the different types of play therapy clinics, 2) the cultural considerations regarding the play therapy setting and toys, 3) the method for selecting toys and materials; 4) the limitations of this research review; and 5) the recommendations for setting up a community-based and a university-based play therapy training site providing clinical services and services for mock clients.

The APT is the national professional organization that standardizes the field of play therapy and offers national credentialing in play therapy. The organization developed *The Play Therapy Best Practices* as an on-line publication with the goal of establishing clinical, professional, and ethical guidelines for the field (APT, 2016). When researching considerations for setting up a play therapy clinic, the authors reviewed the APT best practices publication as a starting point; however, recommendations for structuring a play therapy room were not addressed in this document. This online publication further did not address the recommended play therapy room size, diverse settings in which play therapy occurs, playroom characteristics, cultural considerations when selecting toys and providing clinical services, the rationale for selecting play therapy toys and materials, and the playroom set-up including the toy organization and display (APT, 2016). The authors then researched available play therapy literature to find appropriate best practices for the field to create recommendations for setting up appropriate play therapy clinics.

TYPES OF PLAY THERAPY CLINICS

Whether one is establishing a university-based play therapy training clinic, a community-based play therapy clinic, or a university-based training site serving mock clients, there are many factors to consider. Before setting up a play therapy clinic or training site, one must consider the location of the clinic (university-based or community-based) and the purpose of the playroom. Some playrooms will be used

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

solely to provide clinical services to community members, some may act as a training room for mock play therapy sessions, or some may serve clients and trainees. General recommendations will be reviewed for all play therapy sites, including specific recommendations for university-based, community-based, non-traditional training sites offering clinical services to the community, and university-based play therapy training sites offering mock play therapy services.

General Recommendations for All Play Therapy Clinics

General recommendations for all play therapy rooms, sites, or clinics will be discussed with a focus on the ages of the populations being serviced, the type of services being offered, and the specifications of the play therapy space. Additional considerations will include the recording or observation options, the accessibility of the play therapy clinic or room, and the ability level of all individuals being served.

First, when setting up a play therapy clinic or room, it is important to consider the age(s) of the client(s) being served and the type of services being offered. If clients will be seen in the playroom, it is important to determine the ages of the clients who may receive services (children ages two to 12, adolescent ages 13 and up, and/or adults and other family members seeking family therapy) so that the appropriate toys and materials are present for all populations being served (Landreth, 2012). One should also consider the type of services being provided such as individual, family, or group therapy.

Play therapists will benefit from not only working directly with youth when providing play therapy services, but also from gaining the experience of working with clients' parents, grandparents, and other caregivers to better understand the client and offer assistance to the clients' support systems. According to Gil (2015), the benefits of having the family members join the play therapy session are to offer insight to the play therapist on the family's dynamics, as well as to the family members. The therapist can observe the family's communication styles, levels of cooperation and organizational skills, levels of affective and physical contact, levels of enjoyment while interacting with one another, levels of spontaneous insight, the hierarchies and boundaries, and possible coalitions that may be present.

In order to provide appropriate play therapy services or instruction, there are multiple factors to consider when designing a therapeutic space. Landreth (2012), Kottman (2011), and Carmichael (2006) offered many recommendations for the play therapy space. The room size of the play therapy room should be approximately 12 feet by 15 feet with an area of between 150 and 200 square feet so that the child is never too far away. The room should be large enough to allow the child space to explore the room and toys, and to allow space for multiple children to play, but not too large that the trainee or therapist is unable to observe or track the child because the child is too far away from the trainee or play therapist. When providing group play therapy services, Landreth (2012) recommended a playroom approximately 300 square feet and O'Connor (2000) recommended a play therapy room to be approximately 15 feet by 25 feet.

Further considerations for the room itself include ensuring confidentiality and privacy during the session. The playroom needs to have a door that closes to ensure confidentiality. The room needs to be absent of any windows or inside walls to decrease any possible distractions or interruptions that may occur (Landreth, 2012; Carmichael, 2006). If windows are present in the play therapy room, the windows should be covered with curtains or blinds (Landreth, 2012; Kottman, 2011). The playroom needs to be located away from the main flow of traffic in the building so that caregivers in the lobby cannot hear the child in the session and other clients in the office will not be disturbed (Carmichael, 2006). All sessions, supervision meetings, and consultations should remain private. Sound proof walls may assist

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

in preventing others in the hallway or lobby from overhearing conversations, as well as having a white-noise making device that may prevent conversations from being heard outside the play therapy room (Landreth, 2012). If possible, acoustical tiles should be fitted on the ceiling to reduce noise (Kottman, 2011). Further, no client's artwork should be displayed in the play therapy room, hallways of the office, or any other counseling or staff office (Landreth, 2012). All clients' artwork should be viewed as part of their medical record; therefore, displaying any artwork is seen as a violation of the clients' confidentiality and privacy. Also, all artwork from the prior client should be removed from the play therapy room and all toys should be returned to their original location before the next client enters the play therapy room.

Regarding the play therapy room flooring, the initial costs, replacement cost, durability, and ease of cleaning should be considered. Landreth (2012), Kottman (2011), and Carmichael (2006) recommended that the playroom floors be durable and easy to clean, such as vinyl tile squares instead of carpet or solid sheet vinyl. Carmichael (2006) also recommended newer waterproof floors that have a wood appearance but warns against having carpet. Carpet may help keep the noise down in the room, but may be difficult to clean and may restrict painting and sand activities.

Like the floors, the walls of the playroom should be designed with ease-to-clean in mind and have washable enamel (Landreth 2012; Kottman, 2011; Carmichael, 2006) and be stain resistant (Carmichael, 2006). An off-white color (Landreth, 2012), neutral color (Kottman, 2011), or shades of white to cream (Carmichael, 2006) for the walls is recommended so that it provides a cheerful atmosphere, whereas vibrant, dark, or somber colors should be avoided (Landreth, 2012). The play therapy room is supposed to have a neutral and gender-neutral presence so that the room itself does not influence the child's feelings, behaviors, or cognitions. Carmichael (2006) recommended refraining from wall murals or non-neutral colors because this may change the child's mood for behaviors. Also, if artwork or other decorations are displayed in the room, it is recommended that the items need to be displayed at the child's eye level (Landreth, 2003).

Further physical space considerations include ensuring that the room has adequate air conditioning and heating. The lighting in the room needs to be adequate with preferred recessed lighting with protective guards. Recessed lighting, flush mount lights, or fluorescent ceiling lights may be safer if a child were to throw an object toward the ceiling, the light bulbs, or the light fixtures (Carmichael, 2006).

One should also consider the accessibility of the play therapy clinic or room and the ability level of all individuals being served. It is essential that the front door to the clinic, the clinic lobby, the hallway, the door to the play therapy room, and the room layout itself meet the Department of Justice (2010) Americans with Disabilities Act of 1990 requirements. If the site is an older building, renovations should be made to accommodate all clients in the building and the playroom. The toy set-up and the toys themselves should also accommodate the clients in terms of the weight, overall size, and height of the toys and furniture so that the needs of all clients can be met.

Safety considerations in the play therapy room include ensuring the room is both an emotional and physically safe place (Barnes, 1996; Carmichael 2006). Play therapists need to ensure all electrical outlets have outlet plug covers, and all bookshelves are attached to the wall and secured so that if a child tries to climb any large piece of furniture in the room, it will not fall over (Landreth, 2012; Kottman, 2011, Carmichael 2006). The room needs to be checked for sharp corners, objects, protruding nails, or another other possible hazardous material that may harm a child. If windows or window fans are present in the play therapy room, they need to have screens or locks in place to ensure the child cannot hurt him or herself. Space heaters should not be present in the play therapy room due to possible electrical fires or child burn hazards. Play therapists are recommended to contact their local fire marshal if they have any

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

concerns about the room itself or the contents in the room (Carmichael, 2006). The chapter authors further recommend that all cleaning and flammable materials are not accessible to the clients, and all food and beverages are not allowed into the play therapy room in case another child may have food allergies.

An optional recommendation is to have water or bathroom access in or connected to the playroom. A sink in the play therapy room, at the child's height, with cold running water may be used for painting, cleanup, and play in the sandbox or sandtray. Hot water is not needed due to potentially burning the child's hands. If a sink cannot be present, the therapist may place a pitcher of water in the playroom for painting and sand play. It is further helpful to have a small bathroom in the play therapy room with a door that closes or a bathroom within close proximity of the play therapy room (Landreth, 2012; Kottman, 2011; Carmichael, 2006).

Another optional consideration is whether or not the play therapy clinic needs recording equipment or observational tools. Landreth (2012), Kottman (2011), and Carmichael (2006) recommended having a one-way mirror so that trainees or therapists can be observed while providing play therapy services. A one-way mirror also allows videotaping of the session, peer reviews, and the possible observation of the parents or caregivers during the play therapy session. It is also suggested to have recording equipment available so that the play therapy sessions can be recorded. Play therapists or trainees can go back and watch the recorded sessions to identify their strengths and areas to work on. Landreth (2012) recommended to not have a video recorder in the play therapy room due to the child possibly altering his/her behavior, becoming more animated, or being distracted by the equipment.

Ray (2011) further discussed the importance of having video-recording equipment in the play therapy space at university-based play therapy training clinics. Ray noted that self-report by play therapy trainees are notoriously inaccurate and audio recordings limit the play therapy instructor or supervisor's ability to observe the child's and the trainee's nonverbal communication. By video recording the play therapy session, the therapist or trainee can also re-experience the session in the presence of the supervisor or instructor, as well as re-connect with the trainee/therapist's and the child's or client's feelings. Enhanced emotional connections may assist the trainee or therapist in increasing his/he level of empathy and understanding of the child or client, as well as improve the trainee/therapist's level of self-reflection and awareness. Further, the chapter authors noted that any other occurrences that may have knowingly or unknowingly influenced the play therapy session, such as environmental factors, either inside the play therapy room or outside the room or hallway can be identified and addressed.

Researchers further provided items and pieces of furniture that may be beneficial in the play therapy room. A chalkboard mounted approximately 21 inches from the floor with a tray across the bottom with colored chalks or a dry erase board with non-toxic erasable markers with different colors is recommended (Landreth, 2012; Kottman, 2011; Carmichael, 2006). A polished metal mirror mounted to the wall may be helpful (Landreth, 2012). Sturdy wooden book shelves at the child's height (the top shelf should be no higher than 38 inches) with a long-lasting finish should be mounted to the wall to allow the display of toys, as well as ensure the child is safe if the child tries to climb in the shelves or on top of the shelves. A sturdy, wood, or hard-surfaced child-sized table and chairs need to be present in the playroom with an adult-sized chair for the therapist (Landreth, 2012; Kottman, 2011; Carmichael, 2006). Fabric chairs for the child or therapist are not recommended due to possible health concerns and the possible difficulty keeping them clean (Carmichael, 2006). A storage container may be present to store additional art supplies or could be used as a small sandbox or sandtray (Landreth, 2012; Carmichael, 2006). Landreth (2012) and Kottman (2011) also suggested having a storage cabinet to store art materials with a countertop to paint and display artwork. Kottman (2011) further recommended having a small desk if a table and chairs

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

were not available, a pillow for the therapist if a chair could not be present, and additional furniture to accommodate parents or caregivers if they were to attend the session.

NON-TRADITIONAL PLAY THERAPY SPACES

Many universities and play therapy training programs offer practicum and internship experiences in non-academic settings. These diverse community-based and non-traditional counseling sites may include hospitals, community agencies, schools, churches, and in-home settings. In order to provide appropriate play therapy services, there are many factors to consider when designing a therapeutic play therapy space in non-traditional settings.

In medical settings, toys used in play therapy practice present a challenging cross-contamination issue when used in toy rooms or in portable medical play practices due to the pathogenicity. According to the Occupational Safety and Health Administration (OSHA, 2019), universal precautions are defined as "an approach to infection control to treat all human blood and certain human body fluids as if they were known to be infectious for HIV, HBV and other bloodborne pathogens" (p.1). Universal precautions are always recommended according to the World Health Organization (2007) and the United States Department of Labor (2019) standard precautions in health care. By finding ways to sterilize the toys and materials and by having child-specific toys per session, this can avoid cross contamination. Carmichael (2006) recommended only selecting toys that can be washed in disinfectant. She further recommended not having puppets or stuffed animals in the playroom unless they can be washed or dry-cleaned often.

When providing play therapy services in a community, school, or non-traditional counseling settings, it is important that the agency, school, or hospital supervisor have basic knowledge of play therapy services, the recommended play therapy space, and the play therapy toys required to offer play therapy in a therapeutically conducive environment. Many non-traditional counseling settings may have toys at the site, but they are disorganized or broken. The toys made available may also be considered non-therapeutic based on the rational for selecting play therapy toys. The play therapy space may not be a safe and secure environment. Further, play therapy services may be offered at sporadic locations, for example in schools, playgrounds, empty offices, storage rooms, hallways, and media centers. In these cases it is difficult to ensure confidentiality when meeting in open spaces, and meeting in different places at different times with different toys does not ensure continuity or consistency in the clinical services provided.

In order to offer support to non-traditional counseling settings, the authors recommend that university-based play therapy supervisors offer play therapy workshops and trainings to the community supervisors and staff so that everyone at school-based and community-based agencies will better understand the necessity and requirements of a proper play therapy space. Play therapy supervisors could also offer agency consultations so that when students are placed in these non-traditional settings, if the agency is amenable to setting up a play therapy room, the therapeutic space could be established before the play therapy trainee begins his or her practicum or internship experience.

When play therapy services are offered in non-traditional sites, but the site does not have a play therapy room or the required toys, Landreth (2002, 2012) and Landreth and Bratton (2006) recommended the play therapist bring a play therapy toy tote bag with three primary categories of toys: 1) real-life toys, 2) acting-out aggressive toys, and 3) creative and emotional expression toys. *Real-life toys* include: a small baby doll, a nursing bottle, a doctor kit (with stethoscope), toy phones (at least two), a small dollhouse, a bendable doll family that is ethnically representative of the client's family, play money, a couple of

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

domestic and wild animals, a car and truck, and kitchen dishes. Optional toys include: puppets (one aggressive and one gentle), doll furniture (for a bedroom, bathroom, and kitchen), and dress up items. *Acting-out aggressive toys* include: dart guns with a couple of darts and a target, a rubber knife, a rope, aggressive animals such as a snake, shark, lion or dinosaurs, small toys soldiers with two different colors (around 12-15), inflatable bop bag, a mask, and an optional set of toy handcuffs with a key. *Toys for creative/emotional expression* include: Play-Doh, crayons, plain paper, scissors, transparent tape, egg carton and Styrofoam cup or bowl, ring toss game, deck of playing cards, soft foam ball, two balloons per play session, an optional selection of arts and craft materials in a Ziplock bag, Tinker Toys or building blocks, binoculars, and a tambourine, drum or other small musical instruments, and a magical wand (Landreth, 2002, 2012; Landreth & Bratton, 2006).

University-Based Training Site Serving Mock Clients

The purpose of a play therapy training site serving mock clients is to allow play therapy trainees the opportunity to interact with the recommended toys, practice play therapy skills, receive immediate feedback and supervision from both the student counseling cohort and the supervisor, and process the session afterwards. If the playroom or clinic will not be utilized to provide services to real clients, it is important to explore what will be the purpose of establishing a play therapy playroom. Will the room be used for graduate students or play therapy trainees to practice their play therapy skills with each other during role plays? Will the students practice their play therapy skills with a non-clinical population such as friends or family members who may give consent to work with their children or adolescents? Will the instructor role play with students or vice versa to demonstrate the play therapy skills? What type of supervision will be provided if any to monitor the student's progress? Will supervision include live supervision in the playroom, supervision using a one-way mirror, or will an electronic recording device be present to record all sessions and role-plays so that the students will be able to go back and review their sessions at a later date?

It is recommended to have laboratory experiences (i.e. practicum or internships) including: observing play therapy sessions of other trainees; observing the instructor provide play therapy services live or reviewing a recording of a play therapy session; conducting a recorded role play session both with the instructor and fellow trainees; and conducting play therapy sessions with non-clinical populations such as children enrolled in daycares or nursery schools (Landreth, 2012).

For training sites, it is suggested to install electronic equipment to video record the sessions for later playback and viewing. If this is not possible, it is recommended to install a one-way mirror in the playroom (Landreth, 2012). Typically, graduate students enrolled in graduate counseling programs are required to record counseling sessions, review the sessions with their instructor and fellow classmates, and provide a formal case staffing or case conceptualization of their clients. Many university digital recording systems may only retain the counseling session for two to four weeks depending on the system. It is necessary to ensure the recorded sessions are kept for a minimum of four to eight weeks to allow the students the ability to discover themes and patterns of play after reviewing and reflecting upon their play therapy sessions.

It is further recommended by the authors to employ two full-time state licensed Registered Play Therapist Supervisors (RPT-S) to provide all supervision of the play therapy trainees at the university and community-based training sites and to provide graduate play therapy instruction. This number may vary based on the size of the student population and/or university; however, when applying for play

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

therapy certification, all graduate play therapy coursework has to be taught by two different play therapy instructors (APT, 2019). Having only licensed RPT-S clinicians provide the play therapy supervision and teach the play therapy graduate courses, ensures a qualified professional has met the requirements for APT and can provide appropriate supervision and oversight for all play therapy instruction being provided. Further, it is important that the play therapy room be set up according to the theoretical-based clinical recommendations. If the play therapy room is not set up correctly, it will be difficult to provide play therapy supervision, address mistakes made, or discuss possible areas of improvement during the play therapy session that may occur when inappropriate toys are present in the room or the toys are displayed chaotically.

CULTURAL CONSIDERATIONS REGARDING THE PLAY THERAPY SETTING

Professional organizations such as the National Association of Social Workers (NASW) *Code of Ethics* (2017) and the American Association for Marriage and Family Therapy (AAMFT) *2015 Code of Ethics* deem multicultural competency and diversity as an ethical responsibility for the practitioner, as does the American Counseling Association *2014 ACA Code of Ethics,* the National Board for Counselors (NBCC) *Code of Ethics* (2016), and the American Psychological Association (APA, 2017) *Ethical Principles of Psychologists and Code of Conduct.* Cultural awareness and service interventions in play therapy education and in supervision of trainees will be described in the section.

Findings from three studies noted play therapy practitioners are predominantly Caucasian females from middle to upper class strata in the United States (Parikh, Ceballos, & Post, 2013; Gil, 2005; Baggerly, 2006; Phillips & Landreth, 1995). It has been theorized that most play interventions and playrooms were geared to Western European approaches representative of the play therapy education and supervision the registered play therapist received (Gil, 2005; Kranz, Ramirez, Flores-Torres, Steele, & Lund, 2005). O'Conner (2005) suggested that discord exists between basic play therapy theory and practice. Further, O'Conner (2005) recommended three ways play therapists may use to learn culturally appropriate skills: by pursuing information about the specific multicultural norms, the play materials used by that culture, and play interventions deemed most appropriate for that multicultural group.

Multiculturalism is a dynamic and real aspect of play therapy today. In the ever-increasing globalization of modern society, more children and families enter play therapy practices from wide arrays of primary cultures or blends of cultural heritages. These clients come with constellations of beliefs derived from their family systems, self-identities, and ways of communicating related to their upbringing by members of their own multicultural group (Post & Tillman, 2015). This shift in caseload composition is evolving. The shift from a predominantly Western Europe extracted demographic is reflected in many play therapy caseloads. By 2050, our multicultural population is likely to increase to 62% of the total US population (U. S. Census Bureau, 2010). Accompanying this shift in population and caseloads, clients and families are expected to come with a wide range of cultural issues including a likely lower socioeconomic status (Abramsky, 2012), cultural differences related to trust, religion and spirituality, language, self-identity, customs (Sue & Sue, 2003), within-group differences (Haidt, Koller, & Dias, 1993), immigration status, (Carmichael, 2006), and multicultural norms. Play therapists have a responsibility to provide informed evidence-based play interventions sensitive to the client's culture (Hinman, 2017; "National Association for," 2017; "Association for Play," 2018) and level of acculturation to their host country (Sue & Sue, 2003).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

To provide services for this anticipated changing demographic in play therapy caseloads, graduate programs need to provide multicultural and additional social justice concepts in a variety of courses prior to graduation (Brubaker, Puig, Reese, & Young, 2010; Burnes & Singh, 2010; Dixon, Tucker, & Clark, 2010). Play therapists first learn about multicultural competency and diversity in their undergraduate and graduate programs, as well as during their clinical experiences in supervised play therapy. Traditionally, graduate school programs incorporate the Council for Accreditation of Counseling and Related Programs (CACREP) and the Council on Social Work Education (CSWE) standards. As a specialty, play therapy education, according to APT, requires specific education and supervised practice in addition to the professional practice license from the applicant's state (APT, 2019). Coverage of multicultural issues in play therapy primarily depends upon the trainee's education and supervision.

Additionally, play therapy training clinics need to consider incorporating multicultural concepts and discussions including social justice advocacy (Baggerly, 2006) in play therapy courses taught at the university level, practicum in multicultural settings, and culturally-informed supervision of trainees by sensitive trained play therapy supervisors (Burnes & Singh, 2010). Such informed discussion during practicum is thought to increase trainee self-assessment of one's own biases, cultural identification, and areas of prejudice (Baggerly, 2006; O'Connor, 2005). Also, professional organizations such as APT should provide continuing education in multiculturally sensitive areas at national and state association conferences (Ceballos, Parikh, & Post, 2012) to best serve play therapy practitioners who work with children and families to keep ahead of the trends.

Play Therapy Settings: A Multicultural Context

In considering respectful services in a multicultural context, the space where play therapy is offered is often ignored or overlooked (Hinman, 2003). The office and playroom set up; however, provide a welcoming experience if selections of culturally specific decorations depict the demographic population served in a respectful manner. Multicultural equipment includes toys, books, games, and furniture.

Play therapists have long understood that play is a developmentally apt way for children to express themselves (Axline, 1969) where it is core to children on a daily basis (VanFleet, Sywulak, & Sywulak, 2010). Various cultures have specific and discreet qualities that play therapists are best served to become familiar with as caseloads reflect multicultural societal evolution.

As a way to familiarize themselves with clients from multicultural backgrounds, play therapists are encouraged to attend community events outside of the therapeutic relationship such as going to religious services, attending synagogues and churches, theater events, community group offerings, and eating in ethnic restaurants (Coleman, Parmer, & Barker, 1993). As well, therapists are encouraged to discover the community supports such as religious groups, social services, and other agencies available to the children and families in their community (O'Connor, 2005).

To provide culturally-appropriate and ethnically-informed play interventions, therapists have embraced approaches to ally or join with families from the early stages of rapport building and assessments (Hinman, 2003; VanFleet et al.,2010). With joining, noticing specific cultural distinctions may be taught both in graduate play therapy programs and in supervised play practicum. In order to effectively practice in a multicultural context, therapists are tasked to understand each child's cultural manifestations such as eye contact, respect for authority, and verbal and nonverbal communication and within-group differences (Killian, Cardona, & Hudspeth, 2017). Specific considerations related to working with African

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

American, Arab American, Asian American, Mexican American, Muslim, and Refugee populations in play therapy are specifically highlighted below for considerations.

African American Populations

African American children and families generally do not voluntarily disclose information in the course of treatment, according to O'Connor, which is consistent with their multicultural group values (2005). This makes spontaneous discussion with the play therapist challenging but consistent with cultural norms (O'Connor, 2005). African-American children experience levels of poverty (Patterson, Stutey, & Dorsey, 2018). Odom, Pungello, and Gardner (2012) reported that African American infants and toddler levels of poverty measured by the national poverty levels was 42% where White infants and toddler poverty rates were 15%. Some African American children, according to O'Connor, experience violence and hatred at school and cautioned play therapists against assuming all black children have similar experiences that require interventions in play therapy (2005). He also recommended that clinicians attend to subgroup differences for children from rural and urban areas, for example.

Arab American Populations

Arab American families view therapeutic services as a treatment for a mental disorder (Sayed, 2003). According to the author, families view submission to Allah's will is linked to stable mental health, making mental illness a lack of moral consistency. This culture is more likely to pursue pharmacological therapy rather than talk therapy.

Asian American Populations

When working with Asian-American children and families, use of their name is tantamount to how the family member is tied to their family. For example, the common practice of using a first name in the therapeutic process is acceptable only for the child, but not for the parents. Using their title and last name is preferred (Vargas & Koss-Chioino, 1992). Not all Asian cultures view seeking therapeutic help in the same way. For example, families of Cambodian or Vietnamese descent feel seeking professional help incur a debt. They view their debt owed to the therapist as a great cost. So, these families may wish to know the cost and benefit of services sought and suggested by the therapist. In this culture, therapists have to present a clear treatment approach and expectations as the parents weigh their financial and emotional costs to family (Huang, 1998). When designing and setting up a playroom for Japanese and Japanese-American children, one should consider their cultural identity when selecting items to provide a strong bond between children and their parents. When designing the environment, the therapist is mindful of the client's acculturation process due to within-group differences (Hanson, 2004).

Japanese children and families often enter play therapy services with feelings of shame, as the family's inability to solve their own problems is representative of a parenting failure. In this culture, joining with the client and family is prioritizing confidentiality within the therapeutic relationships. According to Hinman (2003), learning about the family structure and later returning to their feelings of shame aid in conveying how the therapeutic process works. During the process, as trust is being developed, the therapist aids parents by providing therapeutic techniques they may perform at home to facilitate hope and diminish loss of control and feelings of failure by seeking therapeutic help.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Mexican-American Populations

Kranz, Ramirez, Flores-Torres, Steele, and Lund (2005) provided culture specific setting recommendations for play therapy with Mexican-American children such as painting waiting rooms in bright welcoming colors and using 12 inches by 12 inches red floor tiles. The indoor playroom dimensions were suggested to be approximately 150 to 200 square feet for individual play therapy sessions and approximately 300 to 400 square feet for group play therapy sessions. Kranz et al. (2005) also recommended having culturally appropriately sized small, sturdy furniture, colorful baskets, castanets, and colorful wall coverings. As Mexican-Americans play outdoor games, Moncada (1962) suggested offering an outdoor play yard including a play house structure, tree house with ladder, dirt, a tunnel, fence, table with benches, and basketball with hoop.

Muslim Populations

Muslim families tend to solve their own problems and eschew working with non-Muslim professionals (Baggerly & Abugideiri, 2010). For these children, many of whom have faced oppression, discrimination, and trauma, a move to a new country is fraught with many changes in their family systems and having to adjust to new school and home environment. For non-Muslim professional, Baggerly and Abugideiri (2010) suggested consulting Islamic leaders in the child and family's community to learn about Islam's role in family life. Baggerly and Abugideiri (2010) also suggested including both culturally-sensitive play materials and toys such as dolls with hijabs to create a culturally-appropriate play space for the child and the family.

Refugee Populations

Stauffer (2008) claimed cultural understanding was the key to providing appropriate play therapy interventions for refugee children. Further, to practice responsibly, the therapist must have knowledge of those multicultural considerations specific to the client (Killian, Cardona, & Hudspeth, 2017). For example, the act of seeking therapeutic services is not common with Somali refugees (Killian, Cardona, & Hudspeth, 2017). Refugees who have lived through oppression and prejudice have a bigger need for familiar toys that resemble those of their own culture (O'Connor, 2005). Additionally, when language may be a barrier, the use of Child Centered Play Therapy techniques and interventions have been suggested as therapists put into words what the child is expressing in their use of toys and materials in the playroom (Kottman, 2011). The authors acknowledge the nature of international immigration of refugees and their movement across borders. The United Nations Refugee Agency (UNHCR, 2018) estimated that 68.5 million people have been displaced. Of that number, 25.4 million were refugees with half estimated to be children under age 18 ("Figures at a Glance," 2018). The authors were unable to locate any current measure of refugee children seeking play therapy services at the time of this publication.

SELECTING TOYS AND MATERIALS

When practicing as a play therapist, it is important to explore the rationale for selecting toys and materials; deciding if one is going to provide mostly directive or non-directive play therapy services; deciding on

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

one's theoretical orientation and selecting the corresponding toys recommended based on the theoretical orientation; and examining general considerations when using art media and other materials; puppets and puppet theaters; sandtray and miniatures; and psychotherapeutic games.

According to Landreth's *Play Therapy: The Art of the Relationship* (2012) and the University of North Texas Play Therapy Institute training video, *Toys and Materials* (Landreth, 2002), there are 14 considerations when determining the rationale for selecting toys and materials, including: 1. Toys and materials should be selected, not collected.; 2. Do the toys and materials facilitate and create a wide range of creative expression?; 3. Do the toys and materials facilitate and create a wide range of emotional expression?; 4. Do the toys and materials facilitate and allow for expressive and exploratory play?; 5. Do the toys and materials allow for exploration and expression without verbalization?; 6. Do the items allow success without prescribed structure?; 7. Toys should facilitate contact with an adult.; 8. Toys should permit reality testing.; 9. Toys should allow children to express their needs symbolically.; 10. Toys should provide for emotional release.; 11. Toys should allow for insight.; 12. Toys should engage the children's interests.; 13. Toys should allow for noncommittal play.; and 14. Toys should have study construction for active use.

If a play therapy room is present and play therapy services can be offered to individuals in the community or school settings, one must first decide if he/she may predominantly provide directive or non-directive play therapy. The length of treatment provided, and the setting or location of the play therapy services being offered, may determine this. Nondirective play therapy implies that the child is in the lead. According to the *Glossary of Play Therapy Terms* published in the *Play Therapy Magazine* by APT, Schaefer and Peabody (2016) defined nondirective play therapy as being "based on the belief that children have an innate drive towards health and healing, this approach leaves the responsibility and direction of the play sessions to the child." In directive play therapy, the therapist is in the lead. Directive play therapy is defined as "an intervention wherein the therapist assumes responsibility for initiating and structuring the client's play activities in order to promote healing" (Schaefer & Peabody, 2016, p. 23).

Highlighting Toys by Theoretical Orientation

After deciding if one is going to practice predominantly as a directive or non-directive play therapist, one must further decide on his or her primary theoretical orientation when working with children ages two to 12 and adolescents ages 13 and up. According to Carmichael (2006), the purpose of a theory is to provide an underpinning for the interventions a counselor might use with the client. The theoretical orientations may serve as a coat rack that supports the philosophical coats of personality development, major assumptions of the client and his or her support system, the role of the therapist and client, model of pathology, and treatment goals and interventions. The theoretical orientation will determine what categories of toys are required, how many toys are present during the session, how the toys will be displayed, and how will the play therapy room be set-up (Carmichael, 2006; O'Connor & Braverman, 2009).

The primary fourteen play therapy theoretical orientations include: Psychoanalytic Play Therapy, Adlerian Play Therapy, Jungian Analytical Play Therapy, Child-Centered Play Therapy, Gestalt Play Therapy, Relationship Play Therapy, Cognitive-Behavioral Play Therapy, Child Developmental Play Therapy, Ecosystems Play Therapy, Child Parent Relationship Training, Filial Play Therapy, Family Play Therapy, Theraplay, and Prescriptive Play Therapy (Carmichael, 2006; O'Connor & Braverman, 2009). Based on all of the diverse play therapy theoretical orientations, there are similar categories found among the fourteen primary theoretical orientations or approaches with also very distinct differences.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

To ensure a play therapy training clinic center is prepared to adequately teach and demonstrate specific play therapy interventions from different theoretical models, specific toys and materials must be present in the graduate classroom or the play laboratory. The clinical setting also needs to be equipped with the appropriate toys to provide play therapy instruction and to provide clinical play therapy services to children, adolescents, and families.

The recommended toys and set-up for each theoretical orientation will be discussed, as well as general considerations for utilizing art media and other materials; books and bibliotherapy; puppet and puppet theaters; sandtrays and miniatures; and psychotherapeutic games. This will not be an exhaustive discussion of all of the recommended toys and materials. The authors will provide a general recommendation when setting up a play therapy training clinic, preparing a play therapy graduate classroom environment or play therapy laboratory, and offering graduate play therapy instruction on the different theoretical approaches.

Psychoanalytic Play Therapy Toys

Psychoanalytic play therapists select different toys specifically for the child he or she is working with. For each child, the toys are brought to each play therapy session in a private box by the therapist so that the toys are not shared by all of the children. The toys are kept safe from other children and the play is considered private. The box becomes a symbolic container for the child's feelings and expressions and is only shared between the therapist and the child. Children are able to symbolically represent their thoughts, feelings and wishes lending to their interpretative work in play therapy (Klein, 1955; Carmichael, 2006; Lee, 2009).

The materials utilized by a psychoanalytic play therapist include dolls, doll clothing, blankets, dollhouses, and family dolls representing mothers, fathers, and other children. Additional toys include transportation vehicles, domestic and wild animals, animal and people puppets, soldiers, guns, action figure, games, blocks, soft balls for basketball and baseball, a small house, and fences. Art materials may include paper, clay string, Play-Doh, pencils, markers, paints, finger paints, crayons, and construction materials to build things. A sandbox may also be present for younger children. Different toys are selected so that the items can be used in different ways to represent realistic everyday interactions and fantasy play (Klein, 1955; Carmichael, 2006; Lee, 2009). According to Lee (2009), depending on the tolerance level of therapist, the office furniture such as the couch, chair, desk, or bookshelves may also be used as part of the child's fantasy play.

Adlerian Play Therapy Toys

When providing Adlerian Play Therapy (AdPT), Kottman (2011) recommended five basic groups of toys including family/nurturing toys, scary toys, aggressive toys, expressive toys, and pretend-fantasy toys. Family/nurturing toys include a dollhouse, several different ethnically diverse families of dolls (with removable clothing and bendable bodies if possible), baby dolls, a cradle, a soft blanket, baby clothes, and baby bottles. Additional family/nurturing toys include pots, pans, dishes, silverware, empty food containers, and play kitchen appliances such as a sink and a stove. Animal families, stuffed toys, ethnically diverse people puppets, and sand in a sandbox are also included.

The scary toy category includes: snakes, rats, insects, sharks, alligators, dinosaurs, dragons, plastic monsters, and fierce animal puppets such as a wolf, bear, or an alligator. For children who have expe-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

rienced a vehicle trauma, cars, trucks or ambulances may be considered a scary toy. Aggressive toys include a bop bag, weapons such as a play gun, swords, knives, a foam bat, plastic shields, handcuffs, toy soldiers, military vehicles, and small pillows for pillow fights. Expressive toys and materials include an easel and paints, watercolors, finger paints, crayons, markers, newsprint, glue, scissors, tape, egg cartons, feathers, Play-Doh or clay, materials for making masks, and pipe cleaners for crafts (Kottman, 2011).

The pretend/fantasy toy category includes masks, costumes, magic wands, hats, jewelry, purses, a doctor kit, telephones, blocks, and other building materials. Other toys items include people figures, zoo and farm animals, puppets and a puppet theater, a sandbox, trucks, construction equipment, kitchen appliances, pots, pans dishes, silverware, and empty food containers. Kottman (2011) further included a wide range of miniatures to be used in a sand tray as recommended by Homeyer and Sweeney (2017). These toy miniature recommendations will be reviewed in the general sandtray and miniature collection section.

Jungian Analytical Play Therapy Toys

When providing Jungian Analytical Play Therapy, the traditional play therapy room includes a dollhouse, doll family, art center with supplies, wet and dry sand, a collection of miniatures, a water source, nursing bottle, telephones, puppets, small bed, construction toys, and areas designated for construction activities and for board games (Allen & Levin, 1993). Allen (1994) utilized many art and drama activities while providing counseling services. Examples of the interventions include: spontaneous and directed drawings; serial drawings and serial story writing; creative drama involving activity group therapy and developmental drama; and sandplay therapy using eight categories of miniatures. The recommended miniatures include: 1. *People* (domestic, military, fantasy, and mythological); 2. *Buildings* (houses, schools, churches, and castles; 3. *Animals* (tame, wild, zoo, prehistoric, and marine; 4. *Vehicles* (land, air, water, space, and war machines); 5. *Vegetation* (trees, shrubs, plants, and vegetables); 6. *Structures* (bridges, fences, gates, doorways, and corrals); 7. *Natural objects* (shells, driftwood, stones, bones, and eggs); and 8. *Symbolic objects* (wishing wells, treasure chests, and jewelry).

Child-Centered Play Therapy Toys

Landreth (2002, 2012) and Landreth and Bratton (2006) recommended three broad categories of toys including real-life toys, acting-out aggressive-release toys, and toys for creative expression and emotional release when providing Child-Centered Play Therapy. *Real-life toys* include: dolls, a nursing bottle, a bendable doll family that is ethnically representative of the client's family, a dollhouse, doll furniture (for a bedroom, bathroom, and kitchen), diverse puppets with at least one aggressive and one gentle puppet, a couple of domestic and wild animals, a doctor kit (with stethoscope), toy phones (at least two), and a nondescript figure such as Gumby who could represent any person or family member in the child's life. Other real-life toys include a car, truck, boat, cash register, chalkboard, kitchen dishes, groceries, play money, dress up items, and a broom and a dust pan.

The *acting-out aggressive-release toys* include: small toy soldiers with two different colors (around 12-15), alligator puppet, guns (space or dart gun with a couple of darts and a target), a rope, rubber knives, set of toy handcuffs with a key, pounding bench, a bobo or bop bag, a mask, and wild and aggressive animals such as a snake, shark, lion or dinosaurs. Creative and aggressive toys can include Play-Doh that may be used for pounding, smashing, pinching or rolling. Aggressive-release toys may

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

also include items that can be destroyed, torn or broken in the play therapy room such as egg cartons, paper and popsicle sticks (Landreth, 2002, 2012; Landreth & Bratton (2006).

Toys utilized for *creative expression and emotional release* include: sand, water, Play-Doh, crayons, easel paints, plain and newsprint paper, blunt scissors, transparent tape, egg carton and Styrofoam cup or bowl, ring toss game, deck of playing cards, soft foam ball, two balloons per play session, an optional selection of arts and craft materials in a Ziplock bag, Tinker Toys or building blocks, a magical wand, and binoculars, a tambourine, drum or other small musical instruments. Landreth recommended to not include in the play therapy room any mechanical toys that may limit the child's creativity (Landreth, 2002, 2012; Landreth & Bratton, 2006).

Gestalt Play Therapy Toys

The founder of Gestalt Play Therapy is Violent Oaklander. Oaklander first published her book, *Windows to Our Children: A Gestalt Therapy Approach to Children and Adolescents*, in 1988. In this book, Oaklander described the process of integrating Gestalt Therapy with play therapy and reviews the necessary toys and activities recommended. Oaklander (1988) selected toys and other materials based on the five senses to appeal to the child's sense of hearing, taste, touch, seeing, and smelling when practicing Gestalt Play Therapy. Oaklander (1988) also recommended music instruments, storytelling, poetry, and puppets to assist the child in creative and fantasy exploration.

Suggested art materials may include paper of all sizes, colored pencils, crayons, pastels, felt-tip pens, finger-paints, a pair of scissors, glue, paste, stapler, paper fasteners, scotch tape, masking tape, hole puncher, and diverse collage materials. Collage materials may include tissue paper, construction paper, gift wrapping paper, old greeting cards, newspaper, paper sacks, corrugated paper, poster board, butcher paper, cardboard cartoons, doilies, wallpaper, magazine pictures from old and new magazines, calendars, date books with images, coloring books, children's activity books, and old story books. It is also useful to have pre-cut images and words from magazines and newspapers (Oaklander, 1988).

It is further recommended to have both soft and rough or hard items, as well as items with various textures. Various textures of cloth are recommended such as cotton, wool, burlap, flannel, silk, and lace. Soft items include feathers, cotton, and furry pieces of material. Rough or hard items include pieces of steel, glass, wood, wool, sandpaper, sponges, and pieces of plastic. Other craft items that may lend to creative building and expression are yarn, string, buttons, ribbons, and mosquito netting. Examples of household, kitchen, bathroom, or outdoor items are aluminum foil, cellophane, orange sacks, egg cartons, noodles and macaroni, plastics, bottle caps, chicken wire, tongue depressors, and cotton swabs. Naturally found and food items include leaves, shells, driftwood, cork, pebbles, and seeds of all kinds. Any other additional items that are lightweight and can be attached, pasted, or fastened to a flat surface in any manner are also considered to be a good collage material (Oaklander, 1988).

Relationship Play Therapy Toys

According to Moustakas (1959, 1997), when practicing Relationship Play Therapy, the number of toys in the play therapy room is not important. The attitude of the therapist and the relationship with the child are considered to be the most important factors of therapy. It is also important that the child be able to play with any toy in the manner he or she chooses without the child feeling pressured to play with a

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

specific toy in a specific way. The toys are purposely not displayed in a specific manner to identify their use or context.

Moustakas (1959, 1997) described the toys present in the play therapy room as structured or unstructured items. Unstructured items such as sand, water, paints, crayons, finger paint, paper, scissors, steel vises, tools, and clay allow the child to express pent-up feelings and tension. Structured items such as guns, knives, swords, darts, and a punching toy or bobo allow the child to express hostility. Other recommended toys to express emotions include family dolls and a large dollhouse, dollhouse furniture, puppets, stuffed animals, and other items representing human figures. Cars, trucks, tractors, boats, airplanes, checkers, paper, and pencils allow noncommittal play activities. Additional recommended toys include bowls, spoons, nursing bottles, plastic aprons, telephones, soldiers, shovels, jump rope, masks, blocks, balloons, and a bop toy (Moustakas, 1959, 1997).

Cognitive-Behavioral Play Therapy Toys

When proving Cognitive-Behavioral Play Therapy (CBPT), Knell (1995, 1998, 2009) recommended similar toys to be utilized when providing Child-Centered and Adlerian Play Therapy. Additional items recommended are books to be used in bibliotherapy, child prepared stories and books, stories both made up by the therapist and published, structured workbooks, recordings of stories, music that depicts various moods, board and card games, pictures of faces depicting various feelings, charts, art materials, sculpting materials, dolls, puppets, stuffed animals, and action figures. Additional information regarding the use of puppets and bibliotherapy can be found under the specific play therapy toy selection discussion.

Developmental Play Therapy Toys

Brody (1997) did not have toys available in the play therapy room when providing Developmental Play Therapy. The core therapeutic component of Developmental Play Therapy is a dialogue between the therapist and the child using touch. Toys are considered a distraction to the relationships with the therapist. Brody recommended having a large rug big enough for an adult and a child to sit on comfortably, a rocking chair, a table and chair, a bottle of lotion, and paper with basic art materials such as crayons and pencils (Brody, 1992; 1997; Carmichael, 2006).

Ecosystemic Play Therapy Toys

In Ecosystemic Play Therapy, O'Connor (1994, 2009) described the therapist as the primary material or therapeutic agent of change with limited play therapy toys present. When providing Ecosystems Play Therapy, it is recommended to have three to five toys present at a time during the play therapy session. O'Connor (2009) recommended that three toys are selected based on the child's developmental functioning. One toy is selected based on the child's current developmental functioning. One toy is selected that is below the child's developmental level and one toy is selected that is above the child's developmental level requiring a higher level of functioning. An additional two toys may be selected based on the toys' possible symbolic value to the child based on the child's presenting problems, current situation, or the child's treatment goals (O'Connor, 1994, 2009).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

CPRT, Filial Therapy, and Family Play Therapy Toys

When providing Child Parent Relationship (C-P-R) Training, the same suggested toys utilized in Child-Centered Play Therapy are recommended in the *Child-Parent Relationship Therapy (CPRT) Treatment Manual: A 10-Session Filial Therapy Model for Training Parent* (Landreth & Bratton, 2006; Bratton, Landreth, Kellam, & Blackard, 2006). Landreth and Bratton (2006) cautioned against the use of mechanical toys that may inhibit the children's creativity. When preparing for the filial play therapy in-home session, parents were instructed to arrange the toys on an old blanket or quilt that serves as the boundary for the play area. This blanket would also protect the carpet if spills occurred. Further, a cookie sheet or a similar flat and easy-to-clean surface could be used for drawing on and for play with Play-Doh. After the play sessions were completed, Landreth and Bratton (2006) recommended the parents have a special playtime box to store the toys in.

When providing Family Play Therapy, Gil (2014) recommended using therapeutic games and diverse art supplies to provide family art therapy. These art supplies and craft materials included: pencils, pens, markers, chalk pastels, drawing and construction paper, large poster board, easels and easel paper, scissors, glitter glues, beads, feathers, pompoms, buttons, small tiles, sand, plastic eyes and mouth, and additional craft materials. She further recommended having sandtrays (one wet and one dry) with many diverse miniatures. She also suggested that clinicians should have approximately 30 diverse and similar puppets to conduct family puppet interviews.

In Filial Therapy, similar to Child-Centered Play Therapy, the toy selection is comparable (VanFleet, 2014). Playrooms contain toys that facilitate expressions of feelings including aggressive toys, such as dart guns that do not look similar to real guns, a bop bag, flexible rubber knives, and ropes. In playrooms, a full array of nurturing toys including dollhouses, nuclear family figures, infant dolls, puppets, food-making and food-eating toys, water, and bowls are found. Games and toys used to build and construct allowing competition, cooperation, and mastery are also seen in filial therapy playrooms along with blocks, play money, and toss games. Expressive art materials such as sand, crayons, paint materials, and markers as well as dress-up clothing, toy medical kits with masks, round out many filial playrooms.

VanFleet (2014) encouraged filial therapists consider three aspects when deciding to include certain toys in their playroom: a) is the item safe, b) does it's use facilitate children's feelings, and c) does it provide the child with avenues for imagination or projection? Further, VanFleet (2014) encouraged the use of less elaborate and costly playroom materials, suggesting instead use of moderate-cost useful toys that parents may find in their own homes. As older children frequent filial playrooms, VanFleet (2014) recommended expanding this toy list to include more toy options. She recommends board games for child-family play outside of the filial playroom. In filial therapy, home toy kits are recommended for parent and children. Additionally, VanFleet (2014) made "loaner toy kits" (p. 25) available for families who lack funds, including items from each toy area.

Theraplay Toys

Theraplay, founded by Dr. Ann Jernberg, focused on increasing attachment between Head Start mothers and their children. Theraplay is highly adaptable and does not use traditional play therapy toys. Activities are created to maximize the emotional and physical connection with caregivers, children, and the therapist. Materials such as cotton balls, nerf balls, ping pong balls, balloons, bean bags, beans, straws, bubbles, bubble wands, water pistols, plastic garbage bags, band-aids, small books for balancing, small pillows,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

large floor pillows, beanbag chairs, scarves, chairs or hoops, small hand towels, and a blanket are used in the activities. Art and craft materials provided are Play-Doh, felt pens, finger paints, white drawing paper, newspaper, construction paper, crepe paper strips, and paper towels. Snacks are also provided such as apples, seedless grapes, or other piece of fruit, raisins, slices of watermelon without seeds or with seeds for spitting out, potato chips, pretzels, M&M and other small candies, doughnuts, popsicles, Jell-O, popcorn, lollipops, licorice, bubble gum, soda, and a baby bottle or juice cartoon filled with juice or milk. Hygiene, hair and make-up products are also provided including lotion, shaving cream, liquid soap, baby powder, hair brushes and combs, hair ribbons, ties, headbands, clasps, and barrettes. Dress up items may include necklaces, bracelets, sunglasses, hats, neckties, and make-up for older children (Munns, 2000; Carmichael, 2006).

Prescriptive Play Therapy Toys

When providing Prescriptive Play Therapy, toys and play therapy activities were selected and provided based on the individual child's presenting problem or symptom, diagnosis, and/or goal for treatment to create a comprehensive, tailor-made treatment program. Play therapy toys and materials may include paper, drawing materials, books, videos, dollhouses (multiple houses if working with children whose parents are separated or divorced), and miniatures representing the child's family members (Schaefer 2001; Gil & Shaw 2009).

Highlighting Specific Play Therapy Toys and Materials

Art Media and Materials

Many play therapists may use art or employ art-based activities during their play therapy session; however, they may not consider the possible health hazards that may occur by the actual art media itself and the unsafe storage practices of media and other art supplies. Further, play therapists may use inappropriate art materials based on the client's age, medical background, or ability. They may overlook the therapeutic qualities of the art media and may not consider the importance of selecting a least to most controlled media referred to as the Media Dimension Variables (Graves-Alcorn & Green, 2014).

MDV). When processing the art activity, play therapists may also not consider the kinesthetic, sensory, perceptual, affective, cognitive, symbolic, and creative level of the media referred to as the Expressive Therapies Continuum (Landgarten, 1987; Kagan & Lusebrink, 1978; Lusebrink, 1990; Lusebrink, 1992; Graves-Alcorn & Green, 2014).

Safety Considerations of Art Media and Other Materials

When reviewing the recommended toys and materials for the primary play therapy theoretical orientations, thirteen theoretical orientations recommended art materials. These play therapy approaches included: Psychoanalytic (Klein, 1955; Carmichael, 2006; Lee, 2009), Adlerian (Kottman, 2011), Jungian Analytical (Allen & Levin, 1993; Allen, 1994), Child-Centered (Landreth, 2012), Gestalt (Oaklander, 1988), Relationship (Moustakas, 1959, 1997), Cognitive-Behavioral (Knell (1995, 1998, 2009), Child Developmental (Brody, 1992; Brody, 1997; Carmichael, 2006), Child Parent Relationship Training (Landreth & Bratton, 2006; Bratton, Landreth, Kellam, & Blackard, 2006, Filial (VanFleet, 2014), Family (Gil,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

2014), Theraplay (Munns, 2000; Carmichael, 2006), and Prescriptive Play Therapy (Schaefer 2001; Gil & Shaw 2009). The categorizations or qualities of the art materials were not discussed possibly due to the scarcity of evidence-based literature in the field of play therapy. By play therapists becoming more aware of the safety considerations of art media and materials and the media dimension variables, play therapists can better prepare for their sessions and provide directive or non-directive art activities to better meet the needs of their clients.

When providing art materials to clients, it is important to be aware of the properties of the materials, abilities of the clients, as well as possible safety precautions when using certain materials. The chapter authors have noted possible safety considerations based on their personal and professional practice. Safety considerations of art materials include being mindful of the expiration date of paints, aerosols, and glue. Some art materials may also be flammable and cannot be stored in direct sunlight or rooms with elevated temperatures. Some materials must be stored in open, ventilated rooms due to possible toxic fumes. When using markers, it is also preferred to use washable and non-toxic markers and dry erase markers (Carmichael, 2006).

When working with art media and sand, the play therapist must always consider possible medical problems the client may have such as asthma, allergies, diabetes, or other chronic illnesses. Clients who are sensitive to dust or may have any respiratory problems may not be able to use chalk (CDC, 2019; Carmichael, 2006) or play with sand. Non-dust play sand is always recommended. Also, many materials may carry a Proposition 65 Warning that indicates any exposure to chemicals that may cause cancer, birth defects, or other reproductive harm. Materials such as silica and some paints have cancer-causing agents that result in a Proposition 65 Warning (Office of Environmental Health Hazard Assessment, 2019).

Many clients with severe asthma or allergies cannot tolerate smells found with certain paints, aerosols, markers, dry erase markers, Play-Doh, plasticine, clay or other materials that may have a strong odor (CDC, 2019). Further, many odors of art materials may linger in the room for an hour or hours; therefore, the play therapist should not only consider the needs of the current client they are working with but also future clients. Clients with major chronic illnesses may be very hypersensitive to certain smells, both art materials and food. If clients ingest any hazardous materials, the therapist needs to have a safety protocol in place with access to a fresh water source (CDC, 2019).

When working with children or clients who present with self-harming thoughts or behaviors or have a history of substance abuse, blunt scissors should be available, however all sharp objects (Rubin, 1999) or other hazardous materials, such as toxic markers, aerosols, X-ACTO knives or detailed knives, box cutters, or a cut-off wire or wire, should be removed. When working in an individual and group setting, the play therapist should ensure the return of all art materials and supplies by having an updated inventory list available and count all items before and after distributing the supplies to the clients.

Selection of Art Media

According to Landreth, toys should be carefully selected and not collected (2012). When using art media and other materials, media should also be purposefully selected. According to Wadeson (1980), art media should be purposefully selected based on the needs of the client and the goals of the session. When determining what art media to use in session, the therapist should consider the amount of space needed to complete the activity, how much preparation is required to set up the art media in the play therapy room, and how much time it will take to clean up after the session. If the client presents with difficulties either holding or controlling the media or has problems with gross and/or fine motor control

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

such as young children or senior adults, it is recommended to use media that can be easily manipulated lending to more control. A sufficient variety of media and colors are needed, as well as an adequate size and amount of paper, canvasses, and other media such as clay or plasticine. Too much media can be overwhelming to clients; however, too little media can be restrictive and frustrating to clients. Wadeson (1980) suggested that when therapists are choosing art media, they should be aware of the possible feelings and reactions the media may elicit, as well as the properties of the media.

Media Dimension Variables (MDV)

According to the Media Dimension Variables, this concept was developed based on four factors including: "a) the reinforcement value of making art is inherently a therapeutic process; b) all individuals can be creative to some degree; c) dimensions of art media are discernable and can be classified; and d) media dimensions can be therapeutically applied." The continuum of least controlled media to most controlled media is referred to as the Media Dimension Variables (MDV). Beyond classifying materials as least to most controlled media, other aspects of the physical properties of the media were examined such as the media's fluidity, malleability, indestructibility, expansiveness, unpredictability, and adaptability. Three variables were delineated to include: a) structure, b) task complexity, and c) media properties. Unstructured activities or goals were left up to the client and the instructions were simple such as "Paint anything you wish." Structured activities provided little choice by the client with specific directions provided by the art therapist. Easy to complete tasks were classified as having a low-complexity versus complicated level. More difficult to complete tasks were classified as having a high-complexity level (Graves-Alcorn & Green, 2014, p. 4-5).

Art materials and media were either categorized as less restrictive and fluid in nature or more restrictive and complex in nature. Least controlled materials or media are soft, aqueous, malleable, and easy to manipulate. Examples of fluid media include finger paints, watercolors, soft or wet clay, soft plasticine, polymer acrylics, oil pastels, and thick felt markers. More controlled and restrictive materials are hard, brittle, slightly pliable to nonmalleable, and difficult to manipulate. Examples of more restive media include hard or highly gorged clay, hard plasticine, metal, wood, poster boards, heavier papers, collage materials, lead pencils, colored pencils, and felt markers. The medium based on more controlled or least controlled properties can heighten or lower the client's affective state, influence the freedom of expression, and can circumvent defenses (Graves-Alcorn & Green, 2014, Landgarten, 1987)

Expressive Therapies Continuum (ETC)

The Expressive Therapies Continuum (ETC) describes a systems-oriented approach to the expressive therapies. The ETC consists of three hierarchical levels, including the kinesthetic/sensory (K/S), the perceptual/affect (P/A), and the cognitive/symbolic level (C/S). These levels are based on "the sequence of increased complexity in cognitive and emotional development." The fourth level is that of creativity which can cross all of the levels. A reflective distance that "denotes the time span between the impulse or stimulus and the reaction to it" characterizes each level of the ETC. The reflective distance increases with the consecutively higher levels of the ETC from the first level of the kinesthetic/sensory to the cognitive/symbolic level (Landgarten, 1987, p.395; Kagan & Lusebrink, 1978; Lusebrink, 1990; Lusebrink, 1992; Graves-Alcorn & Green, 2014).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The *kinesthetic* component focuses on releasing energy and expressing it through bodily action such as pounding clay or scribbling on paper. The *sensory* component focuses on inner sensations and tactile experiences, including interacting with different media such as exploring finger-paints. The *perceptual* component focuses on the formation of schematic forms and representational images. Examples might include focusing on the formal elements of a form, color, or pattern. Experimenting with different media, such as highly structured media (pencils and markers) versus fluid media (watercolors and paints), allows the person to perceive the media differently and to enhance the *affective* component by applying intense color or using fluid media, thereby enhancing the expression of one's affect. The *cognitive* component emphasizes the analytical and logical thought required for information processing. The s*ymbolic* component emphasizes the metaphorical and intuitive nature of the art process whereby one can view problems differently and enhance problem solving and decision-making skills. The *creative expression* can be experienced on all three levels and can enhance all three components, thus encouraging new experiences though perceptual openness and enhanced receptiveness to inner and outer stimuli (Landgarten, 1987; Kagan & Lusebrink, 1978; Lusebrink, 1990; Lusebrink, 1992; Graves-Alcorn & Green, 2014).

Books and Bibliotherapy

Many play therapists use modern and older fictional and non-fictional books in play therapy. Bibliotherapy, as defined by Carmichael (2006), is the use of books, structured workbooks, stories, and recordings that address a specific topic. According to Knell (1995, 1998), bibliotherapy has been used as an adjunct to Cognitive-Behavioral Play Therapy. Children's literature offers messages and morals, but also serves as a storytelling approach. Many children's books may address specific clinical issues such as divorce, relocation, dying, or other traumas. By reading a story in which the character is experiencing the same problem as the child, the child may experience the sense that he or she is not alone and that other children may have experienced the same problem as the child. Secondly, bibliotherapy allows children to see that they are not alone in their feelings and if the character has learned to cope with whatever the presenting problem may have been, so can the child learn to cope with the problem or event. Finally, stories describing characters dealing with possible problems or traumas also provide a means of desensitizing the child to the presenting problem.

In many stories used in bibliotherapy, a message is conveyed more indirectly with the hopes that the child will learn something through the book characters through an indirect form of psychoeducation. The characters in the story will model for the child healthy ways of coping with life events. Many play therapists may also write a children's story particularly for a child dealing with a stressful event. The story may be read to the child several times over multiple sessions and sent home with the child so that the caregivers could continue to the read the story. The child may then be able to personalize the story and utilize the same healthy coping skills described in the story by the main character (Knell, 1995).

Selection of Books

Oaklander (1988) specifically recommended the use of fairy tales and folk tales to help children tap into the basic universal emotions of love, hate, fear, rage, loneliness, isolation, worthlessness, and deprivation. Children are able to gain meaning from the stories based on the individual person, as well as at various moments in the person's life. Regarding suggesting a list of recommended books to use in bibliotherapy, there are many different types of books and resources that may be helpful. Suggested

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

topics by Pardeck and Pardeck (1994) included: changing role models, blended families, separation and divorce, child abuse, foster care, adoption, and childhood fears. Doll and Doll (1997) provided a list of recommended novels, picture books, poetry, and audiovisual materials to address building friendships for fourth-graders. Stanley (1999) further offered a recommendation of fiction, nonfiction, self-help books, and poetry with sample reading plans to address 36 diverse topics.

In Davis' (1996) *Once Upon a Time: Therapeutic Stories that Teach and Heal*, 108 therapeutic stories with a variety of themes were provided in twelve categories. These categories included: 1) stories that empower and treat symptoms of trauma and Post-Traumatic Stress Disorder; 2) stories that empower and treat symptoms of child abuse; 3) stories that develop healthy emotional reactions, thinking, perceptions, beliefs, self-image, and social skills; 4) stories to aid in the disclosure of traumatic experiences and/or abuse; 5) stories for children who must testify in court proceedings; 6) stories to reduce and eliminate nightmares; 7) stories for children who have not followed a normal developmental path; 8) stories to help with death, loss and illness; 9) stories to help with problems related to parents, siblings, adoption, foster care, and divorce; 10) stories for adolescents and adults; 11) stories for school-related problems; and 12) modern day fairy tales.

Kottman and Meany-Walen (2018) provided a list of recommended books to address 14 diverse topics in the publication, *Doing Play Therapy: From Building the Relationship to Facilitating Change*. These topics included: 1) maladaptively perfectionistic children; 2) children whose parents are divorcing; 3) anxious children and children with specific fears; 4) children who struggle with problem solving; 5) children with low self-esteem/self-confidence or need help with self-doubts/believing in themselves; 6) children who have experienced trauma; 7) foster and adopted children; 8) children being raised by grandparents; 9) children who steal and/or lie; 10) children with ADHD/impulsive behavior; 11) children who are uncomfortable about being different/struggle with belonging; 12) children with social skills and friendship issues; 13) children who need help with recognizing and expressing feelings; 14) angry and aggressive children; and 15) children with behavior problems.

Additionally, books about counseling and specifically play therapy may be helpful for clients to understand the process of counseling. The authors recommend Nemiroff and Annunziata's picture book published in 1990 entitled *A Child's First Book About Play Therapy,* Rashkin's (2005) book entitled *Feeling Better: A Kid's Book About Therapy,* and Zilberstein and Abel's (2014) book entitled *Calming Stormy Feelings: A Child's Introduction to Psychotherapy.*

Puppets and Puppet Theaters

Puppets are recommended in almost every play therapy theoretical orientation and are a staple in the field of play therapy. According to Landreth (2012), puppets can promote a wide range of feelings for children so that the child and the puppet may express a negative or positive feeling. Puppets provide a safe way for children to express their innermost emotions and thoughts without feeling threatened or judged. Children may also need a safe place to hide or escape from the therapist. The puppet theater allows the child the space to hide from the therapist and gain emotional distance and separation if needed.

Use of Puppets

Puppets can be used in both directive and non-directive therapy. They can be used in the assessment process as part of a structured or semi-structured interview (Knell, 1995) or as a clinical intervention

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

with either only the child playing with puppets or the child and the therapist playing with the puppets simultaneously (Gil, 1994). According to Oaklander (1988), it is easier for the child to talk through the puppet than it is for the child to say something directly to the therapist or caregiver.

The therapist can also utilize puppets for modeling purposes in CBPT. The therapist, through the voice of the puppet, can model adaptive coping skills for the child. As therapy progresses, the child may then incorporate these skills into the child's stories and puppet play. Eventually, the child may integrate the coping skills discussed and learned into his or her daily routines at home or school (Knell, 1998).

Selection of Puppets

Carter and Mason (1998) found the following guidelines useful when selecting puppets: 1) Choose puppets which are easy to manipulate for both children and adults; 2) Choose puppet figures that do not carry universal symbolism; 3) Choose puppets that will fit in both children's and adult's hands; 4) Choose puppets that are soft and cuddly as opposed to firm and rigid; 5) Choose puppets that are washable or can be dry cleaned; and 6) Choose puppets with personality that engage the child's and the therapist's imagination and can express a diverse range of feelings and behaviors. Bromfield (1995) also recommended choosing puppets with mouths to enhance verbal expression to allow additional behaviors such as eating, licking, sucking, and biting to occur. The chapter authors recommend choosing puppets with mouths and tongues to make it is easier to manipulate the puppets to kiss, sing, yell, whisper, cough, and yawn. If the child may be experiencing inappropriate touch, a medical illness, or needs to express a secret or intense feelings, having well-defined mouth movements will allow the child to express more verbal and nonverbal information through the use of puppetry.

Based on the work of Irwin (1993), Carter and Mason (1998), and Sweeney, Baggerly, and Ray (2014), it is recommended to have a wide range of puppets with at least 15 to 25 puppets. Gil (1994) recommended having at least 30 puppets present to include duplicates of selected puppets. When providing group therapy to more than five children, it is suggested to have more than a five to one ratio of puppets to children.

The puppets need to represent a wide range of affects including neutral, friendly, and aggressive puppets. The selection needs to include real and fantasy puppets, realistic and ethnically diverse family puppets, and royal family puppets including a puppet to represent mothers, fathers, children, a queen and king puppet, and a princess and prince puppet. Occupational puppets are recommended to include doctors, nurses, policemen, and teachers. Symbolic puppets are recommended to include a ghost, witch, devil, skeleton, and pirate. Animal puppets are recommended to include both wild or predatory or domestic or tame animals (Irwin 1993; Carter & Mason, 1998).

Gil (1994) recommended having duplicates of selected puppets to symbolically represent blurred boundaries, sibling rivalry, or a lack of differentiation among family members. When working with children with abuse or neglect issues, children may need to retreat symbolically when sharing their thoughts or feelings. Additional recommended animal puppets may include a turtle puppet with a shell so that the turtle can retreat and hide. Other recommended hand or finger puppets utilized by the authors include an armadillo, clam, or snail with a shell for hiding or other animal or people puppets that are housed or can hide in a tree, house, shelter, box, or can. Gil (1994) further recommended possible aggressive or neutral puppets such as a tarantula, other spiders, or sharks that may have the ability to intimidate others and can make a quick entrance and exit. Other aggressive puppets used by the chapter authors

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

include puppets with large teeth such as a monster, dinosaur, alligator, crocodile, tiger, lion, wolf, bear, Tasmanian devil, piranha, or barracuda puppet.

Gil (1994) proposed having a caterpillar puppet that can turn into a butterfly to represent a state of metamorphosis, a fairy godmother who can grant wishes, a judge who can make decisions, police puppets who can maintain the law, and reversible puppets who can be turned over to uncover another character. Additional cultural considerations for a puppet selection may include having an indigenous healer, priests, or mariachi puppets. The chapter authors recommend having puppets available to represent family pets such as a cat, dog, bird, fish, rabbit, guinea pig, gerbil, hamster, ferret, hedgehog, small turtle, lizard, and a snake. Additional family puppets to be considered may include having a grandmother, grandfather, or a senior or aged puppet to represent an older family or community member. Many children often come into therapy to deal with grief or loss issues. They may need specific people or animal puppets to represent the family member or pet they have lost. They may further need religious or spiritual puppets such as a priest, minster, or angel to help them deal with their loss.

The authors further suggest having people puppets that represent the children and families we serve with puppet clothing and other items to represent the child's family heritage. It is also recommended by the authors to have animal puppets from the child's geographical background such as a Tasmanian devil or a camel puppet so that the child may experience a closer connection to his or her home environment. The authors also suggest having selected puppets from popular fairytales and storybooks including an elf, gnome, unicorn, genie, troll, jester, magician, dragon, monster, alien, and prehistoric animals such as a sabretooth tiger, mastodon, or wooly mammoth for the purpose of fairytale and folktale enactments. Please see *Appendix A* for a list of puppet artists and retailers listed alphabetically.

Basic Skills of Puppet Use

Carter and Mason (1998) acknowledged that many play therapists may be apprehensive to use puppets due to possibly appearing foolish in front of their clients. Hand puppets are noted to be the most popular type of puppet due to their ease of use and weight. When therapists are using puppets in counseling, there are some points to remember when using hand puppets. A puppet should hold the interest of the audience and should look directly at the audience. Many puppeteers or therapists make the mistake of having the puppet either look up towards the ceiling or down towards the floor. When using puppets, it is recommended to keep the puppet moving; do not keep the puppet still and staring into space. It is also important that the movements of the puppets should mimic human-like movements such as talking and walking. When talking using the puppet, one should manipulate only the lower jaw, not the upper jaw or both. The therapist should keep the upper jaw fixed since all humans and most animals only move the lower jaw. To wrinkle the face of the hand puppet, the therapist can move the thumb to emphasize different emotions. When practicing with puppets, the therapist can practice in the front of a mirror tailing, walking, or singing. The child will be more likely to respond to the puppet if the puppet acts more lifelike and engaging with the child.

Further, if the play therapist can take a puppetry course or workshop and learn more about the manipulation of hand and rod puppets, the therapist will have an additional avenue to emotionally and physically connect with the caregivers and children served. By using rod puppets, the puppets are not only able to establish an emotional connection with the child, therapist, and/or caregivers, but also a physical connection with other people or puppets through the use of hand or foot rods. For families that may have difficulty expressing physical intimacy or appropriate physical boundaries, connection,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

or contact among the family members, the caregivers and children may be able to initiate and receive physical contact in a safe and appropriate manner.

Sandtrays and Miniatures

Sand and some variation of a use of sandtray in therapy is another common approach utilized among various play therapists of diverse theoretical orientations. Sandtray as defined by Homeyer and Sweeney (2017), is "an expressive and projective mode of psychotherapy involving the unfolding and processing of intra and inter-personal issues through the use of specific sandtray materials as a nonverbal medium of communication, led by the client or therapist and facilitated by a trained therapist" (p. 5).

Based on the clinician's theoretical orientation, one may practice from a variety of recommendations including, but not limited to, The World Technique (Lowenfeld, 1939,1950), The World Test (Buhler, 1951); The Picture World Test (Buhler & Manson, 1956); Sandplay Therapy (Bradway, 1979; Kalf 2004), Sandrama (Toscani, 1998); Sandplay-Worldplay (De Demenico, 2000), or Sandtray Therapy (Homeyer & Sweeney, 2017). Sandtray containers may vary by number, size, color, shape, and type of sand based on diverse theoretical orientations. The above play therapists and researchers are merely a partial list of contributors associated with the use of sand and sandtray as an assessment tool or as the primary clinical intervention; however, having an extensive sandtray miniature collection is required to assist the client in exploring one's thoughts, feelings, behaviors, and wishes.

Selection of Sandtray Miniatures

Different types of sandtrays may be used, along with various types of miniatures lending to diverse theoretical interpretations, and distinctive forms of processing the activity (Lowenfeld, 1950; Buhler, 1951; Buhler & Manson, 1956; Bradway, 1979; Allan, 1994; Toscani, 1998; De Demenico, 2000; Kalf, 2004; Sweeney, Baggerly, & Ray, 2014; Homeyer & Sweeney, 2017). According to Lowenfeld (1950), miniatures are viewed as the words, symbols, and metaphors for the client's nonverbal communication. The figures can be used to express thoughts, beliefs, feelings, and desires that may be too overwhelming or challenging for the clients to express in words. It is recommended that therapists have a great number and a wide variety of miniatures with multiples of many objects. The size of the miniatures should vary with some miniatures being smaller than others so that not all of the miniatures are in scale with one another. The composition of miniatures should also vary. The miniatures may be made of wood, plastic, and metal with different shapes, colors, weights, and textures. There should include a wide array of category of miniatures including people, animals, buildings, vegetation, boundary structures, natural items, fantasy, spiritual/mystical, landscaping, household items, vehicles, and additional miscellaneous items.

Lowenfeld (1939; 1950), a British pediatrician who was first documented using sandplay as a counseling technique, recommended clinicians possess people miniatures including: 1) Ordinary: farmers, workers, policeman, country/city (sitting and standing); 2) Military: soldiers, guns, tanks, some from county not known to children (some lying down); and 3) Special: circus, witches, gnomes, and other cultures. The miniature collection should also include *houses* (both large and small, shops, stations, churches, schools). Tree sizes should vary with large and small variations, as well as bushes, hedges, and jungle trees. A large quantity of fences should be included in the miniature selection with gates and different types of bridges. The *animal selection* should include wild animals (both timid and fierce

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

animals with wild birds), and tame animals such as farm animals and birds, horses, and other domestic animals. The age (both young and old) and the sex of the animals should differ.

Transport miniatures may include: 1) Road (most usual on child's country's roads), 2) Rail (open and closed rail cars and coal cars), and 3) River and Sea (ordinary and military). Street signs should include gas pumps and telephone boxes. Lastly, a *miscellaneous category* should include garden equipment, flowers, domestic equipment such as vacuums, school desks, lavatories (interior thought), planks, blocks, broken parts of objects and people, sticks, and stones (Lowenfeld, 1950).

Homeyer and Sweeney (2017) offered suggestions for intentionally selecting sandtray miniatures and not just collecting miniatures. Many sandtray miniatures are made from plastic; they are both durable and inexpensive. Plastic miniatures are easier to select; however, the miniatures should be diverse in size, type and composition. Sandtray miniatures should be small so that they can fit in the sandtray; however, the miniatures do not have to be to scale as found in railroad miniatures. It is also important to have some miniatures such as predatory animals or creatures (e.g. rats, spiders, snakes) to represent a power differential between the client and a possible perpetrator. The miniature people figures should be representative of the client's world with varying ethnicities and occupations. The vegetation should vary with different trees, bushes, and grass. Diverse living accommodations such as single-family housing, multi-family housing, and apartment buildings should be included. The buildings and structures should reflect regional and geographical differences. The miniatures should also vary based on a variety of materials such as natural materials (e.g. wood, minerals, rock, sea shells) either shaped or in the original or carved form. It is also important to have heavy and light items that may be textured.

Homeyer and Sweeney (2017) published a suggested list of 300 required miniature toys in 11 categories. These categories are listed below: 1. *People* (diverse families, babies with different poses if possible); bride and groom; occupational figures (police, firemen, construction workers, etc.); 16 or more army solders; and astronauts or knights; 2. *Animals* (four different dinosaurs, and zoo animals (lions, giraffes, zebra, and elephants), domestic animals such as cows, horses, sheep, insects, spiders, snakes, and sea animals; 3. *Vegetation* (trees, plants, and flowers); 4. *Buildings* (houses, school, lighthouse, castle fort, teepee, or jail); 5. *Vehicles* (cars, trucks, airplane, boat, helicopter, police car, ambulance, and other rescue vehicles; 6. *Fences and Signs* (fences, traffic signs, and barricades); 7. *Natural Items* (sea shells, vegetation, twigs, rocks that are plain and polished, Fools gold, and crystal; 8. *Fantasy* (wizard, fairy godmother, dragons, monsters, cartoon figures, and space aliens); 9. *Spiritual Mystical* (angels, cross Buddha, Madonna, Star of David, and menorah) and small mirrors; 10. *Landscaping and Other Accessories (*wishing well, bridges, treasure chest, treasure, gold coins, cannon, and various flags); and 11. *Household Items* (furniture, tools, garbage can, mailbox; windmill, and food).

