Telecommunications was started as telegraph in the 1830s. It was based on Morse code and telegraph cables. Initially, telegraph connected only the big cities. Due to the increasing demand, telegraph was extended to the medium and small cities. The restructuring in the 1850s was based on the customer demands. Railways were being built during that time and telegraph companies used the railway tracks to lay the cables along the railway tracks. Even some railway operators started laying their own cables for telegraph and leased them to the telegraph operators. At that time the competition was not very intense as the initial cost for investment in the infrastructure was very high. Later in 1876, telephone was invented by Graham-bell and it needed new kind of cables. The price of voice telecommunications was higher than the telegraph. Co-existence of telephone and telegraph motivated for restructuring around 1900s. That is how, the strategic planning and competition in the telecommunications market in the US gathered pace. Later similar restructuring was followed in Europe and other continents. However, the private companies were very few in number. Most of the telephone and telegraph services were being provided by the public sector companies under the government. In the first decade of the twentieth century, wireless communication was started in the form of Radio. It was very much popular for the long distance broadcasting. Typically, the governments provided the public broadcasting services such as news and public announcements through the radio. It played important roles during the First World War. Commercialization of radio services started during the 1920s, and it became a popular source of

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

entertainment. During the 1920s, television came into the public arena. However, it was very much expensive during the first several years. Silicon-based electronics was started in the late 1940s. It paved ways for economical components for radio and television. This was a big change and television became popular in the 1940s. Both radio and television were very much dependent on the wireless communications. The technological restructuring of the telecommunications sector during the 1920s and 1930s were slow. However, Second World War brought many new inventions in the telecommunications technologies. Transcontinental communications between Europe and North America was mainly through the undersea cables.

Telecommunications Restructuring From 1951 Until 1980

After the Second World War, massive restructuring in all the sectors started in the 1950s. Leaders all around the world focused on political, social and economic stability. Moreover, economic stability was the main priority due to the resources and revenues lost during the war years. Economic development started with the aim of increasing the productivity and to provide employment for the people. Telecommunications sector got a priority due to its importance in the war planning and information management. Infrastructure for telecommunications expanded through the deployment of new networks. Telecommunications companies got bigger and better in the services. However, in most of the countries, telecommunications used to be under the control of the governments (Bell, 1990). Privatization was not very popular and thus the expansion plans and tariff related decisions used to come from the government. Gradually over the years, the telecom companies monopolized due to the absence of competition.

Despite the monopoly of the government-controlled companies, several new initiatives were started during this era. The technological restructuring through research and development used to be funded through the government. Optical communication was developed during the 1960s and 1970s and changed the global telecommunications to a large extent (Routray, 2014). Similarly, digital signal processing and satellite communications too were developed during these years. Satellite communications were the main basis for the international voice and video communication. The price for these services used to be quite high due to the complexities associated with the processes. However, the arrival of optical communications changed that scenario. All the continents were connected with each other through the high capacity optical fibers and the services become economical. Diplomatic differences during the cold war era motivated for better encryption techniques for communications. It became possible though different encryption standards such as data encryption standard (DES).

Telecommunications Restructuring From 1981 Until 1990

In this decade, many surprising changes happened in the telecom sector across the world. Liberalization and privatization started in all the economic sectors. Monopoly of the large companies started diminishing. American Telegraph and Telephone (AT&T) used to be the largest company in the world and it had monopoly over the US telecommunications market. This was found to be against fair competition in the market for the small, medium and private companies. A lawsuit was filed against AT&T and the court in the US ordered for its disintegration. So, the giant AT&T was divided into 19 companies known as baby bells. This is how a huge restructuring came to the sector. New companies found an opportunity to compete. Several new telecom operators and vendors were started after the division of AT&T. Similarly,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in Europe privatization in telecommunications was started and several countries followed it (From & Eliassen, 2007). Among them the privatization of BT is the most notable.

Mobile communications were started in 1980s. It induced technological restructuring in several companies. Digital mobile communications started in Europe which was later named as 2G. This was a joint venture of several countries in Europe and the company formed to look after these technologies were named as GSM. This technology became very popular within a few years.

Telecommunications Restructuring From 1991 Until 2000

This decade saw the real growth of ICT in terms of infrastructure and popularity. World Wide Web (WWW) was introduced in 1989. It was the floodgate for telecommunications proliferation. The Internet became popular globally. Online businesses were started over the Internet. ICT started to be a part of part of all important activities of human lives and businesses. The GSM-based mobile communication was started in the 1980s, but its real deployment started in the 1990s. It was the first technology disruption in telecommunications sector. Therefore, the role of the traditional wire line-based telecommunications started losing its importance and in its place people got the mobile services. Mobile services were costly at the beginning. However, due to the large scale competition, the prices came down and it was affordable to the general public. The 2G services helped both individuals and businesses in a whole new fashion. Due to this disruption, land line subscriptions started decreasing and in its place people took new mobile connections.

From the rapid growth of 2G, the operators and vendors were motivated for advancement of the mobile technologies. In fact, their main goal was to provide Internet connectivity through the mobile handsets. Several telecommunications companies came together to form a common mobile research and standardization forum known as Third Generation Partnership Programme (3GPP). They also laid a long term evolution (LTE) goal together. This 3GPP alliance played key roles in the future mobile developments. 2G was not good enough to send anything other than voice. Therefore, the 2G protocols were enhanced through several new packet radio protocols which facilitated the text messaging. The Short Message Service (SMS) was the new dimension of 2G and the new version was called 2.5G (Routray & Sharmila, 2016a). Similar to 2.5G several incremental versions of 2G came to the mobile services. The Internet service provision also started in the 2.9G. Mobile communications induced massive restructuring in telecommunications sector. In fact, it became a disruptive technology and further liberalized the ICT markets.

Telecommunications Restructuring From 2001 Until 2010

The first decade of this century was remarkable for the cellular communications and the restructuring around the mobile communication technologies. The 2G revolution continued into the Twenty-first century and in the developed countries mobile subscriptions approached close to 100%. Technological restructuring continued further and the next generation of mobile communication, i.e., 3G was rolled out. 3G provided enhanced services when compared to the 2G ones. In addition to that it started providing new services such as video and other streaming services. The telecom vendors too found new opportunities in the network building as well as advanced handset design. In both areas the revenues soared significantly which created gigantic mobile operators like Vodafone and Verizon.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Technological restructuring in 2000s was very much relentless. The 3G services were slow in the streaming and other high speed services. This was a bottleneck for the LTE service networks. Contemporary technologies such as WiMAX and 802.11g/n were better than 3G in these aspects. Therefore, the 3GPP started new initiatives for the next advanced version which was named as fourth generation of mobile communications (4G). In 4G, the speed, latency, spectral efficiency and overall throughput were enhanced with respect to 3G. Therefore, it was suitable for streaming and other real time applications. The final version of 4G was finalized in 2009. The rolling out of this advanced version started from the second half of 2009 in the developed countries and a few developing countries. However, the widespread deployment happened only after four to five years.

Telecommunications Restructuring From 2011 Onwards

In the current decade, we see fierce competition among the telecommunications companies in every segment of their businesses. Operators take bold steps to keep the markets with them. Vendors are equally competitive in keeping their revenues intact. Restructuring in the recent days are multi-faceted. The telecommunications value chains between the vendors and operators are observed for each vendor operator pair. For large companies having collaboration with other operators and vendors these value chains turn into value networks.

The current decade is dominated by the widespread technological restructuring across the world. Several new technologies disrupted the markets and changed the traditional framework of telecommunications. In this decade, several value added services were witnessed over the mobile communication platforms. However, the biggest addition was the Internet of things (IoT). It has expanded the domain of the ICT to several new paradigms. Smart cities and smart grids are the outcomes of the IoTs. Through IoTs several new business potentials have been observed over the ICT infrastructure (Ramnath et al., 2017). IoTs are basically sensor driven technologies which can perform computing, communication, storage, actuation of associated components and some domain specific tasks. A connected living environment can be possible through the IoTs. IoT became an integral part of all cellular communication networks. It brought several value added services to the cellular communication businesses (Sharma et al., 2017).

In 2015, the 4G services were substituted by 4.5G which were better than the 4G services. In fact, it was regarded as the hybrid of 4G and 5G services. 4.5G also gave a lot of confidence to the 5G developers in terms of the service performances. Voice communication over the cellular networks found a new technology called Voice over LTE (VoLTE). This new technology provided high quality voice over the LTE networks. The core network capacities increased significantly. Optical fibers were deployed all around the world and it provided superfast connections across the world (Routray, 2014). Internet connectivity increased significantly and it brought dramatic changes in global businesses (Mohanty & Routray, 2017).

Big data became the new buzzword in the ICT in the recent years. With the fusion of computing and communication, several benefits were harnessed. However, the amount of data produced through this was huge. It cannot be processed using the traditional tools (Mohanty & Moreira, 2013). This is called the big data. The importance of big data is that it carries a lot of intelligence which is essential for several applications. Big data are analyzed using special tools known as big data analytics. ICT companies are one of the main generators of big data. The ICT companies are using data analytics to harness the intelligence which can be crucial for their growth and sustainability.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Artificial intelligence (AI) and machine learning are the new dimensions in the ICT platforms. These tools are used to carry out several smart functions. In order to facilitate these new dimensions several restructuring are being proposed for ICT. The Fifth Generation of mobile communication (5G) will have several advanced features which were not available in the previous mobile generations (Routray & Sharmila, 2016b). Some of the 5G new services would use AI. Mobile operating systems are developed to handle these new tasks. Several new versions of these operating systems have been tested for the use in 5G.

GLOBALIZATION OF TELECOMMUNICATIONS MARKET

Expansion of markets is a key motive for restructuring for any large company. It is also an essential strategy to improve the performances of a company. Liberalization and privatization provided a lot of freedom to the telecommunications companies. It also motivated the companies to look for opportunities beyond the national borders. Mainly the companies from the US and Europe started their offshore businesses in their friendly countries (Bruce, 1989). Telecommunications companies too started their international ventures through different means. The telecom equipment vendors easily found partners due to their expertise in making equipments and deploying networks.

Globalization of telecommunications companies can be viewed under two different categories: globalization of vendors and globalization of operators. Telecommunications vendor companies are the telecom equipment and network component builders and they normally deploy the networks. Telecommunications operators are the direct service providers. Therefore they directly deal with the end customers which can be individuals or businesses. They directly collect the revenues from their clients periodically through the post paid services. In case of prepaid services they collect the money in advance. However, the telecom vendors collect their revenue from the operators and it normally come I phases.

Globalization of the telecom vendors' market is as old as the telecommunications industry itself. For instance, telephone was invented in 1876 and Eriksson started manufacturing the telephone sets in 1878 and sold them not only in Sweden but throughout the world. Similarly, just after the invention of Radio, its commercial manufacturing was started by several companies and they sold them globally. Initially, the selling was though some middleman. However, gradually, the manufacturers globalized their manufacturing by opening their bases in several countries. This trend of globalization of telecommunications vendors is still there. However, it has become very much systematic with global marketing and globalization of the markets has created bases in multiple countries. For instance, Eriksson had only a few international bases in the 1970s. Now it has direct business presence in more than fifty countries. Similarly, other vendors such as Nokia networks, Huawei, Cisco, ZTE and Corning are having direct business presence in multiple countries. Without globalization large vendors cannot do good business as the requirements of a single country are not too large for their growth and progress. These days, only small and limited vendoring of some specific components can be done within the geographical limits of a country. Therefore, it is obvious for a vendor company to go for globalization.

Operators have a very much different business perspective. They are not like the vendors who are experts of network deployment. Rather, the operators can just invest for the network building and once it is ready they start the services and collect the tariffs. The competition for the operators is also more direct when compared with those of the vendors. For the operators, the end customer base is very important. Depending on the quality of service and the cost for the services, the operators may lose or retain

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

their customers. These two aspects are also important for an operator when they plan for globalization. Therefore, when an operator enters a new overseas market it must provide something new or something attractive so that they can grab the customers from the existing operators of that new market. Based on the innovative ideas and better technologies, operators go for globalization these days. For instance, the European operators such as Vodafone, Orange and T-mobile have several overseas operations based on their quality of service and advanced technologies. However, it is noteworthy that the competitors of these operators in the overseas countries get better every year (Pedersen et al., 2017). Therefore globalization of the operators is more complex than the globalization of the vendors.

FUTURE RESEARCH DIRECTIONS

Telecommunications is a vibrant technological sector which generates a lot of revenue. Researches on its restructuring and globalization are studied with much interest across the world. Future research directions of telecommunications restructuring too are widely analyzed by the consultants and scholars of the field. In the recent years and near future, there are several important areas in which the telecommunications restructuring researches will be focused. In the following paragraphs we have highlighted these research areas.

Fast and Enhanced Telecommunications Services

Every year new innovations come to the telecommunications sector. Their implementation leads to better services for the end customers. Currently, 5G development is under progress. Through its deployment several performance enhancement will be achieved. Data rates will be increased significantly, latency will be decreased, scalability will be enhanced by several folds, and energy efficiency will be increased (Routray & Sharmila, 2016). Overall, the 5G handsets will provide several new computing and communication facilities which never existed before. A major technological restructuring is going to happen through 5G deployment in the 2020s.

Managed Services for Better Network Management

In the past, the operators used to deploy the network. The revenue for this deployment used to come from their own investment or through the bank loans. It was a burden for the operators. However, this trend has been changed to a large extent. Now, the telecommunications vendors take that role. In several instances, we find that the vendors utilize their expertise to build the networks. Once the network is ready they provide it for use to different operators. The ownership is now largely with the vendors. Operators just rent the networks and pay the fees periodically. The research on the telecommunications value chains and value networks are very much popular these days (Pedersen et al., 2017). In the coming years these concepts would be further developed and would pave the way for more increased roles for the vendors.

Widespread Deployment of Internet of Things

IoT is a game changing technology. In the modern world it has several important roles in our surroundings. In the smart cities all the information will be collected, processed and disseminated by the IoTs.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Starting from security to taking care of day to day activities will be executed through the IoTs. In the coming decades, IoT will play key roles in almost all our activities.

Energy Efficiency and Green Technologies

In the recent years, energy efficiency of the telecommunications networks has an increased importance due to the wide spread use of ICT. The net power consumed by the ICT networks and devices is gigantic. Therefore, the current restructuring is very much focused towards energy efficiency. Every operator is now concerned by the high energy bills. Recent advances in the green technologies too have given a boost for its widespread adoption.

Artificial Intelligence and Machine Learning

Artificial intelligence (AI) and machine learning are now very much essential in the telecommunications networks and device management. There are several operations in which human estimation would take a long time and the accuracy may not be that good. In such cases, a machine can be trained to provide optimal results. Several learning theories have been used for machines. Optimal resource allocation and consumption are complex processes in large communication networks. These things can be optimized though AI. Research in this segment of ICT is very much popular and the technological restructuring will be oriented towards these new initiatives.

CONCLUSION

Telecommunications is an essential technology sector which has become an integral part of modern human lives. In the recent years, telecommunications has a role in every aspect of our social activities. It will remain as one of the most widely used technologies. Restructuring of telecommunications is an inevitable requirement. However, in the modern business world of tough competition, restructuring has become a continuous process. Without restructuring, telecommunications companies will lose their competitive edge over their rivals. Even the demise of a company is very much common these days without restructuring. There are four main areas of restructuring in telecommunications. Each of them play essential role in the growth and survival of a company. Globalization is a strategy to expand the market. In addition to the growth, it provides survivability to the companies in the difficult situations. Both restructuring and globalization are important for the telecommunications companies which are large and intend to survive for a long time. The future restructuring will be very much oriented along the managed services. Therefore, the vendors will play important roles in the future restructuring than their traditional roles seen in the past.

KEY TERMS AND DEFINITIONS

Emerging Segments of Telecommunications Market: These are the new and value-added business segments of telecommunications market. These new segments are strategically important for revenue generation.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Globalization in Telecommunications: It is the process of international expansion of businesses and services of a telecommunication company beyond its original base. It is an important strategic action to remain competitive in the global market.

Managed Service: Managed service is the new paradigm in which the network is built and owned by the vendors, and operators just rent them for their services.

Restructuring: Restructuring is the process or combination of processes to remain effective and competitive in the market.

Restructuring in Telecommunications Industry: It is the market-oriented modernization of telecommunication industry which is essential to remain effective in the market. Without restructuring, the company may lose its markets to its rivals.

Strategic Changes in Telecommunications: It is the combination of all key strategic changes in the telecommunications operators and vendors markets across the world.

Telecommunications Industry: Telecommunication industry comprises of all types of information and communication related companies, businesses and its overall customer base. It is one of the largest modern industrial sectors contributing a significant revenue generation.

Telecommunication Management: This is the overall management of all aspects of telecommunications including revenue, technology, manpower, and infrastructure.

Chapter 63
The Significance of Trust to the Adoption of E-Working Practices Within Local Government

Hazel Beadle
University of Chichester, Bognor Regis, UK

ABSTRACT

Drawing upon an in-depth study of one local authority based in the United Kingdom, this article examines the significance of trust to local government workers who are beginning to make increasing use of e-technologies through e-working practices. The article identifies trust to be of particular significance but that the examined context is not supportive of that trust being developed. It notes differences in the perceptions surrounding trust development, that consideration of trust is not just limited to the relationship between management and their workers, and that there is a fear that trust is at risk of abuse. In the face of e-work serving to raise the profile of trust as a significant factor for concern, the associated technologies are suggested to have the potential to offer a solution to some of the issues arising.

INTRODUCTION

When considering the increasing use of e-technologies, electronically facilitated technology-based provision, focus tends to be placed on the associated hardware and software. Receiving less attention are the perceptions of those who are called upon to use those resources; the workforce. Since it is the workforce who execute organisational information technology strategies (Iyamu, 2014), and change associated with technology is acknowledged to cause uncertainty (Meier et al., 2013), this is surprising. One effect of this decreased focus is the development of a mythologised environment and a risk of management being based on assumptions (Van den Broek & Keating, 2011).

This paper is drawn from an unpublished doctoral research study investigating the increasing use of e-working in one local authority organisation based in the United Kingdom (UK). The study's context is significant in that there is little material about worker use of e-technologies within local government in the UK, much less studies in that context which focus on the perceptions of workers.

E-working is a term readily used in practice but which has received limited explanation within the literature. It is, therefore, a term which has contributed to the perpetuation of what Barley (1990) terms 'a maze of analytic abstractions'. An analysis of the related literature, undertaken as part of the aforementioned doctoral study identified e-working to be

...a mechanism for executing work tasks utilising technology in the form of electronic media. Since these tasks are so broad ranging, what the work tasks associated with e-working amount to is largely immaterial. Technological media is subject to development. This developmental factor, seen in the literature as having impeded the provision of technology related definitions, is central to the reality of working with technology. Embracement of development contributes to terminological longevity. It also heightens awareness of innovative practice; including ways of culturing and sustaining the relationship between the worker and the technology made available to them. Thus, in brief, e-working is...both a way of being a worker as well as a way, or mechanism, for carrying out the work task.

In this paper it is in relation to trust, noted to be a 'complex, multi-faceted, and context dependant concept' (Corritore et al., 2012), that the e-working focus is examined. Making use of the aforementioned conceptualisation of e-working, the focus of this paper is how trust is perceived to be relevant to local government workers who are making increasing use of e-technologies.

LITERATURE REVIEW

The literature is considered under three headings. After this brief introduction where the trust term is explored, attention turns to the context of the study; local government. This is followed by two sections examining factors significant to the perception of trust in the e-environment; the potential for liberation arising from use of, and communication in the presence of, e-technologies.

Trust is a term which is regard to be 'intuitively understood' despite being context specific (Mouzas et al., 2007). Indeed, there is suggestion that 'the domain of trust is rarely specified and its conceptual dimensions are used with imprecision and ambiguity' as a consequence of the concept being associated with inherently personalised factors such as beliefs and expectations (Mouzas et al., 2007). In the context of this paper, the issue of trust is contained to an organisational context; deemed to be a popular area of the trust debate (Vidotto et al., 2008; Kramer and Lewicki, 2010).

There are two strands of organisation-related trust debate apparent within the literature. Firstly, there is the debate relating to the repairing of trust, specifically where the perception of trust has been compromised and, secondly, there is the debate relating to how an existing level of trust can be sustained (Kramer and Lewicki, 2010; Caldwell et al., 2008). Both hinge on the perception that the presence of trust is inherently positive and something that is worth striving to achieve (Goel et al., 2005). Operationally the effect of trust is related to the links which can be drawn between how the worker feels, for example how trusted they consider themselves to be, and how they behave - the reaction to the perception of trust

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Perrone et al., 2003; Dynes et al., 2013). Inevitably context plays a role in that perception and it is the context of the local government organisation, which is central to this study.

The Local Government Context

Although there is a sizable body of literature about local government per se, the volume of material about the use of e-technologies in local government in the UK, much less the implications for the respective workforce of increasing the use of those technologies, is limited. This is surprising because the use of technology in local government more broadly has received significant governmental focus. Writing a decade ago King & Cotterill (2007), for example, emphasised how transformation of local authorities had taken a central role in the UK government's political programmes over the preceding two decades, with technology playing a key role.

Beyond the United Kingdom, it is seen that whilst some technology-related local public administration studies have been undertaken within Europe, particularly Italy (e.g. Della Rocca, 2000; Arduini et al., 2010), the Scandinavian countries (e.g. Baldersheim & Øgård, 2008; Van Veenstra et al., 2012) and, noting Reinsalu's (2006) work, within and related to the State of Estonia; the greatest breadth of research has taken place within the United States of America (e.g. McNeal et al., 2008; Wohlers, 2009). However, even this material demonstrates little focus on the experience of the worker and thus a gap in that literature is evident.

With some blurring in the use of the 'technology' and 'e-technology' terms evident, potentially reflecting how contextualised application of technology becomes developed and embedded into operational practice, as well as the role played by the internet (Ho, 2007), the literature identifies the 'transformational' potential of using e-technologies in the local government setting. Writing beyond the focal UK setting Ho and Ho (2006) identify, for example, technology to be used for the improving, or transforming, of services which the public receive. This amounts to far more than the simple use of personal computers for handling routine business tasks (Ho, 2007).

Inevitably the extent to which transformation has occurred is influenced by the initial reticence to adopt technology (Asgarkhani, 2005). It is this reticence which contributed to perceptions of local government languishing behind its private sector comparators. In the early 1980s King (1982) suggested that whilst sophisticated application of information technology is plausible 'there is no *a priori* reason to expect that they will come to pass in the near future'. In other words, highlighting that change could happen but that it was unlikely to occur in the short-term. In part this appeared to be the consequence of a 'sitting out change' approach in order to make a more informed assessment once those e-technologies had been used elsewhere. This is not an untypical approach for UK local authorities to take.

Two decades later some writers (e.g. Worthington & Dollery, 2000; Wohlers, 2009) highlighted there to be increasing adoption of e-technologies in the local government context, with the change in approach credited to technological progression during the intervening time period. Local government was suggested to have awoken to a need 'to stay current with ever-changing technological applications' (Norris & Jae Moon, 2005), with factors such as the central government drive to 'achieve 100% electronic service delivery capability' (Paris, 2005), reduced public funding and raised efficiency targets all having a significant influence. Indeed, the context of the examined case study reflected the factors highlighted through the literature and were directly mentioned in the corporate explanation for the increased focus on e-working. Also noted was that the literature places limited emphasis on whether use of e-technologies

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is the best means for achieving operational efficiencies within local government, suggesting that the adoption of e-technologies within local government is as a one-way route.

Some of the initial reticence associated with implementing technological solutions in local government appears to have been a consequence of what Della Rocca (2000) terms the 'public administration paradox'. The paradox is identified in the mismatch between a belief in the continuous value of historical operational practices, and the emphasis placed on meeting contemporary service requirements. Indeed, this mismatch might well account for operational processes having been purposefully targeted; for example, through the central government driven reform agenda (Worthington & Dollery, 2000) wherein emphasis was placed on significant organisational change being brought into play as opposed to a simple 'repackaging' of the existing product.

Worker responsiveness, however, is influenced by the context in which their work is conducted (Stachova et al., 2015); the organisation's culture. Whilst the literature provides a wealth of material in relation to organisational culture generally, specific focus on culture within local authorities is limited. Indeed Sandford (2006) highlights that "almost nowhere in local government or scrutiny literature is there any focused discussion or analysis of what local government 'culture' actually is… No literature exists on this subject". It can be questioned whether this is the consequence of, as Orr & Vince (2009) highlight, there being no such thing as a single local government culture or whether it is the result of that culture being a 'fluid 'blooming buzzing confusion' of traditions, beliefs and assumptions' (Sandford, 2006).

In contrast to the limited detail provided about the nature of the culture within the local government organisation, the literature (e.g. Hayes & Macleod, 2008; Silver & Clark, 2013) flags up local authorities as having an increasing interest in the culture experienced within the society that they serve. Indeed, this 'outward looking' focus serves to emphasise the absence of attention on the internal, and therefore the worker-orientated, implications of the local authority culture; the context within which any perception of trust may flourish or flounder. It is within this context which the local government worker encounters e-technologies.

Liberation Through Use

Leadbeater's (2003) work highlights how, as a consequence of the application of e-technologies, information and responsibilities have generally moved to 'front line employees'. Identified is an underpinning focus on technology facilitating individuals to take responsibility for their work and, if responsibility equates to finding a mechanism for fulfilling requirements, then it is difficult to refute that there is potential for local government workers to feel 'liberated' through their use of e-technologies. This perception is argued to be pivotal to a perception of trust (Perrone et al., 2003). However, there are other factors, consequent to the presence of e-technologies, which also impact upon the working environment and, therefore, any perception of liberation.

One of these factors is the issue of flexible specialisation. Leadbeater (2002) alludes to this when writing about the 'mix and match' potential of technology. Underpinning the flexible approach is a moulding of the use of e-technologies according to prevailing organisational circumstances (Dawson, 2003; Garman, 2005); an approach which is allied to the moulding of the use of technology more broadly (Bouzaabia et al., 2016). Thus, if there is a desire to effect worker liberation through the use of e-technology, then this desire might be accommodated.

It is acknowledged that management operates through people as opposed to functioning as disembodied practice (Leadbeater, 2003; Fleming et al., 2004). In exercising that management role there is

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

potential to incorporate limiting measures, whether or not this potential is consciously recognised (Rosen & Baroudi, 1992; Sewell & Wilkinson, 1992). Thus it might well be through a process of 'deemphasizing managerial control' (Fuller & Smith, 1991) that individuals gain a perception of being empowered, or trusted, to undertake their work role.

However, despite the potential to perceive trust there are factors which risk undermining that perception. One of these factors is the potential for hidden constraint and the panoptican-like systems which receive attention in the Foucault-related literature. Foucault's writing about panoptican-like systems of control and domination relate to the risk of observation and the impact that that risk has on compliance (Foucault, 1977). There is suggestion that an omnipresent perspective facilitates fairness on the grounds that everyone can be observed (Townley, 1993; Felstead et al., 2005), with the risk of observation positively influencing the likelihood of required behaviours being exhibited and, as a consequence, reducing the need for corrective action (Sewell & Wilkinson, 1992). A similar theme is echoed in the work of other writers (e.g. Warner & Witzel, 2004; Valsecchi, 2006) and is one which inevitably has an impact upon individual perceptions of self-determination (Sewell & Barker, 2006).

With this risk hanging over the worker, it can be questioned whether the technologically-assigned (self) management role largely amounts to managing feelings of uncertainty. Leadbeater (1999) highlights that those using e-technologies are 'living on their wits', enigmatically capturing the need to maintain confidence, competence and motivational self-belief in a working environment where the nuancing effects of e-technologies are accelerating.

Thus, whilst the use of technology has the potential to prove liberating, or empowering, what that perception amounts to may not be immediately comparable with other uses of the term. It can, for instance, be questioned whether trust is a composite feature, or simply an illusion.

Communication

One area where e-technologies play a key role is in facilitating communication within the organisation, acknowledging that communication is more than the simple exchange of words (Dawson, 2003; Fairhurst & Putnam, 2004). Indeed, communication is acknowledged to be comprised of four domains; business, management, corporate and organisational (Kalla, 2005); with, for the purpose of this paper, focus placed on an amalgam of the latter three elements since these robustly embrace the within-organisation perspective. Despite acknowledgement of the influence of the management role in system adoption (Ho and Ho, 2006), somewhat ironically the significance of internal communication is argued to have come to the fore as a consequence of "…a drastic reduction of trust employees have in [that] management…" the consequence of detachment fuelled by the use of e-technologies (Tkalac Verčič et al., 2012).

Barley (1990) highlights that where e-technologies are adopted within organisations, that a piecemeal approach is often used; an approach which allows learning, for example in relation to communications processes, to occur (Dawson, 2003). One of those areas of learning relates to the satisfying of socialisation needs through electronic means (Layder, 2006; Liu et al., 2013). Socialisation plays a role in ensuring compliance through the provision of a 'framework' for behaviour (McBride, 1986; Stanworth & Stanworth, 1991), offering a parallel to the aforementioned panoptical approach.

The literature is silent on how workers handle e-socialisation capabilities where the organisational preference lacks clarity. The way ideas are conveyed inevitably influences the understanding that arises (Leonardi & Jackson, 2004; Hogler et al., 2008). Organisational procedural documentation provides an example, with its tendency towards a 'pigeonholing' approach in assuming that all workers can be satis-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

factorily handled the same way; that trust, for example, is consistently perceived by workers exposed to the same operating processes. Whilst this approach amounts to 'gross categorisation' (Alvesson, 2000; Fairhurst & Putnam, 2004), the removal of procedural direction can cause anxiety.

Also contributing to the communications approach is the structure of the organisation. The task of briefing workers is influenced by the way in which the organisation is constructed (Ogbonna & Harris, 2005), with that structure influenced, in turn, by the organisation's culture. The contribution to the briefing process of organisational size is also acknowledged, with Marks & Huzzard (2010) proposing that one of the benefits of the pursuit of an optimal organisational size is the opportunity to sift out workers failing to embrace the changes associated with introducing e-technologies.

Recent writing (e.g. Eikeland, 2015) suggests that there is a need for greater understanding of the trust concept. The volume of literature about the use of e-technologies in local government in the UK, much less the implications for the workforce of the increasing the use of e-technologies, has been identified to be limited. This study contributes towards a filling of the gap in understanding relating to these issues. Specifically, this paper examines the significance of trust to local government workers who are beginning to make increasing use of e-working practices.

METHOD

The study made use of a single local authority case study. The selected case was a local authority which at the point of examination had only recently decided to actively embrace e-working practices. Qualitative data was gathered through the use of single semi-structured interviews which explored understanding of the e-working term; the expectations and understanding associated with changing working practices; and the accommodation of worker and worker body needs. These themes were derived from an analysis of the literature which had resulted in the devising of the aforementioned definition of e-working.

The underpinning trajectory was to elicit an understanding of the perspectives held at the point when, within the organisation, increasing use was being made of e-working. Each of the 21 interviews lasted up to one hour and took place over a period of 6 months commencing in 2012.

The e-working participants included those who had links to the trade union as well as those who held management roles. Whilst all workers were invited to participate, a diversity of participants was sought mindful of Currie & Brown's (2003) identification of the value of case studies 'incorporat[ing] plurivocal understandings' and, furthermore, realising that change management involves workers at all levels (Pettigrew, 1985).

The data was gathered, transcribed and analysed by the writer in her role as a supervised part time PhD student, with a process of thematic content analysis used to draw meaning from the data collected. Smaller categories were subsequently merged to provide larger themed units, as illustrated in the following section.

FINDINGS AND DISCUSSION

Five themed sections, each derived from the data and with a trust-associated undercurrent, are presented. In turn the themes relate to the changing of the organisational culture; generation of enthusiasm; the potential for monitoring; the rise of e-socialisation and empowerment.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Changing the Organisational Culture

Almost without exception participants suggested the organisation's culture needed to change in order that it might benefit from the potential of e-technologies, as applied through increasing use of e-working. This was not regarded as a challenge that would be easy to fulfil but one, in the words of Participant 5, an e-worker in a technical department, where "…the positives outweigh the negatives so you are going to have to live with a few issues…"

E-working, and in particular the flexibility of working practices which the associated technology can facilitate, was identified to require the organisation to embrace mechanisms of work which, in the words of Participant 3, it had 'shied away from in the past'. That this risked causing discomfort was acknowledged. Furthermore, there was a suggested mismatch of expectations between those who had worked in local government for any length of time and recently recruited workers who were suggested to be more familiar with the impact of e-technologies on the worker role. This should, perhaps, not be surprising for, as Participant 11 highlighted, "a judgement is made about the required skill set at the time of recruitment…"

Trust was, akin to the perception portrayed by Goel et al. (2005), regarded as a positive feature. However, there was invariably caution attached. Participants, including those without managerial roles as illustrated by the following example, questioned whether trust was being abused where individuals were facilitated to carry out their duties outside of their traditional working environment:

Sometimes I'll be wondering what my colleagues are doing. I'll be wondering whether they are working or whether they are doing something at home. I don't know. It is not something for me to worry about but I wonder what they're doing. [Participant 4].

Asked how organisational trust was being generated, responses took one of two routes. The majority perspective suggested that trust was something which would inherently arise albeit this would take time and entail some turnover within the existing cohort of workers. Here there was an identified absence of urgency and little desire to actively seize the potential highlighted in the literature (e.g. Marks & Huzzard, 2010) to *actively* sift out workers who failed to respond to the potential of technological change. Participant 11 described this in terms of

...going in the right direction. They want this to be a significant change, a cultural change for this organisation. It is going to take time because that's how the mechanisms of local government work.

The second perspective suggested that trust could be cultured through 'stock' resolutions such as being instructed to think differently; 'to trust'. The organisation's Human Resources Department, for example, had identified some online training and, consequent to engaging with this provision, argued that changed behaviours would automatically result.

Generating Enthusiasm

The rigidity with which the management role had been traditionally fulfilled within the organisation, with that rigidity impacting upon the ability to exhibit trust, was regularly raised by participants. Management practices largely amounted to adhering to written procedures which precluded variation or uncertainty.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Three participants, all managers, proposed that a 'Dickensian label' would serve as a useful descriptor for the organisation's historical style of management.

How this historical style contrasted with requirements in the presence of e-technologies was illustrated by Participant 5, who identified that their manager had demonstrated the required approach:

[They] don't have to be on my back all the time. [They] don't need to know what I'm doing all the time. [They] don't need to check the results of my work or anything like that. They just need to be [available] to support me...and to ensure that my focus or the overview of where I am going is in the right direction.

Participant 2, one of the managers who were spoken about as providing an example of the required approach, highlighted that a further change was evident in the blurring of the distinction between working and non-working lives. In doing so he acknowledged that the associated decrease in clarity had the potential to cause discomfort; in part because the work role risked having an unfamiliar impact upon those surrounding the individual.

Participant 10, a manager in an administrative department, highlighted that the decreased clarity also impacted upon managerial expectations. He provided an example which highlighted the need to acknowledge limitations in worker availability despite the increased flexibility offered through e-working:

If they say 'I can only work till 3 but I am e-working remotely' then you don't expect to phone them at 4 and say 'Well I know you technically finished at 3 but I still want to contact you, I still want your help' [Participant 10].

Some enthusiasm was generated by managers being facilitated through the use of e-technologies to become more immersed in their professional (as opposed to managerial) discipline. It was the removal of the day-to-day emphasis on the controlling stance, the consequence of needing to trust workers to satisfactorily complete their roles, together with how this contrasted with historical working arrangements, which was suggested to be significant.

The Potential for Monitoring

The potential for technology to be used to monitor the workforce was acknowledged. Participant 10 described monitoring to be 'a side effect of technology's presence'; a view aligning with the literature (e.g. Dawson, 1988).

However, a number of those in managerial roles indicated that they believed a lack of obtrusiveness equated to worker ignorance of the monitoring potential. Some managers gained pleasure from this perception. Indeed, one manager recounted joking with a peer about the extent of their monitoring capabilities.

It was not clear why some managers perceived there to be a lack of an awareness of the monitoring potential. However some managers did indicate that they found the presence of monitoring capabilities to be unsettling and that they sought to manage the associated anxiety. Participant 9, a manager in an administrative department, suggested that by failing to identify an awareness of monitoring that it 'save[d] putting ideas into people's heads'.

If monitoring is perceived to undermine trust, and trust is pivotal to effective use of e-technologies through e-working, then an attempt to conceal the potential to engage in monitoring activities might be argued to be appropriate. Furthermore, if concealment is not achievable then the practice of justifying

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

monitoring activities could prove to be a substitute position. Whilst both perspectives were exhibited in the data, a number of participants mentioned organisational policies and the right to 'observe' workers which was embraced by that documentation. As highlighted by Participant 1, "It is always there. There is a communications policy so it is always there with regard to internet access and so on being monitored". There was also mention of monitoring being used to check on the safety of workers. In relation to use of Global Positioning System (GPS) tracking Participant 3, for example, suggested this was supportive in that it enabled 'an alert in case anything happens'. However this supportive perspective was off-set by comments regarding the ability to use GPS solely for the purpose of checking whether work was being actively undertaken.

Thus a tension was identified between the potential for e-facilitated monitoring and the uses to which that monitoring capability can be put. If all sides to the employment relationship are operating within a framework of trust then, as Participant 2 explained, "staff shouldn't care about, shouldn't even think about whether they are being monitored". However, in the studied local authority, this framework of trust appeared to be absent and thus the impact of the *potential* to monitor was regarded to be significant.

The Rise of E-Socialisation

Participants used a variety of terms when discussing communications, potentially reflective of the domains identified within the literature (Kalla, 2005). However, 'being in touch' and 'social' were the most popular. Despite gaps in understanding how e-technologies functioned, there was indication that socialisation had the effect of generating feelings of inclusion and that the technology associated with e-working might facilitate new ways of fulfilling work-related social needs; needs which were highlighted to be of particular significance if working remotely.

However significantly influencing participant embracement of the e-facilitated approaches was the effect resulting from a number of operational mechanisms converging. Policy provision was one influence, with an expectation that 'protocol policies' would be adopted for e-socialisation being regularly raised. It was suggested that the perception of needing such a framework, as well as the time period associated with policy generation, undermined the potential to generate trust. One of the difficulties appeared to be an inability to effectively communicate changed approaches. As Participant 21 highlighted:

We have got something called Yammer, if you have heard of that but there was no launch of it or any instruction that you could use it to communicate between staff. I got an invite from [name] and thought 'why has she invited me to this? What is it? I clicked on it and accepted and looked at it. It was obviously a way to communicate but there was no distinction as to which tool the organisation wants us to be using for what.

There were participants who suggested that they would only use the e-socialisation provision with which they felt comfortable and that in the absence of a trust culture, that this comfort was limited. Facebook and Twitter were named as examples of platforms which were increasingly used within the organisation but which were regarded to have generated discomfort amongst the workforce. Yammer was, as the following quote from Participant 21 illustrates, generating a similar effect:

Some people are just posting on this Yammer stuff the crap that they would put on Facebook socially, so what is the barrier? It makes me sound really up tight and it would be nice to have something that

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

would be relaxed without worrying that the Chief Exec might be reading your comments, but people are putting some weird things on.

Whilst, therefore, there was evidence of efforts to respond to worker socialisation needs, the effectiveness of using e-technologies for that purpose appeared to be being hindered by perceptions of trust and the extent to which the new ways of working differed from the familiarity offered by the historical processes. Thus the perception of e-socialisation in the context of the studied environment was identified as being one of limitations and the result was a leaning towards perpetuation of the status quo.

Empowerment

The literature suggests that whether an individual perceives they are, or are not, empowered, depends upon both their control over the work location (Feldman & Gainey, 1997; Edwards & Collinson, 2002) and their perception of task ownership (Klein, 1989; Rubery & Grimshaw, 2001). This latter element includes the deemphasising of managerial control (Fuller & Smith, 1991). Thus the existence of empowerment is determined by the individual worker.

The study identified it was those holding management roles who made particular use of the 'empower' term. However, this did not mean that empowerment was part of the reality for their staff. Indeed Participant 8 was seen to acknowledge this optimistic focus in their use of the "I would hope that they're more empowered" phraseology.

Trust has already been highlighted to have not historically been a feature of the local authority working environment. Generation of trust was not indicated to require the removal of management per se, but efforts to generate trust were highlighted to be associated with managers adopting more facilitative (empowering) approaches. Despite this need being identified, several participants mentioned managers requiring sight of completed task lists when, using the capabilities of e-technology, work was undertaken out of their sight. However Participant 2, an e-worker and manager, highlighted how one of his own e-workers had provided without request a detailed listing of the work undertaken. He recalled having berated the individual for feeling they needed to prove they were working but then acknowledged that this was an approach that he had also used: "Because in my mind I am thinking I've got to let that person know I'm working". Suggestion that proof is required indicates the absence of trust.

Empowerment might arise from an absence of formal instruction, allowing the individual to feel they are able to make their own decisions regarding the execution of their role. This might, therefore, be perceived as being the benchmark which workers may be desirous of achieving. However such an approach was repeatedly described, by those identifying themselves as having the potential to undertake e-working, as being 'let loose'. The inference was that far from being empowered to make decisions, these individuals felt unsupported.

Also inducing anxiety was the risk of the level of fear being sustained. It would be an incorrect reflection of the data to suggest that there were no managers who were identified as exhibiting trust, but certainly there was evidence to indicate that managers who were desirous of being trusted were encountering difficulties. Participant 2, a manager, highlighted:

It's the culture of the organisation. It's about trust. It is exactly about that trust. They didn't believe that I trusted them if that makes sense because they've only ever known the traditional style of management and things like that. [The trust associated with e-working] was a completely different mindset to get across.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In summary, the potential surrounding the adoption of e-working practices to highlight the absence of trust in local government workers to fulfil their job roles was noted, despite general consensus that the presence of trust was both positive and desirable. There was an absence of consensus with regard to how that trust might be generated in the presence of increasing use of e-working, with the influence of an historically favoured regulated approach playing a significant role. Indeed e-technologies, for example in the capacity for monitoring workers, were identified as having the potential to be used in such a manner that there was active undermining of any perception of trust.

The prospect of trusting workers to carry out their duties as e-workers, minded that this encapsulates the way of being a worker (one part of the aforementioned e-working conceptualisation) was acknowledged to offer benefits to those in managerial roles as well as those who reported to those managers. Those in managerial roles were, for example, highlighted in the presence of increasing use of e-working practices as having the opportunity to place increased focus on their primary professional discipline. However, despite the desire expressed by some managers to benefit from this revised position, workers appeared to pick up on a more cautious managerial perspective. Thus, despite evidence of small pockets of changed operating processes, the potential to generate a sizable body of trust within the organisation was negated.

CONCLUSION

The focus of this paper has been to examine the significance of trust to local government workers who are beginning to make increasing use of e-working practices. That the study has identified trust to be of particular significance is not surprising in the light of the focus placed on the perception within the literature more broadly (e.g. Vidotto et al., 2008; Kramer and Lewicki, 2010). However this paper offers value by identifying this significance through a study conducted in a local government context, a largely neglected area of focus, where trust was identified to be desired but where the context was not supportive of that trust being developed. Differences in the perceptions surrounding how trust might be developed appear to be problematic. Since trust has been identified to be perceived as being central to the increasing use of e-working, actions suggesting there to be an absence of urgency with regard to the development of that trust inherently have a stalling impact. Of influence here is the fear that trust, if developed, might be abused. From an operational perspective, the study has noted the need to focus on intra-organisational cultural change, the subject of current research activity.

Acknowledging, as Sandford (2006) highlights, the 'fluid 'blooming buzzing confusion' of traditions, beliefs and assumptions' which constitute the local authority culture, the study has highlighted that the trust is not limited to the relationship between management and their workers, but also with workers trusting their peers. Thus this paper contributes to unpacking a little further, specifically within the context of the local government organisation, the magnitude of and factors requiring examination in the effecting of cultural change.

Finally, whilst e-working is identified as serving to raise the profile of trust as a significant factor for concern, the associated technologies are identified to offer a solution to some of the issues arising. Technology's facilitation of socialisation is identified, for example, to have the capacity to generate perceptions of inclusion and that inclusion has a positive and perpetuating effect, for example through its influence on a worker's self-regulation of behaviour.

Inevitably this research has limitations. First, the study was exploratory and whilst it purposefully sought the perceptions of the participants, those perceptions are subject to change. Whilst participants

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

were self-nominating and all of the local authority's workers were invited to participate, it is inevitable that the viewpoints held by some employees were not captured. The effect on the findings of a failure to capture these perspectives can only be surmised. The study explored one local authority organisation, with the choice of organisation influenced by that organisation being in the process of increasing its use of e-working processes. Since other local authority organisations in the UK have already embraced e-working arrangements, the extent to which learning from the study can be used at a practical level in other organisations is limited. However, the relevance of trust where e-working has become embedded is an avenue for future research activity.

Chapter 64
The Knowledge Management Culture:
An Exploratory Study in Academic Context

ABSTRACT

Knowledge management is defined by different authors as the process that enables the sharing, capture and application of knowledge from the individual to the group and further to organizational level. The organizational atomization observed in the academia imposes importance in paying attention to a culture that encourages knowledge management and also assigns equal importance to the cooperation and the work in team. However, due to the different levels of heterogeneity among and within these organizations there is not just one model that fits well. Through a literature review on the knowledge management in the academia, the purpose of this chapter is an exploratory study that identifies the main cultural challenges in the development and implementation of a knowledge management system in the academic context.

INTRODUCTION

Knowledge management (KM) has been mainly developed in the corporate knowledge perspective. Nevertheless, there are other environments within which KM should be studied, such academic context. Despite the wealth of knowledge and knowledge-intensive (KI) activities, in general, the academia do not have their knowledge properly organized and they have been paying little attention to their management, differing from the corporate sector (Ali, Gohneim, & Roubaie, 2014; Geuna & Muscio, 2009; Rowley,

DOI: 10.4018/978-1-7998-7297-9.ch064

2000). Geng et al. (2005) indicate that the application of KM in this context is fairly recent and that the first publication is dated in 1997.

The social academic communities are constituted by universities, public research institutes, and public research laboratories (Perkmann & Walsh, 2007).

Several authors have the opinion that the development and implementation of knowledge management processes in the academia presents often some difficulty (Petrides & Nodine, 2003; Rowley, 2000; Tippins, 2003). Although its missions are closely related to the management of knowledge (Howell & Annansingh, 2013; Tian, Nakamori, & Wierzbicki, 2009), and the existence of some important facilitator elements (e.g., large experience and expertise in creating and developing knowledge, and the horizontal and academic structure organizational).

In a similar way to the other KI organizations, academia are exposed to marketplace pressures (Rowley, 2000), which makes as critical as in the corporate sector the use of mechanisms of KM (Howell & Annansingh, 2013; Kidwell, Vander Linde, & Johnson, 2000). However, academia faces some difficulties in establishing an organizational culture that focuses on KM and significantly boosts the sharing of scientific knowledge.

The academic environment has certain characteristics that dominate their culture and that need to be understood. According to Tippins (2003), the academic environment is characterized by a group of individual experts in different and diverse areas of knowledge. This environment of diversity propitiates the development of sub-cultures (Howell & Annansingh, 2013) transforming these communities in complex social organizations composed by diverse cultures, predominating the academic freedom and autonomy (Sporn, 1996), where close control can induce negative reactions (Starbuck, 1992).

Knowledge in academic context is created by different forms and is related to the experience and competence of their teachers and researchers, without any coordination or management in line with a specific strategy. Geuna and Muscio (2009, p. 99) add that "the characteristics of individual researchers have a stronger impact than the characteristics of their departments or universities". According to Tian et al. (2009), basically, in the creation process of new knowledge academics reach required knowledge from three dimensions (scientific, social, and creative) and can be supported from four knowledge sources (supervisor or professor adviser, colleagues, self-study, and outside scholars).

The created knowledge becomes explicit through articles, patents, books, conferences, classes, etc. In the meantime, part of this created knowledge is kept in the tacit form.

An effective KM in academic context is possible. However, the organizational atomization observed in the universities imposes importance in paying attention to a culture that encourages KM and also assigns equal importance to the cooperation and the teamwork (Bjørnson & Dingsøyr, 2008; Howell & Annansingh, 2013; Sporn, 1996).

Thus, in order to provide knowledge-intensive inputs to companies, government and to society (Schmitz, Teza, Dandolini, & Souza, 2014), as pointed out by Kidwell et al. (2000), the academia have to move from the old culture that considers, "What is in it for me?" to a new one "What is in it for our customer?".

From a critical analysis derived from the literature on the KM in the academia, the purpose of this chapter is an exploratory study that identifies the main cultural challenges in the development and implementation of knowledge management processes in the academic context. The chapter also aims to address some further research directions.

In this chapter the authors address the non-profit academies, since the for-profit institutions tend to reflect more similar characteristics to business organizations (Kezar, 2001).

BACKGROUND: ABOUT KNOWLEDGE MANAGEMENT

The advancement of an economy based on knowledge has increased the visibility and importance of organizations that create and disseminate knowledge. Through knowledge, organizations can disrupt limitations, enhancing development and create new opportunities (Pekka-Economou & Hadjidema, 2011).

Even though knowledge and information are far from identical, the concept of knowledge has varied considerably, and is often used as something similar to information (Kakabadse, Kakabadse, & Kouzmin, 2003; Mårtensson, 2000) or is used interchangeably (Stenmark, 2001).

There is not a common knowledge definition accepted and, as such, knowledge is defined according to the context in which it is discussed (Gloet & Terziovski, 2004; Stenmark, 2001; Stoyanov, 2014). Rowley (2007) agrees that knowledge is an elusive concept which is difficult to define.

Regardless of the concept, knowledge always brings their respective truths and beliefs, judgments and expectations, methodologies, and know-how (Prieto, Revilla, & Rodríguez-Prado, 2009; Reimer & Karagiannis, 2006).

Knowledge-intensive (KI) can be applied to organizations in which knowledge has more importance than other inputs (Starbuck, 1992), work is mainly of intellectual nature (Alvesson, 2001), and consequently where knowledge workers is the major part of team work (Drucker, 1994; Tzortzaki & Mihiotis, 2014). Generally, KI organization has the capacity to solve complex problems through creative and innovative solutions (Wong, 2005). Social norms of openness and teamwork, where cooperation is fundamental, are key cultural characteristics in this type of organization (Starbuck, 1992). Alvesson (2001) adds that KI organization can also produce good results with the help of outstanding expertise.

The KM is crucial in organizing processes and can representing many gains for the KI organization. However, Rowley (2000) highlights that an effective KM process may require significant changes in culture and values, and in organizational structure.

Types of Knowledge

The different dimensions focused by the authors in different fields of study result in various classifications and distinctions of knowledge. Alavi and Leidner (Alavi & Leidner, 2001) summarize the various views of knowledge under different perspectives and present knowledge taxonomies. Johannessen's (2008) study offers a schematic depiction of different knowledge distinctions, and Kakabadse et al. (Kakabadse et al., 2003) answer the question "What is knowledge?" presenting a table of taxonomies that addresses types and forms of knowledge and level of embodiments.

However, the major part of authors adopt the classical division introduced by the Hungarian chemist and philosopher Polanyi (1966), and widely spread by Nonaka et al. (1996): knowledge can be explicit or tacit.

Explicit knowledge (EK) is a type of knowledge that can be easily codified, articulated, documented and archived, and usually, it is stored and expressed in the form of texts, data, scientific expressions, maps, manuals and books, websites, etc. (Alavi & Leidner, 2001; Iacono, Nito, Esposito, Martinez, & Moschera, 2014; Nonaka & Konno, 1998; Polanyi, 1966; Santoro & Bierly, 2006; Seidler-de Alwis & Hartmann, 2008).

Tacit knowledge (TK) is the basis of knowledge creation, it is complex and not codified, and presents some difficulties in its reproduction in document or database. Smith (2001) reports that 90 percent of the knowledge in any organization is TK and it is embedded and synthesized in peoples' heads.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In general, the literature mentions the existence of two dimensions of TK: (i) technical and (ii) cognitive (Alavi & Leidner, 2001; Nonaka & Konno, 1998). The technical dimension is often referred to as expertise, and consist of informal personal skills, and crafts that apply to a specific context. The cognitive dimension refers to mental models, beliefs, ideals, values and paradigms, which are deeply ingrained in people. Nonaka and Konno (1998) suggest that while difficult to articulate, this cognitive dimension of TK shapes the way each one person perceives the world.

Some authors even differentiated the knowledge between individual and organizacional (Birasnav & Rangnekar, 2010) assuming that the individual resides entirely in the mind of each person, while the organizational exists in explicit and tacit forms and may be resident in people, groups, documents, processes, policies, physical contexts or in data basis.

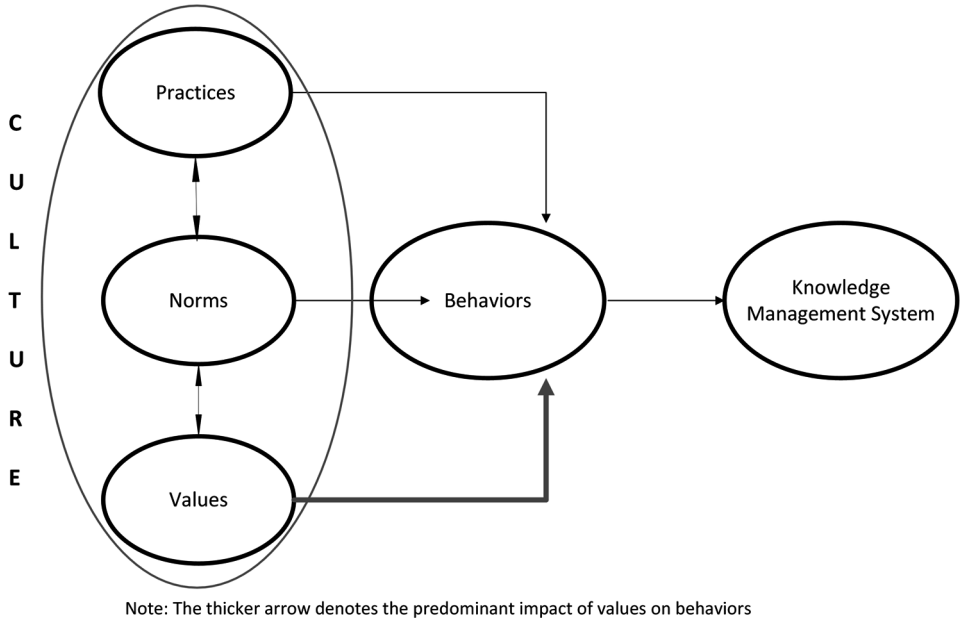
Knowledge Management

After the information management, a neutral and normative system in the organizations (Gloet & Terziovski, 2004), the KM emerges as a distinct area of study, establishing as a significant source of competitive advantage and as one of the most important resources in the capacity of progress of modern organizations (Mårtensson, 2000; Pekka-Economou & Hadjidema, 2011).

Prusak (2001) indicates that the first conference devoted to KM occurred in Boston in 1993. Strongly influenced by Nonaka and Takeuchi's book (Chen, 2006), the KM expanded rapidly in various fields such as psychology, management science, sociology, strategy, production engineering, etc. This wide diversity of areas transforms KM in a complex and multi-faceted concept (Alavi & Leidner, 2001), reflecting the wide range of definitions, leading in the absence of a standard and universally accepted definition (Chen, 2006; Kakabadse et al., 2003; Sadeghi & Salemi, 2013). In a recent article, Girard and Girard (2015) listed more than a hundred KM definitions from twenty-three distinct domains. It is important to note that, in general, such definitions bring with them the concepts of the domains in which they are applied.

Although the absence of consensus regarding the definition of KM, the Davenport et al.'s (1998) definition is one of the most cited in the literature: "KM is concerned with the exploitation and development of the knowledge assets of an organization with a view to furthering the organization's objectives".

Knowledge management is based on three main pillars: (i) technology, (ii) people, and (iii) process (Kalkan, 2008; Prieto et al., 2009). Considering that a knowledge management system is not an automatic data processing system (Tuomi, 1999), the focus should not be on one element, and is certainly a combination of all three the best approach (Bjørnson & Dingsøyr, 2008).



Knowledge Management Culture

The organizational culture of each organization affects the implementation and sustainability of KM. According to Davenport et al. (1998), in order to create a favorable environment for a successful KM, a discussion that considers its relation with the culture of the organization (Figure 1), is appropriate.

Organizational culture is created and maintained through different interactions between team members, teams, organizations, etc., and reflects the behavior that is characterized by the values, norms and practices commonly accepted by the members of the organization (De Long & Fahey, 2000; Jolaee, Md Nor, Khani, & Md Yusoff, 2014; Omerzel, Biloslavo, & Trnavcevic, 2011). De Long and Fahey (2000) alert that at the deepest level, culture consists of values that are often difficult to change, but in the meantime should never be underestimated.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Elements of culture
adapted from (De Long & Fahey, 2000)

Note: The thicker arrow denotes the predominant impact of values on behaviors

For De Long and Fahey (2000), organizational culture is recognized as a major barrier to leveraging knowledge. They identify four ways which organizational culture influences the behaviors in knowledge management process: (i) shapes assumptions about what knowledge is and which knowledge is worth managing; (ii) mediates the relationships between levels of knowledge; (iii) creates the context for social interaction; (iv) shapes the processes by which new knowledge is created, legitimated, and distributed in organizations.

THE CULTURE OF KNOWLEDGE MANAGEMENT IN THE ACADEMIC CONTEXT

The academic institutions are social communities constituted by universities, public research institutes, and public research laboratories (Perkmann & Walsh, 2007). Many of them are a conglomerate of autonomous subunits, composed by a group of individual experts, with loose links and a high degree of specialization in the disciplines, which are organized in different domains of knowledge (Sporn, 1996; Tippins, 2003). These individual experts are simultaneously developers, users, and bearers of knowledge (Omerzel et al., 2011).

Due to its missions closely related to the KM (Table 1), academic institutions have a cultural, social and technological structure highly favorable to the practices of KM (Howell & Annansingh, 2013; Tian et al., 2009), and a significant experience and expertise in creation, sharing and dissemination of knowledge, especially explicit knowledge (Rowley, 2000). The academia have been recognized as knowledge-intensive organizations (Ali et al., 2014; Fullwood, Rowley, & Delbridge, 2013; Howell & Annansingh, 2013).

However, in the Kerr's (1987) opinion, currently, academia face the greatest critical age as a result of the confrontation between accumulated heritage and modern imperatives of society. Different society

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. The Academia's missions

Missions		Knowledge Management Process
1º Mission	Education	Preservation and sharing of knowledge
2º Mission	Research	Knowledge creation
3º Mission	Service to society	Knowledge transfer to the different stakeholders

drivers of change (e.g., radical shift from an industrial to a knowledge society, market pressures from industry, lifelong learning, new technologies, etc.) and the pressure to reach different sources of funding in the research process, bring new challenges to the academia (Franco & Haase, 2015; Geuna & Muscio, 2009; Kerr, 1987; Kezar, 2001; Pekka-Economou & Hadjidema, 2011).

This context makes as critical as in the corporate sector the use of mechanisms of KM in the academia (Howell & Annansingh, 2013; Kidwell et al., 2000). Alexandropoulou et al. (2008) add that the possibility of consolidation of the three academic missions can be one of the main benefits of KM.

Several authors have the opinion that knowledge in the academic context is not so completely organized and the implementation of a KM is often difficult (Petrides & Nodine, 2003; Rowley, 2000; Tippins, 2003). Due to the distinct nature of academia, its organizational culture has been recognized as one of the main barriers in the implementation of KM (Dill, 1982; Rowley, 2000; Tan, 2016).

Although their members are involved in innovation processes and are considered as agents of change, several attempts to change the organizational culture in the academia have been frustrated as a result of unique features that are associated with the set of long history and traditions (Kezar, 2001; Poole & Iqbal, 2011).

Knowledge and Knowledge Management in the Academic Context

Throughout their history, the academia have played a crucial role in creating and disseminating knowledge. In continuation of their history, the third mission reinforces the importance of the academic knowledge and establishes strong incentives for development a more efficient way of transferring the knowledge from academia to the business world.

The academic knowledge includes professional knowledge, teaching skills, and research capabilities (Omerzel et al., 2011). In general, it is in the basis of technological development and in the products and processes in most industries (OECD, 1996). The academic knowledge has been acknowledged as a key resource for innovation, for promotion of technological change and for fostering of higher productivity and greater economic growth (Cohen, Nelson, & Walsh, 2002; Freitas, Geuna, & Rossi, 2013; Lee, 2000; Mansfield & Lee, 1996; Polt, Rammer, Gassler, Schibany, & Schartinger, 2001).

However, Mansfield (1995) notes that many of the innovations is based on academic research but it is not invented at academia. In many situations, academia just provides a source of knowledge and skills that makes innovation happen (Wallin, Isaksson, Larsson, & Elfström, 2014; Wright, 2008) .

Academic knowledge management is a set of processes that provides academia the most effective way to create and organize knowledge, share this knowledge and foster its application (Geng et al., 2005), which supports the achievement of the goals related to their missions.

Knowledge management in this context is particularly appropriate, and may have a significance equal to or even greater than in the corporate sector (Gill, 2009; Howell & Annansingh, 2013; Kidwell et al.,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

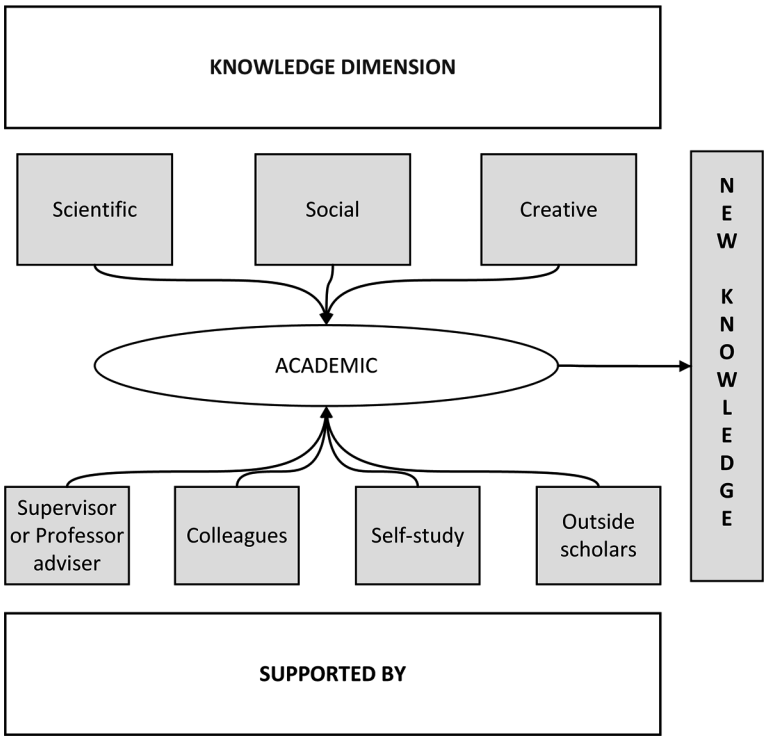
2000; Petrides & Nodine, 2003). Tian et al. (2009, p. 84) consider that "knowledge as the cornerstone for scientific creation itself is the most important factor to effective KM implementation".

Despite the existence of important facilitator elements for implementing knowledge management processes in academic context, the practice is very recent and has still received scant attention and little research has been conducted on this topic (Fullwood et al., 2013; Geng et al., 2005; Geuna & Muscio, 2009; Tan, 2016; Tian, Nakamori, Xiang, & Futatsugi, 2006). In most cases corresponding to the individual initiatives, without any kind of coordination or management with specific purpose, or limited to some applications of information technology (Gill, 2009). D'Este and Patel (2007) reported that often, the experience and expertise of individual academics have a stronger impact than the characteristics of their departments or universities.

The nature of diversity across different disciplines often implies difficulties in identifying which knowledge is critical to manage, representing some constraints in development and implementation of academic knowledge management (Townley, 2003). However, on the other hand, KM processes offer a great opportunity for the creation and organization of interdisciplinary knowledge (Rowley, 2000; Tippins, 2003).

The corporate and academic knowledge creation processes presents a significant difference between them. The knowledge created within academia has mostly individual motivation and is related to the experience and expertise of its researchers (Tian et al., 2006), and some academics which wishing to ensure the academic freedom are reluctant to the knowledge management process (Townley, 2003). Unlike the corporate process, in which the knowledge creation is a mission of the group, and is embedded in work process, systems and infrastructure (Howell & Annansingh, 2013; Tian et al., 2009). Organizational culture will play a determining role in the knowledge sharing behavior among academic members (Howell & Annansingh, 2013; Mansor, Mustaffa, & Salleh, 2015).

Basically, according to Tian et al. (2009), in the creation process of new knowledge, academics required knowledge from three dimensions - scientific, social, and creative - and can be supported from four knowledge sources - supervisor or professor adviser, colleagues, self-study, and outside scholars (Figure 2). Probably due to the individual motivation in the knowledge creation process, academic members prioritize self-study as the principal knowledge source (Tian et al., 2009), assigning a secondary place to cooperation (Tian et al., 2006).



In general, the sharing of knowledge occurs through papers, books, researches, classes, conferences, etc. (Mansor et al., 2015). These mechanisms of sharing often privilege the EK, whereas for TK the option is informal communication or remain as grey literature (Freitas et al., 2013; Grimpe & Hussinger, 2008; Nilsson, Rickne, & Bengtsson, 2010). For this reason, perhaps, is assigned to informal communication relevant importance in the creation of scientific knowledge. Polt et al. (2001) argue that the involvement of academic members with industries (and vice versa) contributes to the sharing and creation of EK and TK.

The TK possessed by academic members constitutes the main part of academia's intellectual capital, and usually this knowledge is primarily shared externally where academics consider there are clear rewards (Howell & Annansingh, 2013) . Kezar (2001) alerts to the risk of substantial loss of TK in this decade when is expected a volume of about 40% of retirements within the academia. The exit of any academic member may correspond to loss of important knowledge for the academia.

In addition to considerable improvements in the sharing of explicit and tacit knowledges, which intensifies knowledge creation process, KM environment offers a varied number of benefits that ranges from knowledge refinement to greater collaborative opportunities.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Academic knowledge creation

Different authors indicate several other benefits that can be achieved through the implementation of KM. In their work, Kidwell et al. (2000) relate relevant number of applications of KM and respective potential benefits in the various activities of the academia: the research process, curriculum development, alumni services, administrative services, and strategic planning. Steyn (2004), in his study, also presents several benefits that may be reached with the application of KM.

The Table 2 summarizes the main potential benefits to be achieved with the implementation of KM described by several authors in the reviewed literature.

Organizational Culture in the Academic Context

Academia, as a complex social organization, have distinctive characteristics that dominate their culture, and that characterizes it as being different from other organizations. These characteristics highlight the complexity and fragmentation existing within the academia (Sporn, 1996), with their organization in different domains of knowledge, through systems such as scientific, pedagogical, research, and cooperation.

The various communities that constitute an academic institution assume a common culture with symbolic context based on the history and traditions, hindering the establishment of a culture with rational process of management and strategic vision (Dill, 1982).

Kerr (1987) observes that unlike other sectors, academia have not been subject to any greater challenge of technological change, and in his view, "the academics continues to operate largely as individual craftsmen" (p. 184). However, in Kezar's (2001) opinion, factors such as technological advances, distance education, and constraints of funds for research, will impact the culture over time.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Benefits of implementation of knowledge management

Benefit	Authors
Recognition of knowledge as organizational intellectual capital	(Rowley, 2000)
Improve the quality of teaching and research	(Gill, 2009; Kidwell et al., 2000; Steyn, 2004)
Closing gaps between senior and new academic members	(Gill, 2009; Kidwell et al., 2000; Steyn, 2004)
Locating experts ("yellow pages") – facilitating attempts to find experts on specific subjects	(Gill, 2009; Kidwell et al., 2000; Steyn, 2004)
Develop an environment where more experts would be more interest to work - recognition for its excellent research facilities, resources and programs, etc.	(Gill, 2009)
Document management, improving responsiveness by monitoring and including lessons learnt	(Gill, 2009; Kidwell et al., 2000; Steyn, 2004)

Sporn (1996) identifies in her study some characteristics that dominate the culture of academic institutions:

- **Goals Are Ambivalent:** Different objectives and standards, many of which cannot be measured very well;
- **Large Extent "People-Oriented":** Necessity in recognizing different stakeholders in order to fulfill their missions;
- **Problematic Standards for Goal Attainment:** It is hard to define segmented and routinized procedures, due to the need to develop and employ an array of standards in relation to the variety of outcomes (Bartell, 2003);
- **Difficulty in Establishing a Coordinated Initiative for Governing and Managing Due to the Involvement and Different Interests of Academic Members:** Close control can induce exits (Starbuck, 1992);
- **Academia Are Vulnerable to Its Environment:** Changes in political, economic, social, and technological conditions can strongly affect universities. These changes affect the academia more than the other institutions (Kerr, 1987).

Academia faces another problem related to the existence of diverse subcultures within the institution.

The organization based on different areas of knowledge associated with inviolable values, like freedom and autonomy, is propitious for the formation of different subcultures that overlaps the main culture (Howell & Annansingh, 2013; Sporn, 1996). These subcultures often exert strong influence on the way of action of each member the organization. According to Howell and Annansingh (2013), subculture is a set of meanings shared by a group which shapes the way that these members teach, engage in research or interact with colleagues and students.

In general, subcultures are related with the culture of the academic profession at large, and the culture of academic discipline (Dill, 1982; Fullwood et al., 2013; Poole & Iqbal, 2011). The current high degree of specialization in the disciplines lead to the exacerbation of existence of subcultures. This specialization, according to Dill (1982, p. 312), may result in "declining involvement in institutional requirements, and a lessening of social ties with disciplinary and institutional colleagues".

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Sporn (1996) notes that the challenge is to integrate all activities of the subcultures so that they can be used on an institutional level. The encouragement to a higher level of social interactions can lead to the unification of the various subcultures of the different units around the academic culture (Bartell, 2003; Dill, 1982).

Knowledge Management Culture in the Academic Context

In their article Kidwell et al. (2000, p. 28) raises the question: "Are the concepts of knowledge management applicable to colleges and universities?". Although the existence of important facilitator elements for implementing KM in academic context, Kidwell et al. (2000) conclude that the existing examples are the exception rather than the rule. In general, academia have an individualistic culture (Fullwood et al., 2013) that do not maintain norms, values and practices, focusing on KM, or have a complex one (Rowley, 2000).

Academic culture presents some specific characteristics, which usually act as barriers or obstacles that difficult the development of a sustainable KM culture. In the Table 3, the authors summarize these unique characteristics described by several authors in the literature on the topic.

Knowledge management culture must be part of the institutional vision and mission and shall be in line with its goals and strategy. The cultural factors will strongly affect KM practices.

The adoption of a wide approach to the KM by the academia, can lead to effective cultural change that enables the development and implementation of KM. This approach requires understanding the unique characteristics of academia, incorporation of the main principles, and then proceeding the necessary cultural changes (Gill, 2009; Kezar, 2001). However, Rowley (2000, p. 331) alerts that "culture change is likely to be a slow and painful process".

Table 3. Factors that act as barriers or obstacles and affect knowledge management culture

Barriers and Obstacles	Authors
Decentralized nature of departments and disciplines. Loyalty to discipline rather than organization.	(Fullwood et al., 2013; Townley, 2003)
Inadequate management competencies to prepare the organization for KM. Lack of strategy, policies and work process. Lack of leadership.	(Howell & Annansingh, 2013; Petrides & Nodine, 2003; Tan, 2016; Tian et al., 2009)
Academia are knowledge-intensive institutions, however do not share and leverage their knowledge to realize their goals as corporate organizations.	(Howell & Annansingh, 2013; Petrides & Nodine, 2003; Tian et al., 2009)
Environment characterized by lack of effective environment of communication that enables the sharing of knowledge, with few areas of collective work, where the few existing meetings are administrative, and with closed, separated and unlinked groups. Lack of social interaction.	(Omerzel et al., 2011; Tan, 2016; Tippins, 2003)
Individualistic organizational model with absence of a knowledge sharing culture offers very little chance for collaboration and cooperation. Mechanisms of sharing such as conference and publications act more as competition than rather cooperation. Cooperation is a weak point.	(Howell & Annansingh, 2013; Tian et al., 2009)
The institutions do not clearly recognize or reward knowledge sharing. The majority of knowledge sharing is done externally, where there are clear rewards.	(Howell & Annansingh, 2013; Tan, 2016)
Knowledge is often not stored in the correct format to facilitate sharing. Many knowledge repositories often use different software, are poorly organized and the relationship between them is not well or clearly defined.	(Petrides & Nodine, 2003; Rowley, 2000)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Another important factor in the academia that affect the development and implementation of a sustainable culture of knowledge management that prioritizes the sharing of knowledge is related to the distinctive personal characteristics and behaviors of their members (Table 4).

Table 4. Academic characteristics and behaviors that affect knowledge management culture

Academic Characteristics and Behaviors	Authors
Most likely individualistic, independent, and autonomous. In general, they are not aware of valuable expertise within the academia that can contribute to their work, preferring acquire knowledge through others mechanisms, such as internet and personal networks.	(Alexandropoulou et al., 2008; Howell & Annansingh, 2013; Kim & Ju, 2008; Petrides & Nodine, 2003; Rowley, 2000; Starbuck, 1992)
Knowledge as private intellectual capital, and in some cases, the perception is that any attempt to exploit this capital would be against their work ethic. Knowledge is retained in individuals' heads or personal files. Lack of trust.	(Alexandropoulou et al., 2008; Kim & Ju, 2008; Omerzel et al., 2011; Tan, 2016; Tippins, 2003; Townley, 2003; Weber, Morelli, Atwood, & Proctor, 2006)
Knowledge creation more interesting than knowledge sharing, due to the fact of absence of system that protect their intellectual assets.	(Alexandropoulou et al., 2008; Kim & Ju, 2008)
Objective distance from the work of their peers, focusing on individual goals rather than working toward common goals.	(Kim & Ju, 2008; Tippins, 2003)
Typified by lack of flexibility, tending be conservative, and hesitant in accept maturing technologies or rapid changes. Slowness in adopting many principles taught in the classroom.	(Kezar, 2001; Kim & Ju, 2008; Tippins, 2003; Townley, 2003)
Perception of little benefits and rewards in sharing knowledge within the academia. Academics see their community as mainly existing outside the institution.	(Howell & Annansingh, 2013; Mansor et al., 2015; Tan, 2016)

Usually, academic members consider knowledge as their private property that is not freely shared (Omerzel et al., 2011; Tan, 2016; Tippins, 2003). Considering that knowledge increases in value and importance when shared (Tippins, 2003), this individualistic characteristic is not suitable with the knowledge sharing process. This shall become the main challenge of the implementation of a knowledge management culture in the academia.

In addition to the factors listed in Table 4, Tippins (2003) discusses the fact that academic members also tend not to share knowledge due to the individual different skill levels among them. They wonder about the absorptive capacity of certain types of knowledge by the others members.

Knowledge is dynamic and its evolution, or creation of a new one, depends on the sharing of knowledge and experience. In a context where there is not a culture that promotes and encourages KM, the process of sharing is not so easy, and consequently knowledge is often lost (Omerzel et al., 2011). That strengthens the hypothesis that Gill (2009) calls the "erosion" of knowledge. Howell and Annansingh (2013) highlight that often knowledge sharing in the academia involves breaking down barriers and knowledge silos.

The lack of social interaction in the academic context influences effectiveness of the creation of social networks. In Gill's (2009) opinion, networking is not just an activity related to knowledge sharing but also about leverage of knowledge. Some studies have shown that direct contact and oral communication processes may foster the acquisition of the major part of knowledge through face-to-face meetings or telephone conversations (Davenport & Prusak, 1998). Like in the corporate sector, academia should encourage and promote cooperation, collaboration and teamwork.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The environment of competition rather than cooperation is unfruitful, and often discourages or demotivates people. According to the studies, the environment of cooperation has not been recognized or emphasized enough (Tian et al., 2006). Thus, for a successful knowledge management process in academia, it should be strongly considered promoting a cooperative environment. Petrides and Nodine (2003, p. 18) are the opinion that "knowledge management is more likely to take root in communities that need to share knowledge to realize their goals".

FUTURE RESEARCH AND DIRECTIONS

After the review of relevant literature on knowledge management culture focusing on the academic context, the authors point the following further research opportunities:

- First of all, the authors would like to highlight that the majority of studies reviewed were focused on academics' views. It would be interesting other studies that focus on additional views.
- Organizational strategy and knowledge management culture are key factors to the development of initiatives that foster the knowledge sharing environment. Future case studies with empirical validation of models are needed to examine which elements in organizational strategy and knowledge management culture are suitable to the academia achieve their strategic goals.
- Most of knowledge in the academia is shared in the explicit form. However, apart from this EK there is evidence that the major part of TK is not registered or is not properly registered. There is scant evidence in the literature on how to deal with TK or the real necessity of its management. Since the academia missions are related to KM and their intensive TK nature, makes essential the development of research that address this question.
- Finally, due to the globalization process of academia, one area that needs further research is related to the development of KM models in the academic context that address aspects of the dispersion and / or concentration of knowledge, and check the impact of cultural differences between different academic members.

CONCLUSION

In this chapter, based on the critical analysis of literature, it was possible to perceive that the current context of increasing organizational atomization and external vulnerability, assigns an increasingly importance to the role of culture in the KM. Thus, the chapter's authors have the opinion that there is an urgent need for greater awareness on the part of the academia on the importance of establishing a culture that values knowledge and promotes the creation, sharing and application of knowledge in the most effective way.

Given the distinctive nature of the culture of academic institutions and their subcultures there is no single model that fits all situations. There is a need of changes and definition of strategies that can provide directions to the academia to choose, implement, and overcome resistance to a new culture of KM. The change and its implementation should be gradual and should contemplate the unique characteristics of the academia. The cultural change is a difficult element and lengthy process for the institutions like academia. According to Towley (2003, p. 11), "fundamental changes in organization, like KM, are evolutionary and take time to develop".

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Despite the type of approach, depending on the strategy to be defined by the institution, explicit knowledge already has over the years a strong trend of shares and coding actions. A greater effort should be conducted in the sharing of knowledge and in the identification of specific knowledge experts. However, motivating individuals to share knowledge is not an easy task, especially where the institution does not encourage and adopt this process as institutional culture. The authors of the chapter tend to agree with Gill's (2009, p. 609) opinion that "a successful organizational shift in culture definitely signals the success of a KM process".

KEY TERMS AND DEFINITIONS

Academia: A community constituted by universities and public research institutes or laboratories. The academia offer teaching, research, and service to the community in various areas of knowledge.

Academic Members: Researchers, teachers and student incorporated in an academic institution.

Codification Approach: A "people-to-document" approach, which knowledge is carefully codified and stored in databases where it can be accessed and used easily by anyone in the organization. Knowledge is extracted from the person who developed it, made independent of that person and reused for various purposes.

Knowledge-Intensive Organization: A kind of organization that it is characterized by a high proportion of highly qualified workers, due to access to and manipulation of large quantities of knowledge.

Knowledge Management Culture: A culture that is affected by the organizational culture, but refers to particular values, norms and practices pertaining to knowledge management processes.

Knowledge Sharing: Sharing and transfer are interchangeable in the literature, and commonly appear with the same sense. It is a key process related to the knowledge-intensive context. Knowledge sharing promotes the creation of new theories and ideas, and establishment of new research principles.

Organizational Culture: The pattern of shared practices, norms, and values of an organization that shapes its functioning and the behavior of their members.

Tacit Knowledge: Type of knowledge that is complex, not codified, and presents some difficulty in its reproduction in a document or in a database. It can be get from experience, perceptions and individual values and depends on the context in which is inserted.

This research was previously published in Enhancing Academic Research With Knowledge Management Principles; pages 1-24, copyright year 2017 by Information Science Reference (an imprint of IGI Global).

Chapter 65
ERP On-Premise or On-Demand

Fan Zhao
Department of Information Systems and Operations Management, Lutgert College of Business, Florida Gulf Coast University, Fort Myers, USA

Elias T. Kirche
Department of Information Systems and Operations Management, Lutgert College of Business, Florida Gulf Coast University, Fort Myers, USA

ABSTRACT

This article contends that vendors are now pushing into the small to mid-size organizational markets with simplified, less-risk, less-reward systems while consultants have project experience and have thorough contracts isolating their role. However, SMEs that adopted ERP on-premise solutions before are now facing a dilemma: continuing with ERP on-premise upgrades or switch to on-demand solutions. This article contains data surveyed from Chief Information Officers (CIO) of SMEs with respect to indicators of ERP adoptions. Cost, reduced demand for own IT resources, outage/accessibility and performance were found to be the most critical and important factors to assess ERP adoptions for SMEs.

INTRODUCTION

Enterprise Resource Planning (ERP) solutions have evolved from reorder point and materials management focused systems (MRP) based on mainframes to responsive and integrated resource planning systems based on client-server architectures and web platforms. Through data standardization and process integration, ERP systems have the potential to facilitate communications and co-ordination, enable the centralization of administrative activities, reduce information systems (IS) maintenance costs and increase the ability to deploy new IS functionality (Gattiker & Goodhue, 2000). ERP systems are adopted for strategic, technical, and operational reasons including: providing an integrated "enterprise" wide application with real-time data access available across the entire organization, simplifying and standardizing systems and business processes, and replacing legacy systems. When they are properly implemented, ERP systems are able to bring operational, managerial, strategic, information technology (IT) infrastructure and operational benefits to their customers (Shang & Seddon, 2000). Motivations which have become more dominant

include pressure to keep up with competitors on a global scale, mergers and acquisitions and the need for restructuring, and combining and integrating business processes. ERP systems have spread rapidly among organizations and according to Allied Market Research (2015), ERP market size is expected to reach $441.69 billion by 2020.

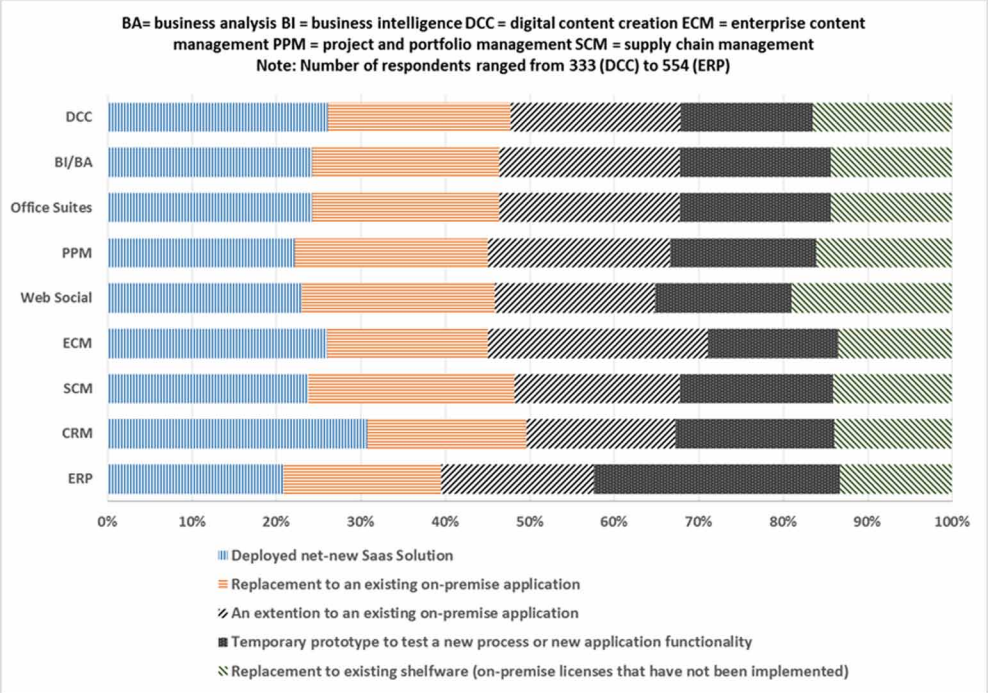
During the last decade many small and medium-sized enterprises (SMEs) have tried to adjust their business operations to cope with dramatic changes in the market. SMEs are trying to adopt better solutions to improve the effectiveness and efficiency of their business processes. Benefits from ERP systems are obvious. Gattiker and Goodhue (2000) describe the ERP benefits in following aspects: (1) improving the integration of information flow between sub-units; (2) centralizing the administrative activities, such as accounts payable and payroll; (3) reducing costs of system maintenance; (4) increasing the ability to deploy new IS functionality; (5) enabling transformation from inefficient business processes to accepted best practices. In this case, an ERP system seems to be one of the best solutions to SMEs (Olson & Satre, 2007). Since the majority of large companies have already implemented ERP systems, today ERP vendors are shifting their focus towards SMEs. Several reasons have encouraged the interest of ERP vendors towards SMEs. These include saturation of the market as the majority of large enterprises have implemented ERP software, the pressure for supply chain integration between large small enterprises, the high amount of SMEs compared to the number of large enterprises, and the technologies development alongside the availability of relatively inexpensive hardware.

In recent years, after many SMEs adopted various ERP packages from different ERP vendors, a new approach is available for ERP adoption called cloud computing, which supports an on-demand delivery of computing, storage, applications and collaborations over the internet. A recent International Data Corporation (Mahowald & Sullivan, 2012) report shows global revenue in cloud software market reached $22.9 billion and will grow to $67.3 billion in 2016. This projection includes revenue generated by the shift from on-premise to on-demand providers as well as by the planning activities and service architecture requirements behind the shift. Cloud computing can be adopted as one of the following services (Bhardwaj, Jain, & Jain, 2010; Kim, Kim, Lee, & Lee, 2009; Linthicum, 2010; Velte, Velte, & Elsenpeter, 2010; Wang & He, 2014):

- **Software as a service (SaaS):** Providing software subscription services;
- **Storage as a service:** Providing remote storage resource services;
- **Database as a service:** Providing remotely hosted database services;
- **Information as a service:** Providing remotely hosted information services;
- **Process as a service:** Providing business processes based on remote resources;
- **Application as a service:** Also known as SaaS;
- **Testing as a service:** Providing testing services for local or remote systems;
- **Platform as a service (PaaS):** Providing a complete platform to support application development, interface development, database development, storage, information and testing;
- **Infrastructure as a service (IaaS):** Providing a service to access computing resources remotely;
- **Security as a service:** Providing core security services remotely over the internet;
- **Integration as a service:** Providing a complete integration stack service.

Typically, a cloud ERP model refers to a traditional ERP solution which is hosted off-site. This model has the possibility to access real-time data without complex and costly remote-access technology. As a comparison, the SaaS model has a smaller technology footprint which is best suited for organizations

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use



with minimal technology infrastructure in terms of complexity, size and network reach. Additionally, a cloud ERP provider can host a SaaS model within its own infrastructure as an alternative to locating the system on-premise of the purchasing organization. There are three distinct ways to implement a cloud ERP model, and the reader can refer to Beaubouef (2011) for additional information:

- **Software as a service:** A subscription model for small customers who share hardware;
- **Hosted ERP:** A typical solution for large customers who have separate hardware and instances;
- **Hybrid ERP:** A combination solution that maintains on-premise software as well as a degree of on-demand services.

Clearly, SMEs which adopted ERP on-premise packages earlier are facing a new challenge now: when a new version of the on-premise ERP arrives, are the companies implementing the ERP upgrade on existing infrastructure or switching to on-demand ERP? If on-demand is the choice, then what is the model to adopt? A survey of the market (Figure 1) in Anderson et al. (2012) shows that an increasing number of companies are considering on-demand services for different applications with SaaS.

This shift in technology is not only impacting buying decisions but also many large vendors of ERP related gears that are restructuring their labor force to adjust to a more software-centric business environment (Gallagher, 2016). Despite this important change, there is virtually no empirical research that has been done to evaluate and compare the two ERP adoption models for SMEs. To address this gap, this study investigates the benefits of the on-premise and on-demand ERP solutions for SMEs, summarizes factors influencing CIOs and IT managers in the adoption decision, and classifies critical factors in a framework to guide the decision process.

Figure 1. How SaaS is developed by application (adapted from Anderson, Britz, & Bell, 2012)

LITERATURE REVIEW ON ERP DEPLOYMENT

The primary purpose of ERP upgrades is to take advantage of new technologies and business strategies to ensure that the organization keeps up with the latest business development trends and in the elimination of non-value-added activities (Zhou & Ji, 2015). Therefore, the decision to upgrade ERP is usually not driven by code deterioration or anticipated reduction in maintenance costs alone. According to Swanton (2004), 55% of upgrades were voluntary business improvements triggered by the need for new functionality, expansion or consolidation of systems; 24% of upgrades were triggered by technology stack changes; 15% of upgrades were forced by de-support of the running version of software to avoid vendor support termination; and 6% of upgrades were triggered by bug fixes or statutory changes. Nevertheless, the decision to upgrade to add functionality to the system most often comes at a very high cost (Montgomery, 2004). Swanton (2004) indicated that the cost of each upgrade includes 50% of the original software license fee and 20% of the original implementation cost per user, which means over 6 million dollars for a 5,000-user system. Contributing to the cost, typical ERP upgrade requires eight to nine months of effort with a team equivalent of one full-time employee per 35 business users.

The ERP-adopting organization does not have to develop and rewrite the ERP system itself but it rather replaces (or upgrades) the old version with a readily available new version from the ERP vendor. However, a lack of experience may cause the cost and length of the upgrade project to approach or even exceed those of the original ERP implementation effort. Typically, every three years a major ERP upgrade and several small upgrades are needed to keep the system running smoothly. Therefore, organizations will spend a significant amount of money on each ERP upgrade project notwithstanding the reason for it.

Another choice for ERP deployment is through cloud computing which can support an on-demand delivery of ERP over the internet with substantial benefits for SMEs. However, a cloud computing model should be carefully evaluated since not all deployments have the same response on business requirements. Cloud services are provided through four deployment models (Mell & Grance, 2011):

- **Private Cloud:** One which the platform for cloud computing is implemented on a cloud-based secure environment that is provisioned for exclusive use by a single organization. It can be owned and maintained by the company or by a third-party firm. It may be deployed on or off premises. As a result, private cloud is best for businesses with dynamic or unpredictable computing needs that require direct control over their environments;
- **Public Cloud:** Is a type of cloud hosting in which the cloud services are delivered over a network which is open for public usage. This model is a true representation of cloud hosting by which the service provider renders services and infrastructure to various clients. It exists on the premises of the cloud provider. Public cloud services may be free or offered on a pay-per-usage model. The main benefits of using a public cloud service are the scalability to meet needs, the ease and affordability of set-up because hardware, application and bandwidth costs are covered by the provider, and the low to no waste of resources because you pay for what you use;
- **Community Cloud:** Is a type of cloud hosting in which the cloud infrastructure is mutually shared between many organisations that belong to a particular community, i.e. banks and trading firms. It may be owned, maintained, and operated by one or more of the organizations in the community, a third party, or some configuration of them. It may be deployed on or off premises. The goal of a community cloud is to have participating organizations realize the benefits of a public cloud but with the added level of privacy and security usually associated with a private cloud;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Hybrid Cloud:** The cloud infrastructure is an arrangement of distinct cloud infrastructures (private, community, or public) that remain unique entities, but are linked by standardized or private technology that enables data and application portability. Hybrid cloud gives businesses greater flexibility and more data deployment options. For example, resources that are non-critical like development and test workloads can be housed in the public cloud that belongs to a third-party provider. While the workloads that are critical or sensitive must be housed internally.

Consequently, the SME interested in adopting on-demand ERP solution will have to evaluate the functionality of the system provided by the deployment models above. Specifically, for SMEs, Wang & He (2014) indicated that there are three different cloud-based services available. General purpose cloud-based services provide a large variety of services for a wide range of industries, such as video-conferencing and data storage. Industry-oriented cloud-based services are designed toward some special business requirements in targeted industry, such as cloud manufacturing systems (Tao, Laili, Sun, & Zhang, 2013). The last type of services, named fully customized cloud-based services, focuses on specific needs of SMEs by offering tailored services such as a factory's online ordering service. ERP cloud services can be offered through the first two types of services. However, it is challenging to provide a totally customized ERP system for SMEs in the cloud because the implementation cost will be high, maintenance will also be expensive, and there will be many issues toward system upgrade.

Besides complete ERP systems, ERP functions or modules can also be deployed through cloud services. License fee and/or maintenance fees will be charged based on the use of the software such as per number of users and ERP functions/modules adopted. Companies will no long need to purchase the software and keep IT staff, which will make the initial deployment of EPR much less expensive. Additionally, according to Gheorghe & Lupasc (2012), cloud ERP solution will save about 30% project time after analyzing the critical path of both classic and cloud ERP solutions. Table 1 summarizes the extracted benefits of cloud computing ERP systems from the literature.

Table 1. Benefits of on-demand ERP solutions

Benefits of On-Demand ERP	Reference
Short implementation cycles	Gheorghe & Lupsac, 2012; Karabek, Kleinert, & Pohl, 2011; Purohit, Jaiswal, & Pandey, 2012; Weng & Hung, 2014

Based on the delivery model, cloud services can be categorized as SaaS, PaaS, IaaS, and others as indicated in previous section. Because of the relatively small scale of SMEs' production or services, they generally tend to adopt SaaS ERP solutions, rather than PaaS and IaaS (Wang & von Laszewiski, 2010). With SaaS, an organization switches all the IT responsibilities to the cloud service provider. The SaaS model provides an integrated solution consisting of servers, bandwidth and software packages that customers need.

In this study, we focus on SaaS as the main cloud service for SMEs, and in the remainder of the study only this form of on-demand for ERP are considered when comparing with the traditional on-premise deployment. Given the many choices for ERP adoption (Laukkanen, Sarpola, & Hallikainen, 2007; Raihana, 2012) we summarize the following three ERP solutions related to SaaS:

- **On-Premise Software:** The organization purchases, implements and runs the ERP package on servers and computers on the premises of the organization;
- **Cloud-Hosted:** The organization purchases the ERP package and adopts the hardware management model from a cloud service provider who allows the organization to implement and run the ERP system at a remote facility (cloud);
- **Cloud-Software as a Service (SaaS):** The organization doesn't purchase any software and hardware. Both parts are licensed on a subscription basis. Typically, the service provide is the ERP software publisher.

However, we widen the studies of Laukkanen et al. (2007) and Raihana (2012) by advancing that there are four ERP deployment options which SMEs can choose when they face the ERP upgrade decision: 1. Keep updating On-Premises; 2. Switch the ERP hosting services to a Cloud service provider; 3. Adopting SaaS for a majority of ERP functions while keeping part of the functions as on-premises; and 4. Completely adopting SaaS from a Cloud service provider for the ERP system. We provide a guideline for the adoption process by formaly comparing the benefits for each deployment option in Table 2.

Additionally, there are several challenging issues that adopters of on-demand ERP should be concerned with such as cost, security and performance of the system among others (Zardari & Jung, 2016). However, although companies can adopt on-demand ERP solutions at a much lower initial cost and lower total cost of ownership comparing with the traditional ERP solutions, the ongoing monthly or annual payments may be higher for on-demand adopters on account of the subscription payment methods can be complex and incremental as the company growths in size and/or revenues (Panorama Consulting Group, 2009). Table 3 summarizes the extracted challenging factors of cloud computing ERP systems from the literature.

As an increasing number of SMEs, which first implemented on-premise ERP solutions, are now considering on-demand solutions as one of the options for future system upgrades, we seek to provide a comprehensive understanding of two ERP solutions; on-premise and on-demand, by collecting CIOs' perspectives and experiences with their organizations' ERP adoptions. In order to provide a classification framework for the survey results, we ranked and compared the response weights with the study of Kilic, Zaim, & Delen (2014, 2015) who identified the following three main criterions during ERP system selection process:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Comparison of four ERP deployment options for SMEs

	On-Premises ERP	Cloud-Hosted ERP	Hybrid-Hosted ERP	SaaS ERP
IT Requirements	More Intense: require a full IT department	Moderate	Less Intense	Minimum
Initial Investment	Largest Investment including software, hardware, and all other related costs	Moderate Investment	Less Investment	Lowest cost (only license related fees and client computers)
Software License	Organize owns the package	Organize owns the package	Rent the majority parts of the package	Rent all the whole ERP package
Upgrades Requirements	Have to pay for all upgrades	Have to pay for all upgrades	Only pays the upgrades hosted by organization itself	ERP will be automatically upgraded to the latest version
ERP Package Customization options	Unlimited	Unlimited	Very Limited for the hosted part and almost unlimited for the part on premises with compatibility	Very Limited
Add-on functions after initial implementation	Unlimited with compatibility	Unlimited with compatibility	Very Limited for the hosted part and almost unlimited for the part on premises with compatibility	Very Limited
Data Access	User-Based security	User-Based security	User-Based security for hosted part; Restricted Corporate-wide for the part on Premises	Restricted Corporate-wide
Data security	Define customized security policies on premises	Totally depend on security policies from the service provider	Totally depend on security policies from the service provider for the hosted part; with freedom for the part on premises	Totally depend on security policies from the service provider
Extra Data Storage request after initial implementation	Buy and add hardware	Request more space from the service provider by paying extra fees	Request more space from the service provider by paying extra fees	Request more space from the service provider by paying extra fees
ERP vendor/service switching barriers	Very high	Very high	Low with hosted part and high for part on premises	Lowest

- **Business Criteria:** Considering all the factors from business operations perspective. There are several sub-criteria in this group, such as vision, brand image, references, adequacy of advisors and developers, after sales service, and know-how sharing policy;
- **Technical Criteria:** Considering all technology related factors, such as functionality, reliability, compatibility, accessibility, security, usability, and cross-module integration;
- **Financial Criteria:** Considering cost related factors, such as ERP package purchasing cost (subscription fee, in cloud SaaS) including software license, hardware, and network costs, implementation cost including customization, consultancy and training costs, and maintenance cost including service and technical support costs

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In that study, the authors ranked the importance of factors in the selection of ERP systems indicating that business criteria have the lowest importance weights with the financial criteria ranking the highest in the selection process. In our study, we adopted this process theory approach to classify all the identified factors influencing the ERP selection decisions.

RESEARCH METHODOLOGY

The survey instrument was designed and evaluated by a group of experts for content validity. Six experts from two universities and four organizations were asked to read the survey and decide whether in their opinion it measured what its name suggested. The survey items measured the factors reflecting the benefits and challenges of on-demand ERP solutions identified from the literature. The survey questionnaires were improved according to comments from the experts. The final survey was returned to the experts and approved before mailed out to companies.

The survey questionnaire was sent to CIO/IT managers in 272 SMEs who are currently using on-premise ERP solutions. Company size is measured by the number of employees (Chow & Holden, 1997). In this study, an SME is one with fewer than 500 employees. A total 63 survey responses were obtained after removing 7 incomplete questionnaires. The distribution of the respondents was as follows: gender (male: 76%, female: 24%), deployed EPR systems are from a wide range of vendors such as SAP, Microsoft, Syspro, NetSuite, etc. The number of employees range from 36 to 483 (64% small companies and 36% mid-size companies). A wide variety of industries were represented in the responses as shown in Table 4.

RESULTS AND DISCUSSION

The survey focused on the benefits and the challenging factors involved with ERP adoptions decisions when considering on-premise and on-demand solutions. For each item, a brief description and a 5-level rating scale ranging from extremely critical and important for ERP adoption evaluation to neither critical nor important for ERP adoption evaluation were provided. We computed the simple average for all items

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Industry summary

Industry Sector	Number of Companies
Manufacturing	18
Information technology	19
Retail	5
Health Services	16
Insurance	5
Total	**63**

loading in each of the factor for all responses regardless of the industry type. The numerical anchors for the 5-level rating scale are indicated in Table 5.

According to the average ratings in Table 5, the results indicate that there are top four factors identified by CIOs facing to the options of on-premise or on-demand solutions which are extremely critical and important in ERP adoptions for SMEs: Cost, Reduced demand for own IT resources, Outage/Accessibility and Performance. The second group, which is critical and important, includes five factors: Control of the system, Elasticity/Flexibility of services, Short implementation cycles, Security and Scalability. The rest of the factors, Integration, Flexibility of customization, and Focus on core business, received lower ratings from CIOs.

To provide a framework for the decision process, we ranked and classified the factors in line with the ERP selection criterion process model (Kilic et al., 2014, 2015), which is presented in Figure 2. The results indicate that the business criteria which is most often analyzed in the initial stages of the adoption process contains the lowest ranking values of concerns by CIOs. Thus, companies should start the decision process with an evaluation of the brand value and recognition, references, adequacy of advisors and developers, after sales service, and know-how sharing policy, before moving into higher priorities

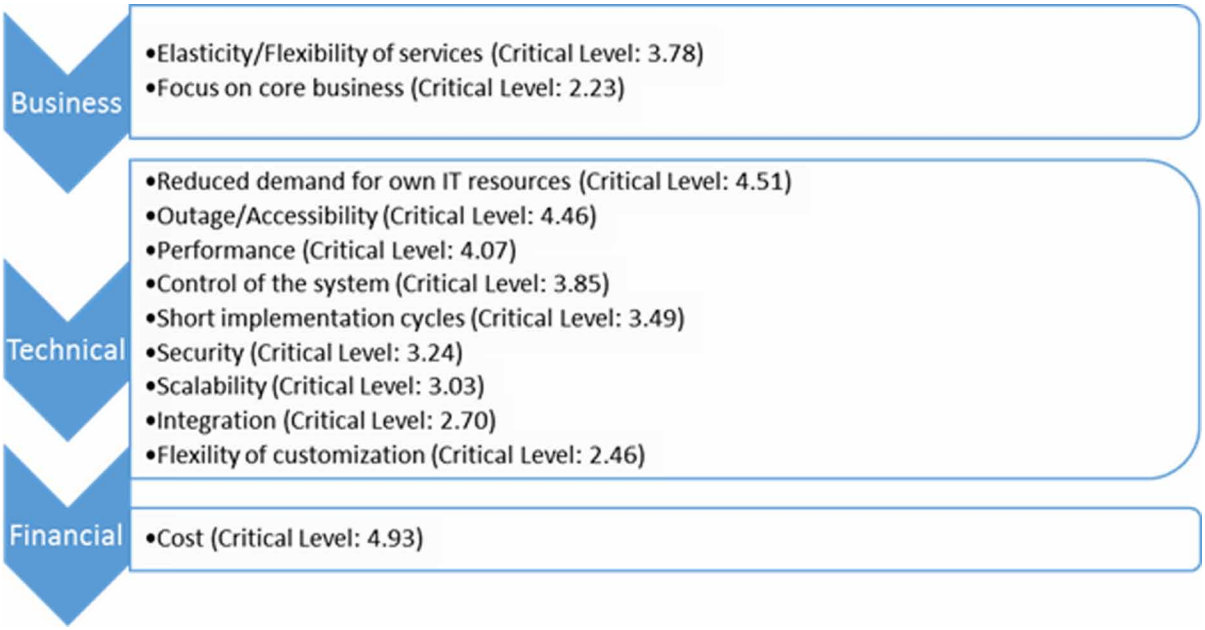

Table 5. Survey averages by factor

Factor	Average (1 – 5 Scale)
Cost (including purchasing, implementation, and maintenance)	4.93
Reduced demand for own IT resources	4.51
Outage/Accessibility	4.46
Performance	4.07
Control of the system	3.85
Elasticity/Flexibility of services	3.78
Short implementation cycles	3.49
Security	3.24
Scalability	3.03
Integration	2.70
Flexibility of customization	2.46
Focus on core business	2.23

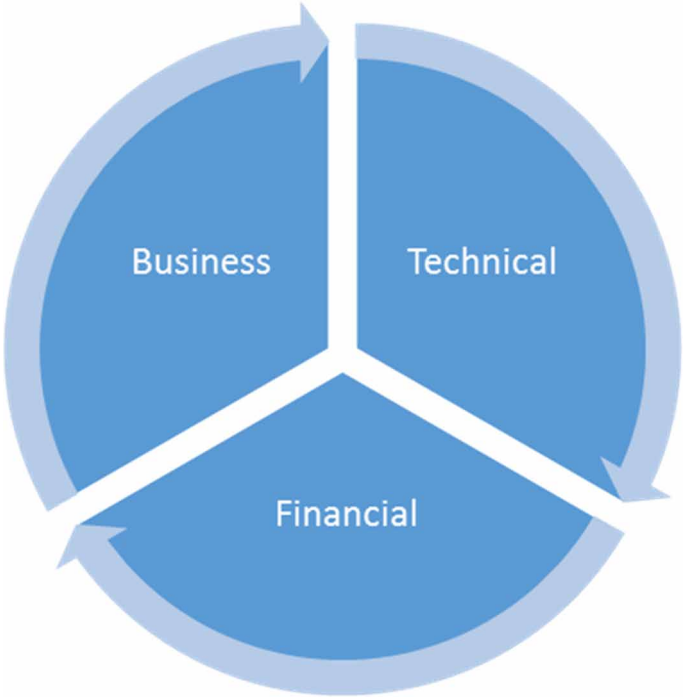
factors. Typical concerns in this category relates to the flexibility of services to best fit company strategies and priorities which may change overtime. Therefore, the ability of the selected option to adapt to new strategies and the growing needs for technology is the focus in this phase. Also in this stage, the strategy should be reviewed in terms of how well it supports non-core and core operations details such as day-to-day functions for the technology platform, website integration, marketing solutions, portfolio management, payment processing and order management capabilities. It is worth understanding the low-ranking value of this stage in light of the need for companies to focus on core functions in order to remain competitive. In this research, we do not address first time adoption of ERP packages in SMEs and, specifically, the question posed to CIOs relates to whether it is critical that the ERP selection handles strictly core business processes when considering replacement systems. In this situation, the CIO already knows that the functionalities affecting core processes will only be improved from an upgrade perspective and therefore the focus on core business processes is not a high-ranking concern in the adoption decision. Additionally, and particularly for SMEs, ERP packages are adopted to relieve organizations from the tedious day-to-day processes and overhead (Karabek et al, 2011) such as payroll and accounts payable processing, sales order tracking and other routine tasks, which would allow them to focus on core competency most likely requiring specialized systems. This also implies that, from a perspective of switching to a cloud system, ERP systems do not provide significant advantages to SMEs on core processes. Thus, the low ranking can be explained by the CIO's experience with competing systems, including cloud platforms, and an ERP market which offers broad systems with little differentiation in terms of functional capabilities (Markus, Petrie, & Axline, 2000).

Figure 2. Classification of key factors influencing ERP upgrade

The second category, technical, is the second stage in the review and adoption process, and generally represents the functionality, reliability of the system, compatibility and cross-module integration.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use



It is a lengthy evaluation process and represents a mid-range of critical requirements for SME adoption of ERP solutions. It addresses the functionality of the ERP solution for example by the ability of running report on a periodic basis and supporting applications to enable data visibility across suppliers and customers. The technology solution should represent the firm's strong commitment in fulfilling its mission and goals and must be balanced in addressing requirements to reduce costs (next category) and response time, increase customer service levels, provide strong process controls, and to reduce risks associated with system outage, data control and security, which is often one of the major benefits of an on-premise solution. However, on-demand solution allows smaller firms with limited IT staff to benefit from economies of scale and efficiencies of this model, and services are accessed via the internet and are often available to users from the office as well as on mobile devices. Other important factors for SMEs is the ability of on-demand solutions to positively address scalability, short implementation cycle and reduction on the use of existing IT resources, which all carry moderate weights in the solution decision.

The cost benefit is a major driver for the adoption of a particular ERP solution and it may include costs associated with moving from existing on-premise IT assets to usage-based pricing schemes for the on-demand solution. This factor received the highest weight in the survey representing the most critical category for the solution decision. It also represents the final stage in the adoption process in line with the proposed framework. The cost category takes into consideration purchasing costs, implementation cost and service and support costs among other financial concerns. Of critical importance for SMEs under this factor are the low entry cost due to the usage-based pricing approach, the lower overhead for IT maintenance and upgrades, and the ability to plan and expand according to budget estimates for the on-demand option. Instead of licensing server software, most commonly a firm would simply need a web browser and appropriate bandwidth since the application and database is hosted in the cloud. Therefore, the lack of little upfront investment is very attractive to many SMEs and it may represent the best of both ERP solutions: the efficiency and cost effectiveness of cloud solutions together with the flexible service and reliability of an on-premise system. However, the SME must be concerned with the migration phase will impact user's perception and acceptance of the technology with consequential impact on productivity. While a migration to such a standardized modular on-demand solution is difficult and costly the long-term benefits may outweigh these short-term considerations.

In the ERP selection criterion process model by Kilic et al. (2014, 2015), financial category was identified as the third step during the general ERP selection process. However, according to the results of our survey, we find that cost in the financial category is the first and the most important key factor when SMEs start to consider the ERP migration. Therefore, our results underlie the fact that most SMEs would conduct budget planning at the early stage of the ERP migration projects rather than consider it after summarizing all the business and technical issues. In fact, most firms would start evaluation of a solution within certain budget restrictions, delineated by existing expenditures or by future allocation of specific resources conducted during the firm's annual planning activities. When evaluating options, frequently there are configuration issues, security and confidentiality, networking, hardware, costs and other concerns that may meet business, technical and financial requirements at different levels of fulfillment, and the company must continuously cycle through the three phases in search for the best fit solution. Consequently, the existing model does not properly reflect the actual process flow in SMEs. Therefore, we propose a modification, shown in Figure 3, in which the continuous model from business to financial categories is replaced with a segmented cycle model for the ERP selection projects in SMEs. Implementing this model would enable SMEs to have a flexible approach closely matching their adoption process. They can start from the financial step if cost is their priority concern for the project.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Modified ERP selection criterion process model

However, if budget considerations are less critical, the company can start considering business critical factors first, cycle through technical and then the financial considerations, which may not be the last phase if the solution does not satisfy all the initial requirements in the three phases. This process will continuously cycle through all phases searching for the best fit solution.

In this study we recommend that SMEs, when making adoption decisions, not only implement the circular classification framework from Figure 3 but also use it in conjunction with the guidelines in Table 2 for comparison of the different ERP deployments options to reach the best fit solution. For example, when a company is in an environment of low budget but experiencing high growth, it is best to select the SaaS ERP option because the initial investment is the lowest and the company can focus on critical business issues. This option also has the lowest switching barriers if the vendor cannot provide efficient or required scalability to support its growth. In case the SME is more concerned with technical issues such as data security, the on-premise deployment would be an appropriate decision because it will keep more control of their business processes and data. When competitive advantages and budget considerations are critical, the company may want to avoid hybrid hosted ERP and SaaS ERP options because both have limited customization options. Additionally, the company must be taken into account that the significance of the ERP selection criteria will change over time.

Four changes may impact the ranking of different factors influencing the choice of an ERP type over time (Garrison, Wakefield, & Kim, 2015; Tsai, Lee, Chen, & Hsu, 2009; Tsai, Lee, Shen, & Lin, 2012): user experiences changes, technology changes, user requirements changes, and economical changes.

Tsai et al. (2009) argue that organizations might have increased their ERP related knowledge and experiences over time after their first ERP implementations. In their comprehensive study on over 200 organizations, over three years, the importance ranking of ERP package selection changed dramatically.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

For example, Ease of Use and Maintenance was ranked #7 in the list of 20 factors and became to #1 three years later.

Technology changes continuously influence the organization's choices of ERP packages. Fifteen years ago, the majority of the organizations considered the on-premise ERP option. However, with the emergence of cloud computing technology, more and more organizations are now switching to cloud ERP. Therefore, when organizations source ERP packages, some of the factors in consideration that used to be critical and important, such as system integration, have now become less important; and some new factors, such as outage and accessibility, have become more critical and important.

User requirements is in some cases perceived as means of driving ERP evolution (Kilic et al., 2014). In the selections of ERP package, organization's requirements are one of the key factors influencing ERP technology. For instance, ERP modules and cloud version ERPs have been developed because of the adoption requirements from many SMEs. Also, data warehouse and data analytics modules have been developed because of the analysis requirements from ERP users. Similarly, ERP mobile portals and applications have been developed because of mobility usage requirements.

Organizations may also consider economical changes during their ERP selections. According to Kremers and Dissel (2000), both ERP vendors and users were impacted by the financial crises. Because of the economic crises, organizations hesitated to invest in switching to ERP from their legacy systems or upgrading their current ERP packages after the initial implementation. Chiang et al. (2010) found that SaaS became one of the first options in ERP selections as a consequence of the economic crisis in 2009. Organizations believe that SaaS will help them recover during the economic crisis and any factors in ERP selection related to cost need be emphasized while the importance of other factors should be reduced.

CONCLUSION

There are several interesting results summarized from data. First, besides the three factors (cost, reduced demand for own IT resources, and performance) that are commonly regarded as critical success factors in ERP selection, outage and accessibility are rated as one of the highest factors. It is obvious that system outage is closely correlated with on-demand adoptions. After the outage issue of Microsoft Azure, CIOs realized the importance of system accessibility for on-demand solutions. Second, security was emphasized by several researchers in their studies of cloud computing (Kim, 2009; Saeed et al., 2011; Truong, 2015; Zadari & Jung, 2016). However, according to our data, CIOs only rated security in the second importance group. Third, most of the small companies prefer adopting on-demand solutions while mid-size companies hesitate to switch from current system to on-demand ERP.

The results of this study provide organizations with valuable knowledge that might prompt them to make significant changes in their current ERP related processes and in the acquisition of enterprise packaged software, which could result in substantial benefits. Our research helps both researchers and practitioners understand how ERP adoption choices impact SME's strategies and concerns. To researchers, this study shows the tradeoffs between on-premise and on-demand ERP adoptions and offers opportunities to expand the model in future research. To practitioners, this study identifies critical issues related to ERP adoption in SMEs, allowing CIOs and other IT managers to evaluate strategies and concerns thoroughly before making final decisions. Additionally, we proposed a new framework which cycles through phases in the adoption process extending a sequential process in the literature, and provided guidelines to be used with the framework to help SMEs search for a best fit solution between

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

on-premise and on-demand options. ERP vendors will also benefit from the insights from CIOs and on the challenges perceived by SMEs for future ERP developments and marketing.

One limitation we found in this study is that our proposed framework may reduce the relative importance of the weights found in the survey. However, the critical factors are still components in the framework which represents a more logical process for ERP selection and adoption. In our future work, we will investigate the reduction on the level of importance of key factors by SMEs which adopted the proposed model for ERP selection decisions.

Chapter 66
Online Organization: A Flexible, Agile and Adaptable Organizational Instrument

Carlos Páscoa

Ana Telha
Portuguese Air Force Academy, Pêro Pinheiro, Portugal

Tiago Santos
Portuguese Air Force Academy, Pêro Pinheiro, Portugal

ABSTRACT

Competitiveness has forced organizations to improve and adapt faster allowing the most capable individuals to fulfil organizational positions. Despite the need to overcome difficulties in resource management, the Portuguese Air Force still uses a method centered in hierarchical structure and career progress. Competencies within job positions are not yet typified, meaning that the individual that occupies a certain job position may not be the most capable. To solve this problem, this article studies an online organization model that represents the concepts of organizational entities, job positions, resource management and human resource management through competency management. The model describes each concept individually and the relationships between components. If validated and implemented, the model will allow an improvement in human resource management effectiveness, and efficiency.

INTRODUCTION

Change is the law of life and those who look only to the past or present are certain to miss the future. (John F. Kennedy)

Tribolet and Magalhães (2007) affirm that the challenges that an organization faces at each moment in history determine its survival, according to its capacity to respond, adapt and change.

In the current organizational context, technological, political, economic, social and cultural changes are an unavoidable reality (Ceitil, 2010). Likewise, increasing competitiveness among organizations contributes to the need for organizational change, ensuring the organization's survival.

According to Quintas (2016), "Transversal competence consists of an observable behavior associated with every individual belonging to the Organization, intrinsic or developed in various organizational contexts and useful to the Portuguese Air Force (PtAF). "Such competences assume an extremely important role for the rotation between organizational positions, allowing the organization to engage the most capable individual to perform a given Organizational Position…" (Quintas, 2016; Telha et al., 2016).

It is crucial to effectively manage people in accordance with their competencies in order to continuously improve its organizational performance. Therefore, dematerialized repositories for people and organization must co-exist.

IMPORTANCE OF THE STUDY

The problem can be stated as: within the PtAF, there is no dematerialized system that represents and manages individuals by competencies. The problem can be characterized through the following topics:

- A methodology for defining military attributes has not been defined;
- No profiles are defined for an Organizational Position (OP), which include the requirements in terms of skills and professional profile.

Associated with the problem found the following research question was developed:

- Is there a need to create a dematerialized model for the management of human and material resources in PtAF?

OBJECTIVE, SCOPE AND RESEARCH METHODOLOGY

This paper intends to create a PtAF Online Organization model (OOm), as opposed to the role that can be implemented in the organization, allowing a better management of human resources based on skills as well as material resources.

The scope of this work is within the PtAF organization, applying to it all relevant concepts of Organizational Engineering, as well as the revised literature, in order to create a model that fits correctly.

The methodology proposed by Quivy & Campenhoudt (2005) was adopted in this research. According to the authors the scientific process is divided into three acts: "Rupture", "Construction" and "Verification". Each act is divided into several stages (Quivy & Campenhoudt, 2005).

Rupture is intended to allow the researcher not to be inspired by "immediate appearances or partial positions", thus avoiding being caught by prior knowledge. The construction allows the creation of an "organized conceptual system." Finally, verification allows the propositions validation (Quivy & Campenhoudt, 2005).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Research Hypotheses

The fundamental question, guideline for this research, is the following:

- **Research Question (RQ):** How should a model for a dematerialized Online Organization be built for the PtAF?

In order to better answer the question of departure, it has been broken down into the following derived questions:

- **Derived Question Q1:** How is it advantageous for the PtAF to create an OOm?
- **Hypothesis H1:** The OOm allows better management of human resources, optimizing personnel placements in organizational positions, applying the concept of human resources management by competencies and ensuring the choice of the most competent person.
- **Derived Question Q2:** Are there systems in the PtAF that allow the management of human and material resources in an integrated and dematerialized way?
- **Hypothesis H2a:** There are systems that manage resources independently.
- **Hypothesis H2b:** The information is stored in digital and paper format.

LITERATURE REVIEW

The bibliographic review is based on contextualization of the concepts studied. The Model Development section explains the contribution of each concept.

Organizational Engineering

Organizational Engineering is a concept that dates back to the 1990s and is defined as a set of knowledge, principles and practices that govern the implementation, design and operation of an organization (Liles & Presley, 1996).

This concept arises from the need to increase the performance of organizations due to their increasing competitiveness (Eriksson & Penker, 2000).

Organizational Engineering establishes the use of methods to increase the effectiveness, communication and coordination of the most diverse types of organizations. By focusing on how information is structured, it can improve the organization's results without changing individuals (OEI, 2016).

Organizational Self-Awareness

The Merriam-Webster Dictionary (2016) defines self-conscious as "conscious of one's own acts or states as belonging to or originating in oneself: aware of oneself as an individual". An organization's self-awareness is the ability to be aware of itself as a whole, a sum of the individual consciousnesses of its components (Tribolet, 2007).

Interactions among individuals in the same organization are of great importance in maintaining organizational awareness, for although the sum of individual consciousnesses does not materialize in the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

collective consciousness of the organization, the fact that there are close interactions between individuals allows for the creation of a dense network of constant updating of each one, thus synchronizing the mental representation they have of the organization, or in other words, the organizational consciousness (Tribolet & Magalhães, 2007).

Therefore, Organizational Self-awareness (OSA) should be seen as a phenomenon both individual and collective, which is supported by continuous communication between individuals in the organization. Knowledge and awareness capacities are key factors for the development of OSA (Vicente, 2007).

Ontology

Several authors have defined "Ontology" in different ways according to the context in which it is applied. Uschold & Gruninger, (1996), defined ontology as the term used to refer to the shared understanding of a certain domain of interest. Perez and Benjamins (1999), in the context of Artificial Intelligence, reached a different definition as something that defines basic concepts and relations that compose the vocabulary of a certain area, as well as the rules to combine concepts and relationships, and define vocabulary extensions. However, the most widely used definition is Gruber's (1995), who states that ontology is an explicit specification of a conceptualization.

The formality of ontology can range from highly informal, semi-informal, semi-formal, and strictly formal. This degree of formality affects the language used in the definition and construction of the ontology, which evolves from a natural language into highly informal ontologies, into a careful, meticulous language and concepts defined through formal semantics, in strictly formal ontologies (Uschold & Gruninger, 1996).

Enterprise Architecture

The International Standard ISO / IEC / IEEE 42010 (Institute of Electrical and Electronics Engineers, 2011) defines architecture as the fundamental organization of a system, incorporated in its components, in its relations and relations with the environment, and the guiding principle the design and evolution of the system. Therefore, architecture allows an integrated view of the system being designed or studied (Lankhorst, 2013).

By applying the concept of architecture to an organization as a whole, one obtains the concept of EA, a set of principles, methods and models that are used in function of the design of the organizational structure, as well as its business processes, information systems and infrastructures (Lankhorst, 2013).

The Enterprise Architecture (EA) brings a holistic view of the organization (Lankhorst, 2013), but in order to facilitate the description of the organization as a complex system, it is divided into several levels: Organizational, Process, Information and Application Architectures. All these levels serve the EA in order to align the organization's strategy with its infrastructure and information technologies.

Information Architecture

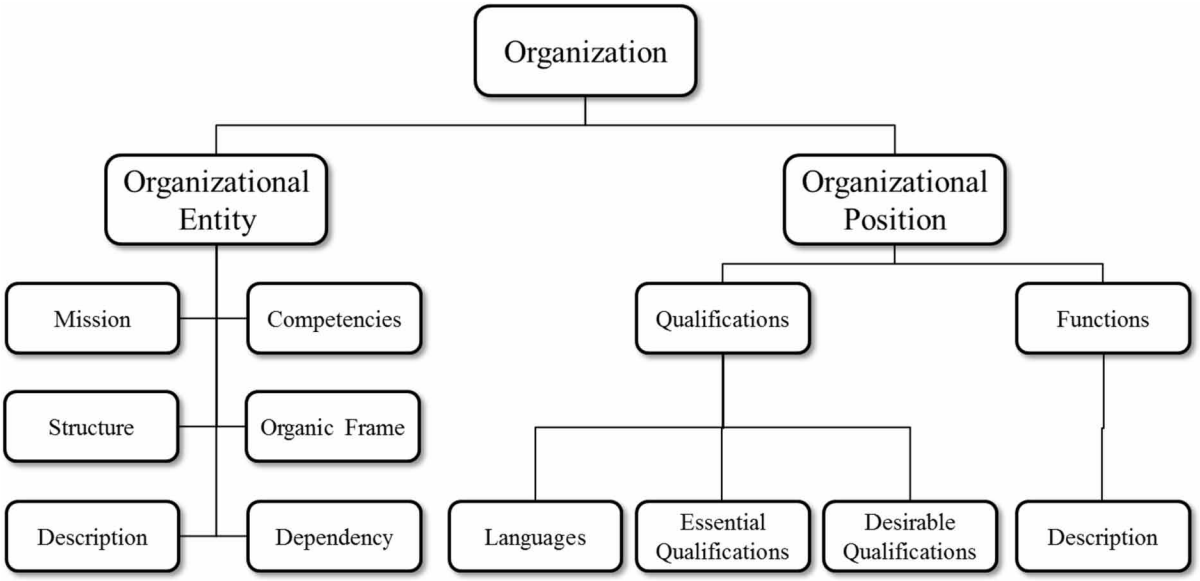
Information Architecture (IA) is the level of EA that is most relevant to this work and will be explained in more depth.

To better explain the concept of IA, it is necessary to first define "information" and "Data". "Data", can be defined as facts in their raw, unaltered, disorganized state, only representative of events occurring

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the organization (Laudon & Laudon, 2016). Data that have already been submitted and processed to bring value and meaning and that are somehow useful for the organization, is called information (Laudon & Laudon, 2016).

The concept of Information Architecture is defined in different ways by several authors. Hoogervorst (2009) defines IA as a consistent and coherent set of principles and standards that guide the way information is used and handled. Rosenfeld et al (2015) present IA in four premises:



- The structural design of shared information environments;
- A synthesis of organization, recording, search and navigation systems within digital, physical and cross-channel systems;
- The art and science of shaping information to support its use, ease of access and understanding;
- An emerging field and community focused on transposing the principles of design and architecture into the digital environment.

Páscoa (2012) considers IA as the structuring of the informational entities of the organization, defining which are necessary for the business processes and how they relate to each other. It then functions as a repository of all useful information for the organization allowing the creation of the necessary information software.

Organizational Concepts

In an organization, the concepts of Organizational Entity (OE) and Organizational Position must be well defined. Both concepts have a preponderant role in the organization and the human resources management must be carried out in order to better adapt to the needs of the organization. Figure 1 represents organizational concepts.

Figure 1. PtAF organizational characterization (Telha at al, 2014; Monteiro, 2014)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

An OE consists of high-level bodies that make up the organization, and which are filled by individuals in the organization (Páscoa et al, 2011; Telha et al, 2014; Monteiro, 2014). An OE has attributes:

- Name
- Structure
- Mission: Mission to be performed
- Competences: Set OE competencies within the organization
- Organic Framework: Total of the personnel belonging to the OE
- Dependency: Identification of hierarchical dependence
- Organizational Position

The Organizational Position (OP) is one of the attributes of the OE. The OP can be defined as a certain position or function within the organization, performed by people (Páscoa et al, 2011). Its attributes are:

- Designation: OP's Description;
- Functions: A set of responsibilities and activities that are assigned to the OP, with the expectation that they will be fulfilled;
- Qualifications: They are divided into Languages, referring to the languages to which the individual's proficiency in a given degree is required; Essential Qualifications, those that are essential for the execution of the OP; and Desirable Qualifications, which are the qualifications that it is desirable for an individual to possess to fulfill the OP.