Psychotherapeutic Games

There are many therapeutic games that may be useful in therapy, both currently and no longer manufactured or published. Dr. Richard Gardner's first developed therapeutic game, *The Talking, Feeling, and Doing Game* (Creative Therapeutics, Cresskill, NJ) was first developed in 1968 and later published and made available to mental health professionals in 1973. Since then, there have been approximately 100 additional therapeutic games published. Shapiro (1993) published *The Book of Psychotherapeutic Games: A Review of the Most Popular Games Used in Psychotherapy* to describe 70 psychotherapeutic games. He describes each game according to five primary categories with additional subcategories. The categories are as follows: 1) age considerations of the players; 2) numbers of recommended players;

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

3) types of games; 4) who the game is designed for such as mental health professionals, mental health professionals with at least a master's degree, parents, teachers, or a general audience; and 5) the major theme of the game or the recommended theoretical orientation. For the major themes or theories, classifications were determined by the editors and not by the original authors.

Each game may address a specific skill such as communication, cooperative, diagnostic/therapeutic, skill-oriented, theory-oriented, and theme oriented. Communication games are designed primarily to teach and/or stimulate communication skills. Cooperative games demonstrate the benefits of cooperation among the players with no winners or losers. Everyone wins the game together. Diagnostic/ therapeutic games a have a broader purpose of diagnosing and treating the problem. Skill-oriented games teach specific psychological and/or social skills. Theory-oriented games indicate a specific theory of psychology or counseling. Theme oriented games are designed to address a specific psychoeducational problems or concerns (Shapiro, 1993).

LIMITATIONS

When conducting the literature review for this chapter, the chapter authors either found limited information on certain topics or a vast amount of information on other topics that were well researched and published. Therefore, the authors chose to provide limited, more general, or detailed information based on the available research gathered. The authors also reflected upon over 25 years each of clinical practice in multiple settings and over 15 years each of teaching experiences at multiple universities and other professional settings teaching diverse art and play therapy, community mental health and substance abuse counseling, marriage and family therapy, and human services and social work coursework. Many recommendations were based on professional practice, teaching, and supervisory experiences. The authors attempted to review multiple considerations to explore when setting up university-based and community-based play therapy clinics offering clinical services to the community, as well as many considerations when establishing a university-based play therapy training site providing mock play services to play therapy trainees. Acknowledging the current fluid nature of global immigration, the authors were unable to locate recent professional peer-reviewed data reflecting children and adolescent refugees seeking play therapy services.

Recommendations

Due to the limitations of this chapter, the chapter authors have made several recommendations related to considerations when designing a play therapy space or clinic. There is still more room for further research on the multicultural refugee needs and settings. In the community-based agencies, the authors recommend play therapists to consider the multicultural groups they serve by providing a milieu consistent with their demographic groups' cultural norms and values when setting up their play therapy clinics.

It is further recommended that university and community-based settings provide opportunities for direct clinical experiences to work with children, adolescents, and families under the direct supervision of a licensed professional who is a qualified Registered Play Therapist-Supervisor (RPT-S). If an RPT-S is not available at community-based sites, it is recommended to have an RPT-S from the university-based training site provide on-site supervision and trainings for the agencies or sites.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Mock play therapy experiences are helpful at university-based sites; however, play therapy trainees need as many opportunities as possible to work with diverse clinical populations. Further, it is necessary to create play laboratories in the classroom setting when providing graduate play therapy instruction for play therapy trainees, as well as ensure the university-based play therapy training sites are well equipped with play therapy toys and materials to correspond to the primary fourteen play therapy theoretical orientations or approaches discussed in the chapter. It is also recommended that all play therapy clinics have the basic play therapy toys and supplies to include: art media and other materials; books for use in bibliotherapy; puppets and puppet theaters; sandtrays and miniatures; and psychotherapeutic games.

It is also suggested that when APT updates the Association for Play Therapy publication, *The Play Therapy Best Practices*, in 2019, these areas reviewed in this chapter are included: a) recommendations for toys and materials based on diverse theoretical orientations, cultural sensitivity, and specific considerations for popular materials; b) play therapy space and technology; c) considerations for specific settings and multicultural practice, d) the need for consistent play therapy supervision by a RPT-S for all students completing a practicum or internship placement either at a university setting or off-site community-based setting; and e) the need and possible benefits for a consistent playroom laboratory in all graduate classroom settings. By developing and sustaining quality play therapy clinics and training sites, as well as conducting research in our field to guide our clinical practice, this will promote the field of play therapy and ensure we are providing the most efficacious treatments according to *The Play Therapy Best Practices.* In light of the ever-evolving nature of global immigration, studies are needed to reflect emerging needs, interventions, and trends of children and teens who are refugees seeking play therapy services.

CONCLUSION

This chapter presented the required toys based on one's theoretical orientation, and the therapeutic space necessary to provide quality play therapy services based on the available research and the authors' professional experiences within the field of play therapy. A detailed discussion about toy selection specific to the wide-variety of theoretical orientations provided information necessary for both trainees and supervisors designing and practicing in university and community-based play therapy clinics. The authors presented considerations for most-represented multicultural groups including play space, toys, and values to be acknowledged when working with children, adolescents and their families. Trainees and play therapy supervisors face a myriad of issues in today's play practices. Having current information is more than helpful. It is critical to providing best practice to our children, adolescents, families and groups.

Presently, there is limited research and/or practical application literature available regarding prudent and effective preparation and set-up of a play therapy training clinic. Many perspectives and considerations went into the development of this chapter, as well as review of the existing research and literature. In addition, using a filter of having over 25 years of teaching and therapeutic application in a variety of settings, the authors reflected upon their personal experiences and offered a pragmatic direction that may be followed by those who wish to establish their own play therapy training clinic using this as a guide.

The chapter offers guidance to creating an appropriate therapeutic space for providing play therapy services. Emphasis is placed on the importance of cultural sensitivity and accommodating for the various client cultural therapeutic needs, setting up for clinical theoretical orientations that are appropriate and match the specific client populations, being mindful of safety concerns, and discussing technological

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and/or mechanical enhancements that better serve the clients' needs. Given this, clinicians are guided to be mindful and intentional when they select, acquire, and organize toys and materials in the play therapy room based on evidence-based practices, including the use of art media and other materials, books and bibliotherapy, puppets and puppet theaters, sandtrays and miniatures, and psychotherapeutic games.

A discussion was provided on the required toys based on theoretical orientation, the therapeutic space necessary to provide quality play therapy services from the available research, and the authors' professional experiences within the field of play therapy. A detailed discussion about toy selection specific to the wide-variety of theoretical orientations provided information necessary for both trainees and supervisors designing and practicing in university and community-based play therapy clinics. The authors presented considerations for most-represented multicultural groups including play space, toys, and values to be acknowledged when working with children, adolescents and their families.

Trainees and play therapy supervisors face a myriad of issues in today's play practices. Having current information is more than helpful and critical to providing best practice to our children, adolescents, families and groups. The authors make suggestions and recommendations that illuminate and pave the way for needed research in the future and open discourse between clinicians and researchers that may positively heighten the play therapy experience and provide more efficacious treatment outcomes.

Chapter 18
Attention Perception and Social Cognition:
Bridging the Gap Between the Physical and Perceived

Bobby Nisha
University of Sheffield, UK

ABSTRACT

Perception is the basis of being human. It warrants everything we know and everything there is to be known. This chapter explores the perceptual system that leads to the exploration and interpretation of qualities of urban space. The chapter challenges the disciplinary tradition of regarding perception and cognition as being one and establishes that systems of perception and cognition play an equally important role to enable this construct of 'place'. By means of an inter-disciplinary review and knowledge transfer, the chapter reimagines the dimension of perceptual simulation in urban design by constructing a process map to understand the complexity of the workflow from subjective perception to social cognition. The chapter further advocates the need for design to incorporate cognitive affordances to better shape physical reality. The process map and framework is intended as a reference for understanding sensory stimuli in urban design practice to aid efficacy and to reinstate the importance in recreating and bridging the physical and perceived realities.

INTRODUCTION

Urban Design has long been concerned with the psychological construct and perception of space. While perception deals with the multiple means by which people sense information from their surrounding environment; cognition, the psychological construct of that information deals with how the information is identified, organised and interpreted. Psychology transacts these two concepts as independent faculties that exert influence on one another. The tradition of Design as a discipline to understand people's perception with regards to their environmental experience has not acknowledged the nature of these individual

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

systems and explicitly interrogated how perceptual representations and cognitive representations interact; and have been more inclined to argue against the existence of this bifurcation (Gieseking et al, 2014). Understanding the analogies between sensory perception and cognition from the spatial dynamics point of view is hence under explored. The systems of perception and cognition play an equally important role to enable a construct of 'place'. While the importance and the need for design to incorporate perceptual simulation to better shape physical reality is established with interdisciplinary work in ecological psychology and environmental psychology. It is paramount that some basic assumptions and disciplinary divides that currently exist are inquired systematically and bridged to enable a more holistic approach to the creation of desirable urban futures.

The concept of affordance as explained by Neisser (1994) distinguishes three modes of perception: Direct perception/action, that enables perception and action effectively on the environment; Interpersonal perception/reactivity, that which triggers social interactions with other users, and Representation/recognition, by which we identify and respond appropriately to familiar objects and situations. Spatial perception theories have not engaged with the modes of perception and concept of affordances in design stimuli. Thus a holistic approach to urban design is needed to positively reinforce the potentials of urban perceptual simulation. This requires an understanding of the relationship between people and place from both the modes of perception and cognition. Methodological investigation of the perceptual and cognitive process is needed to establish an informed approach to simulation of places through design. This chapter responds to this identified theoretical gap and aims to bring together the different disciplinary understandings on perception and cognition, its relationship, and map the dynamics of interaction between the two to further stretch its understanding to inform the relationship dynamics between people and place.

The chapter provides an interdisciplinary inquiry into theories of perception and cognition in disciplines of psychology, philosophy, Neuroscience, and, looks into concepts of affordance, perceptible, percept and socio-cultural schemas that form the building blocks of the interaction between the physical and perceived world. The chapter further illustrates the relationship between urban structural components and perception that lead to cognitive comprehension. The understandings that emerge from the review are presented as a process framework that embeds the spatial determinants of perception. The proposed framework reimagines the dimension of perceptual simulation in urban design by providing a conceptual and operational mapping of perception as a process. The proposed framework is intended as a reference for understanding sensory stimuli in urban design practice to aid efficacy and to reinstate the importance in recreating and bridging the people/place relationship. In place making, promoting people/place relationship can contribute to increased sense of belonging, social integration, cohesion, and inclusion.

Perception: Constructing the Urban Narrative

The mutual relationship between the psycho-spatial aspects of our environment has intrigued philosophers, psychologists, geographers, architects, and neuroscientists. The process of which includes sensing information from /about the environment, the perceptual and cognitive representation of the information as enabled by the information, and arriving at certain choices and judgments (Garling and Golledge, 1989). For a unified disciplinary overview, Moudon (1992) offers a useful framework to categorize research areas in urban design namely as image studies, environmental-behaviour study and studies that focus on place creation. Sitte's (1889) work was influential in elucidating experiential issues in the built environment. Research on cognition and ecological perception (Gibson, 2014) further opened up understandings of the subjective experience of the city. Seminal work of Lynch (1960) and Appleyard (1979) uncovered and

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

advocated visual legibility of spatial components that make up a city. Hall (1966) introduced the concept of social distances that opened up exploratory avenues in design literature than sought to enhance social integration and inclusion. Much of the work in environmental psychology observed people's response to their subjective perception of the environment and its consequence, construction of a subjective judgment of the environment (Bosselmann, 1998, 2012; Arnheim, 1977; Altman et al, 2012; Thiel, 1997; Whyte, 1980, Gehl 2011). This tradition of research has argued that appearance of the physical environment is made of less aesthetic singularity, but of the perceived quality as evaluated by people who experience it (Sanoff 1991, Nasar 1998). Identifying and understanding the environment is considered a primal ability (Lynch, 1960) with sensations such as shape, colour, motion, light, smell, sound, and touch. The dominating literature has paid more attention to vision as the dominating sense, but there has been a recent shift in the rhetoric that stress environment is not just perceived visually (Carmona, 2010). Thus studies have emerged to understand the perceptual systems that interpret qualities of urban space which includes visual, Auditory, olfactory, gustatory and tactile features.

In summary:

- **Visual:** The visual sensory apparatus is considered key to how space is experienced; however at city scale, the sensory perception is more on a horizontal plane at pedestrian eye level (Gehl, 2013). Architectural expression is a strong and vital visual cue in identifying the functional aspect of the urban environment as they can capture the attention of the observers given their sturdy presence. Critics have been tough on this approach as the aesthetics driven architectural symbols to contribute to 'homologation of places (Sepe, 2013). Landry (2006) regards 'grey' as a canvas on top of which the city presents itself, where vistas are characterised by the sheer volume of traffic and signage.
- **Auditory:** Each city is characterised by a sound of its own and is often not designed in. Studies have established that the 'all surrounding' acoustic space has higher perceptive factor than visual perception that is more 'sectoral' in nature (Porteous, 2015). The acoustic character has the ability to accentuate space than the objects that make up space. With its transitory, fluid nature and the imperative nature of its presence, as unlike visual the ear lids don't shut on instinct, it has a strong social presence. The homogenization of visual component is criticised to affect the urban soundscape where the specific sound quality is replaced with noise pollution from 'petrochemical roar' of the car (Landry, 2006). Given the profound impact, auditory perception can exert, it makes a compelling case for sound design to be engineered into the urban environment than regarding it a residue effect.
- **Olfactory:** Neuroscience has established that smell is directly involved in thought and cognition, as it possesses a sub conscious association with emotion, thus has the ability to evoke a reaction. Research has established that emotions such as happiness, surprise, anger, anxiety, sadness, and disgust are triggered by stimulants such as breeze, coffee, disinfectant, burnt smell, musty odour an vomit respectively (Heuberger et al, 2001). Literary authors often employ smell as an identifiable characteristic attribute of a place and use it as a means to describe the place, like "with a mixture of brine and rust, cities with a stale, mouldy smell" (Barbara and perliss, 2006). The increasing atmospheric pollution with garbage, landfills, and where air pollution has reached hazardous levels in cities like Shanghai, Mumbai and Delhi the smellscape design is of paramount importance. The lack of strong official policy concerning smellscape is a serious threat to the environment (Sepe, 2013) and lead to hazardous environmental conditions that threaten human livelihood.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Gustatory:** This is concerned with the sense of taste and linked to the survival instincts of human primacy. The perspective aspects have strong links to cultural habits and behaviours of the city's inhabitants as Individuals use elements of an environment to construct their own individual identity (Diaconu et al, 2001). The nutritional, sensory and health fostering aspects of food and taste are regarded as a means of socio-cultural communication (Durrschmid, 2015). The globalised supermarkets and hypermarkets have modularised this experience thus homogenising the cityscape experience.
- **Tactile:** The relationship of tacile preceptors is intimate compared to other sensory perceptions as it has much to do with the human interaction with the texture and materiality of the environment. This has the capacity to alter and impact the overall perception of an environment. As they deal up- close with elements like road texture, handrail, pavement, seating, building facade reflections on steel, glass etc. These confer unique identity and vitality to the environment and have the potential to initiate social interactions. Porteous (2013) argues that the sensuous experience of city walking is comprised by standardised approach to design.

The human impulse to interpret and compose their own urban narrative is thus enabled by the sensory stimuli. The sensory stimuli with five senses as discussed above are not the only means with which the world is perceived. Recent research explorations have identified up to 33 sensory systems ranging from vision, smell, sound, taste, touch, trigeminal perception, somatic pain, balance, cutaneous pain, heat, cold, muscle behaviour, blood temperature, blood pressure and kinaesthetics (Durie, 2005). The sensory systems can lead to conscious perceptions as well as unconscious perceptions and neuroscience has vested interest in stretching this understanding further. Though people have their own dominant mode of perception, the identity and experience of an environment is multisensory and it is very important for the design process and policy narratives to pay ample attention to the sensory quality of cityscapes.

Having established the importance of sensory stimuli, the overview of rhetoric that further demonstrates the importance of sense-scape design has been dominated by studies that exert a lot of importance on aspects of perception and engaging less with how the sensory information that is perceived is processed to produce a narrative. The next part of the chapter examines the concepts of perception and cognition in urban design, and attempts to map the dynamics of interaction between the two to further stretch its understanding to inform the relationship dynamics between people and place.

Perception vs. Cognition

To reiterate, perception and cognition are referred to as the "the internal mental processes by which individuals sense, perceive, interpret and make a decision about their environment" (Gold, 1980). The discipline of environmental psychology has been inclined to operate on the paradigm that considers the concepts of perception and cognition as one. Proshanky (1976) detected that the terms were employed interchangeably; a historic overview of the literature does suggest that the tradition has continued, (Gieseking et al, 2014) and the distinctiveness of these concepts has arguably been taken for granted. Though this can be seen as a reductionist approach, the argument given is that the distinction between the two terms is more of a 'heuristic device' than a fundamental dichotomy in the sense-making process and that by means of its function; perception in itself is a cognitive process. (Gold, 1980; Yadav, 1987). This chapter attempts to challenge this paradigm/ assumption with which environmental psychology as a discipline operates and explores to understand the analogies between sensory perception and cognition

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

from the spatial dynamics point of view. The spatial reasoning for the self is how an individual acquires, codes, stores, recalls and decodes spatial information (Stea and Downs, 1970) about the relative location and characteristic attributes of the everyday spatial environment. The knowledge gained on perceptual-cognitive processes can enable the creation of responsive environments through policy, planning, and design (Garling and Golledge, 1989). The relationship between self/space is hence of paramount significance, and there is a need to ensure that we operate with un-edited understanding when it comes to designing the socio-spatial systems for the individual cognitive system. As Wachowicz et al (2003) argue, people have their own accumulated definition of reality based on relevance and perceptions of social, cultural, economic and political factors, and there is a need to further inquire the relationship between the social-spatial system and the individual cognitive system. A socio-spatial system encompasses elements that make a society comprising of cultural, economic, social and political systems, whereas, the individual cognitive system is made up of values, desires, and ideas of individuals.

The next part of the chapter provides an interdisciplinary overview that examines the concepts of perception and cognition to establish the distinctiveness of these concepts and further maps the dynamics of interaction between the concepts to steer the shift in how these concepts must be understood and interpreted in urban design.

INTERDISCIPLINARY OVERVIEW

Key Understandings From Psychology, Philosophy, Cognitive Psychology and Neuroscience

Psychology understands perception as the consciousness of particular material things present to sense (Angell, 1906). This is enabled by stimulus from the environment that present as neural signals and referred as sensation. The discipline of psychophysics deals with the study of the relationship between physical stimuli and its experience; and regards these concepts as distinct processes with which people/place interaction takes place where sensation leads to perception. Kant (1998), in philosophical lens, interprets perception as a process that exhibits the reality in space and in the absence of which no power of imagination can invent and produce that experience (Guyer and Wood, 1998). This demonstrates that perception is an exploratory and active process; and, that which is perceived, is not a sequence of static images but flowing scenes of the environment. Studies in psychology have further reinforced that in perception 'the whole is more than the sum of its parts' (Kubovy and Van den berg, 2008), this shows that the understanding of sensory information through perception is a follow through process. Neisser (1976) defined this concept of cognition as the act of knowing, acquisition, organisation and use of knowledge and the process where by the input of information is transformed, reduced, elaborated, stored, recovered, and used. In line with the understandings from Psychology and Philosophy Neuroscience provides evidence that perception and cognition as functions, are carried out in/by different areas, within the physical architecture of the brain, Tacca (2011, 358) argues that "To claim that perception and cognition are tightly related makes sense only if one can explain how those systems, which are individuated in different brain areas and process different types of information, communicate".

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Theories of Perception and Cognition

Neisser (1976) model of perception is the interplay of schemata, environmental information, and perceptual exploration. Schemata refer to past experiences and expectations, if the environmental data that exists does not connect or pair with the schemata then perception does not occur, and in instances, schemata could respond and be modified in the interactions systems between the physical and perceived environments. The top-down and bottom-up theories of perception play a vital role in guiding how information is sensed and processed. The top-down is a data-driven approach where sensation leads to perception, and through to cognition and behaviour. The top-down approach is when conceptual data from previous experience leads to perception through to cognition and behaviour.

In philosophy, the theories of perception are presented as direct realist, the representative theory of perception, and idealism. Direct realism is built on the ideology of the existence of an objective world independent of perceptions. The representative theory presents a thesis that the sense data in our minds is representative of the environment. The idealistic theory advocates that all experiences are mental representations and that there is no objective environment that exists beyond perception and that the essence of existence is perception. The various theories presented in psychology and philosophy open doors to understanding the perception as a process and product. It is important for the designer to understand the underlying exponential possibilities when perception as a process is designed into the environment with sensory data.

Cognition as a concept, is much more complex and has perplexed numerous disciplines and hence has a multitude of literature and this process of cognition is key to a human understand the self and space around them. Quine (2013) defined the qualitative content of experience as qualia. Various traditions from Aristotle (350 BC) have proposed various process and means by which the mental process of cognition manifests. Locke (1689, 1975) proposed a theory of 'how we come by any knowledge' stressed on the role of perception and sensation. In the era of artificial intelligence, cognition has gained a lot of research attention in an aim to recreate the human cognition. The human intellect stores memory information for places, objects, and events in complex ways. Piaget (1936) in his cognitive theory argues that schemas are the building blocks of knowledge, and defined schema as 'a cohesive, repeatable action sequence possessing component actions that are tightly interconnected and governed by a core meaning' (Piaget and cook, 1952)

The role of visual-spatial manifestations has been acknowledged since the Greek civilization (Yates, 1966). Cognitive research (Cooper and Lang, 1996) has progressed to decode the properties of visual spatial representations and their relationship dynamics between human behaviour and space. The representation of thus formed knowledge in the process of cognition are too complex and rich to be contained in a single form of representation (Kosslyn, 1980, 1994) such as only verbal, visual or auditory cues. Bringing in this understanding to environmental psychology, means that when spaces are designed with the sensitivity to the kind of human cognition they may contribute to, it is important to acknowledge its complexity. It is also clear that implying only one sensory mode such as visual or auditory may simplify the design, which can lead to a compromise in the environmental experience.

The concept of distributed cognition, Hutchins, (1991) argues is not only an internal mental process and knowledge, and that cognition is distributed across objects, individuals, and tools in the environment. This is very relevant to environmental psychology as it pivots on information processing, concept of space and extends boundaries of the space to incorporate knowledge in the mind of the users. It proposes that human thinking is enabled by the coordinated use of knowledge structures in the mind of the individual,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

in the environment and other individuals. Given the inter-relationship, the concept of affordance is the instrument that initiates interaction. Gibson (2014) defined it as what environment offers humans; they offer cues to the operation of things and arise from direct perception. These perceived affordances could be physical, logical, and cultural (Norman, 1988) and have been widely applied in design especially in interior design, graphics design, the design of interfaces. This concept of affordance embodies interaction between user and environment based on how the user will perceive the environment. Norman (1986) categorised affordance as being cognitive, physical, perceptual and functional and how design can enable interaction between user and environment with these affordances. Distributed cognition is hence achieved based on combining affordances that are physical, perceptual, cognitive and social for multiple users. To enable perception and cognition, taking into account the theories of top-down and Bottom-up processes, as perception is the first step to cognition, and attention is the first step to perception (Derrberry and Tucker, 1994). The spotlight of attention focuses on the amount of sensory information at any given dimension of space and time.

It is important to identify and understand general patterns of perception and cognition common to people or particular social groups. The overview of inter-disciplinary understandings from the range of disciplines, present cognition as a very complex process, neuroscience presents explicit arguments that differentiate perception and cognition as two different processes. Thus understanding people/place relationship to further nurture it can be holistic only when environmental psychology factors in the cognitive process and not stifle the knowledge by only studying perception. The next part of the chapter reimagines the people/place relationship by taking into account the learning that comes from this inter-disciplinary overview.

Place and Perception: Subjective Perception to Social Cognition

The inter-disciplinary understanding of perception as a concept reveals that the act of perception is, in essence, the interface between the physical and physiological world. Though there are multiple sensory stimuli that lead to cognition, the existing studies on urban space include visual, Auditory, olfactory, gustatory and tactile sensorial stimulations. Neuroscience and Cognitive psychology establish that contextual stimuli create sensorial signals, which the perceiver receives, and through the process of cognition, they are interpreted as meaningful representations; and these collectively become the experiential interpretation of the external reality. The theories of perception in psychology suggests that the process of perception can be bottom-up or top-down; the former is the format where sensory input leads to way to cognition to influence social behaviour and the latter is where meaning is imposed based on pattern recognition or template matching (Marr, 1982; Triesman & Gelade, 1980). In both processes of perception, higher order cognition is involved in informing the intentions and further actions of the perceiver.

The studies in environmental psychology, particularly in urban design has been inclined to simplify this complex process and represents this complex psychological process as a linear flow diagram, (see Piga and Morello, 2015; Jalali and `Massoud, 2015). The process mapping does not capture the complex, multiple modes, means and mechanism of perception as a process. The understandings also do not engage with how subjective perception relates to the concept of social cognition. The interdisciplinary review established that distributed cognition (Hutchins, 1991) is the act of knowledge and cognition is distributed across objects, individuals, and tools in the environment and that this is key to enable social cognition. Social cognition as a function and reflection of the collective understanding that a society exhibits with its socio-cultural schemas is vital for social belonging. If social cognition is designed in to

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the urban fabric, an enhanced people/place relationship can contribute to increased sense of belonging, social integration, cohesion, and inclusion.

The theoretical understandings from inter-disciplinary review have paved way to reimagine the understanding of this relationship between people and place/ perceived reality and physical reality. This is done at two levels; the first is a process map that brings together the concept of distributed cognition in mapping the process of subjective perception to social cognition without compromising its complexities in line with the psychological theories of top-down and bottom-up modes of perception. The second layer of simulation takes a closer look at the apparatus and interface that enables the process of perception and takes into account the contextual force fields that add symbolic meaning to the sensory information that is received from the environment.

Figure 1. Process map: subjective perception to social cognition

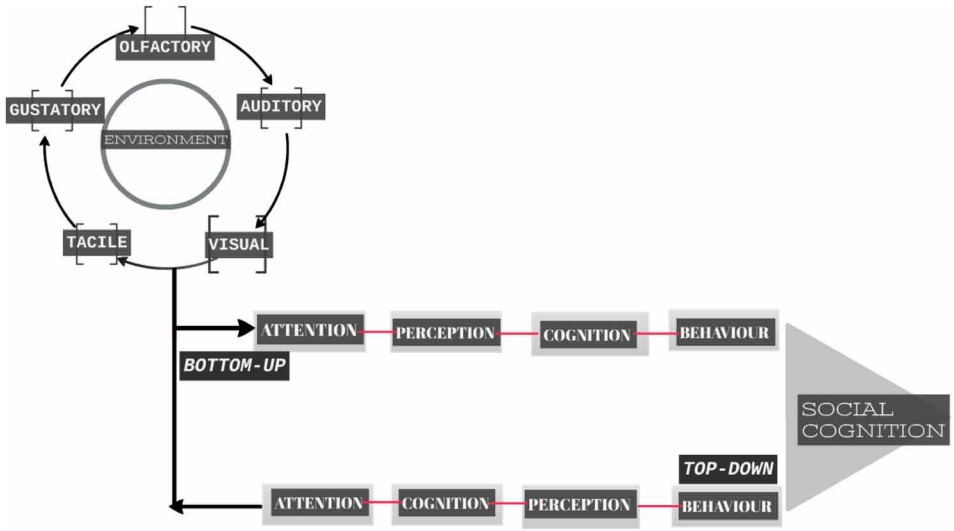

Figure 1 is a visual representation of the people/place relationship that is broken down into its components. The Environment denotes the urban space that interacts with human senses through the visual, auditory, olfactory, and gustatory and tacile senses. The Bottom-up mode of perception is initiated by attention to the sensory information from the environment; the sensory stimulus leads to perception or processing of the sensory information. Cognition contextualizes, understands and interprets the information as responses or actions that guide human behaviour. The top-down processing as governed by the inherent cognitive system has a particular understanding of the urban environment guides perception and leads to instinctive cognitive actions that can be unconscious in nature. This has the capacity to focus or attend to a particular or preferred type of sensory stimuli. The top-down processing mode scrutinises the sensory information to respond to certain awareness threshold (Posner, 1994). The phenomena of distributed cognition initiated by the various sensory perceptions in both the modes of perception lead to social cognition. This process map encapsulates the people/place relationship by highlighting the various layers and conceptual work flow of psychological activities involved in the process of perception.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

While the conceptual workflow represented by Figure 1 can be useful to understand the overview of activities that are involved in establishing the people/place relationship, a holistic understanding must also include the operational workflow of these activities. The disciplines of Neuroscience, philosophy and cognitive psychology have looked at the nature of the brain and how it comprehends its external realities. It is important for environmental psychology and urban design to understand such operational dynamics that ties the perceived and physical world. The operational layer of understanding investigates the apparatus and interface to outline the line of interaction between the physical and perceived realities. The line of interaction takes into account the differentiation between the physical and perceived environment and accommodates the contextual force fields of socio-cultural norms /meanings/values systems that add symbolic meaning to the sensory information received from the environment.

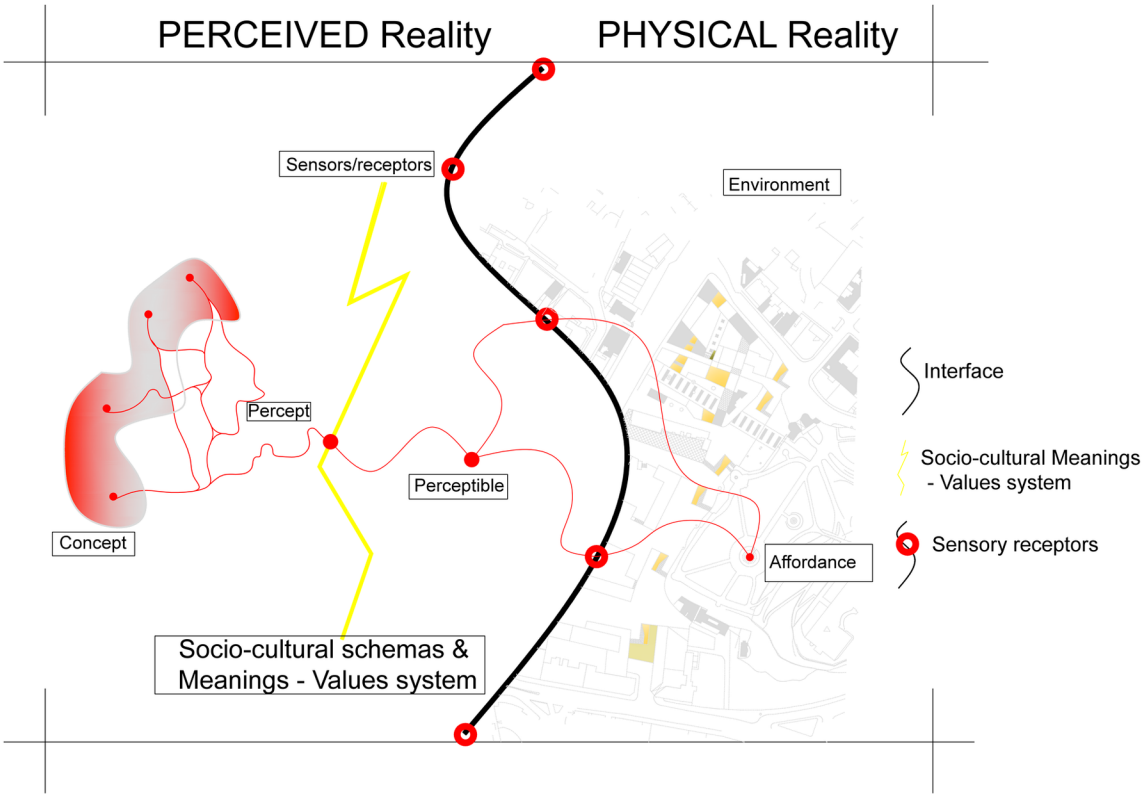
As noted earlier, internal structures and schemas of long-term memory govern cognitive operations and the schemas are activated when new sensory information is received from the environment. The conceptual understandings initiated by the schemas are hence fluid in nature and constantly evolve as the perceiver is exposed to various environmental experiences. The working memory of the brain to process is limited and hence the cognitive system relies on perceptual and interaction patterns that are part of long-term memory and schemas to provide expectations and arrive at generic understandings about a situation and environmental condition (Still and Dark, 2013). This implies that when the cognitive system is in action, the sensory information processing represented by schemas enable a user's perception of an interface: a reflection of a representation as it arises out of contributions from both environmental and cognitive domains. This interaction between environmental and cognitive domains that is the physical and perceived world, as the cognitive theory explains is initiated by Affordance. The presence of affordance in an environment can be cognitive, physical, perceptual and functional (Norman, 1986) and offers cues to the operation of objects present in the environment (Gibson, 2014). This can be conceived as a first step that initiates perception. Affordance and the concept of Attention hence have a cause-effect relationship, where affordance is the caused by the environment that leads to user's attention.

This concept of affordance embodies interaction between user and environment and affords to manifest as stimuli that strike perceiver's sensory receptors. These sensory receptors as noted earlier can be visual, auditory, that is can manifest as an ophthalmic object or sound wave from the environment. The stimulus and carrier for the stimulus enable sensation to take place. Understanding the nature and occurrence of visual, auditory, olfactory, gustatory and tacile stimulus, stimuli and carrier may be switched. The affordances can either be the stimuli or/and carrier, (visual object/sound wave). When the stimulus carried from affordance reaches the sensory receptors, the neurological system interprets the stimuli and the complex neural paths transmit the sensory information to the brain.

The sensory information that reaches the brain is perceptible. The perceptible go through the rigour of cognition where the sensory information is interpreted in the context. The Schema referred as the long-term memory is made up of socio-cultural meanings and values make the perceptible intelligible. Figure 2 is a visual simulation of this process that traces the line of interaction from affordance to conceptual understanding of the context. The figure represents a conceptual line of interaction on a canvas that depicts and distinguishes physical and perceived reality as parallel realities divided by a surface (depicted as fluid the black line). The surface has sensory receptors that receive information from affordances present in the physical environment. The perceptible that reaches the brain is a yet to be processed sensory information. The socio-cultural schemas (represented as the yellow line in Figure 2) orient and interpret the perceptible as percepts. The socio-cultural schemas can be made of diverse layers

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Visual simulation of the line of interaction: perceived reality and physical reality



of concepts and depths. The dimensions of time, space, and geographic orientation provide meaning to how the perceptible are given significance.

The coveted Neuroscientist Vilayanur Ramachandran (much known for his work in behavioural neurology interprets this process as, when sensory information reaches sensory receptor, like the eye ball, the information is transferred to the visual area of the brain and message is transferred to temporal lobe where the object is identified and analyzed. A part of the brain, named 'amygdala' gauges the significance of the object being looked at, a signal is then sent via spinal cord to prepare the body to take action. Amygdala gauges the value, meaning and emotional significance of the objects in the external world. The process is similar with other sensory perceptions like sound and smell.

This understanding from Neuroscience establishes that the socio-cultural system of meanings and values provides perceptible their significance by assigning purpose and value. The practical action that follows in human behaviour is thus in the interpretative importance provided by the socio-cultural lens (governed by amygdala). Figure 2 represents a perceptible passing through this matrix of a social-cultural lens to become a percept. The processed information that is percept is what the user apprehends and is aware of. For example, the presence of a sound wave of chiming bells can imply the presence of a religious institution in proximity such as the church or temple and it is important to note that the socio-cultural conditioning has caused the association of chiming bells with a church and not a corporate business park. The perceptible as a particular form of colour, sound, motion, and object has no identity and significance, the socio-cultural matrix makes the perceptible of colour, sound, motion into vibrant,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

dynamic, and lively environments. As Figure 2 represents repeated reinforcement of a relationship between perceptible and percept leads to conceptual understandings to take shape, the concept of where the perceived blue object above becomes the sky. The intuitive awareness offered by the socio-cultural schema and the system of embedded meaning and values is key to for any environmental affordance to be made sense by the user of the environment. The sculpted body a of socio-cultural schema is hence instrumental for this process of perception to produce an urban experiential narrative, as the operational dynamics represented in Figure 2 informs that the socio-cultural matrix turns percept into concepts. Urban design hence has the necessity to understand and deal with the relationship between perceptible and percept to enable interaction between user and environment with these affordances.

BRIDGING THE PHYSICAL AND PERCEIVED: SPATIAL-SCHEMA

The inter-disciplinary understandings of the concept of perception and cognition have led to a knowledge-transfer of conceptual and operational dynamics of workflow between the people/place relationship, that is the perceived and physical world relationship. Given the understanding, the concepts of affordance, perceptible, percept and socio-cultural schemas form the building blocks of the interaction between the physical and perceived world, the socio-cultural lens allows for the crucial interpretation to take place between physical and perceived objects, where by meanings become the socio-cultural interpretation of perceived objects or perceptible. The social reality of human interactions with the physical world is there by made of such meaning and values. This signifies that urban design, as a task must design 'affordances' in the environment that carry meanings and values and not just spend its effort in initiating perception as a process with empty affordance that don't translate into socio-cultural meanings and values.

An affordance with content and value can establish connections with the socio-cultural space in the perceiver's mind, where meanings are nothing but a socio-cultural expression that reflects fundamental beliefs, properties, conditions of the complex interactional dynamics between the physical and perceived reality. And simplifying the urban systems with affordance cues that are stimulating with no inherent value and meaning can create a compromised experience of the physical environment in the perceivers mind.

Conceptualizing Enriched Urban Design Affordances

The concept of design affordance is not new to design literature, however it is sparingly discussed and employed in the discipline of urban design. Clarke and Uzzel (2002) explored the concept of affordance for adolescent needs of social interaction in the physical environment. Given the understandings from the inter-disciplinary review and the mapping of process from Subjective perception to social cognition along with the simulation of the lines of interaction between perceived and physical reality, it is clear the design affordances act as triggers present in the physical environment. Understanding the concept of socio-cultural schemas further revealed that there is a need for affordances to be enriched with meanings and values to stimulate interaction between the perceived and physical environment. As Norman (1999) suggests, "Sloppy thinking about the concepts and tactics often leads to sloppiness in design. And sloppiness in design translates into confusion for users" (p. 41). In product design, perceived affordances offer intuitive instructions for people to use simple things. Given the significance, the concept of affordance must be further explored in the context of urban design, as You and Chen (2007) state, "the concept of affordance challenge designers to avoid the reliance on symbols and cultural conventions in design.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Instead, it encourages them to utilize possible intuitive actions that can serve as function in the process of user-product interaction" (p. 29).

To pave the way for further explorations in research, a basic categorisation of design affordances can be conceived to correspond to the nature of sensory receptors known. This leads for design affordances to be visual, auditory, olfactory gustatory and tacile in character. By embedding meaning into the design affordance and not letting the sensory stimulus a by-product of a not-well thought through design, enriches the design affordance to enable and foster well-reinforced people/place relationship and hence bridge the physical and perceived environment in meaningful ways.

Having established the conceptual and operational work flow of perception as a process and the potential of enriched design affordance to enable meaningful interactions between physical and perceived environments, the next part of the chapter will feed this learning and further illustrate the relationship between the layers of urban structural components, their relationship to perception that lead to social cognition.

Spatial Determinants of Perception: Urban Components Framework

The two basic questions that present to understand spatial determinants of perception are; how is space represented as a perceived environment in the mind? And what are the urban structural components that make up the physical space/city? Firstly, Spatial perception as noted, is the cognitive ability that enables the awareness of a relationship between the self and environment, both from the egocentric and allocentric frames of reference. An allocentric frame of reference is one where the location of another entity is in reference to other objects, independent of oneself and in contrast egocentric reference frame is a spatial frame that denotes the location of another entity in reference to oneself. This processes of spatial comprehension is also regarded as extroceptive (a relationship between the objects with in environment) and interoceptive (self and environment).

Given the subjective nature of the egocentric frame of reference that involves the interoceptive relationship between self and environment, this spatial frame warrants the self to directly interact with design affordances. The allocentric frame of reference is a result of percept that establishes the relationship between one object to another in the environment. This means that the spatial determinant of perception can follow either allocentric or egocentric frame of reference. The percept that reaches the perceived reality zone in the brain can then interpret, understand and structure objects on allocentric and egocentric frames of references.

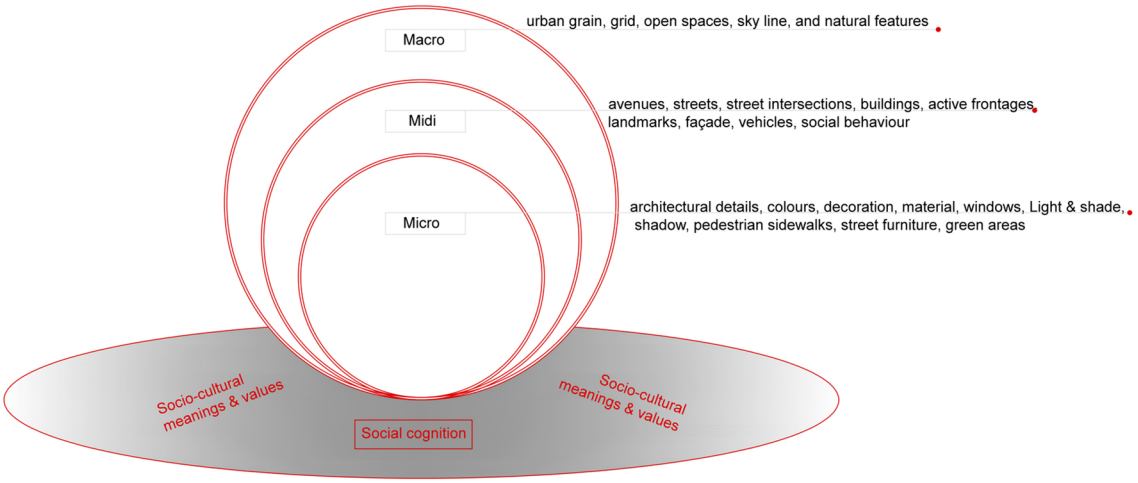
To address the second question, what are the urban structural components that make up the physical space/city it is important to understand the basic morphological features of the city. The urban morphology is regarded to be in constant flux and that no city is ever designed complete (Lynch, 1960). The historical layering of the urban components are arguable reinforcements that positively bind people's perception (Lynch, 1972, Carmona et al, 2003) Change is an essential order of life, and so it is in urban city too, as it constantly renews itself to accommodate the ever-changing/ evolving economic, political, social (Dovey, 2001) and technological systems that go into the making of the contemporary city. This is true of the physical urban fabric as it flexes itself to accommodate these activities. The physical environment provides stimulation of interest at three scales, which are conceptualised as a silhouette (complexity of the outline), form articulation (three-dimensional modelling) and surface texture (Stamps 2013). The structural aspects of the physical urban fabric, with regards to scale and size of the various elements that make the city can be conceptualised as a whole city, a specific district or parts of the city.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The human interaction with the city can be at corresponding three levels; from a distance for a whole city view, with in the urban fabric and close confrontation with urban components (Macro, Midi and Micro levels of interaction with the city). The spatial features that determine perception (Figure 3) at the three levels of people/place interaction are:

- **Macro:** The spatial features at the macro level of a cityscape comprises the composition of the urban grain, grid, open spaces, sky line, and natural features.
- **Midi:** The spatial features at the midi level of a cityscape comprises avenues, streets, street intersections, buildings, active frontages, landmarks, façade, vehicles, social behaviour.
- **Micro:** The spatial features at the midi level of a cityscape comprises architectural details, colours, decoration, material, windows, Light & shade, shadow, pedestrian sidewalks, street furniture, green areas.

Figure 3. Spatial determinants of perception



The stimulus offered by these spatial components have the to potential to generate positive aesthetic experience (Nasar, 1994). When spatial components are designed as enriched affordances it can simulate aesthetic pleasure at subconscious as well as cognitive levels of perception when the perceiver can assign a value to derived meaning from the sensory information (Weber, 1995). A collective experience can lead to social cognition where sensory and cognitive appraisals of the environment are aligned with the schema that can relate the environment around socio-cultural meanings and value. The recognition of the environment in association with the memories of people can create a significant impact on the landscape of the city (Baqayi et al., 2011).

The social life of cities is a by-product of the multiple layers of perceptions coming in contact with each other. The 'Cloud gate' at Millennium park Chicago (Figure 4) is an example that depicts this philosophy of multiple perceptions coming together and the artistic public space design reflects all that is around it at the three levels of people/place interaction: Macro (The Chicago skyline); Midi (streetscape); Micro (Pedestrians, architectural detail). While this example is a literal depiction /reflection of the grandeur

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Cloud Gate at Millennium Park, Chicago

of the city of Chicago; spatial configurations embedded with socio-cultural meanings foster a sense of belonging and aid social interaction. The meaning of spaces inform people how they themselves use the buildings and spaces, thus bridging the perceived and physical with design affordances at the three conceptual levels of macro, midi and micro can enable social interaction leading to social cognition. Social cognition as the collective understanding that a society exhibits with its socio-cultural schemas is vital for social belonging and lead to tangible people/place relationship and hence increased sense of belonging, social integration, cohesion, and inclusion.

CONCLUSION

Philosophy has long wanted to understand means and mechanism with which the self-interprets the realities of the external world. Together with disciplines such as psychology, Neuroscience and cognitive psychology the studies on this complex mental process of comprehending external realities have progressed significantly. Environmental psychology and urban design have interest in how the physical

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

environment is perceived interpreted and experienced in the user's mind. While there have been studies that focus on smell and sound scape designs in the last few years, a holistic review of the approach to studying perception had been stagnant. Moreover, environmental psychology operated from the paradigm that regarded perception and cognition as one and the same thing. This chapter challenged the existing notions and traditions and provided an interdisciplinary overview of the concepts of perception and cognition from Philosophy, Psychology, cognitive psychology and neuroscience. The learning from literature established that perception and cognition are unique processes that take place in different areas of the brain and that the construct of a place is warranted by cognition. The key understandings from the review led to the construction of conceptual process that mapped the workflow from subjective perception to social cognition in the bottom-up and top-down perception modes. The operational workflow of the interactional dynamics between the perceived and physical world was simulated as a visual representation.

The line of interaction reinforced the importance of socio-cultural schemas of meaning and values. It also established that sensory information is inherently meaningless and that there is no behaviour value in sensory information and that the socio-cultural schemas establish the relationships, thus cognition as a process, actively discovering relationships and associating relationships with meaning and value. The mapping led to the conceptualisation of enriched cognitive design affordances as these have the potential to establish perception stimuli indicators, which can positively underpin design values, and characteristics that can bridge the gap between the perceived and physical environment. Perception being the lens through which reality is viewed as it relates to objects and people the chapter further uncovered the spatial determinants of perception in the urban structural components. The framework illustrated the relationship between the micro, midi and macro layers of urban structural components, with regards to spatial configuration, their relationship to perception that can lead to social cognition. This collective social understanding that a society exhibits with its socio-cultural schemas is vital for social belonging, enabling social interaction, wellbeing and social cohesion. This framework incorporates that city is the product of set of perceptions of the physical environment and reinforces the importance of design affordances at spatial levels. This understanding calls for a paradigm shift where sensorial design approach is integrated into the spatial design process. The sensorial design approach is the realm where enriched design affordances can be realized and created. The design 'affordances' in the environment that carry meanings and values and not just spend its effort in initiating perception as a process with empty affordance that don't translate into socio-cultural meanings and values. The need for this paradigm shift opens further research paths to pin down on sensory stimuli and cognitive design affordances for urban components at the identified Macro, Midi and Micro spatial levels. .

Given the necessity for a more holistic approach, that incorporates sensorial design approach at various spatial levels, research is needed to establish theoretical guidance that identifies the perceived meanings, memories, and values, people attribute to urban structural components. As philosophers advocate, the sense of self and purpose is imparted from meanings and values and make the core of being in humans, the same is true for our cities. The sense of the city is the collective representation of perceptions, which the city can afford its people and it is of paramount importance for design and policy to ensure the physical and perceived realities are bridged appropriately and sufficiently.

KEY TERMS AND DEFINITIONS

Affordance: The intuitive reasoning of how a particular object must be used as informed by the object or the context where the object is present.

Cognition: The process or action of receiving/retrieving information and going through conscious reasoning through sensory perception, thought processing, or experience.

Mental Representation: External reality as interpreted by the mind.

Percept: The component that has been perceived.

Perceptible: That which can be identified and apprehended by the senses to further interpret it.

Perception: The identification, organization, and interpretation of information received through senses.

Social Cognition: The concept of people acquiring and processing observations about other individuals during social interactions and social situations.

Chapter 19
Yogic Care for Neurodevelopmental Rehabilitation:
Bringing Life Into Treatment, Management, and Prevention

Arun Pratap Singh
https://orcid.org/0000-0002-1973-9070
Mahatma Gandhi Antarrashtriya Hindi Vishwavidyalaya, India

ABSTRACT

Recent biological and behavioral studies indicate that several unhealthy alterations in ways of living (i.e., consumption-pattern, leisure activities, sleep routine, postures, breathing, stress-level, and use of high-tech gadgets) may be related with aggravation and augmentation of neurodevelopmental disorders. In this backdrop, it is important to recognize that yoga offers holistic knowledge for correction in lifestyle to not only prevent but also manage and alleviate neurodevelopmental disorders. Unfortunately, clinicians have been relying in their practice rather heavily on intrusive and pharmacological interventions and avoiding the use of sustainable techniques. Therefore, in order to increase awareness and promote its use in clinical settings, present work is ventured on the understanding effectiveness of and challenges in utilizing yogic practices for neurodevelopmental rehabilitation. It also identifies priorities for future research and action to amplify applicability of yogic lifestyle in hospitals, clinics, and other public health centers.

INTRODUCTION

In last few decades, Neurodevelopmental Disorders (NDD) has emerged as one of the greatest threats to public health. Persons with developmental deficits in speech, use of language, scholastic progress, social skills, communication and intellectual ability, constitute a substantial chunk of human popula-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

tion throughout the world. In a study, only among children of 4000 families in six regions of India, the prevalence rate for NDD ranged between 10-18 percent (Silberberg, Arora, Bhutani, Durkin, Gulati, Nair, & Pinto-Martin, 2014). Autism Spectrum Disorder-which is only one specific disorder under the NDD- has been globally estimated to occur in one person in every 160 persons (Elsabbagh, Divan, Koh, Kim, Kauchali, Marcín,... & Yasamy, 2012); while prevalence rate for many other NDDs in many low-income countries remains unexplored (Hossain, Ahmed, Uddin, Chowdhury, Iqbal, Kabir,... & Hossain, 2017). Additionally, if we take full life course perspective into our account, then incidences of developmental deficits in the central nervous system and their consequent malady for human life, would present a much grim scenario.

In many countries, traditionally, persons lacking developmentally relevant capacities are socially ostracized and face inhumane stigma. While some peoples suffering from NDD have normal abilities to live independently but many others need life-long care and support. As a result, many families and communities have to carry a substantial degree of emotional and financial burden (Dykens, 2015). Due to lack of skilled health professionals, infrastructure, and financial constraints, a majority of developing and lower-income countries are not capable to provide appropriate health and education services to those, who are afflicted with these disorders and caregivers. In this context, with support from more than 60 nations, World Health Organization has sought to promote sharing of sustainable and cost-effective strategies to strengthen and expand integrated healthcare services for mental health and disability (Grupp-Phelan, Harman, & Kelleher, 2007).

Furthermore, although, we lack clear picture about causes of NDD, a number of pre-natal and environmental risk factors have been recognized. For long, previous studies have noted that childhood, in the modern age, has become susceptible to much vulnerability due to the unhealthy lifestyle of parents before and after conception (Dykens, 2015; Sampson, Streissguth, Bookstein, Little, Clarren, Dehaene, ... & Graham, 1997; Talge, Neal, & Glover, 2007). Also, many unhealthy alterations in lifestyle have been found to be major contributors in the development of social, behavioral and communicative disorders (Mattson, Allison, Fontana, Harvie, Longo, Malaisse, ... & Seyfried, 2014; Mattson, 2015; Singh & Misra, 2012, 2015, 2016). In this context, several agencies have articulated the urgent need to outline relevant cost-effective strategies.

We can also easily interpret following multiple aspects which denote for suitability of yoga in the care of persons suffering from developmental disabilities.

- First, it harmonizes multiple aspects of mind-body functioning (Singh, 2017).
- Second, being convenient to learn and practice, both for patients and healthcare providers, it can be adopted in any rehabilitation settings, comparably easily than any other therapy for management and treatment of NDD.
- Thirdly, yogic care involves little financial investment because it does not require a huge financial expenditure for purchasing equipment and training yoga therapists. It can be easily used in resource-deprived countries also (Chuang, Soares, Tilbrook, Cox, Hewitt, Aplin, ... & Torgerson, 2012; Hartfiel, Clarke, Havenhand, Phillips, & Edwards, 2017).
- Fourth, as evidenced in several studies for supplementing role, yoga can be integrated with any other therapy (Desikachar, 1999; Kalyani, Venkatasubramanian, Arasappa, Rao, Kalmady, Behere,... & Gangadhar, 2011).
- Fifth, because of holistic effects, it can resolve multiple concerns related to physical, mental, social and occupational domains (Jeter, Slutsky, Singh, & Khalsa, 2015).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Sixth, being substantially free from any potential side effect, yogic care can be used for neurodevelopmental rehabilitation without minding much about negative repercussions of rehabilitation.

As observed, in view of several limitations of psychiatric, developmental, psychological and community interventions, the efficacy of yogic care for preventing, managing and providing cure from NDD, yogic techniques can be particularly relevant for neurodevelopmental rehabilitation (Dykens, 2015). Against this backdrop, this chapter discusses several dimensions of yogic care for facilitating neurodevelopmental rehabilitation.

In the first section, it orients towards an understanding of major challenges and issues of prevailing primary, secondary and tertiary rehabilitation services to address developmental deficits. Then, in next section, it provides a layout of opportunities found in potentials of yogic techniques as envisioned by popular experts of yoga and also summarizes major reviews on the effectiveness of yogic wisdom to address disorders related with the nervous system. In the third section, challenges of using yogic knowledge for rehabilitation of persons afflicted with NDD have been elaborated. In the following section, the author describes directions for research and actions for imbuing yogic care. Lastly, the author concludes with major highlights of this chapter.

CURRENT SCENARIO OF NEURODEVELOPMENTAL REHABILITATION: CHALLENGES AND ISSUES

Traditionally, resource-demanding interventions (i.e., drugs, psycho-educational, developmental and behavioral) are being utilized to address developmental deficits in communication, speech, language and scholastic performance. Some recommendations for systemic changes in the environment, to assuage disability, are also in focus. But, their delivery in any setting is marred by several challenges. A majority of these reside in financial, biological, systemic, environmental, cultural and contextual repertoire of dominating perspectives.

Most of the psycho-educational, developmental and behavioral interventions have been experienced to be resource and labor-intensive. Large randomized controlled studies have highlighted financial complications of behavioral rehabilitation (Rappley, 2005). In consequence, the paucity of healthcare professionals, and lack of resources for effective service management impede access to rehabilitative care in different countries. In vast parts of the world, mental health experts, psychologists, and psychiatrists are variably placed in rural and urban areas, with greater density in capital or metro regions.

The biomedical model had remained occupied in tracing specific etiology, underlying pathological processes, and their particular effects. Although, this model has held center stage it paid limited attention to the relevance of individual actions, the role of environment and individual perceptions in accounting for their developmental traces of mental health (Bury, 2004; Foucault, 1973). Initially, confined to morbidity and mortality, it had reduced all causes of developmental deficits to the biological territory. Recently, ill-effects of such conceptions have been widely recognized. Many negative side-effects of drugs in the prevention, management, and treatment are being substantially noticed. For instance, it has been found that treatment of ADHD by using drugs induces a decrease in appetite, headache, problems falling asleep, irritability and abdominal discomfort (Elia, Ambrosini, & Rapoport, 1999; Greydanus, 2005).

Freud's insistence on explaining any disability through unconscious conflicts is beginning to lose its credibility (Palombo, Bendicsen, & Koch, 2009). Psychological overemphasis on only individualistic

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

view of disability and disorders is being challenged by the contrasting emergence of evidence of the effect of parent's lifestyle and environment on the shaping of the development of the child. Realizing the limitations of existing popular perspectives, the biopsychosocial model had broadened its ambit of understanding of disease and disability by dynamically adding the influence of psychological, social and behavioral factors to the biological factors. Currently, lay notions of disease and disorders, as explored and recognized in several scholarly studies, have emerged to challenge mainstream views of rehabilitation with their notion of 'reserve stock' to be invested in by adopting health behavior, or diminished by self-neglect or unhealthy behaviors (Blaxter, 1990).

Henceforth, many mechanical, artificial and materialistic changes in contemporary life have begun to be noticed to explain spurt in the prevalence of developmental disabilities. These changes are altering not only the pattern of everyday life but also shaping the micro-level contexts such as home, school, and work setting. A plethora of living choices (i.e., fast foods, cold drinks, alcohol, pornography etc.) offered by persuasive media and market is interfering with the mind-body functioning of a majority of the world population. Cut-throat competition glamorized by globalization and disturbances in traditional customs of leisure, consumption and daily life are creating constraints in multiple spheres of development. Prominently, inappropriate living choices (e.g. unhealthy dietary habits, intake of fast food, irregular sleep, less physical activity etc.) have been realized to contribute to developmental delay but unfortunately, these issues are not getting space in neurodevelopmental rehabilitation settings.

A majority of neurodevelopmental rehabilitation services and networks, in developing and low-income countries, are based on service-delivery models originated from research evidence of developed countries. Consequently, they are less affordable and ensuring their applicability becomes a huge challenge in any other setting. Furthermore, the genesis of NDD in childhood had received greater attention but a full-life course perspective has been ignored.

While the prevalence of NDD is higher in developing countries but most of the rehabilitation strategies have been derived from studies in developed countries and thus operate with cultural incongruence. Therefore, development of culturally-sensitive and socially-contextualized knowledge, for addressing these conditions, is becoming important. Recently, several healthcare agencies have realized the need for locally relevant knowledge.

It has been noted that non-specialist service providers and parent-mediated interventions are more effective in dealing issues of developmental disability. It has also been realized that there is a need to ensure greater participation of persons with developmental disorders and their families. In short, we find that in the process of neurodevelopmental rehabilitation role of ingredients of life have been avoided. Despite several pieces of evidence indicating the role of consumption patterns, sleep-related habits, daily routine habits, spiritual practices, their use in neurodevelopmental rehabilitation remains rather minimized.

POTENTIAL OF YOGIC CARE

Traditionally, yoga has been viewed as a set of practices which not only pacifies physical and psychological turmoil and confusion but also induces calmness, harmony and balance in the body (Saraswati, 1996). Maharshi Patanjali, who is believed to be the first person to summarize theory and practice of yoga in his most famous treatise-yoga sutra, outlines controlling and transformation of mind as the goal of yoga (Iyengar, 1993). Although in modern times, physiological aspects of yoga have been over-emphasized, if we try to explore rather deeply then we find that yoga had evolved with a variety of contours. It included

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

not only postures, deep breathing practices, cleansing techniques, daily routine instructions, dietary restrictions, and habits for the spiritual uplift, but it evolved also as a set of cognitive and affective techniques to deal with problems in many other spheres of life (Acharya, 2008; Cornelissen, 2004). While doing so, it does not view the existence of individual as confined in one's physical realm but mutually dependent on the societal and environmental contexts (Aurobindo, 1917).

Several studies, in last few decades, have indicated towards multiple routes for the utility of yoga to prevent the occurrence of risk factors responsible for delay or defects in the central nervous system. According to a review of independent prospective studies, by reducing the stress level in pregnant mothers, the risk for attention-deficit/hyperactivity, anxiety, and language delay in the offspring can be substantially prevented (Talge, Neal, & Glover, 2007). Yoga-based practices can be useful as an add-on treatment for socio-occupational functioning (Behere, Arasappa, Jagannathan, Varambally, Venkatasubramanian, Thirthalli,... & Gangadhar, 2011), caregivers relationship with patients (Harrison, Manocha, & Rubia, 2004), improving mood-disturbance, anger, resilience, fatigue, negative stress-response behaviours and concentration on the task in children (Herbert & Esparaham, 2017; Jeter, Slutsky, Singh, & Khalsa, 2015).

Based on the yogic perspective of life and evidence-based knowledge, following techniques are being elaborated as follows:

Regulating Dietary Habits

Dietary regulations occupy major space in yogic life. Food items have been categorized into three types according to notions of their effects on the human mind (Aurobindo, 1917). Sattvic category, which quietens the mind, consists of organically grown sweet potato, cow milk and other milk products, wheat, barley, gram, dates, fruits, coconut, pumpkin and maize. Rajsic food items induce egoism, aggressiveness and excess of activity. It includes salt, pepper, tea, coffee, garlic, sugar, cold drinks, chocolates and other spicy, dry and bitter food preparations. In a third category called-Tamsic, different types of liquor, chips, meat, pickles and preserved food items have been experienced to result into dullness. In yoga, the act of eating food is required to be preceded by devotional actions and mood so as to induce calmness to facilitate proper digestion. In addition, appropriate chewing of each morsel, not to eat anything in between two meals during a day, eating only when feeling intense hunger, eating regularly and drinking enough amount of water are some important habits. Over-indulgence in eating and not eating at all during the period of intense hunger - both were suggested to result in serious health problems. Regarding the quantity of food, yogic instructions to fill half of the stomach with food, one fourth with water and remaining one fourth to be left for aeration are relevant for better digestion. In order to facilitate appropriate growth during different developmental trajectories, Yoga also emphasizes on the practice of rational fasting to promote vigor, vigilance, and well-being.

Recently, yogic notions of diet have been supported by psycho-biological studies. In modern studies, intake of protein-rich food has been found to be associated with an increase in awareness while of carbohydrate to lack of fatigue and vitamins to experience vigor (Benton & Donohoe, 1999). In neurological studies, intermittent fasting and intake of vegetables and fruits have been found to increase resistance to neuro-generative disorders (Mattson, Allison, Fontana, Harvie, Longo, Malaisse, ... & Seyfried, 2014; Mattson, 2015). In particular, fasting has been noted to be of great importance for the prevention of developmental problems in old age because it reduces intake of free radicals and increases production of neurotrophic factors and protein chaperons. Several yoga therapists have been reporting anecdotal evidence for the effectiveness of yogic dietary habits for ameliorating developmental delays in the ner-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

vous system. In one such article, fasting was reported to treat several neuro-generative disorders such as palsy, mental retardation and the age-dependent emergence of concerns of anxiety, depression, and loneliness. In another article, intake of tea or coffee was reported to be related to the developmental lagging of nervous system. However, it remains to be seen that whether these anecdotal findings may stand to empirical scrutiny.

Synchronising Sleep

Sleep is considered as one of three important foundations of health in equivalence with diet and sexual restrictions (Charak Samhita, 11/35). The period of sleep was recommended to be regulated in synchrony with daily natural events (e.g., sunrise, the appearance of stars). Particularly, 'Ayurveda' recommends sleep during early hours of the second quarter of the night till the onset of the fourth quarter of the night. Regular sleep during this period of the night is said to improve fitness, stamina, digestibility and self-esteem and serve several restorative functions of the body (Rigveda, 10/127; Charaka Sutra, 21/38). Remaining awake during the night was stated to increase physical illnesses. The second important suggestion was about getting up early in the morning. Early rising was conceived to have medicinal value for many diseases. Multiple effects of morning rise such as in enhancing gaiety, optimism, positive body image were especially emphasized (Ashtanga Hridaya, Sutrasthana, 2/3).

Some recent biological studies have validated Ayurvedic realizations about sleep. Positive changes in the biochemical constitution such as increased secretion of health-enhancing neuro-peptides (i.e., corticosteroids and hormones (i.e., melatonin) have been demonstrated to be associated with the timing of sleep in synchrony with sun-rise and sunset (Buschkens, Graham, & Cottrell, 2010; Roeser, Obergfell, Meule, Vögele, Schlarb, & Kübler, 2012). However, in the modern age, urbanization and technological predominance seem to have badly affected the practice of appropriate sleep habits resulting in several developmental complications.

Daily Routine and Positive Leisure

Regular pursuance of daily routine activities (i.e., bathing, massaging, physical exercises), positive leisure and religious behaviors (i.e., prayer, chanting religious mantras) have been widely mentioned in different yogic texts. Bathing was recommended to be performed daily for overcoming fatigue and sweat and promoting physical stamina (Ashtanga Hridaya Sutra, 2/16-18). Positive effects of oil massaging of children to prevent excessive sweating, fatigue, and increase flexibility, strength and fitness were eloquently recognized. Physical exercises were considered of great value for their positive contribution to improving digestion, physical fitness and strength (C.S., Sutrasthana, 7/ 31-32). Engagement in violent, addictive and sexual activities was suggested to be highly harmful during adolescence (C.S. 7/29). The sexual restriction was greatly recommended for gaining multiple positive effects of Yoga (Kathopanishada, 11/5). Chanting of mantras is a major religious behavior recommended in yogic tradition. Particularly, 'Om' is of major importance considered as 'syllable' of the God in different religions. In a study, chanting of 'Om' has been found to be correlated with deactivation of the limbic system and stimulation of vagus nerve and thus indicating for the potential to treat emotional reactivity and stress (Kalyani, Venkatasubramanian, Arasappa, Rao, Kalmady, Behere, ... & Gangadhar, 2011).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Postures

We find an astounding variety of structured postures in several spiritual texts of India (Desikachar, 1999). The effect of postures in the calming restlessness of mind was of special significance for spiritual seekers (Yoga Sutra, 1.2). The postures (Asana) were particularly meant for effortless, relaxed and poised sitting in meditation (Yoga Sutra, 2/46-48). Yoga Sutra did not provide any more description of categorization and classification of postures (Iyengar,1993). But some other texts indicate about manifold forms of postures developed from minute observation of different creatures and their species-specific concomitant physical or mental capacities (Dhayanbindupanishad, 42). During later ages, multiple forms and series of postures were invented to alleviate psycho-physiological imbalances in body and mind. Effects of yogic postures operate through internal massaging of specific muscles, neural ganglions and organs of the body and in turn results into the improved functioning of the human nervous system, muscular system and circulatory system (C.S., Sutrasthana, 28/7, Acharya, 2008).

Postures play a facilitative role in ensuring proper absorption and distribution of nutrients to the different organs of the body. Rao (2002) contends that by attention to coordinated breathe and body movements, awareness of emotional blockages goes on to increase. In a study among children aged 5-16, diagnosed with ADHD, the practice of loosening kriya, postures, kapalbhati, Ujjayee, anuloma-villoma, and nadanusandhan resulted into a significant reduction in severity of symptoms (Hariprasad, Arasappa, Varambally, Srinath, & Gangadhar, 2013).

Breath Regulation (Pranayama)

Next to postures (Asanas), regulation of breath (Pranayama) is considered of crucial significance for increasing mental acumen. It was intuitively realized by yogic sages that particular forms of conscious breathing are related subsequently to specific kinds of mental experiences, cognitive abilities and states of human wellness. It came also to their experience that alleviation of many negative effects and reestablishment of harmony between human body and mind can be possible through breath-regulation (Y.S., 2/52; Prasnopanishad, 2/10-11). The spine and spinal muscles are a source of action and lungs are receiving instruments of breathing technique. There are three components of all breathing practices: inhalation, exhalation and retention (Iyengar, 1993, p., 30). In some types, deep breathing is practiced through both nostrils; in some others forceful expulsion of breath is undertaken and in other types, alternate breathing from nostrils is carried out. In some other techniques, certain divine syllables are mentally repeated in consonance with inhalation, retention or exhalation of breath. There are also some highly advanced practices in which there is no actual breathing but merely conscious visualization of receiving vital energy. These breath taking practices increase muscular strength of lungs. Increased availability of oxygen enhances functional capacity of different internal organs of the body. Especially, the positive effect of deep breathing (Pranayama) on purification of the nervous system, increasing concentration and mental vigor was considered of special importance (Shvetashvaropanishad, 2/9).

In congruence with yogic realizations, several recent clinical studies have identified less utilization of lungs and consequently reduced intake of oxygen as a major source of multiple ailments (Gupta, Gupta, Sood, & Arkham, 2014). The practice of alternate nostrils breathing (Anuloma-Viloma Pranayama) and Kapalbhati pranayama are viewed as special value during initiation of deep breathing practice (Saraswati, 1996).

Yognidra

Yoga Nidra, a classical yogic technique prescribed for psychophysical relaxation (Hatha Pradipika, 1.32; Gherand Samhita, 2.4; 2.19), is a state between sleep and awakening. In this state, relaxation is induced in simultaneity with mental alertness and experiential journey of different parts of the body (Desikachar, 1999). This technique is practiced by inculcating imagery, awareness of breathing and abdominal movements. It has a revitalizing impact on human existence (Brihadarakyopanishad, 4/3/18). It's regular practice develops self-control, attention and concentration and helps in overcoming stresses of life and gaining composure (Y. S., 2.54-56). As a result of widening recognition of Yognidra, its' different offshoots i.e. iRest, divine sleep have become popular in western countries.

Through its' practice, autonomic nervous system and the endocrine system gets harmonized resulting in greater energy, relaxation and strength. Many previous studies have noticed significant changes in the sympathetic activity in practitioners of Yognidra. It stabilizes glucose level (Amita, Prabhakar, Manoj, Harminder, & Pawan, 2009), blood pressure, heart-rate (Monica, Singh, Ghildiyal, Kala, & Srivastava, 2012) neural activity, and functioning of the hypothalamus and thus indicates for its potential benefit in anxiety, depression and different types of disabilities (Kim, 2017) (Vempati & Telles, 2002). Other concomitant changes such as increase in ATP and frequency of alpha and delta brain waves during Yoganidra may be linked positively with the nourishment of several parts of the human body (Dusek, Otu, Wohlhueter, Bhasin, Zerbini, Joseph,... & Libermann, 2008). Research evidences have corroborated for its great effect in reducing negative thought patterns and unhealthy habits (Pence, Katz, Huffman, & Cojucar, 2014). In patients of combat-related post-traumatic stress disorder, use of Yognidra only for eight weeks has shown promising potential to reduce rage, anxiety, emotional reactivity and increase relaxation, peace, self-awareness despite the intrusive memories in veterans (Stankovic, 2011).

Meditation

There are a variety of meditation techniques. These include focusing fixed attention on present moment or a fixed stimulus such as one's breathe, use some imagery or observing one's own thoughts rather than suppressing or engaging with them. Meditation has found to yield a positive contribution to well-being among a wide range of healthy people and persons with mental problems (Murphy & Donovan, 1999; Shapiro, Schwartz, & Santerre, 2002). In short term, it leads to a reduction in arousal by inducing changes in heart rate, respiration, skin conductance, cortisol levels, and by increasing alpha waves. In long term, it has been found to lead to increased health, cognitive functioning, creativity, empathy, and in the management of conditions such as hypertension, chronic pain, anxiety, and depression. Merely, 20 minutes a day of guided meditation for few weeks has been found to produce favourable changes in inflammation, ageing, and energy production (Bhasin, Dusek, Chang, Joseph, Denninger, Fricchione, ... & Libermann, 2013).

CHALLENGES AND ISSUES IN RESEARCH AND PRACTICE OF YOGIC CARE IN NEURODEVELOPMENTAL REHABILITATION

In mainstream research and practice of neurodevelopmental rehabilitation, pharmacological and to some extent behavioral approaches are highly emphasized. But, there is minimal availability of evidence-based

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

knowledge on content and process-oriented aspects of yogic care (Salmon, Lush, Jablonski, & Sephton, 2009). As a result, although persons are utilizing yoga on their own to overcome several developmental disabilities and anecdotally reporting their effects but yogic approach for neurodevelopmental rehabilitation is largely invisible in hospitals and clinics. Taking into account existing scenario, this section recapitulates challenges in research and practice of yogic neurodevelopmental rehabilitation. In particular, it provides a snap of methodological limitations and practical constraints.

In last few decades, many studies have been conducted to explore and evaluate the promising possibility of yogic practices for neuro-developmental rehabilitation (Behere, Arasappa, Jagannathan, Varambally, Venkatasubramanian, Thirthalli,... & Gangadhar, 2011; Hariprasad, Arasappa, Varambally, Srinath, & Gangadhar, 2013; Harrison, Manocha, & Rubia, 2004; Hartfiel, Clarke, Havenhand, Phillips, & Edwards, 2017; Jeter, Slutsky, Singh, & Khalsa, 2015). Some attempts for randomized control trials have also been made (Chuang, Soares, Tilbrook, Cox, Hewitt, Aplin, ... & Torgerson, 2012; Jeter, Slutsky, Singh, & Khalsa, 2015). In popular academic view, RCTs are considered as 'perfect' scientific approach to validating effects of yoga. But, due to the impossibility of double-blind trials mental health associated effects are difficult to evaluate in an absolute sense (Mason, Tovey, & Long, 2002; Cornelissen, 2004). This is because any yogic practice has its own ontological and epistemological premises and also there is a gap in basic paradigmatic assumptions between science and yoga as a method. Moreover, yoga involves a variety of practices. Recently, different versions of Yoga, claiming for their supremacy have evolved. Across these different styles, there is the lack in uniformity in content and procedure and thus complicating any endeavour for the comparative assessment for standardization and replication (Mason, Tovey, & Long, 2002). Also, in any intervention, there may be plausibility of abundance of participatory bias that can influence the outcome either in positive or negative manner for or against its practitioners. Further, the settings in which the published studies are conducted, vary from laboratory, residence, clinics, yoga studios, to university campus. Outcome measures also vary considerably across studies.