Andrade (2015) developed a representation of the attributes of an Organizational Position for the PtAF. Such a representation is slightly different from that presented above. Table 1 shows that it is possible to characterize two types of attributes, essential and secondary (Andrade, 2015; Telha et al, 2015). Of the first group are:

- Subunit: Organizational Entity in which the OP is inserted
- Position: OP Description
- Rank
- Specialty
- Qualifications: requirements that the individual must possess to perform the OP
- Functions: responsibilities assigned to the OP

The secondary attributes are:

- OP Number / Code
- Observations: useful information for choosing the individual to occupy the OP

By dividing the attributes into essential and secondary, it is possible to elaborate a second representation (see Table 2) of the attributes of an OP in the business processes of the PtAF, that is, those that actually influence the characterization of the OP in the organization (Andrade, 2015; Telha et al, 2015).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. PtAF Organizational Position representation (Andrade, 2015)

Organizational Position		
Essential attributes	Subunit	
	Post	
	Rank	
	Specialty	
	Qualifications	
	Functions	
Secondary attributes	Post Number/Code	Post ID
		Order of Battle
		Normal
	Remarks	

Table 2. Organizational Position representation in business processes (Andrade, 2015)

Organizational Position	
Attributes to represent	Post
	Rank
	Qualifications
	Functions
	Hierarchy

According to Andrade (2015), only the position, rank, qualifications, functions and hierarchy are attributes that characterize the OP. All others are not used or have no influence on the characterization of the OP. Andrade added the Hierarchy attribute to its representation, considering relevant an attribute that defines the hierarchical dependencies of a OP, either above or below its hierarchical position.

Competencies

McClelland (1973) strongly marked the study of skills with his article on the method of intelligence testing for a given job position arguing that intelligence tests are quite fallible since only the intelligence of the individual in question is tested in a given context, and not their competence to perform the function in question. He further argues that the degree of intelligence is not directly linked to an individual's professional success, and then argues that competence tests are far more reliable than intelligence tests.

Camara et al (2010) define competence as "the set of qualities and professional behaviors that mobilize the technical knowledge and allow acting in the solution of problems, stimulating superior professional performances, aligned with the strategic orientation of the Company."

Ribeiro (2015) and Telha et al (2015a), in the PtAF context, proposed a definition: "Competence consists of the abilities, values, behaviors, abilities and qualifications of an individual, inherent in himself or obtained through training, personal experience or professional experience, and that is useful to the organization…" and a set of attributes that allow a generalized characterization of any competence:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Name – competency name
- Description – competency description
- Theme – competency area of interest
- Code – competency unique ID
- Validity – competency validity

It is important to emphasize the need to define the competences associated to a certain OP, by elaborating a competency profile. This competency profile is made up of the generic competences, or transversal competences (TC), and the specific competences (CE) (Camara et al, 2010).

Work has also been developed within the Air Force on these more unique types of competencies. Telha et al (2016) and Quintas (2016) propose that transversal competence "…consists of an observable behavior associated with every individual belonging to the Organization, intrinsic or developed in various organizational contexts and useful to the Air Force." These competencies play a significant role in the selection of candidates and recruitment, and in the rotation of personnel between organizational positions. The model proposed consists of a group of skills grouped into six groups: Individual Excellence, Military Skills, Strategic Skills, Operational Skills, Results and Courage (Telha et al, 2016).

Telha et al (2016) and Quintas (2016) also defined levels of proficiency in order to describe in more detail each of the transversal competences listed. Five levels are defined that define transversal competences: "level 0 - does not have, level 1 - basic, level 2 - intermediate, level 3 - advanced, level 4 - expert" (Telha et al, 2016; Quintas, 2016).

Regarding the specific competences, they were defined for PtAF as follows: "Specific Competence is an observable characteristic, owned by an individual of the organization, which is essential for the fulfillment of the technical function attributed to him, and which can be developed experience or professional training…" (Bonifácio, 2017). In line with transversal competences, proficiency levels were also defined for specific competences, in the same way. These skills and proficiency levels were defined for all the PtAF specialties, grouped in the areas of support, maintenance and operations (Bonifacio, 2017).

Competencies Management

Competence Management is an object of study with considerable importance when studying the areas of knowledge management and human resource management in an organization (Mentzas & Draganidis, 2006). According to Houtzagers (1999), cited by Mentzas & Draganidis (2006), competence and capacity management is strongly linked to organizations' efforts to improve and increase their competitive advantage, innovation and efficiency.

Competency-based management has proven to be a valuable tool in increasing an organization's productivity and performance. Draganidis et al (2006) present the main advantages that lead an organization to adopt a competency-based management system such as the following:

- Identification of the skills, knowledge, behaviors and skills required to meet staff selection requirements, in accordance with the organization's strategies and priorities;
- Ability to focus individual and collective development plans, eliminating the gap between the competencies needed to perform a function or position in the organization, and those that actually exist in the individuals available.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Other authors, such as the SINFIC organization (2007), present different benefits for the use of a competency management system. The following stand out:

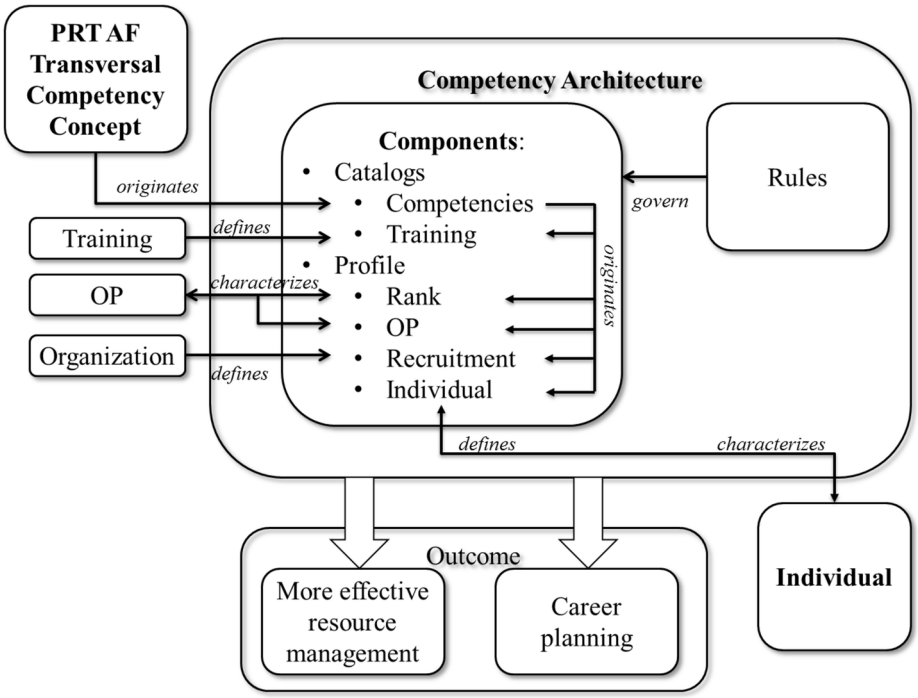
- Smoothing the transitions of elements in the process of reform to their substitutes, by the anticipated preparation of the succession, based on the competency requirements necessary for each position;
- Motivation and compensation of employees, giving them the tools to model their career goals and align them with the needs of organizations;
- Meet performance objectives and support career goals by providing learning and development opportunities that are directly linked to skills improvement needs;
- Capitalization of existing talent in the organization, prior to departure for recruitment, using updated skills profiles of existing employees;
- Overall improvement of the company's stability through the extension of the hiring period of employees;
- Competency Selection Model.

In the competency management domain, it is important to describe how to define which competencies an organization should select to gain a competitive advantage over other organizations.

Zingheim et al (1996) proposed a method for selection and definition of competences. According to the method, the organization must define its business strategy, structure and organizational culture first. Then it is necessary to determine the desired results and what behavior is needed to attain them. The following is the definition of a compensation strategy for people. A study should be carried out to find possible sources of skills. Finally, the organization will have to select competencies that fit and then be defined and executed, with the ultimate aim of obtaining a competitive advantage (Zingheim et al, 1996).

Competency Architecture

According to Lankhorst (2013), architecture must exist to manage complexity in large organizations.



Thus, a competency architecture can be defined as "…the set of all the competencies that are necessary to the organization's activities, its representation and specification, the relationships that exist between them, how they are developed and where OP are used…" (Telha et al, 2016a; Rodrigues, 2016). Rodrigues (2016) developed a model (see Figure 2) for a facilitated competency architecture understanding, which understands that it is constituted by regulatory rules of the remaining components and the architecture itself.

After defining Competency Architecture, it is necessary to explain how it should be used in the management of competencies of an organization. Rodrigues (2016) has developed rules of application of Competency Architecture according to the needs of the organization in order to optimize the recruitment of personnel and OP occupation. These rules aim not only to match the competences of an individual with the competences necessary for the OP to be occupied, but also to maintain competencies and to develop new competences through the exercise of other OP.

The first phase of competency management begins with the recruitment and the drawing up of recruitment profiles, crucial tools in the selection of candidates (Rodrigues, 2016). It should be assessed which competencies are desirable in an individual to join the organization, and evaluate which individuals are effectively the holders of those competencies. Thus, it is possible to classify candidates as fit to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Competency architecture model (Rodrigues, 2016)

join the organization if their competencies are compatible with those desirable for the organization, and unfit otherwise.

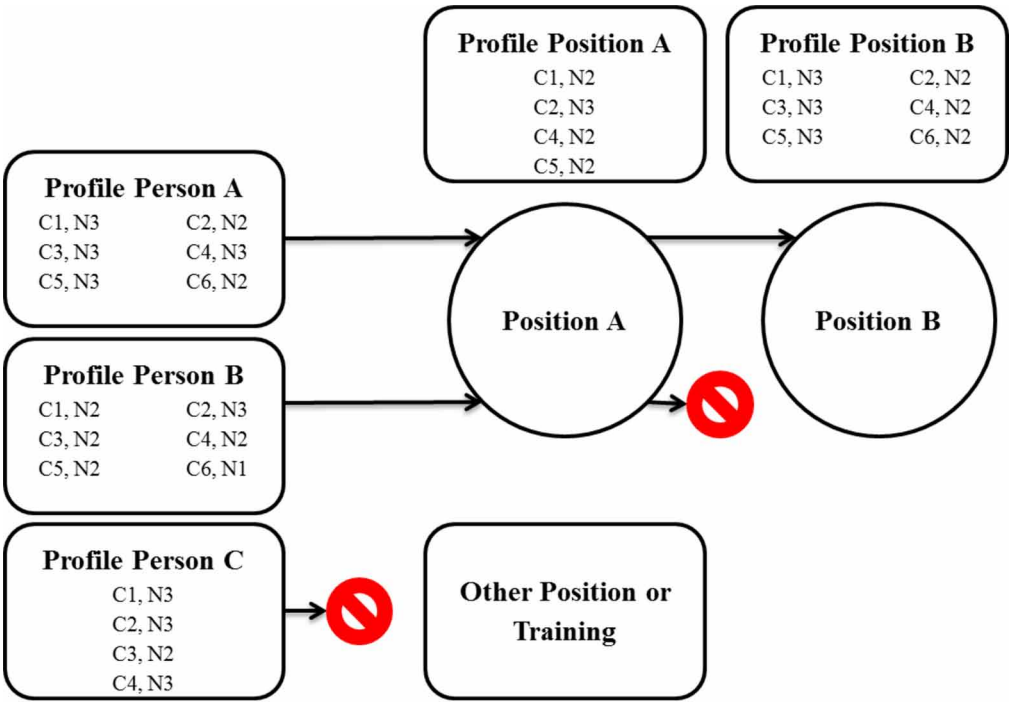
The usefulness of the competency profile is not limited to recruitment, since it must be stored by the organization throughout the individual's permanence in the same, and updated whenever the individual's competences change, whether they are adding new skills, improving the level of existing competencies or the existence of skills that are not being applied, are lost and need to be renewed (Rodrigues, 2016).

Figure 3 presents a template for filling Organizational Positions. The interpretation of the model allows the reader to understand how to apply the Architecture of Competencies proposed by Rodrigues (2016). According to the author, after elaborating the competency profiles for each OP, which defines the competencies that an individual must have to successfully perform the OP, a correspondence with the competencies profile of the individuals must be made. If the competences of the individual correspond to the minimum level of competence of the OP, he is considered fit to perform it. In the opposite situation, in which the individual does not have the competencies to perform the OP, the same must be oriented to another position with a different competency profile. There is also the option of providing training to the individual in order to develop a set of competencies, making it fit for the OP in question (Rodrigues, 2016).

The performance of functions is also a method for the development of competences, in that when performing functions in a given OP the individual develops new competencies, making him / her fit for Organizational Positions for which he did not previously have competencies (Rodrigues, 2016). Figure 4 represents this process.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Organizational Position filling model (Rodrigues, 2016)



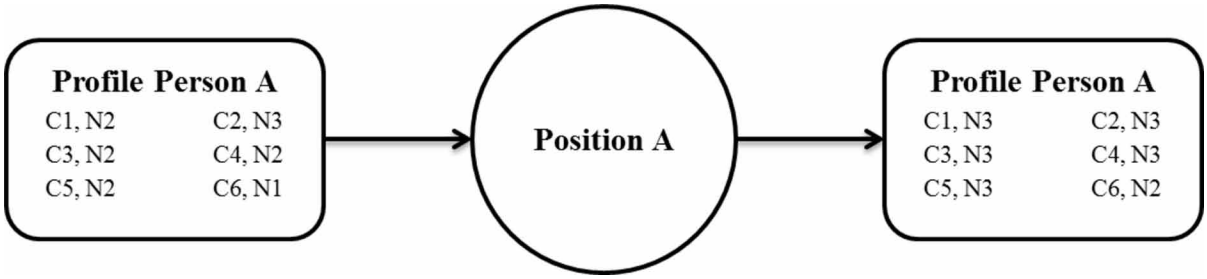


Figure 4. Competency development model based on experience obtained in an OP (Rodrigues, 2016)

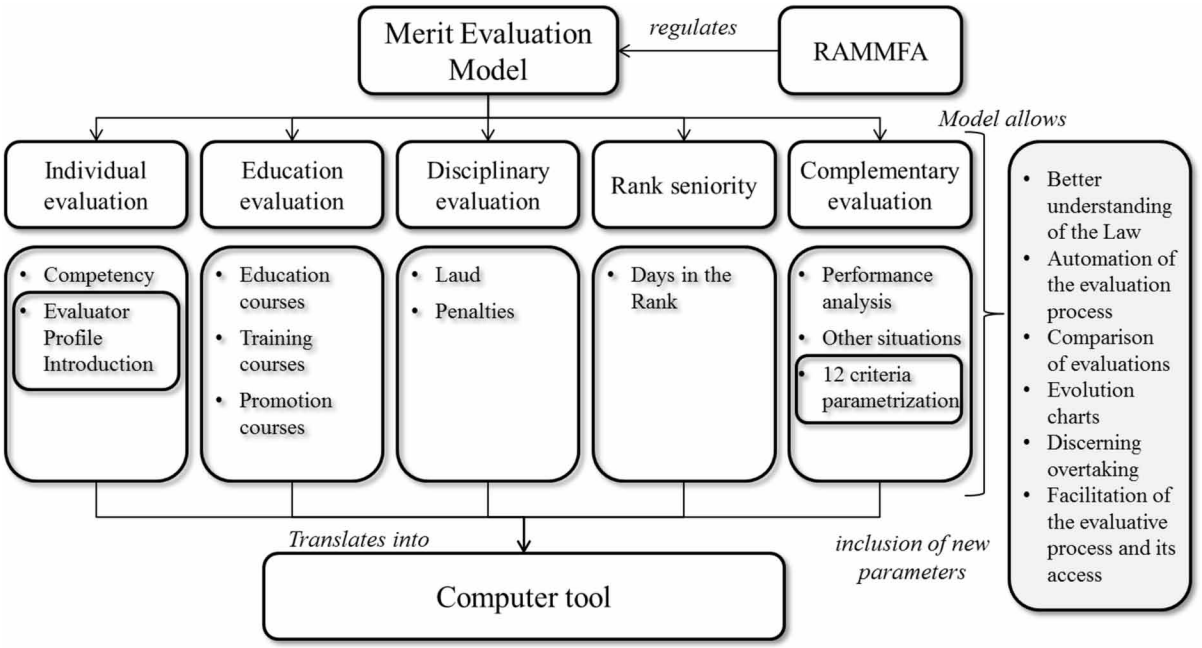
Merit Evaluation



The evaluation of the merit in the organizations, allows them to gauge the real value of their employees, as well as identify training needs.

In the scope of the Armed Forces, a model was developed that reified the evaluation parameters defined in the Armed Forces' Military Merit Evaluation Regulation, aiming to integrate it into a computer tool (Pires, 2017).

The developed model comprises five distinct evaluation domains: Individual, Education, Disciplinary, Rank Seniority and Complementary (Pires, 2017). Figure 5 presents the five evaluation domains and its components indicating advantages of using the model through a computer tool.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

PtAF Literature Review

The Organic Law for the Air Force defines it Mission. The Chief-of-Staff Directives present its Vision. The Air Force 101-1 (Portuguese Air Force, 2013) Manual defines a set of professional competencies for each specialty.

MODEL DEVELOPMENT

Throughout the first paragraph, the author made an introduction to the topic to be addressed. It was also explained the motivation associated to the theme, based on the presented problem. In the same paragraph, a starting point has been elaborated, guiding all research, which has resulted in derived questions. Finally, the methodology used was presented. Paragraph two, literature review, addresses essential concepts.

This paragraph evaluates each concept's contribution to the research. The interviews will be analyzed qualitatively and later the model developed to solve the initial problem, followed by its validation, will be presented.

Literature Review Contribution

The contribution of the bibliographic review is based on contextualization. In reviewing the literature, the author has acquired the necessary scientific knowledge to develop the proposed model, being the link between the model and the initial objectives. Thus, this paragraph describes how each topic addressed in the literature review contributes to the development of the model.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Organizational Engineering strives to improve organizational performance by establishing new methods for increasing effectiveness and efficiency in organizations. The PtAF uses these methods to study and create a new artifact to perfect itself, aiming at the fulfillment of its objectives.

OSA is a concept strongly linked to Organizational Engineering. In order to understand its present state, an organization needs to develop the concept of organizational self-awareness. The concept of Online Organization is closely linked to the concept of OSA, since the PtAF online model would make it easier for the organization to develop its self-awareness. It would then be possible for PtAF to make adjustments over time based on its development, correcting the organization's course to achieve the objectives.

For an organization, it is not enough to simply define the concepts of Organizational Engineering. There is a need for a graphical representation of the organizational structure, and for this there is the EA. The Business Architecture, as a set of principles and methods for the design of the organizational structure, allows the representation of the organization according to different perspectives. The EA is divided into several levels, with Information Architecture being one of them. This level is of special importance for the subject to be addressed, since it consists of representing the organization according to the perspective of information and information systems. The IA defines the informational entities necessary for the business, and how they relate to one another. The importance of IA to the Online Organization is evident, serving as a repository of all information relevant to the PtAF.

The concepts of OE and OP are essential for the management of human resources in an efficient way in the organization. There must be organizational awareness to clearly identify the attributes of both organizational entities and organizational positions. Attributes such as qualifications or competencies are vital in the management of people in the organization. For a given OP there is a competency profile to be filled. To occupy the position, an individual must possess the minimum competencies established in the profile. Otherwise, it will not be able to perform the proposed function due to lack of skills.

Skills are thus an important concept. In an Online Organization, the concept of competence, transversal or specific, must play a prominent role, being associated with the organizational positions and the people who fill them.

Competency management is a tool used to increase the productivity of an organization. This management allows identifying the competencies necessary to the organization, so that these and the requirements of the organization are in tune, focusing efforts in the development of the employees. The OOm emerges in order to incorporate competency management into the PtAF.

In the previous paragraph we defined the concept of Competence Architecture and the rules applied to it. The contribution of these elements is vast, insofar as the competency architecture defines the competencies necessary for the activities of the organization, and in which OP is used. The rules of competency architecture describe how competency management should be performed according to the needs defined by the competency architecture. The Online Organization should implement these rules, as well as the correspondences between the competencies of the individuals and the organizational positions.

It is possible to affirm that all the concepts mentioned above contribute to the development of the OOm, expanding the hypotheses of development.

PtAF Literature Contribution

The PtAF literature review contributes to the organization knowledge development by including the revision of pertinent documents and legislation unveiling, with clarity, the Mission, nature and why it

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is relevant to carry out human resources management. The PtAF vision presents people as one of the pillars of the organization, thus revealing the importance of human resource management for the culture of service and well-doing that must be practiced.

The Air Force 101-1 Personnel Command Manual contributes directly to the development of the OOm as competencies are one of the key points to incorporate into the model. The professional profiles of the military define the ideal competences for a specialty, and although they are not defined according to the Organizational Position, they allow to identify the activities performed limiting the OP to be occupied.

The analysis of the organization's manuals allowed expanding knowledge about the organization and distribution of the units.

Interview Contribution

The interviews were a valuable tool that allowed the gathering of knowledge about the current management of human and material resources and the current IS. After the qualitative analysis of the interviews, key points were identified, and some conclusions drawn.

The concepts of competency management and competency management, although already studied, are not yet applied in current methods of human resource management in AF. Persons are mostly managed by functions.

The individual military information is managed by an information system (IS) called SIGAP, functioning as an information repository. Much of this information also exists in paper, which support the system and its updates.

The information on Professional Profiles for each OP is defined in manuals, outdated to the current needs.

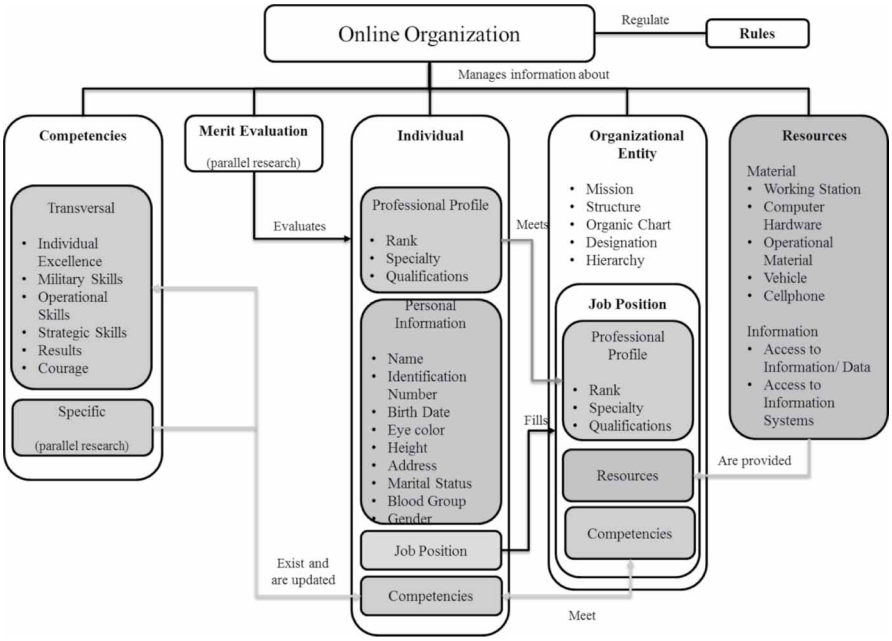
The current phase of scarcity of resources does not allow an efficient management of human resources. It is imperative to adopt a more efficient system, which allows optimizing the few existing resources.

The organization's manuals do not provide for an instantiation of the material resources required for each OP. This instantiation, where applicable, is important in that it guarantees the availability of resources as well as the optimization of their distribution.

The creation of a dematerialized model for the management of human resources translates into the creation of an Online Organization. This concept allows a complete integration of organizational positions with their attributes and functions, while at the same time acts as a database for the organizational profiles of the people of the organization, storing information about them. In this way, the model allows the online allocation of an individual to an OP. It also allows an instantiation of the individual work tools at the workstation, when accessing it. The Online Organization enables a way of optimizing human resources and time spent in managing them.

THE MODEL

The Online Organization



The PtAF Online Organization Model (Figure 6) consists of an automatic and unifying resource management tool, since it aims to manage people in OP effectively and competently saving significant hours

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of work in configuring for the organization rather than configuring for the individual. It is composed of several components and rules.

Each component of the model has attributes, which describe it and the relationships with the other components. The components are the Individual, the Competencies, the Merit Evaluation, the Resources and the Organizational Entities, of which the OP are part. Rules regulate and manage the model, determining which relationships exist between its components.

Figure 6. The online organization model (Source: Authors)

In order to facilitate understanding the model, each component will be further explained.

The individual is the center component. Its attributes are divided into four different areas: Professional Profile, Personal Information, Organizational Position (Job Position) and Competencies. Personal Information stores the relevant individual information. According to the Personnel Management Directorate, the personal information that is currently managed in the PtAF consists of Name, Personal Identification Number, Date of Birth, Eye Color, Height, Residence, Marital Status, Blood Group and Gender. The Professional Profile contains not only characteristic attributes of a military organization, such as Post and Specialty, but also the Qualifications and the current OP occupied. Skills are also one of the attributes related to the individual and will be discussed later in this paragraph.

The highest organizational component is the Organizational Entity. It includes attributes such as Mission, Structure, Organizational Chart, Designation, Hierarchy and Organizational Positions (Páscoa, Pinto & Tribolet, 2011). The OP attribute consists of three sub attributes: Professional Profile, Resources and Skills.

The Resources component is divided into two groups, Material and Information. The first group consists of the physical resources that an individual needs to perform the assigned functions. This group

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

includes resources such as a Post Office, Computer configuration (Software and Hardware), Operational Material, Car and Mobile. Information resources consist of either access to information or data, or access to information systems as a working tool.

Skills are also a component of the OOm and its importance lies in the fact that the model manages people according to competencies. This component is divided into Transversal Competencies (Telha et al, 2016) and Specific Competencies Bonifácio (2017). Transversal Competencies are composed of attributes such as Individual Excellence, Military Skills, Operational Skills, Strategic Skills, Results and Courage. Specific Skills are divided into the areas of Operations, Maintenance and Support, which in turn encompass the different specialties in the Air Force.

Finally, the Merit Assessment component is based on the model developed by Pires (2017), which is divided into five distinct fields of evaluation: Individual, Education, Disciplinary, Rank Seniority and Complementary.

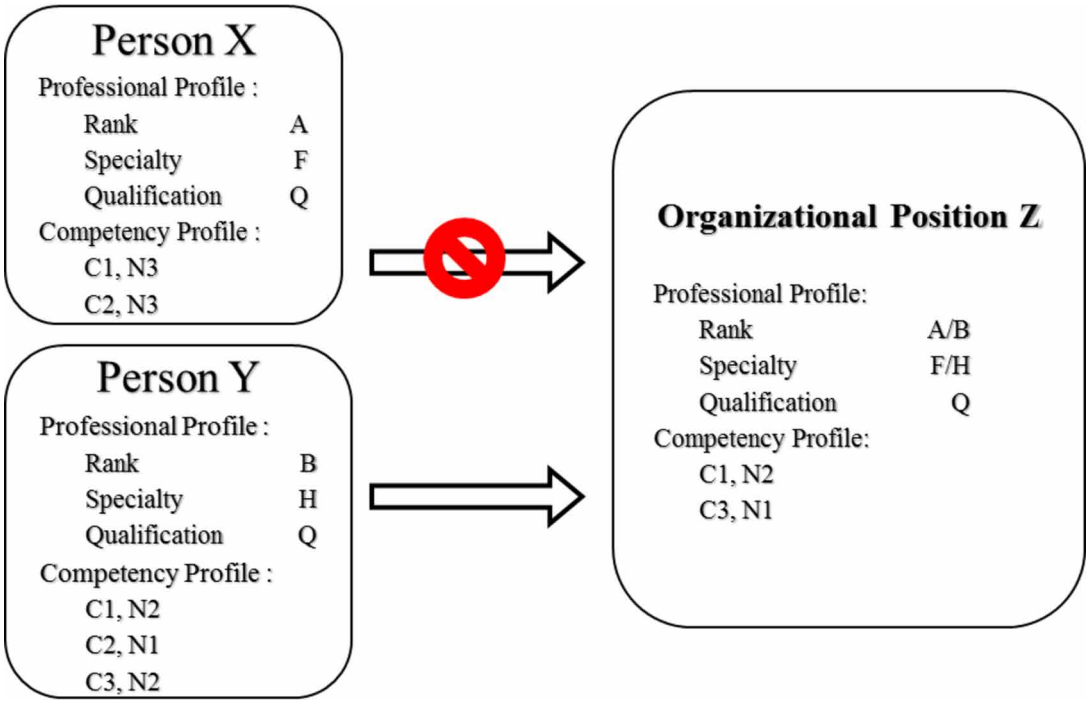
The relationships between components of the OOm and how particular events influence the organization are of great importance. In this way it is important that rules are defined for this model.

According to the analysis of the organization's manuals carried out in previous paragraphs, it is possible to affirm that there are requirements for an individual to fill a particular OP. These requirements are included in the template through the Professional Profile of both the individual and the Organizational Position. Currently, these requirements are: Post, Specialty and Qualifications. However, according to the Skills Architecture developed by Rodrigues (2016), the OOm includes the Skills as a limiting factor in filling Organizational Positions.

Both the Professional Profile and the Competencies are attributes of both Organizational Positions and individuals, so that an individual can only occupy an OP if the requirements are met.

Figure 7 presents an example of this process and depicts the completion of OP Z by Persons X and Y. This Organizational Position has a Professional Profile with requirements such as A / B Post, F / H Specialty, Q Qualification, and a Competency Profile which includes C1, N2 and C3, N1 skills.

Both Person X and Person Y meet the requirements at the Professional Profile level. The same does not apply to Competencies. Person X has the Competencies 1 and 2, both with the level of proficiency 3. Person Y, on the other hand, has Competency 1 at proficiency level 2, has Competency 2 at proficiency level 1 and also has Competency 3 at proficiency level 2. OP Z requires Skills 1 and 3 at proficiency levels 2 and 1 respectively. This means that although Person X possesses skills with an average proficiency level above Person Y, cannot fill the OP Z, while Person Y, having a lower average level of proficiency, meets all minimum requirements and is able to fill OP Z.



In order to maximize effectiveness and efficiency in the performance of duties, it is not enough to be the most competent person for the OP to perform duties. It is imperative that this person has at his disposal all the necessary resources, thus relating the Resources component to the OP.

According to a source in the Directorate of Communications and Information Systems, currently the resources needed for each OP are not typified, and are managed according to the need of the individual that occupies it. That is, if an individual needs a particular resource, it makes a request that later authorizes the distribution of that resource. Certain resources such as vehicles and mobile phones are associated with the individual and are not automatically assigned to the OP.

By including the resources in the Online Organization model, it is intended that an instantiation of the resources needed for each OP, as well as the resources that the organization has available for assignment, is made. In this way it is possible to associate the resources assigned to an OP, rather than to the individual, ensuring that when placing an individual, he will have access to the resources necessary for

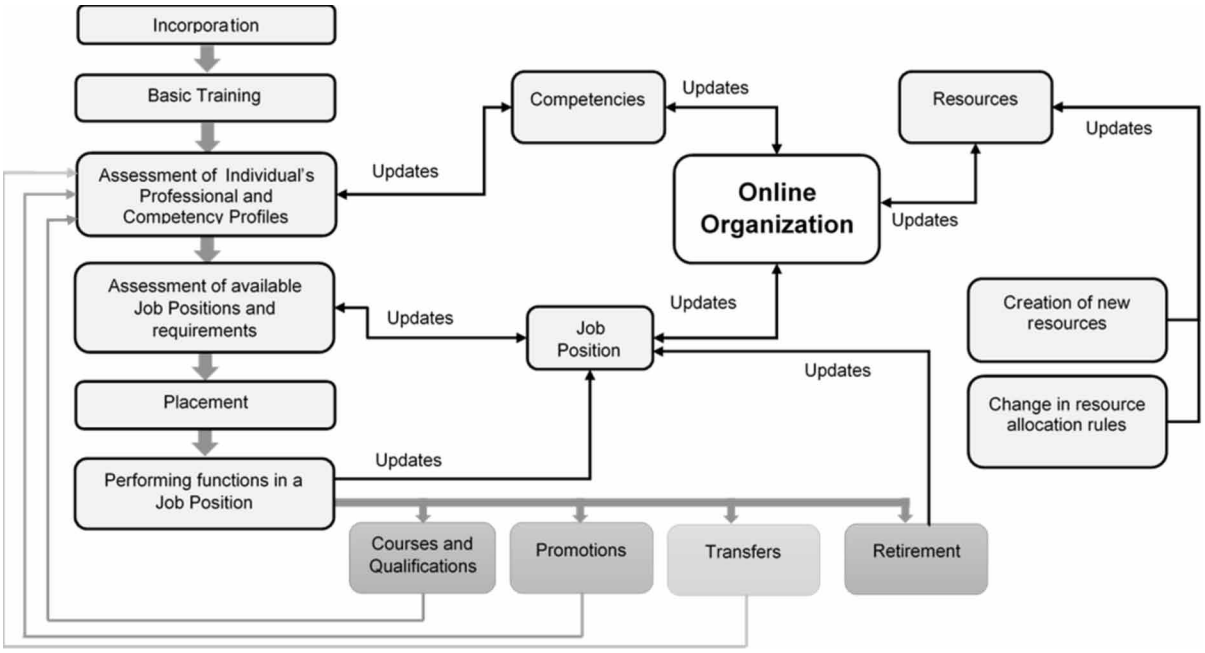
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. OP completion (Source: Rodrigues, 2016; Telha et al, 2016a)

the position he plays. It is also possible to ensure that in the event of a new rotation of personnel, each individual will have access to the resources of the new OP to be performed.

There is the possibility that, when instantiating the necessary resources and available resources, it is possible to conclude that there are insufficient resources in the organization to allocate to all Organizational Positions. Efforts should therefore be made to acquire resources, or to re-instantiate the resources required according to available resources.

Events in an individual's career, from incorporation to retirement, influence the organization in a number of ways. Figure 8 shows how the OOm predicts these changes throughout the individual career.



Since joining the organization, the individual has undergone several phases such as basic training, Competency and Professional profiles assessment, available OP evaluation and, finally, placing (posting) in an OP (to perform specific OP functions). After placement, the individual continues to influence the organization through various events: Courses and Qualifications, Promotions, Transfers and Retirement.

The first three events imply that an update of the Competency Profile and the Professional Profile of the individual should be made in the OOm, returning to the normal chain of events until new placement and performance of functions in a different OP. Retirement, on the other hand, implies that the OP that was occupied by the individual is now unoccupied, and this field should be updated in the Online Organization.

Resources also influence and change the Online Organization. The creation of new types of resources in the organization requires an update of the resources available, as well as the resources needed for each OP. A change in the rules of resource allocation, by changing the way resources are distributed, also requires updating resources.

CONCLUSION

This paragraph summarizes the research questions and hypotheses and presents the conclusions and proposals for future work.

Problem. There is no dematerialized system that represents and manages individuals by competencies, management of Organizational Positions and necessary resources, in an integrated, automatic and efficient way.

- **RQ:** How should a model for a Dematerialized Online Organization be built for the PtAF?
- **Q1:** How is it advantageous for the PtAF to create an OOm?
- **Q2:** Are there systems in the PtAF that allow the management of human and material resources in an integrated and dematerialized way?
- **H1:** An OOm allows better management of human resources, optimizing personnel placements in organizational positions, applying the concept of human resources management by competencies and ensuring the choice of the most competent person.
- **H2a:** There are systems that manage resources independently.
- **H2b:** The information is stored in digital and paper format.

H1 Validation: The current PtAF resource management system can be improved. The Organization faces a period of extreme shortage of human, material and financial resources, so resource management should be optimized. The OOm allows managing people by skills optimizing resource management guaranteeing that an OP is occupied by the most competent individual. The model components are implemented through an integrated IS (as opposed to many) which allows accessing different information easily. Hypothesis H1 is validated.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

H2a Validation: Resource management is currently done using several information systems through different platforms and computer applications. These systems, while communicating to one another, sharing various types of information are not integrated making integrated operation difficult to achieve. Thus, resource management is carried out independently, validating the H2a hypothesis.

H2b Validation: The research (including the interviews conducted) concluded that there are several types of information files in the PtAF. Much of the military information is stored in an personnel IS called SIGAP that is managed and updated based on physical information files, which are currently indispensable as a tool to support the IS. It is concluded that in PtAF the information is stored in digital format, and is supported by information in paper format. H2b hypothesis is validated.

RQ Validation: The OOm supports the construction of an IS that allows the integrated management of all its components. It is a highly complex task. It is possible to conclude from the qualitative analysis of the interviews carried out that there are several obstacles to the development and implementation of such a system. An integrated information system would allow for a simplified use of the model as a management tool. However, given the current budgetary difficulties, consideration should be given to adapting existing systems, with a focus on simplifying them and transferring information between systems. This information transfer is crucial to the functioning of the OOm, and the optimization of resource management depends on the links between the different components of the model.

The Online Organization model should ideally be implemented through the development of an integrated, simple and functional IS that assists the decision maker, never replacing the function of the human operator. It is also concluded that in the impossibility to develop a new system, the existing systems can be adapted to behave the model, implying, however, an update of the same in order to standardize these systems. Some clear advantages for IT professionals are:

- The organization is dematerialized and configured and the individual is inserted in a job position that has already all the settings identified;
- A considerable number of hours are saved on configuring the user software, hardware, printer access, privileges, etc.;
- Functions for the job position are identified and online which saves organization manuals, paper, printer consumables and immense work managing, updating and distributing paper versions.

The following future work recommendations are derived from conclusions drawn and advice from the entities interviewed and involved in the research:

- Classification of transversal and specific competences for each OP, in order to develop a manual;
- Development of a method to evaluate and update individual competences;
- Instantiation of the resources required for each OP;
- Development of an IS, or adaptation of existing systems, to enable the use of the OOm in an integrated manner;
- Study of the influence of Merit Evaluation on the choice of individuals for OP;
- Classification of Merit Assessment requirements for OP.

Chapter 67
Contemporary Change Management and Leadership in Local and International Businesses

Aytaç Gökmen
Çankaya University, Turkey

ABSTRACT

Organizational change is to transfer the organization from its current position to the desired future state. This process involves the differentiation of the activities, processes, structure, and targets of the organization. It is significant for an organization to decide where it is supposed to be in the future and to comprehend how to get to that new status-quo. Increasing globalization, fast technological changes, necessity of a well-trained labor force, changing social and demographic structures have intensified the competition and organizational change has become inevitable. The elements of an effective change process are openness to change, willingness of the personnel, flexibility, adjustment capacity of the business, optimism, and effective planning of change. The change process affects the organizations at structural, managerial, and individual basis as a result of the success of the change process.

INTRODUCTION

Organizational change is a process that is mostly difficult to manage, and which could be negative and destructive with regards to its affects. However, it is indispensable for businesses to change their structures and processes in a dynamic business environment with respect to market and economic conditions and also local and international customer needs, expectations and demands in order to adapt to the environmental change. In the new millennium, the obligations to be achieved by a business have diversified considerably. Thus, organizational change is an important tool to respond to the altering conditions. Organizational change is a process enabling the local businesses and international businesses to gain flexibility, competitive power and agility which are essential for organizational success. These are the

Copyright © 2021, IGI Global. Copying or distributing in print or electronic forms without written permission of IGI Global is prohibited.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

also the key issues of becoming a prominent enterprise in the business environment in both national and international terms. However, the organizational change issue might be hazardous and could lead to stress, unemployment distress, anger, displeasure, conflict, resistance to change, job dissatisfaction, poor performance, absenteeism and high rate of labor turn over when directed unsuccessfully (Safar et al., 2006; Doppelt, 2017).

21st century is the age of globalization. Globalization refers to the increasing convergence of national economics and declining worldwide commercial and investment barriers. In this sense, the agents dominating the global business arena emerge as multinational businesses (MNBs) which transcend borders to make investments. MNBs possess tremendous financial, human, knowledge, know-how, technological and managerial resources. Therefore, it is just natural for them to regard the goal business arena as their filed of interest. However, when they do business on the international scale, they must understand and adopt to the international market place very well. This could be defined as thinking globally and locally but acting appropriately. Therefore, any firm doing international business or wishing to do international business must comprehend situations in the local and international markets thoroughly. This includes having a profound comprehension of cultural, economic, financial, commercial, technological, legal and political parameters as well as defining and differentiating firms-specific strategies, policies, goods and services according to the environment in which a firm is operating. Therefore, it is not possible to act with only one product in a national or international market. It is not possible to perform the strategies and tactics of a business with only standardized goods, services and planning. Furthermore, if a company aims at sustainable successes and development, it has to change continuously. This involves the change in its structure, processes, human resources, improving knowledge, experience and technology, differentiating goods and services in accordance with the expectations, wants and demands of consumers as well as the differentiating parameters in. business environments. Yet, defining the need, process and execution of organizational change requires the guidance of an agent who stands out as a leader. A leader is the one who initiates the change process and motivates the personnel to take action and finish their duties successfully. A leader is the one who can influence the other to make the best of their effort. This requires different motivations in local and international conditions. Therefore, the aim of this study is to define the importance of the thriving change process, how to turn it into a successful one and define the role of the leader in this process with respect to local and international businesses.

AN OVERVIEW OF THE ORGANIZATIONAL CHANGE PROCESS

The organizational change process is a complex one. Organizational change is to transfer an organization from its current situation to a desired future situation in order to accomplish efficiency and effectiveness. Organizational change stems from the renovations within the environment that an organization tries to survive and prosper in. No business is established with a predefined time frame. Every business is intended to survive forever. Nonetheless, no business can stand still forever and survive too. So, the issue of change is both a need and a necessity for any business, no matter whether it operates on local or international scale. Moreover, as to remain up-to-date, competitive and innovative every business is to change its structure, processes, organizational commination system, cultural variables, statuses, positions, duties, liabilities, strategies, tactics, plans and policies. This would not only make a company an efficient and effective one with respect to accomplishing its goals and targets, but also a profitable

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

one with the capacity of responding to consumer expectations properly (Boshoff, 2005; Welford, 2006; Doppelt, 2017).

A well-known name on the subject of change is Kurt Lewin. Lewin's change process involves three steps as unfreezing, action and refreezing which is to overcome the existing mind-sets, bypass defense mechanisms and create a new equilibrium. This is called the Planned Change. Human nature is mostly resistant to differentiate, snice the status quo is always preferred. People are not willing and akin to abandon their status quo. A status quo is a situation in which a human being is used to survive. When a change agent or a manager spoils the status quo, an individual resists. That's why, within the Planned Change process, the intention is to break the patterns within the mindsets and create a brand-new equilibrium to transfer an organization from the current situation to desired future state (Boshoff, 2005; Welford, 2006; Burnes, 2004).

The process of change in organizations could be a problem-solving process. It could also stem from any opportunity that exists in its environment. Moreover, environmental factors such as economic, financial, cultural, commercial, political or legal factors could stimulate and require change in a company. When there is a good opportunity such as a developing market or increasing consumer demand in another host market, this requires a company to take action in the international market place. Th company may need to increase its production capacity, employ more personnel, use a new technology or differentiate its products for the consumers in the new host market. These issues all compel a business to change its strategy and policies in order to respond to the opportunities in the new host country market. The necessity of change could result from the business environment such as changes in the law, political atmosphere or business cycles in both the local and international market conditions. Laws can force companies to differentiate their products such as making them more environmentally friendly. The replacement of a political leader with a new one can affect the whole economic, financial and commercial order, in turn these impact on all companies whether local or international to apply a compulsory change process in their structures. Therefore, one can claim that the process of change can result from internal and external factors which affect a business or opportunities in the domestic or international market place. Moreover, the process of change can be triggered as a result of emerging issues in a company. In this sense, change begins with the determination of the issue and investigation of the problem. Fundamental strategies to solve issues are to be signified, the most convenient strategy is chosen and applied, then the efficiency of the strategy is tested and final step is to assess whether the desired target is achieved or not (Çavuşgil et al., 2014: 46-48; Boshoff, 2005; Doppelt, 2017).

The elements to be changed could be sorted as organizational structure, processes, management style, leadership model, technology, products and personnel, but not only limited with these mentioned subjects. The organizational factors related to the process of change could involve the internal environment, the role of the management; investigation and evaluation of external environment, well-defined organizational mission and goals, strategic planning, defining the customer needs and lining up appropriate relations with the suppliers. Of all the organizational elements, organizational leader and management play important role in securing the organizational change. The responsibility of a manager is to act as a problem solver and a change agent. A manager or a change agent (leader) is the one responsible from changing the behavioral patterns, stressing the need for change, establishing the suitable conditions for change and implementing the necessary plans to implement the change process in an organization. Furthermore, an accomplished change agent constantly seeks chances to change, feels necessity for change and develops efficient change methods. However, it is imperative to consider the position of the personnel in the face of organizational change. In order to secure the continuity and success of change,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the involvement of the personnel in the process is substantial; because, people who assist the constitution of a concept shall have a strong belief in the process as well. Therefore, for the success of a change program, it has to involve management, organization and personnel at the same time (Boshoff, 2005; Elsmore, 2017; Callaly, Arya, 2005; Doppelt, 2017).

Globalization which could be defined as the convergence of national economic, elimination of the restricting conditions and the development in communication and transportation technologies have intensified the competition among organizations and entail the change of organizational structures and processes in order to adapt to their internal and external environments. Almost all of the organizations have become vulnerable to environmental trends and customer demands as well as it is imperative to alter the organization in order to secure efficiency, competitive strength, fast communication and flexibility. Thus, this sort of organization patterns enables administration to decide and transfer data quickly in flattening and lean organizations. Organizations with rigid structures should be a matter of past. So, organizations with sound technological fundamentals, customer orientation, highly skilled workforce would be more competitive in the global market, if they sustain organizational change continuously (Gratez, Smith: 2005; Callaly, Arya, 2005).

Another important factor affecting the change process in businesses is knowledge economics. However, creating a business that is efficient in terms of structure, strategy, processes, capacity, personnel abilities, leadership, cooperation and joint values entail a detailed restructure process. Since, an organization is an agency where people unite to integrate their knowledge and abilities; then, those abilities and knowledge shall be interchanged in order to ensure efficient organizational change process. Benefiting from knowledge, human resources, technological synergy and organizational solidarity are crucial during positive change management. Utilizing these synergies building factors enable organizations to attain success in their turbulent environments. Furthermore, delayering, downsizing, restructuring, reengineering, slimming, contracting, flattening and delegation of authority are the methods that could be used in the organizational change process. Organizations achieving to benefit from these methods could perform the change process efficiently in a flexible and innovative manner. Since the change process is executed in a complex and turbulent environment, it is considerable to develop a core competence to differentiate the organization from other organizations too (Gratez, Smith; 2005; Boshoff: 2005; Elsmore, 2017).

SOURCES OF INERTIA AND FACTORS STIMULATING CHANGE IN LOCAL AND INTERNATIONAL ORGANIZATIONS

Organizational change is to transfer a business from one state to another desired status in order to accomplish the organizational goals and objectives as efficiently and effectively possible. Organizational change encapsulates to alter the scope and goals of the organization. The scope of change differs in a wide range such as change in procedures, entry to international markets, merger and acquisitions, joint venturing, restructuring and etc. Factors influencing organizational change are as openness to change, personnel support (whether the personnel resists the change or not), careful implementation (applying the change process by creating a new and harmonious organizational environment and atmosphere which are conducive to development) as well as ability of adaptation (differentiating and adjusting organizational elements to the new equilibrium), flexibility (ability to adjust new conditions and organizational components agilely), optimism, well-planning of change process and tendency to change (how much an

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

organization and its individuals are akin to accept a new status quo) (Kearney, 2018; Tan, Tiong, 2006; Karp, 2006; Reynolds, Vince, 2017).

Organizations facing change with an open and positive manner shall adapt competition and altering market conditions easily. However, being open to change is not a common issue. Although, resistance to change is mostly a case related to an individual, there could also be a resistance in organization wide and group level as well. A solution for this resistance is to set up an appropriate organizational climate by establishing affective communication channels, informing personnel adequately, motivating personnel for change and preoccupying personnel as a part of the change process. That's why, it is considerable to establish a process that is akin to change. Thus, it is possible to say that organizations akin to change would be less resistive and adaptive to their environments (Welford: 2006; Tan, Tiong, 2006; Karp, 2006; Welford, 2006).

Resisting to change and exhibiting inertia are negative conditions hindering the change process in organizations. Inertia stands for a slow and unwilling change in organizations. Some sources of the organizations are collected over the years such as assets, technology, experience, human resources, well-known products and tacit knowledge as well as are used to create an efficient organizational structure and business processes. Yet, a structure that becomes too large could also become too clumsy. For, large structures are difficult to change and could be resistive too. It is easier to convert above mentioned sources into cash by current and established ways of doing business. Moreover, changing the structure of an organization is to differentiate the situation and could also mean the loss of some of the sources as technology, experience, human resources, trademarks, patents, copyrighted materials and tacit knowledge. Furthermore, if the change process is like a radical one like the business process reengineering (BPR), radical changes fail to positively affect a company and its personnel. For instance, when the name of a company changes or modifies as a result of a radical change process, merger or acquisition, the change process could lead to inertia, since a new company would emerge and the network of the firm can alienate the business in its new form. A company's name, logo, trademark, products represent a status quo and related parties would not want to lose them. For example, when the pc branch of IBM acquired by the Chinese firm Lenovo, the aim was to obtain a company with a well-reputation, distribution network and consumer portfolio. Yet, converting the company to a Chinese one was not easy and caused slight inertias (Kearney, 2018; Hannan, Freeman, 1989: 72- 74; Ahrne, Papakostas, 2001).

The internal environment of an organization could be a source of inertia and inflexibility. Rules, policies, decision making styles, communication and inter-organizational relations could also bring about inertia and resistance to change. Members of an organization could have a certain understanding on specific issues and would not abandon their existing way of doing business in an organization. When the members of an organization would not abandon certain decision-making styles, authority, rules and policies, it is clear that this issue can lead inertia and resistance to change (Ahrne, Papakostas, 2001; Fligstein, 1991: 312-313).

Yet, another source of resistance to change and inertia is not having the ability to perceive new things and act quickly. This is related to having a need for change or not and acting rationally or not. Organizations shall have personnel who has a good perception of the business environment and comprehend the changing conditions around the business quickly. It is sometimes a matter of creating and sustaining competitive advantage to specifically perceive what is changing around the business and take action right away (Reynolds, Vince, 2017; Perrow, 1986; Ahrne, Papakostas, 2001).

Implementing the change process in an organization involves the positive tendency of the personnel. Acquiring the support of the staff at all levels simplifies the change process for managers and leaders.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Sometimes, the administration would not inform the staff about a forthcoming change course. Shall the staff be not informed about the change decisions good-enough; mistrust, inertia and resistance against senior management may emerge. However, the more staff believes in the change process and is informed enough on it, the more they would be willing to participate in the implementation phase. If the change is exercised in an environment that has an appropriate organizational climate, then this would give an impetus to the process (Welford: 2006; Tan, Tiong: 2006).

Harmony and flexibility are two factors which are necessary to maintain and conclude the change process. Harmoy is how much the members of an organization can have an agreement on an accord. Flexibility is the litheness of how much an organization can restructure itself according to altering internal and external conditions. In today's highly competitive environment, businesses can only survive with dependable, flexible and adaptable structures; because, businesses that are slow in adaptation shall cease to end, on the other hand, business akin to alter may predict the conditions in the competitive environment. Google is a good example of a flexible firm. The structure, decision-making processes, allocation of authority and cooperation mechanisms make up a good and flexible company in Google which guides it to agility, improving consumer satisfaction and enhancing competitive advantage. Flexibility and adaptability requires a business to respond the ever-changing conditions in a market within an acceptable period of time and to adjust the goods and services to customer demands and expectations. Therefore, a business that is able to adjust itself to the market conditions, would work competitively. For instance, changing the target market and mission of an organization harmoniously with an environment. Flexibility is to adjust one organization's internal structure according to the environmental conditions. For example, adjusting the human resources with regards to current necessity is an instance of flexibility. Moreover, creating an optimistic and positive atmosphere by senior management, promoting and supporting the change process shall yield to the successful aftermath; for, organizational change brings about distress and reluctance. Yet, a positive atmosphere in an organization simplifies the process (Kearney, 2018; Reynolds, Vince, 2017; Welford, 2006; Tan, Tiong, 2006; Karp, 2006).

However, even though the aim of change in an organization is to achieve effectiveness, some of the plans for change could fail to succeed for not being able to receive the support and active participation of the staff. Whereas, change process shall be devised by taking into consideration of the expectations and demands of organizational members. On the other hand, the change process should involve communication, participation of the staff, transition plan and training of the human resource too (Welford: 2006; Tan, Tiong: 2006). Common factors inducing change and inertia in an organization are stated in this section. The classification of the change process is defined in the next section of this study.

CLASSIFICATION OF THE CHANGE PROCESS

The operation of change of a business is to adjust its organizational processes, structure, and capacities in order to harmonize the organization with its environment. Change is an ever-existing feature of an organization both in the operational and strategic levels. Nevertheless, it bears great a significance for a business to decide its future status and goals as well as to determine to how to attain those goals. Factors such as the intensification of globalization, fast changing technological innovations, more competent workforce, altering social and demographic inclinations, intensified competition compel organizational change and renovation. The necessity for change and renovation is usually not foreseen and thus is triggered by reactive, ad hoc impetus and organizational complexities. Although there is a considerable

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

necessity for change in today's ever-changing and competitive business environment, the rate of success is not likely to be 100% in all cases. Thus, conducting the operation of change is not a simple issue. Furthermore, this complex issue of the classification of change is defined in the subsequent paragraphs (Todnem By, 2005; Hudescu, Ilies, 2011; Bruch et al., 2005).

- **Change With Regards to the Rate of Emergence:** The organizational change theories to be examined under this heading state that should organizations change constantly, they might not be able to be efficient or have high performance. According to this opinion, organizations need routines in order to be efficient. However, when the theory is examined from a different point of view, after some time, change itself becomes a routine and change becomes a regular response to both the external and internal environment. Types of change to be investigated under this heading are discontinuous change, incremental change, bumpy incremental change, continuous change and bumpy continuous change (Todnem By, 2005).
- *Discontinuous change* expresses the quick variations in organizational structure, strategy or culture. These quick variations may originate from both internal and external concerns. Discontinuous change happens once in long time intervals and is followed by a long consolidating and stabilizing periods. Therefore, discontinuous change refers to making organizational changes within long standing intervals. For example, reframing, restructuring, revitalizing and renewing an organization after a long period is discontinuous change. A response to this sort of change is to change gradually, that is *incremental change*. An example of incremental change is to streamline, optimize, reengineer the company and achieve cost reduction and reliability. Toyota Inc. is a corporation that innovates and applies incrementally and continuously (which is defined in the next line). *Continuous change* is to have a basic changing pattern in an ever-changing surrounding. On the other hand, incremental change means every part of the organization deals with its certain problems incrementally. According to the supporters of this view, change can be best achieved by alternations in every department and part of the business consistently without striking radically. Incremental change evolves in a systematic and predictable pattern (Bruch et al., 2005; Todnem By, 2005).
- **Change With Regards to How it Emergences:** When change is examined from the point of view of how it emerges, it could be sorted as planned change, emergent change, contingency change and choice change. However, the most known ones are planned and emergent change and it is generally accepted that planned change is the most popular one and lines up the factors of change specifically (Boshoff, 2005; Todnem By, 2005; Welford, 2006).
- *Planned change* was first introduced by Kurt Lewin. According to this concept, in order to complete the change operation successfully and alter behavioral patterns, former behavioral patterns must vanish. As for Lewin, an accomplished change operation involves three steps: First step is unfreezing and involves tackling inertia and dissolving the existing mindset. Second step is to transfer the organization to the targeted level. And finally, last step involves freezing which refers to preserve the status-quo and prevent from returning to previous levels. This model reveals the fact that in order to secure a targeted new status quo, previous status-quo must be removed (former structure, management and culture to be oppressed) and new status-quo must be reserved without returning to previous stages. Planned change is a forecasted change and is proper in a non-turbulent organizational environment; but, in a fast-changing surrounding, its positive effect is a question mark, sine the organization is affected by external forces too. Therefore, planned

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

change is adequate in constant times, whereas in a fast altering surrounding it may not be likely to have a positive effect since there might not be time for detailed planning. Yet, another criticism for planned change is that planned change requires to fallow certain stages in times of change. Yet, in a period like emergency, it is imperative to act fast and an implementation like planned change would be inadequate and slow. Last criticism for planned change is whether the change would be accepted voluntarily by the staff or not. An instance of planned change is for a software company could be to redesign the structure and reallocate the sources in order to restructure the productivity and business processes, establish an intelligent cloud platform and computer system as well as supporting this process with staff training (Boshoff, 2005; Todnem By, 2005; Welford, 2006; Burnes, 2004).

- *Emergent change* was devised in response to planned change. Planned change is a top-to-down implementation of change. Furthermore, in emergent change, the change process occurs down-to-top direction. According to this opinion, the change process could necessitate fast and momentous implementations. For, the senior management may not be able to comprehend and provide solutions for concerns. It shall be reasonable to establish the necessity for change at the bottom of organization and begin implementation. With regards to emergent change, it is to adapt the organization to its turbulent environment continuously rather than adopting a linear change. Emergent change occurs with the interaction of factors related to the internal and external environment of the organization. Also, emergent change enables organizations to serve as learning originations, since the structures of the businesses adapts to altering, unpredictable conditions constantly. In addition to that, since organizations adapt the altering situations continuously, the change process would be implemented more efficiently in emergent change in comparison to planned change; because, in order organizations to be successful to adapt complex and turbulent environments, the behavioral patterns of the staff of organizations should be congruent open systems. Thus, the system of the organization should be devised in order to prevent inertia in strategies, structure, staff and organizational culture. Moreover, an efficient change operation depends on benefiting from appropriate opportunities rather than always implementing detailed and highly planned operations. The most critical property of emergent change is to be prepared for all sorts of unexpected change concerns and involves dynamic processes. Emergent change simply realizes in biological and social systems when the underlying factors have accomplished a new order which leads to new behaviors. Facebook and Twitter are contemporary examples of emergent change which emerged as a new worldwide way of communication. They have developed quickly and become an integral part of our lives (Brotheridge, 2005; Todnem By, 2005; Burnes, 2004).

Furthermore, a model for emergent change could be as (Brotheridge, 2005; Todnem By, 2005; Burnes, 2004);

- Analyzing the reasons for change,
- Determining a joint vision and mission,
- Creating a compulsory feeling of change among the staff,
- Support of a strong leader,
- Influencing support of the staff for the change policy,
- Formulating a change plan,
- Devising the new structure,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Involving the staff in the process and informing,
- Stabilizing change and institutionalization.

Yet another classification for the organizational change is the *contingent change* is to adapt an organization in accordance with current conditions and situations. Contingent change does not seek the best change operation for an organization; but, it seeks to devise the best change operation for every organization. Thus, the performance and structures of organizations vary at each organization separately. For example, the contingent change in organizations is aimed at empowering management and subordinates to constitute particular integrated solutions to solve business challenges and meet the expectations of clients incessantly. *Optional change* is to maintain a change process according to certain and optional factors. According to this view, it is considerable to implement change voluntarily, not by enforcement. For example, a multinational business making a differentiation in its products for a certain host market rests on its consideration (Brotheridge, 2005; Todnem By, 2005).

IMPLEMENTATION AND EFFECTS OF CHANGE IN LOCAL BUSINESSES

In order to execute a successful change process, management of organizations shall take into consideration the former, current and later situation of individuals, groups and organizational structure. By taking into consideration the former, current and later situation of individuals, groups and organizational structure, the administration could identify the factors that might favorably or unfavorably affect both the organization and staff. The external factors that could affect the organization in this process are local market conditions, business cycles, local culture and customs, domestic socio-economic factors, government policies and legal regulations and etc... On the other hand, internal components are the staff, organizational structure, management characteristics and inter-group relations. Conditions to begin the change process successfully are (Fisher, 2005; Brotheridge, 2005);

- Full explanation of the reasons for change. It would be appropriate to explain the reasons for change to the staff in order to overcome the resistance,
- Predicting the expectations of the staff,
- The involvement of the staff in the process to facilitate the operation; because, people would support causes which they actively participate in,
- Organizational vision should be explained in detail in order to unveil the future state, structure and processes of the organization,
- A road map clarifying the responsibilities of the staff should facilitate to establish behavioral patterns,
- Preparing transition plan from current situation to future potential situation would facilitate the staff to act rationally,
- The staff should be a part of the change operation possibly at all levels.

Beginning a change process is a complex operation that has some grades. The process shall be executed with great care since the former structure is to be replaced with a new one. Moreover, the change process would have various effects on the organization in the transition period and the effects might be as follow (Collerette et al., 2006; Smollan, 2006);

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The change process could make individual, social and structural effects on the organization,
- The staff would learn the reasons for change process that affect their status-quo,
- The staff that feel ignored might think that they are not considered and act defensively,
- Since the change process could influence each and every level of the organization technologically, socially and individually, it might bring about uncertainty,
- The staff could be in a state of unwillingness, distress and disinclination in transition period,
- Transition stage is a learning phase where efficient leadership is compulsory,
- The staff that is under stress in the change process may act dishonest, furious and unfaithful,
- The quality of goods and services might be negatively impacted during the transition operation,
- Failing to determine priorities of the organization and staff could affect the organization inversely.

The operation of change is such an arduous and tough period. Thus, supportive measures should be taken and implemented during the operation of change. Some precautions to back up the process of change with respect to local business are (Collerette et al., 2006);

- Informing the staff regularly,
- A group of specialists to monitor the process of change could be summoned. These specialists should be from the domestic business environment to know and estimate local conditions better,
- Efficient leadership of senior management,
- Regulative reviews of senior management,
- Proper consultation of senior management to the staff during the operation of change,
- Individual support to the negatively influenced staff.

If the process of change is concluded successfully at the end of the progress, the organization, groups and individuals strive to establish a stable structure with new status-quo. However, at the end of the process, this new status-quo could specify various effects on the structure, staff, and processes. These effects and the consultation that is to be managed are as follows (Collerette et al., 2006; Smollan, 2006);

- Since the stress and burn out could affect the personnel adversely, the assistance of a consultant could be needed,
- The personnel might feel disqualified in the new system. Therefore, in order to secure the adaptation to the new system supplementary training shall be provided,
- New system may involve completely new working conditions. The staff should be promoted to share their knowledge and experience to create a learning organization; because, the new system may involve a delicate structure and individual problems could deteriorate the operation of change. Thus, senior management should strive to constitute a positive organizational climate,
- The operation of change may involve methods such as rightsizing, restructuring, reengineering or downsizing, all which might have adverse effects on the organization. The staff might be skeptical of losing their jobs. Therefore, the personnel should be informed properly,
- As the new stable situation has removed the former status-quo, assistance of an external advisor may necessitate,
- The new status-quo could entail new technology, management processes and structure,
- The supervision of the senior management shall always remain as a support for the staff.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

THE LEADER'S ROLE IN EFFICIENT CHANGE MANAGEMENT IN LOCAL BUSINESSES

Creating an environment that is conducive to the process of efficient organizational change depends on some external and internal factors in the local business arena. In addition to this, the conditions in which an organization exists, differentiates the ability of the leader and management to intervene in the process of change. The leader and management shall have certain properties to influence efficient change operation both at the beginning, in implementation and also to conclude the process. The application of the change process in terms of a determined vision by an influential and persuasive leader and changing the organization's structure and processes is substantial. When faced a status necessitating change, the responsibility of a leader is to mobilize the staff in favor of the organization. Therefore, if the leader is to execute and willing to be successful at the end of the operation of change, one must bear the necessary leadership capacity. The structure, system and processes of a domestic organization is formed with the supervision and directives of the leader. If stated specifically, the leader of the organization should be the key person that directs the process of change. The influence of the leader also depends on how the staff regards him/her and whether the staff has faith in its leader or not. Leaders execute processes much better when the personnel have got faith in them, perform and adopt the directions of the leader with loyalty and confidence. Thus, the leader plans, organizes, leads, coordinates and monitors the process of change with the confidence derived from his personnel. Moreover, the leader shall constitute a structure and processes that could be absorbed by everyone in the organization; because, the factors and parameters might affect the organization both positive and negative depending on the capacity of the leader. So, at the inception of the of change process, the leader (Kavanagh, Ashkanasay, 2006; Smid et al., 2006; Elsmore, 2017):

- Shall demonstrate positive behavioral patterns,
- Shall prefer adequate managerial strategies to implement,
- Should influence the staff in favor of adopting the new structure, system and procedures,
- Must assume the key role in the operation of change.

The leader shall undertake the responsibility as a prime architect at the beginning of at the process to both initiate and structure the change mechanism. It is also considerable to involve all staff in the process. Only by this way, the resistance, inertia and conflict could be avoided in the individual, group and organizational basis. When individuals, groups and permanent systems resist to change in an organization, the capacity of the leader proves to be significant to find out an effective solution by also taking domestic conditions and environment into consideration (Kavanagh, Ashkanasay, 2006; Smid et al., 2006).

The operation of change affects the organizational processes, structure and mentality of the personnel substantially. Therefore, the duty of the leader is to supervise the change process in order to progress it as efficiently as possible. An organization's fundamental values and strategic goals influence the staff and their domestic environmental perception significantly. The recruiting and training of the new personnel after the operation of change and adaptation of the former personnel to the new structure are of the responsibility of the leader. Regarding to this, the process of change brings about uncertainty and distrust in the personnel and threatens their welfare as well. Thus, the negative effect of the operation of change on the personnel must be monitored and avoided by the leader instantly (Rowland, Higgs, 2005; Smid et al., 2006; Kavanagh, Ashkanasay, 2006).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The process of change is to adapt the organization difficulty in the local organizational environment and thus derives resistance as well. Therefore, the conditions, in which the personnel might resist during the operation of change, shall be examined thoroughly before the execution of the process. If the process not examined with regards to its significance, potential developments with respect to the leader could be (Rowland, Higgs, 2005; Kavanagh, Ashkanasay, 2006);

- Unfaithfulness against the leader and his implementations,
- Sentiments such as anger, conflict, absenteeism and wrath,
- Malfunction and inefficiency in the process,
- Involuntary and resistive action by the personnel.

Misperception of the personnel's behaviors and their motivation factors by the leader are also reasons for resistance to change; thus, this could cause an increase in personnel turnover for the reason of disbelief in management and leader. If the local job market is abundant, then the personnel turnover might increase. The staff that loses their positions and authority may feel insignificant. As a result, aversive behaviors and reactions of the personnel during the process of change could affect the operation unfavorably. Therefore, it would be quite beneficial for organizations and the staff to create a positive organizational climate by a leader in order to sustain the process positively; because, as for the personnel, adopting the new organizational structure, climate, management and processes would take time. Therefore, it is the leader's responsibility to involve, promote and motivate the staff in favor of the operation of change. In order to create individual trust and inclination, the leader shall be in contact with the personnel continuously and act as a transformational leader. Moreover, the personnel could adopt the new organizational order and a return to the former status should be avoided. Briefly, the liability of the leader is to promote and support the staff in the operation of change. Hence, at the end of the process, if the organization accomplishes its goals, this means to achieve the operation of change efficiently (Kavanagh, Ashkanasay, 2006; Elsmore, 2017).

The leader has a significant responsibility to conclude the process of change. It is important to initiate, implement and conclude the process of change in accordance with the goals and targets set before. This is similar to the planned change process. It is necessary to make sure that the firm would not return to the previous problematic stages, to differentiate existing mindsets and replace the mindsets with the new ones compatible with the new situation. It is also essential to ensure that new status quo is preserved strictly at the end of the change process (Boshoff, 2005; Welford, 2006). The nature of the international business, its differentiating characteristics and organizational change in the international context are going to be reviewed in the next section.

MANAGEMENT OF CHANGE IN THE INTERNATIONAL BUSINESS CONTEXT

International business is the sort of business that goes beyond the national frontiers. It involves importing, exporting, licensing, franchising, mergers and acquisitions (M&As) and foreign direct investment (FDI). International business has got a wide scope of interest. International businesses are significant organizations (including MNBs) which do business and make investments in numerous countries with their affiliates and subsidiaries. International businesses could have considerable sums of financial resources, technology, knowledge, know-how and managerial experience which facilitate them to act in

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the world. International businesses are indispensable players of the world business forum and make their investments in many places. They do a substantial volume of business in the world that they have got a comprehensive influence in the global business arena and shape how the global business conducted. Moreover, international firms do not only impact on countries and globe by commercial and economic means, they also make considerable effect in the socio-cultural, political, legal and financial environments of host countries too (Harrison et al., 2000: 28-29; Taoka, Beeman,1991: 15-24; Leontiades, 1985: 3-6).

Every international business has got a distinctive capability which gives it an advantage over others and this capability can be utilized in different national markets. The distinctive assets enjoyed by international firms enable them to do business in numerous regions, encounter numerous experiences and modify their structures and processes accordingly. International businesses allocate their activities in the entire world so that they have got more commercial and investment potential in host country markets apart from where their headquarters are situated. International companies have value chains covering the world. They source inputs wherever it is the most convenient and sell their merchandises wherever it is the most profitable. Yet, in this process, they are subject to cultural, commercial, country and currency risks. That's why, it is very difficult for international companies to manage the process of change effectively for almost every national market where they do business stemming from country differences and the risks associated to do international business. Risks associated with doing global business and bringing about organizational change are presented in Table 1 (Wild et al., 2003: 21-22; Harrison et al., 2000: 29 – 30).

Table 1. Risks Associated with International Business

Cultural Risk	Country Risk (Political Risk)	Commercial Risk	Currency Risk
Differences in culture, Patterns of negotiation, Manners in decision making, Ethical issues.	Unstable politics, Laws not in favor of foreign businesses, Unreliable legal system, Corruption, red tape, bureaucracy, State intervention and protectionism.	Wrong and weak partnerships, Operational difficulties, Wrong timing of market entry, Intensive competition, False implementation of strategy.	Exposure of currency, Undervaluation of assets, Unequal taxation, Inflationary economic environment.

Source: Çavuşgil et al., 2014: 45.

Resting on the four different types of risk mentioned in Table 1, one can conclude that international businesses are supposed to do business and apply change management when necessary to avoid country-specific differences in every national market where they do business. Issues stated in Table 1 are the major sources of risk in international business which differentiate it from local business endeavors. For, today, organizations struggle in the global business arena where they must achieve and apply changes in manufacturing, technological development, marketing, promotion, global value chain activities, quality, cost effectiveness, managerial strategies, organizational structures, managerial issues and leadership as well. These items are the key factors which an international business utilize to achieve competitive advantage. Therefore, these factors must be managed effectively. When the change process is not managed effectively and properly in the global business arena, there is always a big toll that must be paid. For the executives of international businesses, fundamental reasons for initiating and dealing with organizational change process determine the success of international business operations and the steps to be taken in

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

such a critical process could define the faith of an organization and its workforce. Moreover, when it is inevitable to make organizational changes within the structure, processes and scope of business interests, it is critical to preserve employee motivation and their commitment firmly regarding every level of the organization. Also, since there could be workers from various nations in an international business, the motivation of each worker could be different. It is also important to sustain the customer portfolio and profitability of the business as stable as possible since changing the status-quo would inversely impact on firm-specific stability (Sofat et al., 2015; Tran, Anvari, 2014; Ajagbawa, 2012; Luo, Jiang, 2014; Singh, 2011).

After defining the differentiating characteristics of international business, it would be convenient to review the change process with respect to the issue of international management. Therefore, change is indispensable for any organization whether local, international or multinational. The term change in international management refers to a variation in one or many premises of an international company in order to adjust and adopt new ways of doing business and/or internalizing new processes to secure and enhance competitive advantage in the global business arena where the conditions are different from local markets. The issue of change management in international business could be defined as the continuum of constant renovation in global organizations to improve the firm-specific structures and capacities to best cater the needs and expectations of internal/external clients of a firm and customers located in numerous markets in the world as well as taking different cultural, social, economic, legal and commercial issues into consideration. Such a change in an international firm should never be a coincidence of or a reflection to a sudden economic, political or financial fluctuation since, the management of change and constituting a new status-quo are not simple issues in global business. So, these factors must be taken into consideration profoundly by the manager/leader of an international business/MNB. For, international businesses are supposed to monitor the global business market continuously to follow up changes instantly. The international forces of organizational change could result from laws, regulations, political, financial, cultural, legal, ethical and governmental factors. Nonetheless, the internal forces of organizational change may originate from wrong firm-specific policies in different national markets, local and expatriate employment policies, false administrative mechanisms not compatible to the international environment and false product development schemes. Therefore, firms operating in international business are compelled to monitor and adopt to the global business place, no matter in which country or region the business operations are applied continuously. The supervision of the global business arena with respect to almost every culture, political, economic, financial and commercial issues are indispensable. In other words, the management of change is a prevalent topic which is always current and valid in international business. Therefore, monitoring and executing the organizational change in international business is transformational by its nature. The magnitude of the operations of the firm, how these operations are structured on an international scale, what strategies are appropriate and which change agent conducts the organizational change are critical factors in global business (Sofat et al., 2015; Valackiene, 2015; Tran, Anvari, 2014; Hudescu, Ilies, 2011; Luo, Jiang, 2014).

Organizational change is never easy. Whether it is a local or an international company, organizational change is not welcome by the staff. When individuals feel that they lose power, vested rights, status-quo, titles, prestige, etc, they would resist. The resistance could be at different levels respecting to local and international personnel. Yet, it is imperative to explain the local and expatriate personnel of an international business that organizational change stems from commercial, legal, economic and/or financial factors which the company can barely influence and the continuum of change would be in favor of them. Or, the organizational change could result from the proactive reasoning of executives to take measures

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

which could make a firm stronger in the future in various host markets. This is generally the case when the employees do not comprehend the intended reasoning of the organizational change. Resistance to change may intensify when the personnel of the international company feel that they will not be able to satisfy the requirements of the new status-quo. Therefore, executives of international organizations shall never disregard and underestimate the resistance to change as well as shall determine the fundamental reasons of resistance and apply the right strategy with the proper diagnosis. The reasons stemming from the facts summarized in Table 1 must be especially considered. Also, when the organizational change process is applied, there should be no discrimination related to nationality, gender, age and ethnics (Luo, Jiang, 2014; Sofat et al., 2015; Singh, 2011; Hassin, 2010).

The executive management of an international business shall closely supervise the change process. Board members and executives of an international corporation must be precise to decide what process, procedures, subsidiary or affiliate would be subject to change since the implementation of organizational change could cause extreme costs in organizations which may extend over borders. The focus of the process shall be oriented on the products (goods & services), cost, quality, technology and marketing issues since each of them differentiate in different country markets. Besides, any organizational change applied respecting to elements enumerated in previous line will be a long-lasting change in the organization. For example, differentiating the product, price, promotion and marketing processes for every national market. Therefore, it is essential to cautiously determine the marketing mix for every product. The change agent or the leader would be the catalyst in this process. Globalization and internationalization of firms compel them to innovate, invent and rapidly change in a constant manner. These are the issue that must be monitored by the top executives of international companies and MNBs (Luo, Jiang, 2014; Sofat et al., 2015; Martincic, 2010; Valackiene, 2015).

While the roles of the board members and the top executives are profound and they have significant responsibilities, the country environments that an international business operates must be considered, since the organizational change could be unavoidable for companies which do business in various country environments. Within the different country environments, the objective of the process is to adopt to everchanging consumer needs and wants as well as prevent the risks associated with doing global business. Conversely, the company may research the market and differentiate its products with a proactive rationale. Besides, the solution for optimal change management for international companies could be obtained with proper strategies for change, development of necessary skills and capacities as well as the application of convenient leadership styles. Global business requires sophisticated organizational structures, processes and strategies owing to its complex nature and expanding need for change. International organizations are supposed to follow and adopt to change to maintain competitive advantage. Also, the organizational change is substantial for international companies to fit their internal, external and host country environments. As to adopt to such complex situations, organizations are supposed to consciously rethink current situations and devise plans for short, middle and long terms. These plans shall not be only limited to organizational processes, strategies or structures, but also involve product differentiations, pricing policies, investment opportunities, market niches in different countries, amendments in vision and mission statements, organizational rules, new M&A policies and utilization of investment opportunities in new markets (Luo, Jiang, 2014; Sofat et al., 2015; Singh, 2011; Hudescu, Ilies, 2011).

The organizational change process could have negative mental repercussions on the staff. Organizational change in international firms may create a psychological reaction and opposition by the personnel for altering status-quo. It is more difficult to create a status-quo in international business than domestic business, since the conditions are more complex. When organizational change is applied in an interna-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tional business as well as in its subsidiaries and affiliates, the impact of ambiguity, stress and fear might influence organization members pervasively. The experience of uncertainty and disorder in the process of change might stimulate anxiety, frustration and mental discontent. Local personnel of a corporation might be negatively affected by the change process much more with respect to expatriates in terms of downsizing, rightsizing, restructuring and reengineering of the business structure, processes and asset allocation. Such developments may prompt distrust and absenteeism as well as weaken organizational commitment of local staff. In order to avoid such distress in an international organizational change process, senior executives shall define and communicate the reasoning of change and its expected outcomes not only to the personnel, shareholders and the board members, but also to the closely related stakeholders as its laborers and lower level managers to sustain cohesion in the company. Considering different cultural norms, values, styles, customs as well as local legal, commercial and financial conditions are essential. Henceforth, it is imperative to deal with the emotional situation of employees, especially the local ones. To deal with the emotional situation of employees, a change agent should follow the emotional disparities of employees and assist if necessary; devise strategy to manage the emotional state of employees in a sweeping change process; attempt to neutralize employees in the process; and continuously communicate with employees to inspire enthusiasm, trust and aspiration among the personnel (Luo, Jiang, 2014; Tran, Anvari, 2014; Hudescu, Ilies, 2011; Sofat et al., 2015 Valackiene, 2015).

There are many developments in field of technology and transportation which compel businesses to rethink their organizational structures and status. Intensifying global rivalry among international and multinational businesses, immense developments in technology, spread of communication technologies all over the world, especially the Internet, and business cycles in national economies continuously compel businesses to innovate and fine-tune their organizations for survival and accomplishment. As to respond such an everchanging international business environment, change agents and particularly organizational leaders should address the issue with outmost care. Nonetheless, affective organizational change management entails a change agent to have the knowledge and experience of individual and organizational psychology, finance, accounting, economics, consumer behavior; since, organizational change would first impact on the internal environment of businesses, then its external environment. When such changes and developments are accommodated to the businesses and organizational structures with efficient change processes, the outcome would be favorable (Hudescu, Ilies, 2011; Hassin, 2010; Ajagbawa, 2012; Tran, Anvari, 2014).

Organizations dealing with international business mostly operate in turbulent business environments in various countries or regions. This substantiates the importance of monitoring culture, politics, economics and legalities in general as well as employee motivation and retention in particular. Therefore, organizational change must be addressed with great care and a cautiously devise plan shall be executed in the process. Within the change continuum, some issues to be considered in the change management of international business are as follows (Tran, Anvari, 2014; Martincic, 2010; Hudescu, Ilies, 201; Hassin, 2010; Ajagbawa, 2012; Singh, 2011):

- It is necessary to constitute capabilities to share experience among the employees and encourage cooperation along different cultures and nationalities in the company. The objective shall be to share knowledge and skills to establish enhanced motivation and organizational commitment,
- The process of change requires conscious leaders who can act as firm change agents. Such change agents are supposed to encourage innovation and renovation, obtain the rapport of both local and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

international employees to particularly cope with resistance and employee morale disruption. It is essential to propagate the positive outcomes of the new system after organizational change,

- The objective of the change process should be adopted by company personnel to build cohesiveness and promote cooperation,
- A rational affiliation ought to be constructed between the initiators of change and the ones who are against. Establishing well-structured relation with company personnel and communicating the objective of the operation could be quite beneficial,
- It is considerable to ensure the loyalty and commitment of employees to execute effective change management; because, an organizational change process which lacks coherence might fail, particularly in a host country or another national market,
- The more employees know about the change process and its goal, the more they would be willing to cooperate or the less they would resist. Yet, this should be defined in an international language for simplicity and clarity,
- Understanding cultural traits of employees is crucial. Culture is composed of values, beliefs, customs, language, religion and related ways of life which distinguishes a group of people from others. Culture is the recognition of a mindset. Moreover, comprehending, internalizing and institutionalizing various cultures, combining them in a pot and establishing a joint organization-wide culture can enable executives to clarify the situation for the whole staff,
- The ultimate task of the organizational change process shall be continuous change to constitute an efficient and advantageous framework which is conducive to permanent adaption to any environmental circumstance.

The global business arena involves a turbulent, dynamic and perpetually changing and challenging environment involving differentiations in commercial conditions, customs issues, exchange rates, economic subjects, etc. Therefore, the process of change should be an incessant one. The effective change management in an international organization under global issues and complexities compels international companies to keep the business alive and sustain its continuity along with a never-ending organizational change process. Moreover, change management is not a one-time process. Change management entails reassessment of the progress in various markets continuously and unceasingly. Organizational change in an international business mostly involves a wide initiative, redefinition of functions and duties, reallocation of resources and assigning of managers/leaders. Organizational change and management in international companies requires a holistic comprehension of processes and optimal combination of cultural differences. Nevertheless, the fundamental objective of the change initiative is to reinforce the structure, processes, positions and assets of a corporation and to achieve successful business continuity over the long-run. As to accomplish the permanency of a firm in the international business arena, the continuum of organizational change should comprise of constituting, applying and maintaining ideal change projects to procure competitive advantage over international rivals. In addition to this, securing flexibility and agility is essential. While the sustainability of a successful business is priority in the organizational change process, conservation and further improvement of company trademarks, fame and efficient value chain are also essential. Financial losses ought to be avoided, current and potential customers shall be preserved. Henceforth, the sustainability of the success and incessant adjustment of an international company to its environment shall be the main intention (Valackiene, 2015; Savolainen, 2014; Hassin, 2010; Ajagbawa, 2012).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The international organizational change mechanism is supposed to comprise of its subunits in a holistic manner. The change continuum should be implemented to reorganize, fine-tune, reorient and adjust to conditions pertinent to a company. The wider purpose of organizational change in international companies may comprise of (Ajagbawa, 2012; Valackiene, 2015):

- A competitively intended strategic initiative,
- A log lasting life span which would never end,
- A knowledge-oriented learning process in which the acquired data and knowledge would be utilized in further endeavor,
- A far-reaching and long-term oriented leadership initiative relevant to global business.

The intention to positively impact the process of organizational change in an international company can involve the following items (Ajagbawa, 2012; Martincic, 2010; Gillam, 2013; Valackiene, 2015; Singh, 2011)

- Mission and vison statements could be changed according to the new status-quo,
- Long-run plans and strategy can be rearranged,
- Goals and performance objectives and its evaluation criterions should be redefined,
- Organizational culture ought to be restructured in order to encapsulate both local culture and international customs,
- Duties, skills and tasks of employees should be refurbished,
- Organizational structure, processes, titles, resources, positions and duties shall be developed to adjust any change in the external and international environment almost instantly,
- It is imperative to constitute a comprehension among the staff for the necessity of change and developing the vision accordingly,
- Change agents, especially the leader, act as role models and create a framework to put the system of change in an order and design an adaptive structure,
- Handling the phase of transition is critical in the process of change; because, parties affected by the progress might display negative attitude and resist. Therefore, it would be rational to have contingency planning along with continuous and adaptive plans,
- Measures must be taken to avoid conflict between and among the local and expatriate staff as well as the personnel and organization,
- The impact and reflection of the organizational change process must be assessed in order to evaluate whether the change process matches with the objectives or not,
- The final of a successful change process is not an end, but just the beginning of a new era. Therefore, one should never forget that what does not only change is the change process of itself. Therefore, a successful organizational change must be reinforced with further adoption schemes.

Organizational change is very important for businesses to renew their structures and build optimal means through success. This issue is also considerable for international businesses since they operate in foreign environments and global marketplace characterized with various cultural, legal, political, economic and financial variables. Since every national market is different than the other ones, it is essential for international firms to differentiate and attune to new market conditions. This means that an international or multinational company must do its best to get accustomed to new consumers, laws,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

regulations, customs, employees, rivals, local conditions and many other variables. Yet, the management of the organizational change process is also important. Therefore, the optimal and effective leadership of a change agent is indispensable to fulfil the differentiation and adjustment operations.

ORGANIZATIONAL CHANGE MANAGEMENT AND LEADERSHIP IN INTERNATIONAL BUSINESS

Organizations do not exist alone. They are a part of a quickly changing globalized world. When the situation is considered regarding international businesses, they operate in a wider, more active and more dynamic business world. Today, global business environment compels businesses to constantly change and adjust to fast developments in technology, communication means, laws, regulations, local and international politics, sophisticated customer preferences from different parts of the world, competitive global rivalry and shareholder expectancies relative to increasing volume of dividends. Therefore, in order to adapt to the continuously changing business world, international organizations keep changing on a consistent pace. Actually, creating and sustaining this ability is the source of survival. This stands for rivaling in numerous scopes of business and industries in different countries. So, international businesses are supposed to adjust their subsidiaries and affiliates to local conditions in host countries. This entails a polycentric managerial orientation which champions visionary leadership to adjust the company to host country local conditions as well as to the differentiating customer wants and demands. Henceforth, the means to accommodate the differentiating demands and expectations of customers is to look for distinct solutions for every host market and search optimal diagnosis for transformation in international businesses with the effective leadership of an executive. Effective leadership in organizational change shall adjust company policies, procedures, products, processes, managerial orientations and mentality, employee skills and performance, organizational culture and strategy to global and/or host country market conditions. The aim is to find out and establish the most appropriate and competitive organizational status-quo in terms of international business (Hassin, 2010; Quinn, Quinn, 2016; Savolainen, 2014; Kostovski et al., 2015; Martincic, 2010; Gillam, 2013).

The agent of the organizational change process should be a competent leader with global point of view who can facilitate the organization to gain and enhance the necessary capacity to transform the firm to a new status-quo in which it can act and use its resources more efficiently than its competitors. The leader's role in a foreign environment is especially emphasized and critical since the accomplished leaders should create a global mindset, common culture and joint organizational climate among the staff to constitute cohesiveness. Furthermore, leaders of organizational change in international businesses can develop their skills with global point of view by visiting the subsidiaries and affiliates of a parent company, corporate training, applying teamwork with employees from different nations and gaining experience in different international companies. Henceforth, successful and effective global leadership comprises of the talent to influence and inspire the values, attitudes, mindsets and behavior of employees (Deresky, 364: 361-363; Quinn, Quinn, 2016; Martincic, 2010; Savolainen, 2014; Hassin, 2010).

Leaders in international companies are supposed to display certain roles. They are the representative of their parent companies; so, they must adapt to the local conditions and culture not to make serious mistakes, understand endogenous markets, local consumer behavior and domestically recruited personnel as well as apply the same thing to the companies' structures and processes. Leaders also bear the responsibility to act as a local, a citizen of a host country and a member of a multicultural framework.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The context in which leadership executed and the content of it also matter. Moreover, the context of the leadership involves the entire peculiarities unique to an issue. As the peculiarities related to a situation result from cultural, political, cultural variable as well as the context of leadership compels enjoying creative skills (Deresky 2014, 364: 361-363; Martincic, 2010).

Also, the leader of an international company should have certain traits as (Deresky, 2014: 364; Martincic, 2010):

- International experience of comprehensive management skills and knowledge,
- Adaptability to different cultures, customs, values and norms,
- Collect and internalize information about the host country where business is conducted,
- Ability to use its authority impartially and rationally among different nationalities, ethnic groups and customs,
- Good at cooperating with employees from different nations as well as host country governments and partners,
- Capable of designating convenient facility locations in various geographies which are favorable for business continuity and resource availability,
- Ability to establish domestic professional contacts which can facilitate its business and good relations with the local community,
- Having contemporary international knowledge and experience on modern technology, business structure and means of internationalization,
- Capacity to comprehend and apply country-specific political, commercial, socio-economic and cultural conditions,
- Establishing a fair system of staffing and rewarding for both local and expatriate personnel.

Leaders of international businesses are to learn and adopt various leadership traits unique to global business environment, international interaction patterns, global and local perception and capability to implement organizational tasks and influence organizational culture to adjust to both local and international contexts. Executives from different countries and cultures can create an environment which can be conducive for organization-wide learning and experience share. Yet, leadership styles of executives differentiate over time according to environmental conditions. These leadership styles could be democratic (who delegates authority and involves employees in the decision-making process), autocratic (makes decisions without consulting others), laissez-faire laissez-passer (who have a more advisory style, stimulating organizational members to contribute ideas rather than specifically directing their tasks) and visionary leaders (who manage to inspire others, believe in their own vision, and encourage people toward a shared dream). The leader might use all of its authority pervasively in times of uncertainty which requires risk management; be a mentor and coach just to monitor the business processes in peaceful times; involve as many as employees in the decision-making process and delegate its authority; and allow its stuff to act by itself and tolerate their actions as much as possible. In other words, leadership process promotes leaders to act contingently as well as arrange and apply norms, rules and policies to influence, motive and encourage their staff to contribute their best to realize the objectives a business in a host country (Deresky, 2014: 366-368; Martincic, 2010).

Leadership is a complex, sophisticated and paradoxical issue particularly in international organizations; because, the business is done in an environment of divergent cultures, economic conditions and commercial contexts. That's why, the guidance of an international experienced and competent change

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

agent is essential. This change agent is to be a leader who has a comprehensive understanding of international business environment and local differences. Organizations, especially the international businesses cannot only follow a routine. International organizations must change and adapt to the hectic global business environment continuously. In such a dynamic and turbulent global business context, international companies need leaders who can influence and motive the workforce to contribute their best more than conventional business periods. Managers acquire their authority originating from a position; but, leaders have natural appealing impact on the workforce and are followed voluntarily. (Martincic, 2010; Quinn, Quinn, 2016; Savolainen, 2014; Gillam, 2013; Hassin, 2010).

Leading change is not easy in any organization, particularly in international ones. A leader of organizational change in an international company should highlight the importance and necessity of change in its organization and try to prevent any resistance that might appear. The leader shall inspire motivation and courage on its local, expatriate and third country personnel to take the organization to a further developed desired status in which it will evolve to be a competitive one. Moreover, leadership is related to managing the corporate culture which should be structured firmly. Leadership signifies motivation, encouragement, involvement and communication of the personnel. The effective leadership in international businesses requires to take various cultures and nations into consideration and shall highlight the significance of organizational change and development to employees as well as stimulate the individuals to carry on and finalize the tasks intendedly. Good leaders are comfortable in complex and sophisticated situations in order to inspire the personnel. Eventually, leadership in international organizations is an arduous duty which can make or break the destiny of a corporation. That's why, it must be handled cautiously and entrusted to capable individuals who can transform a business into a successful one and constitute a long-lasting structure which can facilitate its improvement continuously (Kostovski et al., 2015; Gillam, 2013; Singh, 2011).

FUTURE RESEARCH DIRECTIONS

Organizations do not only exist in the local business environment, but also exist in the international business context too. Yet, 21.st century comprises of a dynamic and turbulent business environment which compels businesses to change and adapt their processes, routines, status and structure to the ever-changing nature of the global business. It is intended to review the optimal change management and effective leadership in national and international businesses in this paper. However, in further studies and research, the same issue could be investigated with respect to certain country groups or regions such as BRIC, NAFTA, Latin America, South East Asia, emerging countries or Eastern Europe, especially considering the importance of cultural differences.

CONCLUSION

The process of organizational change is a difficult operation to execute. Thus, when the process is conducted successfully, the result would be favorable, but if it is conducted unsuccessfully the result might be devastating. However, if the organization strives to be competitive in the ever-changing business environment and respond to customer needs and demands effectively, they have to change. Completing this task is not easy as well. The process of change must be handled cautiously and carefully, since it

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

may affect individuals, groups, structure, processes and organizational climate randomly and negatively. For, a business change operation that is managed efficiently, may lead to a flexible structure, advantage over the rivals, an agile structure and personnel satisfaction, but on the other hand, a business change operation that is conducted without the necessary care may lead to stress, anger resistance and absenteeism in the personnel and decrease the efficiency in all operations and output of the business. In order to avoid the negative effects of the process of change, management of an influential leader is imperative. A leader who is competent, experienced, prospective as well as involving the personnel, their necessities and demands in the operation of change would likely to be successful and accomplish an efficient change process. That's why, a leader having hands on management and involving its personnel in the change process, explaining the reasons, stimulating positive climate and restructure the organization soundly would bring about positive results in both national and international organizations.

When the situation is considered with respect to international companies/MNBs the process of change and leadership shall be regarded from a different point of view and should involve:

- The change process for international businesses/MNBs must involve cultural, economic, political, commercial and financial issues.
- Application of the change process requires the overcome of inertia which might result from changing decision-making, authority, communication, management and leadership styles for every host country and region.
- Leaders that initiate change in international businesses/MNBs are supposed to strike a balance among the local, third country and expatriate personnel.
- The acquisition of local knowledge and experience as well as converging these with international knowledge and experience.
- The authority shall be implemented neutrally.
- Local goals and targets ought to be reconciled with international goals and targets.
- A company-wide international mindset shall be constituted to beat inertia and resistance.

KEY TERMS AND DEFINITIONS

Change Agent: Any party which initiates, conducts, and finalizes the organizational change process.

Change Management: The process of transforming an organization into an efficient and effective status along with its sources, processes, and structure.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Change Stimulus: Factors instigating organizations to change status when they are deficient.

International Business: Business and its operations conducted over the borders of a country in a host market by means of importing, exporting, licensing, franchising, mergers, acquisitions, greenfield investments, and international joint ventures.

Leadership: The process of influencing and motivating individuals to contribute their best to achieve the goals and targets of an organization as effectively as possible.

Local Business: Business and its operations conducted in a domestic market.

Management: The process of planning, organizing, leading, coordinating, and controlling the material and nonmaterial sources of an organization to accomplish its goals and objectives.

Chapter 68
Leading Digital Transformation in Higher Education:
A Toolkit for Technology Leaders

Christine Elizabeth Miller
California State University – Sacramento, USA

ABSTRACT

The pace of innovation continues to accelerate. Students expect campuses to keep pace with the technology they use in their daily lives, and the technology they will likely need to use when they enter the workforce as graduates. Students and their families now pay more of the costs associated with earning a degree, and they want to have a voice in campus planning and decision making. Higher education technology leaders will need to help their campuses shift from incremental adoption of disparate technologies to digital transformation. Digital transformation includes adopting innovative technologies to transform mission critical activities and optimizing related processes and data with the objective of increasing customer satisfaction and providing an excellent end user experience. To guide digital transformation, technology leaders in higher education need a toolkit to build buy-in and facilitate cultural transformation on their campuses.

INTRODUCTION

Technology leaders in higher education can empathize with Cassandra of Greek mythology. Technology leaders try to illustrate the opportunities that digital transformation can offer their campuses in essential areas such as teaching, learning, advising, fundraising, and administration. Sometimes these prognostications receive a daunting level of resistance or a confounding lack of interest. Higher education technology leaders need to help their campuses envision and implement a digital future that preserves core values and embraces strategic innovations more broadly, deeply, and rapidly. In simplest terms, "digital transformation means transforming an organization's core business to better meet customer needs by leveraging technology and data" (Clark, 2018). For example, in higher education digital transformation

could involve a strategic, campus-wide effort to plan, implement, and adopt an integrated ecosystem of advising technologies powered by data analytics to improve student persistence and graduation rates. Labeling students as customers causes some campus members to bristle; nevertheless, "Money is exchanged, debt is incurred, and a valuable asset in the form of a degree, certificate, or badge is obtained" (Stoller, 2014). Technology leaders tend to view everyone they serve as a customer. Higher education does itself a disservice by rejecting customer-centric concepts on principle. A distinction should be made between digital transformation and initiatives that result in incremental improvements or innovations that have transformative effects on a small target audience. According to Harvard Business Review, "a digital transformation occurs when you use digital technology to change the way you operate, particularly around customer interactions and the way that value is created" (Libert, Beck, & Lind, 2016). Digital transformation is not a one-and-done project or initiative; it can and should be repeated selectively. When enculturated, digital transformation becomes the approach the organization uses to achieve many of its strategic goals.

The private sector regularly introduces disruptive innovations by leveraging technologies such as the Internet of Things (IoT), artificial intelligence, and machine learning (Sastray, 2018). What about higher education? A couple of universities, such as Western Governors University and Singularity University, receive recognition as innovators in pedagogy and curriculum, but the list of examples is not very long. Entrepreneurial campuses, such as Georgia State University, that use a strategic blend of data, technologies, and cost-effective, time-tested practices are ahead of many of their peers (Quinton, 2013). How will traditional universities embrace digital transformation when there is so much dissonance between the pace of change in academia and the pace of technical innovation? Technology leaders in higher education need a robust toolkit to address this conundrum.

BACKGROUND

The Defense Advanced Research Projects Agency (DARPA) and scholars affiliated with research universities such as MIT and UCLA collaborated to develop the network of networks that we call the Internet (Leiner et al., 1997). The technology leadership role once played by higher education lapsed in the dot com and post-dot com eras as the Internet evolved from a predominantly public-sector resource to a predominantly commercial resource. Some universities have innovative research centers such as the National Center for Supercomputing Applications at the University of Illinois Urbana-Champaign. Typically, universities adopt technology innovations at an unhurried pace. When the pace of innovation was slower, universities could exert more control over the pace of adoption. A couple of decades ago, email accounts and File Transfer Protocol (FTP) were for power users, and universities were deciding if they wanted to have websites. These things were still optional in the mid-1990s. They are not optional now, and these technologies, or their successors, are ubiquitous at all universities. Although digital transformation may seem optional now, it will likely become commonplace in the future much like email, FTP, websites, etc. Universities that are effective early adopters of digital transformation will differentiate themselves from their peers.

Higher education has experienced periodic revolutions such as the Serviceman's Readjustment Act of 1944, the coupling of accreditation with federal financial aid programs, and the civil rights movement (Thelin, 2004). In the early 2000s, some thought that for-profit universities like the University of Phoenix might eat the lunch of traditional universities by bringing economies of scale to the design,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

development, and delivery of instruction (Pepicello, 2012). More recently there has been buzz about badges and micro-credentials unseating universities from their position of authority over the conferring of degrees. If badging and micro-credentials gain greater legitimacy, this could reduce the attractiveness of making the substantial investment of time and money required to earn a college degree. Large technology companies like Microsoft have boldly stated that they recruit based on skills, not degrees (Bunio, 2018). Technology startups have had this mindset even longer. Waiting passively on the sidelines could lead to being disrupted by more nimble alternatives, and the higher education news media has reported an increasing number of university closures (Lederman, 2017).

Students are becoming less and less tolerant of large gaps between the technologies they use in their daily lives, and the technologies provided by the universities they attend. Universities compete with an increasingly instant gratification-oriented world. The student experience should not feel like a visit to a time capsule, and many students will deride a university experience that puts the burden of siloed processes and legacy systems on them. They expect a unified, seamless, secure, and accessible experience. According to John Gardner, "Students experience college as a whole, not as discrete units" (J. N. Gardner, personal communication, September 1, 2009). In other words, students do not care about the organizational chart.

Students have become more influential in campus planning and resource allocation in part because they and their families are bearing a larger portion of the costs associated with attending college (U.S. Government Accountability Office, 2014). The gap between technology inside the university and outside it continues to widen. One can still find VCRs and CRT monitors in dark corners of some classrooms at public universities. Prevailing Student Information Systems are not natively mobile device friendly. The cultures and organizational structures of universities often lead to proliferation of tools that may or may not be integrated. A holistic student record with appropriate role-based access is a rarity.

Increased scrutiny from federal and state governments and the public have created a greater emphasis on outcomes and student success. Selective universities have the advantage of focusing on inputs and admitting students who are academically well-prepared and typically persist through graduation. These students often have parents who attended college and set expectations about college attendance and graduation. These students may want a traditional college experience characterized by living on campus and participating in student activities, and they may not require interventions to persist and graduate. Access institutions play a different role; they admit many students who are first generation, non-traditional, underrepresented, or undocumented. Education can be transformational for these students and their families. Access institutions are already in the transformation business.

The fragmentation of some university processes and data creates barriers to student success, and these disparate systems can provide poor or confounding experiences for students, faculty, staff, and administrators. Now, universities can and should implement seamless student information systems powered by technology and data, and technology leaders in higher education must often serve as the standard bearers for this and other digital transformations. In a time of dissonance, characterized by greater expectations from students, increasing competition from alternatives that may be viable, and rapid introduction and adoption of disruptive technologies outside of academia, embracing digital transformation is a necessity to ensure that higher education retains its place as an institution of enduring regard, relevance, and value.

Leading digital transformation involves tools and challenges that will be familiar to technology leaders in higher education. Digital transformation can still be elusive because it is not limited to the implementation of new technology. To transform the 'customer' experience, digital transformation also

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

involves transforming underlying data, processes, and even some roles. Digital transformation will be a cultural transformation on most campuses.

A DIGITAL TRANSFORMATION TOOLKIT FOR TECHNOLOGY LEADERS

Based on the definitions provided, digital transformation includes the following essential elements: innovative technologies, people, data, and transformation that affects core organizational activities. Fundamentally, digital transformation is organizational transformation led by people for people.

Drivers for digital transformation include eventual necessity, competition from universities that innovate more rapidly or alternatives outside academia, and student expectations in terms of both technology and university governance. Students, and prospective employers, expect universities to provide knowledge, skills, and abilities that enable graduates to successfully transition to an increasingly digital workplace. Barriers to digital transformation include lack of buy-in and resistance to changing campus culture and processes that would enable greater capacity for innovation and the increased agility that will be required to maintain greater parity with the world outside academia. Leading digital transformation may seem daunting. Using the past and current climate as context, this chapter identifies 11 capabilities and opportunities that comprise a digital transformation toolkit for higher education technology leaders. Technology leaders should be able to use all the tools proficiently and select the right tool or tools for the task at hand. Many of the tools in the toolkit are soft skills such as communication, collaboration, and change management. The chapter concludes with a few suggested initiatives that may represent low-hanging fruit and an example of a university that has successfully achieved a digital transformation.

Transformational Leadership for Cultural Transformation

The first tool in the toolkit is transformational leadership. In the university context, digital transformation will require a cultural transformation from incremental and/or shallow changes to accelerated, campus-wide changes that affect mission critical activities. The American Council on Education provides the following definition of transformation:

Transformation 1) alters the culture of the institution by changing select underlying assumptions and institutional behaviors, processes, and products; 2) is deep and pervasive, affecting the whole institution; 3) is intentional; and 4) occurs over time. (Eckel, Hill, & Green, 1998, p. 3)

In the future, highly effective universities will develop highly collaborative cultures that are nimble and adaptable. Fortuitously, technology leaders in higher education have been working to cultivate these qualities in their organizations for decades so they already have some experience making these shifts.

Cultural transformation requires transformational leadership. EDUCAUSE recognized the need for transformational technology leadership over a decade ago: "Transformational leaders are good role models: they inspire, empower, and motivate staff; encourage creativity; and effectively communicate a shared mission and vision" (Katz & Salaway, 2004, p. 5). Furthermore, technology leaders must serve as trusted partners in the academic enterprise: "This new leadership approach requires these people to be partners in reconceptualizing the institution's mission, articulating a vision, and forging the political alliances necessary to achieve the kind of change required" (Katz et al., 2004, p. 6). They must develop

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

strong alliances with other campus leaders and engage in continuous collaboration and communication with faculty, staff, and students across the university. They will need to cultivate a keen understanding of the digital landscape, apply the technical expertise of their organizations, seamlessly play multiple roles, and most importantly be mindful of working within the culture to change the culture (Eckel, Hill, Green, & Mallon, 1999). Additionally, they will need to find allies and areas of receptivity that will ripple concentrically into bigger and better opportunities that culminate in transformation.

Shared Governance and the Big Table

Most universities have some degree of shared governance characterized by stakeholder engagement in matters such as curriculum and academic policies; engagement and buy-in often go hand in hand. Shared governance serves as the second tool in the toolkit. Technology leaders in higher education need to incorporate shared governance in digital transformation initiatives to build buy-in and support. Sometimes this can be accomplished simply by including shared governance representatives on project or advisory committees. When stakeholders are excluded, issues are inevitable. These issues typically affect faculty, staff, or student experiences, and they reduce trust between people and organizational units. Technology projects are susceptible to failure due to role ambiguity, change fatigue, lack of buy-in, or shifting priorities. Experientially, technology projects are more likely to fail due to a lack of buy-in than problematic technology.

Universities need a bigger table for planning and decision making in the digital age. Brian Hawkins (2008), past President of EDUCAUSE, initiated the 'big table' conversation and advocated making room for technology leaders at the senior leadership table over 10 years ago. Using technology strategically and partnering to transform mission critical activities necessitates a place for technology leaders at the planning and decision-making table. Dualism of controls (Birnbaum, 1988) has been replaced with quadruple controls that include 1) administrators, 2) faculty, 3) staff, and 4) students. Students, who are bearing more of the costs associated with college, expectedly also want their voices heard as priorities are set and resources are allocated.

Because digital transformation typically crosses organizational boundaries, the positioning of technology in the academic enterprise is more important than ever. Reporting relationships can reflect the role of technology at the university. When technology reports to finance or administration, the university may view technology as a cost. When technology reports to academics, the university may view technology in a support role. Reporting to the academic side of the house could accelerate intentional use of technology for teaching, learning, and scholarship, and optimizing technology in Academic Affairs should ease the path to optimizing technology in other areas. When technology reports to the President, the university, at a minimum, recognizes that technology is ubiquitous and spans all functions of the university, and when technology leaders report to the President, they have the opportunity to demonstrate how the university can leverage technology and data to achieve strategic goals, improve end user experiences and processes, and increase efficiency throughout the campus. Regardless of reporting relationship higher education technology leaders will need to have campus-wide influence to facilitate digital transformation successfully.

Although expanding the table can be threatening to some stakeholders, a bigger table does not reduce status or influence nor does a bigger table need to result in protracted processes or deferred decisions. The size of most universities makes direct participation in shared governance impracticable (Bates, 2000); technology can help facilitate engagement opportunities through polls, surveys, webinars, and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

other feedback mechanisms. Committees and taskforces continue to provide valuable engagement opportunities; effective committees tend to be small in size, include representative stakeholders, and are designed to manage expectations and achieve defined outcomes. Committees have their limitations:

Committees are useful for communication, education, consultation, recommendations, and sometimes decision making. However, in most higher education institutions committees do not execute actions. This is usually best done by individuals, or more accurately by people with the power and mandate to do things. (Bates, 2000, p. 53)

Avoiding role ambiguity by documenting roles and responsibilities at the outset of a project or initiative will help ensure success. A model such as RACI (Responsible, Accountable, Consulted, and Informed) can be used to assign accountability, facilitate involvement, and set boundaries. Role definition will help avoid conflict, turf wars, and confusion. Borrowing from the email signature of a colleague and faculty member: "Genuine consultation happens when the party being consulted has a meaningful chance of influencing the outcome."

Sometimes campus leaders may perceive urgency and omit the consultation process. According to Tierney and Lanford (2018),

The rhetoric of change and disruption also plays a role in contemporary strategic decision making, particularly when it appears that early adopters of a new technology may have a strategic advantage over peer institutions. Lest they be placed at a disadvantage that could cripple their institutions' future economic viability, many leaders feel compelled to make quick decisions, circumventing traditional participatory processes that give voice to multiple constituencies. Consequently, communication becomes an essential tool for the dissemination and implementation of institutional strategies. (p. 5)

Since consultation tends to be a core value, it should be omitted with caution and selectivity. Tierney and Lanford's research indicates that communication before the fact may diffuse some resistance. Meaningful consultation will continue to be valued at many universities, and technology leaders will need to develop engagement strategies that make engagement meaningful and nimble.

Technical Expertise and Academic Acumen

To lead digital transformation or any far-reaching change in higher education, technology leaders must know technology and higher education. The combination of technical expertise and academic acumen represents the third tool in the toolkit. Some espouse the idea that leadership skills are transferable, and great leaders can lead anything. Technology leaders in education will have to initiate technical changes in their organizations and on their campuses. They will not be able to proclaim 'cloud first' and drop the mic. Technology professionals in higher education tend to have long tenures. Over time, this can limit exposure and/or receptivity to innovations. Technology leaders will need to drive and manage change inside and outside the technology organization. This task will be insurmountable if the technology leader does not have at least a high-level understanding of current and emerging enterprise architectures and applications, or will not endure if he/she cannot reasonably assure confidentiality, integrity, and availability of data and other campus information assets. At the same time, the technology leader must understand the strategic goals and business processes of the campus. The term, business processes, can

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

be anathema to traditional academics, but the higher education technology leader must understand the academic calendar, and the complete student lifecycle from prospective student to matriculate, to graduate, to alumna, or one will not be able to get buy-in for proposed improvements or innovations. Technology leaders need to effectively navigate campus culture and respect the role of the faculty in delivering the teaching and scholarship missions of the university. Other leaders can contribute to technology strategy; the technology leader should be tapped to coordinate **how** the strategy will be accomplished to ensure compatibility, security, accessibility, and sustainability of the solution. The technology leader should know the capabilities of the technology organization in terms of expertise, infrastructure, applications, and other resources.

Empathy

Empathy serves as the fourth tool in the toolkit. Higher education technology leaders must develop a wellspring of empathy for those they serve because these are tough times on many campuses. Many public universities continue to experience a recession in the portion of their budgets that comes from the state. Many faculty have witnessed a decline in the number of full-time, tenure-track faculty in favor of greater dependence on part-time, temporary, and adjunct faculty. Sometimes universities adopt this practice in an effort to serve students by offering seats and sections to meet demand, and sometimes saving money is the driver. Students are bearing a greater portion of the cost of college and adding debt to their college experience; concurrently, students are vying for more influence in campus governance. The stress experienced by many campus constituents affects receptivity to digital transformation and necessitates an abundance of empathy on the part of technology leaders. Practices such as active listening and reviewing user stories and feedback help cultivate and sustain empathy.

Change Management

Technology leaders spend an abundance of their time serving as change managers; the fifth tool in the toolkit is change management. Many administrators, faculty, and staff members couple technology and higher education technology leaders by association, with change, and most typically, with changes that are not wanted or welcomed. This mindset can be a barrier to pursuing even incremental changes. However, early career faculty are increasingly likely to be digital natives who are more receptive to innovations and accustomed to the pace of technological change outside the university. Effective technology leaders must excel at change management. The critical role of change management in any change endeavor cannot be overstated. Digital transformation, or enduring change of any kind, cannot be accomplished without effective change management. Change management is not easy. It is easier if the change is a goal that can be accomplished by a range of alternatives. Change management is excruciating if the goal is to drive an organization to a single, specific alternative. For example, change management will be easier if the goal is to undertake an inclusive and intentional process including an evaluation of alternatives that will lead to the selection of a next generation learning management system. Getting buy-in for a predetermined outcome is much harder. For example, announcing that the campus will be moving to Instructure Canvas without gathering requirements, evaluating alternatives, and consulting with faculty, staff, and students will likely be received with resistance and disparaging remarks even if the campus would have chosen this option.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Change management often begins with a change readiness assessment. The assessment can help identify support and barriers that will facilitate the creation of strategies to help build buy-in. A well-defined change management process and the ability to demonstrate some change management wins will help make the process more nimble with each iteration. Change management is especially important in organizations that lack trust. A published project plan that includes engagement strategies provides transparency and helps build trust. Defining roles and responsibilities is essential, and this step can diffuse conflict and turf wars. In addition to stakeholder analysis and engagement strategies, change management also includes setting metrics, making organizational changes, creating training, navigating culture, and developing communications (Lewis, 2011). Change control processes for infrastructure, systems, and applications are an essential aspect of effective change management to ensure that all system changes are documented and approved.

Communication

Communication serves as the sixth tool in the digital transformation toolkit for higher education technology leaders. EDUCAUSE, the leading professional organization for technology in higher education, has an IT Communications Constituent Group listserv, and the practice of having a communications officer or team embedded in the technology organization has become a necessity. Because technology and change can be synonymous, technology leaders must communicate early and often. Tierney and Lanford (2018) recognize the essential role communication plays in stakeholder engagement and strategic projects; they provide the following advice:

When new people join an institution, the socialization process needs to establish preferred forms of communication so that feedback channels can be utilized. Additionally, communication from administrators is essential during strategic reform processes that can easily be misinterpreted by individual actors. (p. 6)

Best practices include developing communication plans for campus-wide projects and marketing campaigns to reiterate services offered and shared responsibilities such as information security and accessibility. Information overload continues to be a challenge, and the quantity and frequency of campus messages leave many recipients teetering on the verge of email bankruptcy (Musgrove, 2007). Effective leaders will have to identify new communication channels that enable them to rise above the noise. The usefulness and viability of email is evaporating (Brandon, 2015).

Collaboration

The road to digital transformation is paved with collaboration, and collaboration requires cultivating and sustaining effective relationships throughout campus. The seventh tool in the toolkit is collaboration, and all collaborations are personal. Taking advantage of opportunities provided by digital transformation necessitates removing barriers to integrating systems, sharing data and processes, and developing a culture of collaboration. Many universities have organizational silos. Technology leaders must facilitate the task of making their campuses less siloed and more collaborative. Organizational silos tend to operate more like separate, semi-autonomous units. Technology spans all functions of the university so there are abundant opportunities for collaboration, and the technology organization must partner with the entire campus. Lack of collaboration can be an enormous barrier to creating or maturing university capabilities

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in critical areas such as online learning and research computing. Academic Affairs and the technology organization must work as partners when technology intersects with teaching, learning, and scholarship.

Silos can lead to a proliferation of disparate or redundant tools that the university would like to integrate. Integration platforms like Oracle X, Dell Boomi, and Mulesoft can help with this task. In the future, universities will be more intentional about technology investments and likely adopt 'born digital' platforms such as Workday that can provide a responsive and intuitive experience for faculty, staff, and students. The disparate systems of the present will likely be replaced by holistic, next generation student information systems or at least well-designed interfaces that create the illusion of seamlessness.

Carr (2003) provocatively stated that information technology ceased to be strategic when it became ubiquitous. Carr's pronouncement predated mobile and digital transformations. Technology can be a differentiator when used strategically and led effectively. Weick (1976) and Birnbaum (1988) described higher education as a loosely coupled, open system. One of the stated benefits of loose coupling is that subunits of the university can respond to changes without affecting the whole (Birnbaum, 1988). Furthermore, loose coupling prevents management fads from taking hold in the university (Birnbaum, 2000). Unfortunately, loose coupling can be a barrier to change including changes that could improve experiences for all faculty, staff, and students by increasing the consistency and reliability of shared systems, processes, and data. Loose coupling is good if campus goals can be accomplished through initiatives at the unit level; loose coupling will not create a seamless campus-wide experience for students, and campus-wide goals such as reducing time to degree cannot be realized without a tightly coupled, campus-wide strategy. Collaboration helps decrease the fragmentation that students can experience as they navigate organizational complexity. Digital transformation requires using standards, processes, and tools campus-wide. Campus-wide projects and programs can lay the groundwork for meaningful, ongoing collaboration. Digital transformation cannot be accomplished without effective, campus-wide collaboration.

Business Process Analysis

Business Process Analysis is the eighth tool in the toolkit. Because digital transformation typically involves process improvement, business process analysis is a core competency of technology leaders and their organizations. Technology leaders in higher education are uniquely positioned to see data and processes flow through the campus. Conducting process analysis and revealing complexity, vestiges, or gaps can facilitate collaboration across disparate campus units that share processes or data. Because many universities have been loosely coupled or siloed for decades, processes and data have not been reviewed regularly, and they tend to drift over time. If the technology leader can facilitate process mapping and diffuse conflict and defensiveness, he/she has a chance to build trust, create value, and position the university for innovation. It is impossible to innovate effectively on top of bad processes and data. Technology leaders must do the hard work of busting silos and their clutter. Unfortunately, processing mapping and analysis is high effort work that does not yield instant gratification; frankly, it is a slog. Technology leaders may collaborate with campus partners, for example, to significantly reduce the time it takes to make financial aid disbursements. This creates better experiences and increases satisfaction, and it is not the kind of work that yields rock star recognition. Do this work anyway.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Strategic Planning and Visioning

Strategic planning and visioning serve as the ninth tool in the toolkit. Understandably strategic planning projects are often met with cynicism. Many have had the experience of participating in a planning process that yielded a dusty binder or a website. Nonetheless, the organizational changes that need to occur to support digital transformation require a concerted planning effort. Strategic planning requires an understanding of where you are and where you want to go, and there is more than one way to do strategic planning.

Strategic planning readiness begins with reviewing mission, updating vision, and scanning the environment to understand context. Strategic planning also requires some urgency and sustained energy to drive it to its specified outcomes. Sometimes strategic planning needs a nudge. The technology leader may have to paint a picture of a highly desirable alternate reality. Would you like your preferred classroom settings to be stored and launch automatically as soon as you are recognized? Although some campus community members will be skeptical, techniques such as working backwards (Vogel, 2006) and design thinking (IDEO, 2018) can facilitate exploring new directions. Other nudges include compliance, security, and students. Drivers related to compliance or security often emerge external to the university; students serve as internal drivers. Students can be very effective change agents, and their campaigns for change are often received with greater receptivity by the campus community.

Presidents and other leaders need to create expectations for transformation and reiterate the messages associated with the transformation. "For mission statements to be effective, their basic principles need to be reinforced by leadership through speeches, letters, and other forms of written and spoken discourse, especially at times of institutional uncertainty" (Tierney & Lanford, 2018). One will have an uphill battle attempting to transform a campus that strongly resists. One could also consider creating a Center of Excellence for innovation or digital transformation or conducting a pilot or proof of concept. These experiments will help identify the allies and champions who may make broader initiatives possible. One will find areas of receptivity and create pockets of transformation that could lead to culturally palatable incremental transformation.

"A vision is a picture of the success…at a particular time in the future" (Weinzweig, 2008). Furthermore, an effective vision needs to be inspiring, achievable, documented, and communicated (Weinzweig, 2008). The vision statement should reflect the aspirational culture; clarifying, communicating, and reiterating the vision is a necessity. Stakeholders need to understand the target as well as the rationale. Digital transformation offers benefits such as reducing the technology gap between the university and the outside world, improving processes and experiences, and facilitating a seamless, holistic experience for students and other campus members. A well-crafted vision can help sustain organizational transformation efforts when frustration, impatience, and fatigue set in.

Culture Change Management

The tenth tool in the toolkit is culture change management. Universities tend to embrace their history and traditions. Although universities are often loosely coupled, community members also have a strong, shared identity as demonstrated by the preponderance of school colors and logos that appear on the apparel, backpacks, water bottles, etc. of students, faculty, staff, and alumni. Culture is palpable on many campuses, and as the saying goes, culture eats strategy for breakfast. Culture consists of multiple attributes, and culture tends to have both enduring and fluid aspects. Tierney and Lanford (2018) define culture from

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a social constructionist perspective. They state that culture is more than structures, norms, and values: "Instead, a broad array of factors — including changes in the greater environment, the unanticipated actions of individual actors, and the constructed understanding of an institution's history are more likely to inform contemporary events." Tierney (1988) created a frequently cited cultural framework for higher education, which includes the following categories: environment, mission, socialization, information, strategy, and leadership. The American Council on Education Project on Leadership and Institutional Transformation (Eckel, Hill, Green, & Mallon, 1999) identified the change paradox: change agents, such as technology leaders, must work within the culture to change the culture. Cameron and Quinn (2006) espouse the belief that a *modified culture* is the output of change, and they developed an instrument called the Organizational Cultural Assessment Instrument (OCAI) that is intended to measure culture and identify the gap between current and desired culture. Digital transformation and cultural transformation are tightly coupled. Technology leaders need to plan digital transformation projects that will be compatible with campus culture and push boundaries at the same time.

Maturing Information Technology Governance: Data, Project, and Procurement

The eleventh and final tool in the toolkit is information technology (IT) governance. Effective technology governance on the front end always saves time in the long run and helps universities reduce and/or prevent technical debt. Technical debt is the practice of taking short cuts to achieve short-term gains that will reduce efficiency or create complexity in the long run. Before one attempts digital transformation, the effectiveness of the technology organization and IT governance processes must be addressed. Although there are many types of IT governance, data governance, project governance, and IT procurement governance are a powerful trio.

Data Governance

Hawkins (2006) advised technology leaders, among other things, to make information an asset:

Institutional leaders must understand that our colleges and universities are information-based organizations, that technology facilitates highly interdependent relationships between organizational units, and that the traditional stove piped or vertical structures are inadequate to manage the information-based institution. This educational responsibility is an obligation that all IT professionals need to actively assume. (p. 8.5)

Making information an asset requires intentional data governance efforts. Rouse (2017) defines data governance as "the overall management of the availability, usability, integrity and security of data used in an enterprise." Information and processes must flow across the organization; they cannot be stuck in silos. Technology leaders often must make the case for data governance and serve as enablers or facilitators of the process as well as implementers of data definitions and data models. Technology leaders must hone facilitation and mediation skills to bring functional data owners and stewards together and stress the necessity of maturing data governance.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

IT Project Governance

Enterprise project management is a core competency of higher education technology leaders and their organizations. The project management office facilitates an inclusive and standardized process for gathering and prioritizing project requests, allocating resources, and delivering value on time and within budget. Digital transformation will undoubtedly involve projects, and universities desperately need effective project management capabilities. One of the reasons technology projects fail is the lack of a project charter. The charter should include goals, roles, scope, risks, and milestones. In addition to the charter, technical project management includes sub-plans for communication, engagement, testing, and change controls. Having a vetted engagement plan with milestones will increase the likelihood of buy-in and cultural compatibility.

Some technology organizations have adopted agile project management in whole or in part. Traditional waterfall project management tends to be more sequential and can include long gaps between defining requirements, producing deliverables, and engaging customers. Agile facilitates iterative development and customer check-ins that provide an opportunity to revisit requirements, make micro-decisions, and review micro-deliverables. Agile may also be more compatible with university culture because the agile experience feels more like incremental change. Based on the characterization of higher education as a loosely coupled (Weick, 1976), open system (Birnbaum, 1988), adjustments, or incremental changes are more compatible with the organizational culture of many postsecondary institutions than transformation.

IT Procurement Governance

Many technology leaders understand the experience of being circumvented – sometimes intentionally and sometimes accidentally by colleagues who have good intentions; many technology and other leaders in higher education can relate to the experience of having to oversee an implementation after procurement or a decision-making process has occurred. This situation is problematic on a number of levels. The product may not be a fit for campus technology standards and practices, and it may not have been reviewed to ensure that information security and accessibility standards are met. Sometimes it may even duplicate features or functionality of an existing investment. Additionally, it puts the technology organization in a reactive mode, and this makes it impossible to manage resources effectively.

Due to the increased emphasis on student success, many universities are making significant investments in technologies and other initiatives that may help students stay on track, persist, and graduate. This is another way that loose coupling can be problematic. All units want to contribute to or take credit for student success so campuses may unwittingly invest in multiple products that have similar features or functionality. Inclusive IT procurement governance will be even more important in the digital age. Many of student success tools can be beneficial, but none of them offers a quick fix or instant gratification. They need buy-in, a well-developed project plan including communications, testing, and the development of change controls and other processes to ensure sustainability, consistent and inclusive participation, and eventually program management. These tasks are daunting, and many universities do not persist in their efforts to implement tools that are designed, ironically, to improve student persistence and success. Technology procurement review should ensure that all aspects of program management have been considered prior to procurement and implementation. Project managers typically cycle off a project when deliverables are achieved; program managers tend to have a portfolio of products with ongoing responsibilities.

LOW-HANGING FRUIT

Digital transformation offers an incredible opportunity to improve core campus activities for 'customers' through implementation of innovative technologies and transformation of related processes and data. Some technology leaders have initiated digital transformation, and others need to identify opportunities that represent the path of least resistance to digital transformation. This section offers two suggestions.

Innovate the Technology Organization

Digital transformation is about using technology, data, and processes to innovate the end user or customer experience. All campus members use technology resources and services so the technology organization can serve as the inception point for digital transformation. Technology leaders cannot facilitate other digital transformations if the technology organization is lagging. The technology organization should be able to serve as an innovation engine for the campus. If the technology organization does not embrace digital transformation, it is unlikely that the campus will embrace digital transformation. The technology organization can serve as a microcosm of the university at large. The digital transformation toolkit can be used to innovate the technology organization and the rest of the campus. The technology leader will need to collaborate with the technology organization and other stakeholders to develop a shared vision and strategic plan. Silos within the technology organization will need to be busted; the use of standard tools and practices must begin in the technology organization, or they will not scale campus-wide.

Digital transformation includes both digitization and transformation (Gruman, 2016). Implementing new technologies accomplishes digitization; underlying processes and data must be optimized to achieve transformation. Gruman (2016) advises organizations to become fungible; he states,

Fungibility means the ability for something to be changed. That's not the same as the ability to change something; fungibility is an intrinsic characteristic, not a force imposed by an external source. Transformation is the act of making substantive change; fungibility is the intrinsic ability to be substantively changed. (para. 9)

Technologies of the future will be adaptive, and the technology organization will also need to be adaptive, or fungible, as well. Solutions will need to be designed to adapt to new requirements and questions that have not been asked yet. Becoming an adaptive organization will likely be a culture change for many technology organizations.

Change management also plays an important role in the technology organization. The changes that accompany digital transformation can create fear and anxiety for some technology professionals, and digital transformation will involve augmenting some roles and responsibilities and diminishing others. For example, administering cloud-based hardware or applications requires different emphases than administering on-premise hardware and applications. Reductions in staffing are unlikely based on campus appetites for software and services. Staff in the technology organization will need both technical and soft skills training to prepare for changes associated with digital transformation and the increased emphasis on the end user experience that goes along with it.