Moreover, in any experimental study, a researcher faces an arduous task of separating effect of yoga from physical exercise. According to yogic philosophy, if any action is performed with awareness and particular intention then and only then it becomes Yoga; otherwise it remains merely an exercise (Saraswati, 1996). In such a scenario, a researcher is likely to be perplexed with the task of invoking a particular type of attitude in practitioners participating in a research.

Yoga consists of immense variety. It is like a vast sea of practices which can subsume almost any practice blended with an attitude of intention, awareness, and relaxation (Iyengar, 1993). Now the question before us is how can we empirically evaluate the effect of Yoga? Should we use it as a whole system or stand-alone practices? Yoga emphasizes on the experience of self by one-self (Aurobindo, 1917). Then, to what extent, neutral observation of the effect of yogic practices can actually provide real glimpse of yoga for mental health? Yoga is based on the basic idea of holism and continuity of existence but not on the broken idea of a dichotomy between body and mind (Aurobindo, 1917). But, existing research findings are based on reductionist notions and explanations. Conventional studies have mostly been merely limited to capturing of certain biochemical alterations and self-report of subjective experiences. Lack of detail in specifics of yogic intervention is frequently noticeable in different empirical studies (Salmon, Lush, Jablonski, & Sephton, 2009).

According to the yogic theory of human mind, these subjective experiences constitute a lower level of human existence and the effect of Yoga operates through qualitative alterations in different sheaths of consciousness and transgressing ordinary states of the mind (Cornelissen, 2004). As espoused in yogic tradition, the mind is of four layers. The deepest layer is Chitta, the transformation of which is

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

related to experiences of divinity, mystical union, beauty, and space and time transcendence (Iyengar, 1993). Scientific studies are often caught in the puzzle of measurements of subtle changes at uppermost level-body; While, effects of Yoga are conceptualized to operate through body's undetectable nadis or energy vortices (Desikachar, 1999). Due to paradigmatic fixation to ritualistic to the Newtonian scientific inquiry, experiences at other levels of being are either rejected or sometimes believed in ambiguity (Cornelissen, 2004).

To gain benefits of yoga, a person needs to be motivated to practice. According to yogic theory, with an increase in motivation, benefits of yoga are maximized (Iyengar, 1993). Now the problem for researchers is related to increase motivation among subjects for participation in yoga to measure effects. If researchers get involved in motivating subjects then how will they be able to avoid intrusion of biases due to direct engagement of experimenter? And if not, then how to overcome effect of drop-out rate in any experimental research on yoga. Also, in view of the individual variation in motivation for participating in yoga, researchers remain perplexed about the relevance of generalized statements for the outcome of engagement in yoga.

A researcher does not act in oblivion but in the midst of contextual influences and pressures. The act of interpreting particular forms of yoga is often given varied orientation by socio-political debates and controversies (Saraswati, 1996). In such a backdrop, a researcher often gets baffled with the task of what to research and what not to research. The researcher himself/herself may be preoccupied with a certain type of perception due to his training in the particular type of research and disciplinary tradition; which may further prevent from unearthing culturally sensitive mechanisms underlying practice of Yoga. Therefore, we need to have a re-look towards our priorities of research in future.

FUTURE RESEARCH DIRECTIONS

There is need to strengthen research endeavors to address several issues and challenges of rehabilitation efforts through yogic interventions. In order to advance evidence-based knowledge, effective methodology for research on the effectiveness of yogic care needs to be undertaken. In view of holistic effects of yoga, research endeavors also need to undertake mixed-method approach. In view of Yoga being a set of multiple practices, effectiveness of isolated practices needs to be investigated. In addition, holistic modules of yogic lifestyle also need to be assessed for managing and treating individual disorders. In any such research endeavor, the collaboration would be needed in between yoga experts, psychologists, psychiatrists, and anthropologists.

Since, Yoga was developed in a particular historical and social context, several sociological issues related to the application of yoga in different types of settings need to be properly understood. Although Yoga as a term was developed in India, there can be multiple practices in different religions which can be clubbed under yogic care but any such endeavor needs to pay appropriate attention also to several issues related with faith. Also, we will need to work upon effective models for delivery of yogic care in different therapeutic settings.

For long, scientific method has been used to assess the effectiveness of Yoga. In this pursuance, whatever aspects of Yoga would have been scrutinized objectively has been accepted and denial mode has been adopted for all other aspects. As a result 'half-baked' truths are commonly noticeable (Carnelissen, 2004). But, if try to fathom deep into process and content of Yoga by using it's own method, then it can provide much more relevant knowledge.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

This chapter has highlighted multiple issues and challenges for neurodevelopmental rehabilitation and effectiveness of yogic care for the same. It has also underlined challenges involved in yogic neurodevelopmental rehabilitation. In view of several lifestyle changes, yogic lifestyle and practices offer promising possibility to reduce the cost of services for prevention, management, and rehabilitation. Since, the practice of any particular component of Yoga also requires enough attention to balancing life style, daily routine affairs of living related to diet, sleep, daily routine habits cannot be segregated apart. In view of racial and communal perceptions for yoga, any such effort involves careful scrutiny and consideration of relevant yogic practices in different religions and countries.

KEY TERMS AND DEFINITIONS

Daily Routine and Positive Leisure: This term denotes ordinary activities of life in the transaction with daytime and seasonal variation.

Dietary Habits: It refers to habits related to ingestion.

Meditation: This term is defined as concentration towards any object/situation with full awareness and relaxation.

Neurodevelopment Disorders: These disorders indicate developmental deficits in the development of the central nervous system.

Posture: It denotes a particular bodily position influencing physical and mental aspects of health.

Pranayama: Ordinarily, this word is used for breath-regulation but in actual yogic terminology, this term means for controlling and harmonizing vital force of the body.

Yoga: This term refers to a perspective of life/therapy/a cluster of spiritual practices as ingrained in Indian traditional systems of knowledge.

Yognidra: In order to maintain harmony in the body, this practice involves loosening of each part of the body with full awareness and successively relaxes the body.

Chapter 20
Vojta-Therapy:
A Vision-Based Framework to Recognize the Movement Patterns

Muhammad Hassan Khan
Research Group of Pattern Recognition, University of Siegen, Siegen, Germany

Marcin Grzegorzek
Faculty of Informatics and Communication, University of Economics in Katowice, Katowice, Poland

ABSTRACT

This paper proposed a novel computer vision-based framework to recognize the accurate movements of a patient during the Vojta-therapy. Vojta-therapy is a useful technique for the physical and mental impairments in humans. During the therapy, a specific stimulation is given to the patients to cause the patient's body to perform certain reflexive pattern movements. The repetition of this stimulation ultimately makes available the previously blocked connections between the spinal cord and brain, and after a few sessions, patients can perform these movements without any external stimulation. In this paper the authors propose an automatic method for patient detection and recognition of specific movements in his/her various body parts during the therapy process, using Microsoft Kinect camera. The proposed method works in three steps. In the first step, a robust template matching based algorithm is exploited for patient's detection using his/her head location. Second, several features are computed to capture the movements of different body parts during the therapy process. Third, in the classification stage, a multi-class support vector machine (mSVM) is used to classify the accurate movements of patient. The classification results ultimately reveal the correctness of the given treatment. The proposed algorithm is evaluated on the authors' challenging dataset, which was collected in a children hospital. The detection and classification results show that the proposed method is highly useful to recognize the correct movement pattern either in hospital or in-home therapy systems.

1. INTRODUCTION

Vojta-therapy (VT) is a useful technique to treat the disorders in the central nervous and musculoskeletal system, and is very effective for small babies of less than 6 months. The patients suffering from such diseases are unable to make some specific movements in their different body-parts, in the normal manner. VT is based on the principle of Reflex Locomotion (RL), that is, the patient's central nervous system can be activated by giving the correct simulation, assuming that it is still partially intact. RL is a combination of Reflex Creeping in prone lying position and Reflex Rolling from supine and side lying positions, which enable the elementary patterns of movement in patient. The various lying positions of a patient during the therapy are shown in Figure 1.

Figure 1. Example of child's lying positions during the therapy process. Reflex creeping (a) prone lying position, and Reflex rolling (b) supine lying position and (c) side lying position. Photo courtesy: Red Cross Children Hospital, Siegen, Germany.

According to Prof. Dr. Václav Vojta (a child neurologist from Czech Republic, who introduced this treatment), one can observe motor reactions occurring throughout the patient's body when a specific stimulation is given to him/her, while lying in one of the above mentioned positions. Therefore, the therapists exploit a combination of 10 different zones on a patient's body by putting light pressure on this area and resistance to the current movement (e.g., the tendency to rotate the head during reflex creeping) to cause the patient's body to perform certain reflexive movement patterns. The repetition of this stimulation many times ultimately make available the previously blocked connections between the patient's spinal cord and brain, and the patient is able to perform similar movements without any external stimulation. VT has been effectively used to treat various diseases like cerebral palsy, peripheral paralysis of the arms/legs, hip joint dysplasia, problems in breathing, swallowing and chewing functions[1].

VT can be applied to the patients of any age group but it is extremely effective for young babies of less than 6 months because most of the developmental changes take place in the early stage of a child's life. For a treatment to be successful; the therapy session of 5-20 minutes should be performed several times in a day or week and this process can last for several weeks or months. Therefore, the therapists explain the goal and objective of the therapy and recommend an in-home continuation of the therapy as well. The therapy program is then determined in regular intervals in accordance with a child's improve-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

ment. During the therapy, children may start cry, causing the parents to be discomfort about their child's well-being. Resultantly, they stop the treatment in claiming that it is not beneficial. At this age, however, crying is an appropriate means of expression for the young patients, which after a short familiarization period, becomes less and less intense. An automatic vision based system is required to analyze the accurate movements of a patient (i.e., correct treatment), during the therapy session. The aim of home-based therapy evaluation is to provide an accurate in-home therapy alternative to in-hospital therapy. The therapy process at home is not only helpful for the quick recovery of a patient but also quite useful for those who do not have access to a local hospital offering said treatment. Moreover, the frequent visits to the therapist's clinic add an economic burden as well.

In this paper, we proposed a novel computer vision-based method for patient's (i.e., child) detection and accurate recognition of the movement patterns in his/her body parts during VT, using Microsoft Kinect camera. The proposed method works in three steps. In the first step, the child's head location is detected in the depth images using the sum of square differences (SSD) and cross correlation (CC) based matching algorithms in an efficient way. The detected head locations are fitted into a 3D head model for verification. We apply a region growing algorithm on verified locations to extract the entire child's body region from the background. During the therapy, a specific movement can be observed in the upper and lower limbs of a child when a particular stimulation is given to him/her, lying in one of the aforementioned positions. Second, various features are computed to capture the movements in upper and lower limbs of a child. Third, a multi-class Support Vector Machine (mSVM) is used to classify the accurate movements, which ultimately leads us to the correctness of the given treatment. The proposed method is evaluated on our challenging dataset, which was collected in the children hospital. The dataset contains more than 15,000 RGB and depth frames, captured from Microsoft Kinect camera. Experimental results show that the proposed method performs rather well and is highly useful for at home-based therapy systems. Some preliminary result of this research is reported in (Khan, Helsper, Yang, & Grzegorzek, 2016). However, this paper contains the detail of data capturing process, additional diagnostic experiments and in depth discussion of the proposed method.

2. RELATED WORK

Several researchers have been effectively used the computer vision and image processing techniques in physical rehabilitation either using sensors-based (Arteaga et al. 2008; Rado, Sankaran, Plasek, Nuckley & Keefe, 2009; Shih, Chang & Shih, 2010) or vision-based (Chang, Chen, & Huang, 2011; Da Gama, Chaves, Figueiredo & Teichrieb, 2012; Bryanton et al., 2006; Exell et al., 2013; Chang et al., 2012; Gao, Zhao, Qiu, Yu & Chang, 2015; Tokunaga, Tamamizu, Saiki, Nakamura & Yasuda, 2017) methods.

Rado, Sankaran, Plasek, Nuckley and Keefe (2009) introduced an unsupervised patient rehabilitation method with the help of marker based motion tracking of knee movements using infrared optical tracker. They detect the errors in movement and showing to the user how to perform the movement correctly. However, the use of such marker sensors need of extra equipment and suffers from the reduction of tracking efficiency due the high incidence of motion blurs (Da Gama, Chaves, Figueiredo & Teichrieb, 2012). Industrial motion sensors have been utilized as a physical rehabilitation tool (Arteaga et al., 2008; Shih, Chang & Shih, 2010). However, these methods require wearing a number of sensors on the human body, causing discomfort. Virtual reality and motion-based games have also been exploited for rehabilitation (Jack et al., 2000; Arteaga et al., 2008). Admittedly, the evidence indicates that these methods provide

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

an interactive, engaging, and effective environment for physical therapy, but they require expensive hardware and software. They are generally designed to suit a very specific group of patients and cannot be useful in cases of newly born babies because they cannot interact with such systems.

Vision based methods can track movements using either color-based or depth-based imaging. Color-based method usually use a specific color marker attached to the patient's body-part (Hondori, Khademi, Dodakian, Cramer & Lopes, 2013). On the other hand, depth-based systems either make the use of skeletal tracking or computer vision based algorithms to detect and track human body from the sequences of depth images (Da Gama, Fallavollita, Teichrieb & Navab, 2015; Khan, Shirahama, Farid & Grzegorzek, 2016). With the invention of a very low cost device, i.e., Microsoft Kinect, a new tool is now to be considered in similar rehabilitation, as well as in assessment and monitoring systems. A Kinect camera is quite cheap and can be extended far beyond gaming (Han, Shao, Xu & Shotton, 2013). It consists of RGB camera, a 3D depth sensor that provides the distance information of object from camera, and a pivot which can be tilted either up or down direction for sensor adjustment.

Several researchers have utilized the Kinect as assistive technology at ambient assisted living and rehabilitation places. Chan, Chen and Huang (2011) developed a Kinect-based rehabilitation system to assist the therapists in their work to treat the children suffering from motor disabilities. They used the motion tracking data to analyze the rehabilitation standards and to allow the therapist to view the rehabilitation progress. Bryanton et al. (2006) proposed a system for in-home rehabilitation using Dynamic Time Warping (DTW) algorithm and fuzzy logic. The evaluation is performed on the trajectory of joints and the time duration in the completion of designated exercise. Exell et al. (2013) utilized the skeletal tracking information to analyze the rehabilitation in the upper limbs. Chang et al. (2012) proposed a system that used the motion tracking of 6 upper limbs for rehabilitation. For validation they used the outputs of OptiTrack[2] as ground truth and compared them to the outputs of Kinect. In the article by Da Gama, Chaves, Figueiredo and Teichrieb (2012), the authors proposed an interface for adults to monitor the correct description of therapeutic movements. The recent surveys on various therapy techniques for rehabilitation using Kinect are presented in (Da Gama, Fallavollita, Teichrieb & Navab, 2015; Mousavi & Khademi, 2014). All of the above mentioned techniques used skeleton information from Kinect, which either could not be made available in the case of little babies or which was problematic if some body parts were occluded. Moreover, due to the nature of VT, some of the patient's body parts are always occluded, as shown in Figure 7.

Compared to the aforementioned methods, the proposed algorithm does not require any statistical learning, motion information, and is computationally inexpensive. The proposed algorithm exploits only depth information for child's detection using a fast template matching algorithm and used the segmented body region in combination with visual information to classify the accurate movements in their various body parts. The rest of the paper is organized as follows: Section 3 describes the overview of the proposed method. The patient's body segmentation and detection is presented in Section 4 and Section 5 contains the method for feature computation. The data capturing process and experimental results are reported in Section 6 and conclusion is drawn in Section 7.

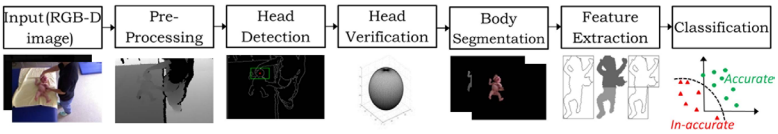
3. OVERVIEW OF THE PROPOSED METHOD

The proposed method works in three steps. The short description of each step is given below and the detail implementation is explained in succeeding sections.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In the first steps, the child (i.e., patient) is detected from the depth image using the location of his/her head position. In a given depth image from Microsoft Kinect camera, we reduced the noise and smoothed the array for later process. The edges information in the depth data is utilized to locate the candidate positions of the child's head region. The proposed method scans across the whole image and exploits the relationship between the sum of squared differences (SSD) and cross correlation (CC) based matching algorithms, to locate the possible regions of the child's head. Each of the detected head regions are then verified through a 3D head-model fitting technique, which utilized both the edge and relational depth change information from the original depth image. After verification, a Region Growing algorithm is applied on the detected head location to segment the child's body region from the captured scene. We performed the calibration of depth and RGB images using the camera's extrinsic and intrinsic parameters to segment the child's body region from RGB image as well. Later, this visual segmented information is utilized to identify the child's lying position during the therapy process. In the second step, various features are computed in the segmented child's body region to capture the movements in upper and lower limbs. Third, in the classification stage, a multi-class support vector machine is used to classify the accurate movements in the child's body region during the treatment. A block diagram presenting the complete process is shown in Figure 2.

Figure 2. Overview of the proposed method



4. PATIENT'S BODY DETECTION AND SEGMENTATION

4.1. Depth Data Pre-Processing

Prior to start detection process we need to remove the noise from depth data. The 3D depth sensor in Microsoft Kinect provides the depth information of the scene as a two-dimensional array, known as the "depth image". Each pixel in a depth image represents the distance of the corresponding object from the camera. For visualization and compression, the depth values are normalized in the range 0-255. The depth sensor in the Kinect camera can capture the distance information in the range 0.8-3.5 meters. The pixels out of this range are filled with the offset value 0 and can be viewed as random black dots in the depth image. These missing pixels, considered as noise, and must be recovered to effectively use the depth data in image processing techniques. We recover these missing pixels from the neighboring pixels by applying nearest neighbor interpolation algorithm. This process converts the discrete data into continuous and recovers the depth value of missing pixels, however it may introduce some noise in the depth image. The noise can be removed by using order statistic filter (Khan, Shirahama, Farid & Grzegorzek, 2016). To overcome this problem, we used the median filter and tested it with various sizes to remove the said noise and found the best results are obtained with a 5x5 size median filter. The reason for choosing the median filter is that it preserves the edges in the depth image, which are very important to the later stages of the proposed algorithm.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

4.2. Child's Detection

The next task after the aforementioned pre-processing (i.e., recovery of missing pixels) is to locate the position of the child's body region in the depth image. The edges information of the depth image is utilized for this purpose. A Canny edge detector is used to find all the edges in the depth image. Since the small edges do not contribute in head detection and therefore can be dropped to reduce the computational cost and the disturbance from the irregular objects in the surrounding. The edges smaller than a predefined edge length Ω are dropped.

The proposed detection algorithm starts by locating the position of child's head and the binary template used for this purpose is shown in Figure 3c. For the child's head detection, the proposed template is traversed over the entire edge image from top-left to bottom-right. The matching measure is determined on each pixel of the edge image which lies under the template. For the matching, we utilized the SSD and CC based matching algorithms. Let us define the edge image as E and template image T with size *MxN*. The equation of SSD can be written as:

$$S\left(x,y\right)=\sum_{i=0}^{M}\sum_{j=0}^{N}\left(E\left(x+i,y+j\right)-T\left(i,j\right)\right)^{2} \tag{1}$$

where S represents the sum of squared difference, computed at (x,y) position of E and i,j representing the x,y locations of pixels in T. SSD can also be viewed as the Euclidean distance between image patch E and template T. Expanding Equation (1) yields,

$$S\left(x,y\right)=\sum_{i=0}^{M}\sum_{j=0}^{N}E^{2}\left(x+i,y+j\right)+\sum_{i=0}^{M}\sum_{j=0}^{N}T^{2}\left(i,j\right)-2\sum_{i=0}^{M}\sum_{j=0}^{N}E\left(x+i,y+j\right)T\left(i,j\right) \tag{2}$$

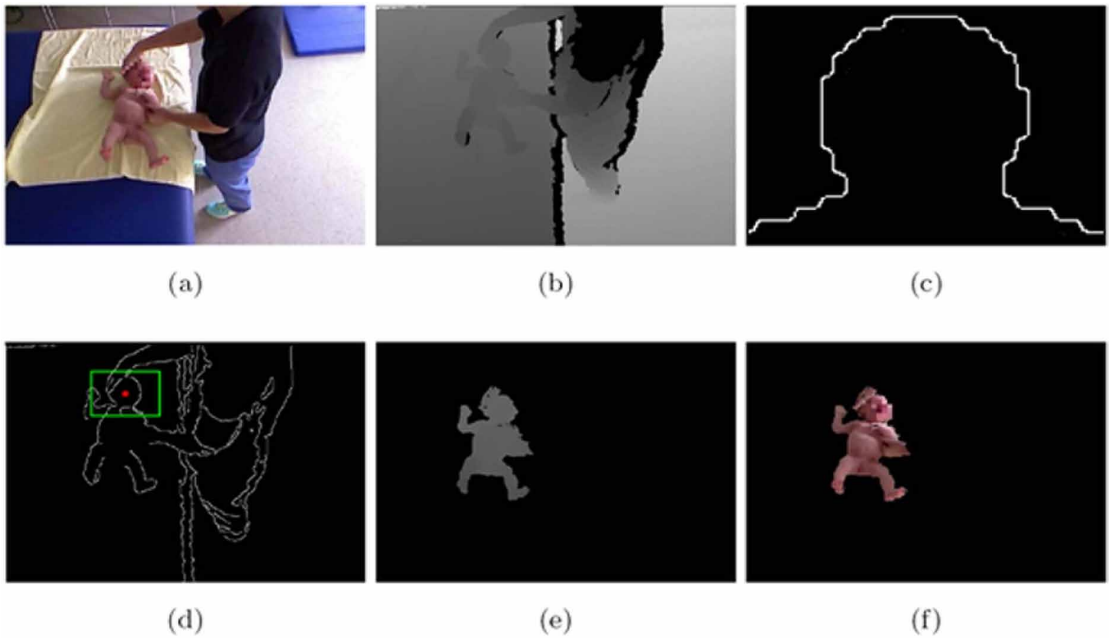
In Equation (2), the first term is the sum of squared values in the edge image, the second term belongs to the template image and the third term is twice the correlation between the image patch and template. Note that the term $\sum_{i=0}^{M}\sum_{j=0}^{N}T^{2}\left(i,j\right)$ is constant. Let us assume that the term $\sum_{i=0}^{M}\sum_{j=0}^{N}E^{2}\left(x+i,y+j\right)$ is approximately constant (Goshtasby, Gage & Bartholic, 1984), so the remaining term (i.e., cross correlation) is,

$$CC\left(x,y\right)=\sum_{i=0}^{M}\sum_{j=0}^{N}E\left(x+i,y+j\right)T\left(i,j\right) \tag{3}$$

where CC represents the cross correlation. It can be easily observed from Equation (2) that the Euclidean distance between the patch of edge image and template decreases as the correlation (i.e., similarity) between the image patch and template increases. This also provides an intuition to use correlation to measure the similarity. However, one should be careful while using a correlation to measure the similarity in intensity images because the correlation is high on the locations where the image intensity is high, even though they are not very similar. To overcome this problem, the normalized cross correlation can

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Example of child's detection (a) original color image (b) pre-processed depth image (c) binary template used for head detection, (d) detected head's location after verification (e) and (f) segmented child's body region in depth and RGB images respectively.



be used but this is not a problem in our case, as the proposed detection algorithm exploiting only binary images which contain the edge information (i.e., E(x, y) & T(i, j) ϵ {0,1}). The regions of the image where the correlation is high are the places where template and image match well.

The cross correlation can be computed by taking the inner product of image patch E and template T. This calculation is computationally quite expensive (Khan, Shirahama, Farid & Grzegorzek, 2016). For a search window of size MxM and a template of size NxN require $N^2(M-N+1)^2$ additions and $N^2(M-N+1)^2$ multiplications (Lewis, 1995). In order to reduce the computational overhead, we compute the cross correlation in frequency domain using the Fourier frequency transformation (FFT) and correlation theorem. The theorem states that multiplying the Fourier transform of one function (i.e., our edge image) by the complex conjugate of the Fourier transform of the other (i.e., the head template) gives the Fourier transform of their correlation. That is,

$$CC\left(u,v\right) = \mathfrak{F}^{-1}\left(\mathfrak{F}^{*}\left(E\left(x,y\right)\right)\mathfrak{F}\left(T\left(i,j\right)\right)\right) \tag{4}$$

where $\mathfrak{F}$ represents the Fourier transform, $\mathfrak{F}^{*}$ represents the complex conjugate and $\mathfrak{F}^{-1}$ is the inverse Fourier transform. The computational cost in frequency domain with the same aforementioned search area and template size is, $12M^2\log_2 M$ real multiplications and $18M^2\log_2 M$ real additions (Lewis, 1995). Although there is no difference in the detection results of the proposed method either in computing correlation in spatial domain or frequency domain, it is shown in (Lyon, 2010) that correlation computation in frequency domain is 2.5 to 12 times faster than in spatial domain.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The size of the head varies from child to child and also depends on the distance of the child from the camera during the therapy. Although the distance and angle orientation of the camera from the table surface (where the patient is lying for treatment) is pre-defined to capture the best quality data with minimum occlusion of the therapists, we apply the proposed matching algorithm in a multi-resolution fashion which makes the algorithm robust to scale in change. Three different sizes of templates are exploited with a sampling rate of $\frac{1}{4}$ for pyramids construction, to detect head location in depth image. Using the above mentioned method, few locations with high correlations are marked as a possible child's head. However, all the detected locations do not necessarily contain the child's head. Therefore, the detected locations are verified through a 3D head model fitting technique. A 3D hemisphere model is used for verification of the detected head regions. We exploited the 3D head model fitting technique proposed by Xia, Chen and Aggarwal (2011) for this purpose. Figure 3d shows the results of human head detection in Figure 3b; the detected heads are shown in green rectangles and the red dot represents the matching locations.

4.3. Child's Body Segmentation

Once a detected child's head is verified, the entire child's body region can be extracted from the background. Since the depth of child's head location in known, we can extract the whole child's body by selecting the same depth pixels from the original depth image. However, this may also extract some false alarms, that is, few other pixels having the same depth values but not lying on child's body region. This problem can be handled by applying a Region Growing algorithm on the detected head location instead of selecting the same depth values directly. A Region Growing algorithm is applied on the verified head location to extract the child's body region from the depth image. The Region Growing algorithm compares the similarity of a pixel to its neighboring pixels and grows itself by including them in the region if the similarity difference is lower than the pre-defined threshold (Khan, Shirahama, Farid & Grzegorzek, 2016). Resultantly, we segmented all the pixels from the depth image belonging to child's body region, as shown in Figure 2(e). In addition, we performed the calibration of depth image with RGB image using Kienct's extrinsic and intrinsic parameters and segmented the child's body region in RGB image as well, which is required in the next stage of our proposed method.

5. FEATURE EXTRACTION FOR POSE REPRESENTATION

The VT has to be given to children in prone, supine, and side lying positions. In our work we primarily focus on the treatment in prone and supine lying positions. We carefully captured the RGB and depth frames containing the movements of upper and lower limbs during the treatment, while lying in one of the aforementioned positions. Since human region in depth images do not possess any color and texture information, therefore, it is very difficult to detect the lying position of a child using only depth data. We utilized the calibrated RGB segmented region for this purpose. To classify the movements of upper and lower limbs, we divided the dataset into four classes. Upper limbs movement in supine lying position, lower limbs movement in supine lying position, upper limbs movement in prone lying position and lower limbs movement in prone lying position. The short description is illustrated in Table 1.

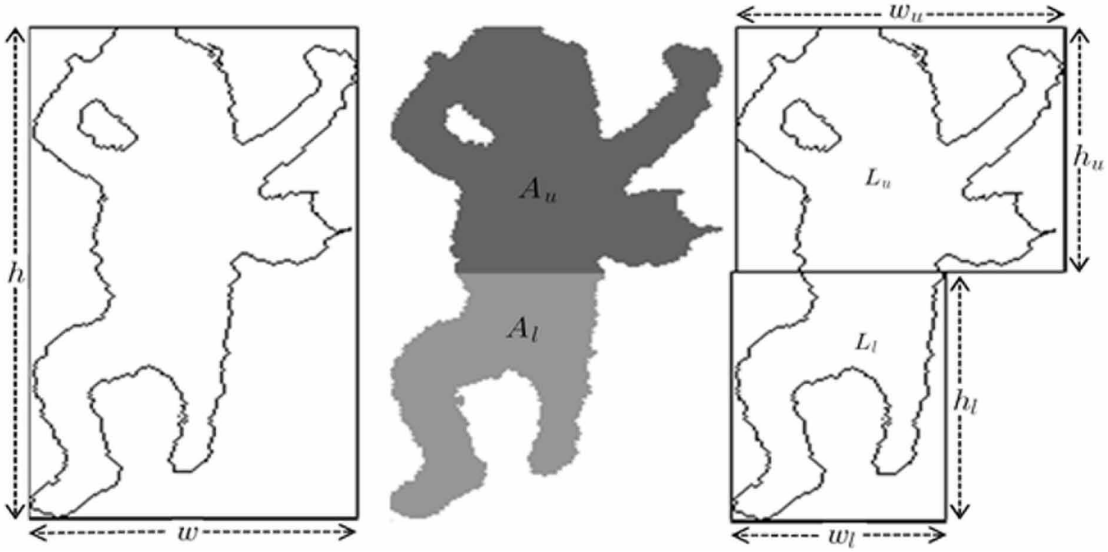
EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Different classes for limb movements

Class label	Movement Type
N_1	Upper limbs movement in supine lying position.
N_2	Lower limbs movement in supine lying position.
N_3	Upper limbs movement in prone lying position.
N_4	Lower limbs movement in prone lying position.

The movement patterns are described using the 9-dimensional features vector F. The first attribute f_1 is the lying position of a child, which can be detected using a face detection algorithm on segmented RGB image. For the other attributes, we used the bounding box of the whole segmented region from depth image in two equally high sub-boxes to define the movements in upper and lower regions separately in a more discriminative way (see Figure 4). Let us define the subscript u is for the boundary box in the upper region and l is for the boundary box in the lower region. The computation of feature's attributes is described in Table 2.

Figure 4. Example of feature computation. Shape bounding box and equally high sub-boxes (i.e., $h_u = h_l$) used for feature extraction.



here, are the height,, are the width,, are the length of the contours and, represent the area of the extracted silhouette in upper and lower bounding boxes respectively, as shown in Figure 4. The purpose for the selection of these features is to capture the movements of upper and lower limbs during the treatment process. The final representation of feature vector *F* can be described as,

$$F = \left[f_1, f_2, f_3, f_4, f_5, f_6, f_7, f_8, f_9\right]$$

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Different classes for limb movements

Feature Attribute	Description
f_1	The lying position of child using face detection algorithm..
$f_2 = \frac{h_u}{w_u}$	The ration of height and width in upper bounding box..
$f_3 = \frac{h_l}{w_l}$	The ration of height and width in lower bounding box..
$f_4=A_u$	The area (total number of pixels) in upper bounding box..
$f_5=A_l$	The area (total number of pixels) in lower l bounding box..
$f_6=L_u$	The length of contour in upper bounding box..
$f_7=L_l$	The length of contour in lower bounding box..
$f_8 = \frac{h}{w}$	The ration of height and width in complete (i.e., outer) bounding box..
$f_9=A_u+A_l$	The sum of area in upper and lower bounding box..

Moreover, we have scaled each feature attribute to the range [-1, +1]. The main advantage of scaling is to avoid elements in greater numeric ranges dominating those in smaller numeric ranges. Another advantage is to avoid the numerical difficulties during the calculation, for example in Support Vector Machine (SVM), kernel values usually depend on the inner products of feature vectors (e.g., the linear kernel and the polynomial kernel), and large attribute values might cause numerical problems (Hsu, Chang, & Lin, 2003).

6. EXPERIMENTS AND RESULTS

6.1. Data Capturing

To the best of our knowledge, no relevant public dataset is available to classify the correct movements in child's body parts during VT. Therefore, it was necessary to build our own dataset prior to conducting experiments. The data was captured in a children hospital[3], using a Microsoft Kinect camera. We recorded the movements of 10 patients of various ages (2 weeks to 6 months) and both genders (8 males and 2 females), originating from different countries. For a fair comparison, therapy was also performed by the parents in accordance with therapists. The camera was put on a tripod, at the height of 2 meters and with an angle of 45º from the table surface. The setting was chosen to be in accordance with the recommendation for capturing the best data quality (i.e., movement patterns in upper and lower limbs) with minimum occlusion. The camera setup and patient's lying positions during the therapy process is shown in Figure 5. For each patient the therapy session usually lasted between 15-20 minutes, both the RGB and depth frames are recorded at 640x480 resolution. Upon careful analysis, we selected more than 15,000 frames containing the useful information of upper and lower limbs movement during therapy. The first release of dataset is available free of cost and can be taken by sending an email to the authors.

Figure 5. Camera setup during the therapy process (a) supine position (b) prone position

(a) (b)

6.2. Detection Performance

The proposed detection algorithm is applied on our collected challenging dataset for child's detection using only depth information. We achieved the detection rate of 83.29% with a small false alarm of 1.27%. The reason for the drop in detection rate is due to the occlusion at the location of the child's head. Although it was pre-decided with the therapists to use their hands with the minimum occlusion of the child's head structure, the situation was particularly often faced when the treatment was given in supine lying position, as shown in Figure 6.

Figure 6. Example of child's head poses during the therapy. (a) a child with clear head structure in prone lying position, (b) occlusion in the child's head structure can be observed in supine lying position due to the therapist's hand.

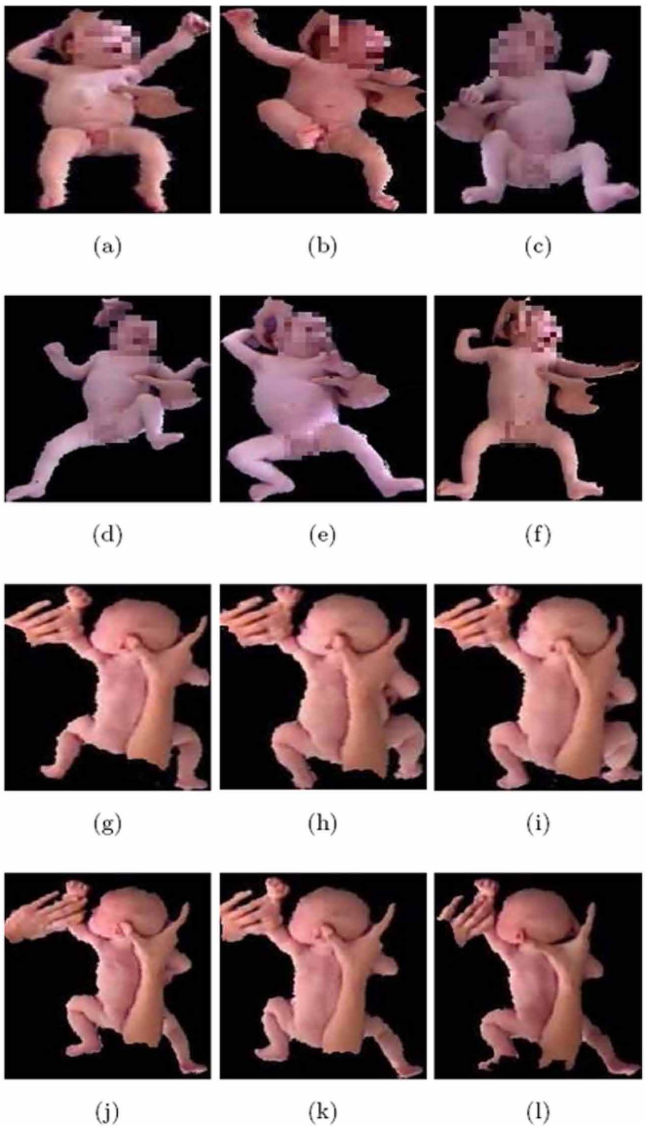
(a) (b)

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

6.3. Classification

SVM has been used as a powerful tool for solving classification problems in many applications. Due to the high dimensionality of our features, we decided to use SVM as classifier. In the comparison of SVM, the other similarity based classifiers like K-Nearest Neighbor and probability based classifiers like Naive Bayes do not perform well for high dimensional features (Khan, Helsper, Boukhers & Grzegorzek, 2016). SVM first maps the training samples in high dimensional space and then extract a hyper- plane between the different classes of objects using the principle of maximizing the margin. Because of this

Figure 7. Example of movement in various body parts of a child during the therapy. First row (a-c) belongs to class N_1, second row (d-f) belongs to class N_2, third row (g-i) belongs to class N_3 and forth row (j-l) belongs to class N_4.



EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

principle, the generalization error of the SVM is theoretically independent of the number of feature dimensions. To solve the multi-class problem, we exploited a multi-class Support Vector Machine using its one-against-one version. It uses two-class SVMs for each pair from a set of all considered classes. Thus, for N classes in total, two-class classifiers are constructed. It uses voting strategy for classification and each testing sample is classified to the class with maximum number of votes. In this paper, we used the implementation of SVM within the LIBSVM library (Chang & Lin, 2011).

We used the C-Support Vector Classification formulation with the soft margin parameter C and, γ when RBF kernels are used as meta-parameters. A 5-fold cross-validation is performed to validate the model with the selection of the above mentioned meta-parameters prior to it training the actual model on the full training dataset. Figure 7 represents the various movement patterns in upper and lower limbs of a child during the therapy process and Table 3 summarize their classification results. One can see that the movement of lower limbs in prone position is the set of activities (i.e., N_4) where the most confusion occurs (see Table 3) because the required portion of the lower limbs is occluded by the therapist's arm. The lying position of a child, however, is detected but the estimation of lower limbs movement might become unstable due to the therapy technique requirement, as shown in Figure 8. Obtaining an average classification rate of more than 78% lets us believe in this solution and encourages us to plan future work in this research area by considering some other features to identify the correct patterns of movement.

Table 3. Classification rate of the proposed method

Class label	N_1	N_2	N_3	N_4	Accuracy (%)
N_1	**548**	52	0	0	91.33
N_2	24	**576**	0	0	96.00
N_3	1	1	**481**	117	80.17
N_4	1	0	330	**269**	44.83
					$\mu = 78.08$

7. CONCLUSION

In this paper, we proposed a framework for child's detection and accurate recognition of movement patterns during VT. The proposed method works in three steps. First, the child's body region is detected and segmented from depth image using his/her head location. Second, different movement patterns are analyzed in the segmented body region and various features are computed to capture these movements. Third, the computed features are classified using SVM. The experimental results show that the proposed method performs well and can be used for in-home based vojta-therapy systems to recognize the accuracy of the treatment. In future, we plan to include few other features like motion trajectories for accurate classification of movement patterns.

Chapter 21
What Cognitive Psychology Can Tell Us About Educational Computer Games

Michael K. Gardner
The University of Utah, USA

David L. Strayer
University of Utah, USA

ABSTRACT

Developers of educational computer games often have incomplete knowledge of the cognitive abilities of learners, yet this knowledge can be useful in informing game design. This chapter reviews two important cognitive abilities that underlie learning: working memory and attentional capacity/executive function. From a description of the developmental course of each ability, we derive a set of recommendations for game developers to follow when designing games for learners of different ages. The chapter next reviews the psychology of transfer of training, including two major theories on the issue. The doctrine of identical elements appears to give the better description of how transfer occurs from training environment (the educational computer game) to target environment (real world performance of the learned skill). It is recommended that games embody, as closely as possible, the end behavior they hope to produce, as this will produce maximal transfer. Finally, we review some controversial research demonstrating distant transfer in computer video gaming.

INTRODUCTION

In this chapter we consider the following questions: (1) What is an educational computer game? (2) How can cognitive psychology inform the developers of educational computer games? and (3) What can we expect in the way of transfer from the educational computer gaming environment to other educationally relevant environments? Our conclusion is that even with well developed, cognitively appropriate educational games, designers should be careful about making claims of widespread transfer, as these claims are rarely substantiated.

BACKGROUND

Although educational computer games are becoming increasingly popular in the K-12 educational system (e.g., Kebritchi, 2010; Maushak, Chen, & Hai, 2001), it can be difficult to characterize exactly what constitutes an educational computer game. At a minimum, the content must be presented on a computer or other sort of digital media. But beyond that, what is necessary? The philosopher Wittgenstein (1953) asked the question "What is the definition of a game?" His conclusion was that there were no necessary and sufficient features of a game. Rather, the members of the category "games" are bound together by the principle of family resemblance. Some games share features with other games (e.g., solitaire and poker both involve the use of cards), which in turn share features with other games (e.g., poker and craps both involve gambling), and so on. The principle of family resemblance derives from the similarity between members of human families: a child may have eyes that are similar to his father, a smile that is similar to his mother, and ears that are similar to his uncle, but there may be no physical feature true of all of them. Likewise, games share features with some other games, but not with all other games. There are no necessary and sufficient conditions for something to be called a game. Therefore, the search for an adequate definition of educational computer games will end in frustration. Instead, we must rely on our common sense to categorize something as an educational computer game.

Although we may not be able to define educational computer games, we can say something about their function. The purpose of educational computer games is to create learning in students: preferably learning that is broadly applicable to many educational contexts. The computer can serve as a motivational device (the game is engaging, thereby encouraging prolonged interaction), as a feedback mechanism (the game tracks student knowledge, and corrects misunderstandings), and as a developer of proficient skill (continued practice should result in fast and fluid responses, with response times governed by a power law [Newell & Rosenbloom, 1981]). But the key to educational computer games is that they should produce learning that extends beyond the gaming context. This is the question of transfer, and we will return to it later in this chapter.

MAIN FOCUS OF THE CHAPTER

The Development of Cognitive Abilities

A number of cognitive abilities are necessary for children to benefit from educational computer games. Games that might be suitable for a 12th grader would not be suitable for a 1st grader. The abilities we will focus on are memory and attention or executive control.

Memory

Early cognitive theories of short-term memory stressed the storage function of memory over its cognitive control functions. Memory was seen as a multistage processing system (e.g., Atkinson & Shiffrin, 1968) that worked in a very linear fashion. Information from the environment was initially registered in a set of sensory stores. These systems held information from the environment in a raw, unprocessed form for very brief periods of time. There was a sensory store for each of the various senses. Information that was attended to was transferred to a short-term store that held small quantities of information for

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

relatively short periods of time (but much longer than the sensory store). Information in this short-term memory could be held for perhaps only 18 seconds before it would fade away (Brown, 1958; Peterson & Peterson, 1959). However, information in the store could be "kept alive" by rehearsing it: repeating it again and again. In this way, material in the short-term memory could be maintained almost indefinitely. The longer material remained in the short-term store, the more likely it was to be transferred to a long-term store. Material in the long-term store was assumed to be stored forever. If an individual was unable to retrieve an item known to be stored in long-term memory, it was assumed to be due to a lack of available retrieval cues (Tulving & Thomson, 1971, 1973) or to interference from other items also stored in long-term memory (e.g., Shiffrin & Atkinson, 1969).

Short-term memory was not only limited in its duration, but was limited in the number of items it could store. It was assumed to be able to store seven chunks of information, plus or minus two (Miller, 1956). A chunk is an organized unit of information. Thus, letters and numbers could be chunks, but words and important dates (e.g., 1066, the date of the Battle of Hastings) could also be chunks. Obviously seven words or dates contain more than seven letters or numbers, but the internal organization of words and dates unify them as single pieces of information. The limit on short-term memory was the number of chunks, not simply the number letters or numbers.

While Atkinson and Shiffrin's (1968) model (often referred to as the "modal model") of memory allowed for processing operations in short term memory beyond rehearsal (e.g., transforming information from visual to verbal codes, deciding whether two items were the same or different, and activating retrieval strategies for long term memory), it was rehearsal that was the processing focus of their model. The longer an item was rehearsed, the better its chances of being transferred from short term store to long-term store. Later research by Craik and Lockhart (1972) cast doubt on this interpretation. They showed that the depth at which information was processed was more important than the absolute amount of time it was processed in the short-term store. Shallow processing was associated with surface features of the information (e.g., phonetic characteristics), while deep processing was associated with the meaning of the information (e.g., semantic characteristics). Shallow processing resulted in poor long-term memory, while deep processing resulted in good long-term memory.

As interest increased in the information processing taking place in short term memory, a new model emerged called "working memory" (Baddeley, Eysenck, & Anderson, 2009; Baddeley & Hitch, 1974). This model focuses almost exclusively on how information is stored for short periods of time, and on how this information is manipulated while being held in storage. In the working memory model, there is a central executive, and a set of information buffers that serve as slave subsystems to be manipulated by the central executive. The model posits a phonological loop that holds sequences of acoustic or speech-based information. Information in the phonological loop can be items that need to be remembered later, but it can also hold "reminder" instructions on what to do next during a processing task (Baddeley, Chincotta, & Adlam, 2001). It can also access language-based information in long-term memory. The model similarly posits a visuo-spatial sketchpad that stores visual and spatial information and allows for its manipulation. This store can also access information related to visual semantics stored in long-term memory. More recently, Baddeley (2000) has argued for a third subsystem: the episodic buffer. This buffer holds about four chunks of information in a multidimensional code (visual, auditory, and potentially other types of information), and allows for connecting together information from the other buffers, as well as linking this information with information in long-term memory and sensory information (Baddeley, Eysenck, & Anderson, 2009).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The "central executive" controls the various buffers. The central executive serves as an attentional controller for the slave subsystems, rather than as a memory system per se (Baddeley, Eysenck, & Anderson, 2009). Its operation is primarily automatic: existing skills are executed with little or no conscious intervention, and conflicts are resolved by simple rules (referred to as "contention scheduling") that give priority to certain actions over other competing actions. However, when conflicts arise that cannot be easily resolved, a more active form of control must be engaged. This is sometimes called the supervisory attentional system (Norman & Shallace, 1986). The supervisory attentional system can intervene in automatic processing and bias certain "schema control units" to make them more likely to execute. In this way, the supervisory attentional system can overcome learned tendencies to respond in certain ways in given situations. For example, if you are driving and see a green traffic light, your tendency would be to continue driving forward. However, if you saw an ambulance crossing the intersection with emergency lights flashing, your supervisory attentional system would intervene to engage the stop response and inhibit the go response.

The supervisory attentional system resides in the frontal lobes, and patients with frontal lobe damage often cannot interrupt ongoing sequences of processing. For instance, in tasks such as the Wisconsin Card Sorting Test (Heaton, et al., 1993) individuals are asked to categorize presented objects according to categorization rules that are not explicitly stated, and instead must be induced. Periodically, the rules are changed, and the individual must induce the new categorization rules. Patients with frontal lobe damage typically demonstrate perseverative errors, continuing to use the old rule to categorize objects in the face of feedback that their responses are incorrect. This is presumably due to damage to the supervisory attentional system, which is part of the working memory central executive.

A distinction in made in the memory literature between declarative memory and procedural memory. Declarative memory is memory for factual information; for the sort of information you can bring into conscious awareness. This includes semantic memory and episodic memory (Tulving, 1972). Semantic memory is overlearned memory about the world around us (e.g., what a cup is and how it is related to a saucer, or that Mars is a planet while the sun is a star). Episodic memory is memory for personally experienced events that have temporal information associated with them. What you had for breakfast is an example of an episodic memory. What breakfast means would be a semantic memory. Most of what we have been discussing so far concerns the declarative memory system.

A second kind of memory can also be defined: procedural memory. Procedural memory is the memory we have for skills and procedures. This memory does not need to be called into conscious awareness, and indeed to try to do so may interfere with the skill (Medeiros-Ward, Cooper, & Strayer, 2014). You may know how to ride a bicycle or hit a golf ball. These skills are based on procedural memories. Trying to think about how to hit a golf ball will likely make it more difficult to hit it effectively. Indeed, when people try to call to mind a skill, they are usually trying to recall the declarative information (i.e., the rules) that led to the skill, not the skill itself. Procedural memory is fundamentally different from declarative memory. Its developmental course and underlying neurobiology are different as well.

Procedural memory falls into the larger category of implicit memory: memory that is demonstrated by a facilitation in performance due to exposure to previous experiences (Graf & Schacter, 1985; Schacter, 1987). This type of memory also includes priming (facilitation in the response to one stimulus due to prior exposure to another stimulus) and classical conditioning (the transfer of a prior response [salivation to food] to a neutral stimulus [a dinner bell] through repeated pairings). While declarative memory (sometimes called explicit memory) shows marked improvements throughout childhood and adolescence, implicit memory shows few, if any, changes as children age. In a meta-analysis of eighteen studies of

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

involving implicit memory, Murphy, McKone, and Slee (2003) found significant effects for age in only three of these studies. Likewise, Perez, Peynircioğlu, and Blaxton (1998) found no age effect on implicit memory tasks when testing preschool, elementary school and college students.

Based on the existing knowledge of memory, there are at least four recommendations that can be made to the developers of educational computer games. First, the developers of educational computer games need to be sensitive to the declarative memory abilities of the age group their games are intended for. Declarative memory increases from early childhood through adolescence, and even into adulthood. Siegler (1998; see also Baddeley, Eysenck, & Anderson, 2009, for a discussion) describes four means through which this improvement takes place. First, the capacity of working memory improves with age. Gathercole Pickering, Ambridge, and Wearing (2004) have found evidence that the phonological loop, the visuo-spatial sketchpad, and the central executive all improve from ages 4 through 15 (the age range they studied). The speed at which an individual can identify a presented item appears to play a role as well (Dempster, 1981). In a related vein, several researchers (Hitch, Halliday, & Littler, 1984; Hulme, Thomson, Muir, & Lawrence, 1984; Nichoson, 1981; see also Baddeley, 1990, for a discussion of the "word length effect") have shown the rate at which words can be spoken is directly related to memory span, and that this rate increases from early childhood through adulthood. This would be expected if vocalization (either overt or covert) is necessary for rehearsal, and rehearsal is necessary to keep verbal information active in the phonological loop. Thus, games designed for the early elementary grades should not put too great a strain on the declarative memory system, and presentation speeds should be slower for younger age groups.

Second, as children age, they acquire more knowledge. The greater the amount of knowledge a child or adolescent possesses, the more connections that can be made to new information that the child or adolescent is trying to learn. These connections can serve as retrieval cues when the information later needs to be recalled. Game developer should not presume extended knowledge structures among young learners.

Third, the older the child, the wider the range of memory study and retrieval strategies at their disposal, and the more fluently these strategies can be employed. While a young child may rehearse a set of items for later recall, and older child may look to see if the items can be grouped by semantic category. Such a semantic coding strategy inevitably results in superior recall. Also, memory strategies that are just being mastered require the child to expend considerable attentional resources just to carry out the strategy; older children who have practiced the strategy can carry it out relatively automatically, leaving additional attentional resources for other processes such as encoding and finding additional patterns in the stimuli. Thus, game developers need to recognize that younger learners will have greater difficulty handling memory retrieval strategies than will older learners.

Fourth, as children age their metamemory increases. Metamemory is the individual's knowledge of their own memory system and its functioning. Young children may believe that simply staring at an item to be remembered will result in its being memorized. Older children realize that some memory strategies are more effective for producing good memory than others. Furthermore, different situations may require different mnemonic strategies. Finally, older children are better at assessing whether they will or will not be able to recall various stimuli. They can then focus their study on those items they are most likely to forget. The take away for game developers is that younger learners will have less command of what they know and don't know, and less knowledge of how to effectively learn the things they do not know.

Attention or Executive Control

Although attention is complex, and can be conceived of as comprising several separate functions (e.g., alerting, orienting, and executive attention/self-regulation (Posner, Rothbart, & Rueda, 2014)), we will focus on the executive control aspect of attention. Executive control can be considered to be the ability to maintain task goals in the face of distraction or conflict (Engle, 2002; see also Watson, Lambert, Miller, & Strayer, 2011).

The executive control aspect of working memory (think of the "central executive" in Baddeley's model) is correlated with a number of important abilities: reading comprehension, complex learning, and reasoning (Daneman & Carpenter, 1980). This executive control function can be measured through complex span tasks such as reading span (e.g., the participant reads several sentences each followed by an unrelated word; at the end of the task, the participant must recall the words that followed the sentences read (Daneman & Carpenter, 1980) or operations span (e.g., the participant reads aloud and verifies a set of operations such as 4/2 x 3 = 6 [yes or no] each of which is followed by a word; at the end of the task, the participant must remember the words that followed the operations (Turner & Engle, 1989)). It is not the ability to read and understand the sentences, or complete and verify the arithmetic operations, that seems to be related to other higher order abilities; rather, it is the ability to use attention to maintain or suppress information, and to avoid distraction, that results in the correlation with higher-order abilities.

Another critical feature of attention and executive function in working memory is the ability to maintain information in the presence of interference (Kane & Engle, 2002). Individuals with low complex working memory spans are more susceptible to various forms of long-term memory interference than those with high complex working memory spans (Conway & Engle, 1996; Kane & Engle, 2000; Rosen & Engle, 1997, 1998). Kane and Engle (2000) compared the performance of low-span (bottom 25%) and high span (top 25%) individuals with regard to the buildup of proactive interference. Both groups recalled approximately 60% of memory items from the first trial. However, as memory trials progressed, low span individuals showed greater amount of proactive interference (that is, fewer items correctly recalled from subsequent lists) than did high span individuals. When both groups were asked to recall items while performing a secondary task, the high span individuals decreased while the low span individuals remained the same. Thus, high span individuals' performance under cognitive load made them appear like low span individuals (with or without load). It appears that high span individuals use their additional attentional capacity to combat the effects of proactive interference (Engle, 2002). The fact that cognitive load had no effect of low span individuals seems to indicate that these people either do not routinely use attention to maintain information in the face of distraction, or are unable to do so because their attention is fully utilized in performing other more basic cognitive functions.

Dempster (1993) argues that the ability to resist or suppress task-irrelevant information is essential for intelligent behavior, and that it develops as the child ages. Several tasks demonstrate this developmental trend. Chelune and Baer (1986) tested children from grades 1 through 6 on the Wisconsin Card Sorting Task (described earlier) and found that as children aged (especially between ages 6 and 7) their performance significantly improved. Their perseverative errors (choosing the wrong category after a rule change) decreased, indicating an improvement in their ability to suppress a previously correct response in the face of changing environmental feedback.

Likewise, performance on a number of measures of field dependence/independence (e.g., the Embedded Figures Task and the Rod and Frame Test) improves during childhood (Dempster, 1993; Witkin,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Dyk, Faterson, Goodenough, & Karp, 1992). This improvement appears to be the result of the child's increasing ability to suppress irrelevant perceptual cues in solving the various field tests.

Another example of the development of the ability to resist interference is the Stroop Color-Word Interference Test (Stroop, 1935). In this test, the "interference" condition asks subjects to name the colors of ink that words are written in while ignoring the words themselves. The words, however, are the names of colors that differ from the ink color. Dempster (1993) points out that this makes the Stroop Test "an index of the individual's ability to focus attention on a relevant dimension (ink color) and to ignore an irrelevant one (word meaning)" (Dempster, 1993, pp. 9-10). Comalli, Wapner, and Werner (1962) tested individuals from 7 to 80 years of age on the Stroop Test and found that interference declined from age 7 through adulthood, indicating a developmental trend toward increased resistance to interference with age over childhood. Interference remained constant during the adult years, but increased again among the oldest participants (over age 65).

Divided attention tasks require individuals to split their attention between two or more concurrent tasks (Strayer & Drews, 2007). The assumption in these paradigms is that total amount of attention an individual possesses is limited, and that performance will suffer when multiple tasks compete for the limited attention available, assuming that the attention necessary to perform the tasks exceed the total capacity available (Norman & Bobrow, 1975). Task switching paradigms measure the cost of task switching by comparing blocks of trials in which no switch is required with blocks of trials in which a task switch is required (Kramer & Madden, 2008). The switch cost is thought to tap the effectiveness of attentional control processes and the efficiency of maintaining the dual task goals in working memory (Kramer & Madden, 2008; Watson, Lambert, Miller, & Stayer, 2011). Switch costs decrease through childhood into early adulthood (Crone, Bunge, van der Molen, & Ridderinkhof, 2006), but increase again in old age (Mayr, 2001). At least some of this effect can be explained on the basis of speed of information processing, which decreases in old age (Salthouse, 1996).

Both Dempster (1993) and Watson, Lambert, Miller, and Stayer (2011) explain the differences in attention, executive function, and resistance to interference on the basis of the development of the prefrontal cortex, which is associated with attention and goal directed behavior. Consider Figure 1 (adapted from Figure 16.3, Watson, Lambert, Miller, & Strayer, 2011), which shows the development of the prefrontal cortex across the age span. The prefrontal cortex is developing throughout infancy and childhood, and peaks in early adulthood (around age 30). Thereafter, it begins a slow decline, which becomes noticeable in early old age (after age 65). This development coincides with task performance on the attention and interference tasks we have discussed above. While this evidence is correlational, it leads us to believe that attention and resistance to inference are strongly related to the performance of the prefrontal cortex.

The takeaways for developers of educational computer games are fourfold. First, in the early school years, goals should be kept simple, and interference from previous interactions with the game should be kept to a minimum. Second, the game should support learning by providing contextual cues that reduce reliance on working memory and attention. Third, games aimed at older audiences (later high school and college-aged groups) can involve multiple and/or conflicting goals, but they should be carefully pilot tested with age appropriate audiences to insure that they do not exceed the attentional capabilities of the typical student. Fourth, games aimed at non-traditional learners, who may be considerably older than typical college students, may also require contextual support to reduce reliance on working memory and attentional capabilities that may be waning in some members of this group.

Transfer of Training

When game developers create an educational computer game, they are often quite optimistic about how information or skills learned in the game will transfer to new situations. Often they are surprised when transfer fails to occur. A review of the theoretical basis for transfer is instructive, because transfer to very different contexts rarely occurs in the real world.

Two theories were proposed early in the history of educational psychology to describe how transfer occurs. The first was termed *the doctrine of formal discipline* (Angell, 1908; Pillsbury, 1908; Woodrow, 1927; also see the discussion of the history of transfer in Singley & Anderson, 1989). This theory views the mind as composed of a number of separate abilities (i.e., faculties) that are responsible for performance. The abilities are conceived of as similar to muscles in the body: if we exercise the abilities, they will become stronger. Then, when these same abilities are needed in the future, they will perform better due to their strengthening through practice. The important aspect of the doctrine of formal discipline is that the abilities are seen as broad and general. Thus, early twentieth century students were trained in Latin and geometry, not because these areas of study were useful in their own right, but because they were difficult, and training in them strengthened numerous mental faculties.

The second theory of transfer was *the doctrine of identical elements* (Thorndike, 1903; Thorndike & Woodworth, 1901; see Taatgen, 2013, for a more sophisticated current version of the identical elements theory). This theory predicted that learning of one mental skill will only transfer to a second mental skill to the extent the two skills share underlying common components. To Thorndike, these components were

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

stimulus-response bonds; however, the same general principle could be applied to other kinds of commonalities such as mental procedures or cognitive schema. Which theory provides the better explanation of transfer? The identical elements theory seems to best comport with the data (Woltz, Gardner, & Gyll, 2000). Thorndike and Woodworth (1901) found that no correlation between memory for numbers and memory for words, despite the fact that both of these tasks required the faculty of memory. In a later experiment, Thorndike (1922) found that changes to the surface structure of algebraic expressions generally led to a decrement in solution performance, even though both the early and later versions of the problems required mathematics ability. It is not the case that transfer never occurs: it does. However, it most often occurs in situations that are similar to the educational or training context (Woltz, Gardner, & Gyll, 2000). These are exactly the situations under which underlying elements of the trained skill will be found in the transfer task, just as Thorndike predicted. These situations are referred to as *near transfer* (Salomon & Perkins, 1989). We would contrast near transfer tasks with transfer tasks that bear few if any similarities to the original training contexts. These tasks are referred to *distant transfer*.

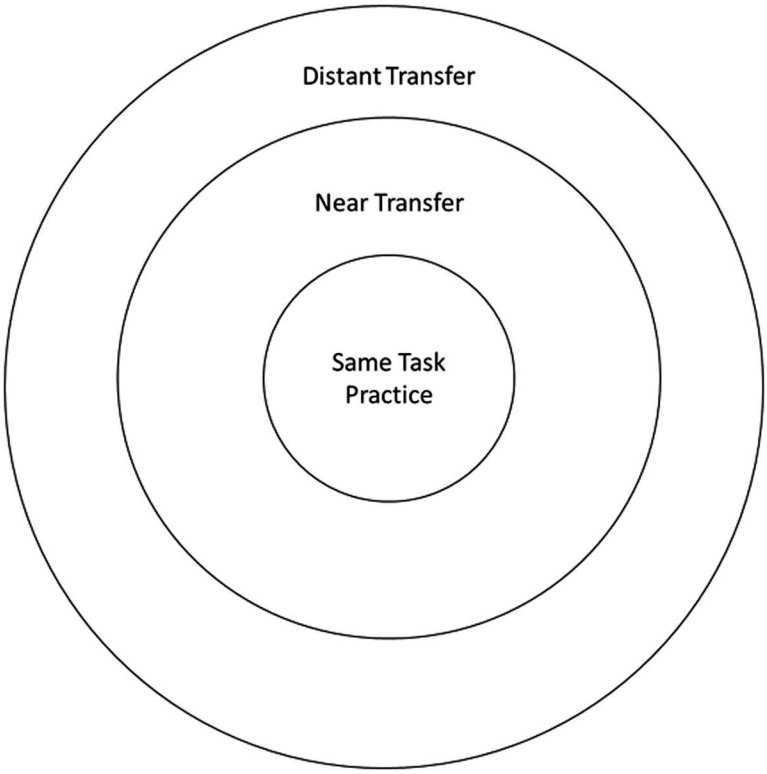
When positive transfer (an improvement in performance due to previous training) occurs, it is almost always in the near transfer domain. When overlapping processing components exist between training and transfer tasks, an improvement in performance can be demonstrated in complex domains such as typing in word processors (Singley & Anderson, 1985), computer programming (McKendree & Anderson, 1987), and geometry problem solving (Lovett & Anderson, 1994). However, example of distant transfer in the psychological literature are relatively infrequent, and often require prompting of the participant to produce the hoped for transfer. Gick and Holyoak (1980) explored the use of analogical thinking to produce distant transfer. Participants first read a story based on a military problem and its solution (the story was an isomorph of Duncker's [1945] radiation problem). Participants were then asked to solve the original radiation problem, which has an analogous solution. Participants generated analogous solutions to the radiation problem, but mostly when they were prompted that the previously read story might provide a "hint" about how to solve the current problem. Without the prompting to use prior training, most participants failed to apply their previous learning to the current task. The takeaway here is that distant transfer is relatively infrequent, and often requires environmental supports such as prompts or reminders.

Of course, there is a degenerative case of near transfer: practice over time on the same task. Here the training situation and the transfer situation are identical. Not surprisingly, we find improvement on a task with practice. The improvement is quite predictable: time to solve a task improves according to a power law (Newell & Rosenbloom, 1981). This can be demonstrated in widely varying task domains such as number reduction (an artificial task developed by Thurstone [Thurstone & Thurstone, 1941] that involves iterative application of rules to reduce pairs of numbers to single digits; Gardner, Woltz, & Bell [2002]; Woltz, Bell, Kyllonen, & Gardner [1996]; Woltz, Gardner, & Bell [2000]), generating geometry-like proofs (Neves & Anderson, 1981), reading inverted text (Kolers & Perkins, 1975), and rolling cigars (Crossman, 1959).

This leads us to a generalization that we present in Figure 2. *The likelihood of positive transfer is a function of the similarity between the trained task and the transfer task.* If we wish to engage learners with an educational computer game, we should expect their learning will be bound to the context of training (to a large degree). So as developers of computer games, we should design our games to be as close to the actual end performance that we seek to develop. But how do games benefit learners if they are simply restatements of the end result we hope to train? First, they provide the learner with *practice*, and practice has been shown repeatedly to result in skill development. Second, they provide *feedback t*o learners about their performance. Feedback is most effective when it is immediate, and educational

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Relationship of likelihood of positive transfer to degree of task similarity between training environment and target task



games are able to provide feedback immediately by tracking learner performance and game moves. Finally, they provide *motivation* to engage in the learning process. Motivation is essential in situations where learning requires extended practice to develop a skill.

Finally, we would be remiss if we did not mention some research that has purported to demonstrate distant transfer from experience with video games (it should be noted that these games were not specifically educational in nature). Gopher and colleagues (Gopher, Weil, & Bareket, 1994; Gopher, Weil, & Siegel, 1989) trained Israeli Air Force cadets on a computer game (i.e., Space Fortress) that required players to balance six game component skills, as well as vary emphasis on certain component skills, in addition to playing the full game. A control group of cadets did not play the game or learn any of the component skills. When the two groups were later compared in their actual flight training, the game group outperformed the control groups on a number of measures. These differences extended to actual training in flying fighter jets, and were most pronounced in advanced flight maneuvers. Gopher et al. concluded was that "the emphasis-change elements promoted the development of skill components that could be transferred and generalized to flight" (Gopher, Weil, & Bareket, 1994, p. 401). This finding is intriguing, because it argues for broad transfer, which is extremely rare in the literature. If such transfer does exist, it would be because of overlapping elements at the very highest levels of cognition (control and deployment of attentional resources across competing task elements). While this is possible, it assumes that a complex process such attentional deployment is functionally the same between computer game playing and flying a jet plane, which seems a little hard to believe.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Green and Bavelier (2003, 2006; Green, Pouget, & Bavelier, 2010) have provided evidence that extended practice on action games (e.g., Medal of Honor) can result in improved visual attention in both the visual center and periphery. Their research showed advantages for serious video gamers both with and without a concurrent central task, ruling out a center versus periphery tradeoff in attention. Perhaps most provocative, they found improvements in attention for non-gamers after 30 hours of video game training. Other researchers have also found support for improvements in visual working memory (but not complex span memory) after action video game training (Blacker, Curby, Klobusicky, & Chein, 2014). It should be noted that many researchers have had difficulty replicating these findings, casting doubt on distant transfer. For example, Van Ravenzwaaij, Boekel, Forstmann, Ratcliff, and Wagenmakers (2014) found similar practice effects over testing for participants who engaged in video game training, cognitive game training, and no video game training; so, the conclusion of enhanced processing and attention due to video game play is equivocal. Boot, Blakely, and Simons (2011) have also cautioned against possible methodological weaknesses in many of the studies that have reported distant transfer with video gaming. They cite concerns such as overt recruiting of participants (creating demand characteristics), unspecified recruiting methods, no tests of perceived similarity between testing tasks and video games, and possible differential placebo effects. Overall, the current literature suggests caution in expecting distant transfer.

Other researchers have used video gaming in an attempt to improve cognitive decline among older adults, with mixed results. Basak, Boot, Voss, & Kramer (2008) found that training older adults in a real-time strategy video game produced improvement on tasks such as task switching, working memory, visual short-term memory, and reasoning compared to controls. Ackerman, Kramer, and Calderwood (2010), however, trained older adults using the Wii Big Brain Academy software, but found no significant transfer from the computer training to measures of cognitive and perceptual speed abilities. Again, distant transfer is found under some circumstances, but it seems difficult to replicate and is dependent on particular aspect of the training and the experimental design.

At this juncture, the research does not support a change in our recommendations to developers of educational video games. *If you wish to develop a skill or impart knowledge, create a game that closely matches the end state you wish to achieve.* The closer the target task is to training, the greater the likelihood of positive transfer (see Figure 2). Use the game to provide the learner with practice, feedback, and motivation to continue the learning process.

SOLUTIONS AND RECOMMENDATIONS

We have presented recommendations throughout this chapter, and we will summarize them again here. Educational game developers need to take into account the cognitive abilities of prospective learners when designing games. Younger learners have limited working memory and attention/executive control abilities. With regard to working memory, this requires that games developed for young learners should include: (1) fewer items to be held in working memory; (2) more explicit connections between things to be learned and previous knowledge (which is likely to be less extensive with younger age groups); (3) fewer expectations of prior knowledge of memory study and retrieval strategies; and (4) less of an expectation that the young child will have a well-developed knowledge of meta-memory (i.e., how their memory system works and what they currently know and don't know). The development of attention/executive function mirrors the development and decline of the prefrontal cortex over the lifespan, with its maximum efficiency occurring around age 30.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

With regard to attention/executive function, games developed for younger learners should: (1) be kept relatively simple, and try to avoid interference between early game experiences and later game experiences; and (2) should scaffold learning by providing contextual cues that reduce reliance on working memory and attention. Games developed for older, non-traditional learners should employ the same strategies as games developed for young learners. With late high school and college-aged learners, multiple game goals can be employed, but pilot testing with the target population is necessary to determine that the game's demands do not exceed the cognitive abilities of the intended learners.

The history of educational psychology leads to the conclusion that the greatest positive learning transfer occurs in situations when the target task is identical to the training task, due to the almost complete overlap of task elements (see Figure 2). Therefore, we recommend that the educational game be an embodiment of the skill the game developer wishes to teach. The greater the difference between training and ultimate goal, the smaller the amount of transfer that is likely to be found. Games can provide practice, motivation, and feedback, all essential elements necessary to continue the skill development process.

FUTURE RESEARCH DIRECTIONS

At the conclusion of the main section of this chapter, we discussed some provocative research that purports to show distant transfer from video gaming (Gopher, Weil, & Bareket, 1994; Gopher, Weil, & Siegel, 1989; Green and Bavelier, 2003, 2006; Green, Pouget, and Bavelier, 2010). These studies have been controversial, but there is a commonality among them: the distant transfer appears to be the result of training flexibility in attentional skills. Future research needs to confirm these previous findings, and, possibly, develop a theory of how to attain training and transfer of attentional processes. If such a theory could be developed, it might well be the "magic bullet" that educational psychologists have long sought.

KEY TERMS AND DEFINITIONS

Attention/Executive Function: The ability to maintain task goal information in mind in the face of distraction, conflict, or competing goals.

Declarative Memory: Memory for information that can be called into consciousness. Memory for factual information (e.g., George Washington was the first president of the United States of America).

Procedural Memory: Memory for information that cannot be called into consciousness. Memory for skills, priming, and classical conditioning are all procedural in nature (e.g., how to ride a bicycle).

Transfer of Training: The degree to which training on one task (the training task) produces improvement on a second task (the target task), which is measured after training has been completed.

Working Memory: A short-term memory system comprised of a central executive (associated with attention) and several slave sub-systems (associated with storage of items of a particular types such verbal-phonological, visuo-spatial, episodic). The key feature of working memory is that it deals with both the short-term storage of information and the processing of that information within the same cognitive system.

Chapter 22
Towards Cost-Oriented User-Friendly Robotic Systems for Post-Stroke Rehabilitation

ABSTRACT

This chapter deals with robotics for assisting patients in their recovery after stroke. The first section outlines the key physiotherapist movements that are needed in post-stroke treatment. Sets of experimental data are discussed for defining the main specifications for post-stroke rehabilitation devices. Then, a detailed overview is provided on the existing key achievements and solutions concerning rehabilitation robotics for post-stroke treatment. This section is followed by a detailed critical analysis aiming at the definition of new concepts for cost-oriented user-friendly solutions.

INTRODUCTION

In the next two decades, the current evolution in average life span and medical progress, will force a paradigm shift in the treatment of many diseases. Such is the case of stroke, a cardiovascular disease, which affects mostly the elder population (over 65) and has, as the most common consequence, a negative effect on the patient's capability of performing activities of daily living (ADL). From a medical standpoint, specific protocols exist, which attempt to correct these disabilities by performing specific drug, neurologic and physical therapy. One of the most common disabilities, which affects over 50% of the stroke survivors is hemiparesis (one side weakness) or hemiplegia (one side paralysis), namely the partial or total loss of the ability to control half of the body. This disability is treated by a physical therapist by using different techniques in a process called rehabilitation, which spreads in time up to two years after the stroke.

The Royal College of Physicians defines rehabilitation as a collaboration with limited time between a person with disabilities and professionals, plus other relevant people, to produce sustained reduction in the impact of disease and disability on daily life. The interventions are focused on the human, on the social or physical implications, or a combination of these, (RCF 2010).

In the current approach one therapist can attend only one patient at a time which limits the number of procedures that one person can undergo daily, thus having a negative effect upon the recovery process and progress. Unfortunately, based on the demographic shift estimates, the number of elderly people will increase, making it impossible for the medical system to deal properly with all of them. One possible answer here is a shift in the rehabilitation paradigm which involves the use of specialized devices to perform specific exercises with the patients, changing the role of the therapist to a supervisor which monitors and adapts the rehabilitation process for each individual, based on his/her specific needs and progress. The specialized devices which can perform these tasks efficiently are the rehabilitation robots. Currently multiple devices exist for both upper and lower limb, balance, gait and so on but there is a need for further development in this field aiming to achieve not only efficient but also cost-oriented devices that could be afforded by the medical systems of lower income countries. Rehabilitation robotics has become one of the strategic fields of research promoted all over the world in an attempt to gain sufficient knowledge and reach a good maturity level before the moment when demographics will force the shift from one-to-one therapy to personalized robotic assisted rehabilitation. If compared with conventional therapy via physiotherapists, rehabilitation robots can offer repeatable, controlled, and interactive training at a much higher intensity and pace (Housman et al., 2009).

This chapter presents a detailed overview of the current problems and progress in patient rehabilitation after stroke, illustrating some of the commercially available technologies for the rehabilitation of the lower limb, upper limb and hand, followed by on-going developments in different maturity stages. Several new solutions for the rehabilitation of the upper limb are illustrated along with an overview of the most important challenges and future research directions.

Note: performing multiple movements significantly affects the rehabilitation of post-stroke patients, as highlighted for example in (Klein et al., 2008). However, research in fully understanding the relationship between limb training and recovery is still undergoing, as pointed out for example in (Yoo, D. H., Kim, S. K., 2015). Additionally, besides existing protocols, such as (Vaida, et al., 2017), significant research

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

is carried out towards defining and understanding what is the most effective rehabilitation protocol, (Vaida, et al., 2017).

BACKGROUND

A stroke, as defined by the World Health Organization (WHO), is a "neurological deficit of cerebrovascular cause that persists beyond 24 hours or is interrupted by death within 24 hours". In simple terms, a stroke will cause either a burst or a blockage in a blood vessel inside the brain which will lead to the temporary or permanent loss of the brain functions from the affected region, the damage being influenced by the blood vessel size and medical reaction time. Some recent numbers published on the WHO page in September 2016, reveal that in 2012 there were 6.7 million deaths registered due to stroke with over 75% being registered in the low- and middle-income countries. However, a mortality study published by the Romanian government shows that Romania, which trails behind the advanced European countries, registered an average of 18.6% decrease in stroke deaths from 2006 and 2010. Quoting from the Multi-Annual Report (MAR, 2015):" It is estimated that in the EU the proportion of the population aged over 65 will rise from 17.1% in 2008 to 30% in 2060 and that the proportion of persons aged over 80 will rise from 4.4% to 12.1% over the same period (EUROSTAT population projections). Neurological conditions, especially stroke, are a major cause of disability among older people. Incidence of a first stroke in Europe is about 1.1 million and prevalence is about 6 million. Currently, about 75% of stroke sufferers survive one year after…approximately 80% of stroke patients experience long-term reduced manual dexterity and half of all patients with neurological conditions are unable to perform everyday tasks."

Another recent study published in Spain (Lopez-Espuela, 2016), reveals that out of the 175 stroke patients admitted in a medical center in acute post-stroke phase, 22 have died and 110 (62.9%) suffered hemiparesis or hemiplegia.

Stroke is the first cause of long-term disability in the United States, about 3% of men and 2% women were reported having a long-term disability after they suffered a stroke. (Benjamin, et al. 2017)

The main objectives of stroke rehabilitation are to regain independence and improve the quality of life by improving the capacity of the patient to perform activities of daily living (ADL). (Sullivan, Schmit &Fulk, 2014)

Stroke rehabilitation support is achieved by a professional team which targets multiple areas, starting with the improvement of the patient's physical impairments, and continuing with cognitive, emotional, and vocational skills. (Clarke & Forster, 2015)

Generally, when discussing about physical rehabilitation the motions that a physical therapist performs are complex, working on the mobilization of each joint which are sometimes difficult to replicate with a robotic device but, in some cases there are reports which emphasize the advantages of existing robotic devices. Such is the case of devices for gait rehabilitation, which can more easily support the weight of the patient in comparison to a person, and because of their repeatability, tirelessness and ability to quantitatively assess rehabilitation effectiveness with high accuracy, (Patton, Kovic, Mussa-Ivaldi, 2006) can provide better physiotherapy training than ordinary physiotherapists.

The market for rehabilitation robots is continuously increasing. The use of rehabilitation robots in hospitals and ADL is increasing in the US and European countries. Due to the high demand of rehabilitation robotic devices, the market is expected to increase to 24.27% by 2019 (Chen et al., 2015) Based

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

on another market research, a rehabilitation robot market size value of 37.2 million euros was registered in 2014 and has expectations to grow up to 1.6 billion euros by 2020. (Winter Green Research [WGR]).

As an overview of the current trends at an international level reference is made to the documents which define the critical domains where the development of robotics represents a necessity in the next years. Healthcare is among the most important areas where robotics systems can enhance the level of medical care that can be provided for patients. With reference to neuro-rehabilitation, the Multi-Annual Roadmap (MAR, 2015) shows an increase in the implementation of robotic solutions which is however insufficient. Their report makes reference to statistical data which forecast very important demographic changes in the next decades. Nowadays the ratio between elderly, retired people and the active (working) population is around 26.8% (one elderly person for every four working persons) whereas in 2060 this ratio will increase to 52.6% (one elderly person for every two working persons). These demographic changes will generate automatic modifications to the expenses in population healthcare (a higher number of pensions and people requiring medical services, increased number of medical personnel and so on) which will put pressure upon the economic development and sustainability of economies worldwide. Furthermore, EUROSTAT studies show that in 2011 20.5% of the elderly European population (EU 27) live in poverty at the border of social exclusion (Bulgaria – 61.1%, Romania – 35.3%, Greece – 29.3%, Portugal – 24.5%, Italy – 24.2%) which shows that with a decrease in the funding allocated for healthcare or an increase in the healthcare costs, this category of people will suffer even more, leading to economic crises which will not be sustainable causing a domino effect with global implications. This data demonstrates once more that actions must be taken before it is too late. The same European document, the Multi-Annual Roadmap (MAR, 2015), points out the fact that the utilization of robotic systems in post-stroke rehabilitation along other neurologic pathologies (Parkinson, Multiple Sclerosis, ataxia) proved to have positive effects (in many cases higher than traditional therapies). Some of the necessary characteristics of these robotic systems are: sustainable production costs, clinical validation, proper protocols for the evaluation of patient progress, large scale implementation strategies.

From the medical point of view post-stroke patient rehabilitation covers three large periods of time, with the general consensus that progress in functional recovery is obtainable in a period of up to two years after which only progress preservation can be achieved. These time periods represent the acute phase which covers a period of up to three months after the stroke, sub-acute phase which extends up to six months post stroke and the chronic phase which spreads up to two years. In each phase, the patients have specific needs and rehabilitation is achieved differently being highly dependent on the patient progress.

Taking into account that currently over 75% of the stroke patients survive one year after the stroke and that the large majority of them (over 80%) experience a certain level of physical disability, the target population which could benefit from robotic rehabilitation is extremely high and will increase even more due to the continuous increase of average life expectancy. As in the next years the available number of physical therapists will no longer be able to provide proper medical care to this population segment, a general conclusion emphasis a big gap between the actual demands in rehabilitation and the available solutions, a gap which extends with time. This raises not just the opportunity but the necessity to act fast towards the development of new rehabilitation solutions, in an economically feasible environment capable of supporting stroke patients in each stage of rehabilitation starting from the acute post-stroke phase which takes place in hospitals, followed by longer stages which can take place in day care centers and home environment.

COMMERCIAL DEVICES

Upper Limb

InMotionArm (Duret, Courtial, Grosmaire & Hutin, 2015)

It is made by Bionik Laboratories Corp.

InMotion ARM Dimensions: Workstation: 1.12m(W) x 1.85m(D) x 1.2m(H) at lowest position. Allows 81cm for the chair. Weight 83kg. Electrical Requirements 100-240VAC, 50/60Hz, automatic < 1250VA.

This device is a 2 translational degrees-of-freedom planar robot that focuses on shoulder (flexion/extension) and elbow (flexion/extension) motions in the horizontal plane. It was planned to have low intrinsic end point impedance with a low inertia. It allows clinicians to efficiently deliver optimum intensive sensorimotor therapy to the shoulder and elbow to achieve the development of new neural pathways. The InMotion ARM is an interactive rehabilitation technology that senses patient movements and limitations, providing "assistance-as-needed" in real-time. This robotic device can provide a serious number of treatment types, including an adjustable (or assist-as-needed) program using a performance-based algorithm that adapts forces to assist or challenge the patient's motions according to his/her motor performance. Especially, if a function cannot be completed in a voluntary manner, then the robot helps the patient to reach the target. The point-to-point unrestricted reaching program is mostly used for the evaluation of kinematic motions.

Advantages: It is able to execute the following motions: shoulder protraction/retraction, shoulder internal/external rotation and elbow flexion/extension, it is an accurate device, it is able to improve the patient's range of motion, eye-hand coordination, strength, movement speed, movement smoothness. It is easy to use, it can be accessed directly from a wheel chair and patient progress reports can be printed directly from the robot.

Drawbacks: Being a planar robotic device it allows the human limb to achieve motions in a three-dimensional space but it is heavily limited by the structure.

Bi-Manu-Track (van Delden, Peper, Kwakkel, & Beek, 2012)

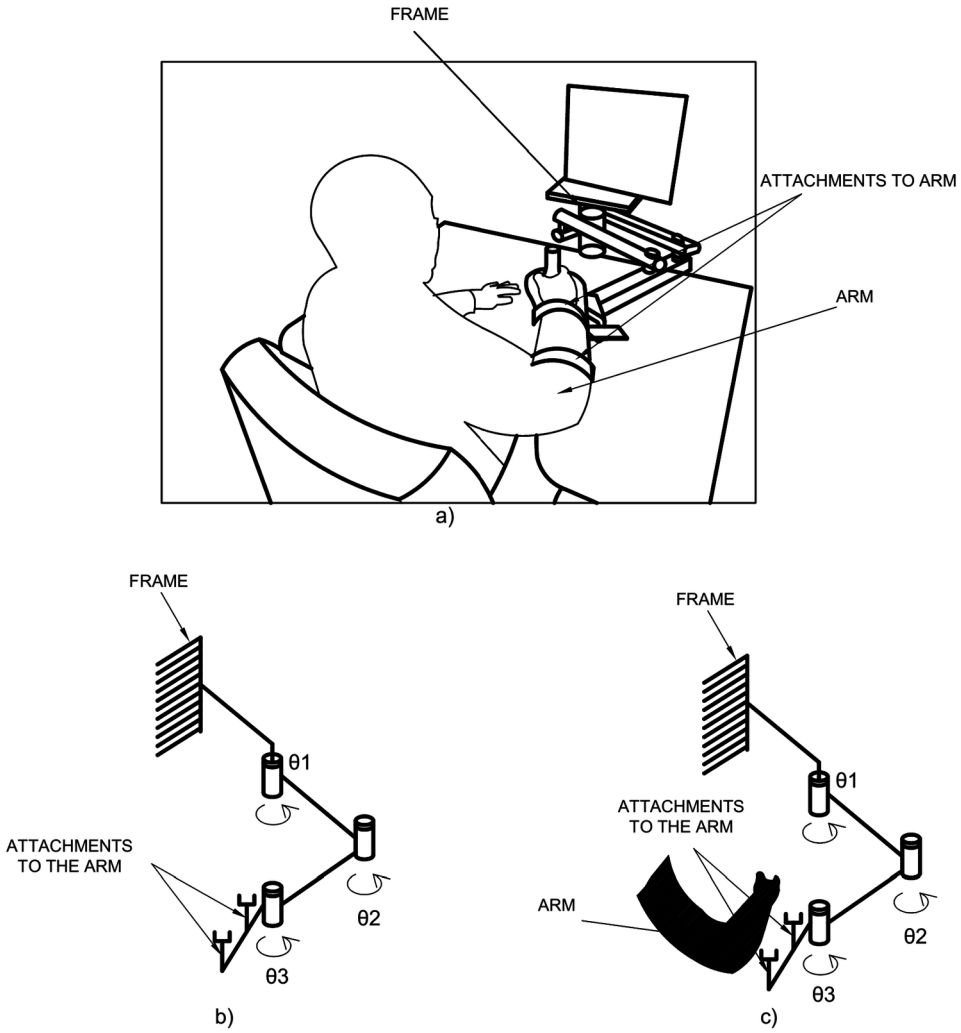
It is produced by Reha-Stim Medtec Gmbh, it is designed especially for both sides of the human musculoskeletal system. Lost movements are regained with the help of the healthy side. The stand-alone therapy permits full concentration on the pertinent brain areas in the affected treatment area.Passive and active therapy offers, two different training movements: forearm pronation and supination, wrist extension/flexion.

Power supply: 230V/50Hz, servo motor driven operating panel, has an individually adjustable resistance, amplitude and speed of arm movement, height adaptable table and arm rest (25x18x13cm).

Dimensions: height:72-105cm, width: 85 cm, depth:90cm (including table), weight 51kg.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. InMotionArm prototype (Duret, Courtial, Grosmaire & Hutin, 2015); a) a general scheme b) a kinematic scheme; c) a kinematic scheme with arm attachments



The Bi-Manu-Track is an automated motor-driven arm trainer that permits bilateral training of two movement patterns: forearm pronation and supination and wrist flexion and extension. To change between movement patterns the device can be rotated by 90°. The Bi-Manu-Track is suitable for three computer-controlled modes of practice. In the passive-passive mode the robot device commands both arms. In the active-passive mode the less affected upper limb actively moves the handle while the robot moves the most affected upper limb. In the active-active mode both arms execute the motions actively by overcoming an initial isometric resistance. Movements can be either mirror-symmetric (in-phase) or parallel (antiphase). Amplitude, speed, and resistances can be set individually.

Advantages: The robot device is simple and easy to use, low cost and permits bilateral exercises.
Drawbacks: Because of the involvement of the healthy limb, the projections to the paretic muscle can be affected.

ArmeoPower

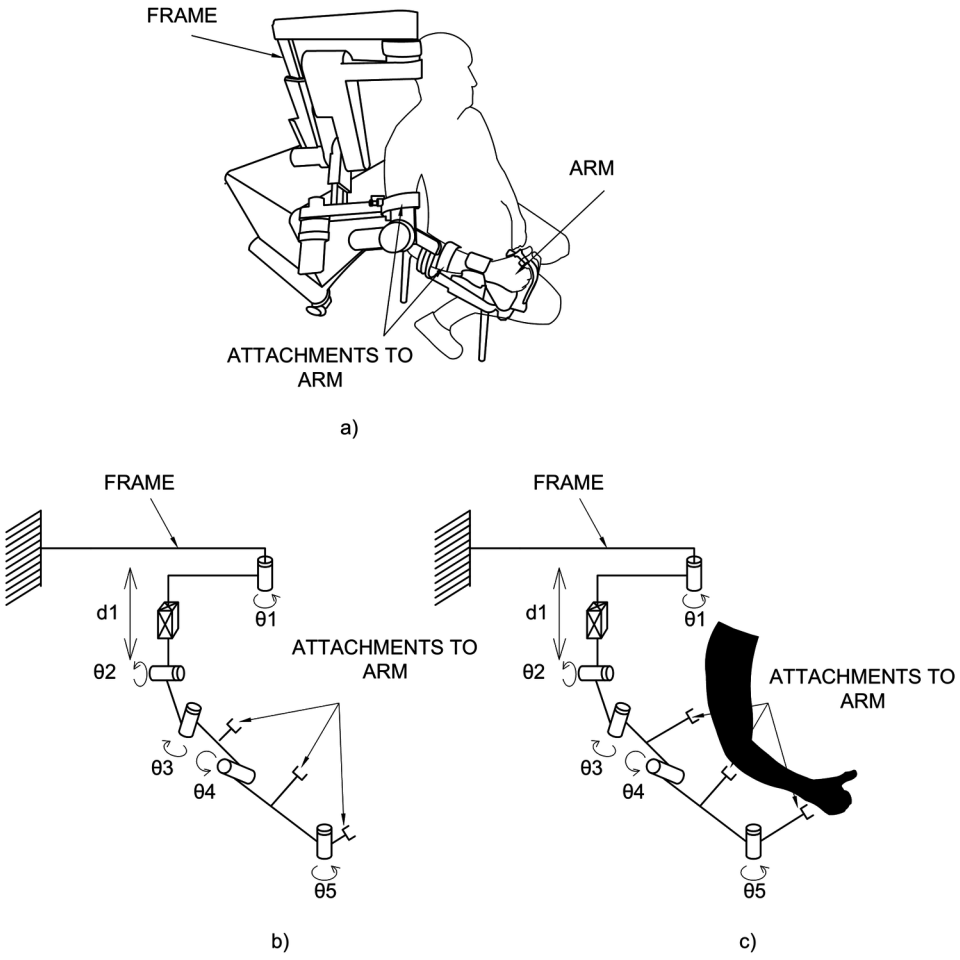
ArmeoPower (Hocoma Web Page) [HWP] 2016) is made by Hocoma AG, Switzerland, and is a rehabilitative exercise device for upper extremity therapy. The main component of the Armeo Power consists of a motorized arm orthosis that is able to sustain the weight of a patient's arm, it can also assist the patient during specific training in a large 3D workspace. The Armeo Power does specific exercises for increasing the strength of muscles and the range of motion of joints in order to improve motor functions.

The motorized arm orthosis with 6 DOF reaches a large 3D workspace. Dimensions 2.7 m (l)x0.8 m (w) x 1.65 m (h), weight: approx. 205 kg. It can be adapted to patient sizes with an electric lifting column (range: 400 mm), forearm lengths (elbow to handgrip): 310-420mm, upper arm lengths (shoulder to elbow): 250-340mm, maximum weight of patient can reach 135 kg. It has an optional module named ManovoPower that is a mechanized hand module which supports the opening and closing of the hand in reach and grasps movements.

Advantages: Allows patients to get early treatment of motor disabilities, enabling patients to perform repetitive, intensive, and goal-oriented exercises.
Drawbacks: The price is high, about 250000 euros.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. ArmeoPower prototype (van Delden, Peper, Kwakkel, & Beek, 2012); a) a general scheme b) a kinematic scheme; c) a kinematic scheme with detail of arm attachments



ArmeoSpring

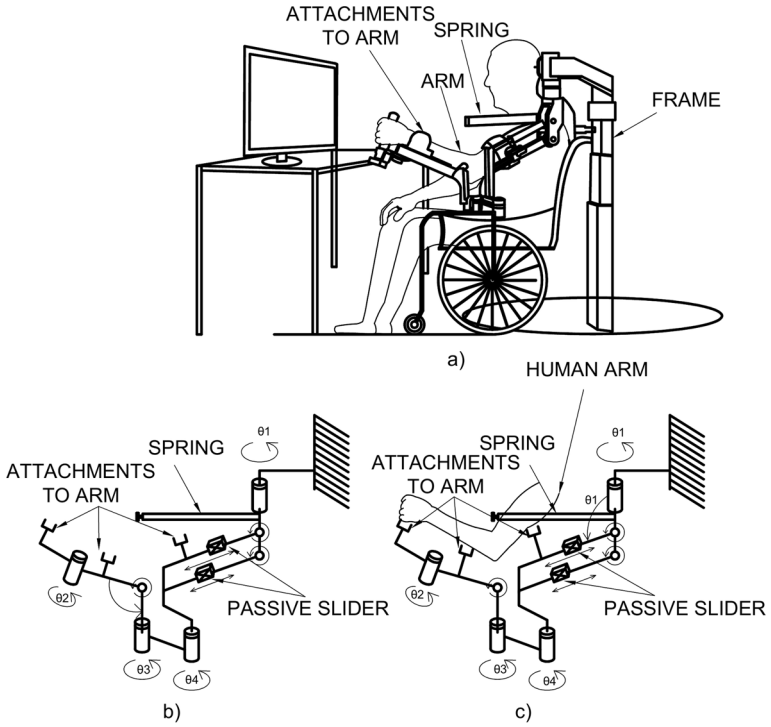
ArmeoSpring (HWP, 2016) is made by Hocoma AG, Switzerland, it is an instrumented arm orthosis with a spring mechanism for an adjustable Arm Weight Support in a large 3D workspace that can be used as a real-time input device to the associated therapy software ArmeoControl. The aim of ArmeoSpring is to provide functional therapy for patients who have impaired upper limbs due to cerebral, neurogenic, spinal, muscular or bone-related disorders.

Device's dimensions: 81 cm (l) x 75 cm (w) x 85-125 cm (h), weight: max. 82 kg, room requirements: 3x3x2m (l x w x h), temperature: 10°C-30°C. Forearm lengths 290-310mm, upper arm lengths:220-310mm.

It has a 5 degree-of-freedom (3 in the shoulder, 1 in the elbow, 1 in the forearm) orthosis without robotic actuators, a so called passive system. The adaptable mechanical arm permits variable levels of gravity support by means of a spring mechanism. This allows patients, using residual upper limb function, to reach a bigger active range of motion (ROM) within a 3-dimensional work volume than is possible without support.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. ArmeoSpring prototype (HWP, 2016); a) a general scheme b) a kinematic scheme; c) a kinematic scheme with detail of arm attachments



Advantages: Permits customized patient's therapy, feedback exercises have been designed to train core movement patterns that are used in activities of daily living.

Drawbacks: Being a passive system, the robotic devices address patients with mild moderate chronic impairment of the upper limb following a stroke, so this robotic system can't be used for patients with severe hemiparesis.

Lower Limb

G-EO-System (Hesse, Waldner, &Tomeller, 2010)

The robotic device is built on the end-effector principle, the trajectories of the foot plates are freely programmable allowing not only the practice of simulated floor walking but also up and down stair climbing.

Its design characteristics are as follows: Length: 406 cm, Width: 124 cm, Standard height: 280 cm, Reduced Height: 260 cm, Weight: 900 kg, power Supply: 110/230 V. The device adopted the end effector principle. The harness secures the patient that stands on two-foot plates, whose trajectories were completely programmable. The two-foot plates have each been connected via a pivoting arm to two moving sledges. The foot's forward motion was given by the movement of the main sledge, which was connected to the transmission belt of the linear guide. The transmission belt was driven by a 1.500 W servomotor mounted in the back end of the linear guide. The robotic system is used to improve the floor walking and stair climbing of patients that suffered a stroke. The G-EO-System robot device patent is held by Reha-Technologies GmbH.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

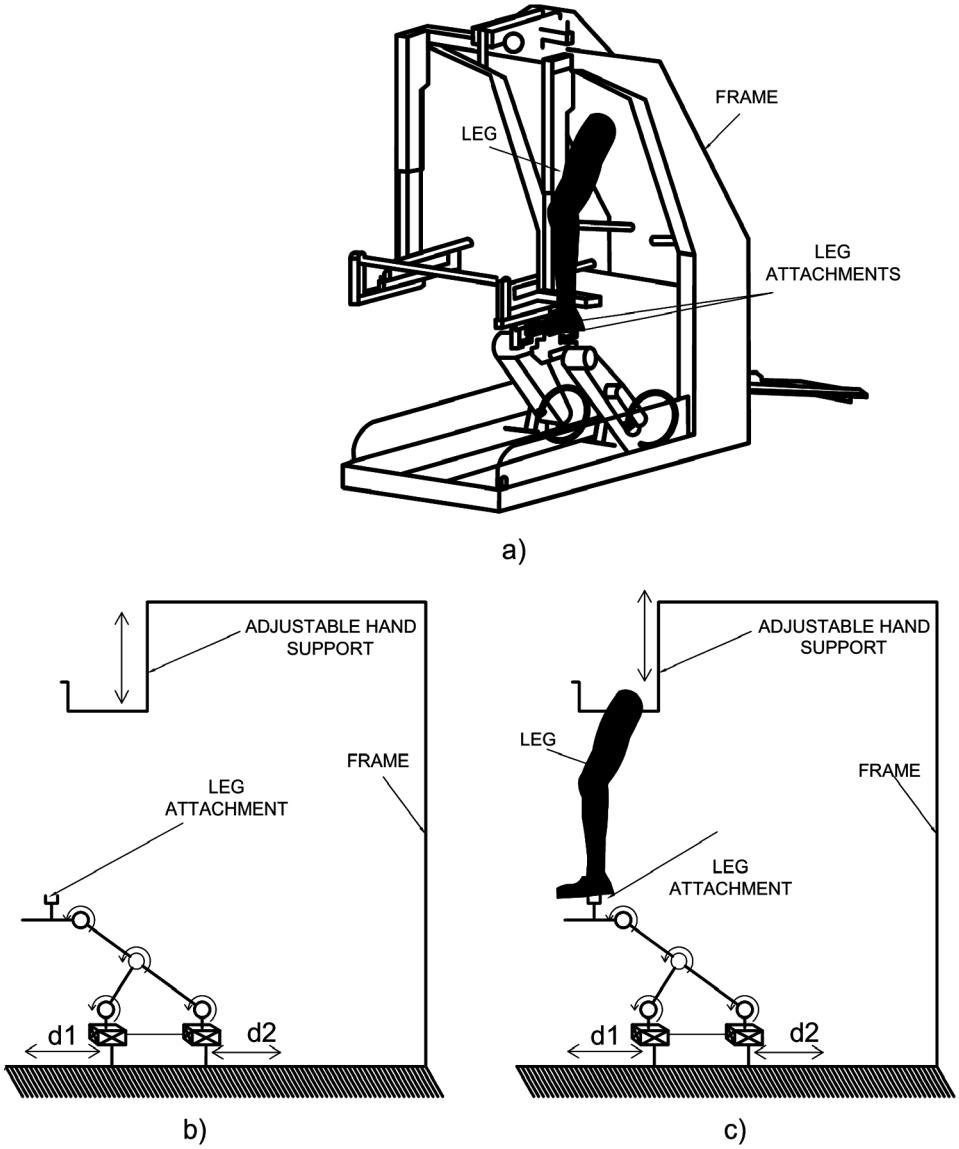
Advantages: Easy for patients to use, G-EO system can simulate walking on level ground and stair climbing, quick setup and easy patient handling.

Drawbacks: It doesn't have a virtual reality interactive training module; this detail could help patients increase their motivation during the therapy exercises.

HAL-5 (Type-B) (Hybrid Assistive Limb) (Sankay, 2007)

This exoskeleton was developed by the University of Tsukuba, Japan and it's produced by CYBERDYNE Inc. The exoskeleton helps in daily activities, heavy work and also entertainment.

Figure 5. G-EO-System prototype (Hesse, Waldner & Tomeller, 2010); a) a general scheme b) a kinematic scheme; a kinematic scheme with detail of leg attachment



EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The Robotic Suit HAL is a cyborg type robot which can enlarge, augment and sustain physical capacity. The robotic device HAL has two kinds of control systems such as "Cybernic Voluntary Control System" and "Cybernic Autonomous Control System". The application fields of HAL are medical well-being, heavy work support, entertainment etc.

The exoskeleton has the following specifications: Height 1,600mm, Weight Full Body Type approx. 23kg (Lower body approx. 15kg), Battery Drive Charged battery (AC100V), Continuous operating time Approximately 2 hours 40 minutes, Motions Daily Activities (standing up from a chair, walking, climbing up and down stairs), hold and lift heavy objects up to 70kg, Hybrid Control System (Cybernic Control: Cybernic Voluntary Control, Cybernic Autonomous Control), indoor and outdoor usage.

Advantages: It is a wearable and portable device that confers the patients significant aid in rehabilitation gait training.

Drawbacks: It has a limited torque, it is heavy and can't be used by paralyzed patients.

Figure 6. HAL-5 (Type-B) (Hybrid Assistive Limb) prototype (Sankay, 2007); a) a general scheme b) a kinematic scheme; c) a kinematic scheme with detail of leg attachment

AlterG Bionic Leg (Li, Ding, Chen, Mao, Huang, Li 2015)

This is an advanced and dynamic lower extremity orthosis that is battery-powered and wearable. It intends to increase existing muscle strength, it gives sensory inputs (i.e. auditory and sensory feedback) and mobility support for users with disability at the lower-extremity functions during rehabilitation. The ROM and quantity of support provided by the Bionic Leg is personalized through the device settings. These parameters are determined by the clinician.

The robotic device has a weight of 3.5 kilograms and an internal sensor that detects the user's foot pressure. The orthosis provides forward propulsion when the users generate enough force on their paretic knee. The RLO (robotic leg orthosis) delivered support with extension (during standing posture, forward gait, and so on), controlled flexion (during standing to sitting posture), and free movement (during the swing period).

Three types of settings on the robotic device can be modified: threshold (the minimum force necessary to activate the device), assistance (the percentage of body weight provided through the limb during extension in the stance phase of the gait cycle), and resistance (level of resistance during flexion on the stance phase of the gait cycle). The robotic device's support physiotherapy training procedure was built respecting a motor control learning theorem that included fifteen sessions held five times per week for three weeks

Advantages: It is a lightweight wearable device which assist the patient with the impaired leg by helping the user to relearn gait support, it also helps patients to place the body weight on the healthy leg.
Drawbacks: Battery life gives limited daily usage.

Figure 7. AlterG Bionic Leg prototype (Li, Ding, Chen, Mao, Huang, Li); a) a general scheme; b) a kinematic scheme; c) a kinematic scheme with leg attachment

Hand

AMADEO Hand-Therapy System (Sale, Lombardi, Franceschini 2012)

AMADEO is made by TYROMOTION GmbH Austria, it is a modern mechatronic finger-hand therapy system for the rehabilitation of patients with motor disability in the distal upper extremity. The AMADEO system is made up of the hand unit, that contains the electrically powered movement mechanism, the hand-arm support, finger supports and finger plasters, a height-adjustable load-bearing frame with table surface, control panel and a PC-based control and operating unit for configuring therapy parameters.

The AMADEO system has the following specifications: power supply 110-240V a.c., supply frequency 50/60Hz, electricity/power consumption 1,83-4A/440W, supply voltage for motors 24V d.c,, max speed 210mm/sec, nominal power of motors 3watts/motor, max. power of motors 30N/Motor, max. permissible finger strength 30N, measurement range strength sensors ±20N, weight 60kg, dimension(WxLxH) 1160x754x1209 (mm) collapsed, 1160x754x1589 (mm) extended.

The Amadeo robot has got 5 DOFs and supplies the motion of one or all five fingers, due to a passive rotation joint placed between fingertip and an entity moving laterally; (the thumb has got two passive rotation joints). All five translational DOFs are independent and provide large coverage of the fingers workspace (but not all of it is covered). The interface between the human hand and the machine is realized thanks to elastic bands or plasters, and the wrist is restrained from the movements by a Velcro strap.

Advantages: This robotic system covers the human hand fingers workspace and performs an intensive training having a high frequency of gripping movements. It can be used even for patients with severe hemiparesis.

Drawbacks: It is a fixed system it is not wearable, it cannot be complementary with a robotic system for upper limb rehabilitation.

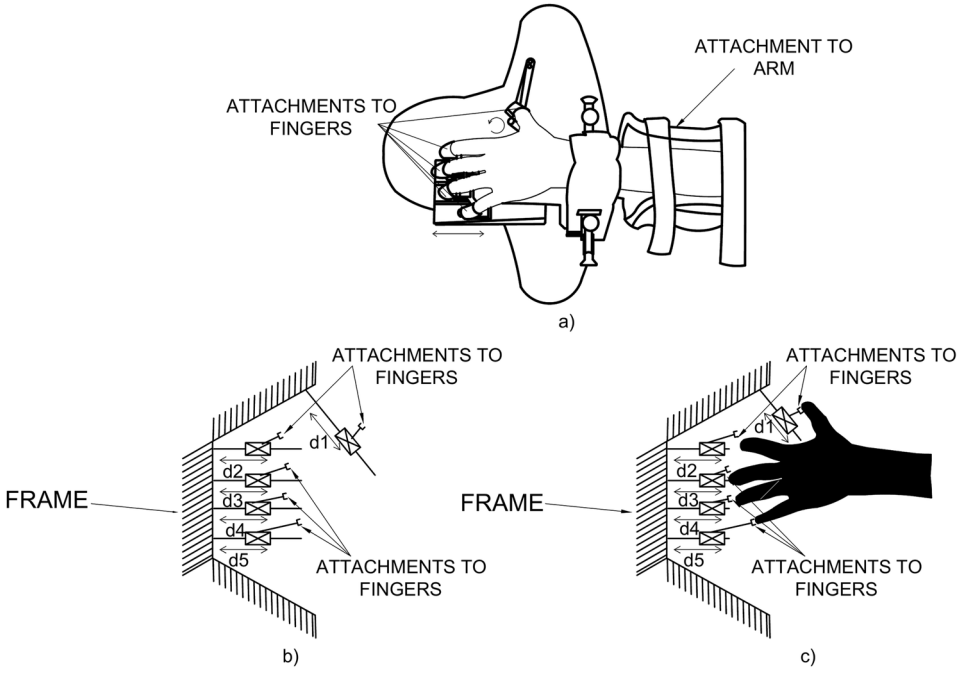
YouGraber (Shuster-Amft et al., 2014)

YouGrabber is made by YouRehab, Switzerland, it helps patients with sensory-motor and cognitive impairments during rehabilitation. It delivers bi-manual training exercises with a focus on visuomotor finger, hand and arm coordination. The interactive physiotherapy is using Virtual Reality technology and can be done even in a three-dimensional environment.

At the beginning of every training session the system is adapted to the patient's current abilities. Particular settings in every training application allow the training difficulty and content to be quickly and easily adapted to the patient's progression and therapy needs. The Auto mode allows an automatic adjustment of the software's difficulty and always ensures an optimal challenge. The software is in accordance with state-of-the-art therapy approaches and mirror therapy is also possible. The training software induces the patient to train intensively, using the following available training targets: Arm pronation and supination, arm lifting and lowering, hand and finger extension, grasping movements, selective fine finger movements, wrist flexion and extension elbow flexion and extension, divided attention, reaction time, visual attention, concentration and visual information processing.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 8. AMADEO Hand-Therapy System prototype (Sale, Lombardi, Franceschini 20012); a) a general scheme b) a kinematic scheme; c) a kinematic scheme with detail of hand attachments



Advantages: The YouGrabber is a wearable, adjustable device that can be adapted in every training session based on patient's current abilities. The training software provided with the system can be used on an usual personal computer for interactive therapy training at home or in a clinic.

Drawbacks: It is designed to move only 3 fingers.

CyberGrasp (Cyber Glove System Web Page[CGSWP] 2014)

The CyberGrasp system, made by CyberGlove Systems LLC, San Jose, CA, USA, is an innovative force feedback system for the fingers and hand. It allows patients to "reach into a computer" and grasp computer-generated or tele-manipulated objects.

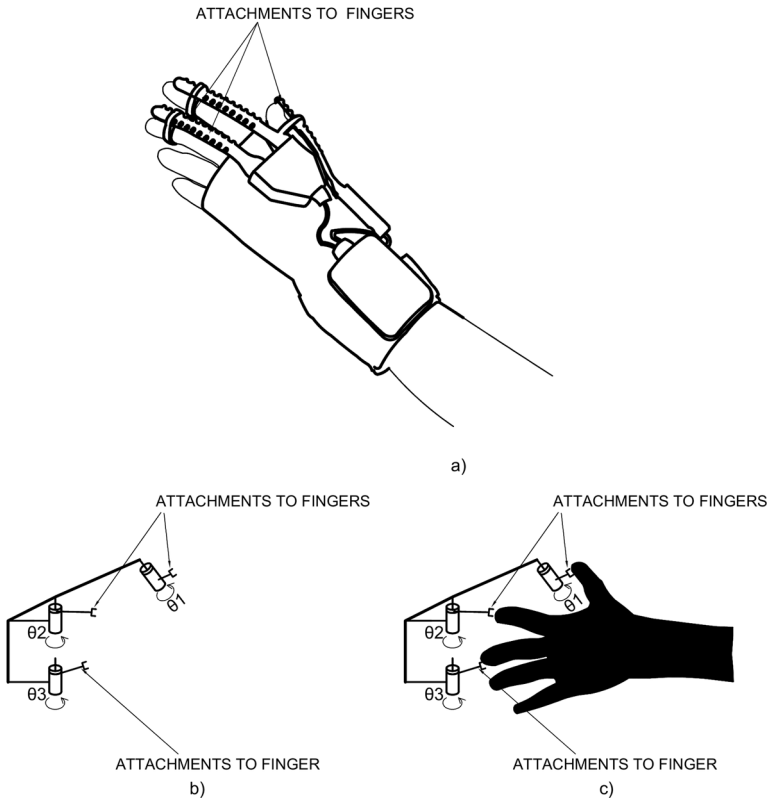
It has a force of 12 N per finger (max, continuous), Weight: 454 g (exoskeleton without CyberGlove system), Workspace: 1-meter spherical radius from the Actuator Module.

Grasp forces are generated by a network of tendons routed to the fingertips via the exoskeleton. It has five actuators, one actuator per finger, which can be one by one programmed to prevent the user's fingers from penetrating or crushing a virtual solid object.

The device exerts grasp forces that are roughly perpendicular to the fingertips throughout the range of motion, and forces can be specified individually. The CyberGrasp system allows full range-of-motion of the hand and does not obstruct the wearer's movements. The device is fully adjustable and designed to fit a wide variety of hands. The CyberGrasp system exerts grasp forces perpendicular to each fingertip, allowing full range of hand motion without restriction. The CyberGrasp system is fully adjustable and designed to accommodate a wide variety of hand sizes.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 9. YouGraber prototype (Shuster-Amft et al., 2014); a) a general scheme; b) a kinematic scheme; c) a kinematic scheme with hand attachment



Advantages: Due to the cable driven actuation system the robot can reach a continuous force of 12N per finger. It can be used in different domains for example in haptic rehabilitation and in the training of the visually impaired.

Drawbacks: the system is pretty complex and has a limited workspace from the actuator module; the price is also an inconvenience, around 34000 euros. Also, with the weight of exoskeleton being 454 grams it is not easy to use the system for a certain amount of time.

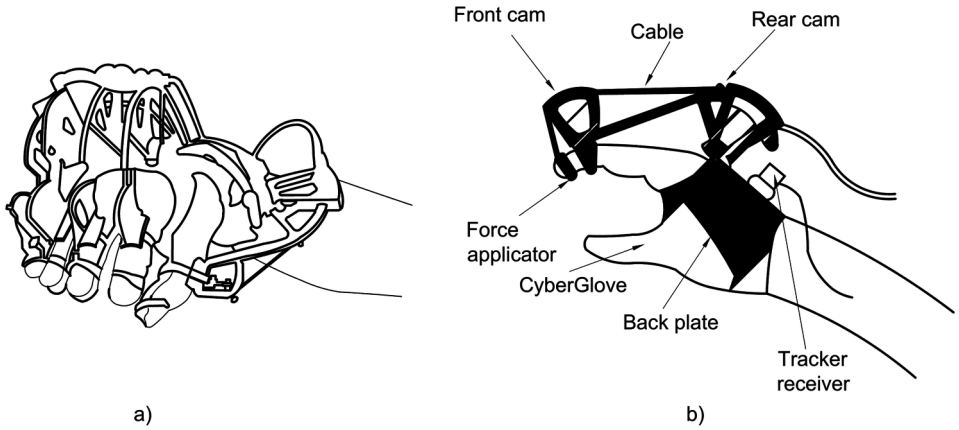
CONCEPTUAL DEVICES

Upper Limb

Robotic systems for rehabilitation are mainly classified in two large categories: end-effector based and exoskeletons (Figure 11) (Loureriro, Harwin, Nagai, & Johnson, 2011) the end-effector based robotic systems for rehabilitation interact with a patient through a single lateral attachment point on the patient's hand. These types of robots are rather simple and can be easily adjusted to different sizes and shapes of the patient's upper limb (e.g. MIT-MANUS (Hogan, Krebs, Charnnarong, Srikrishna, & Sharon, 1992) and ARM-Guide (Reinkensmeyer, Dewald, & Rymer, 1999). Because of their architecture which allows

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 10. CyberGrasp prototype (Cyber Glove System Web Page[CGSWP] 2014); a) a general scheme b) a functional scheme



only the control of the end-effector tip, it is rather difficult to control a certain single joint of the upper limb of the patient, which is why at least another anchor point is usually needed for rehabilitation training.

If not mastered well, this deficiency could cause serious lesions of the patient's joints, which is a serious problem especially for 3D spatial robots.Two types of robots were designed: table-top robots that are able to perform 2D planar training: e.g. MIT-MANUS (Hogan et al, 1992) or Braccio di Ferro (Casadio, Sanguineti, Morasso, Arrichello 2006) and multi-robots that can perform the predesignated exercises of the wrist, elbow and shoulder at the same time or separately (e.g. REHAROB (Tóth, Arz, Fazekas, Bratanov, Zlatov, 2004) and iPAM (Jackson et al., 2007).

A number of end-effectors were developed to address the mirroring concept, namely to achieve the bilateral rehabilitation training (Figure 11), which supposes that the affected arm imitates the healthy or the less affected arm to perform synchronous training exercises assisted by the robots (e.g. MIME (Lum, Van der Loos, Shor, Burgar, 1999), Bi-Manu-Track (Hesse, Schulte-Tigges, Konrad, Bardeleben, Werner, 2003) and Driver SEAT (Johnson, Van der Loos, Burgar, Leifer,1999)).

An exoskeleton robot encloses the upper-limb into the bionic-construction to control its motion. Because of its enclosed mechanism, exoskeletons can completely control all joints of the upper- limb and determine how much torque is needed to actuate each upper-limb joint separately. (Sheng, Zhang, Meng, Deng, Xie, 2016) Moreover, exoskeletons require less working space compared to end-effectors when achieving the same therapeutic exercises. In any case, this capsule structure means that the joint axes of upper-limb are pre-determined, and mechanical singularity will happen if the robots' axes do not align correctly with the patients' upper-limb anatomical axes (Yang, Cao, Zhao, 2013). Both end-effector based robots and exoskeletons in Figure 11 can be actuated using wires, that are connected to a splint, becket or even the exoskeleton, to support the body weight, to control the height, torque and orientation of the upper-limb (e.g. Swedish Helparm (Kinsman Enterprises Product Catalog Web Page, [KEPCWP]) and NeReBot (Masiero, Celia, Rosati, Armani, M 2005)).

Lately, an increased number of robots were designed for bilateral exercise (mirroring), specifically for upper-limb stroke rehabilitation. Cauraugh (Cauraugh, Summers, 2004) and Stinear (Stinear, J., Byblow, 2002) further reported that the activation of the damaged hemisphere could be assured through simultaneous motions of the damaged arm and the less damaged/unaffected arm. (Sheng, et al., 2016)

Biomimetic Orthosis for the Neurorehabilitation of the Elbow and Shoulder (BONES) (Klein et al., 2008)

The authors have proposed a robotic structure having a light weight and a robust force control using a parallel robotic device with mechanically grounded actuators. This enables the use of large, direct-drive actuators since the weight of the actuators themselves is not important. The key feature in the design of BONES consists in the human forearm. The parallel device mechanism allows a 3 DOF shoulder motion, including shoulder internal/external rotation. To allow the elbow flexion/extension, the robot includes a serially-placed actuator for elbow flexion/extension.

The upper arm exoskeleton reproduces the upper arm motion via a spherical joint rotating around the shoulder. The arm is anchored at the elbow and moved by means of two passive sliding rods.

The authors have used pneumatic cylinder actuators to achieve the movements described above. In this study, the inverse kinematics has been used to determine the cylinder coordinates required to produce a desired motion of the end-effector.

The weight of the upper arm exoskeleton is 3438 g (including the elbow actuator). The weight of the forearm exoskeleton module is 921g leading to a total arm weight of 4359g. So, the mass of the exoskeleton is comparable with a human upper limb mass that is around 4220g, in average across sexes.

Advantages: Allows naturalistic motion of human arm using mechanically grounded, direct drive actuators at the shoulder.

Drawbacks: It is not wearable and can be used only in clinics thus not for ADL.

Rocker (APBT)

The Rocker is a rehabilitation device that allows active–passive bilateral motion exercise (APBT, Stinear and Byblow (Stinear, Byblow, 2004)), that is an upgraded version of Hand-Object-Hand system (H –O –H, Lum P. S. et al. (Lum, Reinkensmeyer, Lehman, 1993), (Reinkensmeyer, Lehman, Lum,1993)). The robotic device has two connected crankshafts which are placed on a table that connects to two manipulators (Stinear et al., 2004) and can provide symmetrical or asynchronous trainings (60 ° phase lag) for wrist flexion/extension movements in horizontal plane (Figure 13). This robot system allows actively moving the unimpaired upper limb and can passively move the impaired upper limb in either a synchronous or (60 ° phase lag) asynchronous mode. Compared with the Hand-Object-Hand system, this device supports active training mode, which is important for nerve and coordination recovery (Sheng, et al., 2016).

Advantages: It is a good device which helps patients to improve wrist flexion/extension. Based on mirror symmetrical coordination the less impaired limb can passively move the most impaired limb.
Drawbacks: It allows only planar flexion/extension of wrist.

Self-Controlled Master-Slave Robot

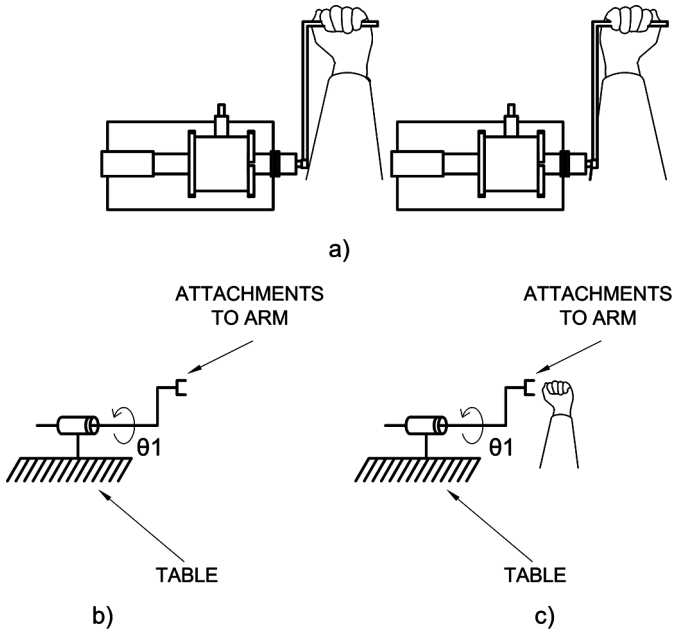
The Self-controlled Master-Slave Robot was developed starting from the ideas of the Bimanual Lifting Rehabilitator (Lum, Lehman, Reinkensmeyer,1995) and Hand Robotic Rehabilitation Device (Rashedi, Mirbagheri, Taheri, Farahmand, Vossoughi, Parnianpour, 2009), which is composed of two identical terminals for elbow flexion/extension movements (SCMSR, Li C.G. et al. (Liu, Li, Inoue, Shibata, 2010). Two adjustable handles are coupled to the terminals with two identical motors. To measure the torque the authors have used two torque transducers and one strain gage signal amplifier (Figure 14). The motor on which a larger force is applied (by the healthy upper-limb) acts as the master and the other one as slave and guides the impaired limb. The device can support three training types: 1) passive-driven mode: the impaired upper-limb will be passively handled and moved by the robot; 2) active-assisted mode:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the impaired upper-limb will be helped by the other (healthy) upper-limb to complete the predefined exercises; 3) active-resistive mode: a resistive force will be applied to the impaired upper-limb by the healthy (contralateral) upper-limb, for the rehabilitation training. (Sheng, et al., 2016)

Advantages: This robotic device has a great potential to be applied in rehabilitation, manipulation. The system provides bilateral arm coordinated training for patients that suffered unilateral paralysis.
Drawbacks: It performs only flexion/extension of elbow.

Figure 14. Self-controlled Master-Slave Robot prototype (Lum, Lehman, Reinkensmeyer,1995) ; a) a general scheme b) a kinematic scheme of one flexion; c) a kinematic scheme with detail of hand attachment



Supinator Extender (SUE): A Pneumatically Actuated Robot for post-stroke Forearm/ Wrist Rehabilitation (Allington, Spencer,Klein, Buell,Reinkensmeyer, Bobrow, 2011)

The robot presented in this study, SUE (Supinator extender), has been developed as an additional forearm/wrist rehabilitation device to the UCI BONES (Klein et al., 2008) exoskeleton robot leading to a 6 DOF robotic system. It can also be attached to the ArmeoSpring rehabilitation device. SUE has a 2-DOF serial chain and has two functions: to measure and to achieve the forearm supination-pronation and the wrist flexion-extension. It uses pneumatic actuators, having large power to weight ratio, thus allowing SUE to reach the required forces for the rehabilitation therapy. Due to its lightweight (0.56 kg) it can be carried by BONES (Klein et al., 2008) or ArmeoSpring (HWP, 2016). Each DOF has a range of 90 degrees and a nominal torque of 2.7 N-m.

It is a strong and compact back-drivable robot that provides forearm/wrist capability for two arm rehabilitation exoskeletons. One of the reasons for the use of pneumatic actuation consists in the low impedance of the cylinders and their lightweight. SUE uses two control types, a simple position control

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and a force control that uses valves to control the air pressure separately in each chamber. In both cases, a sliding control approach is used to take advantage of the fast on-off solenoid valves. The controller is implemented using xPCTarget in standalone mode running at 1000 Hz.

Advantages: The robot device is lightweight (0.56 kg), the system is complementary with the robot system UCI BONES (Klein et al., 2008) and the Armeo Spring (HWP, 2016), the robot system performs forearm supination/pronation and wrist flexion/extension.

Drawbacks: Non-linear forces that came from pneumatic cylinders can be overcome by good controls so adding complex controls is necessary.

Lower Limb

"Physioterabot" (Akdogan, Mehmet, 2011)

This study presents a robotic system with 3 DOF attached to a chair, as shown in Figure 16.

The system can perform all major active and passive rehabilitation exercises but it also has the capacity of learning specific exercise movements and performing these exercises in the absence of the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

physiotherapist. The implemented Human-Machine interface allows a larger adaptability of the system, based on the patient's reaction, so that the robot manipulator can change its position while performing exercises according to the feedback data about the patient's state. The remote manipulator can achieve: flexion-extension for the knee where only link 1 is used, flexion-extension for the hip where Link 1 and Link 2 are working together and abduction-adduction for the hip where link 0 works around the OZ axis. The remote manipulator is extremely versatile in terms of the patient's physical characteristics, generating torque for patients up to 100 kg. The robot is actuated using servomotors, equipped with gearboxes for the motions reported in Table 1

Advantages: It can almost reach the ROM of human limb as is shown in the Table 1 and it can be adapted to fit different weight of patients up to 100 kg.
Drawbacks: It doesn't perform rehabilitation exercises for ankle.

Figure 16. Physioterabot prototype
(Akdogan & Mehmet, 2011)

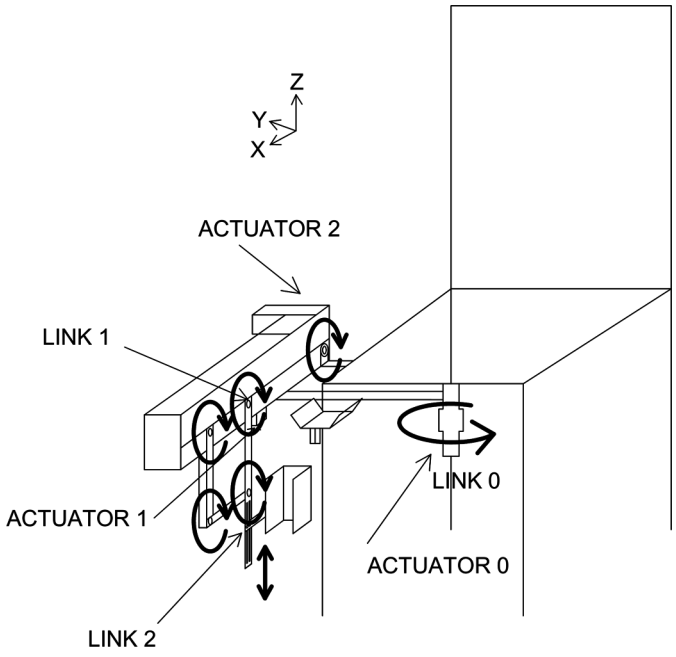

Table 1. Motion ranges as reported in Akdogan (2011)

Limb	Movement	ROM of Limb	ROM of Physiotherabot
Knee	Flexion-extension	-45°/90°	-35°/90°
Hip	Flexion-extension	-15°/45°	-15°/45°
	Abduction-adduction	0°/120°	0°/120°

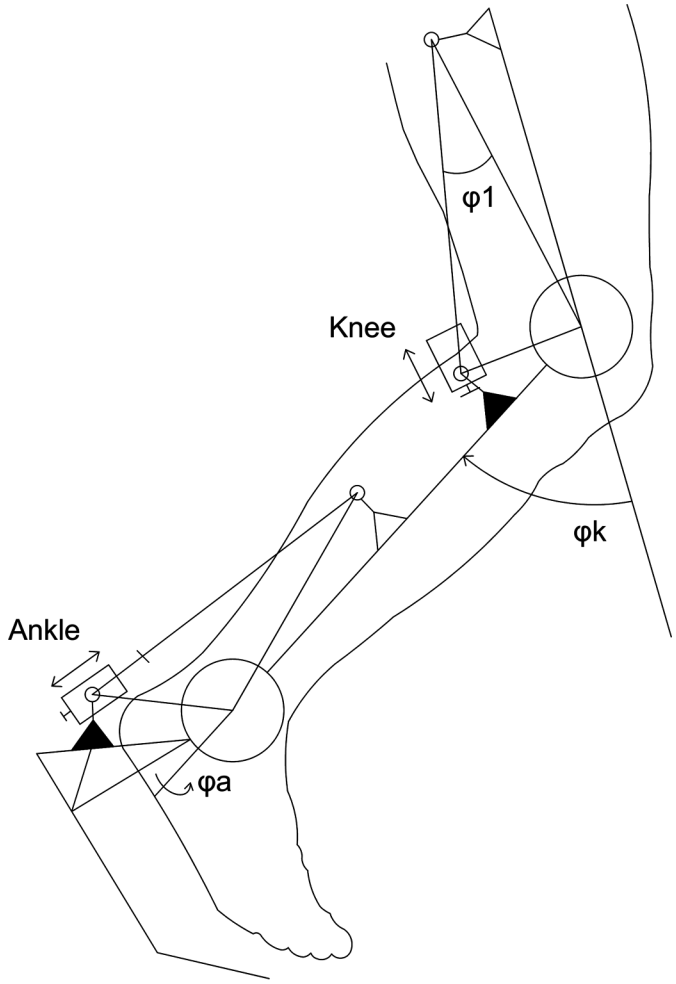
Knee-Ankle-Foot Robot for Gait Rehabilitation (Cheng, Qi, Guo, Yu, 2016)

Knee-foot-ankle is a 2 DOF robot, featuring a modular and portable configuration for post-stroke gait training either in a clinical environment or at home. A new compact series elastic actuator (SEA) has been designed for safe human-robot interactions. For an improved portability, the robotic mechanism is optimized for the walking biomechanics and the mechanical construction has been built using light-weight materials.

The authors have performed an analysis of human walking and starting from this, the design specifications of the robotic system have been delineated. The authors have used Clinical Gait Analysis (CGA) data for the design of the exoskeleton and actuators, collected from the CGA normative gait database. To determine the bio-mechanic features in terms of torque, joint angle and power of the knee flexion/extension and ankle dorsiflexion/plantarflexion, studies have been achieved using a healthy subject (70 kg, 0,9 m leg-length) walking at 1m/s.

Figure 17. Knee-foot-ankle robot a kinematic scheme
(Cheng, Qi, Guo, Yu, 2016)



EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The authors have added a certain number of sensors to monitor human kinematics, muscle activity, interaction forces and the force feedback, to control the actuator. The angles in the robotic joints have been determined using rotary potentiometers. The authors used joint angles as control input for the conventional impedance-based control strategy. The robotic device has integrated EMG (electromyography) amplifiers to record muscle activation patterns. EMG signals are used to evaluate human intention or to rate human effort during rehabilitation training.

Advantages: It is a wearable exoskeleton that is a lightweight system of about 3.5 kg.
Drawbacks: It can be used for low hemiparetic patients but can't help the rehabilitation of hip joint.

LLRR: A 3 DOF Lower Limb Rehabilitation Robot (Wu, J., Gao, J., Song, Li, Li, Jiang, 2016)

The LLRR is an exoskeleton with an adaptive robot sub-controller. The design of the exoskeleton includes three joints which can perform the motions of the following human joints: hip joint, knee joint as well as ankle joint. The robotic mechanism provides an adaptable exoskeleton (the length of linkages can be adjusted per the patient's limbs dimensions) and a bracket. The exoskeleton has three modules: thigh, calf and foot, where the length of the thigh and calf are adjustable. The robot is actuated using DC motors.

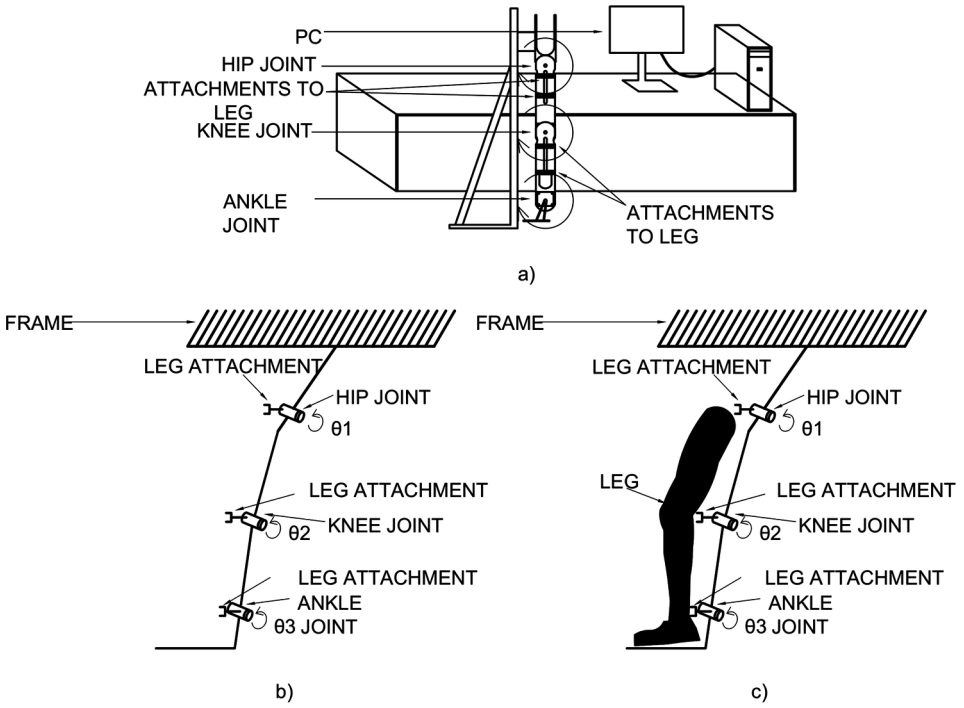
Advantages: Several parameters must be selected and set prior to starting the training program: the exoskeleton length should be adapted per patient's height; the training program parameters must be selected: the maximum intensity, the training time, the rehabilitation training trajectory and the training joints. The control model includes the kinematics, joint friction and actuator characteristics.
Advantages: The system can be used successfully in lower limb rehabilitation therapy involving all of the lower limb joints.
Drawbacks: It is a static system and it can't achieve the proper simulation of the human gait because the leg is suspended. The patient must be in a standing position therefore those who have serious health problems after a stroke can't use this system.

ROAD: Domestic Assistant and Rehabilitation Robot (Carrera, Moreno & Saltaren, 2011)

This study focuses on the development of a robotic system for the assistance and rehabilitation of patients in walking, balance and standing up activities. This robotic system is designed to interact with the user in the indoor environment both in hospitals or at home. The design is safety compliant, assuring the integrity and safety of the user and the surrounding elements. The robot device moves using tracks placed on the room ceiling see Figure 19, adding some advantages compared to other robots that move on the floor such as reduced risk of collision with the disabled person, better performance and balance support, better access to high places, no need of a navigation system for detecting objects on the floor, improved usage of the available space and adaptability to perform different tasks using different assembly tools placed on the robot.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 18. The design and control of a 3DOF lower limb rehabilitation robot prototype (Wu, J., Gao, J., Song, Li, Li, Jiang, 2016); a) a general scheme; b) a kinematic scheme; c) a kinematic scheme with leg attachment



Drawbacks: Because it is suspended on the celling the user's routes are established beforehand, so humans who used this type of robots could feel some kind of spatial restriction as they might feel surrounded, therefore the robotic system has limited mobility and workspace.

CALOWI: A Reconfigurable Cable-Based Parallel Manipulator as a Motion Aiding System (Ottaviano E., Ceccarelli M., Paone A., & Carbone G., 2005)

This study presents the CALOWI (Casino Wire Low-Cost Robot), a reconfigurable four-cable-based parallel manipulator developed as a guiding system for people that have motion disabilities.

The reconfigurability is the main idea behind the concept of this project, being able to achieve different tasks by simply modifying the position of the end-effector anchor points and by building two versions: the planar and the spatial version.

A model for the cable-based parallel manipulator and assisting application has been built. The overall robot dimensions are 2300×2700× 2300 mm, being modeled as a rigid body. The workspace of the robot is quite large, compared to its dimensions. The end-effector has also been modeled as a rigid body, having the overall dimensions: 300× 105 × 216 mm and weighing 3 kg. The selected cable for the simulation is made of steel with a diameter of 2 mm, a Young's modulus of 200 GPa, a breaking load of 3300 N and a mass of 0.02 kg/m.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The human-robot mechanical interface is achieved by using a sling attached to the upper torso of the patient, while four cables connect the sling to the fixed frame of the manipulator, as shown in Figure 20.

Advantages: It can be easy reconfigurable, it is able to do a variety of tasks by changing the position of the end-effector. It is not a complicated solution and also, the costs can't be high. It has a large workspace.
Drawbacks: This system needs a large space to be installed.

Hand

A Rehabilitation Device to Improve the Hand Grasp Function of Stroke Patients using a Patient-Driven Approach (Park, Jeong, Kwon, Kim, Y., H., Kim, L., 2013)

This device was developed to achieve the rehabilitation of stroke patients with the aim of recovering their hand grasp function in order to undertake activities of daily living (ADL). The device has a control unit, two small actuators, an infrared sensor, and pressure sensor in the grasp handle.

The presented system is comprised of a control unit, two actuators, an infrared (IR) sensor, and pressure sensor in the grasping handle. The actuators are LSA-3024SM by PoteNit. The stroke length is 24 mm and the maximum force is 30 N. These actuators assist the grasping (closing the hand) in both passive and patient-driven models.

In the passive training mode, the presented device drives the grasping movement for patients who do not have voluntary hand and finger movements. At this time, the patient's hand must be fixed to the grasping device, thus, a fixing bandage strap is included. The active training mode is utilized when the presented device does not need to assist the patient's motion. Stroke patients who suffer from light after-effects and are close to being recovered can train the grasping motions in this mode. The patient-driven (active-assistive) mode can be utilized using the movement intention of patients with minimal voluntary hand and finger movements. When a patient tries to move the handle for grasp training, the device detects the patient's attempt by way of pressure sensors that are positioned between the patient's hand and the handle.

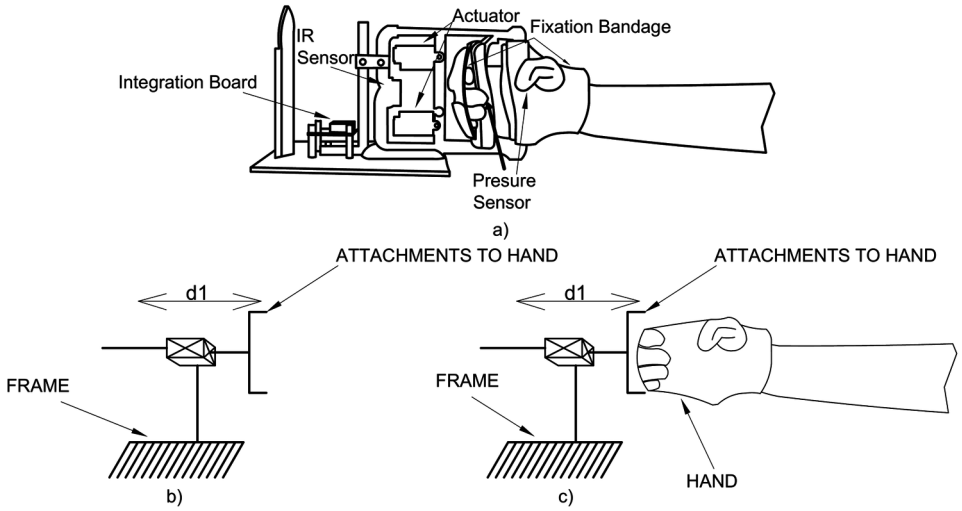
Advantages: The device improves hand grasping, it can be used in passive training mode and in patient-driven mode. The device helps patients that do not have voluntary hand and finger movements. It has a small size, it is inexpensive, and available for use at home without specialist's supervision.
Drawbacks: the system needs to be improved to offer a higher level of comfort to patients.

A Soft Exoskeleton for Hand and Rehabilitation Application using Pneumatic Actuators with Variable Stiffness (Yap, Lim, Nasrallah, 2015)

The design implicates a soft wearable exoskeleton that is composed of a glove embedded with pneumatic actuators of variable stiffness for hand assistive and rehabilitation application. This device is light weight therefore it is easy to wear due to the usage of soft pneumatic actuators. The wearable robotic device is described by the authors as a soft wearable robotic device for assistive and rehabilitative exercises by providing customizable motion.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 21. A Rehabilitation Device to Improve the Hand Grasp Function of Stroke Patients using a Patient-Driven Approach. The Prototype. (Park, Jeong, Kwon, Kim, Y., H., Kim, L., 2013); a) a general scheme; b) a kinematic scheme; c) a kinematic scheme with hand attachment



In the study, an actuator with variable stiffness is utilized, thus enabling the stiffness of the actuator to be adapted at different locations, according to the dimensions of the patient's fingers. The actuator concentrates most of the torque at the joints avoiding to bend the links. Moreover, the stiffness of the actuator can be adjusted based on different physiotherapy rehabilitation exercises required such as full fist, straight fist, hook fist and table top. The actuators with variable stiffness are made by using a two –part mold that was made on a 3D printer. The lower-part mold (channel mold) is used to make pneumatic channels into the actuator, which will inflate upon pressurization, and the upper-part mold (feature mold) is used to impose variable stiffness at different locations of the actuator, which decide the bending profile of the actuator.

The general construction of the device is in the form of a glove that has soft actuators with variable stiffness attached on the dorsal side. The ExoGlove prototype was constructed by attaching a total of five actuators on the glove. The glove is glued with five Velcro straps, as well as the bottom part of the actuators. Therefore, the actuators can achieve DON and DOFF motions when required. The total weight of the prototype is approximately 200g.Once the actuators are attached on the glove, the connector tubing is plugged in and connected to the air source.

Advantages: It is a lightweight glove 200g, allows fingers to reach all necessary DOF by using pneumatic actuators with variable stiffness in different locations. It helps the human hand to perform motions like grasping and pinching.

Drawbacks: The device is too customizable, a single set of actuators is able to support only one type of exercises therefore, to reproduce a different type of exercise it is necessary to change the actuators, this could take a pretty long time.

The Design of Fine Motion Assistance Equipment for a Hand Oriented Robotic Rehabilitation System (Ito, Kawasaki, Ishigure, Natsume, Nishimoto, 2011)

This study presents hand rehabilitation equipment and the control system for operating it. A prototype of the hand rehabilitation equipment has been designed, which is able to achieve a total of 18 DOFs of motion, 3 DOFs for help each finger, 4 DOFs for assisting the thumb, and 2 DOFs for the wrist.

The motion assistance equipment that was developed is composed from three parts: mechanisms for the fingers and thumb, a mobile base of mechanism for the aforementioned, and a mechanism for the wrist. Two types of mechanisms are developed, for the four fingers and the thumb. Two closed link structures are established when the finger mounts the equipment. In the first test model of this equipment, the two closed link structures collided each other, which limited the motion of the link. The equipment presented in this study has been developed to solve this problem. The kinematic relation in the closed link structure allows authors to calculate the MP/PIP joint angles according to the active joint angles detected from the built-in rotary encoder, and vice versa.

A self-motion control strategy is adopted in which the impaired hand is controlled by commands from the healthy hand, so in this way bilateral symmetrical motions are realized. Regarding the motion of the unimpaired side, the angular displacements of the finger joints are observed using a data glove.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Information that is coming from the unaffected hand's stance is also displayed for the disabled user using computer graphics, which allows the user to visually identify the hand's state of motion. Based on inverse kinematics, the reference angles for the active articulations of each movement assistance mechanisms are computed so that the impaired hand takes the same stance as the unimpaired one. These reference angles are sent to the controller of the motion assistance equipment through TCP/IP communication. To do the above tasks the authors used a personal computer operated by a Windows operating system.

Advantages: The robotic device covers 18 DOFs
Drawbacks: Being a prototype concept the authors will have carry out improvements based on experimental results.

Figure 23. A design of fine motion assist equipment for disabled hand in robotic rehabilitation system (Ito, Kawasaki, Ishigure, Natsume, Nishimoto, 2011) a) a kinematic scheme; b) a scheme of mechanism for fingers; c) a scheme of mechanism for thumb

CRITICAL DISCUSSIONS

In order to assess the current progress in robotic rehabilitation and to define some general directions which would enhance the impact of robotic devices in post-stroke rehabilitation, reference is made to a number of review studies which focus on multiple studies which evaluated the efficiency of the systems that reached maturity thus enabling patient testing. Thus, the major conclusions can be summarized in the following guidelines:

- There exists no preferred physical therapy or "more efficient" set of exercises, the selection of the proper rehabilitation plan depends on the physical therapist and the patient progress (Proietti, T., et al., 2016);
- Most available robotic devices focus on patient rehabilitation in the post-acute and chronic phase, emphasizing the need of more devices capable to accommodate the special requirements of the acute phase of post-stroke patients (Yadav, R.K., et al., 2016);
- The preferred modalities for rehabilitation exercises used in robotic devices are: active, active-assisted, passive and resistive control, which based on the existing definitions are the simpler human-robot interaction strategies (Vaida, et al., 2017);
- Unfortunately, some results point out that the progress registered by robotic devices based on consecutive patient assessments using classical scoring methods have no positive influence in the ADL (Yoo, et al., 2015);
- The limited transfer of the motor gains into ADL capability improvement is considered to be caused by the non-uniform distribution of the exercises on the different limb areas, even though medical studies proved that distal to proximal combined training is essential for efficient functional progress; (Proietti, T., et al., 2016);
- The exclusive use of repetitive exercises hinders the patient progress due to a lack of physiological implication of the patient in the rehabilitation activities which would stimulate also cognitive and neuronal progress (Vaida, et al., 2017);
- There must be an increase in the human robot interaction process with the time interval from the stroke as it was shown that in acute phase simple exercises are efficient but later on, the best results are obtained through more complex strategies with motivational elements (Abdollahi F., et al, 2014);
- In the context of independent living and the use of such devices in multiple environments safely, ease-of-use and tele-monitoring are elements that the new devices must integrate.

From the social and economic point of view it has to be underlined that the developing economies face a larger number of stroke patients. As some of the social conditions leading to this situation cannot be solved, proper medical care has to be provided also for this population segment. Thus, the future robotic rehabilitation devices must not only provide efficient therapeutic options but must be cost – efficient, sustainable by average healthcare systems and user-friendly, a concept that must be seen beyond its classical definition, providing:

- The definition of standards in robotic rehabilitation, dedicated for this particular field – as an observation, such a standard is in work with the International Organization for Standardization,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

under the code IEC/CD 80601-2-78, with the latest reported development stage 30.20 (Committee Draft Study);

- The definition of comprehensive medical protocols adapted for robotic assisted rehabilitation (Vaida, et al., 2017);
- Adaptable devices which can cover different anthropometric patient parameters making a system suitable for multiple patients (Vaida, et al., 2017);
- The use of modular concepts where the robot can be easily adapted to certain needs;
- The integration of efficient but simple sensory systems that create efficient progress monitoring solutions allowing fast patient oriented exercise optimization (Proietti, T., et al., 2016);
- The implementation of multiple HRI concepts dependent on the patient degree of disability and applications that motivate the patient in multiple ways;
- Dedicated protocols for hospital, day care centers and own environment use;
- Safety functions which prevent unwanted injuries upon the affected limbs that can be configured during the periodic patient evaluation;
- The user-interface must be effective for both the patient, stimulating more than the physical motor gains and the physical therapist that can safely and quickly adapt the therapy plan for maximum patient progress;
- A cost oriented design approach should be followed to guarantee affordable solutions also for home use as proposed for example in (Cafolla & Carbone 2014; Carbone et al. 2017).

Note: It is to note that it is still an open research issue to identify proper requirements and protocols for rehabilitation robots. Accordingly, literature shows a wide range and variety of rehabilitation robots. They can provide quite different features and characteristics while their use and real application still requires investigation to transfer them from laboratories to real end-users.