Technology spans the campus, and the technology organization must serve as a trusted partner to shepherd digital transformation initiatives. Technology does not add value if it operates in isolation. Although it is desirable for technology infrastructure to operate in the background with the reliability of a utility,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the team and its members need to have a lot of visibility. Visibility is important because it gives team members the opportunity to build the partnerships that will help ensure that technology planning happens in the early stages of emerging initiatives. Visibility also gives members of the technology organization the opportunity to understand business processes, pain points, and the end user experience firsthand.

The higher education technology organization will need to adopt a culture more like a technology start-up company. These cultures are characterized by agility and innovation. The technology organization needs to transform first and lead the way for the rest of the university by adopting agile project management and implementing adaptable solutions that use technologies such as artificial intelligence and machine learning.

Many universities have accumulated technical debt; technical debt accrues from the practice of taking short cuts for short-term gains without recognizing the long-term costs associated with cutting corners. Technical debt is another driver for innovating the technology organization. Technology is still fairly young, and technology on many campuses developed organically rather than intentionally or strategically. Technical debt may exist in many applications and processes throughout the university. The process of getting the debt out may improve efficiency and end user experiences; it is unlikely to save money. Technical debt may be inevitable when implementing innovations that are not mature. Universities may need to spend more on technology in the age of digital transformation, not less. Entrepreneurial universities will invest in digital transformation and the technology organization to meet aspirational goals.

Democratize Data

Democratizing data can be a digital transformation if it is adopted pervasively. Pervasive adoption requires trusted data and a well-documented and supported set of tools. Data democratization increases role-based access to data and provides tools that facilitate self-service reporting, analysis, and data-driven decision-making. Most universities have an abundance of data that could be made broadly available, especially aggregate data. Effective identity and access management and data governance help make data democratization possible. Identity and access management includes the policies and processes used to provision and de-provision identities or accounts.

Many universities are investing in home-grown or off-the-shelf analytics to help identify opportunities to improve student success. The tools can be used, for example, to optimize classroom space utilization, analyze student demand for courses, and identify proactive (intrusive) advising opportunities at the individual or group level. Specifying roles and developing interventions and assessments are essential to making the use of analytics effective. Inevitably, analytics have the positive effect of forcing campuses to review the quality of their data. This can be a painful process if inconsistencies in practice or data definitions are discovered. Data governance should be one of the positive outcomes of initiating the use of analytics. Ideally, data governance comes first. Data governance and democratizing data are tightly coupled. Democratizing data also facilitates ongoing communication and collaboration. To prevent drift, data owners will need to meet on an ongoing basis to address changes and opportunities.

DIGITAL TRANSFORMATION AT GEORGIA STATE UNIVERSITY

Georgia State University raised graduation points 22 points in a 10 year period (Quinton, 2013). Although the pace couldn't be described as accelerated, this qualifies as digital transformation. Georgia State used

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a combination of technology, data, and best practices (or processes) to improve student experiences and outcomes. Georgia State University Senior Vice President for Student Success, Timothy Renick (2018), states, "While the transformation seems far from sudden from my perspective — it is the result of, no joke, participating in an estimated 10,000 meetings with faculty, staff, vendors, and others." Transformation requires extensive effort — communication, collaboration, change management, project management, program management, and effective governance mechanisms.

In a video featuring Renick, Georgia State University (2018) describes their student success model: 1) demographic differences do not have to make a difference in success rates, and 2) the pathway is not through small, targeted boutique programs, but instead by changing the ways the university operates at its very essence — the way it treats all students, the way it serves all students. The Georgia State website features a total of ten student success initiatives. Tinto (1993) indicated that institutions must make a commitment to the students they serve and commit to all students, not just select subgroups. Based on the success of Georgia State, implementing a student success model that serves all students creates an inclusive student experience and facilitates evaluation and continuous improvement.

FUTURE RESEARCH DIRECTIONS

Because this chapter is looking into the future, the recommendations come from a blend of existing scholarship, professional experience, and prediction. Future research provides an opportunity to determine the effectiveness of the toolkit. Some higher education technology leaders may use the toolkit, in whole or in part, to benchmark their digital transformation strategy. They may develop rubrics or other tools that could be used by the community. Scholars may conduct case studies or other types of research on one or more campuses that undertake digital transformation to identify best practices. This research will enhance the toolkit through additions, subtractions, and other improvements.

CONCLUSION

According to Birnbaum (1988), only those who love higher education should try to change it. The rewards of serving as a higher education technology leader come from contributing to the mission, vision, and achievement of strategic goals. The higher education technology leader has an epic opportunity to make a difference and find a way to play a strategic role that is tolerated by all and celebrated by some. Digital transformation will require seeing the university in terms of its possibilities, and seeing the university with fresh eyes may be a challenge for some established campus members who may feel invested in the status quo. Technology leaders will undoubtedly play essential roles in coaxing their campuses to undertake digital transformation.

Making a positive difference is rewarding. Technology leadership in higher education could be considered a calling. It is not the most lucrative opportunity in the technology field. Technology leaders have to love the mission of higher education, love the culture, and love the challenges and opportunities they face. The work of digital transformation will be both high effort and high impact – think back to Renick's 10,000 meetings – and it won't happen overnight. Sometimes it feels like a lifetime. Sometimes it's exhausting, and sometimes it's lonely. It is important to persist in these efforts. At this time, higher

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

education needs change agents even more than it needs preservationists. Now is the time to work together, find common ground, and build the future together.

KEY TERMS AND DEFINITIONS

ADKAR: A change management model created by Jeff Hiatt that includes the following steps: awareness, desire, knowledge, ability, and reinforcement. The model can be used for both planning and benchmarking.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Agile: The quality of being quick to respond to change, and the ability to plan for emerging change. Agile project management principles include sprints to produce deliverables quickly, gather feedback to regroup or proceed to the next deliverable.

Business Process Analysis: The act of mapping a business process in a comprehensive manner. The process provides documentation and helps identify improvement opportunities.

Change Management: The planning and processes associated with identifying all stakeholders, determining their needs, and addressing them to the extent possible.

Culture: The shared identity of an organization that is both fluid and enduring. Identity is influenced by both the internal and external environment as well as outliers, norms, values, and structures.

EDUCAUSE: The leading professional organization for technology leaders and professionals in higher education.

IT Governance: The way that a campus defines roles and accountabilities for information technology; this process typically encompasses policies and standards for the multiple technology domains such as security, project management, IT procurement, data, enterprise resources planning, etc.

RACI: This acronym stands for responsible, accountable, consulted, and informed. This model provides a useful matrix for clarifying roles and expectations in the context of governance, projects, etc. Responsible generally refers to those who will do the work; accountable refers to the executive sponsor.

Silos: Semi-autonomous sub-units in an organization. Sub-units can be a barrier to transformation if they own campus-wide processes or data, and they resist collaboration.

Technical Debt: The result of taking short cuts for short term gains; the short cuts decrease efficiency and increase costs.

Transformational Leadership: A type of pragmatic, selfless leadership that focuses on identifying strategies to achieve goals and outcomes rather than recognition.

Vision: The achievable aspirations of your organization. Ideally, the aspirations are clear and reiterated frequently.

Chapter 69
Determining the Accessibility of e-Government Websites in Sub-Saharan Africa Against WCAG 2.0 Standard

Silas Formunyuy Verkijika
University of the Free State, Bloemfontein, South Africa

Lizette De Wet
University of the Free State, Bloemfontein, South Africa

ABSTRACT

The purpose of this study was to determine the conformance levels of government websites in Sub-Saharan Africa (SSA) to Web Content Accessibility Guidelines (WCAG) 2.0 and examine which macro factors influenced the accessibility these websites. The findings indicated that the majority of government websites in SSA still had a long way to go to become accessible based on the WCAG 2.0 standards. None of the 217 government websites examined adhered to all the WCAG 2.0 guidelines. Cross country analysis showed that there are three macro factors influencing e-government accessibility in SSA, namely Human Development Index (HDI), Corruption Perception Index (CPI), and percentage of the active population (15-64 years). Countries with high HDI levels and low CPI levels tend to have websites with fewer accessibility errors, while those for countries with high percentage of the active population have more accessibility errors.

INTRODUCTION

During the last two decades, governments in developing countries have progressively adopted e-government as an essential means of improving their general performance. E-government, which broadly refers to the espousal of Information and Communication Technologies (ICTs) into mainstream government activities, is continuously becoming an extremely valuable strategy for governments to enhance their

administrative efficiency, gain citizen's trust, eliminate corruption, and ultimately boost democratic governance (Elbahnasawy, 2014; Jun, Wang, & Wang, 2014; Seifert & Chung, 2009). Eliassen and Sitter (2007) expound that e-government initiatives have significantly improved how the public sector manages its resources and deliver required services to the public. Consequently, e-government development has become a vital precondition in the strategy of many governments worldwide (Hui, Xiaolin & Jianying, 2014; Sorrentino, & De Marco, 2013). With government websites being one of the key platforms for government interaction with citizens and other stakeholders, a key e-government competency has been the creation of universally accessible government websites to allow the broad-spectrum of e-government stakeholders to gain access to government information and e-services. Ensuring e-government accessibility is particularly important as it enables all citizens, including those with any form of cognitive or functional limitations, to effectively access government services.

People with disabilities form a considerable part of the world's population, and the need to provide them with access to government information and electronic services have gained considerable attention over the years. Latest statistics from the World Health Organization (WHO, 2011) indicated that over 15% of the world's population was affected by from some form of disability (over 1 billion people), of which 80% are found in developing countries. The case is even worse for poor people living in developing countries as 20% of them are affected by some form of disability (World Bank, 2011). This is concerning, as many factors within a country can establish and maintain barriers to access of e-government services that prevent people with disabilities from actively engaging in economic, civic, and community life (Kuzma Dorothy & Oestreicher, 2009; World Bank, 2011). As such, several researchers (Kuzma, 2010; Olalere & Lazar, 2011; Youngblood, 2014; Abanumy, Al-Badi & Mayhew, 2005; Adepoju et al., 2016; Al Mourad & Kamoun, 2013) across the globe have engaged in e-government accessibility research to examine the compliance levels of e-government portals and provide directions for improving their accessibility. Albeit web accessibility guidelines are well developed, many government websites do not comply with these guidelines (Leist & Smith, 2014). Even in developed countries where e-government accessibility has matured immensely, evidence still indicates that the accessibility compliance of government websites have not improved noticeably over the last two decades (Youngblood, 2014). Consequently, governments in the developed world are continuously enforcing stringent legislations to mandate the accessibility of these websites. This is, however, not the case with countries in the developing world regions, like Sub-Saharan Africa (SSA), where accessibility laws are either non-existent or less stringent (Kuzma et al., 2009).

While e-government accessibility research has gained momentum and is receiving considerable attention in many parts of the globe, there is still a dearth of such research in SSA. E-government development, adoption and diffusion in SSA still lack behind other regions of the globe and the only way to ensure that a wide array of people can access e-government services in SSA is to make the government websites more accessible. Current efforts to examine the state of e-government accessibility in SSA include Adepoju, Shehu and Baker (2016); Costa, Fernandes, Neves, Duarte, Hijón-Neira and Carriço (2013); and Kuzma et al., (2009). With almost all countries in SSA having some form of government website and the existing studies covering less than 15% of these countries, it is evident that there is still a huge gap in terms of understanding the state of e-government accessibility in SSA. In order to fill in this gap, and to contribute to the development of universally accessible government websites in SSA, this study will address the following objectives:

- Determine the compliance levels of government website accessibility in SSA

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Identify the specific accessibility guidelines that are most commonly violated by government websites in SSA
- Examine which macro level factors influenced government websites' accessibility in SSA

Government Website Accessibility

Website accessibility refers to the capability of making websites accessible to a wide array of possible users regardless of their technical aptitude or possible disabilities, thus ensuring that all users have equal access to information and functionality (Olalere & Lazar, 2011; Reis, Barroso and Goncalves, 2013; Shi, 2007). The need to ensure that government websites are accessible to people with disabilities (e-inclusion) have been widely emphasised across the globe. E-government services need to be accessible to every stakeholder who needs the services in order for its benefits to be fully enjoyed by all. As such, the delivery of government services over the internet holds promise for all citizens as the World Wide Web (WWW) is primarily designed for everybody. The WWW Consortium (W3C, 2010) explicates that the internet "is fundamentally designed to work for all people, whatever their hardware, software, language, culture, location, or physical or mental ability."

Several researchers (Potter, 2002; Olalere and Lazar, 2011; Kuzma, 2010; Youngblood, 2014) have contributed to the literature on government website accessibility by evaluating non-SSA government websites in different countries. For example, in the United States, Potter (2002) evaluated the accessibility of government websites in Alabama and found that about 80% of the websites had accessibility errors. Over a decade later, Youngblood (2014) revisited the evaluation of Alabama government websites and established that there had not been any substantial improvement since Potters' evaluation. At the level of federal websites in the United States, Olalere and Lazar (2011) found that 90% of the websites failed in at least one of the accessibility guidelines, which is similar to results obtained in prior studies in the USA (Jaeger, 2006; West, 2008). In the United Kingdom (UK), Kuzma (2010) showed that only about 5% of a total of 130 evaluated government websites met all the accessibility criteria. Likewise, in the Netherlands, Butt (2014) evaluated three Dutch government websites and found that all three failed in at least one aspect of website accessibility.

In the Middle East and Asia, researchers have examined e-government accessibility in Saudi Arabia and Oman (Abanumy et al., 2005), Dubai (Al Mourad & Kamoun, 2013), China (Sun & Chen, 2010), and Malaysia (Latif & Masrek, 2010). All these different studies had a common finding suggesting that government websites in the Middle East and Asia still have a long way to go in terms of accessibility. None of these evaluated websites met all the examined accessibility evaluation success criteria.

Lastly, as briefly mentioned before, there have also been some efforts to evaluate government website accessibility in SSA. Adepoju et al. (2016) recently examined 34 state-level government websites in Nigeria and found that none of the websites fully met the evaluated accessibility standards. Also, Costa et al. (2013) evaluated government websites in three SSA countries (i.e. Angola, Mozambique and South Africa) and established that government websites in all the three countries were plagued by accessibility issues. Kuzma et al. (2009) examined the accessibility of government websites in four SSA countries (i.e. South Africa, Namibia, Liberia and Kenya) and concluded that all the countries had a large number of errors for each of the accessibility priority levels. Nonetheless, out of the 24 SSA government websites evaluated in these four countries, there were two (one for Namibia and one for Kenya) that met all the accessibility criteria. It is important to note that the study by Kuzma et al. (2009) was based on Web

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Content Accessibility Guidelines version 1.0 (WCAG 1.0) which have become obsolete as a result of numerous calls for governments to upgrade to WCAG 2.0 compliance.

Evolution of WCAG

Several accessibility standards and guidelines have been developed, such as the WCAG, Section 508 of the U.S. Rehabilitation Act Amendments of 1998 (henceforth referred to simply as Section 508), Microsoft's Guidelines for Accessible Web Pages, UK's Disability Discrimination Act (DDA) of 1995, and the Stanca Act of 2004 (Abanumy et al., 2005; Kuzma et al., 2009; Youngblood, 2014). Among these different accessibility standards and guidelines, the most widely used in the domain of e-government accessibility are the WCAG and Section 508. However, the WCAG is the most preferred standard around the world, as it is internationally accredited (ISO/IEC 40500), most explicit and also written in an objectively testable manner (Lazar, Goldstein & Taylor, 2015). Moreover, competing standards (including Section 508) are mostly based on the WCAG, with many governments around the world currently using WCAG 2.0 as their preferred standard, while others have been updating their laws to incorporate provisions outlined in WCAG 2.0 (Youngblood, 2015; United States Access Board, n.d). As such, WCAG 2.0 has been argued to be the core accessibility standard around the world (Akgul, 2015; Lazar et al., 2015), and thus, the most preferred benchmark for evaluating accessibility of websites in different countries (Al Mourad & Kamoun, 2013; Butt, 2014; Kuzma, 2010).

The WCAG was developed by the Web Accessibility Initiative (WAI) of the W3C and the first version (WCAG 1.0) was released in 1999 (W3C, 2008). Since then, a later version (WCAG 2.0) was released in 2008 (W3C, 2008). On the other hand, Section 508 is a US legislation of accessibility that was signed into law in 1998 and went into effect in 2001. There is actually a huge overlap between Section 508 and WCAG 1.0, as section 508 guidelines were fundamentally developed from the WCAG 1.0 standard (Olalere & Lazar, 2011; Youngblood, 2014). With the development of WCAG 2.0, the US Access Board, which is responsible for developing accessibility policy in the US, made a detailed comparison between WCAG 2.0 and Section 508 and found that there were several new dimensions that Section 508 did not cover. As a result, the US Access Board has been working to revise Section 508 guidelines to match WCAG 2.0 standards (United States Access Board, n.d). This suggests that the WCAC 2.0 standards are the leading accessibility standards at the moment. Additionally, Section 508 guidelines are based on US-specific legislation, while the WCAG standards are applicable worldwide. As such, studies outside the US mostly focus on the WCAG guidelines (Adepoju et al., 2016; Al Mourad & Kamoun, 2013; Butt, 2014; Kuzma, 2010; Kuzma et al., 2009). With the development of WCAG 2.0, the WCAG 1.0 guidelines became obsolete, with websites that were previously WCAG 1.0 compliance being advised to upgrade to WCAG 2.0 (Al Mourad & Kamoun, 2013; Kamoun et al., 2013). As such, this study will only focus on WCAG 2.0 guidelines.

WCAG 2.0 standards emphasise the need for websites to meet four fundamental accessibility principles (W3C, 2010). These principles are perceivable, operable, understandable, and robust. For websites to be perceivable, the information of the website and user components must be presentable to users in ways that can meet their different perceptive preferences. The operable principle relates to the need for ensuring that user interface components and navigation are designed in a way that users can manoeuvre it with different options such as mouse and keyboard controls or different devices. The understandable principle emphasises the need to ensure that the information and user interface operations are clear to the users, while the robust principle upholds that content presented in a way that it can be interpreted

Table 1. WCAG 2.0 Guidelines (Compiled from W3C website)

Guideline	Description
1. Perceivable	
1.1. Text Alternatives	Provide text alternatives for any non-text content so that it can be changed into other forms (formats) that people need, such as large print, braille, speech, symbols or simpler language.
1.2. Time-based media	Provide alternatives for time-based media.
1.3. Adaptable	Create content that can be presented in different ways (for example simpler layout) without losing information or structure.
1.4. Distinguishable	Make it easier for users to see and hear content, including separating foreground from background.
2. Operable	
2.1. Keyboard accessible	Make all functionality available from a keyboard.
2.2. Enough time	Provide users with enough time to read and use content.
2.3. Seizures	Do not design content in a way that is known to cause seizures.
2.4. Navigable	Provide ways to help users navigate, find content, and determine where they are.
3. Understandable	
3.1. Readable	Make text content readable and understandable.
3.2. Predictable	Make web pages appear and operate in predictable ways.
3.3. Input Assistance	Help users avoid and correct mistakes.
4. Robust	
8.1. Compatible	Maximize compatibility with current and future user agents, including assistive technologies.

reliably by a wide variety of user agents, including assistive technologies (W3C, 2008). These four principles are evaluated based on twelve accessibility guidelines. Table 1 below presents the different accessibility guidelines as they apply to the four WCAG 2.0 central principles.

WCAG 2.0 evaluations examine these twelve dimensions based on three levels of conformance according to different established success criteria. The conformance levels are levels A, AA, and AAA. Level A depicts the basic website accessibility and is evaluated based on 25 success criteria. It is important for websites to satisfy all the success criteria for level A conformance in WCAG 2.0, as these are considered to be the accessibility aspects that developers must satisfy (West, 2008). Level AA focuses on the most common and biggest barriers faced by people with disabilities, while level AAA is the highest level of accessibility. While it is important to address all success criteria, it is, however, important to note that in some cases, it is not possible to address all level AAA success criteria (W3C, 2008).

Macro Level Factors Affecting E-Government Website Accessibility

Macro factors generally refer to national level indices that capture the state of progress in a nation or region using different dimensions especially in the political, legal, economic, social, and technological spheres (Ifinedo, 2012; Ifinedo & Singh, 2011). The development of government websites has long been associated with macro level factors that characterise the jurisdiction of the website. For example, Gaulė and Žilinskas (2013) showed that economic and social factors had a significant influence on the development of government websites in Lithuania. Likewise, Youngblood & Mackiewicz (2012) showed that national income influences the accessibility of government websites. In addition to national income,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

other important macro factors, such as such as HDI, CPI, population age distribution, and commitment to the rights of people with disabilities also capture different socio-political, legal, economic macro environmental resources and capabilities that can provide an understanding of e-government progress in a nation. This follows from the fact that macro factors are particularly important in e-government as macro environmental resources play a vital role in fostering e-government maturity, as well as the dissemination and acceptance/usage of e-government services by citizens (Dias & Costa, 2013; Ifinedo, 2012). With e-government websites being the primary platforms for dissemination of e-government services, it is expected that these macro factors will have a pertinent association with the quality and thus accessibility levels of e-government websites. These factors are discussed below.

National Income

Financial resources play an important role in the development of government websites (Huang, 2007). This has been evident in Alabama when the allocation of more funds towards government website development significantly enhanced the usability of the websites (Youngblood & Mackiewicz, 2012). Likewise, Gaulė & Žilinskas (2013) illustrated by using data from Lithuania that richer municipalities had better-developed government websites than poor municipalities. A macro factor such as national income does not only end at the website development level but can also explain specific aspects of the government website, such as accessibility, as revealed by Youngblood and Youngblood (2013). These authors showed that there was a significant negative correlation between the gross national income (GNI) of a county and the accessibility of its websites, with lower income counties having considerably higher government website accessibility errors. This finding is, however, not surprising, as the link between e-government development and national income has been widely established (UN, 2014). This is because rich countries allocate more financial resources to e-government development. As such, it can be expected that with more resources, rich countries are more likely to develop better accessible websites. This study, therefore, hypothesises that the higher the national income of a country, the fewer the accessibility errors will be among its government websites. Following prior e-government studies (UN, 2014), national income will be operationalised in terms of the GNI per capita.

Human Development

Human development was operationalised in terms of the HDI. The HDI is a measure of a country's overall well-being based on three dimensions, namely: health, education, and standard of living (Deneulin & Shahani, 2009). The link between e-government and HDI has been established in prior literature (Holzer & Manoharan, 2009), with HDI having a positive relationship with e-governance. The 2014 UN e-government survey also showed that countries with higher HDI paid more attention to e-inclusion by providing more e-government services for vulnerable groups, like persons with disabilities and the elderly (UN, 2014). E-inclusion generally entails the act of expanding ICT benefits to everybody and website accessibility is a key aspect of e-inclusion in ensuring that people with disabilities and the elderly can have equal access to e-government services. Since countries with higher HDI pay more attention to e-inclusion, there is a high probability that these countries also pay more attention to the accessibility of government websites to ensure that vulnerable groups can fully gain access to e-government services. This study, therefore, hypothesises that countries with a higher HDI will have government websites with fewer accessibility errors, as they pay more attention to making their websites accessible to all stakeholders.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Corruption

Corruption in public administration generally refers to "the misuse of public power or authority for private gains" (UNDP, 2008). E-government is expected to yield several benefits to governments and citizens; however, its development, especially in SSA, is significantly thwarted by corruption (Cloete, 2012). Several researchers (Aladwani, 2016; Corojan & Criado, 2012; Kim, 2014) have highlighted the notion that corruption significantly contributes to the failure of e-government projects in developing nations. From a technical perspective, many studies (Kirui & Kemei, 2014; Ray, 2011) have indicated that e-government projects in developing countries have failed because of poor usability. It is, therefore, possible that corruption in e-government projects can lead to the redirection of resources, thereby leaving little room for developing high quality, usable websites. This is in line with the argument presented by Aladwani (2016) that corruption in developing countries limits the moral and governance abilities of administrative systems managing e-government projects in a manner that inhibits their capability to produce e-government initiatives that meet stakeholder expectation thus resulting in failure of the projects. As mentioned before, one such key stakeholder expectation in terms of government websites is to ensure that these websites are accessible to all stakeholders, including people with disabilities and the elderly. Consequently, if corruption negatively affects the quality of government website projects, there is a possibly that such government websites will have poor accessibility? In this regard, this study hypothesises that government websites in highly corrupt countries will have more accessibility errors than those in less corrupt countries.

Population Age Distribution

The link between population age distribution and e-government services have been widely discussed in extant literature (Baker, Al-Gahtani, & Hubona, 2007; Gaulė and Žilinskas, 2013; Xu & Asencio, 2015; Wigand, 2011). Xu and Asencio (2015) showed that e-government development was negatively associated with the elderly (i.e. people older than 65 years). This trend can be attributed to the fact that older people are more resistant to change and thus less likely to adopt and use e-government services (Baker *et al*., 2007). In Lithuania, Gaulė and Žilinskas (2013) established that while the development of government websites was not associated with the elderly population, it actually had a significant positive correlation with the percentage of active citizens. This could possibly be explained by the fact that active citizens mostly preferred communication via the internet, while the elderly prefer face-to-face communication (Wigand, 2011). Nonetheless, it is generally emphasised that e-government services should be widely available to vulnerable groups as they are also consumers of many government services (Gaulė & Žilinskas, 2013). With a higher percentage of people with disabilities belonging to the elderly population (Youngblood & Mackiewicz, 2012), there is a greater need to develop accessible government websites to cater for the elderly. As such, this study hypothesises that the higher the percentage of elderly in a country, the more accessible the government websites will be. Similarly, since the active citizens are currently the predominant users of e-government services (Xu & Asencio, 2015) and their percentage is positively correlated with the development of government websites (Gaulė & Žilinskas, 2013), it is expected that the percentage of active citizens will positively correlate with high government website accessibility.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Commitment to Disability

As already mentioned in the previous sections, a key goal of accessibility research in e-government is to enable people with disabilities to gain equal access to e-government services (Akgul, 2015; Bakhsh & Mehmood, 2012; Jaeger, 2006). While several countries in the developed world have laws protecting people with disabilities, most developing world countries, especially those in SSA, lack such laws (Kuzma *et al*., 2009). However, in 2006, the UN passed a Convention on the Rights of the Disabled in a bid to protect people with disabilities worldwide. To date, several countries in SSA have signed the treaty, while others have gone so far as to ratify the treaty. Protecting the rights of people with disabilities in the context of e-government entails ensures that they can easily access e-government services. Arbour (2007) explicates that the UN convention provides an incentive for governments to improve access to ICTs for the disabled. This is because Article 9 of the UN Convention on the Rights of the Disabled emphasises the need for making ICTS accessible in such a way. As such, it is expected that countries that have committed to the treaty will increase access to their e-government services to people with disabilities. Since this can be attained through government website accessibility, this study hypothesis that a country's level of commitment to the Rights of the Disabled treaty (i.e. by signing or ratifying the treaty) will have a significant impact on the accessibility of its government websites.

METHODOLOGY

Sample Selection

In order to determine how well government websites in SSA adhere to accessibility guidelines, it is important to have a representative set of websites from SSA, as well as enough websites from a given SSA Country. As such, seven websites were selected from each SSA country included in the study. Seven websites are enough to depict the state of accessibility in a country as in Kuzma et al. (2009), while also maintaining a manageable amount of total websites for the study. The websites were grouped around seven government ministries as a means to ensure consistency across the different countries. The different ministries included in the study were: ministries of Finance, Education, Health, Tourism, Labour, International Affairs and the website of the Presidency. All the countries in SSA did not share the exact same portfolios for each of the ministries, as some governments had one ministry to cover more than one portfolio. However, the websites were carefully evaluated and selected based on them covering the selected portfolios. Additionally, only websites presented in English and/or French were selected to allow the researchers to fully verify that the website was the official website of a given government ministry of an SSA country. Out of the forty-nine countries in SSA, thirty-one (63.3%) fulfilled the conditions to be selected for this study. A total of eight countries (Eritrea, Somalia, Angola, Mozambique, Sao Tome and Principe, Cape Verde, Sudan and Mauritania.) were eliminated because their websites were not in English or French, while ten countries (Guinea, Swaziland, South Sudan, Togo, Guinea-Bissau, Niger, Equatorial Guinea, Central African Republic, Congo, and Comoros) were eliminated because e-government was still in its infancy with few or no websites to be considered. In total, 217 government websites from 31 countries in SSA were evaluated in this study.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Accessibility Evaluation

Accessibility can always be evaluated either with the use of automated accessibility testing tools or with manual evaluation methods by human evaluators. Even though a combination of both methods provides the most optimal accessibility evaluation, using only automated evaluation still provides a reliable indication of website accessibility. Similar to prior studies (Abanumy et al., 2005; Adepoju et al., 2016; Al Mourad & Kamoun, 2013) this study adopted an automated tool for accessibility evaluation. In order to assess the WCAG 2.0 conformance of government websites in SSA, an appropriate accessibility tool needed to be selected. Even though numerous automated accessibility testing tools exist, they differ in several ways, such as cost, presentation of reports, conformance levels, etc.

Amidst these tools, TAW (Test de Accesibilidad Web) was selected for this study because of it being a free tool and its breadth and depth of report presentation that is easier to comprehend in line with the WCAG 2.0 guidelines. TAW is a Java-based tool developed by the Spanish Center for the Development of Information and Communication Technologies. It has also been used to examine accessibility in several prior studies (Adepoju et al., 2016; Akgul, 2015; Al Mourad & Kamoun, 2013; Butt, 2014). The validity of TAW in comparison with other accessibility tools was also presented by Al Mourad and Kamoun (2013) by showing that the accessibility evaluation results from TAW correlated with results from another widely accepted accessibility evaluation tool known as EvalAccess 2.0. TAW was designed to evaluate all three levels of conformance, thus testing all three priority levels.

Only the homepages of the 217 government websites were examined. It is frequently argued that the homepages of government websites are usually the first point of contact with users and, therefore, very important to be highly accessible (Akgul, 2015; Olalere & Lazar, 2011). This is because homepages shape a user's first impression of the website (Olalere & Lazar, 2011). Additionally, Vigo, Abascal, Aizpurua and Arrue (2009) showed that the accessibility error profile of a homepage mirrored that of other pages in the website. Consequently, the focus on limiting e-government web page accessibility to the homepage has been widely adopted in e-government accessibility studies (Akgul, 2015; Al Mourad & Kamoun, 2013; Olalere & Lazar, 2011; Youngblood & Mackiewicz, 2012). This also allows for cross-study comparisons of accessibility evaluations.

Macro Level Measures

As explained above, five macro level indices were used for examining cross-country differences in accessibility. These include the HDI, GNI, CPI, Commitment to UN treaty of the Rights of the Disabled, and population age distribution. The most recent data for each of the macro indices was used to capture the current state of each country in relation to the current state of its government website accessibility. The following data sources were used to obtain data for the Macro Level indices (Table 2).

RESULTS AND DISCUSSION

Conformance to WCAG 2.0 Standard

The results in Table 3 depict the accessibility compliance level of government websites in SSA based on the 3 priority levels across the four domains of the WCAG 2.0 guidelines. Looking at all WCAG

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Data sources for Macro Level indices

Variable	Description of data
HDI	2014 Human Development Index data from the 2015 Human Development Report (UNDP, 2015).
National Income	2014 Gross National Income (GNI) per capita based on purchasing power parity. GNI World Bank data last updated on February 27, 2016 (World Bank, 2016a).
CPI	2015 CPI data from Transparency International (Transparency International, 2015).
UN disability	Country status as on January 31, 2016, regarding the Convention on the Rights of Persons with Disabilities (United Nations, 2016).
Population Age Distribution	2014 age demographics data from the World Bank (World Bank, 2015). Two data groups of interest were used in this study namely: the active population group (i.e. age 15-64 years.) and the elderly population group (i.e. older than 65 years.)

2.0 domains, it is evident that all 217 government websites had some form of accessibility error. The mean number of errors per website was 53.5 with a median of 41, suggesting that over 100 government websites in SSA have more than 41 accessibility errors. These findings further confirm the dire state of government website accessibility in SSA, as shown by prior studies (Adepoju et al., 2016; Costa et al., 2013; Kuzma et al., 2009; Makoza & Chigona, 2013). This trend of poor accessibility is, however, not only common to government websites in SSA. Kamoun et al. (2013) evaluated 21 Dubai government websites for WCAG 2.0 compliance and found that all had accessibility errors. Similarly, an evaluation of 130 government websites in the UK for WCAG 2.0 compliance showed that only 5% had no accessibility errors (Kuzma, 2010). However, the UK websites fared far better than those in SSA, as the average errors per website were 3.6 with an average of 7.7 warnings compared to 53.5 mean errors and 440.7 mean warnings for SSA websites.

The most common accessibility errors were operable errors, where 98.6% of the websites had at least one type of operable error. Similarly, all the websites had accessibility warnings for the operable dimension. The websites had an average of 17.1 errors and 33 warnings. The main operable dimension that is a call for concern based on high errors and warnings is user navigation. It is imperative to make websites accessible in ways that allow users to easily navigate and find content. If not, this would hinder the overall navigation of a government website, which is very disturbing, as navigation is one of the essential usability dimensions vital for user adoption and usage of government websites.

The second WCAG 2.0 domain needing attention among SSA government websites was the perceivable domain. The most violated perceivable guideline was the creation of content that could be presented in different ways without losing its meaning, including being presented for use by assistive technologies. Equally violated was the lack of text alternatives for non-text content.

The third critical domain was the robust domain which dealt with maximising compatibility with current and future tools. A total of 88.9% of the websites demonstrated robust errors, with errors averaging 11.8 and warnings 308.1.

The understandable domain had the most websites in compliance. About 20% of the websites had no understandable errors. The understandable factor in which more than half of the websites faltered, had to do with helping users to avoid and correct mistakes. The country level analysis is provided below in Figure 1.

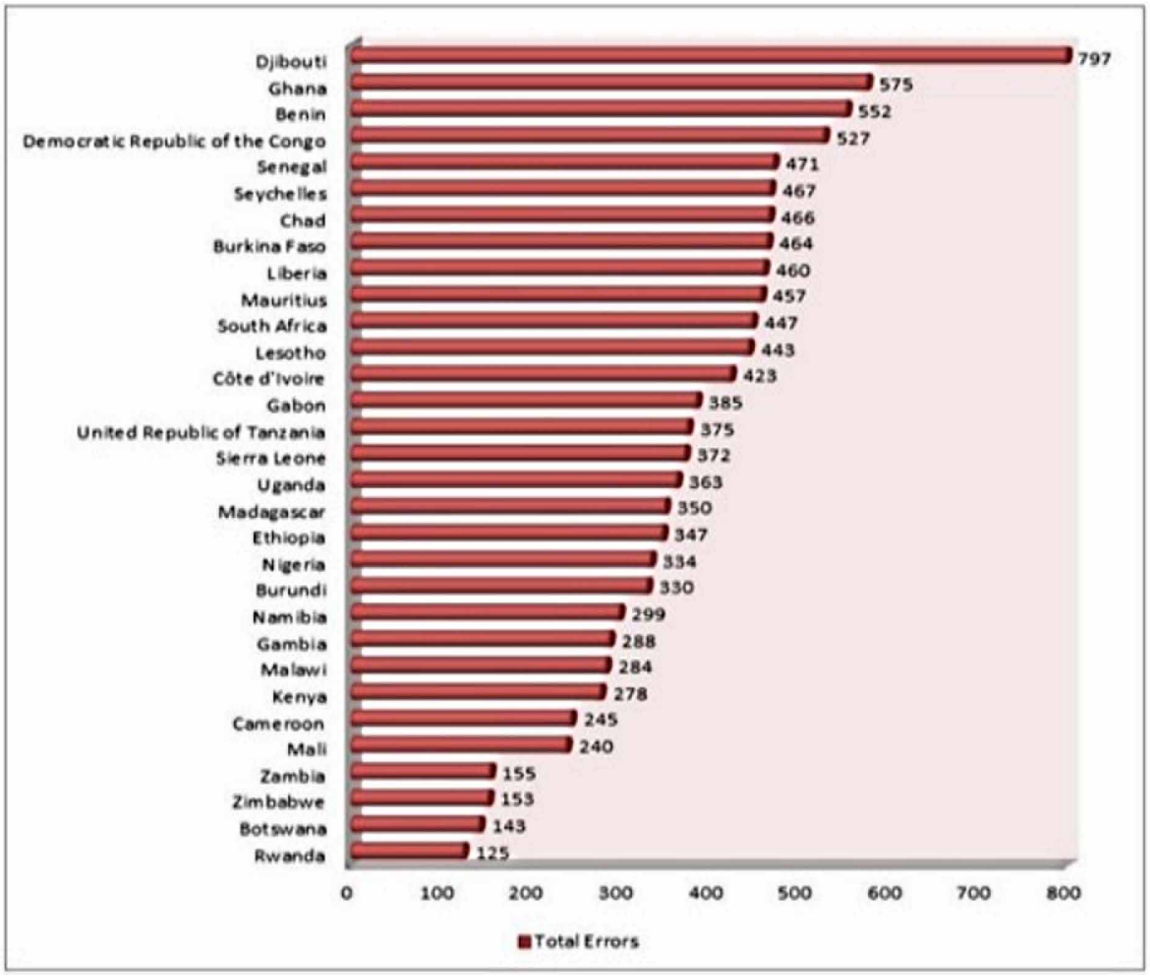
A, AA, and AAA indicates accessibility errors in the three levels of conformance, while W indicated the total accessibility warnings.



Country Level Analysis

Figure 1 depicts the total number of errors for all seven websites in each of the 31 SSA countries.

Rwanda, Botswana, and Zimbabwe were the top scoring countries with the least accessibility errors. On the other end, Djibouti, Ghana, and Benin were the worst in terms of government website accessibility. It is not surprising to see Rwanda and Zimbabwe at the top of accessibility in SSA, as they were part of the countries that have fully ratified the UN Convention on the Rights of Persons with Disabilities. This suggests that these countries are practicing what they signed up for. Even though Botswana is not a signatory of the convention, the country has a national policy on care for people with disabilities and has implemented several programs focused on improving accessibility in government institutions. However, it is surprising that the three worst scoring countries in terms of accessibility have all ratified the UN convention. Ghana, Benin, and Djibouti ratified the convention in 2012, yet to date; they are still to enforce accessibility of government websites. Next, we examined the country level factors that depict the differences in government website accessibility.

Figure 1. Accessibility errors among SSA countries

Association with Macro Factors

The results in Table 4 indicate that the HDI, active population, and CPI are significant indicators of the state of e-government accessibility in SSA countries. The significant negative association of HDI indicates that countries with higher HDIs had fewer accessibility errors. This is in line with the findings of the 2014 UN e-government survey (UN, 2014) that concluded that countries with a higher HDI paid greater attention in providing services to vulnerable groups like persons with disabilities. In terms of e-inclusion, accessibility is one of the ways to ensure that vulnerable groups can gain access to e-government services. As such, this increased attention to e-inclusion from countries with a higher HDI is evident in SSA. High HDI countries are seen to have government websites with fewer accessibility errors. The significant positive association of percentage of active population depicts that countries with a high population of active citizens who have a high demand for e-government services resulted in high accessibility errors. Since the active population prefers the internet and have a high demand for e-government services, governments in SSA with a high percentage of active citizens might focus more

on providing different kinds of e-government services without putting enough effort in their accessibility. This could result from the fact that the weak demand for e-government services from the elderly population does not signal the need for e-inclusion. Lastly, the significant negative beta for CPI indicates that countries that are less corrupt (i.e. countries with a high CPI) tend to have fewer accessibility errors. This is possibly because less corrupt countries are more likely to be transparent in awarding contracts for government website development, thus selecting the most qualified team to develop the websites. On the other hand, highly corrupt countries can award contracts based on who knows who, thus hiring poorly qualified developers who might not have the necessarily skills to develop highly accessible websites. Additionally, the misappropriation of funds required for the development of government websites can significantly hinder the project, resulting in the development of poorly accessible websites. With corruption noted to significantly hinder the maturity of e-government initiatives (Signh et al., 2007) and to contribute to their failures (Aladwani, 2016), it is, therefore, not surprising that corrupt nations develop poorly accessible websites. Without the development of highly accessible government websites, these websites are likely to stifle and fail due to lower user adoption and usage.

Limitations and Directions for Future Studies

This study had three fundamental limitations. Firstly, the scope of government websites covered in the study is limited to ensure full generalisation of the findings to all of SSA. The eight SSA countries that were eliminated from the sample, because their websites were not in English or French are a significant number that if included in this study could change the outcome of the findings. However, evidence from two of these countries (Angola, Mozambique) as presented by Costa et al. (2013), shows similarities with data from the SSA countries represented in this study. Nonetheless, it is imperative to acknowledge the fact that the findings in this study best represent the state of government website accessibility in French and English speaking SSA countries. Future accessibility studies in SSA could include countries with non-English or French websites.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Secondly, the study only focused on automated accessibility evaluation. This provided limited results as a detailed accessibility evaluation requires a combination of both manual and automated evaluation (Abanumy et al., 2005; Adepoju et al., 2016; Al Mourad & Kamoun, 2013). Additionally, the evaluation only focused on WCAG 2.0 criteria as it is one of the popular testable criteria that can be evaluated via automated testing. Future studies in SSA should incorporate both evaluation methods to provide an optimal assessment of the accessibility of government websites in the region. Also, evaluation of accessibility based on other standards such as the Section 508 should be considered.

Lastly, the study was limited in its evaluation scope of the websites, as only the homepages were evaluated. While there is support for the view that evaluation of homepages provides valuable insights on the accessibility of a website (Akgul, 2015; Al Mourad & Kamoun, 2013; Olalere & Lazar, 2011; Youngblood & Mackiewicz, 2012), evaluations that focus on the entire website are likely to provide a more thorough picture of the state of accessibility, as many more accessibility guidelines can be tested. This is one angle that future studies in SSA can examine and also determine if the accessibility evaluation of homepages in the region provides an adequate representation of the accessibility errors throughout the website.

CONCLUSION

As e-government continues to gain momentum as a key means of dissemination of government information and services to citizens, there is an ever increasing need to ensure the accessibility of government websites so that all citizens can experience the benefits of e-government. In the study, the accessibility of e-government websites in SSA was examined based on WCAG 2.0 standards. The key objective was to determine conformance levels with WCAG 2.0 and also examine which macro factors were associated with government websites' accessibility in SSA.

The findings indicated that the majority of websites in SSA still have a lot to do to become accessible websites based on the WCAG 2.0 standards. This indicates the need for governments in SSA to adopt appropriate strategies for advancing the accessibility of their government websites. These findings reiterate the view that government website accessibility in SSA countries remains poor (Adepoju et al., 2016; Costa et al., 2013; Kuzma et al., 2009; Makoza & Chigona, 2013). The most violated WCAG 2.0 guidelines by government websites in SSA were: user navigation (guideline 2.4), providing text alternatives to non-text content (guideline 1.1), the creation of content that can be presented in different ways, including use by assistive technologies, without losing its meaning (guideline 1.3), compatibility with current and future tools (guideline 4.1), and helping users to avoid and correct mistakes (guideline 3.3). This is more concerning as most of the websites do not meet level A compliance, which is the most basic level of compliance that needs to be met by all websites (Lightner, 2014). It is, therefore, imperative for governments in SSA to enforce measures to improve the accessibility of government websites in their countries. Many governments, especially in developed countries have already mandated WCAG 2.0 for all government websites (Rogers, 2016). SSA governments can also follow the same approach and mandate as well as train its IT staff to update the current websites in accordance with WCAG 2.0 guidelines. It is also vital for web developers responsible for government websites in SSA to take special note of these commonly violated accessibility guidelines and to ensure that they are addressed. Similarly, accessibility workshops for web developers, similar to the one conducted by UNESCO in Rwanda

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(UNESCO, 2015), could also ensure that web developers are trained on how to address these common accessibility barriers in SSA.

Additionally, Cross country analysis showed that three macro factors that were associated with the accessibility of government websites in SSA. These factors were the HDI, CPI, and percentage of active population. Countries that have a high HDI or that are less corrupt tend to have fewer accessibility errors, while countries with a high percentage of active population have more accessibility errors. Kerbing corruption in SSA countries remains a priority if governments are to advance e-government development and create high-quality accessible websites. Corruption is already contributing to the failure of e-government projects in developing countries (Aladwani, 2016), and so is a serious macro factor to consider when working towards enforcing accessibility standards for government websites. Similarly, SSA governments need to promote human development in order to stimulate both the demand and supply for e-government services (Stier, 2015), which is likely to result in the development of high-quality government websites that meet accessibility standards.

This study provides both practical and theoretical contributions. For the practical contributions, the study highlights the current state of government website compliance with WCAG 2.0 standards is most SSA countries from which evaluations have not been documented to date. This provides a knowledge base for government officials and developers in these countries to understand possible accessibility issues plaguing their e-government websites. This not only creates awareness of the problem but can also stimulate further examination of other e-government websites in SSA countries. The study also provides practical recommendations that can be useful for governments in implementing or enforcing accessibility standards. Regarding the theoretical contributions, the study advanced knowledge on the accessibility of government websites in developing countries by providing evidence from 31 SSA countries. This adds to the currently limited work on accessibility of government websites in the region. Additionally, researchers (Dias & Costa, 2013; Huang, 2007; Ifinedo, 2012) have suggested the need to consider the role that macro environmental factors play in e-government development as such knowledge holds significant policy implications. This study provided a contribution in this domain by identifying three macro factors associated with the accessibility of government websites in SSA. Future studies can further explore these associations to provide a deeper understanding of how governments can better use macro environmental resources for advancing e-government as a whole and the development of quality and accessible government websites in particular.

Chapter 70
Workplace Social Support and Attitude toward Enterprise Resource Planning System: A Perspective of Organizational Change

Paul Chou
Minghsin University of Science & Technology, Xinfen, Taiwan

ABSTRACT

To respond to competitive environment, many organizations have invested in enterprise resource planning system in order to improve workflow and increase the efficiency of shared services for the last two decades. Nevertheless, most organizations often fail to utilize and explore the new information system's functionalities to achieve their expected objectives as promised. This brutal fact reveals implicitly that there is an urgent need to improve the knowledge of understanding why and how employees accept and use new information systems. Particularly, in many cases, the reasons for the new information system's failure are neglecting social factors and a lack of change management. In view of such, the main aim of this study is to investigate the relationship between workplace social support and employee's attitude toward enterprise resource planning system from the perspective of organizational change. Results from a sample of 334 respondents in Taiwan revealed that workplace social support not only influences employee's attitude towards enterprise resource planning system directly, but also exerts its influences indirectly via affective commitment to organization and affective commitment to change.

INTRODUCTION

Modern organizations face the severe challenge of expanding market, reducing operation cost and rising customer expectations. To respond to competitive environment in a business world, many organizations have invested in new information system (IS) in the hope to reduce operation cost and increase productivity (Avgerou, 2001; Chung & Snyder, 2000). Specifically, for the last two decades, enterprise resourcing planning (ERP) system has been introduced by many organizations in order to improve workflow and

increase the efficiency of shared services and single database operations with streamlined processing, reporting, and access across operating units (Jacobson, Shepherd, D'Aquila, & Carter, 2007; kogetsidis, Hokkinaki, & Soteriou, 2008; Lee, Lee, Olson, & Chung, 2010; Momoh, Roy & Shehab, 2010; Rao, 2000).

In essence, ERP system is a software solution integrating the various functional spheres in an organization – a link through the entire supply chain, aimed at best industry and management practices for providing the right product/service at the right time, at the right place, at least cost (Rao, 2000). From a business standpoint, the benefits that a properly implemented ERP system can offer an organization include time and cost reduction in business process, faster transaction processing, improvement of operational performance, financial management and customer service, web-based interfaces and more effective communication (Kogetsidis et al., 2008).

Despite the benefits of implementing ERP system, numerous studies have reported unusually high failure rate in implementing it due to variety of challenges (Ho, Wu, & Tai, 2004; Razmi et al., 2009; Momoh et al., 2010). This brutal fact reveals that understanding how to implement ERP system successfully is a high priority for both researchers and practitioners (Cho, Park, & Michel, 2011; Momoh et al., 2010; Razmi, Sangari, & Ghodsi, 2009; Venkatesh, 2000). In this regard, Davis' (1986) technology acceptance model (TAM) and its extended model (TAM2; Davis, Bagozzi, & Warshaw, 1989) are widely applied in exploring the inner working mechanism of users' acceptance and usage of new IS (Bhattacherjee & premkumar, 2004).

Indeed, there is a large body of research on successful adoption of ERP system supporting the impact of such perceived ease of use on initial user acceptance and sustained usage of new IS (Bhattacherjee & premkumar, 2004); Nevertheless, TAM's universality to predict across all situations has recently been called into question (Greenfield & Rohde, 2011). Specifically, it is pointed out that fewer efforts have been devoted to understanding the determinants of attitude toward ERP from the perspective of the social fabric/effects (Venkatesh, 2000; Avgerou, 2001; Kotlarsky & Oshri, 2005). For example, as Koh, Simpson, Padmore, Dimitriadis, and Misopoulos, (2006) and Kotlarsky and Oshri (2005) argued, neglecting human and social factors constituted a major problem while implementing ERP system. Further, in many cases, the reason for new IS implementation failure is a lack of change management (McAdam and Galloway, 2005; Momoh et al., 2010; Ziemba & Obłak, 2015).

In practice, ERP adoption itself is a complex project (Markus & Tanis, 2000; Ghosh & Skibniewski, 2010) and change is an inevitable consequence of ERP adoption (Hornstein, 2015; Serra & Kunc, 2014). In general, organizational change has been identified as a formidable stressor in organizational life (Judge, Thoresen, Pucik, & Welbourne,1999; Allen, Jimmieson, Bordia, & Irmer, 2007). In that case, workplace social support may play an important role during implementing ERP system because social support implies an enduring pattern of continuous or intermittent ties that play a significant part in maintaining the psychological and physical integrity of the individual over time and it has been identified as a factor to buffer job stress (Kossek, Pichler, Bodner, & Hammer,2011; Sosik & Godshalk, 2000).

In summary, to make up for such deficiency aforementioned, this study aims at understanding the relationship between social support and employees' attitude towards ERP system from the perspective of organizational change. More clearly, this study hypothesizes that workplace social support enhances employees' affective commitment to organization which, in turn, promotes their affective commitment to change and, ultimately, influences their attitude toward ERP system.

LITERATURE REVIEW

ERP Adoption and Organizational Change

Conceptually, organizational change refers an attempt or series of attempts to modify an organization's structure, goals, technologies, systems, or work tasks (Carnall, 1986), and is the movement of an organization away from it its present state and toward some desired future state to increase its effectiveness (Lunenburg, 2010). Following these definitions, introducing ERP system into an organization is definitely one form of organizational change.

In general, information and communication technology is closely related to organizational change, as far as strategies and their organizational structures are concerned (Adamides & Karacapilidis, 2013). Consequently, the change results from implementing ERP system is essentially stressful because it not only creates fear, uncertainty and doubt (Jaskyte, 2003; Vakola & Nikolaou, 2005), but also leads to changes in and demands the readjustment of an average employee's normal routine (Leana & Barry, 2000).

Workplace Social Support and Attitude Toward ERP

Social support is defined as the "actions of others that are either helpful or intended to be helpful" (Deelstra et al., 2003, p. 324) and is conceived to be information leading an individual to believe that he/she is cared for, loved, esteemed and valued, and that he/she belongs to a network of communication and mutual obligation (Cobb, 1976). According to this definition, an important feature of social support is social interaction and the process between the provider and the recipients of social support (Sundin, Bildt, Lisspers, Hochwalder, & Setterkubd,2006).

Conceptually, social support is usually defined as the existence or availability of people upon whom we can rely, people who let us know that they care about, value, and love us (Sarason, Levine, Basham, & Sarason,1983). Specifically, social support at workplace is defined as the "overall levels of helpful social interaction available on the job from coworkers and supervisors" (Karasek & Theorell, 1990, p. 69). Thus, this study focuses supervisor support and coworker support as social support at workplace.

It is suggested that the social interaction between an employee and his/her immediate supervisor is the primary determinant of an employee's attitude in the workplace (Wayne, Shore & Liden, 1997). In practice, supervisors play an important role in structuring the work environment, providing information and feedback to employees (Griffin, Patterson, & West, 2001) and controlling the powerful rewards that recognize the employee's personal worth (Doby & Caplan, 1995). In essence, supervisor support is characterized by the human relations ability of supervisors, and is displayed in terms of trust, respect, friendship and a deep concern for subordinates' needs (Iverson, 1996).

In addition to supervisor support, coworker support also involves the interpersonal transfer of instrumental or emotional resources (House, 1981). Coworker support generally refers to having close friends at work who are willing to listen to job-related problems, are helpful in assisting with the job and who can be relied upon when things become stressful at work (Iverson, 1996). In this case, as Hobfoll (1988) argued, coworker support also serves as a key resource at workplace in the process of organizational change (adopting ERP systems, in this case).

By and large, social support can be seen as a flow of emotional concern, instrumental aid, information and/or appraisal between people (i.e., supervisor and coworkers) (Sundin et al., 2006). Specifically, social support functions to help reduce one's stress (House, 1981; Sosik & Godshalk, 2000) through the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

exchange of verbal and non-verbal messages that convey emotion, information, or referral (Joe, 2010). In short, social support makes a work environment seem more pleasant or less stressful.

Empirically, individuals with high levels of social support have been found to have a more optimistic view of the future than those with low levels of support (Sarason et al., 1983; Karademas, 2006) . From this perspective, employees who with high levels of social support are likely to have a positive perception toward the potential outcomes of the ERP and, further, tend to demonstrate positive attitude toward ERP system.

Therefore, this study assumes that employees who perceive social support at workplace, because of felt obligation and optimistic view of the future, tend to perceive adopting ERP positively. Accordingly, Hypothesis 1 is stated as follows.

- **H1:** Employees who receive social support at workplace will demonstrate positive attitude toward ERP system.

Social Support and Affective Commitment to Organization

Organizational commitment was defined as a strong belief in the organization's goal and values, a willingness to exert considerable effort on behalf of the organization, and a strong desire to remain a member of the organization (Mowday, Porter, & Steers,1982). In this study, we focus on affective commitment, because most measures of organizational commitment assess affective commitment (Colquitt, Conlon, Wesson, Porter, & Ng, 2001) which has been refers to the degree to which employees identify with the company and make the company's goals their own (Colquitt et al., 2001) and defined as an emotional attachment (Meyer & Allen, 1991).

With respect to supervisor support, according to the concept of personification of organization (Levinson, 1965), the immediate supervisor's behaviors are likely to be perceived by employees as representative of organizational decisions (Griffin, Patterson, & West, 2001). More specifically, supportive treatment provided by supervisors is interpreted as the organization's benevolent or malevolent orientation towards them. That is, to some extent, employee's perception of supervisor can be converted into perceived organizational support (POS), which refers to employees' global beliefs that the firm cares about them personally (Eisenberger, Huntington, Hutchison, & Sowa,1986; Eisenberger, Fasolo, & David-LaMastro, 1990).

According to the organizational support theory (Eisenberger et al., 1986) and the norm of reciprocity (Gouldner, 1960), employees who perceive organizational support will feel obligated to reciprocate the firm's supportive orientation with voluntary contributions that benefit the firm (Organ, 1990). In other words, once employees have perceived organizational support via supervisor support, they tend to develop a generalized felt obligation to care about the organization's welfare and help the organization achieve its objectives (in this study, successful ERP adoption) (Eisenberger et al., 1990; Lind, Tyler, & Huo, 1997; Wayne et al., 1997; Eisenberger, Armeli, Rexwinkel, Lynch, & Rhoades,2001; Wayne, Shore, Bommer, & Tetrick, 2002; Aselage & Eisenberger, 2003).

In summary, social support can create a sense of belonging for an individual at the emotional level (Sundin et al., 2006) and tend to interpret the organization's gains and losses as their own. Consequently, when individuals perceive social support at workplace, according to social exchange theory (SET) (Blau, 1964) and the norm of reciprocity (Gouldner, 1960), they might feel obligated to repay the organization by becoming affectively committed (Witt, Kacmar, & Andrews, 2001). On the other hand, as

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

mentioned above, since social interaction between individuals' supervisors and their co-workers is an important feature of social support, their re-examination of their ongoing commitment to the organization are expected to be based on their interaction and experience with their immediate supervisors and their co-workers during the process of change. Thus, it is plausible to assume that social support fosters employees to derive their identity form association with the organization (i.e., affective commitment to organization). Thus, hypothesis 2 is stated as:

- **H2:** Employees who receive social support at workplace will demonstrate affective commitment to organization.

Affective Commitment to Organization and Affective Commitment to Change

Conceptually, individuals who identify with their organizations are more likely to engage in favor of the collective goals (Michel, Stemaier, & Salvador, 2010), as an employee with high emotional attachment to an organization would strongly identify with the vision of the organization and the goals and values of change initiatives. In that event, when individuals perceive a change initiative is consistent with an organization's vision would enable them to commit to that change (Dvir, Bagozzi, & Warshaw, 2004). In other words, employees with strong affective commitment to an organization are likely to see the value of organizational change (Meyer, Srinivas, Lai, & Topolnytsky, 2007) which, in turn, would enhance their affective commitment to change.

Further, empirical evidence from previous research shows that affective commitment to an organization plays a vital role in employees' acceptance of change (Iverson, 1996; Yousef, 2000). In this case, it is likely that affective commitment to organization is positively related to affective commitment to change because employees who identify with their organizations may take the organization's perspective and integrate organizational goals and interests with their self-concept and are likely to assess the change efforts as necessary and beneficial (Michel et al., 2010).

In sum, based on inferences discussed above, it is reasonable to believe that employees with strong affective commitment to organization would be more likely to demonstrate affective commitment to change. Thus, hypothesis 3 is stated as:

- **H3:** Employees with strong affective commitment to an organization will demonstrate affective commitment to change.

Affective Commitment to Change and Attitude Toward ERP System

Affective commitment to change is defined as 'a desire to provide support for the change based on a belief in its inherent benefits' (Herscovitch & Meyer, 2002, p. 475). Conceptually, commitment to change is distinctive from commitment to an organization (Fedor, Caldwell, & Herold, 2006) and, more importantly, commitment to a change is a better predictor of behavioral support for a change than is organizational commitment (Herscovitch & Meyer, 2002). In particular, those who buy-in to the change and want to make efforts to ensure its success (i.e., strong affective commitment to change) should be willing to do more than is required of them, even if it involves some personal sacrifice (Meyer & Herscovitch, 2001; Meyer et al., 2007).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

It is asserted that employees' affective commitment to change is critical to the successful implementation of organizational change (Meyer et al., 2007). For instance, some researchers (e.g., Kotter, 1995; Armenakis & Bedeian, 1999) had pointed out the importance of employees' commitment to change in carrying out successful change efforts. Furthermore, commitment to change has been found empirically to be a better predictor of specific change-related behaviors (Herscovitch & Meyer, 2002; Fedor et al., 2006; Meyer et al., 2007; Chou, 2015; Chou, 2016).

In summary, as mentioned earlier, most human behavior can be predicted from intentions alone (Fishbein & Ajzen, 1975) and intention is assumed to be the immediate antecedent of behavior (Ajzen, 1991). In that case, it is plausible to assume that employees with strong affective commitment to change are prone to demonstrate positive attitudes toward ERP system. Accordingly, hypothesis 4 is stated as:

- **H4:** Employees with strong affective commitment to change will demonstrate positive attitude towards ERP system.

Mediating Roles of Affective Commitment to Organization and Affective Commitment to Change

Social Support and Affective Commitment to Change

Practically speaking, organizational change is intended to alter key organizational variables that then affect the members of the organization and their work-related attitudes and behaviors (Jimmieson, Terry, & Callan, 2004). In general, the changes experienced by employees are best represented by the new situations affecting their current jobs, which are governed by their immediate supervisors, and influenced by their co-workers. In other words, the impact of organizational change on employees' commitment to such change is expected to be based on their interaction and experience with their immediate supervisors and their co-workers.

Moreover, as noted, high-social-support individuals not only might have a more optimistic view of the future, but also enhanced capacity to withstand and overcome frustrations and problem-solving challenges (Sarason et al., 1983). In that event, employees who received social support would have positive perceptions of the outcomes of organizational change and tend to increase their commitment to change (Fedor et al., 2006). Accordingly, it is plausible to assume that there is a positive relationship between social support and affective commitment to change.

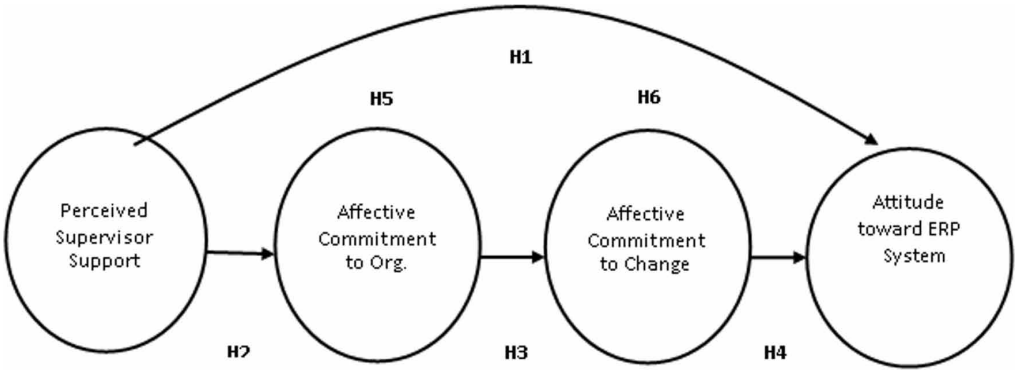
Affective Commitment to Organization and Attitude Toward ERP System

Conceptually, organizational commitment involves manifesting strong desire to remain a member of the organization and entails a high level of identification with the goals of the organization and the values it stands for (Allen & Meyer, 1990). Specifically, it is suggested that individuals with high affective commitment to organization would strongly identify with the vision of the organization and the goals/values of change initiatives (Dvir et al., 2004).

Further, employees with a strong affective commitment to an organization are likely to value the course of action that is necessary for successful organizational change (in this study, adopting ERP system) and are therefore willing to do whatever is required to achieve the target of that action (Meyer et al., 2007). In other words, those who identify strongly with the company and perceive the company's goals (in this

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

study, successful implementation of ERP) as their own (Fedor et al., 2006) are willing to do more than is required of them during adopting ERP system (Vakola & Nikolaou, 2005).



Prior studies evidenced empirically that affective commitment to organization plays a vital role in employees' acceptance of change initiatives (Iverson, 1996; Yousef, 2000). For example, Yousef's (2000) findings reveal a positive relationship between affective commitment and behavioral tendency attitudes toward organizational change. In particular, Iverson's (1996), findings confirm that affective commitment to organization can predict behavioral intention towards change initiatives. In that case, it is reasonable to expect a positive relationship between affective commitment to organization and attitude towards new Information system.

According to Baron and Kenny's (1986) assertion, the role of the mediator of an independent variable–dependent variable relationship is supported, in part, by the links between: (1) independent variable and mediator, (2) independent variable and dependent variable and (3) mediator and dependent variable. In accordance with this assertion and along with all the inferences discussed above and after incorporating the simple bivariate associations into the initial hypotheses, Hypotheses 5 and 6 are stated as follows.