The above-mentioned aspects have been highlighted in the comparison Tables 2, 3, and 4 as well as they have led to the development of some novel concepts for rehabilitation devices where the main focus has been focused at upper limbs. Further concepts are under investigation for lower limbs and hands.

NEW DEVICES FOR THE REHABILITATION OF THE UPPER LIMB

An Exoskeleton-Based Rehabilitation Robot for Elbow and Wrist

Based on the results presented in (Major, K., et. al., 2016), the following motions were selected to be implemented in the rehabilitation process (Figure 24):

- **Elbow**: Flexion/extension and pronation/supination;
- **Wrist**: Adduction/abduction and the flexion/extension.

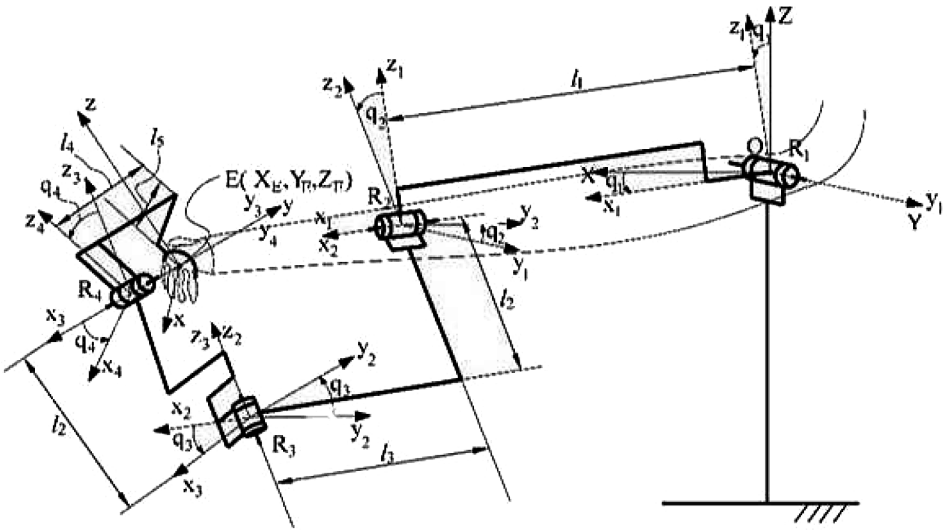
For each motion two contact areas (anchor points) will be used, one acting as the motion generator (the active anchor point – represented with dotted line in the figure) and one acting as joint stabilizer and motion isolator (the passive anchor point – represented with continuous line in the Figure 24).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 24. Shows motion anchor for elbow and wrist mobilization: a) flexion/extension; b) pronation/ supination; c) wrist flexion/extension; d) adduction/abduction
(Major et al., 2016)

For the achievement of the defined motions the ReExRob robotic device is proposed as a 4R robot having an anthropometric structure integrating only rotational joints. The kinematic scheme of ReExRob, presented in Figure 25. illustrates the 4 active joints q_i, i=1…4 and the links that l_i, i=1…5 connect them. Through efficient and modular design, the robot can be constructed with adjustable link lengths making it suitable for different anthropometric patient data.

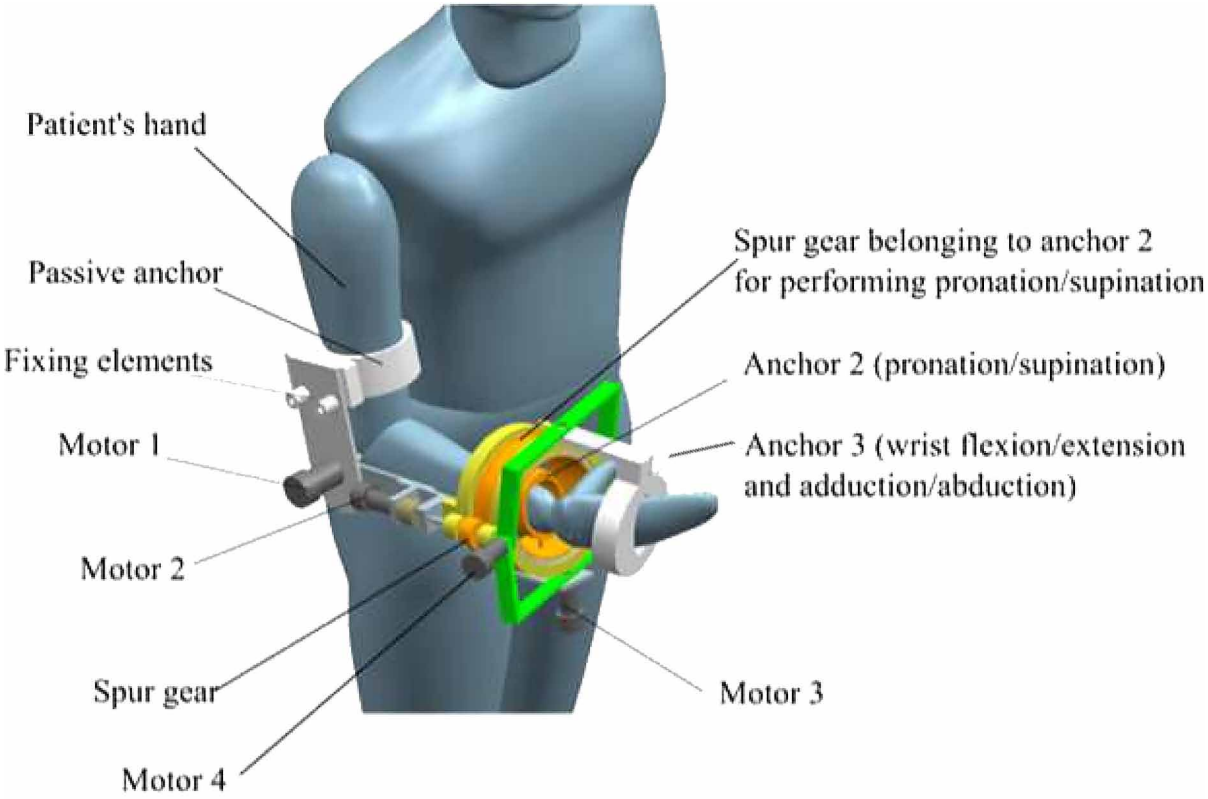
Figure 25. ReExRob robotic system kinematic scheme for elbow and wrist mobilization
(Plitea et al., 2017)



The initial design of the ReExRob robot is illustrated in Figure 26. The main components are: the fixing elements, the three anchors: passive one and the active anchors (2 – for supination/pronation and 3 for the wrist motions). The flexion/extension of the elbow is actuated by Motor 1, the pronation /supination is designed using a spur gear mechanism actuated by Motor 2, while Motor 3 and Motor 4 achieve the motions for the wrist.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 26. ReExRob robotic system scheme for elbow and wrist mobilization
(Plitea et al., 2017a)



An Innovative Spherical Parallel Robot for Shoulder Rehabilitation

Moving to the proximal joint of the upper limb, the shoulder, the motions of interest are flexion/extension and abduction/adduction which, with respect to the shoulder joint, can be simply described as motions performed either in a horizontal plane or a vertical plane. Analyzing the motion from the shoulder joint point of view the two elementary motions describe arcs with a common rotation center, in the joint itself. Thus, one simple mechanism that can replicate easily these two motions is a spherical robot (ASPIRE), whose kinematic scheme is illustrated in Figure 27.

The advantages of this spherical mechanism are the simple concept, wide range of motions, modular design allows the possibility to attach new modules. Due to its structure, the mechanism allows a generalized motion on the sphere which extends its generality degree allowing the definition of multiple exercises with large amplitudes working in a virtually unconstrained volume. One possible drawback could be considered the larger volume the structure occupies, but due to its design the mechanism itself does not hinder in any way the motions of the arm. A concept design of the mechanism is illustrated in Figure 28. (Plitea et al., 2017b)

Based of robotic rehabilitation systems presented above a comparison table (Table 2) is added to clearly see the main aspects of robotic systems analyzed in this chapter.

Table 2. Comparison of robotic rehabilitation systems for upper limbs

No.	Name	DOF	Actuation System	Evol. Stage	Advantages	Drawbacks	Source
1	InMotionArm	2DOF	DC brushless motors	commercial system	-improve patient's range of motion, eye hand coordination, easy to use -it can be accessed direct from wheelchair	being a planar robot device, it allows the human limb to achieve motions in a limited three-dimensional space.	(Duret et al., 2015)
2	Bi-Manu-Track	2DOF	servo motors	commercial system	-easy to use -low cost -permits bilateral exercises	because of the healthy limb's involvement, the projections to the paretic muscle can be affected.	(van Delden, et al., 2012)
3	ArmeoPower	6DOF	DC motors	commercial system	-allow patients to get early treatment of motor disabilities; enable patients to perform repetitive, intensive, and goal oriented exercises.	-high price about 250.000 euros	(HWP, 2016)
4	ArmeoSpring	5DOF	passive (springs)	commercial system	-permits to customize patient's therapy; - feedback exercises to train core movement patterns that are used in activities of daily living	-can't be used for patients with severe hemiparesis	(HWP, 2016)
5	BONES	4DOF	Pneumatic	prototype	-allows naturalistic motion of upper limb using mechanically grounded, direct drive actuators at the shoulder.	-It is not wearable and can be used only in clinics not for ADL	(Klein et al., 2008)
6	Rocker (APBT)	1DOF	DC motors	prototype	-helps patients to improve wrist flexion/extension - mirror symmetrical coordination	-it allows only planar flexion/extension of wrist	(Stinear & Byblow, 2004)
7	SCMRSR (SelfCon.Master-Slave Robot)	1DOF	DC motors	prototype	- provides bilateral arm coordinated training for patients which suffered unilateral paralysis.	- it performs only flexion/extension of elbow.	(Rashedi et al., 2009)
8	SUE (Supinator Extender)	2DOF	Pneumatic	prototype	-lightweight (0.56 kg) - performs forearm supination/pronation and wrist flexion/extension	- non-linear forces induced by the pneumatic cylinders a complex control is necessary.	(Allington et al., 2011)
9	ReExRob	4DOF	servo motors	concept	-efficient and modular design -due to its adjustable link lengths, it is suitable for different anthropometric patient data.	-being a concept, the must be improved to meet a proper pHRI (physical human-robot interaction)	(Major et. al., 2016)
10	ASPIRE	2DOF	servo motors	concept	-simple concept; wide range of motions; modular design allows to attach new modules	-it occupies a large volume	(Plitea et al., 2017b)

Table 3. Comparison of robotic rehabilitation systems for lower limbs

1	G-EO-System	3DOF	electric motors	commercial system	-easy for patients to use - G-EO system can simulate walking on level ground and stairs climbing, quick setup and easy patient handling.	- No virtual reality interactive training module.	(Hesse et al., 2010)
2	HAL-5	2DOF	DC motors	commercial system	-It is wearable and portable device that confers to patient a good help in rehabilitation gait training.	-it has limited torque -is heavy and can't be used by paralyzed patients.	(Sankay, 2007)
3	AlterG Bionic Leg	1DOF	NXT motors	commercial system	lightweight wearable device which assist person with impaired leg, helps patients to place the body weight on healthy leg.	- battery life gives limited uses per day	(Li et al., 2015)
4	Physioterabot	3DOF	DC motors	prototype	-it can reach the range of motion of human limb as in Table 1; -can be adaptive for different weight of patients up to 100kg.	-it doesn't perform rehabilitation exercises for ankle.	(Akdogan & Mehmet, 2011)
5	Knee-ankle-foot robot	2DOF	SEA (series elastic actuator)	prototype	-lightweight wearable exoskeleton around 3.5 kg.	-it can be used for low hemi paretic patients -can't help rehabilitation joint.	(Cheng et al., 2016)
6	LLRR	3DOF	DC motors	prototype	- the system can be used successfully in lower limb rehabilitation therapy involving whole lower limb joints.	-static system, leg is suspended -the patient with serious health problems after stroke can't use it	(Wu et al., 2016)
7	ROAD	3DOF	electric motors	concept	- less risk of collision with the disabled person; good support for balance; no need of a navigation system for detecting objects on the floor; improved usage of the available space	- some limitations to the patient mobility, access to the surrounding environment is limited; users could feel some kind of spatial restriction.	(Carrera et al., 2011)
8	CALOWI (Cassino Low-Cost wire driven)	4DOF		concept	easy reconfigurable; -it is able to do a variety of tasks by changing the end-effector position; large workspace; low-cost; suitable also for upper limbs	-the system needs a large space, to be installed.	(Ottaviano, et al. 2005)

Table 4. Comparison of robotic rehabilitation systems for hands

1	AMADEO Hand-Therapy System	5DOF	DC motors	commercial system	- covers the human hand fingers workspace - performs an intensive training having a high frequency of gripping movements - even for patients with severe hemiparesis.	- it is a fixed system it is not wearable	(Sale et al., 2012)
2	YouGrabber	3DOF	bending sensors	commercial system	-it allows bilateral training aside from unliteral; the device can be adjusted based on patient's current abilities; the training software can be used on an ordinary PC at home or in a clinic.	-it is designed to move only 3 fingers.	(Shuster-Amft et al., 2014)
3	CyberGrasp	5DOF	stepper motors	commercial system	-as it is a cable driven system, the robot can maintain a continuous force of 12N per finger -it can be used in different domains such as haptic rehabilitation and training of visual impaired.	- a limited workspace -high price around 34000 euros -it is not lightweight (around 454 grams) for using the system for a prolonged period of time.	(CGSWP., 2014)
4	Rehabilitation Device to Improve the Hand Grasp Function of Stroke Patients	1DOF	linear servo actuator	prototype	-improves hand grasping; it can be used in passive training mode and also in patient-driven mode; helps patients that do not have voluntary hand and finger movements; it has a small size and it is inexpensive; it is available to be used at home	-the system needs to be improved to offer a higher level of comfort to patients.	(Park et al., 2013)
5	Soft Exoskeleton for Hand and Rehabilitation Application	15DOF	pneumatic actuators	prototype	-Lightweight glove 200g -allows fingers to reach all necessary DOF by using pneumatic actuators with variable stiffness in different locations. -it helps humans to perform motions like grasping and pinching.	- too many customizations; each actuator type is able to support only one type of exercises; long set up time for actuators changes.	(Yap et al., 2015)
6	Fine motion assist equipment for disabled hand	18DOF	servo motors	prototype	-the robotic devices cover 18 DOF's	-being a prototype concept, the authors will have to make improvements based on experimental results.	(Ito et al., 2011)

CONCLUSION

The general conclusion with results from the data presented in this chapter emphasis a big gap between the actual demands in rehabilitation and the available solutions, a gap which extends with time due to the ageing of the population. The current prognosis in world population evolution estimates that in 15 years the available number of caregivers will not be able to satisfy the population need in rehabilitation thus imposing a paradigm shift in the therapeutic approaches, where the physical therapist will become the planner and decision maker for the personalized assistance provided for a patient through dedicated robotic devices, supervising, monitoring and adjusting the therapeutic parameters. These conditions raise not just the opportunity but the necessity to act fast towards the development of new rehabilitation solutions, in an economically feasible environment capable of supporting stroke patients in each stage of rehabilitation starting from the acute post-stroke phase which takes place in hospitals, followed by longer stages which can take place in day care centre and home environment. The existing commercial solutions demonstrate that robotic rehabilitation is very promising and can be used for the rehabilitation of multiple disabilities caused by stroke. The results obtained during their first trials define for the entire community the current limitations and areas that have to be enhanced in parallel with the setup of a first set of standards in robotic rehabilitation. The first clinical trials point out the need for the development of HRI strategies that will integrate the patient within the robot control system as an active component to increase the collaboration between man and machine. This will enable an enhanced rehabilitation treatment with focus on multiple areas, cognitive, neural, motivational and physical, aiming to achieve a faster patient recovery improving, in the end, the life quality and contributing to the concept of independent living. The selection criteria have been based on the engineering significance of each solution. A classification has been made based on the limb which can be treated as well as on the availability of either just a concept/laboratory solution or a commercial product.

Chapter 23
A Case Study of MY Psychology: Malaysia's First Online Psychoeducational Platform

Chong Shen Hew
MY Psychology, Malaysia

Hou Huai Gary Yap
MY Psychology, Malaysia

Mu Yi Hor
MY Psychology, Malaysia

Tin Fung Chong
MY Psychology, Malaysia

ABSTRACT

MY Psychology is an online educational platform currently based in Malaysia, formed with the intention to spread awareness towards the general public of not only on issues related with mental health and those who suffer under mental illnesses, but also to create a place where psychology as a basic knowledge can be taught and learned. This is in order to correct misunderstandings from the public toward psychology. Operating on the internet requires the company to shift towards a marketing-oriented direction, in the meantime, coping with internal and external challenges in order to strive for greater reach and engagement from the audience.

BACKGROUND HISTORY OF MY PSYCHOLOGY'S FORMATION

A statement made by the Malaysian Psychiatric Association (2013), detailed the shocking rise of mental health problems in children below the age of 15, as the group rose from 13% of the population in the year 1996 to 20% of the population in 2012. Add to that, the recent report made by The Star Online (2017) from a statement by resident consultant psychiatrist in the International Medical University, Dr. Philip George, claiming that the actual numbers of people who had mental health problems might be underreported, maybe due to the stigma often attached to such conditions and the topic in general. As such, a non-conservative estimation of the mentally-ill population would be around 40% of Malaysians (The Star Online, 2017).

To further elaborate upon the role that stigma poses against the advancement of the mental health field in Malaysia, stigma towards mental illness and psychology in general are mostly a result of misunderstandings towards the foundations of the field and of the nature of mental illness in itself. Coupled with a lack of knowledge in the subject matter, this causes such a fear to become widespread not only in real life but also in the virtual realm (online and offline). The deficiency in Malaysia when it comes to the availability of mental health practitioners, according to a recent report made in the NST, stands at 1 psychiatrist for every 200,000 of the total population – much lower than the expected ratio set and recommended by WHO: 1;10,000 (Landau, 2017). The report by the World Health Organization (2011) stated that the mental health expenditures from the local government is only a meagre 0.39% in the total budget allocated to health, and that further expenditures towards mental health hospitals are not even available.

This deficiency, coupled with the fact that mental health problems will be on the rise for the foreseeable future as stress levels in a developing country will potentially be one of the most important risk factors for the population, will inevitably demand a higher level of awareness and knowledge regarding mental health in the general public. So what we have now is a vast range of barriers, from perceived stigma towards the mentally afflicted (Clement et al., 2015), a general uncertainty towards clinical effectiveness among the practitioners themselves (Morriss, 2008), economic issues, and finally a deficiency in trained personnel (Berry & Haddock, 2008), all these varying factors result in a reluctance from those who are currently afflicted with one mental health issue or another that can vastly benefit from psychological interventions are now either unwilling to reach out for help, or are unable to do so from the sheer fact of a lack in sources of help.

One of our main goals in establishing MY Psychology as an online platform is to provide a form of countermeasure towards this issue. Our goal is to provide an outlet of information for general knowledge on common psychological topics, and currently progressing towards the dismantling of stigmatization of mental illness through making interventions and information regarding these interventions available and accessible to the audience. It has been shown by Trefflich, Kalckreuth, Mergl, and Rummel-Kluge (2015) that the levels of internet use in those who are afflicted with mental health issues, including those with severe mental health problems (SMIs), are the same as the general population.

Of course, when MY Psychology was originally formed, we didn't have such lofty aspirations, as our original aim was to provide psychological information towards the general public in digestible and accessible formats. These included, educational videos explaining a psychological concept while incorporating comedy skits, or articles ranging from book and movie reviews, to pieces that highlight a single psychological phenomenon. Our approach gradually shifted since our five-year inception from being a pure content creator to incorporating elements of an online educational platform to better suit the goal that developed further down the line. We aimed to not only provide educational insight into the workings of the psychology field and the mental health faction, but also to dispel psychological misconceptions, as well as to raise awareness towards the predicament of the mentally ill. We are not alone in trying to establish ourselves as online providers of psychological and mental health information in Malaysia as well as abroad, as we have also linked up with multiple similar platforms based in the Canada, Taiwan, as well as the Philippines. But this is still a relatively new path for a field that is previously so grounded in the practice of helping through direct contact, and there are still challenges still ahead of us.

In short, MY Psychology, the first Psychology Educational Platform in Malaysia, operating on the belief that psychological information, including discussions regarding mental health issues, shouldn't just be limited to those who are already in the field, and are only used for academic purposes, as we believe that the permeation and popularization of academic knowledge into everyday knowhow should

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

also be of utmost importance. We believe that as psychology students as well as practitioners of the field, we bear the responsibility to provide psychoeducation to the community. With our motto: "Learn. Share. Apply", MY Psychology has been providing mental health information for online users through multiple approaches such as articles, comics and videos on social media platforms including Facebook and YouTube.

NATURE OF BUSINESS

As a company that originally started from the simple idea of being a hub for all psychologically related content that grew during the process into being one of the leaders in the field in Malaysia, we are what is known as a "startup company", and we commonly refer to ourselves as social entrepreneurs or as a social enterprise (Katila, Chen, & Piezunka, 2012). Seeing as the field of online educational platforms, specifically for psychology, is still a growing need that requires innovative approaches and products in order for it to grow (Katila et al., 2012), we see it as our role to generate this shift in moving psychology from the classroom to the layman on the street, so that psychology can become a common knowledge in the vein of oral healthcare, or nutritional healthcare.

Every member on the team has a different role in the company, though of course, since we are still trying to experiment with our approach towards content creation, our roles are often swapped, and overall every one of our current projects involved every single member and they often required a very hands-on approach to accomplish. We are also currently in the process of recruiting more volunteers, be it in the content creation department, or on the management front, so as to expand our scope of operation.

When it comes to the production of content, we have at the emergence of a wider audience and subscribers, developed an outline of two different formats of products that we will continue to provide through our platform in the near future, in order to fully utilize the strengths of the online platform as an outlet for producing and distributing educational products. They take the shape of a Toolkit vs. First-Aid Kit paradigm. Contents falling into the Toolkit category are more focused on conveying information of everyday psychological/sociological phenomena through an approachable manner. On the other hand. contents in the First-Aid Kit category will be dedicated to information on mental health in general, such as the diagnostic criteria and definition of different types of mental illnesses, and some of the methods used to relieve said illnesses, so that we can create an increase in awareness towards such a commonly stigmatized group of people, as well as the misunderstanding towards mental health and mental illnesses in general that is ingrained in the public.

Both sides of the paradigm are presented using a combination of mediums which include: infographic made from online and offline photo editing programs with a monthly change of themes, articles regularly being uploaded onto our personal web-pages as well as social media sites, or videos focusing on explaining some psychological phenomenon or comedy skits detailing everyday situations where knowledge of some basic psychology can come in handy. But one of our biggest aims that we hope to achieve is the elimination of the perception that psychology is a pseudoscience and to increase the awareness of the availability of help for those who faced mental health problems. One of our newest addition to our provided services is the Messenger Bot, which enables anyone with access to our Facebook page to directly inquire for help. In it are directories to our published content that is readily available on our website, as well as a growing list of contacts of mental institutes and healthcare centres in Malaysia, categorized according to each respective state. We are currently inviting more centres to join our efforts.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

CURRENT PROJECTS AND FUTURE PROSPECTS

In addition to expanding the database for the Messenger Bot to include more centres and mental health hospitals in Malaysia, we also plan to extend beyond Malaysia and taking our project into Southeast Asia, and then internationally, in the near future. This is of course a very long running project, and we are constantly upgrading the efficiency of our Messenger Bot, so that it would be able to respond to a wider array of questions, as well as provide faster and more accurate responses. On the content creation front, we have already semi-transitioned into a platform, and although the majority of the content we posted daily on to our website as well as our Facebook page is still produced by us, we have also opened the possibility of being part of our team via a registration page on our webpage, allowing users to write articles, and once filtered and approved by our editors, be able to publish it under our brand.

Currently, our newest product is the production of a video series comprising of short videos between one to three minute that attempt to provide a basic outline of either comparisons between differing concepts that lay people usually misunderstood (psychologists vs psychiatrists), or a simple introduction towards a complicated subject matter (i.e. legitimacy of LGBTQ). We plan to release these videos in seasonal formats, with each season taking on topics with a different nature (i.e. first season is comparisons, second season focusing on debating, etc.). This format of videos will be much easier to produce than our older videos, which involved complicated procedures of shooting on location, as well as the addition of skits. In the future, we aim to establish a stable production line for our videos, so that we can be able to produce these videos on a weekly basis.

The other project that we are currently involved in is the production of a monthly web magazines. Currently we have produced two such magazines, and we think that this is an interesting and beautiful way to present our articles as well as entertainment, such as quizzes or infographics, to our audience. Besides that, we would be able to provide more content towards our patrons on our Patreon page, providing them with a summary of each month's best articles. For this, we hope that we would be able to form a team of writers who will be directly responsible for the production of such a magazine.

CURRENT CHALLENGES

The challenges of establishing and running an online psychology educational platform ranged greatly, from internal maintenance of our motivation and company efficiency to external outreach in our attempts to reach our targeted audience and the market. This includes the concerns we have with regards to technological challenges, optimizing the outreach of our content with a limited budget, consistent content creation process as well as handling the new challenges of our messenger bot. These will be discussed accordingly in the following paragraphs.

Audience and Market Needs

The survival of an educational platform is closely related to whether it is serving the need and solving a problem faced by the community. In other words, it is about whether the existence of the platform itself is celebrated and welcomed by the community, or else the platform will just end up providing content with no response or engagement from the receiving end. To further elaborate upon this: multiple factors

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

need to be considered, including mental health literacy and awareness among the community and the motivation behind help-seeking behaviors.

As noted before, stigma and discrimination are always recognized as one of the most significant barriers to mental health seeking behaviours as well as social inclusion of that particular individual (Corrigan & Wassel, 2008). The stigma towards mental illness is not only limited to the Western context, but also to the Asian context including Malaysia (Ng, 1997). The manifestation of the stigma in a Malaysian context not only brings adverse impact to various important aspects of the lives of the affected population, in terms of their wellbeing and their employment rates, it will also influence the perception of their families in seeing them as disabled and shameful besides avoiding the disclosure in order to protect the family from 'losing face' (Chang & Horrocks, 2006).

All these negative consequences stemming from stigmatization will limit available support given to the affected population. With this, an online psychology educational platform might have its place of being an alternative option in filling up the gap via providing accurate information about mental disorders and giving directions for getting the right help. To MY Psychology, our audiences can be broadly divided into two groups: the in-group and the out-group. In-group here is referred to psychology students, psychology graduates and professionals who are already familiar with the field, and this group will have a strong interest or even a career related to psychology. They have a higher tendency and motivation to know more about psychology and also to gather as much mental health information as possible. As such, they are easier audience to be targeted for our online psychology learning platform.

In contrast, the out-group refers to the general population, including those who have mental disorders who are 'outside' of the field or who has never heard about psychology except through popular myths such as psychology being "mind-reading" or "mind-control" tactics. This population may have lower awareness and are thus less likely to realize the importance of understanding about psychology and mental health. It is reasonable to anticipate a larger degree of difficulty in targeting and attracting them to learn psychology online. The efforts of generating interest amongst them, converting their online behaviour to click on psychology platforms and the latter phase of directing them to the right help is definitely way more challenging than the in-group.

As such, the approach of running an online psychology platform needs to be even more proactive in reaching out to the community. Based on our trial-and-errors, here are a few criteria that needed to be considered for content creators. First, the content itself needs to be educational in nature so that the audience can at least learn something from viewing the content such as knowing about the fact that "Depression is not just sadness". Second, the content needs to be entertaining because it has to provide a pleasurable learning experience for the audience. Third, the content has to be short and precise, also known as "bite-size content". Keep in mind that the targeted audiences are not professionals in the field which indicates that their initial passions and interests are less connected to the nature of the content, so explaining the content from its history to theories would be a redundant and unproductive effort. The content itself needs to be short, easy to understand and relatable to them so that the engagement level can be further elevated.

Current Technological Concerns

The challenges of connecting psychology and mental health information to the public are undoubtedly bounded within social media marketing methods and techniques. The most common online social media platform is Facebook. However, the trickiest part of posting content on Facebook is the number

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

of followers on our page doesn't guarantee the exposure and audience outreach of published contents, meaning that not everyone in the 100k audience population will have received every single update of our newly published posts. In fact, the organic reach which is defined as "the number of people who saw your page posts not due to paid advertising" depends much more on the interaction of various factors including adherence to Facebook's algorithm, the peak period of the contents being posted, audiences' reactions towards the post or photos.

According to the Social@Ogily's report analysis of more than 100 brand pages of various products and industries, there was a concerning decline in average organic reach from 12.05% in October 2013 to 6.15% in February 2014 (Manson, 2014). The biggest decline was found in the month of December, during the period when Facebook's company revealed a major change in algorithm. Regardless of our respective Facebook page sizes and our number of followers, organic reach has shown persistent decline over time, indicating that gaining organic reach from audiences has become more and more difficult.

With that, paid advertising becomes another option to increase the exposure of published contents. Facebook fans will be able to see the content and circulate it on their own Facebook timelines if the content itself is interesting enough. According to Neisen (2012), having a friend's endorsement towards a published content can probably generate higher recall from the advertising campaign. Relating this back to the context of our platform MY Psychology, it is unavoidable that we have to employ both strategies: the organic reach and paid reach in order to increase and maintain the exposure of our contents. Paid advertising campaign has undoubtedly achieved its effectiveness by influencing audiences' online behaviour such as increasing buying behaviour on company's product (Comscore, 2012). However, with the limited budget and the lack of income from our platform, it makes the effort of targeting audiences even harder and a more detailed plan has to be structured out in advertising our contents.

Content Creation Process

With the evolution of Facebook into a platform which publishes and broadcasts contents for the community, the editorial model has become more prominent in publishing about recent news and events with the hope of gaining fan engagement (Malson, 2014). This informs the need of becoming more selective in publishing related contents to generate more engagement and discussion among the fan community. For instance, MY Psychology has adopted some recent news such as school bullying and stigma in job employment as a theme of discussion and also daily canvas pictures that deliver a more holistic approach in discussing about such matters.

This is also related to posting frequencies on our Facebook page, in which posting too little or too often will ultimately kill page engagement. Posting at two extremes is not encouraged and hence more careful choices and considerations have to be taken into consideration to publish quality content less frequently but comes with greater potential in good story-telling methods such as psychology short videos with catchy titles and illustrative themes of mental illness. There is no best method for all pages, but it depends on the data of the page. We have to study and analyze the data about users' engagement and reactions including likes, comments and share towards certain post at certain period of time informs the "do" and "don't" in planning and designing future posts. Relating back to the content of MY Psychology, we have found that our audiences are not fond of articles relating to psychological research but show more engagement when it comes to debunking popular myths, telling the differences between two confusing topics such as "Obsessive-Compulsive Disorder versus Perfectionism" and also funny videos related to Psychological concepts and myths.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

To run MY Psychology, basic knowledge about psychology and keeping ourselves updated to recent news are insufficient. The information of the fans in our Facebook page is very important because it allows us to identify their behavioural information including their motivation of liking and following our page, their reactions towards certain posts, their highest or last engagement with the content as well as their profile and our audience demographic information. Taking cultural background and language into account, these data can become the variables that serve as cues in informing the direction of our platform, whether the platform is publishing potential viral content such as psychology puns and jokes to generate the "wow" effect that attract audiences who jump on merely for similar contents or the platform is attracting a more people who truly want to know more about psychology. The key challenge that always remains on our platform is to publish content that speaks about the core values of MY Psychology and optimize the content outreach at its best among the community of different ethnicities and background.

To improve our targeting functionality, the analysis of the community on our platform along with Social Customer Relationship Management (CRM) is greatly needed to derive an effective communication model such as one-to-one or one-to-many with the audiences in order to narrow down the focus and customize their experience. For instance, we are serving various kinds of contents for our audiences such as publishing daily pictures of bite-size psychology information, monthly articles and psychology-related videos for audiences who are actively engaging with those contents. Also, we post questions such as asking for their opinions on certain topics of interest or even controversy, which can generate engaging discussions, while increasing more chances for audiences to interact with one another so that they can feel the uniqueness of the experience gained from our platform. Trial and error of posting contents in different layout and designs allows us to compare and contrast the effectiveness of the post. Being aware of the limitations allows us to harness the potential of future posts in deriving greater audiences' engagement and reactions.

Bot Creation and Business Connections

Facebook Messenger Bot is undoubtedly one of the most welcomed user features in the coming years as it has been shown that messaging apps have surprisingly surpassed the social networks (Ballve, 2015). The present efforts in integrating business model into the Facebook Messenger Bot is anticipated and the birth of Chatbot which is a software embedded in Messenger Bot with artificial intelligence that can communicate and establish highly personalized conversations with users is well celebrated because it establishes a firm digital presence and friendly approach to the users who are familiar with messaging apps.

Compared to the traditional strategy of utilizing email strategies and websites, the content delivered in Messenger Bot has higher read rates with up to 90% with greater user retention because the message received by users from the Chatbot generates a similar feeling as personal messages sent by their social circles through mobile devices and apps.

With the vision of increasing the mental health awareness against the mental health stigma whereby people are still reluctant to open up for help, Messenger Bot establishes a safer environment which allows users to communicate with the chatbot in a more personalized way, just like how they send and receive message with their friends without needing to post it online on personal Facebook timelines or in a Facebook group. Messenger Bot can also be seen as a way to overcome the algorithm in the social media especially Facebook page in which we don't have full control of the exposure of our published contents.

MY Psychology has soft-launched its bot platform in early July this year (2017) with the hope of being a directory in connecting the users to psychological help. By doing so, our team has extracted the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

contact details of the local government hospitals into the chatbot which allows the users to contact and check the available centres at their fingertips. We have also contacted private centers and community organizations that provide mental health services as an alternative to centres in government sectors for our users. With this, we hope to increase the act of getting mental help among the community and connect them to the right services at the right time.

The key challenges of executing the Chatbot are that the initial purpose is to connect users to the local mental health services in Malaysia. However, it isn't yet ready for use by those living in countries especially in the Southeast Asian region where mental health stigma is still prevalent and there is a lack of legislation bodies in regulating the services. The next goal of our team then is not only aiming to establish a more complete directory of mental health services in Malaysia, but also open a new door to international audiences so that they can have access to this service as well.

Sustainability and Future Direction

One of the key challenges which is consistently faced by MY Psychology is the company's long-term sustainability due to us providing free online psychology contents regularly which does not generate profit in return because there is no product that can be sold other than providing information. Hence, getting funding for MY Psychology would be limited compared to other startups which may come with a business model that can drive profit from the users. Sponsorship could come from companies that wish to advertise or increase brand awareness on the platform. Prior to attracting that sponsorship, the number of followers and the statistics in term of audiences' engagement are undoubtedly the key factors that inform the potential optimized outreach of the company's exposure and the engagement itself is embedded within the strategy of designing and publishing contents on a regular basis.

In order to publish content on a regular basis to promote and maintain the audience engagement, manpower in the content creation process is very important and that brings us to the recruitment and management of workload levels that requires detailed planning and production line. Recently, MY Psychology has started to expand its team and recruit a few key members to take respective roles according to their interests and ability. More and more challenges ahead are anticipated.

The future of MY Psychology is uncertain, as always as it is. Being one of the leading platforms in providing bite-size information in Malaysia where the level of mental health literacy and awareness among the community is still very low definitely invites many unforeseen challenges. Yet, it is believed that it has at least taken the initiative in the hopes of advancing the field of mental health in the country.

POTENTIAL SOLUTIONS

Integrative Platform

As stated above, to achieve self-sustainability, we have to seek for funding and or sponsorships due to the non-profitable nature of our products and provided services, and several such attempts has been implemented. We have set up our own Patreon page in order to gain financial support from the public. Patreon is a membership platform that provides business tools for creators to run a subscription-based service, as well as ways for artists to build relationships and provide exclusive experiences and contents to their subscribers, or "patrons." It is popular among Youtube videographers, webcomic artists, writers,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

podcasters, musicians, and other categories of creators who regularly posted their creations online. It allows artists to receive funding directly from their fans, or patrons, on a recurring basis or per work of art. Despite the slow progress and growth, we have a few patrons who are subscribing to our platform now. The money collected from patrons can be used to pay our writers who contributed articles and designers who compiled them and produce our first issue of the psychology magazine. Hence, MY Psychology would want to use this method to gather funds from our audiences and use them to grow and expand the platform.

MY Psychology's plan is to create a psychology community in which we can connect psychology graduates, students, professionals and the public community en large. By integrating the resources and connecting people from various walks of life, we can easily deliver bite-sized psychology knowledge from credible sources to the public, increase mental health awareness and tackle social stigma towards mental illness. MY psychology has currently been in connection with more than 20 psychological centers in Malaysia and are partners with more than 10 similar psychology online platforms from different countries such as Singapore, Taiwan, Philippines, Canada, and Malaysia. In the journey of promoting psychology and mental health, MY Psychology hope to form an alliance, a community and a closed connection with all the related parties.

Due to the fact that the core members of MY Psychology have their limitations, not only limited time but also are financially insufficient. Without the support from the communities and the public, we would not be able to sustain the platform. For instance, the video series we have been creating as stated before, have achieved quite the success, but because of limited manpower, we are only able to produce one video every two weeks. In order to deliver correct information and credible knowledge from reliable sources to our audience, a much larger quantity of effort is needed. To achieve sustainability, we have to achieve the goal of being able to recruit volunteers first, through the creation of a system, a "psychology content factory", to put it simply. By recruiting talented writers and content creators, we can consistently produce bite-sized psychology infographic, videos, articles, comic and podcast for our audiences as well as controlling the "quality" of the content to make sure each piece of content originated from reliable and credible sources.

Products and Services

MY Psych has several services and products that possess huge potentials in creating job and internship opportunities for Psychology graduates and interns. In order to advance the mental health field, we need to retain the talents in the field, and to provide opportunities for them. MY Psych's current two projects, Bot messenger and Psychology E-magazine, requires a lot of manpower and we are planning use this opportunity to mass recruit psychology students and graduates as volunteers to make these plans achievable. The common problem for psychology students after graduation is not being able to find psychology related jobs and internship opportunities; by promoting these two projects, we can provide these opportunities to the psychology graduates and in turn let them contribute their knowledge and talent back to the society as well as helping them to achieve a better job prospect or academic advancement.

Through this process of hiring psychology students/graduates as writers for our magazine; we gain profit from the public by selling our magazine, and in turn we can use the profit to hire more psychology graduates/ students and to improve the quality of the contents which can later be contributed back to the public once again, in the hopes of creating a positive cycle that can advance the field of psychology in Malaysia.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Media Attention: Offline Connections

Having media attention on our platform can give us the edge we need to grow for years to come if we use it correctly. Publicity will raise the awareness of our platform and we can use that new-found awareness to grow the events attendance and spread our messages. Having major sources provide coverage of our platform speaks volume for our page credibility, as well as lending the mental health cause a big boost in visibility and attention. Because of this, MY Psychology will continue to pursue further into online marketing.

One such way to gain the necessary attention towards our platform is through the organization of a series of workshops and seminars, as it not only fosters a culture of spreading psychology knowledge but also improve the relationship among the mental health professionals from all over the world. To do this require intensive cooperation between us and the universities. In addition, such a relationship can also improve the welfare of psychology students. For instance, MY Psychology can compile various information of psychology courses from several universities for our audiences who might be interested in pursuing psychology. We might be able to gain exclusive "scholarship", "internship", "financial support" opportunities for our audiences. In addition, MY Psychology can also promote any workshops, seminars or talks that organized by the universities. In other words, My Psychology acts as the integrative platform that provides various psychology information for the students or non-students who are interested in psychology.

Such offline activities have the added advantage to connect with our audiences physically and provide face-to-face interactions with the public. Also, MY Psychology can recruit talented people who are interested to become volunteers through these offline campaigns and events. During these offline campaigns, we can invite the public audience to follow our online platform and get the most updated news. By doing this not only increase our exposure in the public, but also attract media attention and perhaps sponsorship.

MY PSYCHOLOGY'S CURRENT IMPACT

The public conception of psychology in Southeast Asia is heavily clouded by myths. The media often portrays psychology in a constant negative light, and the permeation of notions such as 'if you study psychology, you will become crazy' or 'you won't be able to find a job if you study psychology' are common. These myths are harmful and halt the progress that we are trying to gain when it comes to the advancement of the field as a whole, because widespread misconceptions stop the public from truly understanding the core of psychology.

One of the ways in which we achieve the goal of clarification is through creating a structured and easily understood outline of psychoeducation, we hope to create the proper expectations and atmosphere for the public in order to clarify what we as psychology students actually studied. The monthly psychological project offers us a chance to focus and zero in on specific mental illnesses, giving the audience an overview towards these afflictions, and their respective treatment methods. As of today, we have already completed two such monthly projects: a month on depression, and the other on anxiety disorders.

The impact might not seem significant at this point of time but we truly believe that change occurs gradually, and we hope that by influencing others, the change that we hope for can happen, as more

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and more join in on our efforts. What we truly wanted to achieve is the dismantling of stigmatizations so that people won't hesitate to learn psychology, and that the afflicted won't be afraid to seek for help.

The other achievement of ours is that we have slowly expanded beyond the confines of education and have now stationed ourselves as a middle point between the public and the professional. We have, since our inception, been receiving messages seeking for help when it comes to depression, a trouble in grieving or even suicidal notions through our inbox. We have to clarify with each of them since it is beyond our capabilities and qualifications to provide professional help, but it is hard to just turn our back on these people and draw a clear line.

This is where the Messenger Bot comes into play, as it has the potential to become a constant source of information when our audience came for guidance or seek for help, through its automatic feedback towards help seekers, and as a constant presence, they are able to inquire upon such subjects even when we are not available. We had recently gathered and prepared a long list of emergency hotlines, and upon request, the bot will provide instant replies containing contacts that they can reach to. This is still a task in progress and we hope to cover a wider range of help in the near future.

We also managed to generate an interest in learning more about psychology through our recent video series. Videos, in our opinion, can be an effective medium to share information if used correctly. The contents mainly involve around introducing the right meaning of psychology terms and breaking psychology myths. If you are familiar with YouTube education related channels, when you think of minutes science, you will remember 'AsapScience.' When you think of physics, you will remember 'Veritasium.' There are a lot of channels working now in creating educational videos and gaining a huge wave of support but most of them are from western countries. The successful online education model can be learnt and duplicated, but of course, there are cultural differences between different countries and we should not generalize between these two audiences, and should actively strive for a balance in order to cater to our specific audience.

We are nowhere near the top education channels at this moment, but we hope to introduce the possibility of making education videos in Southeast Asia. When one channel had successfully proven that educational videos could work, others would quickly follow. As of today, while we are writing this, we had two successful videos reaching more than 100k views on Facebook. Shortly after that, we have already received a few invitations to collaborate and produce similar contents. We have also inspired and share our tips to a few psychology graduates and professions to start their own social media page. The online psychoeducation will have a bigger impact to the public if there are more creators joining into this wave, adding depth and variety to the scene and community. We foresee a healthy competition between each group and also a growth in motivation to foster organic growth of the field.

FUTURE RECOMMENDATIONS

First of all, we must repeat that we are not professionals when it comes to online psychoeducation. Our findings are mostly based upon our own experiences, as well as through a painstaking process of trial and error. Nevertheless, we took care to research into every possible outcome as much as we can. Hence, what we shared in this case study is solely for the purpose of sharing our experiences to those who wished to join in the effort in advancing the field of online psychoeducation. We hope these would help future content creators and educators, to create a clearer direction, and to act as a paving stone for those who choose such a path.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Know Your Psychology Knowledge

Identify your own level of knowledge on psychology to avoid sharing wrong information. Often there are pages sharing "*psychology says*" without solid research or further readings. Share the right information and along the way, try to explore further into other areas of psychology knowledge. Be ambitious, but be careful when sharing knowledge. You may encounter people who will inform you that your research findings are outdated, and update you on the latest finding in this field.

Know Your IT Skills

The fastest way for an information to go viral is with the aid of a right platform and creative designs. Graphic design is a skill worth enhancing. Creating creative infographics with bite size psychology knowledge can be a good starting point. With the aid of free graphic design platforms online, simple graphic designs can be generated with no hassle. Other than presenting these in picture forms, a more engaging method would be to present information in video forms. Do note that editing a one minute video consumes much more time and would be harder to execute without proper training. There are pros and cons to this but you can always find the style that suits you the most.

Know Your Platform Well

Upon spending all that time on your infographic and videos, you would want to be sure it can reach optimum audience. One main difference between online education and offline education is that you can gather feedback accurately. You can observe the number of viewers and reaction to the video. These two information serves as feedback. Study your audiences well to know the kind of content you should generate. For example, content with bigger font for old age audiences and colorful infographics to attract younger audiences. Also observe when to post these contents as time is a crucial factor.

Study Your Time

At macro level, to raising public awareness on the importance of psychology requires consistent commitment and a long period of time. To change a stereotype or raise awareness is different from teaching. Sometimes, scientifically proven data and/or statistical data may not be enough to convince people. Convincing requires ample time, detailed explanation and sometimes aid of recent events to educate the public. For example, when an influential figure (such as an idol) committed suicide due to depression, then it would be a good time to share knowledge about depression. Not only does the creation of true impact requires a long time, sometimes it requires good timing too.

Personally, how much time are we willing to invest in this? It is important to do a quick check before executing any project. To simplify; are you willing to commit full time to online psychoeducation? If you are, then you are able to create consistent content and subsequently, content which probably consumes a lot of your time. If you able to commit only a few hours per day or per week, then you may want to consider projects which fits in with your available time. It is often easy to get too ambitious, only to realize later on that we are not in the capacity to complete what was started.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Settle With Right Expectations

In comparison to traditional platforms, one of downsides of online education is the lack of positive reward you obtain. Not just in the form of monetary compensation, but also in terms of observing the effects of our effort. To illustrate, we may feel a sense of pride knowing we helped an elderly cross the road, but we may not be able to tell if we have successfully encouraged three patients with mental health problems to seek for help. Despite the powerful impact of our contribution to the society, it can be relatively hard to notice. Raw data shown on the paper will never show the direct effect we have made. So, set your expectations straight. We cannot change the minds of thousands who assumes depression will only affect those who have weak mentalities, but we may be able to save a depressed individual from committing suicide.

Currently, the awareness level towards psychology in Southeast Asia is far behind in comparison with other countries, therefore presenting us with a large barrier to overcome. But at the same time, we are lucky because we now have better tools and platforms to help us achieve our goals. Through online platforms, we are able to easily reach and influence more people. However, it also has the power to mislead if we are not careful enough. Unethical creators can abuse the power of social media and online platforms, spreading misleading information as long as it shows good results and lead to monetary gains.

To paraphrase the cliché sayings of Uncle Ben, if you have the obligation to do the right thing, and if it is within your power to do so, then you are required to be responsible for any such actions. In short, we hope that we have successfully provided steps as to how to start your journey in this field. So, shall we begin?

Chapter 24
The Evolution of a University-Based Center of Play Therapy Education

Tiffany McNary
Georgia State University, USA

Galina Kadosh Tobin
Georgia State University, USA

Sarah D. Stauffer
Association ESPAS, Switzerland

ABSTRACT

More beginning graduate students and new mental health professionals are seeing children and families in their therapeutic work, creating a growing need for play therapy-specific training and supervision. Training students and professionals in the art of play therapy is critical to the wellbeing of children, families, and the future profession. A university-based approved center of play therapy education aims to fulfill this growing need while undertaking a momentous amount of responsibility. Training skilled play therapists is a complex endeavor requiring a combination of foundational knowledge, advanced clinical and conceptual skills, and supervision that surpasses classroom coursework requirements. The authors describe the evolution of Georgia State University's Center of Play Therapy Education and Play Therapy Training Institute to provide readers with a comprehensive model for play therapy training and supervision.

INTRODUCTION

"In play a child is always above his average age, above his daily behaviour; in play it is as though he were a head taller than himself... play contains all developmental tendencies in a condensed form" (Vygotsky, 1966/2016, p. 18). From this 1933 lecture, Vygotsky emphasized the role of play within his larger cultural-historical approach, noting that "play is the leading source of development in preschool

years" (as cited in Bodrova & Leong, 2015, p. 376). Children's need for play remains a constant factor in their development. Recent changes in child development have increased concerns among parents and professionals alike. Georgia State University's (GSU) Center for Play Therapy Education and Play Therapy Training Institute put child development at the forefront of instruction, practice, and supervision training experiences, allowing students and practicing professionals to address children's mental health concerns in a developmentally appropriate way: through play.

Parental responses to a national survey of children's health showed one in seven children (14%) aged two to eight years old had a diagnosed mental, behavioral, or developmental disorder (Bitko et al., 2016). Reviewing national data, Knopf, Park, and Paul Mulye (2008) similarly concluded that 20-25% of youth experience symptoms of emotional distress and about one in ten may have significant impairment from moderate to severe symptomatology. By 2030, the U.S. Department of Health and Human Services (2002) estimates there will be 83.2 million children under 18 years of age in the US, an increase from 72.0 million children in 2000, creating an arguably greater need for child mental health practitioners in the next decade.

Reporting on the state of children's mental health, U.S. Surgeon General, Admiral David Satcher, wrote, "growing numbers of children are suffering needlessly because their emotional, behavioral, and developmental needs are not being met by the very institutions and systems that were created to take care of them" (U.S. Public Health Service, PHS, 2000, Foreward, para. 1). Satcher called for including child- and family-centered mental health services in all systems that serve this population, engaging families, and integrating children's perspectives in mental healthcare planning (PHS, 2000). GSU's programs now involve parents and teachers, however, these and other child mental health training institutions face a number of program complexities; the changing and growing needs of the helping professions have created a training gap between the focus of education programs and the knowledge and skills needed for successful practice (Hoge, Huey, & O'Connell, 2004; Huang, Macbeth, Dodge, & Jacobstein, 2004).

Scarcity of Child Mental Health Professionals

Child-focused clinicians must develop both basic and advanced skills, navigate multiple systems, incorporate families into treatment, apply multiple systemic interventions in both schools and communities, and deliver services that are culturally competent (Huang et.al., 2004; Mellin & Pertuit, 2009). Factors such as insufficient funding, low priority placed on mental health in the public health agenda, and inadequate training of children's mental health providers contribute to the aforementioned training gap (Huang et al., 2004; Kieling et al., 2011; Saraceno et al., 2007; Saxena, Thornicroft, Knapp, & Whiteford, 2007; Tolan & Dodge, 2005).

The President's New Freedom Commission on Mental Health (2003) highlighted professionals' lack of education, training, and supervision as contributing factors to the shortage of well-trained child and adolescent mental health practitioners. This shortage has left providers without adequate training serving children and adolescents (Koppelman, 2004), and has created "poor working conditions in public mental health services, a lack of incentives to work in rural areas,... [and] in mental health specialists spending time providing care rather than training and supervising others" (Saraceno et al., 2007, p. 1171). GSU combats these challenges by encouraging community service and providing play therapy-specific supervision training to reinforce the strength and stability of the child and adolescent mental health provider workforce.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Traditionally, clinical mental health counseling programs focus on adults, and school counseling programs do not prepare school counselors to work with acute mental health concerns on a long-term basis (Mellin & Pertuit, 2009). Although the American School Counselor Association (ASCA, 2012) approves of school counselors providing individual and group counseling services, they list "providing therapy or long-term counseling in schools to address psychological disorders" under "inappropriate activities for school counselors" (ASCA, p. 3). In a review of the Council for Accreditation of Counseling and Educational Program's (CACREP) 2009 standards, Mellin and Pertuit (2009) found that *youth, children,* and, *adolescents* were not included in clinical mental health counseling and that *mental health* was not present within school counseling standards. Our review of the 2016 CACREP standards found the same. Although the Council on Rehabilitation Education (CORE) merged with CACREP in 2017 (CACREP, 2017), CORE's former standards did not include any specific requirements for rehabilitation counseling programs to provide coursework specific to children and adolescents (e.g., Mellin, Hunt, Lorenz, 2009).

Studies examining student access to graduate-level courses specializing in child and adolescent counseling are bleak. Mellin et al. (2009) surveyed 46 CORE- accredited rehabilitation counseling programs. Despite student interest, only eight programs (17%) offered a child and adolescent development-specific course; five programs (11%) offered a child, adolescent, and family helping relationships course. Only 4% of respondents reported receiving specialized instruction in youth psychiatric disabilities; only 2% indicated the availability of classroom instruction *and* clinical experience (Mellin et. al., 2009). Surprisingly, however, 73% of programs indicated that students could work with these populations during practicum and internship (Mellin et. al., 2009). Russ (2016) randomly sampled 2,000 American Mental Health Counselors Association members and found fewer than 60% of participants attended graduate programs that offered specific coursework on counseling children and adolescents and only 20% of these programs required these courses. Those who took childhood-specific courses or courses with childhood content reported feeling more prepared to work with children during internship, although only participants who took childhood-specific courses reported higher levels of expertise (Russ, 2016).

Recommendations for closing this educational gap include moving away from generic training models and offering specialized coursework and clinical experience to students working with children and adolescents (Hoge et. al., 2014; Mellin & Pertuit, 2009). Tolan and Dodge (2005) advised orienting programs to a developmental framework that includes epidemiology, prevention, and mental health promotion. Furthermore, utilizing licensed instructors and supervisors who currently practice (Hoge et. al., 2014) and creating opportunities for students to participate in multidisciplinary team treatment approaches (Huang et. al, 2004) helps students operate within an established professional network.

The American Academy of Pediatrics (AAP) urged pediatric providers to "write a prescription for play" (e.g., Yogman et al., 2018, p. 1), noting that cultural shifts in less parent engagement, more digital distractions, fewer safe spaces to play, and an increased focus on academic readiness, comes at the expense of the learning, skills, and social-emotional benefits developed through play. They eloquently stated:

Play is not frivolous; it is brain building. Play has been shown to have both direct and indirect effects on brain structure and functioning. Play leads to changes at the molecular (epigenetic), cellular (neuronal connectivity), and behavioral levels (socioemotional and executive functioning skills) that promote learning and adaptive and/or prosocial behavior. (Yogman et al., 2018, p. 5)

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

GSU meets child-specific mental health education recommendations and prescribes play by offering play therapy training to graduate-level students and practicing mental health professionals in university-based and continuing education formats. In turn, these students and professionals may provide developmentally appropriate services to children and families in different settings, such as community mental health agencies and public schools, so that mental health care access does not become a barrier to mental health treatment.

Play Therapy Credentialing and Effectiveness

The Association for Play Therapy (APT), a national organization established in 1982, exists "to promote the value of play, play therapy, and credentialed play therapists" (APT, 2018b). APT (2018c) defined play therapy as "the systematic use of a theoretical model to establish an interpersonal process wherein trained play therapists use the therapeutic powers of play to help clients prevent or resolve psychosocial difficulties and achieve optimal growth and development" (para. 1). Several different forms of play therapy were regarded as promising and evidence-based practices by the U.S. Substance Abuse and Mental Health Services Administration (SAMSHA), who listed them on their National Registry of Evidence-based Programs and Practices (NREPP) until SAMHSA ended their relationship with NREPP in 2018 (Ray, 2018). There are several forms of play therapy currently recognized as evidence-based by the California Evidence-Based Clearinghouse for Child Welfare (CEBC), an entity "highly regarded as a credible reviewer of mental health interventions for children... and a stable force in assessing evidence-based interventions" (Ray, 2018, p. 21).

Providing play therapy requires extensive specialized education, training, and experience. APT offers three credentials that licensed mental health professionals, certified school counselors, and school psychologists can earn after having demonstrated the depth and breadth of their specialized play therapy education, training, and experience. For twenty-five years, APT has offered the Registered Play Therapist (RPT) and Registered Play Therapist-Supervisor (RPT-S) credentials, and the School Based-Registered Play Therapist (SB-RPT) credential since 2016.

To meet the educational requirements necessary to obtain the RPT/S and SB-RPT credentials, training courses must be taken from an approved center of play therapy and/or an approved provider of continuing education. APT grants three-year approval status to approved centers at colleges and universities offering master's or doctoral degrees in a mental health field that satisfy requirements, such as (a) generating play therapy instruction, supervised clinical experience, and supervisor training, and employing faculty members with play therapy expertise and RPT/S credentials, (b) producing original play therapy-specific research, especially research advancing evidence-based play therapy practice, and publishing such research in professional peer-reviewed journals within and outside of the play therapy community, and (c) contributing to the advancement of play therapy and the growth of the play therapy community (APT, 2018a, para. 2).

APT also grants approval to approved providers who offer continuing education opportunities for professionals seeking licensure, continuing education, and play therapy credentials. APT-approved providers may be agencies, individuals, organizations, or businesses that award play therapy credit for continuing education purposes for a period of three years (Type I) or for one event of five days or less that offers up to 25 hours of play therapy credit (Type II; APT, 2018b). For both types, this coursework must satisfy specific approval criteria that aims to:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Improve client care, either directly or indirectly, by demonstrating evidence of either: (a) systematic use of a therapeutic model, the establishment of an interpersonal process using the therapeutic powers of play, and intent to prevent or resolve psychosocial difficulties and/or achieve optimal growth and development; or (b) content that enhances the specific professional proficiency of mental health practitioners who are engaged in the clinical practice of play therapy, the supervision of play therapists, or the instruction of play therapy. (APT, 2018b, p. 1) Meeting such stringent requirements helps "promote and protect the credibility and viability of the play therapy profession through strong academic rigor and ethical training standards" (Lebby, 2018b).

As public awareness of the effectiveness of play therapy grows, there is an increasing demand for professionals trained in this specialized modality. Beginning mental health graduate students and new professionals are increasingly challenged to meet the needs of their child and adolescent caseloads. As the flagship national professional play therapy association in the US, APT currently boasts more than 6,800 professional and student members, over 52% of whom have earned an RPT/S or SB-RPT credential (Lebby, 2018a). This growing trend of seeking professional recognition through credentialing validates the importance of play therapy and highlights the critical need for play therapy-specific training and research to demonstrate its effectiveness.

Several researchers have established play therapists' effectiveness through the publication of meta-analyses and other research. Lin and Bratton (2015) found small (d=.33) but statistically significant favorable outcomes for externalizing and internalizing behavior problems, caregiver-child relationship stress, and self-efficacy across 24 studies. Ray, Armstrong, Balkin, and Jayne (2015) found small (d=.21-.38) but statistically significant positive outcomes for externalizing and internalizing behavior problems, self-efficacy, academic, and other problems across 23 studies. Bratton, Ray, Rhine, and Jones (2005) found medium (d=.72) and statistically significant favorable outcomes for behavior problems, social adjustment, self-concept, anxiety, development, and relationship issues across 67 studies. LeBlanc and Ritchie (2001) also found medium (d=.66) and statistically significant positive outcomes for emotional and social adjustment, reaction to traumatic event(s), academic and behavior problems, and family adjustment across 42 studies. In addition, Ray and McCullough (2016) further detailed 25 randomized control trials, 25 observational studies, and 20 case reports and qualitative studies that have demonstrated play therapists' effectiveness in producing favorable outcomes on the aforementioned variables and others.

Play therapy education and training aims to fill the knowledge, awareness, and skills gaps inadequately trained child mental health clinicians demonstrate and to promote the growing need for child-specific mental health services. This responsibility is a momentous and complex endeavor, requiring a combination of teaching and training that integrates foundational knowledge and advanced clinical and critical thinking skills, such as case comprehension and conceptualization, personal awareness, and professional insight. Programs also must offer students support, encouragement, and supervision. GSU has a thirty-year history of providing post-graduate training in play therapy in the College of Education and Human Development's Department of Counseling and Psychological Services (CPS).

ORIGINS OF PLAY THERAPY AT GEORGIA STATE UNIVERSITY

In the late 1980s, Dr. JoAnna White, EdD, LPC, CPCS, RPT-S, offered the first Introduction to Play Therapy graduate course at GSU. She built a solid foundation upon which her successors could stand and

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

continue to innovate and expand. This program obtained national recognition from APT as its second Approved Center of Play Therapy Education in July 2009 and as an Approved Provider of Continuing Education under the name "GSU Play Therapy Training Institute." Dr. White co-founded the Institute with Dr. Lauren Stern, PhD, LPC, NCC, RPT-S, a Clinical Professor and play therapy instructor at GSU during that time. Dr. White still serves the Institute as Director Emerita.

With her contributions, as well as those from Dr. Stern, Dr. Jeff Ashby, and current Director Dr. Tiffany McNary, both the Center of Play Therapy Education and the Play Therapy Training Institute have garnered renown in the Southeast for play therapy training. There are several key elements that make GSU's play therapy training approach effective and appreciated by students and practicing professionals. We enumerate these below to encourage readers to incorporate effective practices that meet children's developmental and mental health needs into their own play therapy centers and institutes for continuing education.

Building a Solid Training Foundation

In 1988, the first Introduction to Play Therapy course was offered at GSU to respond to a need for developmentally appropriate approaches to counseling young children within and outside of the school setting. This course was rooted in child-centered play therapy (e.g., Landreth, 2012) and integrated concepts from Adlerian play therapy (e.g., Kottman, 2011). Mental health and school counseling students received play therapy theory and were introduced to basic play therapy skills. The impact of this specialized course on students' clinical and child development conceptualization skills was remarkable.

With the success of the introduction course, coupled with the increased need for play therapists in and around Atlanta, a second play therapy graduate course was added to the CPS curriculum: Advanced Play Therapy. It served as a continuation and expansion of the introduction class for mental health and school counseling master's-level students, and specialist- and doctoral-level students in School Psychology and Counselor Education and Practice programs, adding advanced play therapy skills to their repertoire and extending their theoretical knowledge to other seminal play therapy theories (cf. O'Connor & Braverman, 2009) and filial therapy (e.g., Guerney, Guerney, & Andronico, 1966).

Both courses were offered each academic semester, though availability sometimes alternated based upon course registration numbers. Approximately six to fifteen students would enroll in each course. Small class sizes allowed the instructor to attend to individual student needs and encouraged group cohesiveness and sharing.

During these early years, Dr. White taught these classes using videos of her own play therapy sessions to demonstrate the use of play therapy theories and skills for students. In class, students would practice play therapy skills by role playing with each other using portable play kits. Recognizing the need for and the value of more experiential instruction with children in a live setting, though, she designed and built GSU's playroom in 1999 to provide a dedicated play therapy training space to facilitate skill development through direct practice and to provide teaching and supervision under optimal real-time learning conditions.

With the addition of the playroom, a graduate teaching assistant was hired to accompany children to and from the playroom and to film sessions. Although the graduate teaching assistant is not necessarily independently licensed, s/he is a doctoral student that must have successfully completed several classes before beginning in the position, such as the Introduction and Advanced Play Therapy courses and the doctoral-level Supervision of Counseling Services course. Additionally, s/he must be concurrently enrolled

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

in the doctoral-level Applied Supervision Internship course, serving as a supervisor-in-training under a licensed and RPT-S credentialed professor while working in the graduate teaching assistant position.

Facilitating Practice and Teaching

The playroom design, based upon Dr. White's play therapy experience, follows Landreth's (2012) recommendations in terms of size, toy selection, and the installation of training equipment. It includes toys selected from Landreth's recommended categories, two sand trays (one wet and one dry), approximately 500 miniatures, a fully functioning sink, a bop bag, and a one-way observation mirror, behind which the teaching assistant can monitor the play session and operate the camera equipment. It is wired and equipped with state-of-the-art audio and video technology for real-time screen projection into the adjacent classroom, where the remaining students and course instructor can observe and discuss the session in progress.

From 1999 forward, requirements for both classes included practicing newly learned play therapy skills with children within and beyond the classroom setting. The in-class required practice invites children from GSU's Child Development Center to be play therapy participants. This center, located on campus, offers child care and a preschool learning environment for the children of GSU faculty, staff, and students. Nearly twenty-five years ago, Dr. White initiated a collaborative relationship with the Child Development Center, with both she and the CPS Department assuming ultimate responsibility for the children's care and wellbeing during this time. This partnership flourished under her leadership and the following procedures, implemented then, still exist today.

Through documented informed consent procedures, parents consent to their children participating in and being video-recorded during "special play times" under direct instructor supervision to help graduate-level play therapists-in-training apply their play therapy knowledge and skills in the playroom setting. Child assent to special play time is obtained verbally after parents have consented to participation in written form. Each academic semester, new informed consent forms are disseminated to parents through the Child Development Center, allowing them to decide how often their child participates in special play time and to withdraw their child from this experience at any time. Parents understand that video recordings of their children may be used for teaching, training, and research purposes. This 25-year collaboration has contributed greatly to the university's research efforts and continues to offer an ideal setting for play therapists-in-training to learn about young children's development while practicing and polishing their play therapy skills.

GSU's playroom is centrally located among the offices and classrooms within the CPS Department. For Introduction to Play Therapy students, the graduate teaching assistant accompanies each child on foot from the Child Development Center to and from the playroom for special play time. The child selected for that day's class rotates among all children with permission to attend, and the play therapist-in-training does not necessarily work exclusively with one child. For Advanced Play Therapy students, one of the first class sessions is dedicated to forming a student-child dyad at the Child Development Center so the relationship begins in a familiar space (the child's classroom) and near a familiar and presumably safe person for the child (the child's teacher); this dyad remains paired exclusively throughout the semester. The Advanced Play Therapy students have the privilege of accompanying their child from the Child Development Center directly to the playroom and back, further building their relationship during their walks before and after their play sessions together.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

This in-class experience allows the play therapist-in-training thirty minutes with a child in the playroom while the teaching assistant records the session from behind the one-way mirror. The rest of the class remains in the adjacent classroom, viewing the session live, while the course instructor encourages the class to note what basic and advanced play therapy skills are being employed, and what strengths and areas for improvement they see in their colleague's approach. This feedback is captured on a play therapy evaluator's form that is shared orally and in writing with the play therapist-in-training after the session. The professor also comments on what the play therapist-in-training and/or the child is doing in the session, further enhancing students' understanding of play therapy theories and process dynamics in real time. Therefore, students learn by doing and by actively observing their peers while direct supervision and commentary is provided by their professor.

Other introductory and advanced course requirements include recruiting and obtaining consent and assent to practice play therapy in special play times outside of the classroom setting with one child on the students' personal time; transcribing recorded sessions to better understand one's personal process and the development of the therapeutic relationship through play therapy; and completing reports on how different theoretical orientations approach case conceptualization, practice, and parent feedback. Students learn to develop encouraging feedback and to deliver this information to their colleagues orally and in writing, which represents an active form of attendance and participation in class and a professional development skill that later serves them in working with future clients' parents/guardians, teachers, other professionals, and eventually their own supervisees.

PROGRAM EVOLUTIONS AND CURRENT PRACTICES

With a solid foundation from which to teach and practice, GSU's Center of Play Therapy Education carried on the mission initiated by Dr. White for twenty years with procedures that remained relatively unchanged during that time. The evolutions that have emerged in current procedures respond more to meeting societal and technological demands for security than changing the underlying play therapy teaching and practice philosophy. All of these differences have spurred enhancements that allow the program to operate to the highest possible ethical and legal standards while adding greater diversity and depth to class discussions.

Tracking the Evolution of Current Practices

Since 2010, the CPS Department and the Child Development Center have agreed to assume joint responsibility for accompanying child participants to and from the playroom. Child participants are now accompanied back and forth from sessions with one of their teachers in addition to either the CPS graduate teaching assistant (in Introduction to Play Therapy) or the play therapist-in-training (in Advanced Play Therapy). Beyond providing an extra layer of physical security to the children, this double accompaniment also promotes children's emotional security to have a person they already trust (their teacher) there to ensure their wellbeing, acting as a secure base for them (Verschueren & Koomen, 2012) while they develop a therapeutic relationship with the play therapist-in-training. This reflection for the child's safety also was extended to bathroom breaks requested by the child during play sessions; children are always accompanied to the restroom by their teacher and their play therapist-in-training.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

To better include parents, the course instructor encourages them to sit in the observation room with their child's teacher and the graduate teaching assistant during the session. The parents may openly communicate their questions or concerns and receive immediate answers from the graduate assistant, who is well-trained in play therapy, child development, and supervision, or from the professor after the session. However, if the parent is not present, no feedback is offered after the session. Additionally, parents are better informed about data security procedures employed through updated informed consent forms.

Sessions are digitally recorded and stored on a server developed uniquely for the Center for Play Therapy Education. This server allows only the course instructor and teaching assistant to access files, though both may digitally send encrypted files to students through a password-protected account. The course instructor works closely with the College of Education and Human Development's lead technology staff person, participating in specialized technology trainings twice a year to comply with the highest levels of data security and ethical responsibility (e.g., American Counseling Association, 2014; American Psychological Association, 2018).

In addition to the technological changes within the Center of Play Therapy Education, the program has updated its original coursework to reflect current CACREP standards and APT objectives, and now includes three additional course offerings. This three-course expansion provides a more comprehensive and well-rounded perspective on child development and further play therapy-specific knowledge and skills in several crucial domains. Notably, professors put special populations and settings at the forefront of play therapy education, such as working with traumatized children and families through play and expressive arts and working "outside the box" of the four-walled classroom through adventure therapy facilitation and education.

Expanding Course Offerings

A total of five graduate-level courses are currently offered and taught by two different professors: Tiffany McNary, PhD, LPC, NCC, CPCS, RPT-S, Clinical Assistant Professor of Counseling, and Jeff Ashby, PhD, ABPP, RPT-S, Full Professor of Counseling Psychology. The difference in the play therapy professors' professional identities provides students with licensure, supervision, and play therapy credentialing advantages; students can seek education and training across disciplines or supervision from a professor within their discipline, as those disciplines may require.

Three of GSU's courses provide students with 67.5 hours each of the mandatory 150 education hours required for RPT/S certification through APT, and the remaining two courses offer 30 hours each towards RPT/S certification. A registration wait-list is necessary to account for the ever-increasing demand for these courses. Enrollment is intentionally limited to increase instructors' abilities to respond to students' specialized training and supervision needs. Additionally, students may benefit from play therapy-specific supervision groups that meet weekly on campus to focus on child and adolescent cases. Each semester, approximately 12-18 master's-level students in practicum and internship classes receive play therapy supervision by faculty members (including one part-time instructor) with doctoral degrees, a mental health license, certified supervisor credentials, and the RPT-S credential from APT.

The development of graduate-level course programming is an intricate task wherein professors are expected to reflect the values, mission, policy and procedures of multiple entities within their syllabi (e.g., university and department standards, accrediting agency guidelines, and specialty certification requirements). GSU play therapy syllabi specify all of these components and align course learning objectives with APT's requirements for RPT/S credentialing. We provide course descriptions in Table 1

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Georgia State University play therapy course offerings

Course	Course Objectives	Course Content	Course Format	Text(s)	Attendance hours offered toward RPT/S credential
Introduction to Play Therapy[a]	Acquire play therapy knowledge and skills. Utilize play therapy skills with children from GSU's Child Development Center and children recruited outside of class time.	Play therapy history, seminal play therapy theories, basic play therapy techniques, and issues related to counseling children.	Lecture, case studies, video presentations, and experiential activities. Limited to 15 students.	Landreth (2012) Kottman (2011)	67.5
Advanced Play Therapy[a]	Develop and deepen play therapy knowledge and skills. Build a one-on-one therapeutic relationship with a child from GSU's Child Development Center. Review recorded sessions in individual play therapy-specific supervision. Participate in group supervision activities outside of class time.	Play therapy history, additional play therapy theories, play therapy research, and recent innovations in play therapy. Guest speakers present on special topics of interest, directly linking theories and special issues to real-world practice.	Lecture, case studies, video and oral presentations, and experiential activities. Limited to 13 students.	Ray (2011)	67.5
Treating the Traumatized Child: Integrating Play Therapy and the Expressive Arts[a]	Acquire traumatology and traumatic play dynamics knowledge. Gain exposure to working with traumatized children through play and expressive art therapies and the neurosequential model of therapeutics.	Discussion and delineation of common concerns, research bases, and practice guidelines among traumatology, play therapy, and expressive art therapy theories and practices.	Lecture, discussion, video and oral presentations, and experiential activities. Limited to 30 students.	Findling, Bratton, & Henson (2006) Gaskill & Perry (2017) Herman (1992/2015) Malchiodi (2014) Steele & Malchiodi (2011)	30
Family Systems, Theory and Interventions: Integrating Play Therapy and the Expressive Arts[a]	Acquire knowledge of family systems theories and working with families in play therapy. Integrate play and expressive arts techniques into family therapy sessions using art, puppets, sand tray, storytelling, and drama.	Family therapy history, major family therapy theoretical orientations, family therapy research and ethics, and family play therapy techniques.	Lecture, discussion, video and oral presentations, and experiential activities. Limited to 30 students.	Gil (2016) Gladding (2015) McGoldrick, Gerson, & Petry (2008)	30
Facilitating Adventure Therapy and Education[b]	Acquire knowledge about adventure/challenge therapy. Learn to facilitate adventure/challenge therapy.	Dynamics of adventure experiences, therapeutic application of adventure activities, and effective group facilitation and processing skills.	Lecture, video, class discussion, and participating in and leading a variety of experiential exercises in high-, low-, and no-ropes settings. Limited to 12 students.	Ashby, Kottman, & DeGraff (2008) Gass, Gillis, & Russel (2018)	30

Note. [a]Denotes courses taught by Dr. Tiffany McNary, PhD, LPC, NCC, CPCS, RPT-S, Clinical Assistant Professor of Counseling at Georgia State University. [b]Denotes courses taught by Dr. Jeff Ashby, PhD, ABPP, RPT-S, Full Professor of Counseling Psychology at Georgia State University.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

as examples that may be useful to other approved centers or individual providers designing coursework for play therapy credit.

Since the inception of GSU's play therapy program thirty years ago, instructors have emphasized that providing an adequate training environment and promoting collaborative relationships among participants allows students to grow in their professional identity as play therapists and to flourish in their skill development. The specific concepts that are emphasized and employed in the GSU teaching approach are worth noting and incorporating in any center for play therapy education or continuing education setting. We describe them here to encourage readers to think globally about how their training programs will make a difference in the professional lives of their students and those students' future or current clients as a result of having participated in readers' own play therapy education and training programs.

TEACHING APPROACH AND THEORETICAL CONSIDERATIONS

Attending to the logistics, details, and setup of a training institute are paramount to its establishment and success. Equally as important are the relationships and connections we have with one another. Developing a sense of community among students aids in fostering a sense of belonging to the course, the program, and the profession as a whole, and helps them build a professional network with their colleagues. While integrating psychological and developmental theories and models, clinical experience, and experiential practice into each class, course instructors underscore connection to the play therapy material, to each other, and to the professor. Several practices are key to GSU's teaching approach to experiential education. For example, instructors emphasize creating a learning community, incorporating supervision directly into the teaching model, and discussing the importance of trauma-informed instruction and care, multiculturalism, and social justice during class sessions.

The program incorporates tiered teaching and supervision experiences to develop a cadre of play therapy professors/trainers and supervisors, addressing Saraceno et al.'s (2007) concerns for developing more practicing supervisors. Furthermore, professors encourage students to use their play therapy skills on a volunteer basis to help others and further promote the play therapy profession. Finally, offering courses in a continuing education format to practicing clinicians allows the GSU Play Therapy Training Institute to have a greater community impact on child clients, answering Satcher's call to expand child mental health services (PHS, 2000). We discuss each of these components in turn to inspire readers to build a solid training foundation for students and simultaneously perform community outreach and strengthening through their own programs.

Creating a Learning Community

This part of GSU's teaching style is multifaceted and includes didactic learning, experiential components, and creativity. Instructors integrate clinical skills into the classroom environment and highlight attunement, intentionality, student strengths, and the use of encouragement, thereby creating a safe and nurturing environment in which to learn and develop personally and professionally. This approach recognizes the developmental processes involved in becoming both a helping professional and a play therapist. Instructional style and depth are informed by the students' developmental levels, as instructors aim to support students' transition from novice learners to competent clinicians. In accordance with Vygotsky's (1978) teachings on the zone of proximal development, instructors are mindful of the level

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

of scaffolding, assistance, support, and encouragement needed for students to complete the various tasks required of them.

This multi-layered approach to teaching, which captures students' unique and varied learning styles, may begin, for example, with a Power Point presentation and lecture embedded in a thought-provoking discussion, followed by a case study from the instructor's clinical practice. Then, students transition to viewing a video of the professor facilitating a play therapy session, cued to highlight the skill taught in the Power Point. Finally, students work experientially using play and expressive activities designed to increase students' awareness of the class topic.

Incorporating Supervision Into the Teaching Model

Supervision is an important component to require within a didactic and experiential training program, for students initially learning play therapy skills and for licensed mental health professionals that supervise others. GSU's Center for Play Therapy offers supervision experiences and training to accommodate different students' needs: requiring supervision of play therapists-in-training and offering tiered teaching and supervision opportunities to doctoral students learning to supervise others in play therapy practice.

Offering Supervision as a Part of Initial Play Therapy Training

Instructor awareness of clinical supervision models (e.g., Bernard & Goodyear, 2018; McNeill, Stoltenberg, & Romans, 1992; Stoltenberg, 1997) offers greater conceptualization of student development. Understanding students' individual professional development stage (i.e., length of time in graduate program and previous courses taken) provides instructors with a roadmap of how to enhance clinical understanding and skills for each class member. For instance, a first semester student will approach and comprehend course material vastly differently than a student entering his or her final semester who has completed basic skills, counseling theories, and practicum.

When these two types of students are in the same class, the instructor can make use of each of their skill levels to create connections and further skill development for all students simultaneously. For example, the instructor can invite more advanced students to describe their experiences to the class, thereby activating case conceptualization and presentation skills, to engage less advanced students in observation through active listening, discussion, and connecting to others and the course material through asking questions and giving feedback. The integrated developmental model (e.g., Stoltenberg, 1997; McNeill et al., 1992) also recognizes that student development may vary within the same cohort year, with some students integrating material and skills more quickly than others.

Meeting students at their developmental level is central to helping them integrate new knowledge and increasing their willingness to examine and reflect upon their practice. Accordingly, professors must balance their roles of educator, supervisor, model, mentor, and consultant. Instructors must be keenly aware of their responsibility to the clients that these students serve (currently or eventually). The discrimination model (e.g., Bernard & Goodyear, 2018) highlights three main skill areas for supervisees that can translate directly to play therapy-specific courses: intervention skills, conceptualization skills, and personalization skills. Intervention skills address counseling interventions and skills; conceptualization skills attend to understanding patterns and choosing interventions; and personalization skills focus on personal counseling style (Bernard & Goodyear, 2018). When addressing each of these skill areas, supervisors will utilize and shift between teacher, counselor, and consultant roles (Bernard & Goodyear,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

2018). In the teacher role, the supervisor provides structure, instruction, feedback and modeling; in the counselor role, s/he increases a supervisees' reflection and awareness of their inner world; and in the consultant role, the supervisor challenges the supervisee to trust his or her own insights and to choose his or her own actions (Bernard & Goodyear, 2018).

However, Allen, Folger, and Pehrsson (2007) posited that standard supervision training falls short in recognizing the unique adult-child relationship, non-verbal communication, and projective approaches inherent to play therapy. They emphasized the need for play therapy supervisors to be grounded in play therapy education, theory, and techniques. Muro, Holliman, Blanco, and Stickley (2015) found significant improvements following play therapy training on students' attitudes, knowledge, and skills following in vivo-experiences of providing play sessions under weekly supervision. They explained that students may experience increased doubt in their skill set when first working with children, and they argued that skill practice is critical to student and skill development.

Allen et al. (2007) provided a three-step model for supervising novice play therapists that focuses on developing content, feeling (at a distance), and interpersonal reflection skills. Following a developmental model, Ray (2004) highlighted how play therapy supervisors often provide structure and specific skills feedback to novice supervisees and peer consultation to those with more advanced training. She asserted that play therapy supervisors aid in developing a supervisee's basic skills, such as nonverbal behaviors and verbal responses, and advanced skill sets, such as limit-setting, identifying themes, and interpreting play behaviors. She further advised that supervisors remain aware of their supervisee's personal and professional limitations and how these may affect the clients with whom they work. She suggested using supervision to process the supervisee's feelings that arise when working with a child who is rejecting or hurtful within the therapeutic relationship.

Teaching How to Supervise Through Tiered Supervision Experiences

Training and supervising students in play therapy requires a different skill set than practicing as a clinician. As such, the GSU Center of Play Therapy Education takes a first-hand role in developing the next generation of play therapy educators and supervisors. Doctoral-level counselor educator/supervisor and counseling psychology students may serve as teaching assistants and supervisors-in-training (SIT) in play therapy courses and supervision groups through tiered teaching and supervision experiences.

Current CPS doctoral students may engage in a full-year SIT experience. These students partner with a CPS faculty member and assist with a variety of teaching and supervision responsibilities. SITs co-facilitate weekly group supervision classes with their assigned faculty member. In addition to co-facilitating weekly master's-level practicum supervision groups, SITs are required to meet for one hour a week individually with one or two master's-level students who are also members of the larger weekly group. Each year, one or two doctoral students who manifest an interest in learning to supervise play therapy interns are permitted to do so as SITs.

In a tiered format, SITs from all different supervisory disciplines (e.g., clinical mental health, school counseling, and play therapy) also meet once a week in an advanced supervision class with a different faculty member to take supervision on their supervisory experiences. This class allows SITs to focus on their roles as instructional and supervisory managers (of master's-level individuals and groups), advocates for multicultural competency, and gatekeepers. All of these skills are paramount to furthering child mental health practice in general and the play therapy profession more specifically.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Incorporating Trauma-Informed Practices

Play therapy courses offered through GSU's Center of Play Therapy Education are designed and facilitated in ways that are consistent with trauma-informed practices. SAMHSA's (2014) 4R trauma-informed approach includes *realizing* the widespread impact of trauma and understanding potential paths to recovery; *recognizing* the signs and symptoms of trauma; *responding* by integrating knowledge about trauma into policies, procedures and practices; and *resisting re-traumatization*. SAMHSA (2014) further highlighted the importance of several principles of trauma-informed care, such as promoting safety, trustworthiness, transparency, collaboration, and empowerment; giving voice; and recognizing cultural, historical, and gender issues present within the trauma and more globally within the person's life.

Trauma-sensitive counseling is taught and modeled in parallel structure to trauma-informed practice. Each semester-long course begins with an overview, purpose statement, and opportunity for the instructor and students to share about themselves and their relation to the course. In the beginning phase, instructors are intentional in establishing safety and connection to allow students a space to fully engage in play therapy. In the middle phase, "the work" is accomplished: the learning, experiencing, challenging, and growing that occurs within the course. Finally, each semester ends with a dedicated space to reflect on their work and transition to other professional and personal endeavors with a sense of closure. The instructors highlight the prevalence and effects of trauma in both a specialized course and throughout all courses with the realization that students will encounter various forms of trauma while working with children, adolescents, and families.

Emphasizing Multiculturalism and Social Justice Advocacy

Multicultural competency encompasses an awareness and ownership of one's own biases, assumptions, and values (Sue, Arredondo, McDavis, 1992). Personal identities influence assumptions, values, and attitudes that can manifest in counseling (Bernard & Goodyear, 2018). As such, multiculturalism needs to be addressed within classrooms, and multicultural competencies must be developed within students. Ratts, Singh, Nassar-McMillan, Butler, and McCullough (2016) emphasized that competence begins with self-awareness that "extends to clients, to the counseling relationship, and to counseling and advocacy interventions and strategies" (p. 35). Multicultural and social justice counseling researchers and advocates have repeatedly highlighted the importance of understanding the effects of power, privilege, and marginalized identities within the counseling relationship (e.g., Constantine, Hage, Kindaichi, & Bryant, 2007; Hays, Dean, & Chang, 2007; Ratts et al., 2016). Ratts et al. (2016) further underscored the importance of understanding the impact oppression has on mental health.

To further facilitate multicultural competency, Hays et al. (2007) suggested holding open discussions involving students' reactions and biases towards clients and highlighting contextual and systemic factors that impact clients during case conceptualization. They posited that multicultural competency is linked with knowledge of privilege and oppression and argued that educators can increase students' awareness through "discussing invisible minority status" (p. 323). To meet these recommendations, GSU's Center of Play Therapy Education incorporates multicultural conversations into each course, attending to systemic and individual client factors, differences and similarities within the counseling relationship, and student self-exploration and reflection in relation to diverse clientele.

We argue that part of being multiculturally competent play therapists is to recognize and understand the multiple systemic factors impacting the lives of children. As with all clients, race, religion, socioeco-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

nomic status (SES), sexuality, gender identity, and ability status are variables that must be considered when working with children. Children, however, are also faced with additional systemic factors over which they have limited control and minimal voice to initiate change. Understanding a child's family dynamics, school life, and the state laws governing their rights and freedoms are central factors to understanding a child's world. Additionally, child mental health professionals need to be equipped to navigate and, when possible, integrate multiple systems while keeping the child's interests at the forefront of all treatment. As such, we make every effort to ensure that case vignettes, videos of play therapy sessions viewed in class, and children brought from the Child Development Center for sessions include diverse characteristics along many lines, such as nationality, race, and SES. Professors acknowledge and process different dynamics that arise in session pertaining to the client's world, his or her potential lived experiences, as well as students' reactions and assumptions that may affect the therapeutic relationship.

Understanding the role of social justice advocacy is crucial to providing multiculturally competent counseling. Social justice advocacy allows individuals to have a voice, gain information, understand their rights, and make more informed choices (Stewart & MacIntyre, 2013) by focusing on issues of oppression, privilege, and social inequity and promoting equitable treatment and allocation of resources (Chang, Barrio Minton, Dixon, Myers, & Sweeney, 2012). Furthermore, social justice advocacy within the counseling profession involves identifying needs and taking action to change inequity and systemic barriers (Ratts et al., 2016; Trusty & Brown, 2005).

Children are a vulnerable population and most often a voiceless population. Students must learn to recognize the power dynamic that exists in most child-adult relationships and that, within many systems, children are entirely powerless. Therefore, play therapists work to dismantle this power differential from their first interactions with children and parents through gathering assent and consent for services, promoting autonomy, and returning responsibility to children in play. GSU's Center and Institute helps play therapists-in-training develop these skills through discussion, modeling, and direct practice.

ADDITIONAL PROFESSIONAL DEVELOPMENT OPPORTUNITIES

Part of teaching play therapy is modeling how we advocate for children's inherent rights to protection, to express an opinion and to be heard, to be silent, and to play (United Nations, 1989, art. 15). As educators and play therapists, we are well positioned to advocate for the changes that will directly impact and assist our youngest clients in their communities. The GSU Play Therapy Training Institute offers opportunities for students to impact children in the community through philanthropic and continuing education opportunities, and awards some with a scholarship for demonstrating their commitment to the play therapy profession.

Encouraging Play Therapy Philanthropic Opportunities

Dr. McNary created "Play Therapy Serves," the Play Therapy Training Institute's service component, in 2016. The mission is to promote play therapy, advocacy, volunteerism, and to provide community service to children and families. Over 120 volunteer hours have been provided by GSU play therapy graduate students above their coursework with Child Development Center participants. This community outreach has served children and their families in Atlanta-area schools, hospitals, community-based mental health centers, and homeless shelters, and could be replicated in other communities.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Providing Play Therapy Scholarship Opportunities

Awarding play therapy students with graduate funding opportunities recognizes their commitment to the profession. Since 2015, the GSU Play Therapy Training Institute has offered the JoAnna White Play Therapy Scholarship, a $1,000 scholarship awarded to a current play therapy graduate student in good standing who has exhibited a strong interest and commitment to the play therapy profession through research, practice, and service.

Offering Continuing Education Through the Play Therapy Training Institute

Recognized by APT as an approved Provider of Continuing Education since 2009, GSU's Play Therapy Training Institute has had four different directors since its establishment. This Institute is the state of Georgia's only college or university that trains professionals in play therapy through university-based courses or continuing education trainings. Approximately ten trainings are offered each year to current students, alumni, and community mental health professionals through GSU's Institute. Twice per year, the Institute invites nationally recognized play therapists to give a full day of training, providing continuing education to 100 attendees or more.

FUTURE PLAY THERAPY PERSPECTIVES AT GEORGIA STATE UNIVERSITY

Play therapy faculty are mindful of the developmental processes involved in becoming a play therapist and their intricate roles as educators, supervisors, models, mentors, and consultants. As GSU's Center for Play Therapy Education and Play Therapy Training Institute both look ahead into the future, there are several common themes in their goals that revolve around offering more training opportunities and continuing to provide cutting-edge teaching methods and materials.

Offer More Training Opportunities

One goal is to continue to offer five play therapy courses to graduate students in mental health professions. Additionally, we wish to expand the current course offerings, allowing additional sections to open on the academic calendar to reduce wait-lists and to promote the therapeutic powers of play (e.g., Schaefer & Drewes, 2014) more widely.

Another possibility is to connect with community agencies or directly with families by keeping GSU's website updated and placing brochures in pediatricians' offices, for example, to market free play therapy services to children in nearby communities. Students would benefit from real-world skill development, and families would benefit from increased access to mental health care through GSU's services.

Provide Cutting-Edge Teaching Methods and Materials

A strength of GSU's teaching method is that we use recorded sessions for teaching and supervision purposes. Connecting a livestream from the playroom to the adjacent classroom or utilizing a one-way mirror allows students to learn and reflect on practice issues and to observe and give feedback to oth-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

ers in real time. Following class sessions with group supervision encourages, strengthens, and provides specific feedback for students' skill improvement.

Structuring class times with didactic and experiential learning opportunities and processing encourages students to engage in, grapple with, and dialogue about the material. Creating an environment that demonstrates safety, honesty, transparency, and openness provides students with the support they need to take risks, explore ideas, self-reflect, and self-evaluate.

Intentionally integrating teaching strategies that promote creativity, play, and expressive arts-based approaches fosters clinicians' ability to move from an adult-client mindset to a child mental health perspective in engaging ways. This can be accomplished by emphasizing the importance of the child-therapist relationship and the therapeutic powers of play, promoting attunement to children's nonverbal and verbal communication, understanding the child's world, and training play therapists to enter the child's world and learn about their experiences from the child's perspective.

We will further model this mindset shift by stimulating students' thinking about individual, family, cultural, and systemic factors that may impact children, highlighting advocacy competencies and ethical considerations in each course. Providing detailed clinical examples that span race, religion, SES, disability, sexuality, and gender identity and encourage open discussion on students' responses to clients with various and intersecting cultural backgrounds helps students craft appropriate treatment responses in their practice sessions within and outside of the classroom.

CONCLUSION

As play therapists, we know that children are not little adults, that their problems are unique, and that their viewpoints are worthwhile. Play therapy courses offer many students their first in-depth exposure to considering child development in context, to counseling children, and to choosing developmentally appropriate interventions and modalities that promote children's self-expression and healing. GSU's play therapy program has embraced this responsibility for over thirty years. Because graduate students and professionals are the foundation of our future profession, when trained in the art of play therapy, they weave threads of trauma-informed practice, multicultural, and social justice competencies into the fabric of our next generation with their impact on the children they serve. We hope that our training models encourage other play therapists to establish or enhance their own programs to help current and future clinicians use the therapeutic powers of play in more creative ways in their own work.

Chapter 25
Positive Psychology Competences of Pre-School Teachers as a Tool for Understanding and Nurturing Children's Play

ABSTRACT

The Positive Psychology frame and definition present a natural environment for understanding and researching children's play in the context of nurturing overall positive characteristics in children's development. Therefore, this article presents a structured review of the common ground between the basic principles of positive psychology and children's play in the context of early and preschool institutions. Also, it demonstrates the implementation of positive psychology principles in children's play and the methods by which positive psychology could be promoted through children's play in kindergartens. Within that frame, the importance is given to the needed preschool teachers' competences in this area. In this context, various activities are presented that reflect a common ground of positive psychology and children's play. Finally, some significant guidelines for future research and practice enhancement are presented.

INTRODUCTION

Children's play is crucial for their happiness, well-being, learning opportunities and healthy development in general. Gleave & Cole-Hamilton, (2012, p. 2) stated: "If children's opportunities for play are restricted there are likely to be profound effects on their life experience in general and more specifically on their physical and mental health. For example, obesity, rickets and attention deficit disorder are just some of the growing problems experienced by children that health experts have recently linked to a lack of particular forms of play." It presents a complex human activity and has been in the focus of many scientific fields such as psychology, pedagogy, sociology, ethnography, etc. (Bodrova, 2013; San Chee, 2014; Tatalović Vorkapić & Katić, 2015). Because of its complexity, children's play should be analyzed and understood through the application of holistic and multidisciplinary ideas (Kamenov, 2006). Schousboe and Winter-Lindqvist (2013) emphasized that it is impossible to separate children's play from their learning and development. "All children and young people need to play. The impulse to play is innate. Play is a biological, psychological and social necessity, and is fundamental to the healthy development and well-being of individuals and communities" (Gleave & Cole-Hamilton, 2012, p.4). Therefore, having in mind the whole frame of children' play, it is clearly observable that it presents the essence of positive psychology. Pearson, Russ and Spannagel (2008) demonstrated that pretend play and positive psychology are natural companions in presenting research on pretend play that fits under the umbrella of the positive psychology movement, and that is closely linked to the adaptive and optimal functioning in children within various environments. Even though these authors have reviewed five areas of positive psychology in relation to pretend play (creativity, coping, emotion regulation, empathy/emotional understanding, and hope), there are also other areas worth mentioning. Therefore, in this article, we present examples of proposed activities for nurturing positive emotions, thinking, traits and relationships with others.

BACKGROUND

Children's Play

Definition of children's play consists of four core aspects (Duran, 2003). The first aspect is a stimulatory behavior with features of divergence, incompleteness and inadequacy. Divergence means the children's behavior is new and unusual. Incompleteness represents that the play does not include the achievement of a specific target. Inadequacy is visible in the children's play since the play presents behavior that is not in accordance with the given situation. From the second, autotelic aspect, children' play has its own motivation sources. This means that the process of play is more important than the outcome of play. In addition, it means that the purpose of children's play is the play itself, where means dominate the goals in the absence of direct pragmatic effects. The third aspect refers to the fact that children's play realizes the private functions of players. This means that children's play releases tension, resolves conflict, and regulates the physical, cognitive and social-emotional development of children. Finally, the forth aspect is the fact that children's play is always running in an optimal condition motivational tone. In other words, it occurs in the absence of immediate biological compulsion and social threats, and in a state of moderate psychological tension. For example, if the child feel sick or (s)he is tired, s(h) will not be able to play spontaneously.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Play is the oldest form of physical education and most autonomous activity of man, spontaneous and a freely chosen human activity, which includes the diversity of movement and a strong sense of happiness and satisfaction (Kvesić, 2008). Considering that the largest part of the game consists of fun, as such it is an ideal way to encourage the child's positive psychological aspects, which motivate them to learn, socialize and develop basic social behaviors. Play is a nice way of meeting people and making friends regardless of racial, linguistic, religious or other differences among children. When children play, they learn about natural and social phenomena, their changes and patterns in the immediate natural and social environment (Vasilj, 2008). Today, play is a basic activity in which children learn all about environment that surrounds them. That same environment enabled them to enjoy the feeling of acceptance, love and warmth, but also to enjoy playing with others, moving and speaking, as well as to communicate with others. Contemporary psychology with empirical findings supports the point of view that the fundamental frame for learning in children is the play itself considering it is the simplest and most natural children's activity (Peti-Stantić & Velički, 2009). Gleave & Cole-Hamilton (2012, p.4) stated that "play is a process that is freely chosen, personally directed and intrinsically motivated. That is, children and young people determine and control the content and intent of their play, by following their own instincts, ideas and interests, in their own way for their own reasons."

Developmental psychology looks at play as the child's inner need for activity (Vasta, Haith & Miller, 2004). Children acquire their first experiences, skills, abilities and knowledge through spontaneous play: they learn to walk, talk, and acquire first knowledge of the world around them. Through play children reveal their own opportunities, develop skills and abilities, gain experience, learn, and create. In addition, play can stimulate imagination and creativity. Considering that children greatly enjoy play, it motivates them to participate in various activities in their surroundings. The significance of play in today's upbringing is very important because it affects all dimensions of physical, cognitive and social-emotional development of the child. Contemporary educators use play to help evoke in the children a sense of curiosity, sensitivity, physical activity and the need for cooperation, tolerance and togetherness among children, regardless of their socioeconomic status or some other differences. Kindergartens are a place for play, because all the toys, picture books and materials are equally available to every child, no matter if the child has them at home or not.

Since play affects the child in different ways, its influence in the education of children noticeable from several perspectives (Kvesić, 2008). The first one relates to the biological significance of the game – it reflects a favorable impact on the functioning of internal organs, which affects the improvement and strengthening of the whole organism; physical activity makes the child's muscles stronger; lungs are releasing old and filling up with fresh air; blood circulation is faster and discharges excess energy. The second focuses on the pedagogical significance of children's play, which relates to developing positive personality traits: dexterity, endurance, resourcefulness, respect for others, self-respect, and moral personality. Creative games stimulate children's imagination, divergent thinking, creativity, and innovation.

The psychological significance of play means that through play children exercise and sharpen their perception, develop imagination, thinking and creativity, explore and exercise their memory, and express their emotions. Within the sociological aspect, children develop social skills in interactions with other children in collective plays, adopt rules of different plays, respect for the norms of behavior in play, show respect for others, learn to express tolerance, social justice, and equality. Institutional or not, when playing the children learn through trials and errors, they experiment with different materials, express their thoughts and feelings, research with various methods. With play, children develop and build their whole personality, as well as their self-regulation (Bodrova & Leong, 2003). In their environment, children

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

who pay get to know themselves and develop their own individuality, i.e. their likes and dislikes. The ability of independent and mature play presents the base on which the children build their confidence, strengthen concentration, sense of identity, resourcefulness, and creativity. So, this should be strongly encouraged by parents and significant others. The basic form of activity and the most appropriate method of positive influence on the children's overall development is children's play.

In literature, there is reference to several types of children's play (Duran, 2003): functional play, symbolic play, and play with rules. Functional play relates to the new functions that are maturing, and these are motor, sensory and perceptive functions. This kind of play is present in children's early interaction with the environment and gradually in the second year of life, it decreases as the intensity of creative games increases. Symbolic play (or play of fantasy, role-playing games) represents play in imaginary situations that are associated with reality through symbols. On the other hand, a play with the rules is a play with sensory-motoric combinations (race, marmot, bouncing etc.) or intellectual combinations (cards, chess, etc.). When playing with rules, children compete and they regulate themselves by certain rules learned from adults or by their own agreed rules. This type of play has a significant impact on the cognitive, moral and social development. Preschool play is the principal activity of the child, and educators should view play as one of his/her basic needs. It should not be a reward or punishment, which depends on the obedience of a child nor it only be understood as fun and entertainment (Findak & Delija, 2001). Through appropriate play content the conditions are ensured for a normal state of health of the children's organism and development of different types of knowledge, skills, and habits, which affect the psychological well-being of the child such as self-confidence, joy, happiness, hope, a sense of satisfaction (Koritnik, 1970). That is the reason why positive psychology is foundational at the core of children's play.

Positive Psychology Approach

The concept of well-being is multi-dimensional, encompassing physical, emotional and social well-being and focusing on children's immediate as well as their future lives (Statham and Chase 2010). The scientific discipline that deals with study of psychological well-being, positive qualities, and the human condition of positive psychology (Seligman & Csikszentmihalyi, 2000). Positive psychology was a reaction to the established empirical fact that previous psychology mainly focused on the research of negative emotions and states, and that this was not giving objective findings on what human happiness and love actually are and how to achieve them. The main goal of positive psychology is to highlight the positive qualities of the individual, which means that every individual should recognize his/her strengths, fully develop them, and make his/her life more positive and fulfilling. It is not enough to live without any difficulties but also to know how to live happily and satisfied. Until now, there are numerous research studies in the fields of positive emotions and moods (happiness, subjective well-being, eudemonic well-being); positive experiences (flow, mindfulness, elevation); positive thinking (optimism, hope and self-efficacy); positive character (virtues and strengths); positive motivation; positive life-long development; positive relationships (altruism, gratitude, forgiveness, friendship and love); and positive community (positive family, positive kindergarten, positive school, positive working organization, positive society) (Rijavec, Miljković & Brdar, 2008).

If we focus on the analysis of what is vital for children's optimal and adequate overall growth and development, soon we come to an answer that refers to play. "It is widely understood that play is crucial to children's healthy development and quality of life" (Foley, 2008, p.6). Therefore, it is more than important to build such competence among educators that enable their adequate role in the children's play,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

the role that optimally supports and encourages children's play in order to achieve the highest possible levels of their well-being (Tatalović Vorkapić & Katić, 2015).

Although positive psychology goes hand in hand with children's play (Pearson, Russ & Spannagel, 2008), nowadays, very few scientific studies exist that clearly associate this field of psychology with children's play, or that recognize positive psychology within the frame of institutional care and education, at least when the Croatian cultural context is considered. The reason probably lies in the fact that it is a relatively young scientific discipline, the youngest in terms of psychology in general (Seligman, 2002). Nevertheless, preschool teachers can still recognize it (Tatalović Vorkapić & Vujičić, 2012).

This research aims to explore the preschool teachers' opinions concerning the need for positive psychology knowledge and its implementation within preschool institutions. It was determined that preschool teachers perceive Positive psychology as very much needed for their profession at all work levels. In addition, they viewed the positive psychology findings as very useful and applicable in their work and especially in their work with children.

So, taking into consideration the aforementioned, the intention behind this article if to review some of the narrow fields of positive psychology, such as positive emotions, positive thinking, positive traits or virtues, and positive relationships. In addition, we will analyze specific types of play and activities with children in relationship to these specific domains of positive psychology that are able to be nurtured and developed in early and preschool care and education.

These specific activities for children by which children are developing positive emotions, thinking, virtues and positive relationships are chosen, since they are mostly used in our country and mostly suggested by Croatian practitioners.

Positive Psychology Competencies of Pre-School Teachers

Moreover, besides all necessary competencies that modern and quality pre-school teachers should possess, positive psychology competences are very important, especially regarding pre-school teachers' role in children's play. University undergraduate and graduate study of an Early and pre-school care and education in Rijeka, Croatia is aimed to develop all necessary generic and specific competencies, so the pre-school teachers would be qualified to adequately and quality respond to every child needs with proper creation of an early and pre-school educational context.

In addition, they would be qualified to efficiently plan, program and evaluate an early and pre-school educational context taking into account all developmental areas of children. Besides, to be the reflective practitioner is one of the major competencies of pre-school teachers, who would be able to think about her/his implicit cognition and enhance practice accordingly. Continuous further professional development of pre-school teachers is very important, the teacher who think integrative in the context of one's own profession and actively pursue needed research studies in educational context. Quality initial education and continuing professional development of pre-school teachers have a direct impact on the implementation of the National Curriculum (2014) for an early and pre-school education. Moreover, it is very important to emphasize that both, initial education (undergraduate and graduate university study) and professional development should result not only advances in knowledge, but also in changes in pre-school teachers' beliefs and actions.

Therefore, the methods of pre-school teachers' education should have not only informative, but also transformative potential. In other words, quality teachers are those who have research characteristics and allow questioning of their and others beliefs, experiences and every day kindergarten practices. Beliefs

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

are filtering the knowledge and managing behavior of teachers, so the promotion practices will not happen if it is not linked to questioning and modifying those beliefs and the overall educational philosophy of pre-school teachers (National Curriculum of Croatia, 2014). Within the elective course of Positive Psychology at the Faculty of Teacher Education in Rijeka, for the last seven years, pre-school teachers have being developing their positive psychology competences. The overall objective of the course is to familiarize students with the objectives and findings of positive psychology, aimed at strengthening and optimizing the positive dimension of the individual, which can provide a better quality of life and the application of knowledge in working with pre-school children. In addition, students gain knowledge and skills how to recognize and relate positive psychology elements with their practice, and how to implement some activities in their kindergarten group with the aim of developing positive psychology aspects in preschool children.

It is expected that students after passing the exam for the course Positive psychology, dispose of the following competencies:

1. To acquire basic knowledge of fundamental knowledge in the field of positive psychology;
2. To develop the capacity of analysis and synthesis of basic knowledge of positive psychology;
3. To develop the ability to define and describe the basic terms of positive psychology such as happiness, positive emotions, factors affecting positive emotions and positive relationships with other people and others;
4. To develop problem solving skills and decision-making in pre-school education by learning from positive psychology;
5. To develop the skills of team or individual work and on the basis of findings from positive psychology;
6. Develop tolerance and sensitivity to individual differences among pre-school children, the general diversity and multiculturalism, and the ethical commitment educator invitation, as well as qualitative level of communication with parents, using the basic principles of positive psychology.

MAIN FOCUS OF THE CHAPTER

Nurturing Children Play by Positive Psychology Competencies of Pre-School Teachers

Defining and Developing Positive Emotions

The only theoretical model that offers a complete framework for understanding positive emotions of humans and their functions is that of Barbara Friedrickson (2009, 2011). According to this theory, *the broaden-and-build theory of positive emotions*, positive emotions have four functions. The first function is related to the behavior that occurs during the manifestations of positive emotions. She notes that unlike negative emotions, positive emotions signal safety, expand our repertoires and allow us to build a new behavior. This behavior includes creative and accurate thinking, tolerance to uncertainty, and focus on solving problems not only in the present but also in the future. The second function of positive emotions is that they increase the number of possible behaviors for which we are preparing. Thus, they help in building the qualities that a person will use in the future. From that reason, positive emotions are an important aspect in human personality growth and development. In addition, they enable people to

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

live a full life. The third function is cancellation, since positive emotions reduce existing physiological responses that are resulted from negative emotions.

Positive emotions can accelerate recovery or undo the physiological effects of negative emotions and return the body to the level of physiological functioning. The fourth function of positive emotions is that they create an upward spiral that person leads to a better emotional well-being, personal growth and development. In educational institutions, the increased interest in the application of activities aimed at developing social and emotional skills in children, such as problem solving, decision making, communication skills, recognizing own and others emotions and deal with them appropriately, control of emotions, manage own behavior etc. are widely visible (Takšić, Mohorić & Munjas, 2006). Many studies have demonstrated that positive emotions, if children properly manage them, can facilitate rational thinking, allow correct decision-making, and direct the individual to the appropriate behavior. Studies have shown that children, who are emotionally competent, are on average, in fact more responsible, more confident, popular, open, ready to help others and cooperate. All of this leads us to the conclusion that educational institutes need to implement activities, which will encourage children to focus on positive emotions so that they could develop emotional competence. Emotional competence is of major importance to the functioning of the individual, as well as learning. According to this, one dimension of David Watson (2002) relating to the self-esteem will be emphasized and it will be explained in the following through the example of an activity that can be performed in the preschool educational institution.

Recommended Activity for Self-Esteem Development

The development of children's self-esteem largely depends on the adults' behavior and their method of upbringing. It is necessary to teach children to perform everyday activities with joy and confidence, to show what they are and to feel free to express what they feel and think. All this is important so children would be able to develop self-confidence. Educators should provide children with opportunities to jointly share their experiences and adventures, to behave spontaneously and to accept their own life situations with joy. They should develop self-confidence of children in a manner that will offer them the opportunity to act independently and to achieve satisfactory results in the activities. For this reason, the starting point in the design of activities should be focused on what children can do with regard to their development, competences, and capabilities. The children will have more confidence if they are independent in finding solutions. To encourage children to develop self-confidence we should implement appropriate activities.

Applying the activity called *"Duckling Mono" ("Pačić Mono"* in Croatian) achieves that objective (Figure 1). The activity begins with a puppet show or story, which is an introduction to the conversation between educators and children. At the end of the activity, the children draw or model ducklings. The aim of the activity is to show children that feelings of uncertainty and lack of confidence can prevent ducklings to enjoy beautiful things. The task is to develop self-confidence in children and this type of activity is listening and retelling of the performance. Materials needed to perform are puppets on a stick or dolls and a CD-player for music. After the performance, they explain to the children what confidence is and that it depends on what people think about themselves.

Here is the text:

One rainy day, the rain flowed through the nest of duck Pomponius who was happy because she was surrounded by her children. The ducklings are constantly peering under the wings of mom Pomponius and every now and then, they would jump out of the nest to shake their yellow wings. The ducklings tasted

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Duckling Mono: a puppet show in kindergarten

the water in the pond and decided to persuade mom Pomponium to go swimming. Mom got up from the nest and went toward the lake. ''Count me out,'' said Moni Duckling, "I don't know how to swim, and if I go in, all water will go to my mouth''. His mother responded: ''Moni, don't you know that ducks do not need to go to the school of swimming? Ducklings can swim as soon as they are hatched from eggs." ''That may be true for the other ducks, but not for me." ''Well'', said mother Pomponia, "you stay at home while we go to have fun." The duckling watched them go and he was very sad because he wanted to be with them. ''I wish I knew how to swim,'' he thought. He walked to the part of the lake where nobody could see him and told himself, "I can do it, and one, and two....." He threw himself on the head and realized that he knew how to swim. ''Weeeee'' he shouted floating toward mother and his brothers. ''Mom, look, I am a water duck, I know how to swim!'' he shouted. His mother, brothers, and sisters laughed when they saw the duckling swimming toward them, confident that he knows how to swim. Moreover, Moni was now sure that all the ducks could swim even though nobody taught them to do so. The only thing they needed was self-confidence, he thought as he proudly glided over the water like a small boat (http://www.waece.org/paz/bosnia/13.%20Samopouzdanje.pdf).

The questions that they children could be asked are: "Why did Mono not want to get into the lake? Could he not swim or was it just his imagination? What did he need to go into the water? Did he believe

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

in himself that he could do it? Questions may continue in the direction in which children begin to answer, but not too far from the topic activities. After speaking, the children can draw or model ducklings, his brother, sister or mother. In addition, the children can retell what has happened to the duckling. Educator can follow the children's responses and record whether they recognized the duckling's low self-esteem or not, and if they could relate the story with some experiences in their own lives.

Defining and Developing Positive Thinking

Apart from hope and self-efficacy, optimism is one type of positive thinking that was investigated the most. When discussing optimism, most people think that it is the standpoint from which we see the glass as half full, or always notice the good side, or habitually expect happy endings (Seligman, 2005). An optimist expects his future mostly to be good, while a pessimist expects something bad will happen. In addition, the optimist is determined by the positive way of thinking about the causes of a situation, based on which optimism is defined as an explanatory style of a person. Each person is accustomed to a certain style of explaining causes or an attributional style. It develops in childhood and becomes lifelong. When optimists encounter difficulties, they do not give up on their goals and continue trying. They have an efficient coping style with unpleasant emotional states, which have resulted from difficult life situations, but they keep on going and usually succeed to achieve their goals. Parents of optimistic children explain the negative events in their lives in such a way so that children would feel good, while they explain positive events in such a way so that they feel extremely good (Rijavec, Miljković & Brdar, 2008). Although there is a significant positive correlation between optimism of children and optimism of their parents (Pavlic & Tatalović Vorkapić, 2015) parents are not the only people who unwittingly impose their explanatory style to children. Preschool, primary school, and secondary school teachers also have a tremendous impact. On a daily basis, they deal with the children's success and failure, so through the process of learning and teaching strongly affect the children's perception of how life works (Seligman, 2005). Fortunately, irrespective of the influence of genetics and early experience, research shows that optimism can be learned (Rijavec, Miljković & Brdar, 2008). Development of optimism depends on the mental health of the parents, parental modeling of optimism and pessimism, and the degree to which parents encourage and reward optimism (Gillham, 2000; Seligman, 2002; Pavlic & Tatalović Vorkapić, 2015). In addition, it could be enhanced through various educational activities within the institutional care and education of children.

Recommended Activity for Optimism Development

Most situations in which a child is sad can be used for the development of optimism in the kindergarten. This activity is called *"I'm sad, but ..."*. When educators detect that a child is showing signs of sadness and that this is constantly repeated throughout the course of several days, they can do the activity with the children through which they encourage and stimulate an optimistic view of that sadness. A practical example is when a boy is constantly crying upon arrival to the kindergarten and is very sad when the mother leaves. The aim of this activity is to show children that it is okay to share sadness with someone you love and that person will always provide you with a warm hug and love. In conversation with children, an educator can show how sadness is part of life, so the child will more easily accept sadness. Educator first asks the children what sadness is and after the introductory talk, he recounts the story of grief, followed by questions and a longer conversation about happiness and sorrow. The story goes like this:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Children drawing a rainbow

For me, sadness is like winter, winter comes after autumn, long rains and cold winds which disturb our heart and soul. However, winter is a time of peace, when all is a sleep and eventually goes into oblivion with many soft snowflakes. Sadness occurs after some events that have deeply impacted us. We should not run away from sadness, we must wait and it will help us to restore peace. It is not bad to be sad, it's okay to cry and sadness will slowly leave us. It is good to share sadness with friends or any other person we love. With love and warm embrace even the coldest winter does not last too long (Veronek-Germadnik, 2001).

Every child tells what saddens means to him or her, and children all together seek for solutions to specific problems. If a child is sad, the educator can lead the children to come up with a solution how to help a friend who is sad by asking questions. Children together conclude that each of them could share his/her sadness with his/her friends and that (s)he is never alone. Children could have a group hug and continue with various activities in the art center. All together could draw a rainbow on a flip chart that will remind them of how many colors (happiness) exist even though when we are sad everything seems futile. The activity in which children are drawing rainbow could be seen at the Figure 2 and 3. In addition, Figure 4 presents the children art activity that was done with their hands and at the same time, it presents their solidarity and togetherness.

Defining and Developing Positive Traits

The earliest attempt at a classification of positive traits occurred when Confucius systematically described the human virtues of humanity, justice and wisdom (Habermas, 1988). Contemporary positive psychology has developed three classifications of virtues of which the most empirically proven is VIA (Values in Action) classification of characters' strengths created by the VIA Institute of Character (Rijavec, Brdar & Miljković, 2008). According to this classification six groups of basic virtues have been identified that are culturally and temporal universal. These are: wisdom, courage, humanity, justice, temperance, and transcendence. For the purpose of easier defining and measuring, 24 traits have been described which can be classified in any of the listed categories. In this review, one of these human strengths and virtues will be emphasized, and that is modesty. Humble people have a reduced need to impress others and dominate them, they are less concerned with material things and are less likely to go against someone. Such behavior brings benefits to a modest person in the area of emotional well-being and self-regulation. In some situations, modesty and humility can protect humans from risk and bad decisions. A modest person will be more careful and will not take risks in situations where there is a realistic estimation of a certain failure.

Recommended Activity for Modesty Development

The name of this activity is *"Listening to the story of the Hedgehog's House and a visit to a nursing home."* During holiday seasons, various activities that promote and encourage modesty in children are more often performed than throughout the year. Perhaps the reason for that is the fact that holidays are periods of giving, but also that we want to show the children how good it is to be humble. With the aim of developing modesty, preschool teachers could use the story *Hedgehog House* by Branko Čopić (2008). In this story, the love of hedgehog for his very modest but lovely home is vividly demonstrated. The educator reads the story *''Hedgehog's house,''* (Figure 5) which is then followed by a discussion about modesty. Then educator explains where to go before Christmas (visit a nursing home), talks about the nursing home, who lives there, why, and how. Children are asked to come up with ideas what to give to people who live there. Their creativity and imagination are very much encouraged. Before visiting a nursing home, the following activities are dedicated to making small gifts. Therefore, the children make ornaments for the Christmas tree with the materials that are collected together during a walk in the nature. After visiting a nursing home, the teacher and children talk about their impressions.

Except for the mentioned topics for discussion in the context of presented activity, it is certainly more than helpful to encourage the development of social equality and justice. This could be accomplished by implementing the concept of reframing the issue of inequalities into an inequality of agency rather than and inequality of money (Jarden, 2012). In other words, Jarden (2012) postulates that money should not be the only reason for human happiness or the lack of it for human unhappiness. Therefore, he emphasized: *"So it's not about throwing benefits and such things to those at the lower end of the income spectrum, it's actually about giving them a sense of agency, and actually getting them to critically and wholly participate in society, or helping them to participate"* (Jarden, 2012, p.111). Through the story of the *Hedgehog's House*, children can clearly see how the hedgehog is happy in his own home, although he is not rich, and is very modest. His happiness is only related with the atmosphere of his home, and

Figure 5. Hedgehog's house
http://www.pjesmicezadjecu.com/bajke-i-price-za-djecu/jezeva-kucica-branko-copic.html

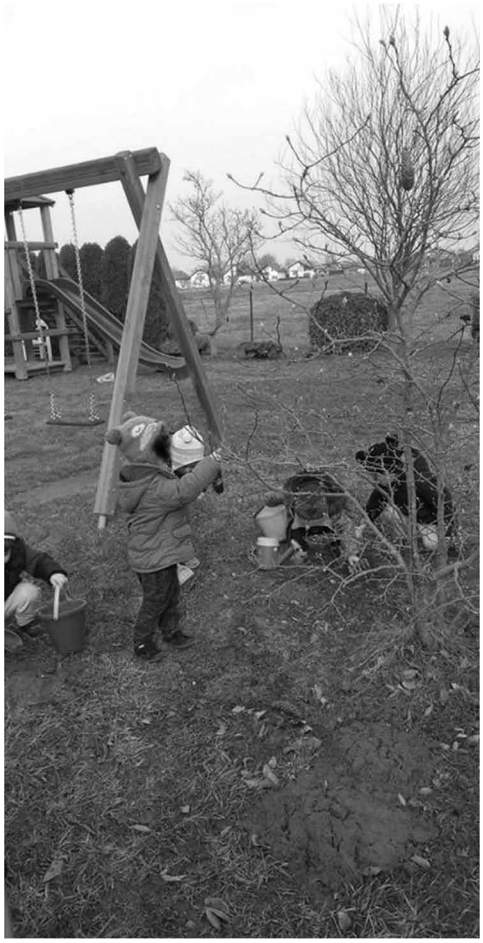
not with money and wealth. In this way, the conversation with children could be initiated about the differences that exist between them. The same talk could be brought into connection with certain toys - are we lucky if we play with those toys that we love the most, or if we play with the most popular and the most expensive toy?

Defining and Developing Positive Relationships

In order to achieve happiness and a sense of life satisfaction people need other people, especially the closest ones such as family members, friends, and acquaintances, colleagues at work or school, neighbors, and other significant others. Relationships with other people greatly affect an individual's life satisfaction and well-being therefore this is one of the research fields within positive psychology that should be thoroughly explored (Rijavec, Miljković & Brdar, 2008). Altruism, gratitude, and forgiveness are essential processes for the successful regulation of relations with others. For the purposes of this review, symbolic play and activities with children that promote and encourage altruism in children are selected. Altruism is a special and selfless form of motivation of one person whose behavior benefits another person (Batson et al., 2002). This prosocial behavior aims to achieve some kind of benefit for another person. The reasons why someone helps others may be different on the motivation continuum: from a true concern for the other person to the desire to realize their own interests. This benefit can be used to reduce their own tension, reduce feelings of guilt or achieve some personal and social gain. Altruism means genuine, disinterested affection for others. An altruistic person is ready to help everyone, not only his family and friends. To consider a social behavior as prosocial it should satisfy the following conditions: it should be willingly initiated, undertaken with the intention of improving or maintaining the well-being of others and it should exclude an expected material or social reward (Raboteg-Šarić, 1995). Prosocial behavior can be encouraged by provoking empathy. A simple way to do this is to bring people in contact with those who need help and put them in a position where they can understand their perspective and motivations (Snyder & Lopez, 2007). Another way is to point out the similarities that

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Adopted tree



exist between those who could help and those who need help, which is leading to the understanding of connectedness between people. When someone shows their altruism to someone, a positive reaction toward a person to whom it was directed, this will increase the probability that they will repeat this behavior in the near future (Rijavec, Miljković & Brdar, 2008).

Recommended Activity for Altruism Development

The development of social skills and overall interpersonal functioning among children is highly facilitated with the integration of affective and cognitive domains in children's play (Russ, 2004). Therefore, this activity is named *"Adopted tree"* (Figure 6). In the preschool period, children develop responsibility for their own health and the health of others. Developing upbringing and education about the environment around children could enhance their development of altruism. This activity starts with the conversation in which children should be explained that taking care of nature and their environment is self-rewarding, since if we care about our surroundings, it provides us with health and life pleasure. This activity lasts for an entire year or as long as the interest of children for this exists. During usual walking, children choose

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

a tree that will be adopted. When the tree has been chosen, they take of it throughout the whole year, by taking walks with the educator and observing any changes related to the tree. After selecting the tree, the children could draw it. In addition, children could measure the height of the tree, its circumference, and its smell. They could embrace it, in order to help children to better experience the tree. Children should visit the tree during all seasons. When it is hot, they should water it, when its leaves fall they should collect them, during winter they should build a snowman for its friend, and clean the snow around the tree. In the spring when the tree's flowers are blossoming, leaves and branches are becoming green the children will feel proud because their tree has come to life after a long winter. If it is possible, the children could paint a tree in different seasons and can later make a poster that will be displayed as the tree is advancing. Depending on the season, children can be offered a variety activities related to the tree. One of them is in the fall when the leaves are falling and when children collect them, then the same leaves can be used for making prints on paper (Rothschild & Daniels 1999). Children develop a sense of altruism with the overall activities, realize that they feel good when help the tree, and do not expect anything in return. With this activity, children are indirectly prepared for life in the society.

CONCLUSION AND RECOMMENDATIONS

Psychology is no longer focused only on alleviating negative states and phenomena. One of its branches, i.e. positive psychology, deals with what is good in people and studies the conditions and processes that contribute to the higher levels of well-being of the individual in the society. When we talk about the practice of positive psychology, one of its first applied fields is the field of education, since the teaching is the most organized part of that process. Apart from teaching in schools, institutional care and education that could be recognized in the Kindergarten classrooms should be mentioned. According to the contemporary paradigms of early education (Tatalović Vorkapić, Vujičić & Čepić, 2014) we can conclude that there is a strong connection between teaching in schools and the educational work in kindergartens. The child is the subject of its own development, he/she is an active social individual, and his/her experiences are important in the overall development since they provide guidelines for the activities in the kindergarten.

Watching a child at play, it is easily perceivable that his/her imitation and dramatization actually present typical behaviors of how a child presents or relives his/her experiences. That is why we say that play encourages experience in the children and through it they create their own picture of the world. In educational institutions, an interest is evident in the application of activities that are aimed at developing social and emotional skills of the children. Children who develop these skills indicate a higher level of accountability, confidence, popularity, and openness, and are more willing to help and cooperate (Tatalović Vorkapić & Lončarić, 2014). Children's play presents an indicator of children's resilience and is at the same time a facilitator of its enhancement (Pearson, Russ & Spannagel, 2008). Therefore, it is very important to encourage the development of positive features, such as hope, optimism, gratitude, modesty, prosocial behavior, creativity, emotion regulation, etc. There are many activities, that can develop positive features, but it is important to follow the child's interests, because some activities simply do not match the ability/need/interest of the child. Therefore, it is important to encourage the development of those virtues that have to be determined as the child's own strengths.

Many activities can be an incentive for the development and maintenance of positive emotions, opinions, features, and the relationship between children. These activities are preparing the children for

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

a future life in the society, a community that would be better if such education went from family, from upbringing educational group in kindergarten through to primary and secondary schools. By introducing and nurturing the fundamental principles of positive psychology in kindergartens through various types of play and systematic methods of analysis, a valuable base could be created for research. This base for research would clearly imply those games and activities that can be used not only for quality work with children, in order to achieve their highest levels of well-being, but also for various prevention programs which aim to reduce the negative emotional states of children who are now on the rise, i.e. anxiety and depression. In addition, as Pearson and colleagues have already emphasized (2008), on the one hand, specific processes during play that facilitate adaptive and optimal functioning in children should be thoroughly analyzed and, on the other, various educational activities should be explored whose aim is to detect which part of them clearly provides a solid structure for developing positive features in children.

Therefore, the modern high-quality kindergarten should provide all materials and methods that encourage children's free play. Different environments, different places from where the children enter the kindergarten and diversity among children in itself have their own interests, and they should serve to encourage the development of tolerance and respect. Chosen activities should aim to develop positive features in children, and pretend play should be especially encouraged since it presents "*…a vital resource which naturally promotes flourishing"* (Pearson, Russ & Spannagel, 2008, p.117). The kindergarten as a children's home means creating an environment in which children will be appreciated as a personality. They will be happy and pleased to be encouraged to learn in a way that suits their age, style of learning, and developmental needs because the child's enjoyment is the central point at the crossroads between children, the kindergarten and play.

KEY TERMS AND DEFINITIONS

Play: A biological, psychological and social necessity, and is fundamental to the healthy development and well-being of individuals and communities. It has four major properties: it is stimulatory, divergent, incomplete, autotelic; it fills the private functions of players, and it is running in an optimal condition motivational tone of the child.

Positive Emotions: The emotions that are positive by their valence, primary and secondary, which are thoroughly described within Barbara Friedrickson's the broaden-and-build theory of positive emotions.

Positive Psychology Competencies: The competencies of pre-school teachers of having contemporary knowledge and skills in the field of positive psychology, so they could be able to strengthening and optimizing the positive dimension of the individual, which can provide a better quality of life and the application of knowledge in working with pre-school children.

Positive Psychology: The scientific discipline that deals with study of psychological well-being, positive qualities called virtues, the positive human conditions and optimal states.

Positive Relationships: They consists of positive feelings for every person included in specific relation, and they are: altruism, gratitude, and forgiveness since they are essential processes for the successful regulation of relations with others. Altruism presents a form of prosocial behavior in which is the aim of helping other person with no self-benefit.

Positive Thinking: It consists of everyday thoughts that are mostly positive by its content. There are three types of positive thinking: optimism, hope and self-efficacy. Optimism reflects the positive way of thinking in which mostly good things and solutions are expected to be in the future.

Positive Traits or Virtues: According to VIA classification, human virtues are: wisdom, courage, humanity, justice, temperance, and transcendence. Modest people have a reduced need to impress others and dominate them. They are less concerned with material things and are less likely to go against someone. Such behavior brings benefits to a modest person in the area of emotional well-being and self-regulation.

Self-Esteem: It consists of all information (objective and subjective) that child has about him/herself. This set of information determine child's behavior (positive or negative), the possibilities of self-expression and related emotions (positive or negative). Higher self-esteem developed on prior success is the solid ground for positive self-development in children.

Types of Children's Play: A functional play, symbolic play, and play with rules. Functional play is related to the new functions that are maturing, and these are motor, sensory and perceptive functions. Symbolic play (or play of fantasy, role-playing games) is related to play in imaginary situations that are associated with reality through symbols. Play with the rules is a play with sensory-motoric combinations (race, marmot, bouncing, etc.) or intellectual combinations (cards, chess, etc.) in which children compete, and that are regulated by certain rules learned from adults or by their own agreed rules.

Chapter 26
A Hybrid Approach for Facial Expression Recognition Using Extended Local Binary Patterns and Principal Component Analysis

Gopal Krishan Prajapat
National Institute of Technical Teachers Training and Research, Chandigarh, India

Rakesh Kumar
National Institute of Technical Teachers Training and Research, Chandigarh, India

ABSTRACT

Facial feature extraction and recognition plays a prominent role in human non-verbal interaction and it is one of the crucial factors among pose, speech, facial expression, behaviour and actions which are used in conveying information about the intentions and emotions of a human being. In this article an extended local binary pattern is used for the feature extraction process and a principal component analysis (PCA) is used for dimensionality reduction. The projections of the sample and model images are calculated and compared by Euclidean distance method. The combination of extended local binary pattern and PCA (ELBP+PCA) improves the accuracy of the recognition rate and also diminishes the evaluation complexity. The evaluation of proposed facial expression recognition approach will focus on the performance of the recognition rate. A series of tests are performed for the validation of algorithms and to compare the accuracy of the methods on the JAFFE, Extended Cohn-Kanade images database.

INTRODUCTION

Facial expression plays a very crucial role in human verbal and non-verbal communication. In human interactions, enunciation and perception facial expression built a communication channel that is auxiliary to voice and that carries prominent information about the mental, emotional and even physical states of the persons. Facial expression is one of the factors among pose, speech, behaviour and actions which are used in conveying information about the intensions and emotions of a human being. The level of accuracy of facial expressions in humans is very high in determining their behaviour and emotions. In recent years a lot of research has been made in facial expression recognition but still recognizing facial expression with a great perfection is not achieved due to the complexity and instability of expressions.

Facial expression recognition steps (FERS) is a three-step process which includes face detection, feature extraction and expression classification (De, Saha, & Pal, 2015). Yang's survey (Yang & Waibel, 1996) states that the face detection techniques has four main types i.e., knowledge-based, feature invariant, template matching, appearance-based. Many algorithms have been proposed by the researchers in their respective research for face detection. One of the widely used face detection algorithm was proposed by Paul Viola and Michael J Jones in 2001. Viola and Jones method (Agarwal & Khatri, 2015; Viola & Jones, 2001) method proved to be a major milestone face detection method. Viola and Jones face detection model is based on three key unique features. First, they introduced concept of 'integral image' that allows features used by their detector that made the computation very fast. Second, they built their efficient and simple classifier using AdaBoost learning algorithm. Third, they developed a method which combines classifiers in a 'cascade' which allows background regions in the image to be quickly suppressed while contributing more computation time on detecting features i.e. nose, eyes, chin and mouth.

The feature extraction process aims at extracting specific data from an image or video that can produce relevant information. Accurate and effective recognition rate is only achieved when adequate features are extracted (Yacoob & Davis, 1996; Essa & Pentland 1997; Yeasin, Bullot, & Sharma, 2004; Hoey & Little, 2004). Geometric-feature based methods and appearance-based methods (Lai & Ko, 2014) are the two most commonly used approaches to extract facial feature extraction. Geometric feature-based methods yield comparable or better results than appearance-based approaches in AU identification (Valstar, Patras, & Pantic, 2005; Valstar & Pantic, 2006). However, the geometric feature-based methods majorly need correct and reliable facial feature detection and tracking crucial points in the face region, which is difficult to achieve in many situations. One of the most widely used geometrical feature-based method is Local Binary Patterns (LBP). The first Local Binary Patterns (Ojala, Pietikäinen, & Harwood, 1996) was proved a vigorous means of texture analysis.

LBP is majorly designed for texture analysis and texture description. It is mainly used because of its excellent light invariance property and low computational complexity. LBP operator works with a 3 X 3 pixel matrix where centre pixel which is surrounded by eight neighbours is used as threshold. Pixels surrounding the central pixel are marked as 1 if they have higher or equal gray value than centre pixel, otherwise marked as 0. A binary code is produced by concatenating marked values anticlockwise. Now the original LBP operator has a limitation that it could give good result because of its small 3 X 3 neighbourhood which is unable to capture required main features with large scale structure. So to enhance the original LBP operator, it is extended to a multi-resolution LBP operator which is denoted by $LBP_{P,R}^{u2}$ (Shan, Gong, & McOwan, 2009).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

In appearance-based method, the whole image of the face is taken as input to extract image features. Among the various algorithms of appearance-based methods, PCA (Turk & Pentland, 1991a), LDA (Martinez & Kak, 2001) and ICA (Bartlett, Lades, & Sejnowski, 1998) are the most commonly used. Turk and Pentland (Turk & Pentland, 1991b) in 1991 developed PCA using eigenspace projection. The PCA aims to minimize the dimensionality of data into reduced dimensional feature space that describe the image data effectively and economically. A method was proposed (Chakrabarti & Dutta, 2013) for expression recognition that uses eigenfaces for recognizing the different standard expression. Zilu and Xieyan (2008) proposed an approach for FER which combines LBP and ADABOOST. A model was developed (Pukhrambam, Das, & Saha, 2015) which initially takes the static image as input and extracts the different skin regions using the hue saturation value to recognize facial emotions and uses support vector machine as classifier. Tawari and Trivedi (2013) developed a model which uses audio and visual data information for expression recognition. Happy and Routray (2015) developed a model which uses different prominent facial patches for human expression recognition. Ahonen, Hadid, and Pietikainen (2006) developed a method which divides images into different blocks and their description is evaluated by LBP. The obtained different descriptors are united to get histogram and the combined texture descriptors of every region present in overall face geometry.

In this work a hybrid approach combining Extended Local Binary Patterns and Principal Component Analysis is proposed for improving the accuracy of recognition rate for FER system. First the quality of image is enhanced by applying image pre-processing and then prominent features of the face are extracted by using ELBP. Feature extraction is the process of obtaining reduced feature set from input data to represent original data without redundancy. It plays very crucial role in pattern classification/ recognition because redundant information in input data affects the performance of classification/ recognition. The feature extraction process aims at extracting specific data from an input image that can produce relevant information. PCA will be applied on the output of ELBP images to lower down the dimensionality of data into reduced dimensional feature space that describe the data efficiently and finally classification of expression is done by Euclidean distance method which compares the projections of the sample and model images.

This paper is dived into six sections including first introduction section. The second section of the paper gives a brief view of the work which has been previously implemented. The next section three explains the traditional Local Binary Pattern operator. Next section four gives objective and methodology of the proposed work and in section five results are discussed and compared with different existing methods. The paper will be concluded in section six.

BACKGROUND

Expression representation and classifier method are the two indispensable aspects of facial expression recognition system (Fasel & Luettin, 2003). Expression representation considers the feature extraction to represent face data effectively taking optimized variations within all class of expressions. A combination of active infra-red illumination and kalman filtering is used to account enormous changes in head pose (Zhang & Ji, 2005). Lai and Ko (2014) suggested the significance of perfect human emotion feature extraction method for expression recognition. Authors proposed a two-stage algorithm and in first one global data information and in second one subtle data information of required image is extracted. Valstar, Patras, and Pantic (2005) categorize the attributes evaluated from facial points and identify the minute

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

changes in human emotional behaviour by analyzing facial muscle AUs. Deriving the feature set is not an easy task, because features should be descriptive and possibly not correlated with each other. Shape of face and position of facial components i.e., geometry of face points is widely taken into account for optimized feature extraction process (Pantic & Rothkrantz, 2000; Tian, Kanade, & Cohn, 2001; Pantic & Rothkrantz, 2004; Pantic & Patras, 2006). Different fiducial points are studied and features are extracted to represent an image (Zhang, Lyons, Schuster, & Akamatsu, 1998). Salmam, Madani, and Kissi (2016) proposed a novel geometric feature extraction method which evaluate distance on face points like eyes, mouth, eyebrow and nose and for comparison between different distances on face decision tree algorithm is used. One of the most widely used geometrical feature-based method is Local Binary Patterns (LBP) (Ojala, Pietikäinen, & Harwood, 1996). Ojala, Pietikäinen, and Mäenpää (2002) proposed a robust approach for different resolution gray scale variant and rotation independent texture identification. Authors implemented LBP for texture feature extraction and analysis. Shan, Gong, and McOwan (2005) states that LBP is best suited for feature extraction of low-resolution images and have excellent light invariance property and low computational complexity. LBP operator is used to eliminate the environmental lightning effect on human faces and texture features are captured (Zilu & Xieyan, 2008). With the help of LBP histograms facial features are represented into several regional blocks. To decrease the time complexity modified ADABOOST select the features with great discrimination and SVM is used as facial expression classifier. Zhang, Chen, Wang, and Liu (2012) proposed a hybrid method for feature extraction which combines geometrical attributes as well as appearance based features. Miyakoshi and Kato (2011) without stuffing the crevices of occluded features detect the human emotions by applying Bayesian network. Dixit and Gaikwad (2015) proposed a method by which they detect emotions on Zernike moments and result gained is classified using Naïve Bayesian classifier. The unique property of Zernike moments i.e. rotation invariance is also tested.

Saaidia, Zermi, and Ramdani (2016) proposed a method which uses combination of different feature attribute vectors for expression recognition. First face localization is done and after that Zernike moments vectors are extracted, then AR model is compiled and finally LBP is used for statistics distribution analysis. Agada and Yan (2015) extracts the human facial features using sobel textures with μLBP and edge detection method to detect the human emotion expressions. The whole face image is taken as input to extract image features in appearance variations of faces. It is the technique where face is considered as a complete unit and analytic where co-occurrence of distinctive feature facial elements is analyzed. Among the various algorithms of appearance-based methods, Gabor Wavelet (Lyons, Budynek, & Akamatsu, 1999), PCA (Turk & Pentland, 1991a), LDA (Martinez & Kak, 2001) and ICA (Bartlett, Lades, & Sejnowski, 1998) are the most commonly used and their applications vary from one data set of facial images to another. But applying Gabor Wavelet for facial image representation is costly due to its computational complexity and time taking nature (Lyons, Budynek, & Akamatsu, 1999; Zhang, Lyons, Schuster, & Akamatsu, 1998). PCA algorithm is used to divide input image into sub spaces and these sub spaces are used to calculate eigenfaces (Chakrabarti & Dutta, 2013). Calculating eigenfaces using sub spaces gives advantage in lighting directions and illuminations. Sopa et al. (2016) proposed a method in which PCA is also used for identification of required region on the face plane and the information which is redundant in facial expressions is stamp out. The cross points of each sub region is measured and the information is used for evaluating momentous level of every sub region. Kaur, Vashisht, and Neeru (2010) combined the singular value decomposition (SVD) with PCA for feature extraction to obtain all universal emotions and the obtained results have been critically analyzed and compared with the conventional PCA which illustrate that the implemented novel method achieves higher rate of recog-

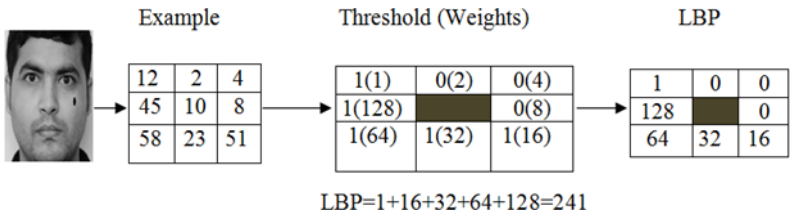
EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

nition. Geetha, Sundaravadivelu, and Singh (2009) proposed a novel method which uses optical neural network for detecting facial expressions and KLT method is used for expression identification. Chen, Lin, Takiguchi, and Ariki (2014) proposed a novel approach which does not depend on huge data sets and will provide a classification framework which recognizes both expression and objects. The proposed framework is a support vector machine based which uses three main different techniques i.e. first PSM is implemented for creating training database and then SURF method is used for features extraction suitable for real time circumstances and finally region characteristics based on SVM are evaluated. Zheng and Liu (2016) presents a technique that is based on active appearance model which uses distinctive face feature points and texture data of required area of the face. The approach initially determines the texture and shape values by evaluating the unique physical significant specifications of given input face and after the evaluation of these features expression classification is made based on machine learning methods. Ozbey and Topal (2018) proposed active shape models to get discriminant subsets of LBP features from the facial landmarks. Alam, Vidyaratne, and Iftekharuddin (2018) proposed sparse deep simultaneous recurrent network technique which glean sparsity property and curtail the parameters and diminish complexity for expression recognition.

LOCAL BINARY PATTERN

LBP is majorly designed for texture analysis and texture description. It is mainly used because of its excellent light invariance property and low computational complexity. The local binary pattern (LBP) operator was initially illustrated by Ojala et al. (1996) for local image contrast as a complementary measure. The starting personification of the LBP worked with the eight-neighbourhood approach (3x3) with centre pixel as a threshold. The operator code for neighbouring pixels can be calculated by multiplying the threshold values with respective pixels weights.

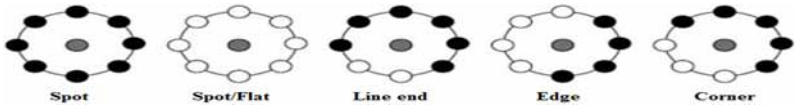
Figure 1. Original LBP code calculation



All Pixels surrounding the central pixel are represented as 1, if they have higher or equal gray value than centre pixel, otherwise marked as 0. So, the binary representation of this is 11110001and decimal value is 241for this basic LBP operator as shown in Figure 1. Inventors of local binary pattern operators must go through three fundamental points. First point is to describe various local patterns & extraction of these patterns of facial elements. In Figure 2 different local patterns edge, line end, spot, corner and flat area are illustrated (Shan et al., 2009). As per LBP operator's definition, local patterns are denoted with binary codes. So, ones can be shown by white circles & zeros with black circles.

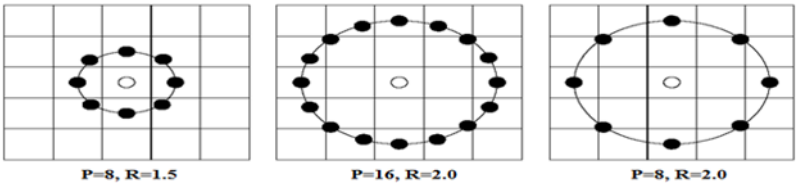
EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Generic methods based on generic image processing features



The limitation of eight neighbourhood approach occurs with large structures because of not capturing dominant features. Thus, the LBP later was extended with different size neighbourhood approach as shown in Figure 3 (Ojala et al., 2002). Hence, two neighbourhood approaches came into existences which are known as circular neighbourhood & bilinear interpolation. These approaches allow any radius and neighbourhood pixels. The pixel neighbourhoods will be (P, R) for above notation.

Figure 3. Extended local binary patterns



Second point is to prefer the essential subset of local patterns to show facial elements. Last point is to form an effective facial element descriptor with these selected patterns. Moreover, select the local pattern in such a manner that contains major portion of all patterns. Thus, the uniform pattern approach is introduced. It consists of two bitwise transitions either from 0-1 or from 1-0 in case of circular binary string i.e. 11111011, 00001110 and 11000001. LBP is known as uniform if it has zero transition (00000000, 11111111) and two bitwise transitions whereas four bitwise transitions (10001001) and six bitwise transitions (10101101) are non-uniform. Uniform patterns are involved in computing LBP labels. The fundamental LBP operator is nothing but the summation of threshold differences weighted by power of 2 & illustrated in Equation 1:

$$LBP_{P,R}\left(x_c, y_c\right) = \left\{\sum_{q=0}^{P-1} u\left(y_q - y_c\right) 2^P\right\} \tag{1}$$

For each and every uniform pattern having separate label, but all the non-uniform patterns are merged with a single label. This single label concept makes it tough to efficiently recognize some local patterns. Thus, the information is lost which is contained by these labels, especially in larger structures. So, the uniform patterns are noise sensitive. To overcome this hurdle, we assign different labels to all non-uniform patterns, so that we can extract more information as more kinds of local patterns. This phenomenon for local binary patterns is known as extended LBP.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

PROPOSED WORK

Background analysis states that human emotions recognition system gain great interest in many research areas and various different techniques have been proposed and implemented on different databases to gain accuracy in recognition rate and it has been found that the texture-based feature extraction methods are robust and achieve high recognition rate with the variations in lighting, illumination and facial pose. But still a lot of research is to be made in order to increase the accuracy of recognition rate in expression and emotions recognition systems. Combination of local feature extraction method and global feature extraction method may give enhanced results in terms of accuracy. In this paper Principal Component Analysis (PCA) and Extended Local Binary Pattern (ELBP) will be implemented and compared in terms of recognition rate for JAFFE and Extended Cohn-Kanade images database. An efficient method will be implemented by performing dimension reduction using PCA on the ELBP images and comparing the similarity by Euclidean distance.

EXTENDED LOCAL BINARY PATTERN

The LBP operator was initially illustrated by Ojala et al. (1996) for local image contrast as a complementary measure. Inventors of local binary pattern operators face three fundamental points. First point is to describe various local patterns & extraction of these patterns of facial elements. Second point is to prefer the essential subset of local patterns to show facial elements. Last point is to form an effective facial element descriptor with these selected patterns. Moreover, selecting the local pattern in such a manner that contain major portion of all patterns was a big issue. Thus, the uniform pattern approach is introduced. It consists of two bitwise transitions either from 0-1 or from 1-0 in case of circular binary string i.e. 11111011, 00001110 and 11000001. This uniform pattern value can be illustrated by the Equation 2:

$$U_{LBP_{P,R}} = \left|u\left(y_{P-1} - y_c\right) - u\left(y_0 - y_c\right)\right| + \sum_{q=1}^{P-1}\left|u\left(y_P - y_c\right) - u\left(y_{P-1} - y_c\right)\right| \tag{2}$$

In $U_{LBP_{P,R}}$, value of less than or equal to two are represented as "uniform" local binary pattern. Thus, the generalized LBP operator can be defined as:

$$LBP_{P,R}^{riup} = \begin{cases} \sum_{q=0}^{P-1} u\left(y_{P,R,q} - y_c\right) & if \;\; U_{LBP_{P,R}} \le 2 \\ P+1 & otherwise \end{cases} \tag{3}$$

The "riup" illustrate the use of rotation invariant uniform patterns for U values less than or equal to 2. This U represent the spatial bitwise (0/1) transitions in circular representation of the LBP. As per literature P+1 uniform binary patterns exist in circularly symmetric set of pixel value P. Some drawbacks are focused for this LBP operator which is shown in Equation 3. First, point is that it might be tough to describe the complete characteristics effectively because of merging non uniform pattern into single pattern. Second drawback is that this operator is sensitive to noise because local pattern can be treated

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

as non-uniform pattern with addition of noise according to definition of uniform patterns. So, here are some extensions of LBP operator in which some operation applied over non-uniform patterns before combining it.

Extension 1: In this every non-uniform pattern is assigned with respective uniform pattern on similarity basis. The similarity measure (SM) can be illustrated by using following equations:

$$SM_{RRC}^{\min}\left(LBP_{P,R}\right)=\min\left\{SM_{RRC}\left(LBP_{P,R},LBP_{P,R}^{uniform}\right),allLBP_{P,R}^{uniform}\right\} \tag{4}$$

$$SM_{RRC}\left(LBP_{P,R},LBP_{P,R}^{uniform}\right)=\min\begin{Bmatrix}\beta\left(RRC\left(LBP_{P,R},i\right),LBP_{P,R}^{uniform}\right),\\ i=0,1,2....,P-1\end{Bmatrix} \tag{5}$$

$$\beta\left(X,Y\right)=\sum_{i=0}^{P-1}\left|x_i-y_i\right| \tag{6}$$

where, this $LBP_{P,R}$ is local and $LBP_{P,R}^{uniform}$ is uniform patterns in neighboured (P, R). These two patterns can also be represented by y_q and y^U. $RRC\left(LBP_{P,R},i\right)$, shows "i" times rotate right circular shift on P bit no. ($LBP_{P,R}$). The similarity measure estimates the minimum sum using Equation 4. According to result finding of Equation 4, it is easy to assign $LBP_{P,R}^{uniform}$ for a particular local pattern ($LBP_{P,R}$).