- **H5:** Affective commitment to organization mediates the relationship between social support and affective commitment to change.
- **H6:** Affective commitment to change mediates the relationship between affective commitment to organization and attitude toward ERP system.

In summary, with respect to research framework, Figure 1 depicts the research framework of this study.

Figure 1. Research framework

METHODS

Participants

Invitations for participation were sent to three companies located at Hsinchu County which are undergoing ERP project less than 8 months. Procedure-wise, a total of 600 questionnaires with a cover letter explaining the purpose of the survey were sent to the head of the Human Resource Department of the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

three surveyed companies along with a return envelope for each participant to ensure that participants could send back the completed questionnaire on their own. A total of 350 questionnaires were returned (58% response rate), with 334 valid questionnaires after screening (56%).

Descriptive statistics for the valid respondents are presented in Table 1.

Table 1. Descriptive profile of respondents

Gender	Male	63%
	Female	37%
Job Rank	Managerial position	17%
	Non- managerial position	83%
Age(years)	<30	30%
	31-40	44%
	41-50	21%
	>50	5%
Seniority(years)	>15	47%
	11-15	23%
	5-10	12%
	<5 years	18%
Education Level	Master	18%
	University Degree	48%
	Diploma	17%
	High School	17%
Annual Income(NT$)	>1,200,000	3%
	800,001-1,200,000	3%
	400,001-800,000	32%
	<400,000	62%

Measures

Unless otherwise stated, all responses were made on a 6-point scale ranging from (1) strongly disagree to (6) strongly agree.

Social Support (SS)

Social support was assessed by using ten items including 7 items of perceived supervisor support (PSS) which were developed by Cummings and Oldham (1997); 3 items of perceived coworker support (PCS) which were developed by Yoon and Thye (2000). The internal consistency of this 10-item scale was .91 in the current sample.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Affective Commitment to Organization (ACO)

Affective commitment to the organization was measured using the six items developed by Meyer, Allen and Smith (1993) (e.g., "I really feel that this organization's problems are my own."). The internal consistency of this six-item scale was 0.88 for this sample.

Affective Commitment to Change (ACC)

Affective commitment to change was measured with the six items developed by Herscovitch and Meyer (2002). The internal consistency of this six-item scale was .81 for this sample.

Attitude toward ERP System (ATE)

Attitude towards ERP System was measured using three items adopted from Porter and Donthu (2006) (e.g., "I am positive toward the ERP system". The internal consistency of this three-item scale was .89 in the current sample.

Overall, the strength of the internal consistency estimates of the variables in this study suggests homogeneity of the scale items.

ANALYSIS AND RESULTS

Analysis

Before testing the study hypotheses, confirmatory factor analysis (CFA) was conducted with the AMOS software (Arbuckle, 2003) to examine the convergent and discriminant validity of the study measures. Given the large number of items (25) relative to the sample size (334), the procedures recommended by Mathieu and Farr (1991) were followed by creating two dimensions (perceived supervisor support and perceived coworker support) for social support, and three composite indicators for affective commitment to organization and affective commitment to change, in order to maintain an adequate sample-size-to-parameter ratio (Landis, Beal, & Tesluk, 2000).

Following the approach suggested by Andersen and Gerbing (1988), convergent validity is demonstrated when the path loading (λ) from an item to its latent construct is significant and exceeds 0.50. As shown in Table 2, all path loading (λ) in this study was above 0.50 (0.70-0.95). In addition, convergent validity is also adequate when the constructs have an average variance extracted (AVE) of at least 0.50 and composite reliability (CR) greater than 0.6 (Hair, Anderson, Tatham & Black, 2006). As shown in Table 2, the AVEs of all four constructs in this study exceed 0.50 (0.60-0.74) and the CRs of all four constructs are also above 0.6 (0.76-.90). Thus, all constructs in this study demonstrate adequate convergent validity.

To assess discriminant validity, the procedures outlined by Fornell and Larcker (1981) were employed to examine whether the square root of AVE for the two constructs exceeds their correlation. As shown in Table 2, the square root of AVE for the two constructs is greater than their correlation. Thus, all tests of reliability and validity lead to the conclusion that the measures used in the subsequent statistical analyses are of acceptable reliability and validity.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Descriptive statistics and correlations among study variables

Variable	Mean	SD	Cronbach α	CR	Item Loading(λ) (min-max)	1	2	3	4
1. SS	4.46	.75	.91	.76	(.72-.84)	(.79)			
2. ACO	4.43	.88	.88	.88	(.84-.85)	.68**	(.85)		
3. ACC	4.24	.69	.81	.82	(.70-.83	.55**	.54**	(.77)	
4. ATE	4.56	.90	.89	.90	(.80-.95)	.51**	.38**	.44**	(.86)

Note:
SS=Social Support
ACO= Affective Commitment to Organization
ACC=Affective Commitment to Change
ATE=Attitudes towards ERP
CR=Composite reliability
Item Loading (λ) is standardized.
Values along the diagonal represent the square root f average variance extracted (AVE)

In addition, given that the data were collected from a single source, the procedures recommended by Podsakoff, Mackenzie, Lee and Podsakoff (2003) were employed to examine whether the hypothesized four-factor model was influenced by the common-method bias. The result shows that the hypothesized four-factor model (GFI = .97; CFI = .99; TLI = .98; RMSEA = .048) had a better fit than the single-factor model (GFI = .68; CFI = .67; TLI = .59; RMSEA = .22). Thus, although the present data may have common-method variance, the common-method bias does not seem to be a serious problem in this study.

Hypothesis Testing

Means, standard deviations, internal reliabilities, and inter-correlations among the variables are reported in Table 2. All measures show high internal reliabilities, with coefficient alphas ranging from .81 to .91. In addition, social support has a statistically significant positive relationship with the potential mediators, affective commitment to organization (0.68, $p < 0.01$); affective commitment to change (.55, $p < .01$), and with the outcome variable of attitude toward ERP system (0.51, $p < 0.01$). Moreover, affective commitment to organization has a statistically significant positive relationship with affective commitment to change (0.54, $p < 0.01$) and attitude toward ERP system (0.38, $p < 0.01$). In addition, affective commitment to change has a statistically significant positive relationship with attitude toward ERP system (0.44, $p < 0.01$). By and large, the pattern of correlations is consistent with the hypothesized relationships.

Next, structural equation modeling was performed using AMOS 5.0 (Arbukle, 2003). According to Anderson and Gerbing's (1988) recommendation, the measurement model was tested before actually examining the hypothesized model. The full measurement model was tested whereby all latent variables in this study were allowed to correlate. The fit, according to Hu and Bentler (1999), was a good fit, with relative fit indices of 0.99 for CFI, 0.98 for TLI and 0.048 for RMSEA ($X^2 = 67.394$. df = 38, CMIN/

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

DF=1.774, $p < 0.000$). With the fitness of the measurement model confirmed, the hypothesized model was then tested.

The last step is to test the mediating roles of affective commitment to organization in the relation between social support and affective commitment to organization, and affective commitment to change in the relation between affective commitment to organization and attitude toward ERP system. With respect to the testing method, bootstrapping was employed to test directly for the mediators with the AMOS software since it is currently regarded as a more powerful tool for testing the mediating effects in comparison with Baron and Kenny's (1986) approach (Preacher & Hayes, 2008).

As a result, the standard estimated indirect effect of social support on affective commitment to change thus obtained was 0.56 (95% CI: 0.434 - 0.689), and the standard estimated indirect effect of affective commitment to organization on attitude towards new Information systems was 0.35 (95% CI: 0.253-0.483). These results confirm the mediating roles of affective commitment to organization in the hypothesized relations.

Further, in order to test whether a full mediating relationship exists between perceived organizational support and attitude toward ERP system, a competitive modeling test was conducted. Table 3 presents fit indices for the hypothesized model, along with three alternative models. Results of comparison show that although the three alternative models show a better improvement in model fit when compared with the hypothesized model, Alternative Model 2 indicates no significant relationship between affective commitment to organization and affective commitment to change, whereas alternative Model 3 indicates there is no significant relationship between affective commitment to organization and affective commitment to change and between affective commitment to organization and attitude toward ERP system. As a result of comparison, the alternative Model 3 is the most adequate for explaining the data as indicated by a RMSEA of 0.048, a CFI of 0.99, a GFI of 0.98, and a TLI of 0.97.

Table 3. Competitive model test

	X^2	df	X^2/df	ΔX^2	RMSEA	CFI	TLI	GFI
Hypothesized Model	110.829	41	2.703		.072	.97	.95	.96
Alternative Model 1[a]	85.232	40	2.131		.058	.98	.96	.97
Alternative Model 2[b]	71.023	39	1.821		.050	.99	.96	.98
Alternative Model 3[c]	67.394	38	1.774		.048	.99	.97	.98

[a] Alternative Model 1 only added the direct path from social support to attitude toward ERP.
[b] Alternative Model 2added the direct path (1) from social support to attitude toward ERP and (2) from social support to affective commitment to change.
[c] Alternative Model 3 added the direct path (1) from social support to attitude towardERP; (2)from social support to affective commitment to change and (3) the direct path from affective commitment to organization to attitude toward ERP.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Standardized parameter estimates for the alternative Model 3 are shown in Figure 2. For ease of presentation, only the structural model is presented rather than the full measurement model. Examining the path coefficients reveals that social support is uniquely related to affective commitment to organization in the positive direction; affective commitment to organization has significant direct association with attitude toward ERP system. Thus, all hypotheses are supported in this study. Figure 2 depicts the final results from test of hypothesized Model.

Figure 2. Research results

DISCUSSION

Summary of Findings

The results of hypotheses testing are presented in Table 4:

This study proposes an integration of two of the dominant streams in organizational behavior – workplace social support and organizational change. The results of this study indicate that workplace social support has positive association with attitude toward ERP system, whereas affective commitment to organization fully mediated the relationship between social support and affective commitment to change, and affective commitment to change fully mediated the relationship between affective commitment to organization and attitude toward ERP.

Also, the present findings are consistent with social support theory that employee's attitudinal and behavioral intent are primarily driven by employees' evaluation of favorable treatment (e.g., being valued and cared for) provided by his/her supervisor and coworkers. Specifically, given that organizational participants typically engage in multiple exchange relationships, findings of this study reveal that perceived social support at workplace can function as a mean of enhancing affective commitment to organization which, in turn, motivates employees' affective commitment to change and, eventually, influences employees' attitude toward ERP system.

In addition, the results of this study are also consistent with the assertions of Herscovitch and Meyer (2002) and Fedor et al., (2006), which suggested that commitment to change is conceptually and empirically distinct from commitment to an organization. Moreover, the results are in agreement with the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Hypotheses testing results

H1	Employees who receive social support at workplace will demonstrate positive attitude toward ERP system.	Supported
H2	Employees who receive social support at workplace will demonstrate affective commitment to organization.	Supported
H3	Employees with strong affective commitment to an organization will demonstrate affective commitment to change.	Supported
H4	Employees with strong affective commitment to change will demonstrate positive attitude towards ERP system.	Supported
H5	Affective commitment to organization mediates the relationship between social support and affective commitment to change.	Supported
H6	Affective commitment to change mediates the relationship between affective commitment to organization and attitude toward ERP system.	Supported

findings of Iverson (1996) and Yousef (2000) that there is a positive relationship between affective commitment to organization and affective commitment to change ($r = .54$, $p < .01$, Table 2). In short, the more the employees are loyal to the organization, the greater their willingness to accept change (i.e., implementing ERP system).

Practical Implications

With respect to practical implications of this study, this study has several practical implications for organizations whilst implementing ERP system. First, this finding demonstrates the efficacy of workplace social support in developing employees' positive attitudes toward ERP system. In other words, the success of ERP adoption, to a certain extent, lies in workplace social support. Proving such linkages exist implies that management and HR practitioners should focus their efforts on developing a climate of social support within their organizations (Graetz & Smith, 2010).

Second, the proof of the importance of social support during implementing ERP system encourages management and HRM practitioners to focus on certain leadership development programs to trigger employees' "felt obligation" to benefit the organization. For example, it is found that employees led by transformational leaders are likely to develop a generalized felt obligation to care about the organization's welfare and help the organization achieve its objectives (Eisenberger et al., 2001). Specifically, considerable research has identified that leadership as one of the most critical success factors in adopting ERP system (Law & Ngai, 2007; Rai, et al., 2009). For example, empirical findings support that there is a positive relationship between leadership and successful ERP adoption (Cho, et al., 2011).

Third, affective commitment to organization, in this study, was found acting as a determinant of affective commitment to change and a mediator between social support and affective commitment to change. In that event, organizations, while implementing ERP system, should also pay particular attention on how to enhance employees' affective commitment to organization. To this end, management and HRM practitioners, for the sake of enhancing employees' affective commitment to change, should

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

devote their efforts to establish a fair and supportive working environment (Eisenberger et al., 2001; Meyer et al., 2002).

Finally, as Hornstein (2008; 2015) suggested, it is not the technology that provides an organization with a successful implementation of new information system, but the integration of technology into an organizational change management process. More clearly, ERP project success depends, at least in part, on change management which focuses on human factors (Ziemba & Obłak, 2015). The findings of this study reveal that a successful ERP adoption requires employees' affective commitment to change. Specifically speaking, affective commitment to change plays a critical role in the successful implementation of change (implementing ERP system, in this case) (Parish et al., 2007), and does a better job of predicting specific change-related attitude (acceptance of ERP system, in this case) In that case, management and HRM practitioners should devote efforts to enhance affective commitment to change via change management practices such as effective communication (Ziemba & Obłak, 2015).

Limitations and Directions for Future Research

Like previous research, this study also has certain limitations. First, the sample is confined to a limited number of companies which might in turn limit the generalizability of its findings and conclusions to other enterprises. Second, this approach introduces potential problems of common-method bias as the research variables were gathered from the same source, although a Harmon single-factor test (Podsakoff, MacKenzie, Lee, & Podsakoff, 2003) shows that common-method bias is not a serious problem in this study. Third, one must be cautious when interpreting the findings of this study due to the possible constraint of non-response bias, such that non-respondents might hold different views with respect to the variables in question, leading to possible bias in survey estimates. Finally, this study suffers from the common limitations of cross-sectional field research. In this regard, caution is necessary for its inability to make causal inferences with confidence between the variables examined in the study.

Regarding the directions for future research, as noted by Podsakoff et al. (2003), using self-reported measures for both constructs may inflate their correlations due to self-reporting bias. Thus, future research should focus on others' ratings to reduce common-method variance. For example, the use of immediate supervisors or coworkers' assessments of affective commitment to organization, affective commitment to change and attitude towards ERP system would further validate the results of research. Further, given that perceived usefulness and ease of use are central elements of TAM which is most widely used model in the research on IS literature, it would be interesting avenue to explore if future research integrate the notion of workplace social support and TAM examine whether social support contribute to perceptions of usefulness and ease of use.

Contribution

In spite of the above-mentioned limitations, this study has a couple of unique contributions. First, as noted above, although TAM has been and still is extensively used, its universality to predict across all situations has recently been called into question (Greenfield & Rohde, 2011). In this regard, this study sheds new light on understanding the key determinants of employee's attitude toward ERP system from the perspectives of organizational change and workplace social support. Such understanding can assist in the proactive planning of intervention mechanisms for maximizing the possibility of success in implementing ERP system in addition to TAM's knowledge. In other words, the findings of this study

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

contribute as a supplement of TAM, which focuses on "ration" (i.e., ease of use and perceived usefulness), by providing an alternative approach with focus on "human emotion" (i.e. social support) to gain a deeper understanding of employee's attitude toward ERP.

Second, in regard to organizational change management, this study confirms that individuals' attitude toward ERP system as a function of affective commitment to change with social support. Given that the available knowledge of how HR professionals perform effectively as "change agents" is relatively limited (Alfes, Truss, & Gill, 2010), results of this study provide confirm workplace social support's effects on employee's attitude towards ERP system partly via enhancing affective commitment to the organization and affective commitment to change.

CONCLUSION

As noted earlier, many organizations were not successful in reaping the potential benefits as it promised. Hence, many experts and researchers have investigated this issue (high failure rate) from various perspectives. For example, some provide valuable insights in the process of ERP implementation (e.g., Kumar, et al., 2003) and others identify a variety of factors critical to the success and failure of an ERP implementation project (e.g., Akkermans & Helden, 2002; Ehie & Madsen, 2005; Woo, 2007; Momoh et al., 2010).

In particular, as Hong and Kim (2002) identified, employee's resistance to this new IS as a critical failure factor while adopting ERP system. In this regard, improving our understanding of the inner working mechanism associated with attitude toward ERP system through the perspective of organizational change has become increasingly important while adopting ERP system.

Chapter 71
Factors Contributing to Organizational Change Success or Failure:
A Qualitative Meta-Analysis of 200 Reflective Case Studies

ABSTRACT

Change, and changing, exercise the minds of most managers most of the time. In consequence, leadership development and change management tend to be top priorities for many human resource development (HRD) professionals today. Despite this, much academic and practitioner literature suggests that 70% of all change programs fail. Through analyzing 200 organizational change case studies, this chapter examines this high failure rate, investigates leadership styles and their relationship to change, and explores the key factors that either enable or hinder successful change. The key findings of this examination were that the majority of the 200 studied change initiatives were considered successful and that using Kotter's change model, which has been long established, does not necessarily mean success; nor does the use of a democratic/participative leadership style. The most significant hindering factors and the key critical success factors are also acknowledged.

INTRODUCTION

According to Bawany (2016) "we live in a world where 'business as usual' IS change" (p. 32). Change is a normal, natural response to variable, uncertain, internal and/or external conditions (Leifer, 1989). Change is complex, constant, ever-present, increasing in pace, and open-ended and comes in many shapes and sizes. This is true for both change within individuals and change within organizations. Change is something that exists in all individuals, in all organizations, and in all sectors (Todnem By, 2005). We are living and working in a volatile, uncertain, complex and ambiguous (VUCA) world (Rodriguez & Rodriguez, 2015).

Due to globalisation, the fast pace of technological and digital changes, the developing and differing expectations of the workforce, shifting demographics and increasing competition to survive in the workplace, organizations need to recognise the uncertain and unpredictable environment in which they operate. They need to find ways to successfully navigate through the complexity and ambiguity brought about by ongoing change. In short, the rate of change is accelerating, and so organizations must demonstrate that they are up the challenge of moving quickly and adapting continuously and successfully to keep up.

Much is written about organizational change, leadership, and the popular frameworks and models to consider in times of change. We are aware through a plethora of change management books and journals that change is constant (Coleman & Thomas, 2017), that change is complex (Senior & Swailes, 2016) and that change is inevitable (Daft, 2018). Furthermore, numerous leadership models and change management models have been offered as ways to best lead and manage change (Senior & Swailes, 2016). However, there are still gaps in understanding how to better ensure successful organizational change in today's VUCA world, not least because the validity of widely held assumptions about the scale of change programme failure, the best change leadership style to adopt, and the sufficiency of empirical evidence supporting many change management models, have been questioned.

The purpose of the study reported in this chapter was to generate empirical evidence that could contribute to current debates concerning the above assumptions by addressing the following research questions:

1. What is the 'reality' of change programme failure compared to the 70% failure rate 'rhetoric'?
2. What are the most frequently used leadership styles in times of change?
3. What are the key factors that enable or inhibit the effective application of change management models and the achievement of successful change?

The chapter starts with a review of organizational change and development (OCD) related literature which reports why over 70% of change initiatives fail. It then provides a brief discussion of current models of change with a focus on Kotter and a brief overview of leadership in the context of change. This is followed by details of the selected methodology and methods adopted for the current study, the results of the data analysis, and a discussion of the key findings. The chapter closes with consideration of the research limitations and implications for evidence-based OCD practitioners.

LITERATURE REVIEW

Success and Failure of Organizational Change Programmes

It has been reported many times that 70% of all change programmes fail (Balogun & Hailey, 2004; Beer & Nohria, 2000; Bielinska-Kwapisz, 2014; Burnes, 2011; Burnes & Jackson, 2011; Kotter, 2008). According to Carnall and Todnem By (2014), and as discussed in earlier chapters, the key reasons for change failure are time, unplanned uncontrollable factors, inadequate coordination, competing demands on manager's time, insufficient change agency competence, inadequate training and uncontrollable external factors. The inference from this headline grabbing figure of 70% is that there cannot be a valid framework to successfully implement and manage change, otherwise we would be using it and the failure rate would be much reduced.

In this context, there is a lack of clarity as to what is meant by 'failure' i.e. a failure to achieve all the outcomes set? Or a failure to engage all employees with the change? Or a need to make further changes once the initial change has been completed? A definition of failure is not made clear in the literature and so it is difficult to acknowledge whether 70% is a true and/or helpful figure to quote. Hughes (2001) suggests that there is a lack of empirical evidence to support the 70% failure rate rhetoric and suggests that the reality of organizational change may result in different and/or additional outcomes. These may not initially be seen as beneficial as those which were planned but potentially not achieved. Perceived failure may also not take into account the post change successes, nor account for the unique demands of different contexts; i.e. what may work for one organization may not completely work for another or may not produce the same outcomes but may still be considered a success if later embedded/consolidated.

In addition, change does not happen in isolation, so it may be difficult to individually measure change initiatives as separate from other activities that may help or hinder the change process, or indeed separate from the constraints of the context. There is research that suggests that changes in the public sector are more difficult to achieve than those in the private sector due to their political nature and bureaucratic role and rule-based culture (McAdam & Saulters, 2000). Also, perhaps it depends who you are asking to evaluate the change; i.e. if you are asking those who led the change, then perhaps their perceptions are going to be influenced by their own effort or the part they played, and as such this may differ from the expectations and perceptions of those on the receiving end. Stakeholder evaluations of the same initiative may be wholly different. For instance, employees may not feel satisfied with the change, yet from a senior management point of view the change may have met the outcomes and therefore it was considered successful; although we're not suggesting that the successful outcome was geared towards making the employees unhappy!

Hence, one part of our study seeks evidence that supports (or otherwise) commonly held assumptions and beliefs about the 70% failure rate of OCD programmes

Although there is limited evidence to suggest that the 70% figure is valid and reliable, or indeed an outcome of any empirical evidence, authors have continued to suggest alternative frameworks and models for managing change to reduce this high failure rate. And there are now available a wide range of somewhat contradictory, confusing and repetitive models to inform, shape and evaluate change management practices. However, it is still argued that we do not have an approach to change that is "theoretically holistic, universally applicable, and which can be practically applied" (Burnes, 2014, p. xiv).

Accepting the criticism that "all models are wrong, some models are useful" (Box as cited in Burnes, 2014, p. xii), it is surprising that change management education relies on models which suggest one best

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

approach to achieving successful organizational change (Kanter, Stein & Jick, 1992; Kotter, 1995; Lewin, 1947; Luecke, 2003; Pugh, 1993) and/or adopt a contingency approach to change (Stace & Dunphy, 2001; Storey, 1992). Current thinking suggests that these models do not fully explore or display the multitude of approaches to change (Burnes, 2014) and the multiple factors that influence organizational change.

Lewin (1947) is much quoted in respect of his 3-step planned approach to change involving *unfreezing* from the present state, *moving* towards a new state and *refreezing* at this new level. The suggestion is that once movement has occurred, the change has happened and is fixed and embedded in the organization. This approach to change does not permit influence from other variable factors, nor does it suggest there is an on-going process or flexibility once achieved. This model of planned change has been much criticised by those who support the more emergent approaches to change and who advocate a more practical approach, recognising the relationship between variables and context, for instance: Kanter et al.'s (1992) 10 Commandments; Kotter's (1995; 2014) 8 stages or phases of actions for leaders/managers of change to follow; and Luecke's 7 steps (2003). Kotter's work is much cited and considered to be the 'orthodoxy for change leadership' (Todnem By, Hughes & Ford, 2016, p. 11.) As a reminder, Kotter's model or framework draws attention to 8 phases;

1. Establish a sense of urgency
2. Create a guiding coalition
3. Develop a clear shared vision
4. Communicate the vision
5. Empower people to act on the vision
6. Create short term wins
7. Consolidate and build on the change
8. Institutionalise the change. Kotter (1995; 2014)

However, this and other change management frameworks and models have attracted criticism from those who propose a more contingency approach to change, stating that no one-size-fits-all, and all change situations are unique and so require a different, more flexible approach each time (Stace & Dunphy, 2001). More recently Kotter (2014) revised his thinking, suggesting now that his model is not to be taken as a rigid, linear, sequential model but more as a continuous set of steps that run concurrently.

In conclusion and suffice to say, as with the 70% failure rate figure, change management models too are considered lacking in empirical evidence and based on unchallenged hypotheses (Burnes & Jackson, 2011).

Leadership in Times of Change

Leadership is key to the success of any organization as it has a direct impact on organizational performance, and thus organizational survival (Daft, 2018).

A major factor in the failure of organizations to adapt to internal and external changes is their lack of effective leadership. It is recognised that managing change is not enough, but that leading change is what is required (Bawany, 2016). "The heart of the leadership challenge that confronts today's leaders is learning how to lead in a VUCA world" (Bawany, 2016, p. 31) and as such, leading and managing change is increasingly becoming a necessary leadership/management skill. Effective leaders see change as a way to strengthen the organization and not to disrupt it. A critical factor to understanding how to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

lead change is having an understanding of the positive and negative aspects of change, and the impact of these on others within the organization.

"Leadership deals with change, inspiration, motivation and influence" (DuBrin, 2010, p. 5). In short, leaders set the vision and strategy moving forward, align people towards the vision/strategy and then inspire, motivate and influence them towards making it happen (Kotter, 1996). According to the Chartered Institute of Personnel and Development-CIPD (2017) which is based in the United Kingdom (UK), leadership both creates and addresses challenges and goals at the strategic and cultural level of an organization. It involves influence over, and responsibility for, individuals (both internally and externally to the organization) and so a leader's ability to understand and enhance human behaviour is key. The CIPD also states that leadership is a continuous process and must be viewed within its context. There are a variety of schools of thought about leadership including trait theories (Kirkpatrick & Locke, 1991), behaviourist (Adair, 1989; 2007), situational/contingency (Hersey, 1984) and post-heroic (Bass, 1990). The work of Hersey and Blanchard on situational leadership theory (Buchanan, 2013) is considered particularly relevant to change leadership as it relates to the adaptability, willingness, and readiness of those being managed and the ability of the leader to lead change in different and diverse situations. Turnnidge and Cote (2017) identifies this as encompassing the motivational and empowering elements of transformational leadership. Bass and Riggio (2006) argue that transformational leaders set the vision, take an entrepreneurial/innovative approach to all aspects of the organization and are agents of change.

However, when all the debate and theory is stripped away, traditionally there are still considered to be 3 different leadership styles; autocratic, democratic/participative and laissez-faire/delegative (Hopen, 2015; Lewin, Lippit & White, 1939). Furthermore, there are those managers who adopt a more transactional and those who adopt a more transformational approach (Bass, Avolio, Jung & Berson, 2003; Bass & Riggio, 2006).

In addition, there are contemporary emergent leadership theories underpinning the knowledge and development of change leadership; but subtly they focus on the role of the individual in the process of being led: distributed, servant, authentic and relational leadership. These theories put people at the heart of leading change and focus on all the players as moral and ethical contributors to the change process, having self-awareness, openness, transparency, and consistency. They also acknowledge that all people have skills, knowledge and attributes that can be employed in the process of change. This in turn assists with the continuous professional development element of their working lives.

The literature suggests that 'distributed leadership' is a comparatively new concept and one used initially in academic environments to describe change leadership though latterly it has become more widely used and discussed. According to Bolden (2007) distributed leadership has become popular as an alternative to traditional models of leadership that concern themselves primarily with the behaviours and attributes of individual 'leaders' (e.g. trait, situational, style and transformational theories). The suggestion is that organizational change requires a different type of leadership at different times within a change intervention. Spillane (2006) asserts that distributed leadership is dissociated from specified organizational roles, and the action and influence of people at all levels is more important to the overall functioning of the organization. Spillane also suggests that a distributed perspective 'puts leadership practice centre stage', thereby encouraging a shift in focus from the traits and characteristics of 'leaders' to the shared activities and functions of 'leadership' in times of change.

In addition, there is still extensive discussion about the impact of distributed leadership and argument regarding its effectiveness, but both Cannatelli, Smith, Giudici, Jones and Conger (2017) and Harris and DeFlaminis (2016) argue that in spite of this, it can be a successful approach to leadership in a range of

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

environments. Feng, Hao, Iles and Brown (2017) argue that distributed leadership requires a robust approach since it is applied in environments which are subject to frequent and significant change and are increasingly complex. In contrast, Lumby (2013) argues that it can be seen as a fad, that it is 'nebulous and difficult to define' and that the lack of adequate definition means it can neither be endorsed nor can its impact be measured.

Akin to distributed leadership theory and growing in popularity 'servant leadership' puts people at the heart of change management interventions in organizations. Servant leadership is based on the philosophy of service (Akdol & Arikboga, 2017). Therefore, it is a conduit for generating creativity among the people within organizations. Servant leadership is considered as the approach that transcends command and control leadership (Dierendonck & Patterson, 2015). It is a response to the generic practice of leadership that tends in many cases to inappropriately emphasise performance and results over process and morality. However, the extant literature of servant leadership is paradoxical. Originally the theory developed the 'dual being' concept of servant leadership as an elusive subject (Stoten, 2013). In literal terms, 'dual being' refers to the context that everyone in an organization is both servant and leader. This is, however, emphasised by Davis, (2017) and Yigit and Bozkurt, (2017). They have indicated that dual being is not only possible but also imperative for effective leadership practice. This is in line with the opinion of Moll and Kretzschmar (2017), who suggest that servant leadership requires leaders to serve the followers and meet their needs more; the challenges of organizational change that organizations face can be dealt with by servant leadership. This connects to the thinking of Brown and Treviño (2006) in examining the concept of 'authentic leadership'. The principal dimensions of authentic leadership are self-awareness, openness, transparency, and consistency. Avolio, Gardner, Walumbwa, Luthans and May (2004) describe authentic leaders as those who are deeply aware of how they think, feel and behave and are seen by others as doing so. Others also see them as being aware of their own and others' values/moral perspective; aware of the context in which they are operating; and who are confident, optimistic and resilient.

The concept of 'relational leadership', which was first introduced by Uhl-Bien (2006) and is considered new and original, goes even further with the idea that the individual's capacity to influence is the result of a social dynamic. According to Uhl-Bien (2006) "we need to move beyond a focus on the manager–subordinate dyad or a measure of relationship quality to address the question of, what are the relational dynamics by which leadership is developed throughout the workplace" (p. 672). At first sight, in the perspective of a relational analysis of leadership, the answer seems to be in the question. Essentially, Uhl-Bien (2006) defines relational leadership as a "social influence process" through which social order and change are constructed and produced (p. 655). In other words, the social aspect is at the heart of relational leadership; because changes are constructed and produced, and everybody participates in the process. Thus, as Uhl-Bien (2006) adds, relational leadership, especially in times of change, would not be dependent on role or hierarchical position.

Whilst it is recognised that "leadership and organizational change are inextricably intertwined" (Parry, 2011, p. 57), there is little empirical evidence to underpin our knowledge of change leadership; much is being said but little is being rigorously academically or empirically underpinned. Todnem By et al. (2016) suggest that there are three well established myths in relation to leadership of change; 1) that it is the individual that counts and not the multiple others who may well be taking on a leadership role as well; 2) that leadership is enough and is independent of other management activity; and 3) that one-size-fits-all rather than different types of leadership being needed at different times within the change process. Conversely, Grint (2000) suggests that leadership is an art and not a science, so it is not

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

possible to create a leadership formula that works and applies to every change situation because it very much depends on a number of factors. As stated in chapter 2, the Jones and Gross (1996) study showed that 2 quite different leadership styles (top down and bottom up) can still lead to organizational change success. Some time ago, Pettigrew and Whipp (1991) also concluded that there are no universal rules which guide the leadership of change, there are no universally good leaders, and leadership is sensitive to context. However, House and Aditya (1997) believe that several leadership functions generic to the exercise of leadership are likely to be effective across organizations, industries and cultures, but that this belief is theoretical speculation which needs to be developed theoretically and demonstrated empirically. More recently, Caldwell (2006) has argued that leading change is rarely a single, unified intervention by one transformational leader but more likely a series of disparate and fragmented activities at various levels, within an organization. As can be seen, there are considerable divergences of opinion in terms of the received wisdom about the relationship between leadership and organizational change.

RESEARCH METHODOLOGY

To address the research questions the study adopted a critical realist position and an interpretivist theoretical perspective; the central purpose being to understand the lived human experience and subjective world of those involved in change whether as recipients or as facilitators/agents of change (Cohen, Manion & Morrison, 2011).

Recognising the lack of literature providing real-life organizational case studies that inform thinking about change (Coleman & Thomas, 2017) the focus of our study was scholar-practitioner perceptions of their personal experience of effective and/or ineffective organizational change, as expressed in the form of case study reflections.

Notwithstanding the risk of 'participant error' (Robson, 2011), we still considered it most important that scholar practitioners should include in their case study reflections perceptions of their personal reality of change.

Sample of Research Participants

The research participants were all mature students attending management related postgraduate degree (PG) programmes in a UK business school. Creswell (2007) recommends a range of 20 to 40 participants within a sample for qualitative studies. The sample size for this study was determined by the number of PG students who had studied and submitted a reflective case study assessment for a core 20 credit module entitled 'Leading Transformation and Change' or 'Organizational Change and Development' as part of a UK Business School MBA programme, a Master in Public Health programme, or a CIPD/ Diploma in Human Resource Management programme. All these PG students were working managers or HR professionals, and their reflective case studies were 6000-word essays analysing a change programme in a workplace that they had experienced, either through leading it, supporting it, or being on the receiving end of it. Each case study had a common purpose in that it allowed its author to reflect on the success or failure of an organizational change project with which they were familiar. Only those case studies on programmes running during the 5-year academic period from 2012 to 2017 that had achieved a pass grade of 50% or above were included in the empirical data set.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The scholar practitioners were encouraged to adopt a retrospective perspective to locate the story of each change programme and the factors influencing it (Hitchcock & Hughes, 1989). In the reflective case studies the unit of analysis was the change process. Case reflections were thus developed to investigate the phenomenon of change in its real-world context (Creswell, 2007; Farquhar, 2012; Yin, 2014).

Data Collection and Analysis

Collecting an empirical data set comprised of 200 reflective case studies was consistent with Hughes's (2011, p. 462) call for "valid and reliable empirical evidence to support evidence-based change practices". A sample of this size permits comparisons to be drawn and to assess whether transferability between cases can be reached (Saunders, Lewis & Thornhill, 2016). With 200 cases there was sufficient data to triangulate and explore the findings further, and to strengthen the assumptions being made which in turn helped to ensure validity, reliability and credibility of the results (Farquhar, 2012).

The research team was comprised of four Faculty members at the UK University in which the modules were delivered; one teaching and research professor, two senior teaching and research staff, and one research assistant. The first stage of analysis commenced with the reading of a 10% sample of the same cases by each member of the research team who then came together to discuss and establish *a priori* codes to begin to sort the data. These codes comprised:

- Basic organization data; size of organization, industry, location
- Was the change considered successful – YES/NO
- Type of change e.g. planned, emergent, post-emergent
- Scale of change e.g. large scale change
- Triggers/drivers for change including internal (SWOT) and external (STEEPLE) factors
- Aims/objectives of the change programme/outcomes expected
- External Consultants used – YES/NO
- Key change models used e.g. Kotter, Lewin, Kanter et al., Luecke
- Leadership styles at both top/senior leadership level and lower leadership/manager levels
- Reflections on the biggest issues that hindered the change process
- Reflections on the lessons learnt from the change process/critical success factors

The second stage was the development of a database to capture coded data. The third stage involved the reading and coding of the case studies against the *a priori* codes by the research team. Members of the team coded independently, with coding corroborated at frequent intervals. This stage resulted in the capture and coding of raw data from the 200 case studies that could be sorted and further analysed. For the final stage of analysis, the codes were collapsed into key themes and comparisons were drawn between the success or otherwise of the change, the key leadership styles and the factors that helped or hindered successful change.

More About the Reflective Case Histories

Type and Sector

Of the 200 reflective case studies, 117 were written by students from the United Kingdom (UK) and various European Union (EU) countries and 83 by international students from other countries. Of the 200 organizations where they were employed 119 were in the private sector, 81 in the public sector and none in the not-for-profit/third sector. Additionally, 157 were considered large (over 250 employees), 35 medium (between 50-249 employees), and 8 small (less than 50 employees).

Table 1. Breakdown of the number of case studies by industry type and sector

Industry Type	Number of Cases Studies	Private Sector	Public Sector
Aeronautics and Defence	4	2	2
Agriculture and Mining	1	0	1
Banking/ Finance/ Investment	8	5	3
Building and Construction	10	8	2
Chemical/Energy/ Oil and Gas	9	6	3
Education/ University/ College	26	2	24
Electricity	7	7	0
Engineering/Automotive	13	13	0
Health	39	12	27
Hotel/Leisure	11	11	0
Housing/Property	13	6	7
IT/ Telecommunication	7	6	1
Legal Services	2	1	1
Manufacturing	31	30	1
Media	1	1	0
Religious Activities	1	1	0
Retail	8	8	0
Security	3	1	2
Transport	6	4	2
Total Companies	200	124	76

As can be seen in Table 1, 76 (38%) of the case studies were from public-sector organizations and 124 (62%) from private companies respectively; and almost half of these cases were from just three sectors: health, education and manufacturing.

The reason for the high number from the health sector including hospitals, care homes and social/ community care was because one of the 3 PG programmes used for this study was the Masters in Public

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Health programme, and the high number from manufacturing organizations was because the Business School is based in the West Midlands Region; a major manufacturing area in the UK.

Type of Organizational Change

The case study writers were asked to note whether the change programmes they were reflecting upon were planned, emergent or post-emergent. As can be seen in Table 2, almost half of the change programmes (48%) were planned; additionally, 19 (9.5%) involved external change consultants.

Table 2. Type of organizational change discussed in the reflective case studies

The Types of Change	Number of Cases
Planned	96 (48%)
Emergent	63 (31.5%)
Post-Emergent	13 (6.5%)
Planned & Emergent	28 (14%)
Total	200

Organizational Wide Change Initiatives

Of the 200 case studies, 113 related to organization wide change initiatives of which 80 were in private sector organizations and 33 in public sector organizations. Of these, 49 were international and 64 UK based organizations; and in terms of size 92 were classed as 'large-scale', 15 as 'medium scale' and 6 as 'small scale' organizations.

Triggers/Drivers of the Change Initiatives

The cases studies showed that 113 (57%) of the change initiatives were perceived to be driven by internal forces only, 13 (6%) by external factors only, and 74 (37%) by both internal and external factors.

The key internal triggers were based around; making improvements to increase efficiency and profit; for instance, simplifying work processes, realigning the business structure, reducing error rates/wastage/costs, and addressing staffing issues. The key external triggers included: addressing what the competition were doing, keeping up with the change in customer needs, addressing fall-out from fraud and public scandal (in a small number of cases), public pressure, reduction in funding, embracing new technology and growth/decline in sales.

A SWOT (strengths, weakness, opportunities and threats) analysis and STEEPLE (social, technological, economic, environmental, political, legal and ethical) analysis were used consistently by the scholar practitioners to share their views on the organization's position before the change happened. A synthesis of the key common aspects and factors revealed by the respective SWOT analyses are shown in Table 3.

The first 2 aspects of the SWOT (SW) show the internal aspects and the second part (OT) summarises the key external factors mentioned previously and highlighted through the STEEPLE analysis. It is interesting to note that change in the law and (Government) funding was both an opportunity for

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Synthesis of the key common themes resulting from the SWOT analyses

Strengths	Weaknesses
• Employee training/employee support • Government support • Employee skills • Strong market position • Strong brand • Growing business/profitability	• Loss of staff/loss of skills • Outdated systems • Outdated technology • Low morale • Leadership • Falling sales
Opportunities	**Threats**
• Flexible employees • Restructuring • Change in laws • Change in (Government) funding • Change in customers • New markets • New technology • Save wastage/save money	• New competitors • Exchange rates • Funding cuts • Government/legal pressure • Rising costs • Declining sales • Union pressure • Weak leadership

some organizations and a threat for others; and that leadership was not mentioned as a strength in any of the 200 case studies but as a weakness and a threat.

FINDINGS

The results of addressing the three research questions are as follows:

Results Addressing RQ 1: What is the 'reality' of change programme failure compared to the 70% failure rate 'rhetoric'?

At the end of the case study essay, each case study writer was asked to declare whether they thought the change programme that they had reflected on was successful or not. It was not made clear how success should be decided; it was left to their own personal perceptions. The results of their decisions are below;

- **Successful Change:** 145 (72.5%)
- **Unsuccessful Change:** 55 (27.5%)

This table shows that there was no significant difference between success or failure between the two sectors, suggesting that change in either sector is likely to be as successful or as unsuccessful as each

Table 4. Breakdown of the number of successful and unsuccessful case studies by sector

Sector	Successful Cases	Unsuccessful Cases	Total
Private	89 (72%)	35 (28%)	124
Public	56 (73.5%)	20 (26.5%)	76
Total	145	55	200

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

other. This is counter to the suggestion earlier that successful change is more difficult to achieve in the public sector. However, the most interesting statistic here is that the 72.5% success rate is completely counter to the notion that 70% of all change programmes fail.

A variety of key models were used by the scholar practitioners to describe, reflect on and critique the change programmes to decide if the change programme was successful or not, including Kanter et al., (1992), Kotter (1995; 2014), Kubler-Ross (1973), Lewin (1947) and Luecke (2003). All lecturers presented all these models. Therefore, it was not surprising that they were chosen regularly to be used within the case study reflections, but by far the most used was Kotter's model.

It has already been established that Kotter's work is much cited (Todnem By et al., 2016) and is one of the most popular change management frameworks. This model was discussed in 100% of all the case studies, but this is not a surprise as there was an expectation, written into the assessment briefs, to help secure that this happened. This finding was not of interest in itself; but rather it was how the various stages/phases of the model were applied or not that gave insights. Interestingly, only 12.5% (n=25) of the case studies mentioned all 8 phases of Kotter's model having been applied. If this statistic was the way to measure the success of change programmes, then it would suggest an 87.5% failure rate but this contrasts sharply against the reported 72.5% success rate.

Here are several quotes taken directly from some of the successful organizational change case studies which refer to the importance of using the Kotter framework.

With these case study writers suggesting that applying Kotter ensured success;

Kotter's stages were well applied by the company. Overall implementation of change was relatively effective with minimal collateral damage. Due to the size and investment of the transfer, there was little opportunity for reversal and it was clearly re-frozen once implemented. The change agents were well selected and key to the project's success. (MBA/international student/private sector/successful change)

Kotter eight step model of successful change within the organization has significantly helped in avoiding the mistake that may likely frustrate the change and make it unrealistic. Also, transformational leaders in the organization that has contributed to the vision of moving the organization forward has help make the change successful. (MBA/international student/public sector/successful change)

Another recognising that among others, Kotter's model was most applicable;

There is no single model useful to the change process. Amongst the models of change, Kotter's 8 stages model has been more applicable to the organizational change. (HR/home student/public sector/successful change).

Another case study writer reflected they will use Kotter now to consolidate current changes;

It is evident that the initial stages of the merger failed to consider and address Kotter's eight stage process. There is an opportunity now to ensure that each stage is fully considered and appropriately addressed before beginning the next round of changes. The few short-term wins and gains that have been generated but remain hidden, critically need to be shared or communicated. (HR/home student/public sector/successful change.)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Here is a quote taken directly from one of the unsuccessful organizational change case studies which refers to the importance of using the Kotter framework;

The change would have been successful if the applied stages of Kotter's model were followed step by step. (HR/home student/private sector/unsuccessful change).

And another unsuccessful case study which suggests even Kotter was not useful;

None of the change models were applicable in describing the change process that the organization undertook. (HR/international student/private sector/unsuccessful change).

Results Addressing RQ 2: What are the most frequently used leadership styles in times of change?

Leadership of the change was recorded both at the higher, senior levels and at the lower, junior manager levels. Some different terms were used to describe the types of leadership and management involved in the change process, but these were categorised as either autocratic, democratic/participative or laissez-faire/delegative as indicated in Table 5.

Table 5. Different leadership styles mentioned in the case studies

Leadership Style	Higher/Senior Levels of Leadership	Lower/Junior Levels of Leadership/ Management
Autocratic	55	37
Democratic/participative	111	112
Laissez-faire/delegative	33	45
Unclear	1	6
Total	200	200

As can be seen, democratic/participative leadership is the predominant style of leadership mentioned and is twice as prevalent as the autocratic style or a laissez-faire/delegative style of leadership. Interestingly, in 111 of the case studies a transformational leadership style (Bass & Riggio, 2006) was mentioned, with 87% (n=98) of these organizations manifesting transformational leadership at the top management level, and the same leadership style dominant further down into the lower levels of leadership/management. As the majority of change initiatives discussed in these case studies were considered to be successful, the findings suggest that a transformational leadership approach is more likely to lead to a successful change. This is not a new insight, but it helps to reaffirm what we already know.

However, higher level managers in 27.5% (n=55) of the case study organizations were using the autocratic/top down style and 16.5% (n=33) using the laissez-faire/delegative type approach too, thus accounting for 44% (n=88) of all the case studies. This suggests that change can be successful whilst using these different leadership styles too.

Interestingly, reviewing the leadership in unsuccessful cases reveals that in approximately half of these cases (26 out of 55) the higher levels of management involved in managing the change were using

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a transformational leadership style, and over half (30 out of 55) at the lower levels of management were also using a transformational style of leadership. Again this shows a connection between the transformational approach being mirrored between the higher and lower levels of management.

It is interesting to note that the findings of this study do not support the widely held assumption that a more autocratic style of leadership in times of change is partly responsible for the lack of success of change programmes.

Results Addressing RQ 3: What are the key factors that enable or inhibit the effective application of change management models and the achievement of successful change?

Each scholar-practitioner was asked to reflect at the end of their case study write up about the key issues affecting their change programmes and the lessons they had learnt in relation to what should be done more of/less of for future change programmes.

Table 6. Issues mentioned in the case studies and the related lessons learnt

Hindering Factors Mentioned (With the Most Mentioned at the Top, Highlighted in Bold)	Lessons Learnt (With the Most Mentioned at the Top, Highlighted in Bold)
• **Lack of communication** • **Ineffective leadership** • **Employee resistance** • Customer satisfaction • Loss of skilled staff • IT • Legislation • Unions • Budget • Bad publicity • Pace of change	• **Need for effective communication 4)** • **Need for effective leadership 5)** • **Importance of team work 2)** • **Need to involve employees and managers 3)** • Importance of culture • Involve other stakeholders more • Need resources • Stick to a systematic approach/model

Note: The numbers in brackets relate to Kotter's 8 phases of change

Those highlighted in bold were the most mentioned throughout the 200 case studies. The lack of communication was overwhelmingly the biggest hindering factor and the biggest learning referred to at the end within both successful and unsuccessful cases. This finding again is not new but reiterates the importance of communicating change. The need for a more effective leadership style was also considered to be one of the biggest hindering factors, and is also reflected in lessons learnt. Employee resistance was also mentioned as a big issue together with recognition in the lessons learnt, that employees and other key stakeholders needed to be involved and working together for future change programme success. Interestingly it was also mentioned that managers needed to be involved more too; in the decision making and towards encouraging the employees to be more engaged too. Perhaps this helps to advocate the need for a more distributed or relational leadership approach (Cannatelli et al., 2017; Harris & DeFlaminis, 2016) whereby a more shared, team working type approach would better encourage the involvement and engagement of others (Spillane, 2006).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The following are a selection of quotes taken from some of the successful and unsuccessful organizational change case studies which refer to the top 3 themes in respect of leadership, communication and employee involvement;

Need for Effective Communication

These quotes demonstrate the importance of communication and the issues that occur if it is not done or not handled effectively.

This quote suggests progress will be hampered;

Communication is important, and without it, there will be obstacles which will cause disruption and either stop the transition, or severely hamper progress. Change required careful planning, support, and cooperation from all stakeholders. (MBA/home student/private sector/successful change)

That mistrust can develop;

Although the change process was successful through the application of the step by step stages of Kotter's model, communication in the process was very poor. This led to trust issues amongst employee, leading to a dissatisfaction of the change program. (HR/home student/public sector/successful change)

And a lack of confidence ensues;

Communication induces confidence in the team. (Health/international student/public sector/successful change)

Need for Effective Leadership

These quotes show the need for an effective leadership style that considers and includes all stakeholders, particularly employees, so they can all get involved and work together, and not against each other; again perhaps advocating the need for a more distributed leadership type approach.

Successful change management requires a large commitment from executives and senior managers, whether the change is occurring in a department or in a complete organization. (MBA/home student/public sector/successful change)

Factors such as effective management, strong leadership, structure in the organization, and closely considering the demands of stakeholders are important to the process of change. (MBA/international student/public sector/unsuccessful change)

It is interesting to note that in the next 2 quotes, leaders did not actively involve the employees, by taking a more autocratic leadership approach, but the change was still considered to have been successful;

While final consumers or end users were considered when executing change, the role of other stakeholders such as the employees was not considered. The change leadership process was autocratic and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

employees would have worked better towards the change if it was more democratic. (MBA/home student/private sector/successful change).

Resistance to change from employees, lack of employees involvement in the change process (i.e. participative leadership was not applied). (Health/international student/private sector/successful change)

Importance of Team Work/Employee Involvement

Following on from comments made about leaders not involving or communicating well enough to the employees, there were some specific comments made about the lack of involvement of employees. Lack of consideration of the impact;

There was an overemphasis on achieving change and success with little consideration of the impact on employees. (HR/home student/private sector/unsuccessful change)

And the (differing) perspectives of employees;

The main lesson learnt from this particular restructure was that proper and thorough consideration was not given to the cultural and social perspective of the employees. (HR/home student/private sector/successful change)

This case study writer suggested a culture of togetherness was needed;

Importance of team work…It is important for managers to create a safe environment for honest, straightforward dialogue. We needed a culture of togetherness and well-being, together with a captivating vision. (MBA/international student/private sector/successful change)

These quotes help to confirm that even in successful change, the needs of the employees were not always recognised or met, and that a more 'distributed' or shared approach would create a more productive change environment.

Here is a helpful case study quote which sums up all of the 3 essential critical success factors discussed;

The organization has learned many valuable lessons from the change efforts that clear communication is vital, a hierarchical leadership is not suitable in the process, and employee engagement is vital into the success of the change. (Health/home student/private sector/successful change)

It is interesting to note that other factors, for instance; employee resistance, loss of skilled staff, unions and bad publicity were also mentioned as hindering factors; perhaps if the leaders and managers had involved employees more and the communication had been effective too, some of these secondary issues may well have been reduced.

Also, the importance of culture has been mentioned as a lesson learnt. There was little mentioned in the majority of the organizational case studies about organizational culture, so it has not been possible to make any generalisations about more or less effective organizational cultures within these change programmes, but this is certainly an area for further research.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

DISCUSSION

A most surprising finding from our meta-analysis of the 200 reflective case studies was that the majority (72.5%) of the change initiatives was considered to be successful, which is counter to the widely held assumption and belief that 70% of all change programmes fail (Balogun & Hailey, 2004; Beer & Nohria, 2000; Bielinska-Kwapisz, 2014; Burnes & Jackson, 2011; Kotter, 2008). This finding supports Hughes (2001) who suggests reality may be somewhat different from the rhetoric and that there is a lack of empirical evidence to support the 70% failure rate. Our large empirical study suggests that the reality of organizational change programme success, as perceived by scholar-practitioners, is different to the common discourse on this issue.

The key criticism from Hughes (2011) is that there is a lack of clarity about what is meant by failure and certainly (unhelpfully) for this study, no clarity was given about what would constitute failure or success. The scholar practitioners made up their own minds based on their own experiences and the information they had discussed and debated in their reflective case studies. As instructed by the lecturers, all 200 case studies referred to Kotter's 8 phase framework, as well as to other models, but not to the extent to which Kotter's framework had been applied. The 100% mention of Kotter is not surprising as reference to Kotter was an expectation in the assessment. But what was a surprise was that, even though for many the full Kotter model had not been followed, the change was still considered to have been successful. This suggests that using or not (fully) using the models does not necessarily determine change success.

It is possible that individual perceptions of how successful or not the change programme may have been skewed by their involvement in the change and as such, the impact of the outcomes to them personally. Perhaps as managers and HR practitioners they are more likely to have been heavily involved in the change, maybe even led the change, so perhaps they are more likely to have perceived the change positively, due to the effort they put into managing or leading it towards a successful end (Doyle, 2001; Hughes, 2011.) Or perhaps as this was part of an assessment, did these scholar practitioners feel pressure to make out the change was more successful than it was, in the hope of a more favourable mark? This may have been their initial perception, but there was a strong steer from all the lecturers for both modules and with all cohorts that the change programme which they chose to discuss was not expected to be wholly successful. The consistent steer from within the classroom was to be as critical as possible.

The application of Kotter's 8 phases was mentioned within all the case studies but not necessarily in the order it has been prescribed, nor it seems does it predict success. Some successful case studies did not apply any of Kotter's model, and others that did were not always successful. It is also interesting to note that of the 146 organizations that did apply Kotter's 8 phases, they did not always do this in the order that Kotter prescribes. Yet, typically Kotter's model and other change models prescribe various stages or phases that are to be carried out in sequential order. This finding suggests that using Kotter's model or other established change models may not necessarily lead to success. Hughes (2016) suggests that rarely is leadership and change 'rational, linear and unambiguous' (p.9).

One of the case study writers sums this up well;

Whilst change models can provide useful frameworks for understanding and approaching change, no model, regardless of its standing and reputation, will be fully effective and is likely to fail (to be effective) if it does not meet an organization's needs. (HR/home student/Public sector/successful change)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

This perhaps reflects the need for models to be seen as tools to be used in a fluid and flexible way, which is consistent with Kotter's (2014) updated thinking towards a more continuous model of concurrent steps. In reality, change programmes may well be planned in a particular way from the outset, but very often do not play out in the order they may have hoped. Perhaps this fits with the notion of a more blended or holistic approach that works better (Burnes, 2014)? Clearly, some organizations did not follow the steps within the models at all, or when they did they did not follow them step by step, but the scholar practitioners still considered their change programmes to be successful.

As can be seen in Table 5, the most discussed leadership style was a democratic/participative approach (Bass & Riggio, 2006; Hopen, 2015) at both senior and lower management/leadership levels, which suggests this style could be a predictor of success.

This is an interesting finding; but because leadership was perceived to be a weakness, a threat, and a hindering factor (see Table 3 & 6), it suggests a transformational leadership style is not always effective in times of change. As revealed by this study, other change programmes have been successful where an autocratic and a laissez-faire style was used. These findings potentially show that there is not one leadership style that always has a positive effect on the outcomes of the change programme, and that perhaps a more mixed approach is needed. These findings indicate that different types of leadership style are required at different stages of the change programme. This fits with Grint's (2000) suggestion that it is not possible to create a leadership formula that works and applies to every change situation, it very much depends on a number of factors.

The biggest factors which were perceived to hinder change were: lack of communication, lack of effective leadership and employee resistance. The key critical success factors were: effective communication, effective leadership and team working, and employee involvement.

Comparison of Findings Against Common Insights and Lessons Identified by Hamlin (2001)

Hamlin (2001) created 10 common insights and lessons (CILs) learnt from a multiple cross-case comparative analysis of 18 OCD reflective case histories published in Hamlin, Keep and Ash (2001). These 10 CILs have been used by the co-editors of this handbook for conducting a *multiple cross-case comparative analysis* (MCCCA) of all the reflective case histories contributed to Volume II (see chapter "53")"

Using the same CILs, it was decided to explore the extent to which the 200 case studies examined in this chapter contain the same 'key factors that enable successful change.'

The results of the comparison identified in the 200 reflective case studies that lend empirical support for Hamlin's (2001) 10 CILs are shown in Table 7. As can be seen, all 10 CILs are supported to a greater or lesser extent. This provides additional validation to that resulting from the MCCCA of Section III reflective case histories reported in Chapter 53 in Volume II.

Limitations

We acknowledge six limitations to this study. First, all the scholar practitioner (case study) writers involved were taught by different lecturers on different postgraduate programmes. This may have meant that certain lectures may have put certain emphasis on certain models or the application of certain models which could have created different emphasis in the write up.

Table 7. Showing the 10 factors most discussed when reflecting on change

Common Insights and Lessons (CILs) Identified by Hamlin (2001)	No. of Organizations Lending Support
1. Communicating with all stakeholders the purpose of securing common ownership, commitment and involvement.	85 (42.5%)
2. Securing the active commitment, involvement, and participation of senior to middle managers is pivotal	39 (14.5%)
3. Securing top management support.	29 (14.5%)
4. Being clear, consistent and open with regard to what you are seeking to achieve, setting clear strategic objectives and sharing the vision.	28 (14%)
5. Recognising and addressing the real problems or root causes of change agency problems, including the cultural dimensions	26 (13%)
6. Giving enough time for the OCD program to take root and succeed	13 (6.5%)
7. Recognising the relevant contributions that the HR function can make and the strategic role it can play in bringing about transformational change.	28 (14%)
8. The role of learning in the change management process and the need for a no-blame culture	23 (11.5%)
9. The importance of being reflective as a change agent	6 (3%)
10. The value of conducting internal research as part of the change agency	15 (7.5%)

Second, the teaching materials, supporting documentation and assessment brief were the same to ensure as much as possible consistency in delivery. Although this encouraged case study writers to understand the theory/models in the same way, it tended not to allow for additional models to be introduced or a more innovative approach to be taken for the write up. Hence, what may have been gained with having the consistency that allowed clearer comparison may not have encouraged a more creative reflective analysis.

Third, there may have been some misunderstanding of the models, frameworks and terms used (e.g. transformational is not just about transforming/changing something) or indeed the success or otherwise of the change programmes by the student case study writers, even though this may have been minimised by using only those case studies that achieved a 50% pass rate or higher.

Fourth, there is the potential for participant error or bias (Robson, 2011) as these case study writers were discussing the organizations in which they worked; and because of organizational loyalty they may not have wanted to highlight too many ‘failure’ issues to avoid any incriminations later. Furthermore, if they had been heavily involved with the change (e.g. as a designated change agent), they could have perceived the initiative to be more successful than others in their organization.

Fifth, there were no reflective case studies on the management of change within not-for-profit/third sector organizations which means the findings have yet to be generalised to that organizational sector.

Sixth, from a methodological point of view, it would have been helpful to have had some universally agreed upon criteria to determine success or failure so that direct comparisons could be made.

CONCLUSION

The purpose of this chapter was to highlight and share insights and learning from real world reflective case studies from the single viewpoint of HR, Health and Management scholar-practitioners and to look for experiences held in common across these differing organizational change programmes.

As a result of our study we have found clear commonalities and key differences in their perceptions and experiences of change.

Of greatest surprise is the absence of identified empirical evidence to lend support for the widely held belief that over 70% of all organizational change programmes fail. The most significant finding is that change models and leadership styles differ depending on context and that effective leadership, effective communication, and effective team working as well as employee engagement are key factors that enable successful change.

We conclude with some thoughts for evidence-based OCD practitioners:

1. Don't believe everything you read in popular change management books! Our findings suggest that 'organizational failure' depends on who you ask, and that change models are meant to be fluid and not followed rigidly step by step.
2. A flexible organizational change approach is needed: The study findings suggest prescriptive change models are not always fit for purpose as change certainly does not always fit linear, rational, unambiguous models. Indeed, they tend to support the 'one size does not fit all' approach to change as discussed by Burnes (2014).
3. Communication, leadership and team working will enable change: Our findings suggest that those organizations with ongoing communication and a more open and flexible leadership style, which readily involves others, are more likely to achieve successful change.

Our sense is that we knew this already as evidence-based OCD practitioners, we just needed the evidence to prove it…

Chapter 72
Resistance to Organizational Change in Academia:
A Case Study From Palestine Investigating the Under-Reflected Role of Change Agents

Devi Akella
Albany State University, USA

Grace Khoury
Birzeit Univeristy, Palestine

ABSTRACT

Resistance to change happens to be a phenomenon in which both the change agents and change recipients are equally responsible for all forms of resistance. Resistance and its various forms are an outcome of the change agents' observations and their interpretations of the conversations, behavior, and reactions of the change recipients. This chapter uses auto-ethnographic reflexive narratives of two change agents involved in the self-assessment process at a college planning to seek US-based business program accreditation to make sense of the change process. The purpose of this chapter is to emphasize the under-reflected role of the change agents and how they influence and affect the behavior of change recipients and thereby contribute towards employee resistance. The chapter also emphasizes the crucial role of reflection and introspection in the sensemaking activities of the change agents in the entire change initiative and thereby adds evidence-based organizational change and development initiatives in an academic setting where research is limited.

INTRODUCTION

Organizational change has become inevitable over the past few years. With globalization, competition, strategic alignment, introduction of new management theories and models, organizations and their employees are continuously being exposed to change in a variety of ways. Inspite of careful research and planning by organizational leaders, change initiatives are a major source of concern. Usually organizational change and development (OCD) efforts and interventions have a tendency to produce failure (Sorge & van Witteloostuijn, 2004). Resistance to change has been cited as the most common reason for the failure of majority change initiatives (Erwin & Garman, 2009). However, resistance to a large extent has been seen as a "psychological phenomenon located over there in the change recipients" (Anderson, 2016; Ford, Ford & D'Amelio, 2008, p.370) and "objectified as a socio-psychological phenomenon" (Dent & Goldberg, 1999 as cited in Ijaz & Vitalist, 2011, p.119).

This has minimized the development of OCD tools and methodologies to increase the success of change initiatives. Most of the efforts remain concentrated on showing change recipients "the error of their ways by dealing with the misunderstandings, fears and apprehensions believed to underlie their resistance" (Ford et al., 2008, p.370; Kulkarni, 2016), resulting in a lack of 'evidence based' organization development tools which assist change agents in repairing trust (Tomlinson, Dineen & Lewicki, 2004), resolve issues of injustice (Folger & Skarlicki, 1999) and restore credibility (Kouzes & Posner, 1993).

Therefore, to portray a more complete picture, resistance to organizational change should be reconstructed as a phenomenon where both the change agents and change recipients are equally responsible for its occurrence. Employees' resistance to change is observed, deconstructed, made sense of and given appropriate meanings by the change agents (Ford et al., 2008). Employees' actions, conversations and reactions are behavioral triggers which change agents make sense of and label as resistance. Studies which can "engage all forces of change, all contributions to change i.e., recipient action, agent sensemaking and organizational background and the dynamics of relationship" (Ford et al., 2008, p. 362), allow a more balanced picture of the entire change process. Studies which go beyond the "one-sided change agent centric view" (Ford et al., 2008, p.362; Kulkarni, 2016) by critically reflecting on the contributory role of the change agents and the agent-recipient relationships (Dent & Goldberg, 1999, Ford et al., 2008) are few. Further, "reflexivity has been identified as a useful method to support change agents" and assist them in understanding their role in the entire change process but "there is little to no clarity [on] how it should be executed" (Ostentoski, 2015, p.41).