Extension 2: It is noticed that extension 1 does not give optimum discrimination. Thus, all the non-uniform patterns are needful for classification. Furthermore, some non-uniform pattern which contain desired information but not similar to any uniform pattern causes loss of information. A collective set of uniform & non-uniform patterns is described by Equation 7:

$$C\left(LBP_{P,R}\right)=\frac{1}{2}\left(\left|y_{q-1}-y_0\right|+\sum_{q=1}^{P-1}y_q-y_{q-1}\right) \tag{7}$$

Equation 7 shows the concatenation of 0/1 in local pattern. Larger value of C defines less probability of concatenation. If C=1, gives uniform pattern. With C=2, resulting pattern having regular as well as more obvious structure like 10011110, 10001100 & C > 2 result frequent spatial binary transitions like 11010100, 01010101. Thus, C can be acknowledged as a structural measure of LBP. This extension can be illustrated by following Equation 8:

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

$$LBP_{P,R}^{Extended} = \begin{Bmatrix} \sum_{q=0}^{P-1} y_q & if\ \ C\left(LBP\right) \le 1 \\ \sum_{q=0}^{P-1} y^U & if\ \ C\left(LBP\right) = 2 \\ \&SM_{\mathbf{R}RC}^{\min}\left(LBP\right) = 1, P+1+A\left(LBP\right) & if\ \ C\left(LBP\right) = 2 \\ \&SM_{RRC}^{\min}\left(LBP\right) = 2, P+2+A\left(LBP\right) & if\ \ C\left(LBP\right) = 2 \\ & if\ \ C\left(LBP\right) > 2, where, \\ \&SM_{RRC}^{\min}\left(LBP\right) > 2, P+3+A\left(LBP\right) & A(LBP) = 3 * \left[\sum_{q=0}^{P-1} \frac{y_q}{8}\right] \end{Bmatrix} \quad (8)$$

The factor A is used to differentiate similar local patterns like $LBP_{16,2} = 0000000011100111$ & $LBP_{16,2} = 0001111100011111$. Both differ each other that is why different label is assigned with the help of A. This extension has some peculiar features like different pattern assignment to every non-uniform patterns and the extended LBP operator is insensitive to noise.

PRINCIPAL COMPONENT ANALYSIS

The objective of PCA is to diminish the dimensionality of data into reduced dimensional feature space that describe the data efficiently. PCA evaluates the eigenvectors which renders the subspace of an image. Here faces are depicted by linear conflation of weighted eigenvectors termed as eigenfaces. Eigen faces are the eigenvectors of the covariance matrix which renders the principal component of face distribution.

Implementation of PCA on training and test database is shown in Figure 4. Below is the explanation of PCA steps:

Step 1 - Creating Data Matrix D: All the training images of each subject are converted in 1-D vector and concatenated to form a final 2-D matrix in which each row is corresponding to each image.
Step 2 - Normalized Data Matrix: Mean corresponding to each image is subtracted from the data matrix.
Step 3 - Covariance Matrix Computation: The covariance matrix is calculated by multiplying the normalized data matrix with it transpose.
Step 4 - Eigenvalues and Eigenvector Computation: Covariance Matrixx:

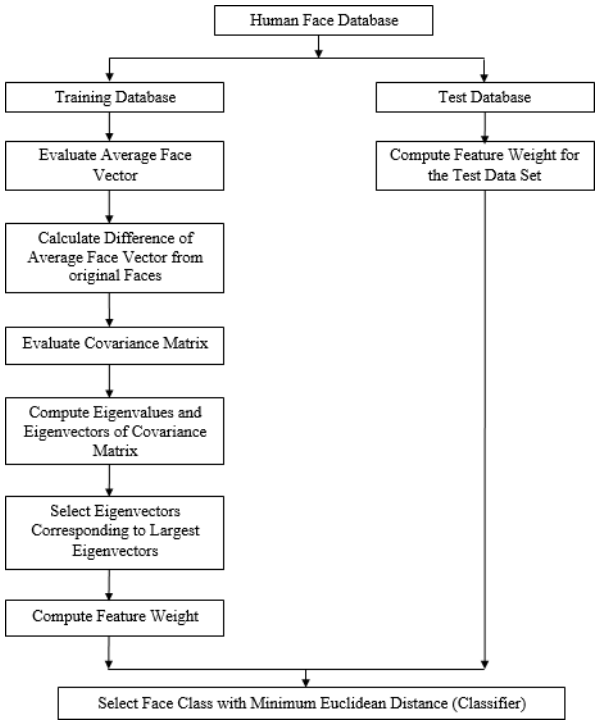
$V = \mu \times V$

where μ is eigenvalues and V is the eigenvectors.

Step 5 - Eigenvectors of Normalized Data Matrix: By Multiplying the transpose of normalized data matrix by eigenvectors of covariance matrix we get the eigenvectors of original data set.
Step 6 - Projection of Training Images: Every face is then projected on to the eigenspace by multiplying the normalized data matrix with eigenvector of normalized data matrix.
Step 7 - Projection of Test Images: The projection of the test images is obtained by the same way as calculated for training images.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Implementation steps of PCA



Step 8 - Finally the projected test image is matched with the test projections: Using distance metric (Euclidean Distance). A best match is chosen which has minimum distance with test face:

$$Ed(i) = \sqrt{\sum_{j=1}^{MN} \left(testp\left(i,i\right) - trainp\left(i,j\right) \right)^2}$$

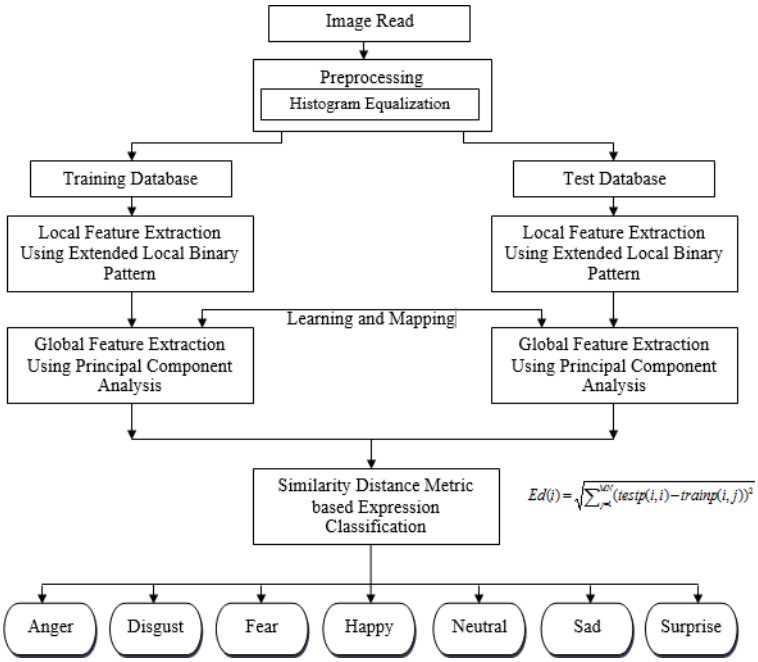
The objectives of this proposed work are:

- To explore the various facial expression recognition algorithms and identify the suitable algorithm for expression recognition;
- To improve the recognition rate of facial expression recognition approach by combining local feature extraction with global feature extraction;
- To analyze the performance of the proposed technique with existing techniques for JAFFE and Extended Cohn-Kanade-images database;
- To extend the implemented techniques for real environment images acquired at different frame rates and compared the accuracy of the methods.

The main work of this paper is to enhance the accuracy of recognition for images with variation in lightening condition, pose, and occlusion and also compare the performance analysis of proposed method with the already existing techniques. The facial expression recognition is performed on JAFFE and Cohn-Kanade images database by ELBP and PCA separately for training database. Recognition rate

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Block diagram for proposed facial expression recognition system



is improved by performing PCA after extraction of ELBP features. The comparison is made in terms of the accuracy/ recognition rate. The proposed work is divided into two phases i.e. training phase and test phase as shown in Figure 5. The process of each phase is explained as follows.

Algorithm for Training Phase

Step 1: Read image from training database.
Step 2: Every image from training set with size M x N is to be reshaped in a vector of size MN.
Step 3: Histogram equalization is performed for quality enhancement.
Step 4: Obtain feature vector $D^{j,1}$, $D^{j,2}$, …, $D^{j,q}$, for each expression class:

1. Divide the face image to sub-image blocks of resolution m × n;
2. Find the ELBP values and Calculate histogram bins for each block;
3. Histograms of each block are Concatenated to get the feature vector $D^{j,i}$.

Step 5: The mean feature vector for individual class is calculated by Equation 9:

$$m = \frac{1}{N}\sum_{i=1}^{N} D^{J,i} \tag{9}$$

Step 6: Normalized Data Matrix is calculated by subtracting the mean corresponding to each Image from the feature vector as shown in Equation 10:

$$\overline{D} = D^{j,i} - m \tag{10}$$

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Step 7: The covariance matrix for each class expression is obtained by Equation 11:

$$C = \bar{D}\bar{D}^T \tag{11}$$

Step 8: Let V be the eigenvector and α be the eigenvalues. The evaluation of eigenvectors and eigenvalues are obtained by Equation 12:

$$CV = \alpha \mathrm{V} \tag{12}$$

Step 9: Eigenvectors of normalized data matrix $\bar{D}$ is calculated by Equation 13:

$$P = \overline{D}^T \times V \tag{13}$$

Step 10: Choose Eigenvectors Corresponding to Largest eigenvalues.

Step 11: Every image is then projected on to the eigenspace by multiplying the $\overline{D}$ with Eigenvector of normalized data matrix (i.e P) as shown by Equation 14:

$$\text{Training_Projection} = \overline{\mathrm{D}} \times \mathrm{P} \tag{14}$$

Algorithm for Test Phase

Step 1 to 11: These are the similar steps illustrated in training phase.

Step 12: Finally, the projected test image is matched with the test projections using distance metric (Euclidean Distance) as shown in Equation 15. A best match is chosen which has minimum distance with test face:

$$Ed(i) = \sqrt{\sum_{j=1}^{MN} \left(testp(i,i) - trainp(i,j) \right)^2} \tag{15}$$

Above steps will be implemented for each method and comparison is made in terms of expression recognition rate.

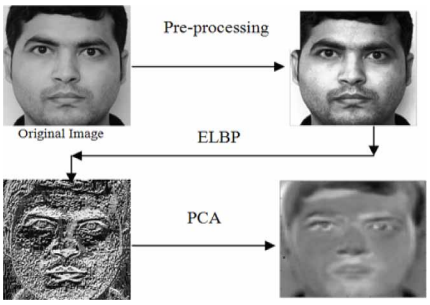
Figure 5 shows the detailed flow diagram of proposed approach used for expression recognition. The main steps involved in facial expression recognition system are reading of image from the database, pre-processing of the images followed by the feature extraction and finally classification of expression is made by suitable classifier.

Step by step explanation of all the process in the proposed approach is presented below:

- **Image Read:** First of all, images are read from standard database and camera in frame-by-frame process. The images are captured with resolution of 224 × 224 pixels at a frame rate of 30 fps with normal webcam. For colour image captured, an additional stage of RGB to Gray colour conversion is also carried out before localizing the faces in the frame;

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Sample images of proposed work



- **Pre-Processing:** After reading the images, pre-processing is to be executed on the face images to improve the visible quality. Histogram equalization which is considered to be the photometric normalization technique is used for enhancing the visual representation of image. This step accepts the face images and produces enhanced image for further processing;
- **Feature Extraction:** The main objective of this step is to derive the features from the pre-processed face images. In proposed facial expression recognition system local feature extraction is followed by global feature extraction. ELBP is used to extract the local features while PCA is used for dimensionality reduction. It is used for describing the texture and shape of a digital image. This is performed by dividing a face image into number of small segments for extracting the features. These features are consisting of binary patterns that depict the neighbourhood of pixels. The evaluated features are then concatenated into a single feature histogram to represent an image. ELBP based expression recognition produces very well results, in terms of speed and discrimination performance. This approach is a robust against face images with variations in expression, lightening conditions, age and pose as it well describe the texture and shape of image;
- **Matching With Similarity (Distance) Metric:** To compare the projections of the sample and model images Euclidean distance method is used. Minimum distance is chosen as the best suitable match of model image. The output image of the proposed work after applying pre-processing, ELBP and PCA steps are shown in Figure 6.

RESULTS AND DISCUSSION

A very momentous part of the proposed work is the experimentation, result analysis and comparison of expression recognition approaches which are implemented. Number of methods has been proposed and implemented over the past decades as potential solutions to the expression recognition problem. However, automated expression recognition is still considered to be an open problem for the researchers in terms of accuracy gain in recognition rate. Although number of expression recognition methods is tested as part of their development. Moreover, expression recognition is a wide area for the researchers where the proposed techniques use widely different approaches and tools to get the solution of same problem.

The evaluation of implemented facial expression recognition approaches will focus on their performance of recognition under various conditions for different data sets. A series of tests will be performed to compare the accuracy of the methods on JAFFE, Cohn-Kanade images database. The same series

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

of the tests will be carried for real environment image database. More specifically, two standard databases i.e., JAFFE and Cohn-Kanade images database and one real environment database are used for the evaluation of the proposed approach for expression recognition. Two different sets are created from all three different databases. These sets will be referred to as the training sets while the input image that is to be recognized will be the test image. Correct identification is obtained if the correct subject is returned as the best match for each method. If multiple images per subject are used, in this case it will be enough for any one of the images to appear as the close match. The recognition rate, which is the measure that a facial expression recognition system will correctly recognize the attempt, is calculated by below given formula:

$$\text{Recognition Rate} = \frac{\text{No. of right recognition}}{\text{Total Matching Attempts}}$$

As far as testing of the expression recognition algorithm is concerned, selection of the appropriate standard database becomes very vital. In the proposed work two standard face expression database i.e.: JAFFE and Cohn- Kanade image database are chosen to validate the implemented techniques. Description of each database is presented in brief.

The Japanese Female Facial Expression (JAFFE) Database

The JAFFE database (Lyons et al., 1999) was created at Psychology Department in Kyushu University. This standard database consists 213 static images with 7 universal face expressions i.e., happy, fear, anger, sad, surprise, neutral and disgust given by 10 different Japanese female models.

It is one of the most widely used standard databases for research purpose like expression recognition, face detection methods etc. Image size of 256x256 pixels, with 256 grey levels per pixel is stored in tiff format. The complete planning and management of database was done by M. Lyons, M. Kamachi and J. Gyoba. The preview of the images is shown in Figure 7.

Figure 7. Sample of JAFFE face database

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

The Cohn-Kanade (CK+) Database

The Cohn-Kanade image database (Lucey et al., 2010) is comprises of 593 image sequences of 123 different individuals with all 7 universal expressions images per subject. It is also one of the most widely used facial expression database in the research field for various different applications like image and video processing, computer vision, medical science and human behaviour studies. Image size of 640x490 pixels, with 256 grey levels per pixel stored in png format. These images are captured with different facial expression or configuration such as: without glasses, centre-light, happy, normal, right-light and surprised. The preview of the images is shown in Figure. 8.

Figure 8. Sample of Cohn-Kanade (CK+) face database

The Real Environment Database

The real environment database is comprises of 210 image sequences of 5 different individuals with all 7 universal expressions images per subject. Image size of 224x224 pixels, with 256 grey levels per pixel stored in tiff format. These images are captured with different facial expression or configuration such as: without glasses, centre-light, happy, normal, right-light and surprised. The preview of the images is shown in Figure 9.

Results for JAFFE Database

Using PCA

Table 1 depicts the validation of the PCA algorithm for training database containing face images from JAFFE database. For each training image set PCA recognition method is executed and through which recognition rate is calculated. Complete comparison of the recognition rate for JAFFE facial expression

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 9. Sample of real environment database

image database using PCA has been depicted in Table 1. The Table 1 shows when individual expression is compared with all seven expressions the recognition rate gain is 60% when anger state is tested and 60% when disgust state is tested and 90% when fear state is tested and 88.24% when happy state is tested and 86.67% when neutral state is tested and 70.60% when sad state is tested and 90% when surprise state is tested.

Using LBP

The Table 2 depicts the validation of the LBP algorithm for training database containing face images from JAFFE facial expression image database.

Table 1. Confusion matrix on JAFFE database using PCA

	Anger	Disgust	Fear	Happy	Neutral	Sad	Surprise
Anger	60	33.33	6.67	0	0	0	0
Disgust	26.67	60	13.33	0	0	0	0
Fear	0	0	90	3.33	0	0	6.67
Happy	0	0	0	88.24	5.88	5.88	0
Neutral	0	0	0	0	86.67	13.33	0
Sad	5.88	5.88	11.76	0	0	70.60	5.88
Surprise	0	3.33	3.33	0	3.34	0	90

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Confusion matrix on JAFFE database using LBP

	Anger	Disgust	Fear	Happy	Neutral	Sad	Surprise
Anger	66.67	20	13.33	0	0	0	0
Disgust	26.67	66.67	6.66	0	0	0	0
Fear	0	0	90	0	0	3.33	6.67
Happy	0	0	0	94.12	0	5.88	0
Neutral	0	0	0	0	80	20	0
Sad	5.88	5.88	11.76	0	0	70.60	5.88
Surprise	0	0	0	6.66	0	0	93.34

For each training image set LBP recognition method is executed and through which recognition rate is calculated. Complete comparison of the recognition rate for JAFFE facial expression image database using LBP has been depicted in Table 2. The Table 2 shows when individual expression is compared with all seven expressions and the recognition rate gain is 66.67% when anger state is tested and 66.67% when disgust state is tested and 90% when fear state is tested and 94.12% when happy state is tested and 80% when neutral state is tested and 70.60% when sad state is tested and 93.34% when surprise state is tested.

Using ELBP

The Table 3 depicts the validation of the ELBP algorithm for training database containing face images from JAFFE facial expression image database. For each training image set ELBP recognition method is executed and through which recognition rate is calculated. Complete comparison of the recognition rate for JAFFE facial expression image database using ELBP has been depicted in Table 3. The Table 3 shows when individual expression is compared with all seven expressions the recognition rate gain is 66.67% when anger state is tested and 66.67% when disgust state is tested and 93.75% when fear state is tested and 94.12% when happy state is tested and 86.67% when neutral state is tested and 70.60% when sad state is tested and 100% when surprise state is tested.

Table 3. Confusion matrix on JAFFE database using ELBP

	Anger	Disgust	Fear	Happy	Neutral	Sad	Surprise
Anger	66.67	26.67	6.66	0	0	0	0
Disgust	20	66.67	13.33	0	0	0	0
Fear	0	0	93.75	6.25	0	0	0
Happy	0	0	0	94.12	0	5.88	0
Neutral	0	0	0	0	86.67	13.33	0
Sad	11.76	5.88	5.88	0	0	70.60	5.88
Surprise	0	0	0	0	0	0	100

Present State-of-the-Art

This section depicts the validation of the implemented algorithms for 3 different databases i.e., JAFFE, Extended Cohn-Kanade image database and Real environment database which consists of training

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

database containing facial expression images. First step include reading of an image from the database and then pre-processing for image enhancement is done. Image is divided into different sub region and texture-based feature extraction methods over each region is applied. The local features are extracted by applying texture-based feature extraction process and then global feature extraction method is applied for dimensionality reduction which will be stored in the database. For each set of training database individual facial expression recognition method is executed and through which recognition rate is calculated. In Table 13 existing methods for expression recognition are implemented and result of proposed method is also shown on two standard databases and one real environment database. The results are shown in terms of percentage on successful and correct identification of expression among all the seven universal expressions. The complete summary of the results is shown in Table 13. The state of art shows that proposed approach on JAFFE database gives better recognition rate in different states like fear, happy, neutral, sad and surprise. Likewise, on CK+ database proposed method also gives improved result for anger, happy, sad and surprise states. The proposed (ELBP+PCA) algorithm is also best suited on real environment database for different states rather existing ones as shown in Table 13.

Table 13. Comparative analysis of present state-of- art

Database	**Expression**	**(Chakrabarti & Dutta, 2013)**	**(Salmam et al., 2016)**	**Proposed**
Jaffe	Anger	95	90	80
	Disgust	80	79.31	73.34
	Fear	90	84.37	93.75
	Happy	80	93.55	100
	Neutral	-	86.67	86.67
	Sad	75	77.42	76.48
	Surprise	85	100	100
Database	**Expression**	**(Salmam et al., 2016)**	**(Happy & Routray, 2015)**	**Proposed**
Extended Extended Cohn-Kanade (Ck+)	Anger	66.67	87.8	96.66
	Disgust	84.74	94.33	80
	Fear	84	93.33	73.33
	Happy	92.75	94.2	100
	Neutral	94.17	-	66.68
	Sad	82.14	96.42	86.66
	Surprise	97.59	98.46	100
Database	**Expression**	**(De et al., 2015)**	**(Chen et al., 2014)**	**Proposed**
Real Time Image Database	Anger	86.2	70.9	83.33
	Disgust	-	-	100
	Fear	77.7	-	76.66
	Happy	93.1	69.3	100
	Neutral	-	78.3	96.66
	Sad	78.9	-	100
	Surprise	91	86.3	100

CONCLUSION

Facial expression recognition's first step is to read an image then followed by some pre-processing to improve image quality and then feature extraction stage is executed, in which, unique and most informative properties (features) are extracted from face image. Using these features, image is compared with the database images, which is done in classification step. The classification unit provides the best match of image with database images. To sum up, this work manifests an investigation and implementation of various expression recognition approaches which analyze and improves the accuracy of the recognition rate and also diminish the evaluation complexity. ELBP is used for feature extraction process and PCA is used for dimensionality reduction and to compare the projections of the sample and model images Euclidean distance method is used. The recognition rate achieved while implementing proposed method (ELBP+PCA) in anger, disgust, fear, happy, neutral, sad and surprise is 80%, 73.34%, 93.75%, 100%, 86.67%, 76.48% and 100% respectively on JAFFE database and 96.66%, 80%, 73.33%, 100%, 66.68%, 86.66% and 100% respectively on Extended Cohn-Kanade (CK+) database and 83.33%, 100%, 76.66%, 100%, 96.66%, 100% and 100% respectively on real environment database. The recognition rate achieved in proposed algorithm (ELBP+PCA) when implemented on JAFFE database get superior result when compared with (Chakrabarti & Dutta, 2013; Salmam et al., 2016) and when implemented on Extended Cohn-Kanade (CK+) database results are also better when compared with (Salmam et al., 2016; Happy & Routray, 2015) and results are also have an edge over (De et al., 2015; Chen et al., 2014) for various expression states as shown in Table 13.

Chapter 27
Using Cognitive Psychology to Understand Anticipated User Experience in Computing Products

Emmanuel Eilu
Makerere University Kampala, Uganda

ABSTRACT

User Experience assessment is an evaluation of user's experience with the product, system or service during 'use' (i.e., actual interaction experience) as well as 'anticipated or before use' (i.e., pre-interaction experience).Whereas many user experience researchers may be conversant with explaining a person's experience during use of a product, system or service, they find it difficult to explain experience before a product or service is used (Anticipated Use), which in this chapter is referred to as Anticipated User Experience (AUX). This chapter applies the theory of cognitive psychology and its principles to best explain how Anticipated User Experience occurs and how this experience can be achieved. This chapter goes a long way in informing user experience researchers and practitioners on the relevance of attaining AUX in a computing product and how it can be achieved.

INTRODUCTION

User experience is the delight and fulfilment a user gets before, amid and after utilizing an item or service. User Experience has been under broad review throughout the most recent decade, producing various User Experience models and assessment techniques. However, the greater part of these models do not show how the delight and fulfilment a user gets before utilising the product can be achieved. In this paper, it is referred to as ''Anticipated User Experience'' (AUX). Understanding Anticipated User Experience (AUX) till now is a challenge to many user experience designers. The greater part of existing user experience theories and models concentrate on comprehending and accomplishing user experience

during and after product use. Yet, AUX is an extremely important aspect in any product or service if the acceptance of that particular product or service is to be guaranteed. AUX in simple terms is an anticipated, pictured or imagined pleasure and satisfaction the user feels about the product even before it's made available to the user. AUX plays a great role in product acceptance. There is need to understand UAX and how it can achieved in computing products. One of the theories that can help user experience researchers and practitioners better understand AUX and how it can be achieved in computing products is the Cognitive Psychology theory.

This Chapter

This chapter attempts to use Cognitive Psychology theory and its principles to better understand AUX and how it can be achieved in mobile computing products. This chapter goes a long way in informing designers of computing products on the relevance of attaining AUX in a computing product and how it can be achieved

BACKGROUND

According to Pakanen (2015), the foundations of user experience research is rooted on usability. As defined by ISO 9241-11 (1998), usability is the extent to which a product [a portal] can be used by specified users to achieve specified goals with effectiveness, efficiency and satisfaction in a specified context of use. According to the revised definition of usability in ISO FDIS 9241-210, it is the extent to which a system, product or service can be used by specified users to achieve specified goals with effectiveness, efficiency and satisfaction in a specified context of use. Designing for effectiveness and efficiency in computing products has rather been successful. However designing for satisfaction has somewhat been under looked. However, the swift of ideology from compulsory work-oriented use of a computer (effectiveness and efficiency) to leisure and personal use (satisfaction) has led to an interest in expanding usability research to focus on User Experience (Pakanen, 2015). During the past 20 years, designing for user experience has been admired (Arhippainen, 2003, 2009). According to Kaikkonen (2009), research in the 1990's was focusing on user interface and interaction, and usability was synonymous with this. In recent years, User Experience has been recognized as an important and determinant factor in design, development and evaluation of human-computer interfaces and man-machine interfaces (Adikari et al., 2010). The raise of the term '*user experience'* came up during mobile devices and services error. It showed that the ease of use, efficiency and effectiveness are not adequate to warranty user satisfaction, in addition to cognitive aspects; wider perspective to humans was needed (Kaikkonen, 2009). Everything has influence on user experience including those that the designer and developer cannot influence, like user past experiences, environmental factors, and many others. Consequently, the increasing use of the term shows the need for a wider approach to the user than 'usability' can offer (Kaikkonen, 2009). Product development in user experience is no longer only about applying features and testing their usability, but it is about designing products that are enjoyable and support essential social, cultural and economic needs and values of the user (Väänänen et al., 2009). A part from optimizing human performance like usability does, user experience aims further at optimizing user satisfaction with achieving both pragmatic and hedonic (pleasurable) goals (Bevan, 2010). According to Arhippainen (2003, 2009) user experience initially was included in usability issues, but afterwards, it has been understood that even a product with

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

good usability can cause negative experiences or dissatisfaction and vice versa. User experience explores much more than just usability of product, even if the usability is an important aspect, without doubt- deficiencies in usability of product will affect user experience in a negative way (Arhippainen, 2003, 2009).

However, despite the growing interest in user experience, it has been hard to arrive at a common agreement on the definition, nature and scope of user experience (Law et al., 2009). Different definitions for user experience have emerged (Arhippainen, 2003, 2009). With McMullin (2004) defining user experience as a systematic cycle that attempts to satisfy hopes, dreams, needs, and desires of the systems' user. While Khambete & Athavankar (2010) define user experience as something that involves the dynamics of space, time, objects, the states of the participants and the context in which the experience occurs. However, the most accepted and adopted definition of user experience is the one forwarded by ISO and (Bevan, 2010). ISO FDIS 9241-210 defines user experience as a person's perceptions and responses that result from the use or anticipated use of a product, system or service. Bevan (2010) in his definition equates user experience to users' culture, attitude, views, emotions, beliefs, preferences, perceptions, physical and psychological responses and behavioral accomplishments that occur *before*, during and after using a service or product. Emphasis in the two definition is on *'' Use''* and *''Anticipated Use''* in ISO and *''Before Use''* and *''During Use''* from (Bevan, 2010). According to Adikari et al. (2010) User Experience assessment is an evaluation of user's experience with the product, system or service during 'use' (i.e., actual interaction experience) as well as 'anticipated or before use' (i.e., pre-interaction experience such as needs and expectations). Whereas many User Experience scholars do agree with the two definitions, there is still a challenge in understanding experience before use, the experience which is normally referred to as *''anticipated''* or "*desirability''* (Law et al., 2009; Hassenzahl, 2009).

This kind of experience (before use-experience) normally creates a desire to use a product or service. It is this kind of experience that someone gets even before the person uses the product or service. It is like watching an advertisement of a product on Television, the intended user would see it important to vividly imagine use cases with contextual factors and this is likely to evoke realistic experiences out of anticipated use (Law et al., 2009). Hasselzahl and Tractinsky (2006) identified *anticipated use* as the user's internal state which is associated with the user's tendency, expectations, needs, motivation, mood and many others. Law *et al* (2009) calls it *''imagined use''*. In this paper, it is referred to as Anticipated User Experience (AUX). According to Roto et al. (2011), AUX can be achieved through expectations created from previous experiences and other sources of information. In the design domain, Yogasara (2014) observes that the importance of emphasizing AUX in computing products and services has been acknowledged. Therefore, when AUX in a given product or service is emphasized, there are high chances for such a product or service to be accepted and used by the user. According to Yogasara (2014), AUX in any product or service plays an important role in user experience. It influences users' desire for the product even before the product is made available to the user. It is closely associated with the marketing and awareness stage of a product or service, where the product's image is formed in a user's mind either through marketing (advertisements) or a product's appearance (Yogasara, 2014). He admits that that these experiences and expectations before actual interaction are normally shaped by advertisements, brand image, other people's opinions, and prior experiences with similar products. It is an imagined experience. According to Yogasara (2014), AUX contributes to the current behaviour of the intended user. People often make decisions, select their actions, and adjust their behaviour according to anticipated emotions or feelings usually based on a number or a combination of past emotional outcomes and present affects (Baumeister et al., 2007). In other words, AUX has the ability to positively influence perception and change people's attitude towards using a given product or service. Anticipating a certain

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

out-come may trigger certain specific emotions, and it is these emotions that may stimulate behavioral adjustments (Huron, 2006). Human-product or service interaction does not only include instrumental and non-instrumental interactions, but also non-included physical interaction such as recalling, fantasizing about a product, or anticipating product usage (Desmet & Hekkert, 2007). From Desmet & Hekkert's assertion, the potential outcomes of the interaction can also be imagined, anticipated, or fantasized about, which in turn may evoke positive emotional responses. This response leads to the acceptance and usage of a product or service. Based on the above discussion, this chapter therefore defines AUX as *a positive imagination, fantasy and excitement that a user feels about a given product or service before the product is made available to the user.*

As stated earlier, Law et al. (2009) and Hassenzahl (2009) observe that whereas many user experience researchers may be conversant with explaining the experience that can be attained during usage of a service, they find it difficult to explain how a service or product can create good experience before it is used. Yogarasa (2014) for example studied over 10 definitions of user experience and many of the definition defined user experience as satisfaction a user get during actual interaction with the product or service. Only a few, however, touch on the subject of AUX and no further explanations regarding this subject are provided. Also, of the 27 user experience definitions listed on ''all about UX'' website, less than 15% consider the influence of AUX as a major determinant of user experience (Yogasara, 2014). This further indicates a research gap in the area of AUX that needs to be filled. Owing to all discussions on AUX made so far, this Chapter makes 3 major observation that underlie AUX. Firstly, AUX is a cognitive process. It is linked to imagination, fantasy, recalling, perception etc (Hasselzahl &Tractinsky, 2006; Desmet & Hekkert, 2007; Law et al., *2009;* Yogasara, 2014). *S*econdly, for AUX to occur, there should be a stimulating factor (Roto et al., .2011; Yogasara 2014). Thirdly, AUX influences user behaviour (Huron, 2006; Baumeister et al., 2007; Yogasara, 2014). It appears these three observations or characteristics associated with AUX are closely related to Cognitive Psychology and its principles. Cognitive Psychology theory and its principles could be a key to better understand AUX and how it can be achieved. Basing on these observations, this paper goes ahead to probe the following questions

Research Questions

1. What is Cognitive Psychology and how does it help understand AUX.
2. What factors can stimulate AUX cognitive process.
3. To what extent do these factors stimulate AUX cognitive process to lead to behavior change (acceptance).

Two methods were used to probe the above stated questions.

Methodology

Literature Review

Literature review was one of the methods used to address the first and second research questions. Literature from different sources was reviewed namely; journals, conference proceedings, books and research reports. Through a thematic review of literature, this chapter was able to identifying the key concepts in the principles of cognitive psychology and its relationship with AUX. This chapter was able

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

to understand what cognitive psychology is and its application on AUX. Through thematic review also, this chapter was able to elicit a number of stimuli that can positively influence AUX cognitive process.

Systematic Review

Systematic Review was used to answer research question three. Systematic Review method aided in providing empirical data on the extent the factors identified through literature can stimulate AUX cognitive process and therefore lead to behaviour change. Systematic Review is a 'rigorous method used to map the evidence base on an unbiased way as possible, and to assess the quality of the evidence and synthesize it' (DFID, 2013). A systematic review answers a defined research question or research questions by collecting and summarising all empirical evidence that fits pre-specified eligibility criteria. Systematic reviews are useful where:

- There is a substantive research question.
- Several empirical studies have been published.

According to Zanker & Mallett (2013), Systematic Review is considered by some to offer 'the most reliable and comprehensive statement about what works and how it worked. Systematic Review has many times been employed in evidence-informed policymaking within the arena of international development (Zanker & Mallett, 2013). In 1984 Cooper (1984) proposed a five stage systematic review process that was followed in this chapter'

- **Problem Formulation:** Statement of objective 3 of this chapter. This chapter used systematic review to investigate the extent to which factors identified in the literature stimulate AUX cognitive process which leads to behavior change.
- **Data Collection:** An unbiased literature search Reports, Journals, Conference proceedings, Books and many others. This effort resulted in 26 citations from which relevant studies were selected for the review. Their potential relevance was examined, and about 8 citations were excluded as irrelevant. The full papers of the remaining 18 citations were assessed to select those primary studies that explain how the elicited stimuli from the literature would positively stimulate AUX cognitive process.
- **Data Evaluation:** Assessing the studies for inclusion in the review. In data evaluation, a simple data extraction table was used to organize the information extracted from each reviewed study (e.g., authors, publication year, abstract, study design and particularly the outcomes of these researches).
- **Analysis and Interpretation:** Narrative Synthesis was the main form of analysis used in this chapter. Narrative synthesis refers to an approach to the systematic review and synthesis of findings from multiple studies that relies primarily on the use of words and text to summarize and explain the findings of the synthesis. Narrative synthesis adopts a textual approach to the process of synthesis to 'tell the story' of the findings from the included studies.
- **Public Presentation:** Discussion and context of findings. Through systematic review, this chapter was able to establish the extent each of the stimuli elicited from the literature influences AUX cognitive process using empirical evidence

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

MAIN FOCUS OF THE CHAPTER

Results from Literature

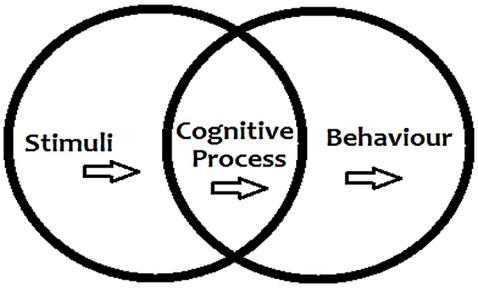
Cognitive Psychology and Its Application on AUX

First introduced by K. S. Lashley in the 1950s. Cognitive psychology is the scientific investigation of mental processes that affect behaviour, this includes all our mental abilities such as perceiving, learning, remembering, thinking, reasoning, imagining, understanding etc (Lin Lu & Dosher, 2007). Cognitive psychology is a relatively modern approach to human behaviour that focuses on how we think, with the belief that such cognitive processes affect the way in which we behave (Robert & Sternberg, 2012; Psychologist World, 2016). Cognitive phycology is based on two assumptions as stated in (Lin Lu & Dosher, 2007; Robert & Sternberg, 2012; Psychologist World, 2016). These two assumptions in Cognitive Psychology help to better understand the three observations in AUX. The assumptions state that;

- Behaviour is controlled by our own cognitive processes, as opposed to genetic factors.
- Human behaviour can be explained as a series of responses to external stimuli.

In other words, Psychologist World (2016) observes that cognitive psychology is based on the principle that our behaviour is a direct result of a series of stimuli and the outcome is determined by cognitive processes as represented below in Figure 1.

Figure 1. The principle of cognitive psychology
(Psychologist World, 2016)



In summary, the principle of cognitive psychology claims that human behaviour is a direct result of a cognitive process, and the cognitive process is often influenced by a stimuli. Detailed discussion of this principle is presented in the next section.

AUX as a Cognitive Process

As observed earlier, AUX is a cognitive process (Hasselzahl &Tractinsky, 2006; Desmet and Hekkert, 2007; Law et al*., 2009;* Yogasara, 2014). In Cognitive Psychology, human behaviour is controlled by human's own cognitive processes. Whereas there is no standard procedure of presenting the cognitive

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

process, McLeod (2015) observes that cognitive psychology recommends the following assumptions, among others, that guide the cognitive process;

1. A series of cognitive processing systems that transform, or alter the information in systematic ways.
2. Information should be made available from the environment (Stimuli) to influence and to be processed by a series of cognitive processing systems.

The presentation of AUX cognitive process in this section is guided by the above assumptions. There are three processing systems in the entire AUX cognitive process and these include; Reproductive Imagination, Fantasy and Excitement. These processing systems transforms information from the environment in a systematic manner. The AUX cognitive process begins with Reproductive Imagination process, followed by Fantasy process, and finally Excitement process. According to ChangingMinds.org (2016) a renowned psychology website, Imagination and Fantasy (also generally referred to Cognitive arousal) leads to Excitement (also sometimes referred to as Affective arousal). Excitement finally triggers physical arousal or physical behaviour, such as taking physical action or change in behaviour. It should also be noted that reproductive imagination is the key that leads to fantasy (Brenner, 2003; Juan, 2006; Roy, 2011). The three processing systems identified in the cognitive process (Reproductive Imagination, Fantasy and Excitement) specify the processes and structures that form the basis of AUX cognitive process. The detailed AUX cognitive process is described below;

Reproductive Imagination Process in AUX

The entire though process begins with reproductive imagination, which becomes the first phase of AUX cognitive process. Imagination, to begin with, is part of cognition psychology, which in particular is a cognitive process, and deals with the ability to form a mental image of something that is not available at that moment. It is a vital component of creative visualization, positive thinking and affirmations (Maher, 1915; Sasson, 2016). Maher (1915) and Angel (2015) observe that, psychologists over years have identified several forms of imagination. However, imagination is largely perceived in two forms, that is, Reproductive Imagination and Productive Imagination. Reproductive imagination is a term employed to designate the power of forming mental pictures of objects and events as they have been originally experienced before (Maher, 1915; Angell, 2015). For example, a voter may visualize a mobile device that he saw in a demo somewhere. Such an application according to Angell (2015) would illustrate what psychologists mean by reproductive imagery. Productive Imagination on the other hand signifies the power of constructing images of objects not previously perceived (Maher, 1915; Angell, 2015). Reproductive imagination experience is an internal experience a person enjoys from visualizing a recently seen or experienced phenomenon. Reproductive imagination is comprised of three phases, namely crystallization, dialectics and effectiveness (Liang et al., 2012; Liang, 2013).

Fantasy Process in AUX

This is the second phase of the AUX cognitive process. Fantasy is a product of imagination, or Imagination is the key that leads to fantasy (Jaun, 2006). The word fantasy is most often referred in psychology as a "mental apprehension of an object of perception; the faculty by which this is performed" and further as "the fact or habit of deluding oneself by imaginary perceptions or reminiscences" or "a day-dream

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

arising from conscious or unconscious wishes or attitudes" (Brenner, 2003). In psychology, Fantasy is an imaginary thought or image, or a set of images that provides a pleasurable experience for an individual, or as a means of visualizing other possibilities (Psychology Glossary, 2016). The term fantasy and imagination in many cases are used interchangeably. However, Albertus Magnus differentiates the two and considers imagination *"the repository of images and fantasy the active power operating them"*. Other psychology scholars such as Reynolds compares imagination with genius, and fantasy with taste. Fantasy, which is the lower and more restricted term, is defined in relation to imagination, which is a higher and more comprehensive term (Brenner, 2003). Roy (2011) considers fantasy as an imagination in its extremes and an important part of our cognitive thinking, it demonstrations how far our minds can stretch beyond the normal and the natural. Fantasy experience is putting reproductive imagination in to imaginary action while enjoying the whole experience, drawing imaginary use cases of a particular product. This therefore leads to excitement.

Excitement Process in AUX

The outcome of reproductive imagination is fantasy, the end result of fantasy is excitement (Changing-Minds.org, 2016). According to Merriam Webmaster (2015) excitement is a feeling of eager enthusiasm and interest, a quality that causes feelings of eager enthusiasm. According to Patel (2015), when a person is excited, the emotions become more powerful and in many cases affects the person's decision-making abilities. An excited person is more likely to make a decision, any decision including a bad one (Patel, 2015). Excitement in Psychology sometimes can be referred to as Affective or Emotional arousal, and this happen when someone is emotionally charged up and feels passionate about something, this creates physical agitation and 'readiness for action' (Berger, 2011). Excitement in this context, is a powerful argue to transform fantasy to reality.

The Analogy

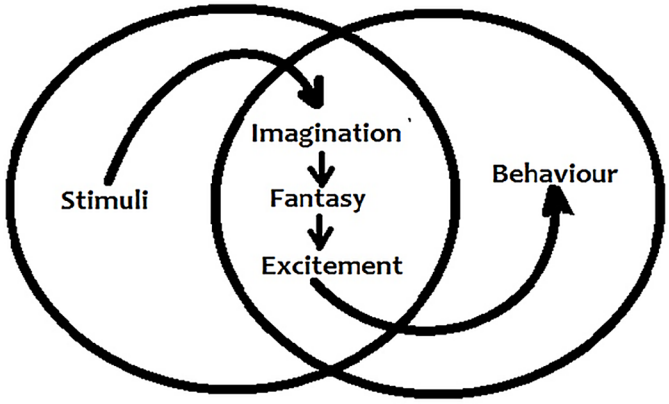
This paper summaries the three phases in this analogy. Once a user begins to imaging a mobile device which he/she saw in recently in a demo or an advert (Reproductive Imagination), the user is likely to begin creating interesting use cases in the mind (Fantasy), once this is done over and over again, it will result to the argue to use the system in reality (Excitement). The interrelationship of the three though processes is illustrated below in Figure 2;

Factors That Stimulate AUX Cognitive Process (Stimuli)

AUX cognitive process is heavily dependent on the nature of environmental stimuli. In this chapter, there was need to establish factors (stimuli) that can influence cognitive processing systems, that is; reproductive imagination, fantasy and excitement. From the literature available, this chapter found out that persuasive techniques used in marketing and in persuasive technology design techniques, technology acceptance theory and other theories could influence the three processing systems. Fogg (2002) defines persuasive design or technology as a technology that is designed to change attitudes, perceptions or behaviours of the users through persuasion and social influence, rather than coercion. According to Fogg (2003), persuasive computing is "any interactive computing approach designed to change people's attitudes or behaviours". Central to the concept of persuasive design is the notion of persuasion, which

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. The processing systems in the AUX cognitive process



Fogg explained as "an attempt to shape, reinforce, or change behaviours, feelings, or thoughts about an issue, object, or action". Fogg (2004) and Cialdini (2007) forwarded a number of persuasive strategies when used in designing computing products or services would change attitudes, perceptions or behaviours of the users towards a given product.

- **Demos:** Show the product features and how they work through trial versions, on TV etc.
- **Tailoring:** Provides relevant and personalized information on the product to change a person's attitudes.
- **Reciprocity:** Uses principles of operant conditioning, such as reinforcement and shaping, to change behaviors.
- **Push Messaging/ Reminders:** Gentle and polite reminders at certain times of the day to influence behavior.
- **Social Learning:** Use of peers, role models or acquaintances to influence behavior of others.

On the other hand, Acceptance theory as originally proposed by Davis in 1986 could also influence the three processing systems. According to Park (2009), TAM is one of the well-known models related to technology acceptance and use. The TAM is an adoption of the theory of reasoned action (TRA), specifically tailored for modelling user acceptance of information systems/technology. The TRA assumes that behavioural intentions are prior to every behaviour and that attitude and biased norms are critical for the intentional behaviour (Riedel et al., 2006). The advantage with TAM is that it offers an informative representation of the mechanisms by which design choices influence user acceptance (Park, 2009). According to Park (2009), TAM accounts for more than 60 percent of user acceptance and usage of a given technology. In TAM, perceived usefulness and perceived ease of use are the significant pillars that constitute and determine user acceptance of a given form of technology.

- PU defines the degree to which a person believes that using a particular service or product could improve his or her work performance, say, reduce on the overall time a person takes doing a task or make it very convenient for a person to perform a task.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

- PEU on the other hand describes the degree to which a person believes that using a particular service or product is free of effort. The service or product should be easy to learn and use, no much effort is required.

Persuasive and acceptance design requirements were found to be able to create positive imagination, fantasy and build excitement. How besides persuasive and acceptance theories, the literature also reveals that the following requirements can influence AUX.

- Prior Success or Legacy. The legacy of a product matters. The history of success makes a product reliable and this wins trust from the users. According Murthy (2007), the legacy of the product which is associated to its reliability conveys the concept of dependability, successful operation or performance and the absence of failures. It is an external property of great interest to both manufacturer and consumer. Unreliability (or lack of reliability) conveys the opposite (Murthy, 2007).
- Trend and Aesthetics. The inclination of the time influences the design of products. Usually people want to buy up to date items and not ones based on 'last years look' (Ryan, 2004). Aesthetic on the other-hand is the branch of philosophy that deals with the principles of beauty and artistic taste (Business Dictionaries, 2015). People are not only attracted to the latest trend of products but also to beautiful things.
- Social and Cultural Environment. These are a set of beliefs, customs, practices and behavior that exists within a given population (Business Dictionaries, 2015). Some product are aimed at different cultures and countries. A product acceptable in one culture may be looked up one as offensive or less desirable in another. The most critical thing is to align the product or service with these set of beliefs and practices.

RESULTS OF SYSTEMATIC REVIEW

Stimuli and Its Influence on AUX Cognitive Process and Behaviour

Systematic review was used to establish the extent to which the elicited stimuli from the literature would positively stimulate AUX cognitive process (change attitudes, perceptions or behaviours of the users towards a given product). As already stated and illustrated in Figure 2, the end result of AUX cognitive process is behaviour change. This could be in terms of accepting a service or product by the user. In this section, the chapter goes ahead to discuss the relevance of each stimuli to mobile computing products and extend each stimuli influence user behaviour on a computing product. Ten stimuli that influence AUX cognitive process and lead to user behavioural change. For easy understanding, this chapter organises these Ten Stimuli in to two broad categories. Namely; Contextual Stimuli and Product Stimuli

Contextual Stimuli

Verschuren and Hargot (2005) defines surrounding Characteristics as existing prerequisites set by the political, cultural, economic, juridical and or social environment. These are the social, cultural, political factors that play a great role in influencing AUX as discussed below;

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Socio-Cultural System

Cultural and religious attributes of the user or group of uses should be highly observed when developing a computing product. There should be no or little conflict between socio-cultural life style of the user and the technology being used. It is right to say that social and cultural acceptance of a particular technology is very vital (Shaukat & Zafar, 2010). For example, a number of manufacturers have a good understanding of colours and colour schemes and how they influence demand of the product in different countries. In China for example, black is always associated with evil, dirt, sin, disasters and bad luck. Black garments in China may not sell as much as white or blue (Ryan, 2004). Social factors are among the major influencers of reproductive imagination. In such situations, Väänänen et al. (2009) recommends designing computing products that are enjoyable and support essential social and cultural needs and values of the users.

Social and Political Learning

According to Cherry (2014), the social learning theory was first proposed by Albert Bandura and has become one of the most influential theory of learning and development. Whereas behavioural theories of learning suggested that all learning was as a result of associations formed by conditioning, reinforcement, and punishment, Bandura's social learning theory proposed that learning can also occur simply by observing what other people are doing. His theory added a social element, arguing that people can learn new information and behaviours by observing other people (Cherry, 2014). Cialdini (2007)] explains that when someone is not sure about a certain course of action, then the person is more likely to look to those around him or her for guidance as far as that particular course of action is concerned. Cialdini (2007) gives a good example on how social validation can significantly influence motivation and persuasion. He explains that, a study found that a fund-raiser who showed homeowners a list of neighbors who had donated to a local charity significantly increased the frequency of contributions; the longer the list, the greater the effect. Cialdini (2007) further quotes Cavett Robert- a sales and motivation consultant who stated that, people are persuaded more by actions or behaviours of other people than any other proof that can be offered. A classic effect of social learning was when Lee's article (circa 2011), reported that and endorsement by Jessica Simpson and aesthetician Nerida Joy helped Beautymint attract 500,000 visitors on day one of its launch (Feldman, 2014). In a survey carried out in Uganda, there was a 32% acceptance rate in respondents who originally did not agree to use their mobile phones for voting, when there was an indication that their political leaders, neighbours, peers or influential would be using their mobile phones for voting (Eilu et al., 2014). Using social leaders, political leaders and technocrats influence wide use of computing products in today's society.

Product Stimuli

Refers to the preferred product/service functionality, features, appearance and other hedonic features. The requirements include; ease of use, perceived usefulness, Demos, push messaging/reminders etc as further discussed below.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Perceived Usefulness

Slatten (2010) describes perceived usefulness as one of the most important factors for influencing user technology acceptance. Perceived usefulness according to Park (2009) is the degree to which a person believes that using a particular system would provide him/her with some benefits. Mobile Phone for example have proved to be a very useful tool in today's world. Mobile phones services have made it easier for people do things, it has provided services such as easy mobile money transfers and mobile bill payment to mention but a few. Through these mobile services, money transfer and bill payment has become easier and convenient in developing countries like Uganda, Kenya and Tanzania. Statistics show that, because of its portability, about 67% of users would prefer buying products using their mobile devices, while 50% of users are more likely not to use an online site if it is not available on their mobile devices even when they like the product available online. About 48% of online customers find a lot of dissatisfaction when they get to a site that is not mobile-friendly (Dholakiya, 2013).

Prior Success and Great Legacy

A good reputation represents a great marketing strategy. A mobile computing product with a good reputation inspires others to use it (Lickerman, 2010). A product with a good reputation has a higher chance of being accepted even by those who have never used it. The Moleskine notebooks for example had built a good reputation over several years as a reliable notebook with a durable cover. Though the books disappeared in the mid-1980s, in 1986 the note books resurfaced and sold out in record numbers because of their earlier reputation (Berget, 2009). Tartan is a type of Scottish cloth which is checked or cross-barred. A variety of colours are used to produce the patterns. Today, tartan patterns are exported all over the world from Scotland and these types of pattern are recognized throughout the world as Scottish. Tartan patterns materials are not only always bought because they are associated with Scotland but they are also purchased for their high quality (Ryan, 2004). For mobile computing product to gain more acceptance, there is need to build legacy or associate it with products that have a solid legacy.

Demos

Reproductive imagination depends directly on the richness of what was seen before, because this is the experience that provides the material from which the products of reproductive imagination, and later fantasy and excitement are constructed. The richer a person's experience, the richer is the material one's imagination has access to (Vygotsky, 2004). Demos are considered a rich source of material for reproductive imagination. A demo is a step by step process which guides the user on how the product works or how it is used. Demos can be done through various means, say on TV, radio, prototypes or sample products. A demo proves to a user that a computing product meets the specified standards and this reduces the level of uncertainty. Demos on TV or radios, or Test prototypes of a computing product given to the user before the user purchases the product are a great confidence and trust builders. Demos are recipe for reproductive imagination, where someone begins to form mental pictures of objects and events seen earlier. A number of researches have been carried to find out the effectiveness of demos on products and the results are stunning. For example, 58% of the respondents in a survey carried out by a research firm Knowledge Networks said they would only buy a product after trying it. In a related survey, there was an increase of 475% when product demonstration in-store were allowed, and further increased

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

sales from the entire product line by as much as 177% on the demonstration day (Lovell, 2015). Khaled (2008) acknowledges that one of the major aim of a demo is to increase self-efficacy and facilitate goal completion of a computing product.

Ease of Use

In designing computing products, unnecessary long steps should be avoided and short simple steps should be made a priority when developing a computing product. Once the tasks in the demo are few and simple, it influences the degree to which a person believes that using a computing product is free of effort. Slatten (2010) believes that users will choose to avoid learning complex process because of the perceived or real difficulty associated with such a process. A survey by usability net revealed that 50% of online visitors to a site would not return if finding information they needed was difficult (Usability Net, 2006).

Tailoring or Customization

According to Fogg (2004), information availed in a computing product will provide better user experience if it is tailored to the individual's needs, interests, personality, usage context, or other factors relevant to the individual. Product customization is gaining ground in many companies. Online product customization for example, raises brand awareness, increases engagement, helps companies identify emerging trends, and adds an additional source of revenue to their online business (Margalit, 2015). Product customization has been taken so seriously, that today, many popular brands are embracing product customization and adding it to their business strategy (Margalit, 2015). Margalit (2015) argues that the decision to buy a customized product is mediated by unconscious factors. There is a tendency for a person to pay more attention to information meant for him or her. When a product is customized, the buyer's touch receptors are activated, creating a sensual stimulation. In a case where touch is not possible, the interaction with the product brings an imaginary path to life, and the imagination of ownership (Margalit, 2015). Cialdini (2007) observes that having a product with a customer's name on can increase chances of winning over the customer. A survey carried out in the United States revealed that clients were willing to pay as high as 20% more to have their products customized (Spaulding & Perry, 2013). A mailing survey found out that there was a 56% response rate for customized mails sent out to people, compared to 30% response rate for non-customized mails (Cialdini, 2007). A survey of more than 1,000 online shoppers conducted by Bain & Company in the United States revealed that more than a quarter of shoppers, 25-30%, are interested in online customization options, even if only 10 percent have tried it until now (Margalit, 2014).

Reciprocity

Reciprocation is a form of reward a user receives after performing a certain task. Computing products that are designed to reward a user attracts more attention from users than others. There is an over whelming evidence that reciprocity is a powerful determinant of human behaviour. Many scholars including sociologist, ethnologist and economist emphasize the omnipresence of reciprocal behaviour (Falk & Fischbacher, 2000). According to Molm et al. (2007), the appreciation of reciprocity in social life is by no means restricted to exchange theorists, that is ''give and take''. In contrast, as a social construct, reciprocity means that in response to friendly actions or behaviour, people are frequently much nicer and much more cooperative; in reverse, in response to hostile actions they are frequently much nastier

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and even brutal. The principle of Reciprocity is equally used in a variety of situations, businesses use it in advertising, marketing, and propaganda (Budiu, 2014). Reciprocity appeals to sub conscious part of a human to be good to those who are good. For example, in order to influence voters to use a given mobile device, rewards to users could be considered. The mobile device should have an in built rewarding service, such as free games, application downloads etc. Therefore, rewards like free airtime, free online game access etc. A survey in the United States indicated that an appeal by Disabled American Veterans organization for contributions increased from 18% to 35% when free personalized address labels where later sent. In another example, research found out that people bought twice as many raffle tickets from a stranger if the stranger first gave or promised a can of Coke (Cialdini, 2007). In another case in the United States, a waiter's tips increased by 23% when a waiter gave one mints to a client but quickly returned to offer a second mint (Cialdini, 2007).

Push Messaging/ Reminders

Push messaging notification is, in mobile marketing context, a short text message sent to remind someone to perform a certain act. These messages are send at certain convenient times. Some technologies like suggestive technologies identify these convenient times and then remind users to perform a particular tasks. For example, during the 2 years of observation at a United States hospital, safe behaviour before implementation of the '*gentle reminder'* was 55% in one ward; it increased after 2 months to above 80%; 4 months later, it was 90%. A similar pattern was documented in all wards. This is one recommended way to overcome unsafe behaviour (Erev et al., 2010). Another survey by Localytics revealed that there is a 66% higher click rate on reminders that are sent on weekdays between 12 p.m. to 5 p.m. (VentureBeat, 2014). In another case, there is a higher chance that customers will reconsider and buy a product when constantly reminded about the product (VentureBeat, 2014).

Trend and Aesthetics

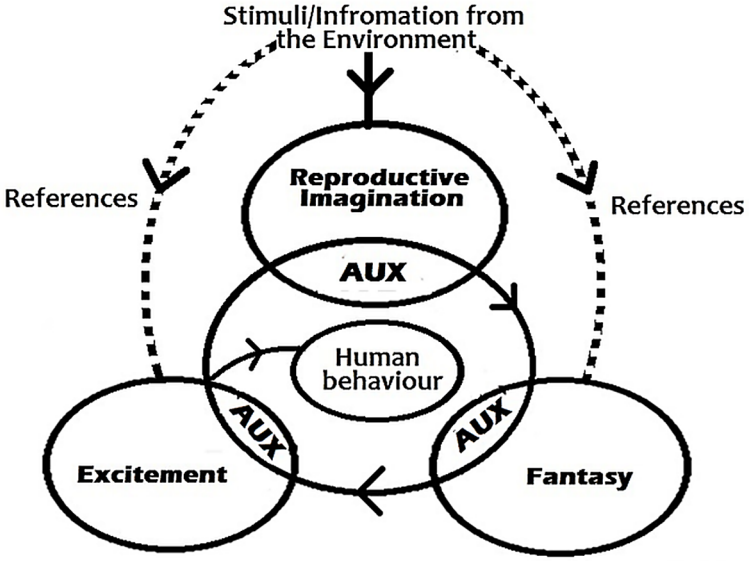
A trendy computing product is the newest, the latest, and the greatest product of the day that catches much of people's attention. According to Baumgartner (2012), the brain loves trends because they are fast acting short-lived blasts of newness. Studies have shown that the substantia negra/ventral tegmental area of the brain is stimulated when presented with something new. The study also showed that humans seek novelty in order to receive reward (Baumgartner, 2012). When a person is presented with something new which he/she has not seen before, all cognitive processes involved in learning (working memory, visual processing, problem solving, etc.) are enhanced (Baumgartner, 2012). Fashion goes hand in hand with beauty. The selection of the product's features, colors and shape generates thoughts on 'how it would feel' to own that object (Margalit, 2015). Cialdini (2007) observes that people tend to be attracted to beautiful and trendy things. Physically attracted people are more likely to receive favour than the other less attractive. A study conducted in the USA in 1993 revealed that, physically attractive fund-raisers for the American Heart Association generated nearly twice as many donations (42% versus 23%) as did other requesters (Cialdini, 2007). Studies have also shown that up to about 90% of a product's assessment is based on beauty and color alone. This mental assessment is normally made within 90 seconds of initial viewing (Patel & Puri, Na). A new analysis by the Design Management Institute, a Boston-based nonprofit focused on design management released a report that, in the decade, design-driven companies such as Apple, Coca Cola, Ford, Herman Miller, IBM, Intuit, Newell Rubbermaid

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and Nike outperformed the Standard & Poor's 500—a stock market index of 500 large publicly traded companies—by 228% (Dunne, 2014)

In summary, key external stimuli that designers should consider when designing for AUX in computing products are presented. As illustrated in figure 3 below, the stimuli discussed in this chapter influences reproductive imagination first, however, fantasy and excitement are further stimulated through constant reference to the stimuli as illustrated in Figure 3.

Figure 3. Processes and structures in cognitive performance that influences AUX



AUX Influences User Human Behaviour

Human behaviour refers to a collection of every physical action and observable emotion associated with individuals. In computing products, this could be displayed in form of acceptance and usage of a computing product. One of the assumptions in cognitive psychology is that behaviour is controlled by our own cognitive processes, as opposed to genetic factors. Meaning that the outcome of the cognitive process influences behaviour. However, before 1940s this cognitive psychology assumption on the cognitive process leading to human behaviour was widely contested. The "father" of radical behaviourism (human behaviour) John Watson (1878–1958) objected to this theory and dismissed cognitive process as nothing more than subvocalized speech (Robert & Sternberg, 2012). Until early 1940s, the behaviorist view that human behaviour is directly influenced by the surrounding environment and no thinking process is required- dominated experimental psychology (Riegler & Riegler, 2012). Behaviorist scholars such as B. F. Skinner emerged as the most extreme advocate for behaviorism claiming that mental events such as cognitive processes have no place in the science of psychology. He insisted that behaviour is directly influenced by the environment only, and no thinking process is involved. He argued that though cognitive processes are real, they are unobservable and hence unnecessary to a scientific explanation of behavior (Riegler & Riegler, 2012). However, towards the end of the 1940s and early 1950s there was an abrupt

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

change in research activities, interests, and the scientific beliefs, which marked a definitive break from behaviorism (Riegler & Riegler, 2012; Robert & Sternberg, 2012). The rapid change in research is seen by some as a revolution in which behaviorism was rejected and replaced with cognitive psychology (Riegler & Riegler, 2012). This changes referred to as the "cognitive revolution" which took place in response to behaviorism (Robert & Sternberg, 2012). Cognitivism is the belief that much of human behaviour can be understood in terms of how people think. Cognitive psychologists assume that behaviour is the result of cognitive process. It rejects the notion that psychologists should avoid studying mental processes because they are unobservable (Robert & Sternberg, 2012).

FUTURE RESEARCH DIRECTION

Although little attention has been given to AUX, a number of user experience researchers and practitioners are currently trying to understand AUX and how it can be achieved. There is need to focus more on identifying and categorising AUX stimulants against particular computing products.

CONCLUSION

The term '*user experience'* came up during the explosive wide spread use of mobile devices and services error. User experience shows that the ease of use, efficiency and effectiveness of a product or service are not adequate to guarantee user satisfaction. In order to guarantee satisfaction, user experience research commenced. However, understanding user experience and how it can be achieved has always been quite challenging to researchers. Particularly, Anticipated User Experience (AUX), one of the tenets of user experience. In this chapter, I attempt to address this gap. This chapter applies the theory of cognitive psychology and its principles to best explain how Anticipated User Experience occurs and how it can be achieved. This chapter makes 3 major observation that underlie AUX; AUX is a cognitive process. It is linked to imagination, fantasy and excitement. For AUX to occur, there should be a stimulating factor such as conducive Social Environments, Social Leaning, Reciprocity, Tailoring, Push Messaging, Trends and Aesthetics, Demos, Ease of Use, Perceived Usefulness and Legacy. Thirdly, AUX influences user behaviour displayed inform of acceptance and usage of computing products. This chapter goes a long way in informing designers of computing products on the significance of attaining Anticipated User Experience and how it can be achieved.

KEY TERMS AND DEFINITIONS

Anticipated User Experience: A positive imagination, fantasy and excitement that a user feels about a given product or service before the product is made available to the user.

Cognitive Psychology: The scientific investigation of mental processes that affect behaviour, this includes all our mental abilities.

User Experience: Defined as a person's perceptions and responses that result from the use or anticipated use of a product, system or service.

Chapter 28
Hinduism and Counseling: Karma, Women Empowerment, Grief and Death, Anger Management, Bhagavad Gita, and Psychotherapies

Devi Venashinee Muruges
HELP University, Malaysia

ABSTRACT

Indian psychology lays enormous importance on the research of religious experiences and the expansion of approaches by which to accomplish them. In addition to that, it also provides understanding of the different states of consciousness. Hence, it is undeniable that Indian psychology will be able to make a definite therapeutic contribution to many psychological problems. For mental health practitioners dealing with Hinduism, there are teachings within various texts that directly strengthen counseling and mental services. Some of the examples include perceiving the conscious and the unconsciousness aspects of the mind, utilizing meditation to support people with mental health issues, yoga exercises to curb anxiety and stress, and many others. Therefore, this chapter intends to elucidate the application of Hinduism in therapy.

INTRODUCTION

Hinduism is one of the five largest practiced religions in the World. There are so many books and beliefs that are part of Hindu practices that some see Hinduism as more a way of life rather than a dogmatic religion. While Hinduism is seen as pantheistic religion, that are practitioners of Hinduism that are monotheistic and even atheist believing in the concepts rather than the ritualistic practices of the religion. Conceptually however there are concepts that guide Hindu, this article looks at the beliefs of Hindus that has an impact on counselling and therapeutic practices.

Our basic philosophy is trinity. Trinity means we believe there are three basic things: matter, soul and God. God to us is all pervading. It is not something that is static and sitting on one place. It is matter through which this world came out of. And the third thing is soul. Regarding soul we believe in transmigration: the circle of life and death. And that circle is according to our Karma. Our deeds become our destiny.

(Quoted from a Hindu participant for Research Karma, reincarnation, and medicine: Hindu perspectives on biomedical research, Sharp &Hutchinson, 2008).

What Is Karma?

Many Indian religions such as Buddhism, Jainism, and Sikhism share karma as their core concept (Berkeley, 2017). Despite that, their specific views on karma vary. Before talking about Karma, I think it's crucial to talk about the atman, (the real self). In Hinduisme, the atman (the soul/ real self) is distinct from both the body and the mind. The atman refers to the self beyond gender, race, species, religion, and nationality.

Karma is a concept in Hinduism which dominantly elucidates causality in which good actions, words, thoughts, and commands directs to favorable repercussion for a person or vice versa (Berkeley, 2017). Hindus more often than not believe that good or bad fortune encountered in life may be the consequence of good or bad actions carried out in a past life. These effects may not necessarily be instantaneous as it can be visited upon a soul in future lives through reincarnation. Unfortunately the misconception here is Karma dictates what to do. As a matter of practice Karma creates situations, how one chose to behave is based on their freewill. One's choice of action determines either they will be accumulating positive karma or negative karma. For instance if you had been wrong by an individual in the past, Karma will put you in a situation where you can continue the negative relationship, forgive and cut the karmic ties or simply just walk away. The choice of what to do is that individuals.

Transmission of a Soul

Transmission of soul is believed to be facilitated by one's karma. One's accumulation of good and bad karma unfolds to determine one's destiny. The family you are born in is Karmic, you have the choice to rise above or sink in the situation that you are born in. Since Hindus believe in transmission of the soul, the focus of Hindu philosophy is on the development of the soul in relation to the body. The driver in the vehicle analogy can be used in further comprehending the soul or atman concept. A body will never function without a soul just like how a car can never move without the driver. Just like how many drivers form attachment with their cars and get concerned about the car's needs, most people without the proper enlightenment may begin identifying with the body and it's needs without finding and acknowledging the soul within it. Failure in acknowledging the soul within may lead to one being trapped, a broken and ignored car however will not be able to move the driver effectively. Therefore the individual while focusing on the soul must ensure the health and safety of the car, which has led to the development of Ayurveda, Yoga and breathing practices which are strongly rooted in Hinduism.

In the nutshell, Karma entails the notion that we are all responsible for our own lives. As such, all therapies that address freedom of choice can utilize the concept of Karma in empowering their client. Karma entails the notion that karma creates circumstances yet how we choose to react depends on our choice. Therapist can utilize this understanding in empowering clients to make up the right choices.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Besides that, Karma in a way suggests the notion that one can only control one's own behavior which would lead to accumulation of karma.

Besides that, the concept of Karma can also be incorporated in behavioral Psychology. In behavioral Psychology, more often than not reinforcements are used to influence probability of an action. Positive reinforcements like rewards enhance the occurrence of an event while negative reinforcements like punishments reduces the occurrence of the event. However, often time negative reinforcements like scolding, yelling and punishing could cause negative repercussions to the psychological well-being of a person. Desired behavior is probably attained using this technique yet it causes adverse effects on social relationships which will lead to accumulation of bad karma. Positive reinforcements on the other hand amplify self-contentment and happiness. As such, they accumulate good karma. On one hand with this, when people use ignorance technique while being confronted by situations that they don't like, they avoid accumulation of bad karma.

Women Empowerment

Sakthi (Divine Feminine Energy)

The significance of women is so intense in Hinduism to the extent it cannot be comprehended in just one distinct way. According to Hindus, the Supreme Being is ultimately believed to be the divine output of the entire universe. As such, Hindus also believe the Shakthi (divine feminine energy) is pertinent for the existence of the Supreme Being to exist. Essentially, Sakthi means "power". In the words of Kolluru, (2011), energy of divinity manifests itself in many forms. Kolluru further described this by categorizing energy manifestation in the masculine form as a male and feminine form as female.As a matter of fact, Hinduism worships the Supreme Being as a divine mother in the form of Shakthi because just like how mothers are accountable for birth, Shakti is accountable for creation (Johnson, 2017).

The Main Goddesses and Their Roles

The only major religion of the world with both God and Goddess is Hinduism. Prominently, most major male Gods have Goddess as their partners. Lord Shiva has goddess Parvati, Lord Vishnu has Goddess Lakshmi, and Lord Brahma has Goddess Saraswati. Ultimately, Hinduism implies the notion that all living beings are fraction of the similar great consciousness which is the almighty. The Almighty is neither male nor female. Within manifest creation, a balance of male and female energy is vital.The goddess in Hinduism displays various roles and freedom of choices.

Ultimately, the goddess portrays the universal truth that all woman are entitled to have their own choice whether to get married, have children, pursue higher education, or stay single. For example, Goddess Parvati is married to Lord Shiva and has children; Lord Ganesha and Lord Muruga. Goddess Lakshmi is married and does not have any children. She is on her mission which is to protect the universe along her husband, Lord Vishnu. However unlike the regular superstitious whereby married woman with no children are considered as inauspicious, Goddess Lakshmi is seen as the symbol of auspiciousness and happiness. On the other hand, Goddess Saraswathi is never seen in any pictures with her husband. Goddess Sarawathi is known as the goddess of knowledge of wisdom and art. Lord Saraswathi is more career oriented as she is mostly pictured with her veenai and books. On one hand with this, fierce and protective Kali Ma, doesn't have a male counterpart.

Navarathri

Navarathiri is celebrated as the divine feminine element of Shakthi. This is a nine day celebration whereby the divine form of Shakthi in its' nine different form: Durga, Bhadrakali, Amba Devi, Annapoorna Devi, Sarvamanagal Devi, Bhairavi Devi, Chandika Devi, Saraswathi Devi, Bhavani Devi, are worshipped. Each forms illustrates on the different portrayals of Shakthi. Durga is depicted as the invincible mother, Bhadrakali refers to the mother of fortune and wealth while Amba Devi refers the mother of the universe. Annapoorna Devi mother of Anna (rice) and is responsible to provide food. Sarvamangala Devi is the divine mother that brings peace and joy to the world. Bhairavi Devi on the other hand is the divine mother of good who does goodness to good people and evil for bad people who demolishes the negative energies in the Universe. Chandika Devi is the fierce goddess who is the Supreme one. Saraswati Devi and Bhavani Devi are depicted as the Goddess of beauty and the Goddess of mercy respectively.

By close inspection of this nine day celebration, it can be clearly noted that this celebration was devoted to celebrate the different traits and qualities in woman. The different forms of shakthi have simply elaborated the equality of man and woman. Women are as capable of man in fighting against injustice. In session, these stories can be used to bring woman to a sense of awareness of their situations and awaken the power within them in fighting against discrimination.

Hindu Stories of Strong Roles Portrayed by Female Figures

So while the Hindu Goddess themselves empower women, historically and culturally male dominance has been practiced the significance of the goddesses themselves lost in translation. Essentially, most women are expected to portray traits like compassionate, forgiveness, compassion, and tolerance of others' misbehavior. Women that comply with the cultural norms are accepted while women that attempts to portray independence and assertiveness are seen as destructive and as a disgrace to family reputation. Women are forbidden from expressing their opinions and views boldly. The actual pantheon of Hinduism, the concept of Shakti can be used to empower women in fighting against patriarchy. In Hinduism, women are acknowledged as the vessels of shakti with both creative and destructive power (Kolluru, 2011). Ultimately, each forms of Shakthi portray different roles of a woman .While Shakthi is mostly seen as the gentle and loving Uma, Shakthi is also portrayed as the fierce Kali and warrior Durga .

Apart from that, equality was also strongly emphasized in Hinduism. The form of Ardhanarishvara, which is the merging of Lord Siva and Goddess Parvati represents the union of the masculine and feminine energies (Kolluru, 2011). Ardhanarishvara is evidential in demonstrating the fact that female element (Goddess Parvati) is inseparable from the male element of God (Lord Shiva) .With respect to the Ardhanarishvara form, it can be clearly noted that Hinduism also shatters all questions with regards to its' perspectives on homosexuality.

A look at the Hindu puranic stories will further illustrate the freedoms and the unique roles played by women. For instance, Goddess Dhurga is depicted as a courageous battle queen with many arms, with each carrying a weapon. Draupathi was known as the heroine of Mahabharata who has stood strong despite going through many trials. As a matter of fact, Draupathi was married to five different husbands (the Pandavas) at the same time. As such, it definitely demanded lots of skills and responsibilities to be the wife of the Pandavas. Draupathi had to spend one year with each husband. Her other husbands were forbidden from having any sexual contact with her while she spends one year with each husband. Drau-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

padi was adored for being compassionate and humble to good people and was volcanic to her enemies. In addition to this, Draupadi was also well-known for her firmness and for having a unbreakable will.