The entire process constituted action, reflection and new action (Schon, 1987). Change agents reflect, consciously explore using their personal knowledge and experience to critique their actions, seek relevant evidence, learn and then apply this new knowledge to rectify the change resistant environment. Reflection and introspection may appear to be a time consuming, abstract and complex process but however it is also a rich experience. Reflection allows questioning of current evidence-based practices and their subsequent modification to increase the overall success of the entire change initiative (Thompson and Burns, 2008).

The focus of the chapter is on investigating the under-reflected role of the change agents in the entire change process and how they could contribute towards the change recipients' resistance practices. Also, how change agents by reflecting on their actions and behaviors and its effect on change recipients can minimize resistance. The chapter explores issues such as the various forms of employees' resistance which might occur within a college functioning under the umbrella of a university, planning to seek business accreditation offered by an American professional organization within the next few years. How do

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

change recipients react? How do the change agents feel and deal with these outward behavioral displays? How do the change recipients interact with the change agents? The chapter uses two auto-ethnographic reflexive narratives of change agents to demonstrate how their actions and inactions led to employee resistance and hindered the change process. However, through reflection and introspection during the entire change process the change agents were able to overcome this resistance and turn it into a force of change instead. To allow a more complete image of the change process to emerge, multiple versions of the same change process are used. An attempt was made to understand the entire change process from the perspectives of two change agents, that of the external consultant (i.e., the accreditation specialist) and the internal consultant (i.e., college Dean).

BACKGROUND

Organizational change and resistance to change has been a topic of research for decades. However, to a large extent views pertaining to resistance to change are predominantly one-sided, favoring change agents and their sponsors (Anderson, 2016; Dent & Goldberg, 1999; Ford et al., 2008; King & Anderson, 1995; Kulkarni, 2016; Meston & King, 1996). Resistance studies have presumed that change agents are "doing the right and proper things" and are the "undeserving victims" of the "irrational and dysfunctional responses of the change recipients" (Ford et al., 2008, p.362). This "change agent-centric" view perceives resistance as the negative and opposing actions of the change recipients as observed by the change agents (Ford et al., 2008, p.362). However, change agents are portrayed as outsiders in this entire change process instead of as active participants who interact with change environments and influence the behavior and actions of the change recipients. Change agents interpret the behaviors, actions and communications of the change recipients. And resistance is the aftermath of these interactions and the relationships between change agents and recipients. Change agents, in fact "contribute to the occurrence of resistance through their own actions and inactions and that resistance can be a resource for change" (Ford et al., 2008, p.362). Change agent sensemaking is a "key factor in organizational reconfiguration" (Tucker, Hendy & Barlow, 2015, p.1047) which allows rearranging the sequence of events as they may have occurred during the change process.

Employee resistance is not a phenomenon that exists independent of the change agents. On the contrary both change agents and the change recipients together make sense of the events, conversations and decisions which surround the change process with change agents trying to sensemake --"how will this get accomplished?" and change recipients trying to sensemake--"what will happen to me?" (Gioia, Thomas, Clark & Chittipeddi, 1994 as cited in Ford et al, 2008, p.363). Sensemaking involves seeking information, ascribing meanings, understanding behaviors and conversations and acting on these interpretations (Balogun & Johnson, 2004; Gioia & Chittipeddi, 1991; Maitlis & Sonenshein, 2010; Mills, Thurlow & Mills, 2010; Tucker et al., 2015; Weick, 1995; Weick, Sutcliffe & Obstfeld, 2005). And in organizations undergoing a change process it is not possible for a change agent to sensemake in a "reifying and objectifying" manner "as if it exists independent of them as if they had nothing to do with its creation" (Berger & Luckmann, 1966 as cited in Ford et al., 2008, p.64). Sensemaking would involve more than just reporting and interpreting the change process. It would also involve influencing and reacting to the organizational events taking place (Kuntz & Gomes, 2012; Mills, Thurlow & Mills, 2010; Weick, 1995; Weick, Sutcliffe & Obstfeld, 2005).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The entire change process is an interactive systemic phenomenon (Lewin, 1952) where the actions and reactions of the change recipient and change agent equally matter. Therefore, change agents along with change recipients are responsible for resistance and its various forms (Kuntz & Gomes, 2012). Change agents contribute to employee resistance through their own faulty sensemaking, violation of employee trust, communication breakdowns and misrepresentation of facts (Ford et al., 2008). Change agents influence employees' reactions by breaking agreements, failing to restore loss of trust, knowing or unknowingly reneging on promises (Andersson, 1996; Cobb, Wooten & Folger, 1995; Reichers, Wanous & Austin, 1997), thereby creating situations of resistance.

The role of change agents is to understand the entire organization and its culture and working environments, to design appropriate change strategies and regularly assess the effectiveness of these strategies (Hamlin, Keep, & Ash, 2001). Change agents both internal and external are faced with the challenge of supporting change recipients, understanding the organization and its members, their reactions and adapt their change initiatives accordingly (Hamlin & Davies, 2001; Handy, 1989). An important responsibility of the change agents in this entire change process is to critically reflect on the effectiveness of the change strategies and keep modifying them as needed to increase the overall effectiveness of the entire change process (Hamlin, Keep & Ash, 2001). Also, as argued in Chapter 2 of this book, critical reflection and introspection provide new insights on the OCD strategies chosen by the change agents and allows replacing or modifying those which are not working, thereby resulting in emergence of new strategies based on the lessons learned by the change agents. Therefore, critical reflection should become an integral aspect of all evidence-based practices used by change agents in all OCD programs.

Effective change agents are those who are "critically reflective, research-informed/evidence-based practitioners" (Hamlin, 2002; 2007). Change agents are to a large extent responsible for creating employee readiness to change and their acceptance to organizational changes (Barrett, Thomas & Hocevar, 1995; Boje, 1995; Czarniawska & Sevon, 1996; Fairclough, 1992; Ford, 1999). They need to understand the organization, its culture, structure, member roles and expectations and then interpret the entire change process within these parameters (Hamlin & Davies, 2001; Johnson, 1992).

Change agents who repair damaged relationships to restore trust during the change process are less likely to face resistance (Ford et al., 2008). Similarly, those agents who are cynical and critical, tend to lower employee motivation and commitments (Andersson, 1996; Dean, Brandes & Dharwadkar, 1998; Reichers et al., 1997). In the same manner, change agents can also be responsible for the occurrence of resistance through communications failures. Communication happens to be an important aspect of all organizational changes. Recipients overcome their doubts and fears through questioning, evaluating and clarifying their doubts. If the change agent misses this opportunity it increases the chances of recipients resisting change at a future date (Knowles & Linn, 2004; McGuire, 1964; McGuire & Papageorgis, 1961).

Also, sometimes change agents may unknowingly mislead the change recipients (DePaulo, Kashy, Kirkendol & Wyer, 1996) during negotiations and discussions. This could create a climate of optimism in the beginning which could prove to be misleading as the time unfolds resulting in feelings of violation, distrust and injustice (Folger & Skarlicki, 1999; Tomlinson et al., 2004) undermining the credibility of the change process. This increases the chances of resistance as well. Change agents need to be truthful, realistic and accurate about the change process and the need for it. Realistic and authentic previews are encouraged (Wanous, 1992).

Change is dependent on mobilizing employee support through talk and conversations with the employees (Ford et al., 2008). When change agents ignore this aspect it invariably leads to resistance (Ashkenas & Jick, 1992). Sometimes change agents themselves may be resistant to new ideas, critical

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

views, and recommendations. They may be defensive, unreceptive and discourage dialogue and two-way communication with the employees (Ford et al., 2008). The outcome of this defensiveness could be escalation in employee resistance (Powell & Posner, 1978).

Finally, employee resistance is not always dysfunctional in nature. In fact, it could assist the change agents in their change endeavors (Anderson, 2016; Ford et al., 2008). Change recipients' reactions and criticisms could lead to further reflection and introspection prior to implementation of the change initiatives (Knowles & Linn, 2004). Talking in a negative manner, has been labelled as resistance (Caruth, Middlebrook & Folger, 1985). However, it also provides an opportunity for the employees and the change agents to participate in conversations, leading to clarifications, exchange of views and perspectives and subsequent acceptance of the change process (Barrett, Thomas & Hocevar, 1995). People usually resist change because of fears, anxieties and inner worries. Change agents instead of considering these attitudes as resistance, should encourage employees to bring these feelings out in the open. Open communication in the form of voicing and listening to these complaints, fears and comments would allow change agent feedback and employee engagement (Amason, 1996; Anderson, 2016; Schweiger, Sandberg & Rechner, 1989).

This chapter will reconstruct employee resistance from the sensemaking perspective of the change agents. It will demonstrate how change agents could themselves be responsible for resistance through their own actions, reactions and conversations. Furthermore, how becoming aware of their role in the occurrence of resistant forces could convert that resistance into resources of change. This increases the chances of an effective change initiative.

MAIN FOCUS OF THE CHAPTER

This chapter investigates the under reflected role of change agents in the change process and examines how change agents themselves could contribute towards the overall resistance practices taking place within an organization during the entire change process. To allow maximum success in any form of change program, i.e., to minimize the occurrence of resistance, the change agent combines action research with sensemaking and reflection. Sensemaking allows the change agent to interpret and deconstruct the past sequence of events, s/he would then be able to reflect on them and take appropriate action.

Sensemaking as discussed earlier "is the discursive process of constructing and interpreting the social world" (Gephart, 1993, p. 1485). It revolves around the process of studying and interpreting how the actions of the actors influence and give meaning to the reality or external sequence of events. Sensemaking is primarily a process "grounded in identity construction, retrospection…ongoing…focused on and by extracted cues and driven by plausibility rather than accuracy" (Weick, 1995, p.17). As Rouleau (2005, p. 1415) further clarifies sensemaking is how managers "understand, interpret and create sense for themselves based on the information surrounding strategic change". It is a highly retrospective and prospective thinking process involved in constructing reality where the emphasis is laid on making sense of past events to influence the sequence of future events. In other words, sensemaking "is a process" (Balogun & Johnson, 2004; Cornelissen, 2012; Gephart, Topal & Zhang, 2010; Weick, 1995 as cited in Maitlis & Christianson, 2014, p. 66), "is a recurring cycle" (Louis, 1980 as cited in Maitlis & Christianson, 2014, p. 66) and "unfolds as a sequence" (Weick et al., 2005 as cited in Maitlis & Christianson, 2014, p. 66). Members confront events, issues and actions which they interpret and explain in the context of their environments using their past experiences and knowledge (Weick, 1995). The crux of sensemak-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing is on its emphasis on "retrospective interpretation of the actual event" (Giogia et al., 1994, p. 623) to create a future perfect situation.

If the change agent adopts reflexivity when making sense of the organizational events, it provides more clarity to the events, roles and conversations. Reflexivity involves reflecting and understanding one's own personal feelings, emotions, behaviors, making it possible to locate oneself in research study and theory. Reflexivity means acknowledging the role of the researcher in the creation and interpretation of research data (Dubois, 1983; Harding, 1992; Maynard, 1994; Stanley & Wise, 1983; 1993).

While action research is the process of gathering data about groups, then intervene in the change process and evaluate the overall results of the intervention. "It seeks to bring together action and reflection, theory and practice, in participation with others, in the pursuit of practical solutions to issues of pressing concern to people…" (Reason & Bradbury, 2001, p. 1). Here there is a combination of both action and research in resolving current problems existing in the organization (Anderson, 2016) [see Table 1].

Table 1. Action research perspective

Action Frame of Reference Perspective
Organization: Consists of a network of actively constructed meanings.
Analysis: The focus of analysis is on the interactions between people and groups within organizations to identify the apparent and/or latent meaning of these interactions from the point of view of the interacting participants in order to understand the rules which govern organizational behavior.
Change: The aim is to change the rules which inform and shape behavior so as to change and transform the meaning of the organization for the individual.

Note: Adapted from Hamlin and Davies (2001, pp. 44-45).

Some of the established methods to study sensemaking and action research constitute case studies, ethnographies, and textual analysis and also qualitative methods like interviews, observations and secondary sources (Gephart, 1993; Gioia & Chittipeddi, 1991; Gioia et al., 1994; Weick, 1988; 1993). Methods which record first-hand accounts of the entire sensemaking process and experiences are also highly useful. Auto-ethnography is a data collection method which allows a structured self-examination by the change agent and his/her role as a change agent when leading the change process. In fact, it has been accepted as a legitimate method to make sense of past experiences (Boyle & Parry, 2007). Auto-ethnography possesses the ability to show "how the personal struggles of an individual are linked to the cultural and social meanings" (Mischenko, 2005 as cited in Osentoskli, 2015, p.52). While Haynes (2011) comments that auto-ethnography allows examination of self both from the theoretical stance and as a contributory factor within the social phenomenon. "Auto-ethnographical material provides a valuable resource for exploring, presenting and representing the self, encapsulates a personal, intuitive knowledge, deriving from a knowing subject situated in a specific social context" (Haynes, 2011, p. 134). It encompasses reflection on outward observation (Parry & Boyle, 2009). In fact, auto-ethnography can be effectively used to give voice to those events, situations and conversations which otherwise might have remained silent (Doloriet & Sambrook, 2012). "People seem to see past events as much more rationally ordered than current or future events, because retrospective sensemaking erases many of the casual sequences that complicate and obscure the present and future" (Starbuck & Miliken, 1988, p. 37). Sensemaking here would be concerned with picking out elements and incidents from the past and then reconnecting them to write a story "which makes present and future meaningful" (Degn, 2015, p. 1183).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Auto-ethnography inspite of its drawbacks, like becoming "too involved with the organization" (Leonard-Barton, 1990, p. 256), or lack of objectivity and biased accounts (Ellis & Bochner, 2000) "provides depth of ethnographic immersion and richness of data" (Van Maanen, 1988, p.18)**.** The authors therefore decided to choose the method of auto-ethnography. A case study in academia undergoing a change process was identified. Both the authors happened to be actively involved in the entire change process as internal and external change agents.

The authors compiled narrative accounts of their experiences of the change process in their roles as change agents. The authors recorded their observations during the entire change process within a range of pre-determined parameters consisting of organizational background, change agents' backgrounds, change agents' expectations, change agents' observations of the change environment.

The authors positioned their research study within the analytical framework of sensemaking and action research (Anderson, 2006) and auto-ethnography was used in combination with case study information consisting of document analysis and reports. In this situation, the auto-ethnographer follows a "(1) complete member researcher status (2) analytic reflexivity, (3) narrative visibility of the researcher's self (4) a dialogue with informants beyond the self and (5) a commitment to theoretical analysis" (Anderson, 2006, p. 378). The main crux of auto-ethnography however remains reflexivity (Perriton, 2001), but how it is done can be flexible dependent on the preferences of the researchers, the research topic and issues (Osentoski, 2015). The next section introduces the academic case study and the change agents and the issues they faced during the entire change process.

SENSEMAKING EMPLOYEE RESISTANCE: A CASE STUDY FROM ACADEMIA

The identified case study is a college, or Faculty of Business and Economics (FBE), planning on applying for US (United States of America) based business program accreditation in the next few years. The college is part of a larger university located in West Bank/Palestine. Palestine is part of the Arab world also known as The Occupied Palestinian Territories (OPT) which consists of two separated territories; the West Bank and Gaza. The university is a public university in Palestine. In Fall 2016, the students went on a major strike protesting, against the increase in tuition fees. Currently the students only pay 70 percent of the tuition fees and the rest is covered by the Palestinian Education Ministry and other independent donors who sponsor tuitions of needy students. The Palestinian government has been facing dwindling financial resources in the last few years and is unable to allocate the much-needed funds to universities in Palestine. The Palestinian universities lack sufficient funds, international faculty and student and faculty exchange programs are limited. The West Bank is isolated from the rest of the world due to checkpoints and other enforced security measures. As a result, Palestinian universities suffer from lack of diversity and opportunities to internationalize their curriculum and expose their students to multicultures. The Palestinian institutions are thus faced with the challenge of overcoming these problems while simultaneously ensuring their academic reputations continue to grow (Khoury & McNally, 2014). However, FBE had an advantage, it had the financial support of its student alumni and advisory board members in the form of donations, grants and

scholarships. For instance, FBE had organized various activities such as an annual career day which had been sponsored by several leading Palestinian corporations. In fact, some corporations had donated approximately $30,000 to FBE and had also sponsored a few doctoral scholars in their educational endeavors.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The college dean of FBE decided on pursuing US based business accreditation for her college. She is a well published female in her early fifties who had been working for the same institution for the past twenty-six years. She had occupied different administrative positions in the faculty as the chair of the department of business administration with two bachelor programs for two years and then as the MBA program coordinator for three terms each of two years' duration. The dean was also a member of a number of committees at a university level and the head of the steering committee for strategic planning few years ago with an emphasis on quality assurance and curriculum development.

She initiated the entire accreditation process by first inviting an official representative from the US based accreditation body to visit the faculty in September 2015. She invited faculty council members and the academic provost to attend the meeting. The representative mentioned that the University had a good reputation and that the business school might be ready for US based business accreditation. However, once the top-level management of the university heard that the faculty was planning to seek US based business accreditation, they expressed their concerns about the financial cost and the inappropriateness of the decision. The top-level management felt US based business accreditation was not as important as local Palestinian accreditation which the faculty already possessed. They also cited the example of another college within the university which had applied for US based program accreditation and it had taken them six years to receive the program accreditation. The dean was disappointed at this reaction. She felt with the university's high rankings in the Arab region, and it being the only Palestinian university currently mentioned in the QS World University rankings, US based business accreditation would prove to be a plus point for FBE. She therefore persisted in her efforts. After the university council and the president had made their views clear, the president formed a committee to discuss the pros and cons of accreditation and provide its recommendations to the university council. The committee submitted its report expressing that accreditation had more pros than cons. However, the top-level management of the university was not convinced about the need for US based business accreditation and did not want to take up unwanted additional expenses.

During this time, the dean received an email about country specific consulate scholarships, and thought it was a good idea to apply and secure a specialist who could evaluate the programs prior to applying for accreditation. The scholarship request was accepted. She invited an external consultant-an accreditation specialist- to assess the college and its readiness for US based business accreditation. The external consultant had to review the curriculum, faculty and staff, research and professional experience and suggest steps to overcome any existing limitations which might come in the way of a possible accreditation failure. The dean was interested in minimizing the risk of accreditation failure in the future. Inspite of lack of support from the top management, she was encouraged by the fact that the other college which had sought US based accreditation had managed to get accredited and she could seek financial assistance from student alumni and college advisory board members. She was confident a positive assessment by the accreditation specialist would overcome top-level management's current apprehension about seeking US based business accreditation. She was not aware at this time that the business faculty would also resist this decision during the accreditation specialist's visit.

The accreditation specialist received a grant for 42 days to visit FBE. The specialist was in her early forties and a faculty member herself at a business college in USA. This was her first visit to Palestine and the Middle East region. The purpose of her visit was to assist FBE in assessing themselves on the different quality standards of the US based business accreditation organization. As per the grant regulations she submitted a scope of work plan prior to her travel in Fall 2016. The scope of work detailed the items and deadlines to ensure work was completed within the time-period allocated. However, it was

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

not possible to strictly adhere to it because of lack of existing data and faculty's lack of cooperation in accumulating it for review purposes and for the finalization of the report.

The subsequent sub-sections analyze the narrative accounts of both the internal and external consultants (i.e., the college dean and the accreditation specialist).

Excerpts From the Sensemaking Narratives of the Change Agents

In this entire accreditation assessment process, the accreditation specialist (i.e., external change agent) and dean (i.e., internal change agent) came across numerous difficulties aside from the lack of quantitative data and evidence in the form of faculty non-cooperation, office politics and other forms of overt and covert resistance. The dean was aware of the opposition. Management at the university level did not feel the need for an US based business program accreditation and did not want to allocate the additional financial resources needed for this endeavor. Also, her faculty was not in favor of her decision to carry out US based business accreditation because they felt uneasy and anxious about its implications in terms of their job security. However, over the period of six weeks of review process things gradually improved.

The empirical data was analyzed in three phases: initial review, open coding and then development of themes. First, both the change agents' narratives were read, that of internal and external change agents to decipher commonalities and variations in their experiences as change agents. The narratives were then read again to relate observed employee resistance as reactions to change agents' behavior and conversations. The entire change process at FBE can be reconstructed as a three-stage process consisting of *action, reflection and introspection and new action*.

Action

In the last few years, the educational environment has become highly competitive due to globalization of the world economy. Universities across the world have been forced to reflect upon their quality, curriculum and schools' rankings. FBE is also facing a similar situation. The dean of FBE had realized the significance of US based business program accreditation for her college. She informed her senior management and the faculty and then subsequently invited the accreditation specialist. The entire accreditation self-assessment started with the external change agent collecting data about the faculty qualifications, business curriculum, promotion and tenure policies and advisement policies amongst a few needed items. The internal change agent informed the faculty about the arrival of the accreditation specialist and then introduced them to her on her first day of arrival. As explained in the change agents' narratives:

I first met the dean and faculty of FBE and got acclimatized to the college's environment. The entire college could be divided into the dean and her supporters, senior and older faculty members, junior faculty consisting of teaching assistants and administrative staff. I was assured of all support from the dean and her team of administrators. (External Change Agent)

…The selected specialist arrived and met with the department chairs, my assistant and all my faculty colleagues....(Internal Change Agent)

The above narratives reveal interesting insights about the college environment and its faculty members. The external change agent identified faculty members as either supporting the accreditation deci-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

sion and those against it. While the internal change agent had different views of the same situation. She considered the faculty members as her peers. People with whom she had worked with over the years and despite the differences now, were still her colleagues—*"…all my faculty colleagues…"*. This attitude, as later revealed, motivated the dean to constantly reach out to the faculty members, question them and try to make them understand her decision and its advantages.

Most of the change processes involved improving the educational quality of the business programs being offered and implementation of new learning and pedagogical standards. It is well known and reported in literature that reasons for employee resistance consist of a fear of unknown, a desire to maintain status quo and one's habits (Anderson, 2016). Change recipients therefore manifest behaviors like "push-back, not buying in, criticism, foot dragging, work around … not responding to requests in a timely manner, making critical or negative comments" (Anderson, 2016; Ford & Ford, 2010, p. 24) and other sabotaging actions. Similarly, the faculty of FBE was also anxious, nervous and uneasy about the new accreditation standards and quality requirements and how it would affect them. The faculty members of FBE were therefore against this initiative to carry out US based business accreditation. Consequently, they made their feelings apparent in different forms of actions and outward behavioral displays. They refused to cooperate with the change agents.

For instance, as recorded in the change agents' narratives:

The major issue which was noticeable from the very first day was Arabic language. All documents, programs of study, tenure and promotion policies, recruitment and orientation policies happened to be in Arabic. The MBA Director had all his program policies and goals and objectives in Arabic. His offer to get the information translated never materialized. (External Change Agent)

I asked the department chairs to assign someone from their departments to communicate and gather data from the departments for the specialist. The information requested by the specialist was not available in one place. The chairs had to request some of the information from the registrar's office, computer center, and institutional research unit. The information was requested by the chairs however there were numerous delays in obtaining the identified information…

Some faculty members did not cooperate with the chairs and did not provide them with the information they had requested like research output…. (Internal Change Agent)

The external change agent had to complete her assignment within forty-two days and was focused on that issue. She overcame the limitation of all documents being in Arabic by using Google Translate:

I finally took a faculty member's advice and used Google Translate. This helped me in gathering evidence on all academic policies and regulations. (External Change Agent)

As evident from the above narrative, some of the change recipients understood the external change agent's circumstances. They even tried to help her without openly assisting her. There also appears to be close collaboration and communication between both the external and internal change agents during the entire self-assessment process for preparation for the planned accreditation. The external change agent mentions the dean and her reactions in her narratives.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The dean was puzzled with this feedback because all documentation was always prepared in English and Arabic. (External Change Agent)

Other instances of faculty non-cooperation were also evident in the change agents' narratives. Some are open while others are subtle and insidious in nature.

Another limiting factor happened to be their online portal which housed all their syllabi, policies and advisement plans. Everything was there, the convenient answer to all inquiries—"it is on the online portal." Later at the end of the visit I finally realized that some of the information was not actually there at all. I heard comments on my last meeting like "it should have been there", "it is usually there", "really how strange it is not there!

I approached faculty members for their feedback on promotion and tenure policies, hiring policies and orientation processes in place. During these small meetings consisting of the specialist and 2-3 faculty members, I was told how the college was not ready for accreditation, the faculty was not qualified, none of the processes were in place, there was no need for accreditation—"we already have Palestinian accreditation", "the dean is always trying to enhance the quality of our college", "there is no need to be international, we are not seeking international students…".

In spite of deadlines and time schedules, there were always delays. In fact, information was submitted to me even after the report was submitted. Data submitted was not consistent across the entire college as well. Some departments submitted others did not. The person identified as data point, did not submit all the required information. He in fact jocularly remarked to me "I might give it to you in the last week what you had been waiting for the entire six weeks". (External Change Agent)

"in fact, one department chair had commented "we are working on too many requirements all at the same time" while another department chair had complained "the information is in Arabic and we don't have time to translate it to English." One faculty member mentioned that if the accreditation is obtained "it would be costly to maintain." A chair who was appointed just before the specialist arrived did not know where to obtain information from and asked, "how can I obtain information about the department students' accomplishments?" (Internal Change Agent)

There is also evidence in the form of some snide and cynical remarks to the external change agent. Unlike the internal change agent, the external change agent is an outsider, at their college for a short period of time. The overall impression was, obstructing her progress on the self-assessment review process would arrest the decision to seek US based business accreditation.

"Another faculty member accosted me on the way to the restroom and informed me "that she had not submitted her excel spreadsheet along with the rest of her department. I have not kept regular record of what I do. Sorry." Some others cheerfully chirped in as well, after giving a friendly wave or handshake "I have not submitted yet. So, busy teaching." I was also encouraged to visit tourist places, not come to campus every day and just give a good report and leave." (External Change Agent)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The change agents constantly sought faculty support during the entire self-assessment process in preparation to seek US based business program accreditation at a later date. They talked with them, discussed with them, and explained the documentation required and the need for it etc.

In some situations, the data was not formatted properly. For instance, one department head listed all her faculty members by names and the qualifications possessed by them. When requested to correct it, she modified it…. (External Change Agent)

I approached the heads of departments personally…. (External Change Agent)

I constantly requested the faculty to cooperate and commit to deadlines. But it was a noticeable fact that a number of faculty members had no appreciation for time and tried to ditch their obligation to help by saying that the information was only available in Arabic or that it wasn't available at all, when in fact it was available all the time. (Internal Change Agent)

Reflection and Introspection

The change agents need to make sense of their actions and their influence on the change recipients. This would elucidate the events taking place, reasons for resistant behavior and the change outcomes. Change agents' narratives show evidence of reflection and introspection. They reflected on their actions, the actions of the faculty members and attempted to deconstruct all outward behaviors of the change recipients.

I had numerous conversations with the dean usually at the end of the working day. The dean would give me an account of the office gossip going on. I heard conversations… (External Change Agent)

I felt like they were purposefully not giving information to their chairs, because they did not support my leadership and did not want me to show results during my tenure as the dean. I also happened to be a woman in a leadership position which was very rare in the Arab world. I also happened to be well qualified and published as well. This I felt had created jealousy and strong feelings of rivalry amongst my colleagues. (Internal Change Agent)

As evident from the above accounts, the change agents reflected on their actions and its effect on employee resistance. The external agent tried to seek feedback from the dean about the working environment of the college and its culture. She eagerly sought tidbits on the general climate of the college and office gossip to secure faculty cooperation. On the other hand, the internal change agent reflected if employees' resistance was due to her being a woman and emerging as a leader in a male dominated society, or her being well qualified and published, or her wanting to bring about change could be attributed to be the cause of rivalry and jealously amongst her colleagues.

There is also an effort to deconstruct the behavior of the change recipients. And these deconstructions reveal a genuine feeling of sympathy and empathy for them.

I was aware of the doubts and anxiety of my faculty members. They were worried because majority of them did not have PhD's and possessed limited published research…

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

…the older faculty members felt that the accreditation would put extra pressure on them because many of them had very low research output. (Internal Change Agent)

It was however noticeable that these feelings of concern were more prominent within the narrative of the internal change agent. This could be attributed to the fact that inspite of being the leader, a dean, she was also an academic who had worked with the faculty members at the institution for years.

New Action

It could be deduced that these introspective feelings ultimately resulted in change agents modifying their change strategies, their communication techniques and leadership styles.

I was invited for faculty meetings where the dean …sought faculty support on the decision to carry out US based business program accreditation…directly seeking clarifications for their behavior and non-cooperation. For instance, she questioned a department chair "…why did you say students have no accomplishments when they participated in this case study competition, published papers …"? Again "why did you inform…when there is survey data on the program participants feedback…"? (External Change Agent)

In this case study the change agents treated employee resistance as a plus point and confronted it. They offered further clarifications and opened up forums for debates and discussions. Sometimes "divergent opinions about direction are necessary in order for groups to make wise decisions and for organizations to change effectively" (Piderit, 2000, p. 790). Resistance could also be a reaction indicating that those resisting may want to know about the change process. By "listening keenly to comments, complaints and criticisms for cues to adjust the pace, scope or sequencing of change and/or its implementation" (Ford et.al., 2008, p. 369), better solutions can be created.

I was invited to the advisory board meetings and other committee meetings as well. This provided opportunities for open dialogue and conversations with new understandings and perceptions being created. The faculty members became aware of what I was doing, why I was collecting data that is to show where the college stood on each of the fifteen standards of the US based accreditation body. They understood this process of seeking US business accreditation was a slow and lengthy process which would take a few years to materialize (even in US it sometimes takes eight years). This would allow them to gradually increase their research output, work on their qualifications, or on any other existing deficiencies.

The farewell meeting consisted of a presentation before the faculty covering the outcome of the entire visit. This allowed faculty to get an idea of the report, ask questions and feel reassured about the purpose of the US based business program accreditation. (External Change Agent)

After carefully reviewing the faculty's environment I appointed two committees one for assurance of learning and another for accreditation to follow up …and work accordingly. I thought these committees would help …-- to believe in the importance of meeting the standards of US based accreditation body and reinforce a culture that would be supportive of the college's new strategic direction. (Internal Change Agent)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the above situation, the change recipients were integrated into the entire change process. Communication and dialogue along with participation and collaboration between the change agent and change recipients were the new action techniques adopted by the leader. This paved the path for a college culture where the faculty realized the importance of US based business accreditation and supported the strategic decision of the college. In fact, at the end of the accreditation specialist visit, the top management based on the report findings felt more positive about the decision to seek US based business program accreditation and was willing to consider applying for it in the future. The top management also invited the external change agent to conduct two workshops emphasizing quality and learning assurance for the faculty and staff members at the university level to create awareness throughout the university, as this step was taking place at a university wide level as well.

Dialogue, open and honest communication and collaboration and participation techniques may not be new in overcoming employee resistance. But in this situation, an attempt was also made to identify with the change recipients instead of dividing the people involved in the change process into separate groups—the change agents and change recipients with the change agents trying to overcome employee resistance. In this case study, change agents especially the internal change agent identified themselves with the change recipients and made efforts to become 'in-group' and or one of them.

DISCUSSION AND CONCLUSION

The challenges faced by universities are different from those faced by organizations within the private and public sectors. The environmental pressures facing educational institutions consist of changing trends in the labor markets, changes in technology, new ways of design and delivery of learning services. Educational institutions also possess a more consensual form of governance involving faculty, administrators, students, parents and communities. The faculty is committed to their subjective disciplines and the vocation of teaching and learning while the administrators believe in responding to the external forces and developing the institution accordingly (Ruben, 2005; Torraco, Hoover, & Knippelmeyer, 2005). The conflict to any change process usually occurs at the faculty and administrative level (Torraco et al., 2005). However, not much is known about OD and change initiatives at the university level. There is a need to further thresh out issues such as "who initiates [the change process]? …what strategies are associated with the development and expansion of OD-based change? Why do some OD initiatives succeed while others fail?" (Torraco et al., 2005, p. 858) within an academic setting.

Further there are few studies which have examined change issues in higher education in the Arab context. This chapter examined a university college in Palestine which was planning to apply for US based business program accreditation in the next few semesters. So, this study contributes towards the limited OCD evidence-based literature. To continue with the case study, the dean, who was the internal change agent had decided on US based business program accreditation for her college, but she lacked the support of the university's top management and her faculty. To ensure college's readiness for accreditation before applying and thereby convince the top management about the soundness of her decision, she decided to invite a specialist to review the curriculum and faculty qualifications. She felt this was the least expensive available option. The entire review period duration was around six weeks. But these six weeks were not smooth, information was scattered, and faculty did not cooperate in compiling, locating or submitting it. The dean and specialist faced faculty opposition, overt and covert resistance and political maneuvers. The dean tried to overcome resistance through open dialogue and employee confrontation and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

involving them in the entire accreditation review process. She formed two committees for accreditation and assurance of learning to encourage and empower her faculty to think strategically as she was aware that this change process could take years before it gets accomplished successfully.

The chapter reconstructs employee resistance in a university college as a phenomenon which acknowledges that both change agents and change recipients are equally responsible for resistance. The actions, conversations and reactions of change recipients are behavioral triggers which the change agents need to make sense of to pave the path for the change initiatives. The study draws upon two auto-ethnographic reflexive narratives of change agents to demonstrate how change agents make or break the change process at their work place. The sensemaking narratives are correlated with different theoretical aspects of OCD evidence-based practices to provide insights on the change process and how introspection and reflection can lead to maximum success. The objective is to allow an understanding of how each change agent interpreted the change process and influenced the stakeholders in the change environment. It focuses on the importance of reflection, introspection and sensemaking activities of the change agents in the entire change initiative.

This study has implications within the higher education sector it provides insights on how successful change requires communication and involvement at all levels of organization. In addition, how this can be practically achieved through quality assurance and accreditation committees which allow collaboration between the faculty and administration. It also recognizes the importance of internal change agents who are aware of the culture of the organization, its problems, and trouble makers and yet are sympathetic to the fears and anxieties of the change recipients. It exhibits how a team of internal and external change agents who are communicating with each other throughout the entire change process, minimize employees' resistance and increase acceptance of change initiatives.

The empirical analysis reveals differences in interpretations and reactions of both the change agents regarding the change process. The internal change agent is more sympathetic to the change recipients and their internal tensions. While the external change agent is more bothered about completing her assignment and to achieve this she tries to overcome the opposition of the faculty and win the trust of the change recipients. These differences in the change agents' approaches could be attributed to their respective positions in the college i.e., paid employee vs. non-employee. Research studies on employee resistance to organizational change so far have concentrated on the resistance practices, the organizational leader or the top management. The influence of the change agents, internal and external, and how their personalities, culture and ideologies could affect the change process has been substantially neglected. This could be an issue worth further investigating. Turnbull and Edwards (2005) in fact demand further case studies in higher education of a cross-cultural nature such as the above, to provide insights about OD and the influence of national cultural values and characteristics.

The empirical findings generated by the auto-ethnographic narratives in this chapter should be further investigated through interviews and surveys to get the perspectives of the faculty and staff members at the college level and the higher-level administrators at the university level as well. This would provide a complete and comprehensive picture of the entire change process.

Chapter 73
Accessibility Improvement Interventions at Byzantine Monuments:
Use of Technology for Facilitating Accessibility of Visitors With Sensory Disabilities

Aristotelis Naniopoulos
Aristotle University of Thessaloniki, Greece

Panagiotis Tsalis
Aristotle University of Thessaloniki, Greece

ABSTRACT

The accessibility of monuments and archaeological sites by disabled persons and persons with restricted mobility in general, constitutes a social, financial and political demand. The project "PROSPELASIS" attempted to counter this problem by focusing on creating a methodology for facing monuments' accessibility and perceptibility problems for people with disabilities and testing its application at Byzantine monuments of Thessaloniki. In six major monuments included in UNESCO's World Heritage List, significant accessibility improvements were realized. A Wi-Fi information system was installed in all of them via which an audio and visual information system was created with audio information in three languages, description of visual information, text information, information in Greek and International Sign Language. Additionally, in Rotunda and Heptapyrgion monuments three dimensional models were developed. The successful validation of the proposed methodology constitute the results of this project not only pertinent to Thessaloniki or Greece, but worthy of a wider application.

INTRODUCTION

A visit to an archaeological site or monument is a unique experience that also constitutes a main tourist attraction. A visit to a monument allows the composition of all stimuli into a unique experience, consisting of the following:

- **Visual Stimuli:** Shapes, colours, textures, images, sense of the real scale of the site.
- **Tactile Stimuli:** The floor's texture and the way in which it is perceived (e.g. gravel or stone) or the texture of the seats (e.g. wood, marble, metal).
- **Auditory Stimuli:** The soundscape of the surrounding area, either natural or artificial, the sound of interaction between man and the environment, walking, the swish of plants when walking through them.
- **Olfactory Stimuli:** Natural scents (depending on the season, time, weather) and artificial scents (e.g. scents of diverse materials or deliberately diffused scents and incenses).
- **Gustatory Stimuli:** Tastes referring to the site and underlining its uniqueness, such as fruits from the trees of a garden, the water of a fountain, the treat in a monastery.

In Thessaloniki, a city with rich heritage, monuments constitute isolated "islets", with the modern cityscape "drowning" them, allowing no visual connection between them, making their identification, their understanding, and physical access to them difficult for visitors in general and persons with restricted mobility in particular. This problem is exacerbated by the fact that the current city's ground level is often four to five meters above the level, where the entrance to the monuments is. Thus, any attempt to "socialize" the cultural heritage of the city has to pursue the following two objectives: a) to provide easy access to monuments for all visitors, including persons with disability and restricted mobility, and b) to help visitors through the provision of adequate information and the indication of ways of moving from one monument to another, connecting the" pieces of the puzzle" (Naniopoulos et al., 2011b.).

The present chapter describes the process of improvement of accessibility in selected Byzantine monuments of Thessaloniki using a methodology created in the frame of the "PROSPELASIS" project, financed by a grant from Iceland, Liechtenstein and Norway through the EEA Financial Mechanism 2004 – 2009 (50%) and from the public investments programme of the Hellenic Republic (50%). The project was realized by the cooperation of the Aristotle University of Thessaloniki (project leader) and the 9th Ephorate of Byzantine Antiquities. The chapter describes the background and the needs that lead to the development of the methodology, the methodology itself, its implementation and the accessibility improvement interventions carried out at selected Byzantine monuments of Thessaloniki. The authors aspire that the adoption of the proposed methodology can lead to further actions that will improve monuments' and archaeological sites' accessibility at national and international level.

BACKGROUND

Addressing, at an international level, the problems of protection, conservation, restoration and management of historical centres, archaeological sites, architectural aggregations, monuments and works of art, has been a major issue. Nowadays, we are not only interested in the monuments' past; we are also interested in their preservation, restoration and role in direct relation to their present and future environ-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ment, their integration into modern life and their connection with economic, educational, tourist and social aspects in particular.

Access to culture is a fundamental right of people with disabilities (EU Council, 1993; UN, 1993). Article 30 of the Convention for the Rights of Persons with Disabilities requires that States parties recognize the right of persons with disabilities to take part in cultural life on an equal basis with others. They are required to take all appropriate measures to ensure that persons with disabilities:

1. Enjoy access to cultural materials in accessible formats;
2. Enjoy access to television programmes, films, theatre and other cultural activities, in accessible formats; and
3. Enjoy access to places for cultural performances or services, such as theatres, museums, cinemas, libraries and tourism services, and, as far as possible, enjoy access to monuments and sites of national cultural importance. (UN, 2013)

Leisure experiences and participation provide unique and valuable opportunities that may result in a variety of positive physical, social and psychological benefits, as well as enhance one's overall quality of life. When people with disabilities participate in leisure experiences, they obtain benefits on a par with their non-disabled counterparts (Stumbo, Wang, & Pegg, 2011).

It should also be noted that making tourist attractions more accessible to people with disabilities, is considered a "golden opportunity" for businesses. In Europe it is estimated that at least 80 million people have a declared disability, a number due to increase because of demographic ageing and the correlation between disability and old age. Yet, this market appears not to be served properly (EC, 2014). Despite the existence of different legal provisions in the EU dealing with equal opportunities, there appears to be a general "inertia" among providers of tourism services in engaging in accessible tourism. (EC, 2014). This was the main reason that lead the World Tourism Day of 2016 to be dedicated to "Tourism for all – Promoting universal accessibility".

A visit to an archaeological site or monument in particular, is an original, unique experience, and constitutes a main attraction in Greece for tourists. Although there are movable findings from all historical periods of Greece in museums around the world, the main archaeological sites and monuments can be found only in their original place. A visit to an archaeological site provides direct contact with the area and the monument, an authentic experience which cannot be substituted by any representation and entails the use of one's senses allowing the composition of all stimuli in something unique.

Barriers that hinder disabled visitors form visiting archaeological sites and monuments exist at various levels, and are identified as:

- Organizational issues, such as lack of staff or lack of support for access improvements
- Physical issues, such as lack of accessible signage and information, narrow paths and entrances, loose or uneven path surfaces, steep slopes and long distances, steps, lack of seating and shelter, luck of accessible toilets and baby changing facilities
- Intellectual issues, e.g., complex or text-only information
- Social and cultural issues, e.g., publicity does not promote access, inaccessible website, lack of information shared with local community etc.
- Financial issues, such as charges for activities, like guided tours, cost of travelling to and from a site. (Ioannidis & Vozikis, 2007)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In order to grant accessibility to cultural environments, activities on two levels need to take place:

- Public awareness needs to be risen as far as cultural heritage is concerned, so that the public interest will start at younger ages and
- Necessary infrastructure needs to be provided, in order to guarantee accessibility to all population groups.

However, archaeological sites and monuments, by their nature, do not allow major interventions to their structure. There is an obvious need for balance between access rights and conservation of the archaeological sites, which demands the development of the relevant access legislation and technical standards. Any intervention to improve accessibility should be made carefully, so as not to alter the monument's character, or damage it visually or structurally (Naniopoulos & Marki, 2003; English Heritage, 2004; NDA, 2011).

The concept of accessibility, as used here, includes:

- Usability and possibility of independent physical access and movement; and
- Perceptibility, referring to the way one perceives, understands the environment (Fertier, 2003).

As far as monuments and archaeological sites in particular are concerned, some efforts have been made in order to improve physical access, focusing mostly on improving access to specific monuments. For example, in August 2004, just before the inauguration of Athens' Olympic Games, one of the most significant Monuments of the world cultural and architectural heritage, the Acropolis of Athens, became accessible to disabled persons via a lift on the north slope of the Sacred Rock. The lift, which was installed with the approval of the Greek Central Archaeological Council, can be reached by a special entrance just north of the main entrance to the archaeological site and the northwest section of the ancient promenade. The highest level of the lift concludes to a lightweight iron balcony-bridge which leads to a level space northwest of Erechtheum. From this point via specific routes, the visitor can tour the most significant Monuments of Acropolis and reach up to the old Acropolis Museum which can be accessed via a platform lift, which has been installed in its yard. (Hellenic Ministry of Culture, 2017)

Cases where monumental buildings are asked to house modern day activities are also of particular interest. This is the case of the National Archaeological Museum of Athens, which is the largest museum in Greece and one of the world's great museums. Although its original purpose was to secure all the findings from the nineteenth century excavations in and around Athens, it gradually became the central National Archaeological Museum and was enriched with finds from all over Greece. Its abundant collections, with more than 11,000 exhibits, provide a panorama of Greek civilization from the beginnings of Prehistory to Late Antiquity. The museum is housed in an imposing neoclassical building of the end of the nineteenth century, which was designed by L. Lange and remodelled by Ernst Ziller.

In order to facilitate visitors with disability and people with restricted mobility in general during the modernization of the Museum for the Olympic Games of 2004, the following interventions took place:

- A second entrance was created at the part of the building adjacent to Vasileos Irakleiou Str. which is accessible. It is connected to the street via a bridge, while access is also achieved via a 5% gradient ramp from the area in front of the Museum's main entrance. Close to the ramp's edge there are 5 allocated parking spaces for visitors with disability.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Two lifts were built at the museum's atriums. At one of these atriums, close to the staircase that leads to the exhibition areas, a large lift was installed facilitating movement on the floor and at the service yard. Right across the exit of the floor there is a vertical lift which covers a small height difference and allows access to the room where the exhibits from Thira are located. At the other atrium, which is located at the left of the of the main entrance, a smaller lift was installed in order to serve access from the ground floor to the public toilets, the canteen and the Museum's shop. Wheelchair users can also access these areas via a stair lift which is placed at the main entrance.
- Toilets for visitors with disability and ramps which cover small height differences were constructed
- Exhibits are placed so that they can be viewed by visitors with disabilities
- Guided tours and educational seminars are held in sign language (Naniopoulos et al., 2011a).

As far as access to information for visitors of monuments and heritage sites is concerned, various efforts have been made exploiting the advantages offered by ICT applications. One of the first examples of current possibilities for increased information access through digital technology was the ARCHEOGUIDE project, first developed at the site of Olympia in Greece. This offers heritage information to the visitor through an ICT system that links augmented reality, 3D-visualisation, mobile computing, and multi-modal interaction techniques. The ARCHEOGUIDE system consists of a site information server and a set of mobile units that are carried by visitors. A wireless local network allows the mobile units to communicate with the site information server. When in use, the visitor can access information about the specific areas he or she is walking through and gain a visual impression of the original appearance of the site through augmented reality reconstructions (Vlahakis et al., 2002).

Many applications also use ICT particularly for the benefit of visitors with sensory impairments. These include, for example, Manchester Museum Touch and Discover Systems. Access was achieved to a small number of objects that cannot be handled by developing a Haptic Interactive. The interface consists of a touch-enabled computer system which allows the user to investigate and explore the topography of an artefact within a 3-dimensional digital environment through a feedback stylus. The addition of sound associated object was another important element, giving vocal instructions and an indication of the objects material qualities and character. For example a broken ceramic gives a dull sound whereas a high-fired ceramic can give a musical ring. The haptic interface does not replace the handling experience, but it can augment a visitors understanding of an object and increase their knowledge and enjoyment on a visit (AMBAVis, 2015).

The PROSPELASIS project described in the current chapter combines the above, following a holistic approach to access of disabled visitors, with interventions carried out to improve both access to information for visitors with sensory impairments and access to infrastructure for visitors with physical impairments. The objective of the current chapter is to pinpoint the methodology for accessibility improvement carried out in Byzantine monuments of Thessaloniki, depicting the process followed, the obstacles encountered and the lessons learned in order to promote the concept of accessible monumental and cultural infrastructure through a combination of information provision (focusing mainly to visitors with sensory impairments) and infrastructure improvements (focusing mainly to visitors with physical impairments).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

METHODOLOGY

The research team's first step was the definition of a theoretical approach model for the improvement of accessibility in monuments, which has been further elaborated through its application to Byzantine monuments of Thessaloniki. This approach contained the following steps:

- Definition of parts of the monument that can become accessible
- Evaluation of existing accessibility level and identification of obstacles
- Definition of information provision needs
- Definition of alternative solutions at pre-study level
- Creation of final studies and implementation of accessibility improvement interventions
- Training of personnel involved

The ideal aim concerning accessibility of monuments is of course that all areas in a monument should become accessible. Thus, from the first stages of a study, the research team had to determine the parts of a monument that can be made accessible, as well as those that do not provide this possibility (English Heritage, 2005).

This process was followed by the evaluation of the existing accessibility level. Appropriate checklists were devised which cover both the monuments' physical access as well as their perceptibility and current use (it should be noted that most of the assessed monuments still host religious activities). In order to create the checklists, first the needs of visitors with disabilities at these particular surroundings had to be determined (Tsalis & Naniopoulos, 2008). This lead to the creation of a task model which was constructed through communication with people with disabilities, cooperation with associations of people with disabilities, in situ observation of the use of infrastructure, communication with experts specialised in accessibility as well as use of the results of relevant research concerning accessibility of the environment, including works by the Royal National Institute for the Blind, the Americans with Disabilities Act Accessibility Guidelines team and the British Department for Transport (RNIB, 1995; ADAAG, 1992; DfT, 2002). The checklists created in the PROSPELASIS project were structured so that the accessibility auditor would not have to be an engineer specialized in accessibility, thus ensuring the methodology's sustainability.

The implementation of the checklists lead to the construction of reports describing the existing situation for each monument, the identification of the visitors' needs and, next, to the definition of alternative solutions for the improvement of accessibility.

In the case of the Byzantine monuments examined in the frame of the project, the historic conservation was the utmost priority and, thus, any solution that did not respect this was rejected, despite the fact that it could be beneficial from the tourist image or economic development point of view. Thus the following principles were followed:

- All of the modern constructions which were necessary for improving the accessibility of monuments, and particularly large scale interventions such as ramps, corridors, lifts etc., were installed in a way which does not insult the aesthetical and archaeological values of the monument.
- These constructions were not projected on the monument and were not fixed on the monument in any permanent way. Bearing in mind that monuments of Thessaloniki are usually at a lower level than that of the street level, these constructions were fixed in the ground slopes of their sur-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

roundings and stand out as extension of the equipment of a modern city, rather than as part of the monuments.
- In order to avoid confusion, these constructions do not look like old ones, and their size and shape does not exceed what is required for functionality purposes.
- The use of modern technology is restricted to a degree that does not compromise the principles of monument restoration.

All the above were necessary in order to improve physical accessibility for visitors with mobility impairments. However, they did not provide direct benefits in improving perceptibility for visitors with sensory impairments, despite the fact that contemporary management of heritage resources aims to facilitate a broad public awareness and appreciation of cultural heritage sites and that ICOMOS (International Council on Monuments and Sites) recognizes that the accessibility of these sites should be of both physical and intellectual character, providing the public with the opportunity to visit a site, and to have the benefit of detailed, up-to-date historical information about it. (Brizard, Derde, & Silberman, 2007). This appears to be common practice in Greece since, in many cases, accessibility interventions take into account only the needs of persons with physical impairments and become synonymous with the installation of lifts and ramps, following a short-sighted approach.

Technology has much to offer to enhance visitors' in situ experience and digital models are used increasingly to:

- Provide access by making easier to view details and allow items that are physically inaccessible to be documented and viewed
- Provide insights and interpretations of the previous condition or states of site or object (e.g. impression of an artefact in its former pristine state)
- Contextualize artefacts (e.g. demonstrate how a tool was used)
- Present representations of tangible heritage as part of the narrative of in-tangible heritage with digital story-telling (Kaminski, Benson, & Arnold, 2013).

PROSPELASIS followed a holistic approach and focused at the inclusion of all potential users, by providing access to monuments with "intangible" characteristics for visitors with physical and sensory impairments.

REALIZATION OF INTERVENTIONS

In total 20 Byzantine – UNESCO monuments were evaluated in Thessaloniki and solutions for accessibility improvement were completed, in pre-study level, for each of them (Naniopoulos et al., 2010a, 2010b). In six of these monuments (Acheiropoietos, church of Saint Demetrios, church of Saint Nicholas Orphanos, church of Hagia Sofia, Rotunda, Heptapyrgion Fortress), which were selected based on their historic significance and interest to the potential visitor, final studies were made and accessibility improvement interventions, which are presented for each monument at the following, were completed (Naniopoulos et al., 2011b). It should also be noted that, in order to create solutions of high aesthetic quality, two well-known artists have been involved in this process, Constantin Xenakis, who was occupied

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

mainly with the signing of a route connecting three monuments, and Cris Giannakos who contributed to the design of ramps.

Interventions Aiming at the Improvement of Accessibility for Visitors With Sensory Disabilities

Development of a WiFi Information System

The research team's cooperation with local associations of persons with visual and hearing impairments resulted in a common belief that the creation and installation of an audio and visual guiding system is necessary for the perceptibility of monuments.

The reason disabled people and people with restricted mobility are not served adequately by the tourism industry is a combination of missing tourism product supply and inadequate information. The lack of reliable information is regarded as one of the major causes that prevent disabled people and others with access requirements from going on holiday (Buhalis et al., 2006).

Potential visitors with visual impairments identified as their main requirements and preferences in a visit to a monument the following:

- They would like to perceive the monuments via appropriate stimuli (audio, visual, olfactory, tactile)
- They consider a visit to a monument as both a recreational and educational activity
- The low level of light in most Byzantine monuments poses difficulties for visitors with reduced vision
- They would prefer something more "interactive", rather than a provision in Braille of the existing information material of monuments
- They did not consider tactile maps that useful, in those particular surroundings
- The creation of a three-dimensional model of the monuments, which visitors could touch, would allow them to perceive not only the monuments' shape and size, but also the different materials used for the monument's construction
- They considered that any accessibility improvement interventions would prove beneficial for the development of accessible tourism in Thessaloniki

The basic requirements of the realized system, according to potential users with visual impairments, were:

- To provide audio information in English, Greek and perhaps other languages depending on the origin of visitors who usually visit the monument
- To provide audio information similar to the one which will be provided in text
- To be easy to use
- To provide audio description of visual images
- To provide information about the monuments' form, size and shape to visitors with visual impairments
- To be compatible with any assistive technologies

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Potential visitors with hearing impairments identified as the main problems they face in a visit to a monument the following:

- Lack of available information
- Communication problems with the monuments' staff
- Even though most of the respondents had experienced visits to monuments, archaeological sites and museums, none of them had any experience of using assisting technologies in situ

The basic requirements of the system, according to potential users with hearing impairments, were:

- To provide clear text information
- To be easy to use
- To provide descriptions in sign language

Following these, a review of possible solutions was carried out, taking into account the demands of the Ephorate of Byzantine Antiquities for any intervention not to require the installation of equipment (antennas etc.) which could cause irreversible damages, or visual intrusion to the monuments. Thus, the creation of a Wi-Fi application, focusing in particular to visitors with sensory disabilities, was considered the most suitable solution.

1. The System Developed

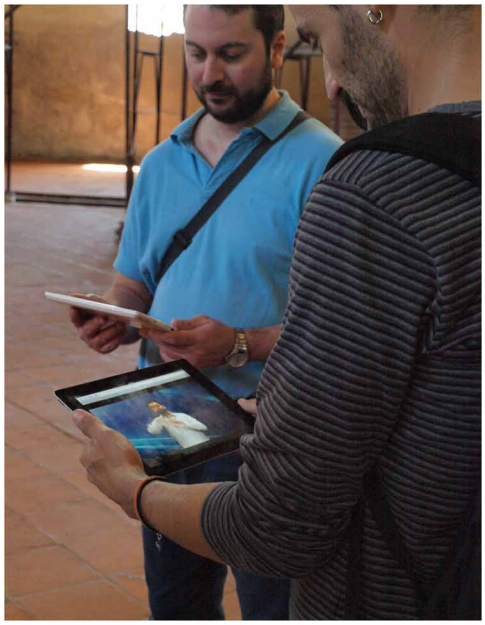
The development of the proposed Wi-Fi network was predominantly performed according to two critical criteria: a) the minimum architectural and electromagnetic disturbance of the monuments and b) the optimum performance of the wireless network by means of the smallest number of utilized components.

Toward these objectives, all the items of the selected equipment have very limited dimensions and weight, while they concurrently embody the most up-to-date technological innovations in the area of wireless communications.

The system was developed through a cooperation of the Transport Systems Research Group of the Aristotle University of Thessaloniki and the Electrical and Computer Engineering Department of the Faculty of Technology of the Aristotle University of Thessaloniki.

The key concept of the infrastructure lies on the use of two Power-Over-Ethernet (POE) access points (AP). The AP encourage open source development and allow their developers to customize their operation, create their own mesh-networking applications. Moreover, they combine a hi-gain antenna system, advanced radio architecture, and highly researched and developed firmware technology allowing throughput, stability, and capacity performance rivaling even the highest-end WiMax networks. It is important to stress, that the specific APs require only one cable (CAT 6 FTP type) for power-supply and data exchange. These were connected through a gigabit 5-port switch to a powerful, yet small-sized server PC, which is responsible for the establishment of the entire Wi-Fi application.

2. Web-oriented Application Development



A website was developed to provide audio and visual information about the monument. Since interaction with the user and support of modern multimedia systems is needed, a Web 2.0-compliant solu-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion should be chosen. Additionally, in order for non-professional personnel to be quickly trained on it, ease-of-use and maintenance of the system is required. Taking into account the above requirements, the popular PHP-based Content Management System (CMS) Joomla! was the selected solution.

Users retrieve text information about the monument in Greek, English and Russian. Info is also available in audio format in the three languages mentioned above as well as in Sign Language, Greek and International, allowing Deaf visitors access to information, as can be seen in Figure 1. The software used is compatible with screen readers and information on the monument is also provided in Braille on an individual basis. A tablet pc is available in situ for those who don't have a Wi-Fi compatible mobile phone or own tablet PC.

Figure 1. Deaf visitors retrieving information in sign language

To meet the requirements of the project, Phoca Gallery component was installed for the management of the monument's pictorial material. This component combines various visualization effects, including slideshow, with many interactive features, such as guest comments and geotagging. Images can be grouped into categories or displayed separately inside an article, thus providing various possible ways of presentation to choose from.

Various other functionalities can be considered and implemented during the website's design procedure or even later, according to the needs of the contractor and possible guests' suggestions. One final important point, concerning the maintenance and safety of the application, is the installation of Akeeba Backup, a component that can automatically back-up the application's files and store them locally on the server, on an everyday basis.

The finished application was evaluated in cooperation with the local association of deaf people before it was available to the public.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Installation of Three-Dimensional Tactile Models of Monuments

Three-dimensional models in general can be used by persons with visual impairments for orientation and perception of the environment. In the case of the PROSPELASIS project, these were used in order to assist visitors with the perception of the monuments' volume, shape and materials.

Two tactile models of the Rotunda and Heptapyrgion monuments were created and installed at the monuments' yards. These give visitors the chance to get familiar with the monument, understand its dimensions and characteristics.

Through cooperation with the local Association of the Blind, the following requirements for the realized models were identified:

- An accompanying audio guide for visitors on the use of the tactile model was a definite requirement, since most of persons with vision impairments, particularly in Thessaloniki, do not have experience in the use of tactile models.
- The model should not, in any circumstances, pose any danger to the user. Thus, it should not have sharp edges and certain compromises should be made, if required, in the accuracy of the monument's representation.
- Depending on the model's placement (indoors or outdoors) a variety of materials can be used. The use of different materials, with different textures, can also be beneficial for the model's usefulness.
- The model's size should not be too large in order to allow the user to easily perceive it.
- Additional information could be written on the model in Braille. Text in Braille can be part of the model's manufacturing process or added at a later stage, if so desired.
- Maintenance is important, particularly for models that will be placed outdoors.
- Smaller scale models should be made during the model manufacturing process in order for the constructor to consult potential users with vision impairments and make any adjustments necessary.

In order to prepare the tactile model, a 3D computer model of the monuments had to be produced using laser scanning equipment, through the following process, aiming at recording the three-dimensional information:

- Scanning of the monument using a Laser Scanner
- Depiction of the monument through the use of a point cloud
- Restructuring of the three dimensional geography
- Creation of the three-dimensional model
- Creation of scale replicas, as in this case, or virtual tours in future applications

The laser scanners used are active depiction instruments that have the ability to collect a large number of three dimensional data, creating point clouds with x, y, z, i coordinates for each particular point.

For example, in the case of Rotunda, in order to achieve the required number of points, 25 scans in total were required, which were carried out from the monument's roof, the monument's yard as well as neighbouring blocks of flats. In total, 51 million points were collected. This was followed by reconstruction and registration followed in order to achieve the visualization of the final model (Tokmakidis, 2011).

The completed 3D model became the basis for the manufacturing process that followed. First of all, a small scale model was produced in a 3D printer (figure 2). This was used for the project implementation

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Tactile model for blind visitors at Rotunda

team to get some feedback from blind and partially sighted potential users. After some small corrections were made, the project team decided on the scale on which the monuments would be represented. This led to the cast printing and the completion of the moulding process.

An audible description of the tactile model was created and is available through the Wi-Fi system installed at the monuments. Through this, a brief description of the monument as well as a detailed description of the monument's representation through the tactile model is provided. As has already been mentioned, this was a definite requirement of the users, since most of the persons with vision impairments in Thessaloniki do not have experience in the use of tactile models.

Interventions on a Route Connecting Three Monuments

The "visual noise" in Greek cities is particularly high, the urban landscape is flooded by arbitrary and vulgar interventions (constructions, graffiti, posters, advertisements etc.). In such an environment, the two partners of the PROSPELASIS project chose a route connecting three important monuments of the city, Hagia Sofia, Acheiropoietos and Rotunda, in order to realize a colour-coded signage. The concept utilizes ideas from the "Freedom Trail" in Boston (Freedom Trail Foundation, 2015) as well as from the European project MAPLE (Naniopoulos & Nalmpantis, 2004).

Main objectives of the signage realized were:

- To facilitate orientation and movement of people with sensory and cognitive impairments
- To depict that accessibility improving facilitations can be beneficial for the general public

The artist Constantin Xenakis participated as a member of the PROSPELASIS team during the signage planning. Constantin Xenakis in his art work has been particularly occupied with the "code of

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the route" and also has made the plans for an artistic/poetic signing of a new settlement in France, the Moissy- Cramayel which though, has never been realised.

It should also be noted that, during the signage implementation, certain actions took place for the improvement of the physical accessibility of the selected route with the cooperation of the technical services of the Municipality of Thessaloniki. In particular, new ramps were created along the route, bridging height differences that hindered the movement of wheelchair users, signifying the Municipality's will to improve the route's accessibility level.

The planning and design of interventions, along the route, followed various stages. What has been realised is described in the following.

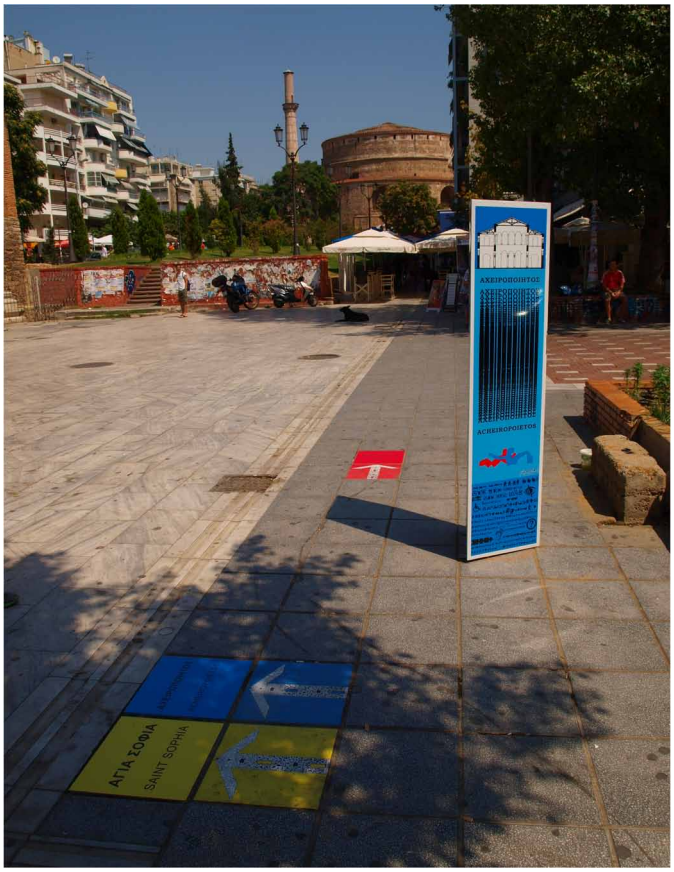
1. **Horizontal Signing:** Along the route connecting the three Monuments, certain pavement tiles were coloured with the colour assigned to each monument, while arrows indicated the movement direction to the monument. For each monument a colour code had been chosen
   a. Yellow for Hagia Sofia
   b. Blue for Acheropoietos
   c. Red for Rotunda

In certain selected areas where direction changes take place, as well as in front of each monument, different tiles were used with the adjacent monument's name written, accompanied with a direction arrow and the colour code selected in the background. The signing at the entrance of the Rotunda monument is depicted in Figure 3.