On the other hand, Kannagi was known for her bravery. Kannagi took revenge on the great Pandyan King of Madurai for wrongfully putting her husband to death. Kannagi's curse burned the whole town of Madurai. Besides that, Avvayar was a famous female poet whose poems and stories are widely used to educate young children till today. These stories have depicted some of the bold roles played by women of those days who did not comply to the expectations and norms of the society, these stories can be used in sessions to help women break away from oppressive situations.

Grief and Death

Perceptions About Death

For sure is the death of all that comes to birth, sure is the birth of all that dies. So in a matter that no one can prevent thou hast no cause to grieve. (Mascaro, 1962, chapter 2, verse 27)

Maya (an illusion) is termed in the Hinduism as an attempt to find permanent happiness in this world (BBC, 2014). A person's atman (spirit) based on the Hindus believe is eternal. Unlike the atman, the physical body is not enduring and can change. Without proper enlightenment people will get trapped in the samsaric cycle (reincarnation). As such, Hindus view death as a natural event that would facilitate the process of the atman attaining Moksha (ultimate release from rebirth).

Reincarnation

Reincarnation simply refers to life continuing after death. Referring back to the driver in the vehicle analogy, just like how people change their car once it gets old, not functioning, people will be using a new body after their death. We buy cars on the basis of what we want and what we can afford. Similarly, the nature of the new body is influenced by their desires and their respective karma. Bhagavad Gita has three main listings for human actions: Karma: those which elevate; Vikarma: those which degrade; Akarma: those which create neither good nor bad reactions. This is believed to lead towards liberation. For most Hindus, this can be an important belief that facilitates grieving process. In addition to this, funeral rituals in Hinduism are designed in such a way to facilitate grieving process. Funeral prayers help people to come out of shock and accept the reality. Longer mourning period often times give a long time frame to survivors of the deceased to come in terms with the death of their loved ones. Psychologically speaking, the hindu funeral rites and rituals are specifically targeted to help the relatives of the deceased in coping with the loss.

After-Life Beliefs

Hinduism elucidates on the four main paths that a man will follow upon his death. Devayana the first path is known as the path of the gods (Ramakrishna, n.d.). This path is taken by spiritually advanced souls who have devoted themselves to meditation yet have not succeeded in accomplishing self knowledge prior to their death. Pitriyana is known as the second path. This path is followed by ritualists and philanthropists who have done worship, charity, vows and austerity. People here enjoy immense happiness for their

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

good will before returning back to earth as they still possess earthly desires .Hell is referred as the third course. This path is followed by those who led an impure life .Such people are born as sub-human species to expiate their evi actions before being reborn as humans. The fourth path is for those who have done extremely unpleasant actions. They are reborn as insignificant creatures like mosquitoes countless times to eliminate their evil actions before being reborn as human form (Ramakrishna, n.d.). Souls that have attained self-knowledge however do need to pass through any of these realms. Such souls attain Moksya.

Suicide and Euthanasia

Suicide in Hinduism is perceived as an act against humanity (Lakhan, 2008) as it causes pain to the family and friends of those who complete suicide. As such, suicide is deemed as a bad death which is violent, premature occurring at the wrong time and wrong place. However there are two prominent distinctions made to distinguish suicide and euthanasia. One killing him or herself for selfish reasons such as financial burden portrays one's ignorance on nature of life. Hindus believe that a person who dies by committing suicide will continue the samara cycle of birth and death. In addition to this, committing suicide will cause negative repercussions in next birth. Ultimately the point of life is to develop and attain self-knowledge. Suffering is part of life. Bliss is just an illusion, (maya). As such when one chooses suicide as an alternative path to end his sufferings, it creates negative repercussions in next birth and hence lessons have to be repeated till next birth. In the nutshell, suicide is never encouraged in Hinduism. On one hand with this, death is seen as a natural occurrence in Hinduism whereby one is karmicly bound to die in time. As such, one should not blame himself or herself when they are unable to save someone from dying. A therapist dealing with suicidal clients could use this explanation to help client understand the consequences of killing themselves. Euthanasia on the other hand is seen as an act of compassionate in case of extreme suffering and lack of consciousness. A doctor does euthanasia by injecting lethal drugs to patients. Euthanasia is not seen as a sin in Hinduism (Lakhan, 2008).

Anger Management

Perceptions on Anger

According to the Gita, desire and anger provoke a man into sinful action (Hindu Dharma, 2017). Desire is deemed as a deadly enemy as if we want something, we will get it by fair or foul. This will drive us to committing sin. As such, anger is also seen as an equally deadly enemy. Anger is caused by unfulfilled desire. The concept of throwing a ball against the wall can be used to comprehend how anger is caused by desire .Desire represents ball being thrown against the wall meanwhile anger is represented by the ball bouncing from the wall (Hindu Dharma, 2017).

While we attack people in our anger, we are hurt more than those we wanted to hurt (Hindu Dharma, 2017). Our whole body shakes when we are angry .Anger triggers pain both to the body and the mind In addition to this, we make ourselves appear ugly when we are angry (Hindu Dharma, 2017).

Sadness and anger are two different types of unreciprocated cravings (Hindu Dharma, 2017). If a person that hampers us from attaining our desire is inferior to us, we turn our anger on them . In contrast to this, if the respective person happens to be superior than us, we have no other choice than mourning by ourselves. Thus, anger is best when it is kept at a distant (Hindu Dharma, 2017).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Stories Relating to Anger

Dhritaraashtra's wrath is an example of story used to elaborate on effects of anger. Pandavas visited their uncle Dhritarasshtra after defeating his sons in the final war (Bhide, 2007). Bheem who killed Dhritaraashtra's son Duryodhana was called closer by Dhritaraashtra so that he could embrace Bheem. Krishna, holds Bheem back and placed a solid metal statue of Bheem before the blind Dhritaraashtra. The statue was reduced to rubble by the vigorous hug of the old man. Such is the intensity of the anger that burns inside him . Dhritaraashtra's Queen, Gandhari blindfolds herself since her husband is blind. When Yudhisthira bends to touch the feet of Gandhari, her partially covered vision falls on his' fingernails. As a consequent, Yudhisthira's fingernails turned black . The anger of the mother was also very profound and literally burning. These stories are significant enough in portraying the dangerous consequences of intense anger .

Focusing Emotions on God

However as humans we are prone to experience anger, so how are we to control it. Associate Professor Dr. Anasuya Jegathevi Jegathesan in her experience with dealing with adolescents and young people with anger issues from a Hindu perspective said this "Your parents, your family, your friends, they cannot take your anger. You will say words that will hurt them and that creates more Karma. So what do you do when you are angry, get angry with God. Sit in your alter scold God, express your anger to God. The Almighty can take your anger, God absorbs it, forgives it and accepts it. Anything offered to God has no Karmic backlash, like the story of Shishupala . Do not of course take your anger out on God in public places like in a temple because there your anger will upset other who does not understand and their upset will create negative Karma. But scolding God in your private space can be a huge anger management too." (Talk, Hindusim and Counselling, HELP University April 2016)

Krishna and Shishupala's Story

The story of Shishupala from the Mahabaratha is as follows he was a prince born with three eyes and four arms. It was said that a heavenly voice told Shishupala's parents that the additional eyes and arms will disappear when a certain person took the child on his lap. However, that person will be the cause of Shishupala's death. When Krishna placed Shishupala on his lap, Shishupala's third eye and additional arms vanished indicating the fact Krishna will be causing Shishupala's death. Witnessing this scene, Shishupala's mother who was Krishna's aunt requested a boon from Lord Krishna. The boon was that Lord Krishna would forgive Shishupala for 100 offences. Krishna agreed, Shishupala's father decided to save his son it was best to let him be brought up by a very powerful rival of Krishna, who instilled hate in the young man, who would openly insult Krishna. As Krishna did not retaliate, he mistook the forgiveness as cowardice, and the young was obsessed with bringing Krishna down.

Both Sushipala and Lord Krishna were invited to a ceremony at Indraprastha by the King. At that event, the King decided to credit Lord Krishna as the guest of honor. Hearing this, Sushipala got furious and insulted Lord Krishna finally exceeding the hundred pardons. A duel commenced and Krishna to the shock of everyone watching when Krishna finally killed the man, the audience witnessed a light of the soul of the man rise from his body and merge with the Krishna who is seen as an incarnation of God on earth. How could someone who had insulted Krishna merge with God?

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Focusing emotions on god will help one in regulating their anger. In Hinduism, it's okay to get angry with god. We can blame god and have a conversation with God. This would give an avenue to express our anger out. When we scream or yell out of anger, it creates negative energy in the surrounding. This would then create unnecessary karma for us. The notion of taking god's name in vain is not a concept in Hinduism. Hindus believe Gods are above emotion. As such, they are non-reactive to emotions. The story of Krishna and Sushipala implies that by focusing emotions on God we are able to express those emotions without negative consequences. This is a powerful anger management practice for young Hindus.

Bhagavad-Gita and Contemporary Psychotherapies

Bhagavad Gita

Bhagavad Gita has approximately 700 verses from Hindu scriptures and is a prominent part of the famous Hindu epic known as Mahabharata. Ultimately, the Gita is based on the conversation between Lord Krishna and Arjuna during the Kurukshetra war. According to Reddy, (2012) Mahatma Gandhi was cited as declaring he would refer to the Bhagavad Gita whenever he encounters a problem as the Gita provides him with the answer and solution to his problem. Resolution of conflict and flourishing recommencement of action from a state of acute anxiety and guilt laden depression are precious case study lessons in psychotherapy for psychology students Many psychotherapeutic principles is believed to have been implemented in The Bhagavad Gita (Bhatia,Madabushi, Kolli, Bhatia, & Madaan, 2013).

The Story Line of Mahabharatha

Essentially Mahabharatha depicts on the Kurushethra war between the Kaurava and the Pandava princes. It is also seen as the longest epic in world literature comprising of 100000 of two line stanzas (Davis, 2001). As such, the Mahabharaha is seen at eight times longer than Homer's Iliad and Odyssey together as well as three times longer than the Bible .However, in the words of Naramsin only about 4000 lines recount to the main story, whereas the rest part of the Gita contains additional teachings In the nutshell, Mahabharatha bears a resemblance to a long journey with many diversions. Hence it was concluded that *"Whatever is here is found elsewhere. But whatever is not here is nowhere else."* (Davis, 2001).

Psychodynamic Psychotherapy

Conflict related to unacceptable aspects of self is the central theme of psychodynamic theories (Bhatia,Madabushi, Kolli, Bhatia, &Madaan, 2013).. Adaptation is encouraged when distress arises due to incongruence between internal dissonance and external requirement. Healthy ego defense mechanisms according to Freud's structural theory resolve the conflict between id, ego and superego (Bhatia et al., 2013). The Gita illustrates on the victorious resolution of discord confronted by Arjuna which shows similarities with id, ego and superego concept .As described in the Gita, the senses (*indriyas*) construct attractions which in turn direct to desire, and a hunger for for possession. Anger displays itself in quest to nurture and conquer that desire.

As elaborated in the id functions, attributes like *kaam* (lust), *krodh* (unadaptive anger), *lobh* (greed), *moh* (insatiable attachment) and *ahankar* (unfounded self glorification) which are are *tamsic* in nature shows significant similarities (Bhatia,Madabushi, Kolli, Bhatia, & Madaan, 2013).. On one hand with

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

this, the Gita also has affirmed that mind is superior than senses which is in harmony with theories illustrating the relationship between ego and super ego (Bhatia et al., 2013). A stable mind is often times carried away by the stable mind. Several layers of consciousness and subconscious were illustrated in the Gita just like how it was illustrated in the Jung's idea of collective unconscious. *Tamas* also displays self-centeredness and deficiency in regard for consequences. This again shows evidential resemblance with the concept of id. On the other hand, *Rajas* and *Satwic* are in many ways analogous respectively to the ego and superego. Good thought, altruistic action and relationships are referred as *satwic* qualities. Doing an action with an expectation of reward similar to ego function refers to *Rajas* qualities Symptoms of anxiety according to the Gita are caused by conflicts among the Gunas As such, Gita advocated rising above the *Gunas* in attaining a stable and a peaceful mind .

Cognitive Behavioral Therapy

Arjuna associating guilt by visualizing the death of his relatives scene during the Kurushthra war was one of the earliest CBT documented sessions illustrated in The Gita (Bhatia,Madabushi, Kolli, Bhatia, & Madaan, 2013) . Dry mouth, tremors, dizziness and confusion were the symptoms of his anxiety (Bhatia et al., 2013). Arjuna was so distressed to the extent he wanted to withdraw from war by dropping his weapon. Arjuna was then inspired by Lord Krishna who described the laurels of a warrior and humiliation with regards to non-participation. However, this method was still inadequate. As such, Lord Krishna conveyed the Gita discourse. This was helpful for Arjuna in identifying his thought process and thus coaching him for an action. Arjuna was experiencing guilt and anxiety as a result of catastrophizing the future. With regards to this, Arjuna also demonstrated several other cognitive distortions. As a method of helping Arjuna, Lord Krishna elucidated the misery he is in transient. In harmony with that, Lord Krishna emphasized on the prominence of possessing an undistorted view of the world. This is pretty much similar to how a therapist would explain the temporary nature of anxiety following psychoeducating on how cognitive distortions affect the symptoms .

Mindfulness

A way of paying attention that is sensitive, accepting and independent of thoughts is known as "Mindfulness"(Bhatia,Madabushi, Kolli, Bhatia, & Madaan, 2013). This is a way to prevent one from being affected or attached (Bhatia et al., 2013). This principle is harmonious with the concept of Zen and Gita has several references with regards to this practice. Mindfulness in the Gita is prescribed as a way of attaining *Sthithapragna* (a state of unperturbedness) by being disconnected from the onslaught of the senses . "One should be tranquil like the ocean which is unaffected by rivers flowing into it","one should draw self away fromthe senses as a tortoise withdraws its limbs", "being similar to water drop on a lotus leaf which does not havean attachment to the leaf."are some metaphors from the Gita that will be useful in directing clients towards mindfulness . The mindfulness state can be reached using meditation. In the western concept of psychotherapy, mindfulness if often times a widely accepted concept. More models along with the proliferation of eclectic therapies are utilizing these techniques.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Notions on Mindfulness

Even as all waters flow into the ocean, but the ocean never overflows, even so the sage feels desires, but he is ever one in his infinite peace. (Mascaro, 1962, Chapter 2; Shloka 70)

Offer all thy works to god, throw off selfish bonds, and do thy work. No sin can then stain thee, even as waters do not stain the leaf of the lotus. (Mascaro, 1962, Chapter 5; Shloka 10)

When in recollection he withdraws all his senses from the attraction of pleasures of sense, even as a tortoise withdraws all its limbs, then his is serine wisdom. (Mascaro, 1962, Chapter 2; Shloka 58)

Grief Therapy

Death of our precious ones is definitely a throbbing phenomenon to accept and as such grief counseling has become an important part of therapy these days (Bhatia,Madabushi, Kolli, Bhatia, & Madaan, 2013). In Hindu Funerals, listening to a discourse on the Bhagavad Gita is seen as one cultural practice. Theory of reincarnation from the Bhagavad Gita is pertinent in helping people to move on with life. In the body, the Gita is referred as the carrier of the soul. Death and reincarnation is inevitable as illustrated in the Gita. This will be helpful in minimizing the intensity of grief.

In interpersonal therapy, re-establishing interests and relationships are seen as crucial process in resolving grief (Bhatia,Madabushi, Kolli, Bhatia, & Madaan, 2013). "the supreme being carries off all things" is a key concept in Gita (Bhatia et al., 2013). Visiting this concept can facilitate the alleviation of guilt with regards to the deceased by directing responsibility towards God However, therapist has to ensure that exploration of beliefs of client was done before using extracts from the Gita.

Shlokas Useful in Addressing Grief

"*Bereavement*"

Thy tears are for those beyond tears; and are thy words of wisdom? The wise grieve not for those who live; and they grieve not for those who die for life and death shall pass away. (Mascaro, 1962, Chapter 2; Shloka 11)

"*Imperishable nature of soul*"

Weapons cannot hurt the Spirit and fire can never burn him. Untouched is he by drenching waters; untouched is he by parching winds. (Mascaro, 1962, Chapter 2; Shloka 23)

"*Reincarnation*"

For all things born in truth must die, and out of death in truth comes life. Face to face with what must be, cease thou from sorrow. (Mascaro, 1962, Chapter 2; Shloka 27)

This article is only the tip of the ice-burg in applications of Hinduism in Therapy.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

Possible conflict may arise when counseling a client with Hindu values due to lack of congruence between values of a Hindu client as well as values of therapist primarily derived from western theories. As such if a therapist could enhance his or her cultural competence by understanding the worldviews of client, the therapeutic relationship between counselor and client could be further enhanced. However, it is very important for therapist to note that great diversity exists within the beliefs in Hinduism. Existence of the immortal soul, law of karma, reincarnation are some of the core concepts of Hinduism. The soul is believed to be immortal and as such death is seen as a natural event that would facilitate the process of atman attaining Moksha. Without proper enlightenment people will get trapped in the samsaric cycle (reincarnation). In addition to this, the concept of Shakti in Hinduism can be used to empower women in fighting against patriarchy. In Hinduism, women are acknowledged as the vessels of shakti with both creative and destructive power. Each forms of Shakthi are portrayed with different roles of a woman. Along this, it was also mentioned that expressing anger to god is a huge anger management method as it does not create bad karma for one unlike scolding or screaming to someone out of anger. Bhagavad Gita or better known as the Gita with approximately 700 verses from the Hindu scriptures is an important narrative in Hinduism. This chapter has also included some slokas which can be beneficial in therapy.

Chapter 29
Preemployment Psychological Screening of Police Officer Applicants:
Basic Considerations and Recent Advances

Cary L. Mitchell
Pepperdine University, USA

ABSTRACT

The psychological screening of law enforcement officer applicants represents a core practice area in police psychology. Significant advances have been made in recent years regarding the development of practice guidelines and standards. This chapter provides an overview of the essential components of this specialized form of high-stakes psychological assessment. Important legal principles are highlighted and key resources are identified. The core steps in a contemporary screening model are described and the psychological self-report measures most widely used in psychological screenings are profiled. Factors impacting the validity and usefulness of psychological test results are discussed. The critical need for preemployment psychological screenings of police officer candidates to be culturally sensitive is addressed, as are some of the criticisms that have been identified in the literature. The chapter stresses the need for preemployment assessments of police officer candidates to be evidence-based, ethically attuned, and consistent with recent advances in police psychology.

INTRODUCTION

The preemployment psychological evaluation of law enforcement officer applicants represents one of the earliest real-world applications of modern psychological assessment. For nearly one hundred years psychologists in the United States have utilized their competence in assessment to contribute to the selection of public safety officers. One of the first examples is that of Terman (1917), who early in the 20th century conducted preemployment psychological evaluations of police and fire department applicants to

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

explore whether this contributed to the effectiveness of selection. By 1939 the cities of Wilmington, DE and Toledo, OH were requiring preemployment mental and personality assessment of all law enforcement applicants (Gottesman, 1975). More recently a national survey of municipal police departments showed that over 90% required psychological assessment of all police officer recruits (Cochrane, Tett, & Vandecreek, 2003). Today, at least 38 states mandate that peace officer applicants be psychologically screened to determine whether they are free of mental or emotional conditions that might interfere with the safe and effective performance of peace officer duties (Corey & Borum, 2013). Moreover, nearly all police agencies serving communities of 25,000 or more in the U.S. require some form of preemployment psychological evaluation (Reaves, 2010), regardless of whether they are compelled to do so by their respective state laws. It has been estimated that 100,000 preemployment assessments of police officer applicants are conducted each year in the U.S., by up to 4,500 participating psychologists (Cuttler, 2011; Corey, Cuttler, & Moss, 2009). Clearly the preemployment screening of law enforcement applicants has emerged as a core practice area of police psychology (Ben-Porath et al., 2011). And, in contrast to the early years, psychologists practicing in this area now have the benefit of a great number of published resources including empirical research findings, recommendations for best practices, and professional guidelines.

The purpose of this chapter is to provide an overview of the psychological screening process for law enforcement applicants, with particular attention to recent advances in this distinctive professional practice area. Following some background considerations and identification of key resources, a number of relevant legal principles will be highlighted, including government mandated requirements and landmark cases. The nature of the preemployment psychological screening process for police officer applicants will be described, including consideration of how screenings contribute to but differ from competitive selection. The core features of a basic screening model will be reviewed, followed by consideration of psychological disqualification and appeals. Brief introductions to the major psychological instruments utilized in screenings will be provided, including recently developed and emerging measures. Two considerations that impact the use of psychological tests employed in screenings will be explored: socially desirable responding and range restriction. Recent developments in the identification of psychological qualification standards for peace officers will be considered. Finally, the need for psychological screenings to be culturally sensitive will be discussed, and some major concerns and critiques will be identified. Preemployment psychological screening is applicable to a range of law enforcement occupations including correctional officer and public safety dispatcher. However, the focus of this chapter will be on police officers.

BACKGROUND AND GUIDELINES

The history of preemployment screening of police officer applicants has been explored in depth elsewhere (e.g., Devan, 2003; Kitaeff, 2011; Spilberg & Corey, 2014; Weiss & Inwald, 2010). It is safe to say that while the practice of psychological screenings of law enforcement applicants may have started early in the 20th century, for decades there were few resources available to guide psychologists in this form of high-stakes assessment. In the second half of the 20th century, various federal entities issued reports that called for more attention to psychological factors in the recruitment of police officers. In 1967, the Presidential Commission on Law Enforcement and the Administration of Justice recommended psychological assessment of the emotional stability of all police officer candidates. In 1973, the National

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Advisory Commission on Criminal Justice Standards and Goals stated that all police agencies should engage psychologists or psychiatrists to conduct assessments of the psychological suitability of police applicants. Currently, police departments that seek national accreditation through the Commission on Accreditation for Law Enforcement Agencies (CALEA) must have formal preemployment psychological screening programs in place.

At the state level, there were likewise significant developments that provided direction and shaped practices in this important area of police psychology. California's Commission on Peace Officer Standards and Training (POST) published its first Psychological Screening Manual in 1984, for use by state and local law enforcement agencies (Hargrave & Berner, 1984). This document summarized relevant research, addressed critical issues such as adverse impact, and provided guidelines that were consistent with state and federal laws at that time. In 2014, California's POST published a greatly expanded Peace Officer Screening Manual (Spilberg & Corey, 2014). California's POST manual is a comprehensive and informative document that represents essential reading on the state of the art in preemployment psychological screening of peace officer applicants. The standards established by California's POST are more highly developed than in most states and are impacting screening practices in other jurisdictions (Tarescavage, Corey, Gupton, & Ben-Porath, 2015).

According to Borum, Super, and Rand (2003), the most widely used and influential guidelines were developed by the Police Psychological Services Section of the International Association of Chiefs of Police (IACP). First adopted in 1998, the Preemployment Psychological Evaluation Guidelines are updated every five years and are available at the IACP website (IACP, 2014). The IACP Guidelines reflect best practices and shape the implementation of psychological screening programs throughout the U.S. (Ben-Porath et al., 2011). These and other relevant resources help equip police psychologists for comprehensive, appropriate preemployment psychological screenings.

LEGAL CONSIDERATIONS

Numerous federal and state laws directly impact the performance of preemployment psychological screenings for law enforcement applicants. Practitioners must familiarize themselves with applicable laws to ensure the interests and rights of individuals, agencies, and communities are respected and protected. Psychologists engaged in this type of high stakes practice must also commit to staying informed throughout their careers about changes and new developments in the federal or state laws that impact screenings.

The relevant federal laws include the Civil Rights Act of 1991, which makes it unlawful to engage in employment discrimination due to disparate treatment or disparate impact (Spilberg & Corey, 2014). The concept of adverse impact is particularly relevant to psychological screenings because employment practices that result in any protected class having a selection rate that is less than four-fifths of the selection rate for the majority group is likely to be in violation of equal opportunity requirements. The Civil Rights Act also prohibits the use of differing cutoff scores on job-relevant tests based on applicants' race or gender (Borum, Super, & Rand, 2003; Padilla, 2001). Consequently, combined gender norms are utilized for psychological tests in preemployment psychological screenings for police applicants.

The Americans with Disabilities Act of 1990 (ADA) protects disabled persons from discrimination in the workplace and addresses issues such as reasonable accommodation. To be consistent with ADA, preemployment psychological screenings for law enforcement applicants must take place after conditional offers of hire, must be conducted by qualified professionals, must be required of all applicants

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

for the positions, must focus on the applicant's ability to perform essential job functions, and must be confidential (Spilberg & Corey, 2014). Because of public safety and officer safety concerns, there may be few degrees of freedom available in regard to reasonable accommodation for police officer positions. However, screening psychologists should be in dialogue with hiring agencies about such matters to ensure that the rights of all applicants are protected.

The Genetic Information Nondiscrimination Act of 2008 (GINA) is the federal law that prohibits discrimination in health coverage and employment based on genetic information. To be consistent with GINA, preemployment psychological screenings must not include information about family genetic or health status, including family history of mental disorders or substance use disorders. Consideration of GINA and its implications is yet another way in which preemployment screenings differ from traditional clinical evaluations and therefore call for specialized training.

State laws also greatly impact the practice of psychological screenings. For example, in California, Government Code 1031(f) stipulates that before they can be appointed, peace officer applicants must be found to be free of any physical, emotional, or mental condition that would interfere with carrying out the duties of a peace officer. California's Fair Employment and Housing Act (FEHA) also has employment-related provisions that directly impact how screenings must be conducted. Psychologists who conduct preemployment screenings of law enforcement applicants must familiarize themselves with all relevant laws and regulations in the jurisdictions where they practice.

States may also vary in the extent to which their laws and regulations emphasize screening out applicants who do not meet minimum psychological qualification standards vs. "selecting in" applicants who demonstrate positive, job-relevant psychological attributes. According to Corey and Borum (2013), 45% of the 38 states with some form of preemployment psychological suitability requirements for peace officer applicants have regulations or laws that emphasize screening out applicants with mental or emotional conditions that would interfere with the performance of peace officer duties. Thirteen states (34%) have laws or regulations that focus on suitability or fitness, and three states (8%) have laws that combine emphases on screening out and selecting in. In addition, there are three states (8%) with generally stated "pass" criteria and two states (5%) that simply defer screening decisions to an examining physician (Corey & Borum). Once again the need for screening psychologists to be well versed on all relevant laws and regulations in the states where they practice cannot be overstated.

IMPORTANT CASES

Case law has certainly been important in shaping the practice of preemployment psychological screenings of police officer applicants. For example, courts have ruled that public safety officer agencies do have the right to require psychological evaluations of applicants (*Conte v. Horcher*, 1977; *McCabe v. Hoberman*, 1969; *McKenna v. Fargo*, 1978; *Miller v. City of Springfield*, 1998). The case of *Bonsignore v. City of New York* (1982) addressed the "vicarious liability" of employers and showed that law enforcement agencies may be held liable for the actions of their employees who were not adequately screened or evaluated (Flanagan, 1995). The timing of a preemployment psychological screening has also been the focus of court rulings. For example, *Leonel v. American Airlines* (2005) showed that medical and disability-related exams, including preemployment psychological screenings, must only take place after a conditional offer of hire has been extended to an applicant.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Confidentiality issues and the right of applicants to have access to the results of preemployment psychological evaluations have been the focus of multiple cases, with varying outcomes. Some courts have ruled that the essential features of a "doctor-patient" relationship, including patient access to records, extend also to the relationship between a psychologist conducting a preemployment screening and the police officer applicant/examinee (e.g., *Cleghorn v. Hess*, 1993). On the other hand, some courts have denied examinees access to their preemployment psychological screening records (*Roulette v. Department of Central Management Services*, 1987; *Schroeder v. Detroit*, 1997). Even in jurisdictions where the courts have denied access to records to examinees who are police officer applicants, Borum, Super, and Rand cautioned, "…an individual applicant may still be granted access under civil service rules or medical records statutes (*Cremer v. Macomb*, 1994)" (2003, p. 248).

It is generally accepted that psychologists are exempted from providing feedback to examinees in preemployment psychological screenings, however this must be explained when psychologists obtain informed consent (Corey & Borum, 2013). The agency for which an evaluation was conducted would have to consent for feedback to be provided to an applicant, and such feedback would need to be restricted to findings that were relevant to an applicant's suitability for a specific position within a particular law enforcement department (Borum, Super, & Rand, 2003). In addition to having familiarity with relevant case law, psychologists need training and supervised experience in order to learn to manage these complex considerations.

POLICE OFFICER SCREENING VS. SELECTION

Selection refers to the competitive process of identifying well-qualified applicants for peace officer positions. Law enforcement agencies typically utilize a variety of standardized procedures and criteria to identify the most qualified candidates. These include educational requirements, written examinations, individual or panel interviews, physical ability tests, comprehensive background investigations, and polygraph or computer voice stress analysis (CVSA) exams (Cochrane et al., 2003; Gamez & Collins, 2012).

The psychological screening process is qualitatively different than selection. Most typically, its core purpose is to determine whether a candidate meets minimum psychological qualification standards for peace officer employment as mandated by the statutes and regulations in force in the jurisdiction where the evaluation takes place. Candidates are screened out when there is a finding of mental or emotional conditions, including psychological disorders, personality traits, or problematic attitudes, that could interfere with the safe and effective performance of peace officer duties (Spilberg & Corey, 2014). Psychological screenings inevitably cover sensitive and personal information that would never be deemed relevant or appropriate to explore in a competitive selection process. As noted earlier, ADA stipulates that medical exams, including all psychological exams that assess for the presence of mental or emotional impairment, shall not take place until after a conditional offer of hire. Consequently, psychological screenings must take place after a legitimate conditional offer of hire has been extended and when it has already been determined that a candidate meets a hiring agency's criteria for peace officer employment (Detrick, Chibnall, & Rosso, 2001). This expectation extends to both the written and oral components of psychological exams, whenever such exams are conducted to assess for the presence of psychopathology, including substance abuse or dependence.

In addition to ruling out applicants with psychological characteristics that would significantly interfere with successful job performance (Lowmaster & Morey, 2012), screenings contribute to peace officer

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

selection by helping ensure that individuals who are well adjusted and possess good coping skills are hired (Beutler, Nussbaum, & Meredith, 1988; Scogin, Schumacher, Gardner, & Chaplin, 1995). There is nothing to prevent a hiring agency from establishing psychological suitability criteria that go beyond a minimum level (Spilberg & Corey, 2014; IACP, 2014), particularly when justified for particular job classifications. In such cases, hiring agencies should work closely with screening psychologists to ensure that such additional criteria are job-relevant, well defined, and measurable at the preemployment screening level.

There is also nothing to prevent hiring agencies from assessing normal personality traits and characteristics early in the peace officer selection process, before a job offer has been extended. This is often referred to as the bifurcated model (Corey & Borum, 2013) and some have advocated for the advantages of this two-stage approach (e.g., Hitchcock, Weiss, Weiss, Rostow, & Davis, 2010). In the bifurcated model, normal-range psychological dimensions are assessed pre-offer and this information is used to help select individuals with desirable characteristics for peace officer employment (Spilberg & Corey, 2014). At the post-offer stage, the psychological screening takes place, and candidates not meeting minimum criteria for psychological suitability are disqualified. An important limitation of the bifurcated model is that pre-offer psychological evaluations must never stray into the assessment of psychopathology or impairment, including exploration of substance abuse. In other words, the pre-offer assessment cannot take on the character of a medical exam as defined by ADA.

BASIC SCREENING MODEL

The basic elements of the preemployment psychological screening process have been well described in a number of sources (e.g., Ben-Porath et al., 2011; Borum, Super, & Rand, 2003; Corey & Borum, 2013; Cuttler, 2011; IACP, 2014; Spilberg & Corey, 2014). Many of the core elements, principles, and considerations are summarized below.

1. Preemployment psychological screenings of police officer applicants are specialized assessments that take place after a conditional offer of hire.
2. The hiring agency is the evaluating psychologist's client, not the police officer applicant. However, the psychologist does have ethical obligations and professional role-related responsibilities that extend to the applicant (Corey & Borum, 2013).
3. Informed consent should be obtained from the applicant to ensure he or she understands the key features and limitations of this specialized evaluation.
4. At least two psychological tests that have been validated for preemployment screening of police officer applicants are typically used: one of normal personality and one that measures psychopathology and/or impairment.
5. A face-to-face interview with a qualified psychologist is an essential component of the preemployment screening. Psychologists must have specialized training to conduct preemployment psychological screenings; they also need in-depth understanding of the job functions performed in the law enforcement positions for which they are conducting screenings. Knowledge of law enforcement agency culture is also critically important, as is in-depth understanding of the training processes for new hires (e.g., police academy, field training program, length and scope of probationary supervision, etc.).

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

6. Prior to the screening interview, the psychologist should review the written psychological test results, any psychological history questionnaires that have been used, the results of the background investigation (if available), the results of the polygraph or CVSA (if available), and psychological/psychiatric treatment and evaluation records for applicants who report prior histories of mental health treatment and/or psychiatric disability. Records pertaining to any history of job stress leaves should also be obtained and reviewed prior to the interview.
7. The psychological interview should systematically review all the relevant domains of history, behavior, and functioning, with particular emphasis upon job-relevant issues and concerns. The interview is an opportunity to contextualize and confirm the results of the psychological testing, as well as to follow up on important themes from the background investigation and other sources of information. The interview allows the examiner to address inconsistencies in the applicant's records or statements; it provides an opportunity to explore the applicant's motivation for and understanding of the nature of the peace officer position; and it allows the examiner to learn more about the applicant's psychological suitability, including strengths and coping resources.
8. Depending upon the jurisdiction and applicable laws and regulations, the examining psychologist renders a decision or recommendation regarding whether the applicant meets minimum psychological qualification standards for suitability. The recommendation or decision is based upon an integration of all the relevant evidence and information, including careful consideration of the essential job functions, the needs of the hiring agency, and all applicable laws and regulations. The outcome of the evaluation is communicated to the hiring agency in a written report that summarizes the essential and relevant findings, including any limitations or constraints regarding the decision or recommendation.
9. The hiring agency provides follow-up information to the examining psychologist about the job performance and job-relevant outcomes of candidates who were hired. Such feedback permits the examining psychologist to continually improve and refine the psychological screening process over time and better meet the needs of all the parties involved, including the hiring agency, the applicants, and the community. Follow-up also allows the hiring agency and psychologist to examine whether hiring decisions have any adverse impact upon particular classes of applicants (IACP, 2014).
10. The examining psychologist engages in ongoing educational and professional development activities, including consultation with colleagues, to ensure high levels of competence at preemployment psychological screening of police officer applicants.

While the core elements described above are generally applicable, actual practices may vary across states and jurisdictions. Ongoing communication and consultation with the hiring agency is critically important and allows the psychologist to refine, adapt, and improve the screening process. Hiring agencies may vary in their risk tolerance and in their capacity to support the development of police officer recruits. Dialogue with the hiring agency will help the psychologist better understand and respond to such parameters.

PSYCHOLOGICAL DISQUALIFICATION

Given that psychological screenings occur after a candidate has successfully cleared a background investigation and other aspects of a competitive selection process, it is not surprising that psychologi-

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

cal disqualification rates tend to be relatively low. A general principle is that the more thorough and comprehensive the background investigation, the lower the psychological disqualification rate (Spilberg & Corey, 2014). Psychological disqualification rates are rarely reported or discussed in the peer review literature on psychological screenings. In a review by Cochrane et al. (2003), psychological disqualification rates that ranged from 5% to 15% are reported. Considering the recent literature, psychological disqualification rates of 24% (Tarescavage et al., 2015d), 12% (Detrick & Chibnall, 2014), and 8% (Lowmaster & Morey, 2012) are among those that have been reported. Disqualification rates will likely vary across job classifications, departments, jurisdictions, and examining psychologists. The amount of feedback a disqualified applicant receives is also likely to vary a great deal and to reflect the policies and regulations observed by the hiring agency.

APPEALS AND SECOND OPINIONS

In the interest of fundamental fairness, comprehensive psychological screening programs should include some reasonable type of appeal process for those applicants who are disqualified (Hargrave & Kohls, 1984; Serafino, 2010). Many jurisdictions permit second opinion evaluations when an applicant disagrees with a psychological disqualification. In most cases, the applicant must locate a psychologist for the second opinion and pay for it with his or her own funds (Khadivi, 2010). The quality of second opinion evaluations is therefore understandably variable. The IACP guidelines (2014) stipulate that second opinion evaluations should be based on the same criteria used in the initial psychological evaluations. However, the psychological tests used in a second opinion screening sometimes differ from those used in the initial evaluation (Ben-Porath et al., 2011; Corey & Borum, 2013).

Arcaya (2011) addresses the complexities of psychological disqualifications in preemployment screenings. He asserts that in order to manage risk, some police psychologists may be inclined to err in the conservative direction and may recommend against some applicants who should be cleared. Arcaya calls for more probing of applicants' positive accomplishments to ensure that examining psychologists have the whole picture. Khadivi (2010) recommends obtaining consent from applicants to pursue collateral information during second opinion evaluations. He reasons that interviews of an applicant's employers, coaches, and/or teachers may shed important light on the screening dimensions of concern. However, he does not articulate how such collateral information would be superior to the collateral interviews conducted by the background investigator. Moreover the costs incurred by applicants for expansive second opinion evaluations need to be considered. Regardless, the point is well taken that second opinion evaluations should be carefully planned and executed to generate appropriate, evidence-based recommendations and to ensure the rights of all involved. Preemployment psychological screening should not be viewed as a panacea or a guarantee that peace officers will not develop any psychological problems over a long term of employment (Hargrave & Berner, 1984).

PSYCHOLOGICAL INSTRUMENTS

The IACP Preemployment Psychological Evaluation Guidelines (2014) call for the use of a written psychological test battery in preemployment screenings, with particular emphasis on objective, job-relevant psychological measures. The tests used to help make screening decisions need demonstrated reliability

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

and validity, and there should be empirical evidence supporting their use in the preemployment screening of law enforcement applicants. As noted earlier, a standard or basic model that has wide applicability is the use of one self-report inventory of psychopathology and one of normal personality traits. According to Serafino (2010), most preemployment screenings feature this approach and this model is likely to be useful across jurisdictions, regardless of varying legal criteria. Semi-structured interviews, conducted by qualified psychologists, are typically an essential component of the preemployment psychological screening process and must take place after the written psychological tests have been administered and scored (Ben-Porath et al., 2011). Administration of a comprehensive psychological history questionnaire is also standard practice and usually takes place at the same time of the post-offer written psychological testing. Preemployment psychological screening decisions represent a complex, high-stakes assessment task that should be evidence-based. Screening decisions are not typically made on the basis of a single data source (Spilberg & Corey, 2014), but rather reflect the thoughtful integration of multiple data sources.

Desirable characteristics for written measures to be considered appropriate for use in preemployment screenings of police officers include that adequate levels of reliability and validity have been demonstrated; that the measure has been validated specifically for use in preemployment screenings of public safety officer applicants; that the measure includes one or more scales or indices of test-taking attitude; that combined gender norms are available; and that police officer applicant norms have been published or are readily available from the test publisher (Detrick & Chibnall, 2013; Spilberg & Corey, 2014). The psychological measures that are most widely used in preemployment screenings of police officer applicants are introduced and summarized below.

Minnesota Multiphasic Personality Inventory-2

The Minnesota Multiphasic Personality Inventory-2 (MMPI-2; Butcher, Dahlstrom, Graham, Tellegen, & Kaemmer, 1989) is among the most commonly used psychological measures in preemployment screenings of law enforcement applicants (Jacobs, Cushenberry, & Grabarek, 2011). It has been referred to as one of the "workhorses of police psychology" (Rostow & Davis, 2004) and is widely utilized not only in preemployment screenings but also in fitness for duty evaluations of incumbent officers. The MMPI-2 has 567 items and a True/False response format. It is designed primarily to measure mental, emotional, and behavioral problems and therefore represents a medical test for the purposes of preemployment psychological screenings of police officer applicants (P. Weiss & Weiss, 2010). According to Graham (2012), the MMPI-2 has demonstrated its usefulness and validity for the preemployment screening of public safety officer applicants. The test includes an array of validity and clinical scales that have often been examined for their relevance to preemployment screenings of law enforcement applicants and to various aspects of job performance in law enforcement (e.g., Aamodt, 2004; Bartol, 1991; Detrick et al., 2001; Hiatt & Hargrave, 1988; Laguna, Agliotta, & Mannon, 2015; Sellbom, Fischler, & Ben-Porath, 2007; Weiss, Vivian, Weiss, Davis, & Rostow, 2013).

MMPI-2-Restructured Form

The MMPI-2-Restructured Form (MMPI-2-RF; Ben-Porath & Tellegen, 2008) is a recently developed measure based on 338 items drawn from its parent inventory, the MMPI-2. The test items are reorganized into validity and clinical scales that reflect contemporary models of scale construction and psychopathology (Ben-Porath & Archer, 2014). As described in depth in another chapter in the present volume,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

a growing body of empirical literature supports the validity and usefulness of the MMPI-2-RF in the preemployment psychological screening of police officer applicants (e.g., Detrick & Chibnall, 2014; Tarescavage, Brewster, Corey, & Ben-Porath, 2015; Tarescavage, Corey, & Ben-Porath, 2015; Tarescavage et al., 2015c; Tarescavage et al., 2015d). Research has demonstrated the equivalence of MMPI-2-RF profiles whether scored from the MMPI-2 item booklet or from the stand-alone administration of the 338 MMPI-2-RF items (Tarescavage et al., 2015b). Like the MMPI-2, the MMPI-2-RF is considered primarily a measure of psychopathology and therefore is appropriate for post-offer screenings.

Personality Assessment Inventory

The Personality Assessment Inventory (PAI; Morey, 1991) is a 344-item self-report measure of psychopathology that employs a four-point response scale (Totally False, Slightly True, Mainly True, and Very True). The PAI items are organized into 22 non-overlapping validity, clinical, treatment consideration, and interpersonal scales (Morey, 2014). Research, though limited, has supported the usefulness and validity of the PAI in the preemployment screening of law enforcement applicants (e.g., Lowmaster & Morey, 2012; Weiss, Hitchcock, Weiss, Rostow, & Davis, 2008; W. Weiss & Weiss, 2010).

Inwald Personality Inventory/Inwald Personality Inventory-2

The Inwald Personality Inventory (IPI; Inwald, 1982) is a 310-item self-report measure of psychopathology, problematic behaviors, and personality characteristics that was developed specifically for application to law enforcement and other high-risk occupations (Inwald, 2010). The IPI features a True/False response format; it includes one validity and 25 clinical scales. Multiple research studies have supported the test's usefulness for the screening of law enforcement applicants (e.g., Chibnall & Detrick, 2003; Cortina, Doherty, Schmitt, Kaufman, & Smith, 1992; Detrick & Chibnall, 2002; Inwald, 2010; Mufson & Mufson, 1998; Ones, Viswesvaran, & Schmidt, 1993; Scogin et al., 1995). The Inwald Personality Inventory-2 (IPI-2) is a briefer version of the test that includes 202 items drawn from the original IPI item pool (Institute for Personality and Ability Testing, 2011). Outdated items were removed and the 202 IPI-2 items have been reorganized into 16 discrete, non-overlapping content scales and one validity scale.

Matrix-Predictive Uniform Law Enforcement Selection Evaluation Inventory

The Matrix-Predictive Uniform Law Enforcement Selection Evaluation Inventory (M-PULSE; Davis & Rostow, 2008) is a 455-item self-report measure that was developed specifically for the assessment of law enforcement candidates. The inventory utilizes a four-point response scale (Strongly Agree, Agree, Disagree, and Strongly Disagree) and is organized into two validity scales; 18 liability scales that identify risk for officer misconduct; 16 empirical scales and subscales that measure attitudes, values, and beliefs considered to be relevant to work in law enforcement; and 10 "California POST Scales" that are considered relevant to job success in law enforcement. The M-PULSE is intended to identify risk for job problems among law enforcement applicants. According to Davis and Rostow, "The M-PULSE Inventory was specifically designed to have utility at both the pre-offer and post-conditional offer phases of the hiring or selection process" (2010, p. 145). However, the inclusion of scales that assess for risk related to chemical abuse/dependency and substance abuse raise some questions about whether M-PULSE could be construed as a medical exam (Spilberg & Corey, 2014). Though the M-PULSE has not often

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

been the focus of peer reviewed publications, it was normed on a substantial number of law enforcement applicants, it has been favorably reviewed (e.g., Blackbourn, Thomas, & Fillingim, 2010; Dean, 2010), and it has generated multiple doctoral dissertations and conference presentations.

California Psychological Inventory

The California Psychological Inventory (CPI; Gough, 1975) is a 434-item self-report measure of normal personality traits and characteristics. The CPI utilizes a True/False response format and is organized into 20 individual scales, three vector or personality dimension scales developed from factor analysis, and validity scales (Groth-Marnat, 2009). The CPI is regarded as one of the most respected of the personality inventories and has a long history of application to police psychology (Kitaeff, 2011). Multiple empirical studies have supported its validity and usefulness in law enforcement applications (e.g., Hargrave & Hiatt, 1989; Hogan & Kurtines, 1975; Mills & Bohannon, 1980).

Sixteen Personality Factor Questionnaire

The 16 Personality Factor Questionnaire, Fifth Edition (16-PF; Russell & Karol, 1994) is a 187-item self-report measure of normal personality. The test utilizes a response format with three options: True, False, and Indeterminate (?). Like the CPI the 16-PF has a long history of application in law enforcement settings (Kitaeff, 2011). The inventory has three validity indices, 16 factor scales, and five global factor scales. The 16-PF's usefulness in preemployment psychological screening of peace officer applicants has been addressed in multiple studies and publications (e.g., Aamodt, 2004; Drew, Carless, & Thompson, 2008; Fabricatore, Azen, Schoentgen, & Snibbe, 1978; Lorr & Strack, 1994).

NEO Personality Inventory, Revised

The NEO Personality Inventory, Revised (NEO PI-R; Costa & McCrae, 1992) is a 240-item self-report measure of normal personality traits. It utilizes a five-point response scale (Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree). The NEO PI-R is often described as a comprehensive measure of the Five Factor Model of personality (Costa & McCrae, 2014). The inventory includes five primary factor scales, plus six facet scales for each factor, resulting in a total of 35 personality scales or subscales. Its usefulness in preemployment psychological screenings is explored in depth in another chapter of the present volume. Given that validity scales have been developed from the item pool (Schinka, Kinder, & Kremer, 1997) and that police officer norms have been published (Detrick & Chibnall, 2013), the NEO PI-R would appear poised for greater use in preemployment screenings of police officer applicants in the future. Early research findings have supported its validity and usefulness for law enforcement applications (e.g., Black, 2000; Chibnall & Detrick, 2003; Detrick, Chibnall, & Luebbert 2004; Miller, Mire, & Kim, 2009; Detrick, Chibnall, & Call, 2010; Salters-Pedneault, Ruef, & Orr, 2010).

Factors Impacting Test Results: Socially Desirable Responding

Socially desirable responding refers to selecting test responses in order to create a more favorable impression for the examiner or others. This response tendency may reflect deliberate impression management (IM), or it may derive from an internalized, dispositional, and perhaps self-deceptive (SD) tendency to

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

view the self in highly favorable terms (Bagby & Marshall, 2004; Paulus, 1991; Vispoel & Kim, 2014). The context of preemployment psychological screenings has a profound impact upon how individuals approach both the written psychological tests and the face-to-face psychological interview. Given the high-stakes nature of such evaluations, it is to be expected that most applicants will engage in some degree of socially desirable responding, positive impression management, and/or underreporting of psychological problems (Detrick & Chibnall, 2014; Greene, 2011; Weiss, Weiss, Cain, & Manley, 2009). For example, research has shown that peace officer applicants often show average elevations of one standard deviation or more above the mean on MMPI-2 validity scales that measure defensiveness and socially desirable responding such as L and K (Detrick et al., 2001). In fact, the absence of socially desirable responding is unusual in preemployment screenings and might conceivably be cause for some concern (Ben-Porath et al., 2011). Nevertheless, underreporting of psychological problems has been identified as the most salient threat to the validity of psychological test results in preemployment screenings (Tarescavage et al., 2015b). Psychologists who conduct preemployment screenings of police officer applicants must therefore become adept at managing the challenges associated with socially desirable responding.

As has been described earlier in this chapter, applicants who reach the preemployment psychological screening stage have survived what is often a complex, rigorous selection process. Individuals who might have produced elevated scores on scales of psychopathology are less likely to have cleared the hurdles encountered in a hiring agency's selection process. Not surprisingly, the applicants who receive conditional offers of hire rarely show elevations on scales of psychopathology and have often been described as better adjusted than the general population (Hitchcock, Weiss, Weiss, Rostow, & Davis, 2010; Spilberg & Corey, 2014). In addition to whatever defensiveness they are inclined to show on the preemployment psychological testing, their positive adjustment itself may elevate their scores on scales of socially desirable responding (Tarescavage et al., 2015a). More research is needed on how to differentiate positive impression management from the realistic strengths or virtues that applicants possess.

An area that has received considerable attention in the general clinical psychology literature is the impact of coaching and tutorial information upon test takers' attempts to underreport psychological problems on self-report inventories (e.g., Hartmann & Hartmann, 2014). The police psychology literature would likely benefit from more attention to this concern.

Despite the challenges presented by socially desirable responding, the screening psychologist must conduct a thorough interview and psychological evaluation of each applicant. When high levels of socially desirable responding are evident in the written psychological test results, the evaluator must rely more heavily on extra-test sources to determine whether significant, job-relevant psychopathology is present and whether minimum psychological qualification standards have in fact been met.

Range Restriction

It has frequently been noted that because police officer applicants seen in preemployment screenings are often psychologically healthy, their mean scores on measures of psychopathology tend to be low and restricted in range (Chibnall & Detrick, 2003; Lowmaster & Morey, 2012; Sellbom et al., 2007). Studies have also indicated that police officer applicants are often more defensive than the general population, which adds to range restriction of their test scores (Tarescavage et al., 2015c). Despite these realities, significant associations between applicants' test scores and their job performance as police officers are often obtained and reported in the literature (Lowmaster & Morey, 2012). However, range restriction

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

may obscure or limit the usefulness of self-report measures of personality and psychopathology that are utilized in screenings.

An important development in recent years has been the application of statistical corrections to address the problem of range restriction. This advancement has permitted researchers to better understand the validity of measures used in preemployment psychological screenings, including the MMPI-2, MMPI-2-RF, and PAI (Sellbom et al., 2007; Lowmaster & Morey, 2012; Tarescavage et al., 2015c). A parallel development has been the determination of relative risk ratios associated with psychological test scores obtained by applicants. This has enhanced the practical usefulness of psychological testing by indicating the increased risk of job problems associated with subclinical variations in test scores. For example, Sellbom et al. (2007) found that *T* scores as low as 55 on some MMPI-2 Clinical and Restructured Clinical scales were associated with elevated risk for job problems among police officer applicants. While *T* scores of 55 are one standard deviation below the usual cutoff for clinical significance on the MMPI-2, scores at this level (T=55) are quite rare among police officer applicants on many clinical scales. Psychologists who conduct preemployment screenings can make better use of psychological test results by understanding the empirical findings that are emerging from this line of recent research.

PSYCHOLOGICAL SCREENING DIMENSIONS

Psychologists conducting preemployment screenings must have a thorough understanding of the specific nature of the job classifications sought by law enforcement applicants. A clear sense of the psychological qualities or attributes associated with the successful performance of peace officer duties is also essential. According to Detrick and Chibnall (2013), the most sophisticated and ambitious effort yet to operationally define those psychological qualities was produced by the California Commission on Peace Officer Standards and Training (POST). Spilberg and Corey (2014) describe in careful detail the results of a comprehensive job analysis for the position of police officer that was undertaken by POST. That landmark effort yielded ten psychological screening dimensions and included identification of both productive and counterproductive behaviors associated with each dimension. POST's ten psychological screening dimensions are: Social Competence; Teamwork; Adaptability/Flexibility; Conscientiousness/Dependability; Impulse Control/Attention to Safety; Integrity/Ethics; Emotional Regulation/Stress Tolerance; Decision-Making/Judgment; Assertiveness/Persuasiveness; and Avoiding Substance Abuse and Other Risk-Taking Behaviors. The POST psychological screening dimensions represent an important advance in identifying evidence-based criteria to be considered in preemployment psychological screenings of peace officer applicants.

CULTURALLY SENSITIVE ASSESSMENT

A core requirement for the competent practice of preemployment psychological evaluation of law enforcement applicants is awareness of how cultural and linguistic factors may impact the psychological tests used in such assessments (Ben-Porath et al., 2011). For an evaluation process to have multicultural assessment validity, psychologists must take into account examinees' cultural and idiographic experiences, including factors related to cultural identity, acculturation, socioeconomic status, education, language, and other individual difference variables (Ridley, Tracy, Pruitt-Stephens, Wimsatt, & Beard,

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

2008). Psychologists conducting legal and employment-related evaluations must be attuned to cultural factors and must ensure that all findings and recommendations are culturally informed in ways that are consistent with sound practice (Johnson, 2011). Moreover, psychologists conducting preemployment psychological screenings need to attend to the ethical guidelines of the American Psychological Association (2010), particularly in regard to Principle D, Justice; Principle E, Respect for People's Rights and Dignity; and Section 9, Assessment.

In a classic paper on cultural factors in psychological assessment, Jones and Thorne (1987) stressed the potential of the clinical interview as an opportunity to clarify the meaning and validity of test results in intercultural assessment contexts. The face-to-face interview conducted as part of a preemployment psychological screening represents an ideal example of such an opportunity. Consider the hypothetical case described below.

Mr. R, a 29-year-old single male for whom English was a second language, was seen for a preemployment psychological screening after receiving a conditional offer of hire for a sworn peace officer position. At the item level, the MMPI-2 findings suggested the possible presence of unusual perceptual or sensory experiences of a kind rarely reported among nonclinical samples. At the scale level, all the relevant clinical and validity scales were essentially consistent with law enforcement norms. During the interview, the screening psychologist asked the applicant to comment on whether he had ever had any unusual perceptual experiences. The applicant described having seen what he considered to be "the face of God" on one occasion after having worked a long day in a security-related job. Follow-up questioning determined that this was an isolated incident that appeared unrelated to any factors such as substance use, medications, or mental or medical disorders. The experience did not cause undue distress nor was it associated with any impairment or disturbance in the applicant's daily functioning, including his relationships and the carrying out of his varied responsibilities. The applicant coped with the experience by discussing it with a trusted mentor and he came to view it as a positive incident that was generally consistent with spiritual experiences and practices within his faith community. He added that he drew some reassurance from the experience, particularly as he was going through the demanding peace officer application and qualification process in his state. In the absence of any other job-relevant concerns, and given the applicant's excellent track record at work, at the community college he formerly attended, in his social relationships, and in regard to his substance use history, psychological history, legal history, finances, and driving record, the psychologist found the applicant to meet minimum psychological qualification standards. Follow up showed that the applicant performed satisfactorily in his law enforcement academy, and he likewise met or exceeded standards in all phases of his post-academy field training.

The generalizability of the above vignette is unknown. However, the vignette helps demonstrate the importance of the interview. In this example, the semi-structured face-to-face interview allowed the psychologist to place the psychological test findings in context and integrate all of the relevant data while making an appropriate recommendation.

In addition to the power imbalance between examiner and applicant in preemployment screenings, there may be significant differences in socioeconomic status (SES) and related variables. Smith (2005) has written thoughtfully of the subtle and overt ways that classist attitudes of psychologists can undermine their efforts to provide psychological services to consumers who vary in SES. Screening psychologists potentially face similar challenges. Serafino (2010) provides a number of practical recommendations about how to respectfully and honestly engage with applicants. Respectful, professional, and constructive engagement with applicants is certainly consistent with the ethical principles that should guide all professional practice in psychology.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

It has been noted that becoming culturally competent in psychological practice is a complex aspiration that involves self-awareness, cultural knowledge, specific skills, and key virtues such as courage, openness to other perspectives, and commitment to social justice (Fowers & Davidov, 2006). While addressing cultural factors in personality assessment Cheung observed, "…the discipline can no longer ignore the cultural contexts of our knowledge base" (2009, p. 54). Certainly more attention to cultural competence is needed in the police psychology literature, including the literature on preemployment psychological screening of police officer applicants.

CONCERNS

Khadivi (2010) posited that a major challenge in conducting preemployment screenings is that the criteria for psychological disqualification are unclear. Arcaya (2011) suggested that attribution error might lead screening psychologists to regard applicants' past instances of poor judgment as examples of stable personality characteristics rather than as problems that were transcended. Such critiques speak to concerns about the fairness and validity of decisions made by screening psychologists. Dantzker (2011) is among those who have called for greater consistency across psychologists and hiring departments in regard to how preemployment screenings are conducted. Dantzker recommends greater uniformity of practice, including one standard battery of psychological tests for screenings. However, the rationale for restricting screening psychologists and hiring agencies to a uniform battery of psychological tests when multiple psychological measures have been empirically validated for preemployment screenings is unclear. In a reply to Dantzker, Detrick (2012) noted that the IACP has generated useful, comprehensive guidelines and California's POST has produced job-relevant criteria of unprecedented scope with its ten psychological screening dimensions. Detrick also advocates for an evidence-based approach when it comes to the issue of which psychological tests to use.

Police psychology is a relatively new specialty area. Its growth and development should continue and will certainly be enhanced by well-conceived research and by the vision and commitment of the involved professional organizations and stakeholders.

CONCLUSION

Preemployment psychological screening of police officer applicants represents a core element of police psychology. This chapter provides an overview and addresses the need for preemployment psychological screenings to be characterized by sound practices that are empirically supported, ethically attuned, culturally informed, and endorsed by leading professional groups and stakeholders. Psychologists conducting preemployment screenings according to the rigorous standards that have emerged in recent years have the opportunity to make positive and substantive contributions to the communities where they practice and to the discipline of police psychology.

ABSTRACT

Rehabilitation is an area of focus by experts and researchers from different disciplines owing to the increase in number of various types of disabilities. This chapter covers information relating to causes and need for rehabilitation devices for differently abled people with motor, vision, or hearing impairment. The chapter begins with a brief on the disability population worldwide and in India, and progresses towards presenting available devices in global market and possible improvement that can be made to improve the functionality of the device and in turn improve the quality of life (QoL) of the users. Towards the end of the chapter, a reader can acquire the fundamental knowledge about the different types of disability, suitable aids, and working.

REHABILITATION ENGINEERING

Disability Data

Many people in the world live with some form of disability. It may either be a temporary or permanent impairment leading to difficulties in quality of living. According to the World Health Organization (WHO), the estimated figure of people with disability increased from 10% as reported from 1970s to 15% of the world's population as reviewed in 2011 factsheet of disability and health (Table 1). As estimated by World Health Survey and Global Burden of Disease that 110-190 million people globally suffer from serious form of disabilities with significant difficulties in functioning (Table 2). The growth in the number of people with disabilities is due to varied reasons such as increase in the number of ageing population, chronic diseases, health conditions, environment and other factors.

According to the Census of India 2011, "Data on Disability", information on eight types of disability namely sight, hearing, speech, motor, mental retardation, mental illness, any other and multiple disability was collected (Table 3). The report showed that the percentages of disabled population were more in rural areas as compared to urban areas and more in males in comparison to females. Also, the percentages of disabled population in each division showed a significant increase in 2011 figures as compared to 2001 records (Table 1).

Table 1. Percentage of disabled population to total population, India

Residence		Persons (In Millions)	Males (In Millions)	Females (In Millions)
Total	2011	2.21	2.41	2.01
	2001	2.13	2.37	1.87
Rural	2011	2.24	2.43	2.03
	2001	2.21	2.47	1.93
Urban	2011	2.17	2.34	1.98
	2001	1.93	2.12	1.71

Rehabilitation Engineering and Its Goal

Any form of disability cannot be fully restored but measures and efforts can be put in to improve the conditions. Rehabilitation engineering and assistive device/technology are terms which are often used interchangeably. However, there is difference between the two. In 1982, James Reswick, a pioneer in the field of rehabilitation engineering defined it as "the application of science and technology to ameliorate the handicaps of individuals with disabilities" while, assistive technology is product of rehabilitation engineering (Bronzino, 2014). For a better understanding, let us take an example of a person with one side of the leg amputee below the knee is using a prosthetic leg to aid him in locomotion. The process involved from designing to developing the prosthetic leg is known as rehabilitation engineering and the product obtained i.e., the prosthetic leg is known as an assistive device.

The area of rehabilitation is quite vast and extensive (John, 2006). It can range from correction in any deformity to replacing a whole part of the body with an aim to improve the quality of life of an individual from the current deprived condition. Major practices of rehabilitation and the assistive devices involved will be discussed in the following sections of this chapter.

When a person has some or the other forms of disability, one or more of the following functions are deprived:

1. A person may not be able to perform activities of daily living (ADL) independently and all such activities require support and assistance of another individual or caretaker. This may not only be embarrassing but at times bring about depression or disturb the mental balance of the patient.
2. Some form of disability may compensate a person with his ability to move around. They may require a minimal assistance of a walking stick or a walker for mobility or using a wheelchair in severe cases.

Table 2. Percentage of disabled population by type of disability, India: 2011

Type of Disability	Persons (In Millions)	Males (In Millions)	Females (In Millions)
Sight	18.8	17.6	20.2
Hearing	18.9	17.9	20.2
Speech	7.5	7.5	7.4
Motor/Movement	20.3	22.5	17.5
Mental retardation	5.6	5.8	5.4
Mental illness	2.7	2.8	2.6
Any other	18.4	18.2	18.6
Multiple disorder	7.9	7.8	8.1
Total	**100**	**100**	**100**

Table 3. Definitional changes from 2001-11

Type of Disability	Definition
Sight	• In 2001, one eyed persons were treated as disabled. • In 2011, one eyed persons have not been treated as disabled in seeing. Enumerators were asked to apply a simple test to ascertain blurred vision.
Hearing	• In 2001, persons having problem in hearing through one ear although the other ear is functioning normally was considered having hearing disability. Persons using hearing aid have not been treated as disabled. • In 2011, persons using hearing aid have been treated as disabled while persons with hearing problem only on one ear were not considered as having hearing disability.
Speech	Definition was made clearer in Census 2011 to record persons with speech disability. For instance, "persons who speak in single words and are not able to speak in sentences" was specifically mentioned to be treated as disabled.
Motor/Movement	Specific mention of the following was made in the definition for Census 2011: 1. Paralytic persons 2. Those who crawl 3. Those who are able to walk with the help of aid 4. Have acute and permanent problems of joints/muscles 5. Have stiffness or tightness in movement or have loose, involuntary movements or tremors of the body or have fragile bones 6. Have difficulty balancing and coordinating body movement 7. Have loss of sensation in body due to paralysis, Leprosy etc. 8. Have deformity of body like hunch back or are dwarf.
Mental Retardation	• In 2001, Mental Retardation was covered under the category of mental disability. • In 2011, It was introduced as a new category.
Mental Illness	• In 2001, Mental Illness was covered under the category of mental disability. • In 2011, It was introduced as a new category.
Any other	New category introduced at Census 2011 to ensure complete coverage. This option enabled respondents to report those disabilities which are not listed in the question. In such cases, where informant was not sure about the type of disability this option of reporting disability as 'Any Other' was available to her/him.
Multiple Disability	New category introduced at Census 2011. The question has been designed to record as many as three types of disabilities from which the individual was reported to be suffering.

*Courtesy for Table 1, Table 2 and Table 3: "C-Series, Table C-20, Census of India 2011, Data on Disability", Office of the Registrar General and Census Commissioner, India. Website: http://censusindia.gov.in, accessed on 4th October 2016

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

3. In some conditions, a person might be able to perform activities of daily living but are not functionally independent i.e., they may not be able to cook, clean, etc.
4. Disability may at times result in a person being less socially interactive or totally avoiding social participation. This may lead to social exclusion, stress and loneliness.
5. Goal setting is an important aspect in rehabilitation management, as it will help channel the plan and expedite the process of rehabilitation. In any rehabilitation process, a bi-directional goal is required for effective rehabilitation, one from the giver's end and the other from the receiver's end. With a SMART goal working in a two-way process, rehabilitation will be a sure success. Goals in rehabilitation engineering require plan and interventions to address as solutions for the above discussed functionalities.

MODERN DAY PROSTHETICS AND ORTHOTICS DEVICES

Definition of Prosthetic and Orthotic

Prosthetics and orthotics are two frequently used terms in rehabilitation. Prosthetic refers to "replacement" of a missing body part while orthotics refers to "correction" of some deformity, While prosthetics aims at replacing and restoring the functionality of a missing body part, orthotics aims at correcting, aligning and supporting, preventing deformities or to improve the function of a moving body part. "Prosthetic" or "prosthesis" and "orthotic" or "orthosis" are terms often use interchangeably. However, it is not to be confused. The "sis" is the noun form and "tic" is the adjective form of the words. Also, while prosthetic can be an external or internal artificial part, orthotic only refers to an artificial external device.

Prosthetic and orthotic have existed even before the advent of technology. Since then it has undergone transformation improving in aspects of function, strength, compatibility and aesthetic concerns. Prosthetic as stated earlier is replacement of an amputee or missing body part (Robitaille, 2010). If a person with an amputee limb is replaced with an artificial limb for the missing part then it is referred to as prosthetic. While, if a splint or brace is used to limit the movement of a sprained wrist, it is referred to as orthosis.

Need for Prosthesis and Orthosis

Limb deficient people not only faces problem in physical ability and appearance but also causes psychological damage and slowly diminishes their existence in the society. The society has a great influence on the existence of people with disability. People's attitude and reaction towards a disabled has its impact on the physical, psychological and social being of the individual. This makes survival either tough or lively.

Absence of a limb or part of a limb not only raises the concern of appearance but also the loss of function of that part. Until another part can replace the function of the lost part, need for restoring the lost function still lingers. The use of the word prosthesis often brings in mind replacement in the limbs. However, the application of prosthetic is not only limited to the limbs. Prosthesis represents an artificial part. Apart from prosthetic limbs, artificial parts of heart and breast implants are also a part of the prosthetic family. Detailed information regarding these will be discussed in section 2.3.

Orthosis refers to artificial device which is used to correct or support or prevent or assist deformities. While prosthesis can be used both external and internal, orthosis is external assist or can be referred to as assistive device like prosthesis, on the use of the word orthosis, limb orthosis often pops up. Apart

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

from limb orthosis, trunk orthosis is another area of application of orthosis referring to areas of neck and spine section 2.4 discusses different types of orthosis.

The long lying goal of using prosthetic is to totally replicate the function of the missing body part. However, the human body is a unique system with unique design. It functions due to interconnection between different sub-systems. Replicating such a system completely is a difficult task. However, due to advances in technology, it is slowly overcoming this barrier. Only concerns for function do not wrap the envelope of prosthetics. Design, comfort and cosmetic concerns also arise. It is important to consider these aspects as it is the wearer who should be benefited by the prosthesis. While the design and comfort will keep in check the function and physical benefit, the aesthetic value will re-instill the social existence of the user (Whitelock, 2006). Also, the use of prosthesis should not result in other physical side-effects. Orthotic on the other hand is the field which explores different techniques to correct or prevent deformities. This will not only result in a better alignment of body parts but also improve the functions lost due to the deformities.

Prosthesis

Before the advent of technology, prosthetics were developed only to replace the missing part. However, with the advent and advancement of technology the goal of prosthetic now is not only to replace the missing part but also to replicate the function of that part. Even if medical science has explained the mechanics involved with the movement of each body part, replicating the exact function is a big challenge as the human system is a complicated complex system. Advances in prosthetics are discussed in the proceeding topics.

Limb Prosthesis

Regaining the ability to walk or perform activities is the prime goal in any prosthesis for rehabilitation. From being a passive device, prosthetic technology has advanced in using active elements such as the bio-signals for developing motorized prosthesis. The major consideration in developing prosthesis is to make use of the residual limb for the function and attachment of the prosthesis. Frequent use of prosthesis helps in delivering rehabilitation to amputees. However, due to the poor cosmetic appearance and lack of functionalities in the traditionally developed prosthesis, amputees hardly use it. In recent years, use of prosthesis by amputee is gaining popularity due to advancement in technology which delivers multiple functions and also, improved cosmetic appearance has made amputee to frequently use it making their everyday life better.

All signals for initiating and controlling movement processing occurs in the brain and follows the motor pathway (through sensory and motor neuronal pathway). These signals are made use in for initiating and controlling movement in advanced prosthesis. Signals are stronger underneath the skin and skull which can be obtained by implanting electrodes (Reinkensmeyer, 2016). However, these are invasive procedures and also may include the risk of material rejection of the implanted electrode. A safer method is by using intracranial electroencephalography (iEEG) which involves placing the electrodes on the surface of the brain to record electrical activity. This in turn initiates the functioning of the prosthesis. Another widely used non-invasive method is the use of EMG signals. EMG is signals obtained from the muscle. One such application of EMG as a driving force for prosthesis is the myoelectric arm. In this, EMG signal from voluntarily contracted muscles within a person's residual limb is used to control movements of the

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

prosthesis. Movement supported by myoelectric arm includes elbow flexion/extension, wrist pronation/supination and opening/closing of fingers. Some of the developed myoelectric arm:

- **Michelangelo Hand:** It features a thumb that electronically moves into position and can perform multiple grip functions.
- **Bebionic 3:** It is a multi-articulating myoelectric hand and features 14 grip patterns. It has optimized weight distribution which makes the hand feel lighter in weight and is available in 9 different skin shades.
- **i-Limb:** The i-limb features five (5) individually powered digits and fully articulated joints. It features key grips with precision and can be used for activities which needs power.
- **Boston Arm:** It is Psychic robot limb moved just by thinking. Movement of hand will be created using motor fixed in the elbow position. The sensory electrodes are fixed at the wearer's arm. The motor will respond according to the tiny electrical charge signal captured by electrodes.

Figure 1. Michelangelo hand
Source: http://www.ottobockus.com/prosthetics/upper-limb-prosthetics/solutionoverview/michelangelo-prosthetic-hand/ on 11th June 2017.

Another method approached for prosthesis is targeted muscle reinnervation (TMR). In cases following amputation, the peripheral nerves are still active in carrying signals between the brain and the peripheral nerves for motor control. TMR makes use of these peripheral nerves in order to redirect these signals to other muscles to control prosthesis. Through surgical procedures, the nerves in the residual arm are attached to some other healthy muscle in the body such as the chest muscle. When the patient tries to move, the redirected signal causes contraction of the chest muscle. Electrodes in the chest muscle sense the electrical activity and transfer the signal to the prosthesis and control it. The TMR provides control of prosthesis using signal which is originally used to control the hand unlike traditional myo electrically controlled prosthesis which uses another group of muscle not intended for the activity to control the prosthesis. Till date, this method has been used for amputees with shoulder disarticulation but, it is being tested for possibilities in applications in other amputation levels.

Orthosis

Orthosis is a corrective measure which in turn increases the efficacy and protecting the body in long run by:

- **Resisting Motion:** For cases in which a joint or a part of the body has sustained injury and owing to which forced or use of that part can lead to greater injury, orthosis is advised to those patients. This not only resists the motion of that part but due to the restricted motion aids in the process of healing.
- **Assisting Motion:** When the movement is hindered due to deformity, orthosis provides support and assists in performing action. For example, a patient with limb length deformity will possess a different gait pattern. To correct this, he may be given a foot orthosis wherein the sole of one side of the footwear is thicker than the other side to equalise the difference in length.
- **Transferring the Force:** Force plays an important role in biomechanics and motion. Rightful origin of force is required for performing an action such as running water searching for a route to continue its flow, in case of deformities, the force also searches for alternative pathways to generate the force in order to perform the action. Such prolong practice will lead to damage in other parts of the body. Use of orthosis enables transferring the force to a valid point of origin or for work to prevent any induced damage added to the existing deformity.
- **Proper Leverage:** There are many activities which we carry out in daily life which requires following the rules of the lever system. This gives efficient mechanical advantage and lesser force required to carry out the work. Lifting of weights, balancing, walking, carrying loads on back, etc. are some of the activities which require proper leverage. For patients with deformities following proper rules of the lever system is difficult. Use of orthosis as assist enables them in performing actions with proper leverage preventing adverse injuries.

EBSCOhost - printed on 2/11/2023 5:46 AM via . All use subject to https://www.ebsco.com/terms-of-use

Limb Orthosis

The limb or appendages are important parts of the body as they are the key to performing activities of daily living (ADL) and locomotion. While the lower limb is the weight bearing portion, the upper limb is responsible for carrying out activities. Simple form of orthosis used by people from all walks of life is braces, splints and straps (elastic). These orthosis are used in injuries such as sprain and aids in resisting, restricting motion and enhancing the process of healing.

The lower limb being the weight bearing portion is prone to injuries. Also, deformities in lower limb make locomotion difficult. The following are the different forms of lower limb orthosis that exists:-

- **FO (Foot Orthosis):** Heel pads, metatarsal pads, insoles, soles, footwear