Figure 3. Horizontal signing at Rotunda

Particular effort was paid, on the one hand to have visual contact among the coloured tiles installed along the route, on the other hand not to intrude visually the urban landscape.

2. **Vertical Signing:** In front of each Monument a sign was installed, which included the following:



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a. Brief history of the Monument
b. Monument's layout
c. Diagram of the route connecting the three monuments
d. Information about the interventions for the improvement of physical and sensory accessibility which took place in the monument
e. Information concerning the context of the project, the sponsors etc.

The above mentioned information was written in three languages: Greek, English and Russian. The last language was chosen since all three monuments are very well known and attract many tourists from countries with Christian orthodox population, particularly from Russia.

On the upper side of the sign, a horizontal strip with the monument's colour code was located. The placement and type of the information signs were approved by the Greek Central Archaeological Council, following a relevant recommendation of the 9th Ephorate of Byzantine Antiquities. As seen in Figure 4, in the area of Kamara, where direction change towards Rotunda takes place, a vertical column of triangular profile was installed, where on each side an artistic reference on each one of the three monuments was made, further assisting pedestrians.

Figure 4. Vertical signing at the Kamara area

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Along the north east pavement of Egnatia Road, where the signage was applied, two bus stops of the local public transport company OASTh are located. Following permission by the Municipality of Thessaloniki, two posters-diagrams were installed on them which offered the following information:

- A diagram of the route connecting the three monuments which appear with their colour code
- Data concerning the realised interventions improving physical and sensory accessibility in each one of the three monuments
- Data concerning the project's identity

It should be noted that the accessible buses of OASTh, whose exterior has been designed by the Greek well-known fashion designer Yannis Tseklenis, bear also the colours yellow, blue, red, something that is in line with the PROSPELASIS interventions, does not create additional "visual noise" and makes a positive reference to the city's public transport system. Thus, the choice of colours and symbols by the PROSPELASIS team serves the grater scope of the unification of the visual communication code of the transport and mobility system of Thessaloniki.

3. **Facilitation of a Short Stop/Rest, Along the Route:** In order to facilitate short stop/rest along the route, special resting bars were designed around street trees and posts. The resting bars are semi-circular and have two levels, thus facilitating their use by people of varying heights. Their design is based on an idea of the disability expert David Finnegan, which had been first realised in Merseyside, UK.

On the resting bars an artistic intervention was created, with graphic elements on it similar to the ones of the same artist, Constantin Xenakis, on the mini buses of OASTh serving as a Demand Responsive Service for disabled people.

Interventions Aiming at the Improvement of Accessibility for Visitors With Physical Impairments

The following accessibility improvement interventions were carried out at each of the six selected Byzantine Monuments:

Acheiropoietos

The monument had two entrances to its yard, both of them used by the general public. Staircases bridged the height difference between the yard's entrance and the monument's entrance, thus making access to wheelchair users impossible (Naniopoulos et al., 2010b).

At the north side of the monument a non-modulated yard was located, where the 9th Ephorate's archaeologists had archaeological excavations in progress. A lift was installed there, its location ensuring that it causes minimum aesthetic intervention to the monument. The lift is fixed on a base made out of concrete as well as on an existing retaining wall.

However, the installation of the lift alone could not solve the problem of achieving access into the main monument. Thus, it was decided to widen appropriately a gate at the northwest side of the monument. In order to bridge the existing height difference between the outside of the new door and its surroundings,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a metal platform was created. The height difference in the inside of the door was bridged through the creation of a platform with a metal staircase and a small platform lift.

Saint Demetrios (Hagios Dimitrios)

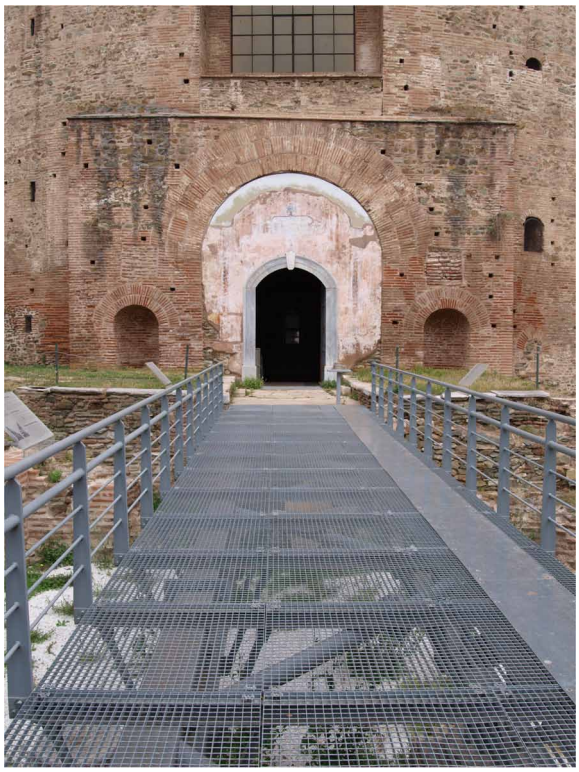
As the entrance to the monument and horizontal circulation in it did not pose significant problems, the interventions concerning physical accessibility focused on the improvement of access to the monument's public toilets, which are placed in the monument's yard. A new toilet was created, its dimensions and equipment ensuring that it can be used by visitors with restricted mobility. The colour contrasting surfaces used facilitate its use by visitors with restricted vision (PROSPELASIS team, 2012).

Saint Nicholas Orphanos (Hagios Nikolaos Orfanos)

Due to the monument's very small scale and particular characteristics, it was decided that the significant interventions required to improve physical access to it would be at odds with its particular character. Thus, only a portable ramp was purchased and is available upon request (PROSPELASIS team, 2012).

Rotunda

Rotunda had significant problems as far as physical accessibility was concerned. The large height difference between the present main entrance of the monument and its interior made access impossible for wheelchair users (Naniopoulos et al., 2010b).



As a solution which would not only improve access to the monument for visitors with restricted mobility but also highlight further its importance, the approach of the monument from the main "Imperial" gate, opened on the south side of the monument and not in use, was selected. In order to enable visitors to reach this gate, a bridge over the excavation of the south outbuildings of the Monument, was created. The bridge has a total length of 15.5 m and is constructed from metal truss section. As seen in Figure 5, the bridge's surface is constructed from perforated metal, while metal plates on the surface act as tactile signs for pedestrians with sight problems. In general, the interventions are designed so as to have the minimum possible visual impact. The artist Cris Giannakos has contributed to the design of the bridge.

In order to bridge the height difference between the entrance and the monument's floor a new staircase as well as a lift were installed inside the monument. The new staircase was created out of metal, and forms a small platform at its top. This construction, together with the "bridge", creates a single tread for wheelchair users. It should be noted also that alternative designs were presented in order to have a final approval of the Central Archaeological Council of the Hellenic Ministry of Culture.

It should be noted that the interventions for the improvement of physical and sensory accessibility that were completed at the "Rotunda" monument of Thessaloniki in the frame of the "PROSPELASIS" project received an honorary award in the UIA (Union Internationale des Architectes) competition "Friendly Spaces Accessible to All".

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. The bridge constructed at the Rotunda monument

Hagia Sofia

There are no particular problems concerning the monument's physical accessibility. Thus, the only intervention deemed necessary for the improvement of physical accessibility was the creation of a small ramp that would bridge a small height difference of 11cm at the monument's entrance threshold.

The monument is also part of the "Cultural route" connecting it with Acheropoietos and Rotunda.

Heptapyrgion Fortress

The monument has two entrances to its yard, only one of them being used by the general public. The staircase in front of the monument's main entrance makes access to it by wheelchair users impossible (Naniopoulos et al., 2010b).

The main entrance leads to a corridor inside the monument, where offices are located and to a second entrance with a staircase in front of it. Thus, even if the visitor negotiates the main entrance, further access to the monument is prohibited for wheelchair users and is difficult for users with restricted mobility. A secondary entrance, which was closed, appeared to be a better solution for a visitor with restricted mobility to access the monument. This led directly to the monument's main area. It should be noted, however, that this entrance had a height difference with its surroundings. In order to bridge the height difference between the entrance and the surroundings' ground the construction of a ramp was deemed

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

necessary. The ramp was constructed from sheet metal grid with a length of 8.00m and 5% slope, to allow the unhindered movement of wheelchair users (PROSPELASIS team, 2012).

It should be noted that the participation of users during the implementation of interventions was achieved through continuous cooperation with local associations of persons with disability and restricted mobility and was deemed essential in order to pinpoint and correct any mistakes before the interventions were opened to the public (Naniopoulos et al., 2011).

ISSUES, CONTROVERSIES, PROBLEMS

The realization of the described interventions revealed procedures which were not known to the research team from the beginning of this project, mainly concerning the approval of the proposed interventions from the Central Archaeological Council of Greece (CAC).

The Central Archaeological Council is the highest advisory body on all matters pertaining to the protection of ancient monuments, archaeological sites and sites of exceptional historical or legendary importance up to 1830.

The Central Archaeological Council:

- Recommends to the Ministry of Culture on principles governing the protection of the cultural heritage and the annual programs of expropriations or direct purchases, excavations, restorations, conservation as well as other works on monuments.
- Gives advisory opinion, among others, on the protection of monuments entered on the World Heritage List, as well as other monuments and archaeological or historical sites of outstanding importance, interventions of major importance to monuments and sites, the designation and establishment of archaeological and historical sites and protection zones in accordance with the provisions of the law.

The CAC is composed of seventeen (17) members, while rapporteurs to the CAC are the respective heads of Directorates of the Ministry's Central Services depending on the issue to be discussed.

The CAC approves or rejects the proposals made or provides suggestions for further elaboration, by majority voting. Following the CAC decision, next the relevant Ministry of Culture and Tourism (MCT) Directorates undertake to elaborate it. The MCT Directorates communicate with the Ephorate and, depending on the case, they inform on:

- The approval of proposal as it is
- The rejection of the proposal
- The approval of the proposal with certain changes

In the third case, a new proposal may be asked to be presented to the CAC or the Directorates will undertake the follow up of their appropriate elaboration.

Due to the importance of the monuments where the interventions took place (UNESCO monuments), all accessibility improving constructions had to be approved by the CAC In the case of the PROSPELASIS team's proposed interventions, the head of the Directorate of Restoration Works presented the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

PROSPELASIS team proposed interventions, together with the opinion and recommendation of the MCT Directorates.

Furthermore, as far as the application of the structural interventions is concerned, the following problems were identified:

- The detailed nature of the checklists for the evaluation of the existing accessibility level allowed its application from non-engineer staff members and the self-evaluation of monuments and archaeological sites. However, it resulted in a large number of data, the recording of which can prove to be time consuming. This also became obvious during the checklists' application in situ, since the research team members who were specialized on accessibility could more easily identify the checklists' more important elements, thus reducing the time required for each evaluation.
- The cooperation with staff members of the evaluated monuments pinpointed accessibility requirements that the research team itself had not identified.
- The solutions proposed at pre-study level were not evaluated nor approved by the aforementioned relative public bodies (CAC and MCT Directorates). Thus, some of the proposed solutions may not have received approval, if the project team had proceeded with their realization at final study level.

Some problems were also encountered in the design and installation of the WiFi information system. These included restrictions in the placement of the system's antennas due to aesthetic or infrastructural reasons which affected the system's effectiveness. Another problem encountered, which was not envisaged by the research team during the system's installation, was the fact that power cuts were common in some of the monuments. Since the system was not designed to restart automatically, an intervention by one of the monuments' employees was required, something that was not always realized on time. Cooperation with the local association of persons with vision impairments pinpointed some problems in the WiFi application's compatibility with screen readers. Finally, copyright issues prohibited the project team from exploiting all the information material available.

SOLUTIONS AND RECOMMENDATIONS

Recognising the difficulties the lack of knowledge of the aforementioned processes can pose to future accessibility improvement interventions carried out at monumental spaces or archaeological sites, the project implementation team created, as part of the project deliverables, a "Handbook of basic principles for the realization of accessibility improvements in monumental spaces". The handbook aspires to provide interested stakeholders a clear "step by step" approach for the implementation of accessibility improvement interventions as well as the experience the project team gained during the interventions' implementation.

In particular, the handbook's contents include the following:

- Description of disabled visitors' needs at monumental environments
- Description of basic restrictions and demands in the realization of interventions
- Identification of the authorities involved in the approval of interventions at monumental sites
- Description of the approach followed at the PROSPELASIS project

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Methodology for assessing the existing accessibility level
- Description of the realized interventions.

The project handbook is available at:

http://www.prospelasis.com/sites/default/files/pdf/handbook_edit_final.pdf

As far as the issues encountered in the application of the methodology itself, on a more practical level, the following solutions were identified:

- The creation of a "short" version of the checklist could prove beneficial, particularly in cases when the responsible auditor does not have previous relevant experience.
- The cooperation with staff members who are familiar with each monument's peculiarities should be made before the suggestion for accessibility improvement interventions even in pre-study level.
- The installation of information systems should take into account particular problems encountered in each monument, including infrastructural issues.

FUTURE RESEARCH DIRECTIONS

Europe is a key cultural tourism destination, with a large number of major monuments and archaeological sites. It is estimated that cultural tourism accounts for around 40% of all European tourism. The great variety of European cultural heritage – both material and immaterial – represents an important competitive advantage. (EC, 2014)

In order to maintain Europe's tourism leadership, a need to modernise and innovate the European tourism offer is recognised. Diversifying tourism products and capitalising on common and rich heritage (natural, cultural, historical, industrial etc.) is the first priority listed in the European Commission's Action Plan for tourism issued in 2010. It is also a stated intention of the Commission to capitalise on those initiatives and look for synergies with similar or complementary initiatives undertaken by other International and European Organisations, such as the UNESCO world heritage sites.

The interventions carried out in the "PROSPELASIS" project combine these characteristics, as the implemented large scale accessibility improvement interventions in major monuments of Thessaloniki which are included in the UNESCO World Heritage list. It should be noted that UNESCO is focusing in particular on the connection between cultural heritage and development through the Mexico City Declaration on Cultural Policies (UNESCO, 1982) and the Report of the World Commission on Culture and Development "Our Creative Diversity" (UNESCO, 1996).

Thus, the methodology and process developed constitute a precedent for further actions in other monuments of similar importance, not only in Greece but at European and international level, since it does not rely on a particular country's legislation, characteristics and authorities' structure.

However, the PROSPELASIS experience also showed that there might still be research potential and an open market for the development and application of an accessibility standard for monumental and archaeological sites. Even though accessibility guidelines have been developed in various countries, with some of them focusing on accessible heritage sites, there is no common accessibility standard applied at European level focusing on the whole mobility chain (infrastructure, perceptibility, information, service

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

provision). The adoption of a common "accessibility label", following the example of the various "eco-labels" developed and applied, could prove a potential critical advantage for the European tourist market.

CONCLUSION

Promotion of accessibility, usability and perceptibility of archaeological sites and monuments for people with disabilities is desirable for social, financial and political reasons.

Improving accessibility of cultural spaces provides people with disabilities with the opportunity to live the unique experience of visiting a monument or archaeological site.

The fact that a large number of archaeological sites and monuments exist in Greece is particularly important, since they are a unique feature and a powerful attraction for tourists. In Thessaloniki in particular, there are numerous monuments that could become friendlier to all visitors and not just to people with disabilities, if their accessibility and perceptibility were improved with the necessary interventions.

Actions concerning the accessibility, usability and perceptibility of a city's monuments and archaeological sites cannot be fragmentary. On the contrary, they must comply with a "systematic approach", according to which all necessary measures and actions are considered in a way that promotes the principles of Inclusive Design, accessibility and perceptibility throughout the entire "chain" related to a person's transport and reception in a site of interest.

The created methodology provides a "step by step" guide for the successful implementation of accessibility improvement interventions in monuments and archaeological sites.

The realization of these interventions, as well as the training seminars realized during the "PROSPELASIS" project, have provided invaluable experience for all involved actors (including authorities of antiquities, tourist guides, organizations of people with disabilities etc.). Moreover, the interventions have initiated a cooperation between involved stakeholders, with common actions concerning access to Thessaloniki's cultural heritage that have already taken place.

The evaluation of the Wi-Fi applications by users with hearing impairments showed that they were quite satisfied with the functionalities provided, particularly with the inclusion of the descriptions in sign language.

Concerning the audio guide of the tactile model for people with visual impairments, it proved to be useful and necessary, particularly if it is accompanied by additional information provided by an experienced tour guide.

The project participants aspire that this experience can lead to further actions that will improve monuments' and archaeological sites' accessibility at national as well as at international level.

KEY TERMS AND DEFINITIONS

Accessibility: As used here, includes: usability and possibility of independent physical access and movement; and perceptibility, referring to the way one perceives, understands the environment.

Byzantine Monuments: Also referred to as the Eastern Roman Empire, was the continuation of the Roman Empire in the East during Late Antiquity and the Middle Ages c. 330 – 1453b.

Central Archaeological Council: The highest advisory body in Greece on all matters pertaining to the protection of ancient monuments, archaeological sites and sites of exceptional historical or legendary importance up to 1830.

EEA Grants: Represent the contribution of Iceland, Liechtenstein and Norway to reducing economic and social disparities and to strengthening bilateral relations with 16 EU countries in Central and Southern Europe and the Baltics.

ICT: Information and Communication Technologies.

Tactile Models: In this chapter the term is used to describe 3D models of Byzantine monuments created to assist persons with vision impairments.

UNESCO World Heritage List: List of sites of outstanding universal value that meet at least one out of ten selection criteria, as described in The Operational Guidelines for the Implementation of the World Heritage Convention.

This research was previously published in the Handbook of Research on Technological Developments for Cultural Heritage and eTourism Applications; pages 191-214, copyright year 2018 by Business Science Reference (an imprint of IGI Global).

Chapter 74
Knowledge Transfer Openness Matrix Facilitating Accessibility in UK Management Education Teaching

Jonathan D. Owens
University of Salford, UK

Usman Talat
University of Salford, UK

ABSTRACT

This is an empirical investigation considering how the Knowledge Transfer Openness Matrix (KTOM) could facilitate accessibility and Knowledge Transfer (KT) for the UK Higher Education (HE) Management Education Teaching when utilising learning technologies. Its focus is where learning technologies applications currently assist the KT process and support accessibility for the HE teacher and learner. It considers the philosophy of openness, focusing on its usefulness to support accessibility within UK HE Management Education Teaching. It discusses how the openness philosophy may assist the KT process for the HE teacher and learners using learning technologies. In particular, the potential to support accessibility within HE Management Education Teaching environments is appraised. There appear several implications for both teachers and learners. These are characterized in the proposed KTOM. The matrix organises KT events based on the principles of the openness philosophy. The role of learning technologies in events is illustrated with regard to teaching and learning accessibility.

INTRODUCTION

If we try and forget the last eight hundred years or so of university tradition of transferring knowledge between teacher and learner, and imagine starting anew with the problem of how best to enable a large percentage of the population to understand and access discussions on difficult and complex ideas. Do

you think putting two or three hundred people into a large room for a couple of hours would immediately spring to mind as the obvious solution? (adapted from Laurillard, 2005)

Technological advances over the past century have greatly enhanced our reach beyond our immediate human senses. We are on a technological curve the progression of which signals the increasing availability of systems that store and aid manipulation of data for human learning and Knowledge Transfer (KT) in organisations. With the emergence of the internet the landscape of Higher Education (HE) has changed. Teachers and Learners in UK HE benefit from aided KT because it enhances their ability to experiment with ideas and share them in productive ways (Goh, 2002). Accessibility to HE has been greatly facilitated through the advance of the internet, learning technologies and e-learning environments (Xiong and Winckler, 2008). Accessibility of university websites, virtual learning environment (VLE's) etc. has a critical role in the activities of currently enrolled and prospective HE students (Cook-Sather, 2014).

In HE learning environments, the interactions between users and technology can represent critical points of breakdown and potentially end achievement. However, sometimes these interactions can provide poor accessibility because of human error and limited availability of information (Nonanka and Takeuchi, 1995; Goh, 2002; Paiva *et al*, 2016). Breakdown at this point can mean that both learners and teachers stand unable to benefit and can suffer low levels of KT (Bates, 2001; Jerrard *et al*, 2013).

In this chapter we discuss the KT and the Openness philosophy, which has the potential to facilitate a current generation of teachers and learners in UK HE by sharing the utility and accessibility of knowledge through a Knowledge Transfer Openness Matrix (KTOM). In the HE sector this approach can represent Higher Education Institutions (HEI's) as environments that mediate generatively the transfer of knowledge and accessibility. This involves systems that are open and can enable accessibility of effective KT for both teacher and learner. A particular focus is developed around the issue of accessibility of knowledge in HE. Therefore, this research considers how the development of a KTOM could potentially assist the reduction of KT barriers to accessibility within the organisation.

Understanding Knowledge Transfer

Over the years various researchers (Stewart, 1977; Ratcliffe, 1997; Jackson; 2002; Mougin *et al*, 2015) have the common view that Knowledge Management is often used to describe the management of knowledge within an organisation and this includes KT within the organisation.

Bates (2001) and latterly Mougin *et al* (2015) claim that the value of KT relates directly to the effectiveness with which the transferred knowledge enables educators within the establishment to deal with the current situations and effectively envision and create their future. People; in the case of this research, the teacher and learner; and the connection between these are considered the most critical factor in KT (Denning, 2011). People create knowledge, share knowledge, learn, and use knowledge to complete tasks (Ratcliffe, 1997). Accessibility to knowledge through a structured KT process can increases the ability of individuals to deal with new situations, events, information, and context (Kunmari and Ilomkai, 2016). Research suggests (Nonanka and Takeuchi, 1995;Goh, 2002; Hanna, 2016) there are potentially many barriers to effective KT that could emerge because the process relies heavily on human interactions and relationships that are not designed into the organisation's culture.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Understanding E-Learning

In simple terms, E-Learning is the use of telecommunication technology to deliver information for education and training (Lin, 2001). Perhaps predominantly due to continuing progress of information and communication technology development, e-Learning is rapidly emerging as the paradigm of modern higher education. The key advantages of e-Learning can include the advantageous interactions between learners and instructors, or learners and learners, free from limitations of time and space through the asynchronous and synchronous learning network model (Paiva *et al*, 2016; Turban et al, 2000). More so that ever E-learning's characteristics can fulfil the requirements for learning in a modern society and have created great demand for e-Learning from both businesses and institutes of higher education (Hasanzadeh *et al*, 2012).

Understanding the Openness Philosophy

The openness philosophy is an attempt to orient research efforts towards the principle that effective knowledge transfer between learning systems is crucial, particularly in the context of fast and lasting penetration of e-learning technology. However, there remains lack of clarity about openness in education (Peter and Deimann, 2013). There is increasing awareness that openness is essential and best practice in education, which should fertile terrain for sharing knowledge as a common good (D'Antoni and Savage, 2009: 138). Three areas of openness have been proposed as social characteristics, technical and the nature of the resources (Hylen, 2006). In the education sector open education has been aided with the development and widespread use of digital technologies (Weller, 2011: 21). Through the openness principle it is argued that greater sharing of knowledge in the scientific community can enhance and refresh perspectives in individual disciplinary spheres. We propose the KTOM taxonomy as an evaluation of the types of systems found in higher education. This is predicated on an exploration of scenarios that signal indeterminacy, transparency and accessibility in e-learning environments.

E-Learning as a Knowledge Transfer Enabler

E-Learning can be perceived as a key enabler to KT within HE sector (Owens & Floyd, 2007; Deejring & Chaijaroen, 2012).The successful introduction and implementation of e-Learning into existing and new units, modules, programmes etc. at an HEI can be heavily influenced by its ability and accessibility effectiveness, in delivering knowledge based products and managing any number of strategic issues that may need to be addressed as part of the successful development of KT though e-Learning products (Conaway *et* al, 2005; Hanna, 2016; Owens and Price 2010).

Laurillard (2008) suggests the strategic issues of significance when considering e-Learning as a tool for KT through traditional and independent study within the HE sector are:

- Identifying the customer service imperative for each stakeholder or institute involved in an e-Learning initiative;
- Appreciating the advantages and disadvantages of incremental KT through e-Learning in HE;
- Understanding the value of national, integrated approaches to e-Learning and KT in HE;
- Understanding the need to develop user support systems, to underpin e-Learning and KT developments;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Working within technological and financial limitations associated with HEI's;
- Successful internationalisation of HE.

Accessibility to Teaching and Learning in HE

Research (Gladstone, 2000; Reeder *et al, 2004;* Weller, 2004; Kandiko & Mawer, 2012) suggests that academics (teachers) and learners have accepted the idea that e-learning environments (i.e. Virtual Learning Environments, Blackboard, Discussion Boards) can be effectively used for accessibility to teaching and learning. Research suggests a common theme in that both traditional and non-traditional students increasingly expect this presence and use HE (Roberts, 2004; Hannon & D'Netto, 2007; Paiva *et* al, 2016). In some HE teaching and learning environments the high penetration of these teaching and learning tools has become the norm, or at least one of the indicators of accessibility to a HEI (Lanham & Zhou, 2003; Dobozy, 2012). Alexander (2002) and Kandiko and Mawer (2012) claim new students expect the institutions to offer up-to-date web based teaching and learning tools. Further studies (Goodfellow, 2004; Goodfellow & Lea, 2007) suggest that some HEI's are using the tools as a competitive advantage for accessibility in order to attract more students in an increasingly competitive HE market. More and more, students expect lecturers (teachers) to use these tools to support their provision and accessibility to teaching and learning (Goodyear & Jones, 2003; Owens and Price, 2010). This is perhaps nothing new though, as mature and distance learning students in UK HEI's, who are often in full-time employment and from a working environment, adopt e-learning environments predominantly due to accessibility necessity for their teaching and learning agendas (Lanham & Zhou, 2003).

Understanding Learning Technologies

Learning technologies can effectively assist teaching when it is seen as one of a set of activities aimed at supporting students' learning (Akgun *et al*, 2003; Kunnari, 2016). This approach corresponds to the level three of Biggs' student-centred theory about teaching (Biggs &Tang, 2011). They discuss how student learning depends on the following:

- The learner's ability and capability;
- The learner's prior knowledge of the subject/field which they are about to be taught;
- The learner's accessibility to new knowledge on the academic subject/field, including:
    - The teacher's responsibility;
    - The learner's decision-making ability and capability;
    - Good KT process management skills of predominately the learner, but consideration should be given to the teachers KT ability and capability in this area also.

Therefore, good teacher and learner interaction, including the use of learning technologies, involves an awareness of contextual dependency of learning and teaching (Borstorff & Lowe, 2007; Falconer, 2006; Goodfellow, 2005; Gosper *et al*, 2008).

The evaluation of learning technologies includes examining the intentions, implementation process and the outcomes of technology use (Hannon & D'Netto, 2007). Sims and Jones (2002) the purpose of evaluating learning technologies is to provide the designer (teacher) or user (learner) with enough evidence on which to make confident judgements regarding the effectiveness of the innovation. They

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

also claim that the match between the intentions and outcomes determines the success; therefore it is important that the intentions add value to student learning.

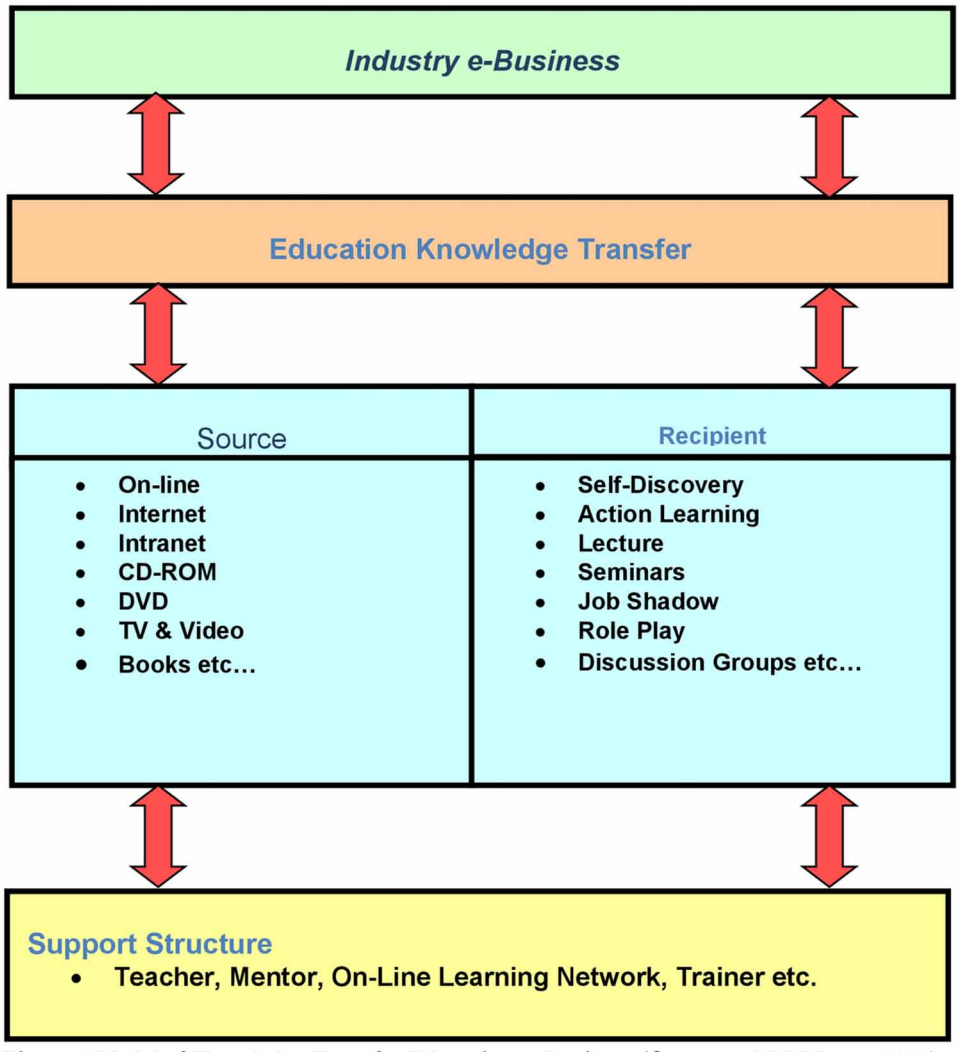
Existing research suggests (Jackson, 1998; Gladstone, 2000; Falconer, 2006, Goodfellow, 2007; Gosper *et al*, 2008) learning technologies can be evaluated against intended outcomes such as ease of use, accessibility, efficiency, student preferences, technology attractiveness, and cost effectiveness. Subsequently, there is a reasonable assumption that accessibility to an effective KT process within the HE learning environment is relatively important requirement for both parties, thereby supporting the need to investigate KTOM as vehicle to support this feasibility.

Using Learning Technologies for Teaching and Learning

Both Borstorff and Lowe (2006) and Kandiko and Mawer (2012) suggest the introduction of e-learning environments represents an additional burden on lecturers' timetables, as it requires co-ordination and integration of the activities in the teaching programme. In order to be effective, these learning technologies should reflect the current constructivist-learning model that over the last few decades evolved from behaviourist and objectivist models (Fry *et al,* 1999; Borstorff and Lowe, 2007; Deejring and Chaijaroen, 2012). Above all, e-learning should foster interaction and dialogue between the learner(s) and the teacher (Goodfellow, 2005). Research (Institute of Teaching and Learning Seminar, 2003; Roberts, 2004; Goodfellow and Lea, 2007) suggests that learning though this environment can be enhanced in all sorts of ways, including hearing, seeing, as well as participating in activities such as a game, quiz, and podcasting.

Hannon and D'Netto (2007) argue that the potential of learning technologies to improve learning depends on the context of learning and assessment. The context is defined by the combination of its elements that include the students, lecturers, institution, teaching material, style and method. Research by Ashraf (2009), Goodfellow (2007) and Gosper *et al* (2008) claim the majority of studies in this area fail to provide solid evidence of increased effectiveness of the e-learning for teaching and learning. As discussed earlier (Student Expectations Study, 2007), when considering technology, there should perhaps be a manner of caution in adoption and utilisation. This is because HEI's cannot assume that presenting new technologies automatically makes their institutions "*youth friendly*", this new generation would like to see some concrete benefits of technology. Additionally, Gosper *et al* (2008) report that adaption of these technologies for teaching and learning contributes to a "*blurring*" of the boundaries between traditional (full-time) and non-traditional (part time, distance learning) students. This is primarily because its introduction is more than solely a teaching issue as it can affect the design of the unit and programme, as well as having professional and organisational development implications.

The literature has predominantly indicated that students are enthusiastic (Jackson, 1998; Roberts, 2004; Gamlanglert & Chaijaroen, 2011) about the e-learning environment, and they take the medium more seriously when their work is assessed (Fry *et al*, 1999; Borstorff & Lowe, 2004). However, both Hannon and D'Netto (2007) and Goodfellow (2007) state an e-learning environment fails to enable the achievement of significantly different learning outcomes. They also suggest that organisational, operational and logistical problems combined with technical difficulties mean that the learning technology cannot always be used to its full potential. Further research (Falconer, 2006; Owens & Price, 2010; Turban *et al*, 2000) suggests that in order for this to perform more effectively, learning technologies need to be fully embedded in a programme/unit/ module etc., and importantly both the teacher and learner should be provided with the adequate skills and support.



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Knowledge Transfer Using Learning Technologies in an E-Learning Environment

Research suggests (Hannon and D'Netto, 2007; Hanna, 2016; Owens, 2002, 2006; Macfayden, 2005) and is relatively consistent in that E-Learning is perceived as a key enabler for effective and efficient KT within the HE sector. E-learning can be used to facilitate KT in a number of ways, as set out in Figure 1. The successful introduction and implementation of e-Learning into existing and new units/ programmes/modules etc. at HEI's is heavily influenced by the institution's ability to deliver knowledge based products and services.

In addition, as discussed earlier in this chapter by Laurillard (2008), it is perhaps useful to consider the strategic issues of significance of e-Learning as a tool for KT through traditional and independent study. This is particularly pertinent, if the HEI needs to be effective at managing any number of strategic

Figure 1. Model of knowledge transfer education to business (Owens & McManus, 2004)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

issues that may arise as part of the development of KT though the utilisation and operationalisation of learning technologies within an e-Learning environment. As such, designing and developing KT processes within e-learning environments and with the utilising learning technologies can be both costly in time and money (Owens & McManus, 2004). Consequently, before making the investment, HEI's may prefer to establish if it is worthwhile (Goodfellow, 2005). It may therefore be beneficial to have a strategy in place for sustaining and embedding the institutes proposed KT and e-Learning developments.

Owens and McManus (2004) suggest there are two schools of thought when considering the integration of KT and e-Learning to support HE accessibility:

1. The exploration of learning technologies currently known and understood to produce sound learning and teaching KT through the model (see Figure 2). Where the current technologies available in the HEI do not allow this, then both internal and external developers should be encouraged to assess if new technologies are necessary, in order to provide a feasible solution for the teacher(s) and learner(s) involved in the KT process;
2. To examine the current learning technologies within the HEI and explore the possibilities for innovation that can lead to the development of new pedagogies and enhance the KT process in the model. This school of thought considers that the potential of the technology that currently exists has not yet been fully investigated and realised by the HEI. Thus, it focuses on the premise of embedding new teaching and where applicable learning practices utilising the existing learning technologies, before moving onto new learning technologies to assist the KT process.

Internet Utilisation in the UK

The 2009 Oxford Internet survey reports that the top four reasons people in the UK accessed the Internet to go on-line were:

1. Check emails;
2. Product information search;
3. Browse to Buy on-line;
4. Fact finding, through search engines such as Google, Wikipedia etc.

Therefore, with the rapid advance of on-line learning technologies (Kunnari and Ilomaki, 2016) it is perhaps interesting that there is no clear correlation to on-line learning at 19th place at just over twenty percent. Unfortunately; from an e-learning perspective; even use of the internet to download to watch videos and listen to the radio achieved an almost ten percent better score than distance learning. Another disappointing finding for learning purposes is that twenty percent read less due to the advent of the Internet. This suggests that perhaps internet is not a perfect substitute for knowledge, and that lecturers need to encourage both means to foster both more creativity and utilisation. Subsequently, as the Openness philosophy is a novel concept that has been underexplored in UK HE, later this chapter will start to consider if the development of a KTOM could help foster this creativity and utilisation.

A summary of the twenty main reasons people access the internet is illustrated in Table 1.

Table 1.Top twenty reasons why we go online in the UK. (Oxford Internet Survey, 2009)

(Oxford Internet Survey, 2009)

Teaching and Learning Through Internet Based Technology

Various authors (Kalkota and Whinston, 1996; Turban et al, 2000; Owens and Price, 2010) have identified that the Internet offers unique opportunities in both teaching and learning applications. A common theme that appears to have changed little (Ackoff, 1989; Dearing, 1997; Conaway *et al*, 2005; Hasanzadeh *et al*, 2012) is that students are very keen on using the Internet for entertainment, peer communication, and for secondary sources of data. Researchers (Lissenburgh, 1999; Dobozy, 2012) claim that, in some cases, students assume the information does not exist if it is not available on the Internet.

Although students are familiar with Internet technology, some researchers (Gladstone, 2000; Hannon and D'Netto, 2007) argue that students often lack the specific skills that would enable them to use it more effectively. It could be that students are not clear about the benefits from the outset (Ashraf, 2009). A Student Expectations and Perceptions survey carried out in 2012 reported that, whilst many current and prospective students are comfortable with the learning technologies both used and available, this new generation of students like to see the concrete benefits of technology usage and implementation; for example that work is recognised and contributes to final grade assessment (Kandiko & Mawer, 2012).

In summary, it becomes apparent that as internet usage continues to gain momentum with increased dependency amongst both teacher and learner. This perhaps supports the increasing need for accessibil-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ity to internet technology to facilitate KT in e-Learning Environments with the UK Higher Education Management Education Teaching.

Preliminary Investigation of Teaching and Learning Through Internet Based Technology at Two UK HEI Business Schools

Introductory research investigating teaching and learning through Internet Based Technology was undertaken at two UK HEI's Business Schools. A number of units that included IT-based learning were identified at both HEI's.

Three teaching modules that offered similar content and level were reviewed and each had a dedicated web site aimed at supporting students' learning. The site gives the lecturer some degree of flexibility in terms of inclusion of teaching material, and setting up the discussions despite being fairly standardised. The cohort for this study included both undergraduate and postgraduate students studying fulltime at both HEI's.

The data collection approach included an unstructured discussion (interview) with the lecturer for each cohort and a questionnaire for the students. The discussion with the lecturer aimed to identify the main issues related to use of the web site that emerged during the semester. The breakdown of respondents for each module and HEI is illustrated in Table 2.

Table 2. Respondents breakdown from both HEIs

UK HEI Business School One			UK HEI Business School Two		
Module	**Level**	**Number of Respondents**	**Module**	**Level**	**Number of Respondents**
Operations Management	7	17	Operations Management	7	12
Strategic Management	6	14	Strategic Management	6	17
Management of Operations	5	19	Management of Operations	5	13
	Total	**50**		**Total**	**42**
Combined Total	**92**				

Table 2 Respondents breakdown from both HEI's.

Interview Findings

It emerged that the teaching team for each module provided a web site that aimed to offer additional support for the students. Although standardised to suit institutional requirements, the web site offers a certain degree of flexibility. The lecturer was able to publish the lecture notes, the syllabus, the module outline, the assessment brief and any other text material. The related web links could be edited at the discretion of the lecturer who has the control over the content of the web site. Additionally, the lecturer

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

could set up a discussion area by proposing a topic and encouraging student participation. Typically, the lecturer posted a question related to the lecture on a weekly basis. The students could respond or comment on the topic and get the lecturer's feedback. The students could see the contributions of their fellow students but could not address the comment to one particular student. Similar to research by Chou (2003), the communication channel corresponded to the interactive of one-to-many model. Each participant was identified through a username and a password.

The discussion with the lecturer allowed for identification of main themes and items that were then included in the questionnaire. For example, ascertaining how often the student accessed the discussion area, if they found it helpful, and if they contributed. The feedback helped to build a picture of the level of interaction between the student and the lecturer using internet-based learning. Once the questionnaire had been drafted, it was reviewed by the lecturer, and the final version administered to students towards the end of the semester. This is similar to Goodfellow and Lea's (2007) thoughts on encouraging links between the two parties involved in the learning process.

Level 7 Operations Management Module Questionnaire Findings at Both HEI's

These students scored the lowest usage rate of the three groups involved in this research. Only twenty one percent and nineteen percent of respondents respectively logged on to the web site at least once a week. Approximately two thirds of the students at the two institutes visit the web site once per month or less, or not more than five times in a semester.

When the students log on they mostly look at the lecturer's questions but only one in four contributes to the discussion. Across both institutes approximately two thirds look at the contributions of other students and use the web links. Less than half use the web based lecture notes and less than a third use other material related to the assessment. This finding is not surprising as it supports the common view (Fry et al, 1999; Borstorff and Lowe, 2007), that the student will only take this medium of study more seriously if it is assessed. Hannon and D'Netto (2007) comment that the real potential of learning technologies to improve the student's learning experience depends upon the context of learning and assessment.

At both HEI's, the majority of students feel the web site helps their learning, makes it easier to keep up to date with the lectures, offers the opportunity to discuss questions with the lecturer, and ask for clarifications. The use of the website therefore promotes efficiency, effectiveness, ease of use and attractiveness as a mode of learning (Gladstone, 2000; Falconer, 2006; Kunnari & Ilomaki, 2016).

However, a large majority of students at both HEI's do not think the web site gives the lecturer a tool to monitor their learning, nor themselves the opportunity to show how much they study. This is supported by Goodfellow (2005), Ashraf (2009) and Randy Garrison (2011), who identified this to be a particular constraint as HEI's appear to predominantly use this as an attendance and retention tool. They suggest more development needs to be undertaken with this mode of learning in order to achieve its full potential for both lecturers and students. The implications for students who are technically competent are that the use of web-based interaction may deliver 'concrete' benefits which involve measuring their level of understanding and improvement.

Level 6 Strategic Management Module Questionnaire Findings at Both HEI's

Almost two thirds of the students at each institute visit the web site at least every other week. They predominantly use the lecture notes, look at the lecturer's questions, and at the contributions from other

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

students. However, only seventeen percent and fourteen percent respectively have ever contributed to the discussion on the web site.

Similar to earlier findings with the L7 findings, the students at both HEI's felt that the web site helps their learning; makes it easier to keep up to date with the lectures, offers the opportunity to discuss questions with the lecturer, and to ask for clarifications. Approximately one in four and one in three respectively agree that it should be part of the portfolio of activities. However, an interesting finding was that the majority of students studying this module at both HEI's agreed that web-based work should not be formally assessed for this module at this level of study. This did not follow earlier trends in this research, nor the literature (Hannon and D'Netto, 2007), where students would prefer to see it as part of their assessment. A possible explanation for this could be that, as this group comprised level six students, they were more aware of the significance of grade at this stage of their degree programme. They perhaps preferred the familiarity and 'concrete benefits' (Student Expectations Study, 2007) of the traditional assessment methods.

Level 5 Operations Management Module Questionnaire Findings at Both HEI's

It was both an interesting and common finding at both HEI's that almost half (forty nine percent and forty seven percent) of the students used the web site on a weekly basis. This was perhaps an expected finding at level six undergraduate, rather than level five undergraduate because of the maturity of the student towards learning and, the weighting of the degree programme at level six in UK higher education.

Similar to the previous two cohorts, these students mostly use the lecture notes; they look at the lecturer's questions and use the web links. Across both HEI's, approximately half the respondents think the web site helps their learning and that it makes it easier to keep up to date with the lectures. This is a finding supported by Goodyear and Jones (2003) and latterly Dobozy (2012), who identify that there is a clear expectation by students to use IT for teaching and learning. One in three and one in four respectively were of the opinion that it offered them the opportunity to have discussions with the lecturer, ask questions, to show how much they study, and that it should be part of the portfolio. However, only one in four at both HEI's thought it should be assessed.

The students at both HEI's were of the opinion they would use the web site more often if it counted towards the final mark, if there was additional learning material and if there was more material related to the assessment. Another common finding was that the lecturer should promote the web site more convincingly during the lectures and seminars. It should also be easier to use and it should be part of the portfolio of activities.

Key Finding From Preliminary Investigation of Teaching and Learning Through Internet Based Technology at Two UK HEI Business Schools

The key findings summarised in Table 3. The ticks indicate where more than half the cohort had used the particular function of the website, or had expressed a preference for how the website had been used.

The majority of respondents across both institutes would like to see more teaching material and more material related to their assessment presented on the module web site. A common theme similar to Hannon and D'Netto's (2007) findings is that they would use the web site more often if it counted towards their final mark. Assessment could consist of a small component of the unit's total marks. For example, there were positive aspects for including the web-based work in the portfolio of activities,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and a small minority of students supported making it count toward their final mark. However, students said they would be more likely to undertake work that they would be rewarded for, which suggests that some kind of assessment of web-based activity could promote use of e-learning. Research (Kandiko and Mawer, 2012; Laurillard 2005; Owens and Floyd, 2007) all suggest that this is a common finding in that the students will not do anything unless they clearly benefit through a contribution to their grade.

The Openness Philosophy and its Application to UK HE Management Education

In HE management education environments across the UK, the concept of openness remains somewhat indistinct and not clearly defined (Baker, 2012). At present, there is limited application of this concept in the field. Overall, openness in science means that data should be shared with the wider scientific community (McComas, 2014). In the context of this ethos, accessibility to platforms and technologies becomes a prime focus for HE distributors. In this regard, we suggest that the openness of a pedagogical system can be understood by recognizing its degree of indeterminacy, transparency and accessibility.

Indeterminacy in UK HE Management Education Environments

Indeterminacy suggests that a system does not have sufficiently rigid boundaries and discrete variables such that its development is wholly determined in advance (Stein, 1991). This characterizes most systems that are used by humans, which are open systems consisting variables not wholly determined in advance. For example, if a student uses the software Microsoft Excel then he or she engages with a system that

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

provides tools through an integrated environment. The behaviour of this system is partly determined through its states, features and rules, and in part through the user's behaviour. The system is open in the sense that its behaviour depends to some extent on the unpredictable behaviour of the user, but also serves idiosyncratic learning needs (Cziko, 1989). In such systems that are characterised by human use of information communication technology, a boundary of the tool in question might be sufficiently rigid, however human behaviour remains relatively less rigid and less predictable, whilst at the same time necessary for adaptation. Such learning systems build through trial and error loops that provide feedback based learning for human users with varying demands for knowledge exchange over e-learning platforms. Such a system cannot become accessible in its authentic form. Thus, indeterminacy means that MS Excel is not accessible in its rule governed forms alone, but rather, it is accessible as *n* number of iterations in relation to user subjectivity, interactions, errors, and learning outputs.

Openness in this sense offers a principle for guiding numerous tasks for learning and developing solutions. To the extent that indeterminacy is a condition for e-learning, improvements in accessibility through higher education systems might aim to manage the inherent indeterminacy of pedagogical processes and outcomes.

Transparency in UK HE Management Education Environments

Transparency of a system is the degree to which its components are visible in their workings. Increased transparency can help align perspectives of users (Benkler, 2006). A transparent system, might increase visibility of indeterminacy in systems, and provide users with options to manipulate components for pedagogical ends. In this instance, research (Peters and Roberts, 2012: 45) suggests the degree of transparency of a learning system such as MS excel is based on two points:

1. Its functions;
2. What the user brings to the social environment in terms of experience, knowledge, expertise, interest, task, goals, and time.

They discuss that openness of technology must be coupled with open-mindedness of users and collaborators. Philip (1987) notes that measuring human learner behaviour accurately is extremely difficult due to the indeterminate nature of education systems, which are inherently complex and open to varying change. To this proposition, transparency adds the likelihood of effective access to content, based largely on the increased ease of managing system components. However, transparency is a condition that is specific to the e-learner engaged in gaining access. A system that is open and visible in its workings remains as such by virtue of learner knowledge and expectations in relation to attributed system features/functions. However, it remains the case that openness as a practice through conduits like Massive open online courses (MOOCS) can be effectively seen as transparency of activity (Cormier and Siemens, 2010: 32).

Accessibility in UK HE Management Education Environments

In contemporary organisations the accessibility of a system is the ease with which users can obtain intended and satisfying outcomes with regard to learning. Enhancement in accessibility signals a relatively open system. In general, accessibility is enhanced with virtual environments that provide storage, processing, representation and transmission of data facilities. This has leveraged the accessibility of

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ideas over computerised platforms, which can often talk to each other, without compromising content quality (Altbach *et al*, 2009). However, in relation to how humans learn with tools that enable access, openness is not a new idea. In the early part of the 20th century the philosopher Martin Heidegger proposed openness as a non-intentional or pre-intentional state of being in the world (Fuenmayor, 1991). The term non-intentional is the antithesis of the term intentionality; the latter is a central feature of human consciousness whereby we walk about in the world always holding beliefs, emotions, imaginations, and feelings that are directed towards things we play with and learn from. Intentionality structures provide access through experience, and represent the analytical experience of idiosyncratically reaching out and carving meanings in experiences, using tools systematically. In Heidegger's sense, openness is about taking a step back from intentionality. For example, openness of a learner in an HE environment is the deliberate letting go of pre-conceptions and starting with a tabula rasa type psychology. Through conversations teachers and learners attempt to improve access by co-constructing what is learnt. They might attempt to linguistically represent each other's narratives (Dahlberg *et al*, 2003) or store, process, and share content, which can be manipulated and become accessible through transparency and interconnectivity of technical frameworks. In this sense, openness applies more easily to electronic technology then to human users, whilst both co-operate to produce educational output in HE systems. When applied to technology openness primarily means ease of use because syntax, rules, goals and processing in technological systems is often easier to delete or modify (i.e. accessibility). Conversely, the application of openness in terms of accessibility of the cognate user-as-learner's behaviour appears riddled with indeterminacy (Cziko, 1989). Conclusively, the application of openness might address accessibility of systems whereby technology, users, and their cooperation can improve or decline in that system. We contend that accessibility sits in tandem and in co-operation with transparency and the in determinacy inherent in human learning spaces that characterize e-learning systems. In such learning spaces, the behaviour of technology and the user represents an integrated process - a continuous system - which can be evaluated for openness through its indeterminacy, transparency, and accessibility.

Openness in UK HE Management Education Environments

In regard to the above picture of openness, in an HE context, we propose that in so far as indeterminacy, transparency and accessibility are applied, this represents behaviour of systems between concentric levels at which they operate and cooperate in learning spaces. In HE learning environments a system can be (Baker, 2012) discernible at the component and sub-component levels. From a higher abstract viewpoint, a system is also discernible at the actor, group, organizational, and the society wide level. These concentrically coupled levels where systems behave can themselves display openness at the intra-level, that is, systems constituting a level (e.g. at the group level classroom learning or blackboard blogs) and at the inter-level, that is, across systems behaving within and between levels (e.g. individual access to content also shared with other learners over social mediums for communication). Applied to the UK HE in management education environment this provides a diagnostic matrix to illustrate the degree of openness of a system, expounded below.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

THE KNOWLEDGE TRANSFER OPENNESS MATRIX (KTOM)

The Knowledge Transfer Openness Matrix (KTOM) illustrated in Figure 2 provides six openness scenarios for teachers and learners in UK HE management education environments. Each one of these can be characterised in different scenarios (i.e. perspectives) when facing the same system. Each scenario's evaluation is based on degrees of indeterminacy, transparency, and accessibility – indicating openness of the system.

Figure 2. The knowledge transfer openness matrix

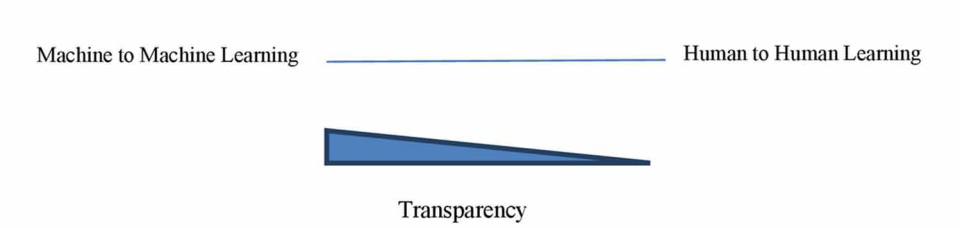
Openness Scenarios for Teachers and Learners in UK HE management education environments	Indeterminacy	Transparency	Accessibility
Scenario 1: Chaos	●		
Scenario 2: Interpretable Chaos	●	●	
Scenario 3: Platonic Openness	●	●	●
Scenario 4: Randomness	●		●
Scenario 5: Closed Environment		●	●
Scenario 6: Rote system			●

Scenario 1: Chaos

The first scenario occurs in learning interactions whereby indeterminacy is increasingly present as the system components (user, technology and content) develops and thus indicates learning that is not predictable, but somehow functional (i.e. it meets minimum user needs to retain its use). Such a system is chaotic in the sense that it is not predictable and only reflects a probable developmental trajectory. This involves the use of most human learning tools. For example, the behaviour of the whole World Wide Web is indeterminate for a human user (Carr, 2012:205). Over the period of its use, such a system increases in complexity with two parallels. First, as more components and relationships are added, the indeterminacy of the system emerges over a time period conceivable as probability distributions. This involves system interactions that add layers of complexity conditioned by the subjective choices of users (Cziko, 1989). Second, the learning system behaves to increase or decrease in indeterminacy. This can impact accessibility of knowledge in so far as the knowledge is searchable throughout learner-teacher-technology structures of the system, in intended ways. Such structures and channels involve mapping of subjective data on other relatively homogenous mediums of communication. We find indeterminacy in complex knowledge acquisition in so far as learner-teacher relations fuse human tacit knowledge with more objective encoding platforms. This process can modify and qualify shared knowledge as indeterminate. The degree of this also depends on the environmental noise that interferes in preserving the intended meaning of types of knowledge shared, processed and stored in a learning environments system.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Scenario 2: Interpretable Chaos



Learning Systems that exhibit indeterminacy and transparency are independent of user accessibility but remain observable in their ultimately non-deterministic and probable behaviour. That is, the user (i.e. student) can observe but cannot modify the system towards a determinate state. These exhibit interpretable chaos for the learner. For example, this might be the use of online software that displays information and can be visually seen such as an algorithm based blackboard learning environment. However, it is not amenable to modification and thus affords partial accessibility whereby the learner is on the receiving end.

The limit of an event that is in interpretable chaos is its non-feedback based behaviour.

Scenario 3: Platonic Openness

The third scenario involves complete openness, which we term *platonic openness* whereby indeterminacy, transparency and accessibility are all featured in the learning system. This is an idealistic state (Stein, 1991; McComas, 2014), albeit one that any system can aim towards. Because the human-technology system is indeterminate, it is an open system in continuous flux. The transparency of the system is indicated through workings of non-human components in the learning system (i.e. system features, relations, functions, and data) with heterogeneous human perspectives (i.e. intelligence, background experiences). Cziko (1989) and Sagan (1977) contend that students in this kind of human-technology learning system are components that are impossible to predict and measure because they are more complex then learning technologies. The difficulty of measurement means that transparency of human-technology pedagogical interactions represents a spectrum of events, such as those identified earlier in Figure 1. One end represents knowledge transfer that indicates machine to machine acquisition with complete openness. This contrasts with human to human learning that is less transparent in its workings due to immeasurable differences between people, as illustrated in Figure 3.

Figure 3. Transparency of human-technology pedagogical interactions

In this instance, accessibility is bounded by user capacity to learn (Peters and Roberts, 2012). Systems close to the Platonic openness scenario would be machine to machine learning systems, used extensively outside pedagogical environments and in the finance and energy markets (Fadullah *et al*, 2011). Applying this to machine-human interaction is a fertile prospect for further research and use that should strike a balance on our spectrum of learning interaction/events.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Scenario 4: Randomness

This is a system with indeterminacy and accessibility, which displays randomness because it is not observable by virtue of lack of patterns. However, it is tacitly received by the learner who has access to partly determine its behaviour through rules or functions of the system available through end-use interfaces. An example is a time series analysis conducted by a computer science student whereby the system/software rules and functions are accessible, the results of input equations are non-deterministic, and after some iteration's transparency is lost in terms of system behaviour (Fuenmayor, 1991; McComas, 2104). A more social example is a one to one conversation between a teacher and student. The conversation is not determinable despite availability of the topic of the conversation and rules of the language. The conversation can lack transparency by virtue of access to how differing perspectives deliver confusing conceptions throughout the conversation (Peters and Roberts, 2012).

Scenario 5: Closed Environment

We propose a transparent and accessible learning system that is not indeterminate. This is a closed system found in e-learning games with definite rules, syntax and a set of discernible patterns for the learner to engage with and utilise. We call such systems or sets of systems closed learning environments. Examples are found in Game Theory studied by learners in a host of fields including Economics, Finance, and Strategy that deals with non-cooperative games. Essentially, environments that provide zero-sum games (Mendelson, 2004:9) are examples found across e-learning platforms like Wolfram Mathematica and Gambit. The determinate nature of such platforms to some extent arises from the complete visibility of component workings (transparency) and access to a finite number of interactions by each learner (accessibility), whereby processes are discretely as well as jointly traceable. Whilst this kind of system is highly amenable to determinate outcomes, the indeterminacy of human error still remains a variable that represents imperfect transfer of knowledge and replication of learning strategy. In large part this is due to the bounded capacity of learners in HE environments aided by communication technologies (Morton, 2012: 147). The openness of a closed environment in so far as this is the ability to share knowledge at individual, group and organization wide levels is high because the platform in question demonstrates predictable, transparent, and accessible behaviour. Given formal axiomatized systems used in disciplines like economics and social sciences, the replication of content for learning is easier to study due to homogeneity of the content.

Scenario 6: Rote System

Finally, there is the scenario where a system is open to the extent that it is accessible, but neither is it indeterminate nor transparent. This type of user-technology e-learning system involves humans memorizing iterative content and replicating it. We recognize this as a single-loop learning system based on Argyris (1976). In this type of system learning takes place with content; however, the methods of learning (human mental models and technological functions) are not transparent for the user. Thus, what is determinate in relation to our indeterminate condition is at the content level rather than a methodological level. For example, a user constructing a pivot table is able to engage in rote learning by memorizing steps needed for using MS Excel functions. This is a matter of memorizing and replicating procedural steps that are determinate in their cause-effect relations (i.e. rote systems stand opposite to chaos systems of

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

learning proposed earlier). The transparency of user subjectivity as well as backend workings of the MS Excel software (i.e. Visual Basic scripts) is absent. In these types of e-learning systems and platforms, learning is severely limited, not innovative and tedious for HE students due to monotonous interactions. We propose that openness in a rote learning system is limited to educational subject specific content, without recourse to methodological or psychological operations. Tan (2011) argues that in UK HE education -within management and other disciplines - international students from the East often engage in rote learning, which is ineffective, and remains poorly recognised by most education providers. Rote learning is not an open system to the extent that content can be replicated without an understanding of 'context' (the connected texts and conditions of learners), that are continuously changing, indeterminate, and not transparent.

DISCUSSION AND EARLY CONSIDERATIONS

Higher Education is on the threshold of being transformed through the application, integration and utilisation of e-learning technologies in UK HEI's. However, it has been on the threshold for some time now (Goodfellow and Lea, 2007; Paiva *et al*, 2016; Turban *et al*, 2000). Personalisation, flexibility of delivery and inclusion of a wider participation are cited (Laurillard, 2008) as being key ambitions for learning e-technologies in education. However, perhaps we should not fully enter the route of making HE "techno friendly" institutes, because as discussed the current generation want to see the concrete benefits of "click and mortar" (Ashraf, 2009) learning before they sign up. The contributions of Internet learning should therefore count towards the completion of only part of the module (Goodfellow, 2005). An e-learning system that exhibits the proposed features of openness should recognize the excessive attribution of techno friendly cultures that cannot condition sustainable and deep long terms knowledge acquisition.

As previously discussed Openness is a novel concept that has limited research and application available in UK Higher Education (HE) management education. This paper has offered an preliminary investigation that considers the philosophy of Openness in a UK HE management education teaching and learning environment. It has discussed the philosophy of openness as a KT tool that might aid UK HE management education teaching and learning technology applications. The early focus being to investigate if the feasibility of developing a Knowledge Transfer Openness Matrix (KTOM) could assist and support the learning process and utilisation.

The KTOM appears to assist with the identification of systems that might facilitate or inhibit knowledge transfer across UK HE management education teaching and learning environments. This could be because KT predominantly depends on co-operation and collaboration between users (Goh, 2002:25), which varies across the types of systems (i.e. scenarios) identified in the KTOM. There exists scope for conceptual ambiguity in learning tasks involving KTOM systems. A closed environment (scenario 5) presents determinate conditions such those involved in solving a mathematical equation through graphical iterations. The homogenous character of such system variables coupled with rules and intended meanings, increases predictability as well as complexity of the learning system (Bauersfeld, 1980; Pea, 1987: 91). The error in learning may occur on the human side of the interaction when a closed environment interacts with user demands (Monetti *et al*, 2005: 5-6). Interaction between a closed environment and a chaotic system (scenario 1) for instance fuses objective encoding platforms with subjective tacit knowledge, whereby multiple meanings are attributed at innate tacit levels of psychological processing,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

compared with the more explicit and shared meanings intended for the platform. Hence, in so far as face to face human learning must compliment the more basic learning needs of e-learning users, conceptual ambiguity is a hazard in e-learning environments by virtue of human error, intended or otherwise. Whilst growing numbers in research endorse the idea that e-learning environments can be effectively used to enhance accessibility (Gladstone, 2000; Reeder *et al,* 2004*;* Weller, 2004; Kandiko and Mawer, 2012) our proposed system type categories (i.e. scenarios of KTOM) provide conceptualizations of e-learning environments. Coupled with the high penetration of learning technology in HE and positive outcomes for accessibility (Lanham and Zhou, 2003; Dobozy, 2012), the KTOM recognises that certain technologies through integration with human behaviour vary in terms of access to intended knowledge transfer and acquisition. KTOM characterizes systems that will recurrently arise through the progressive adoption of e-learning environments based on both accessibility and desire for greater access in education (Lanham and Zhou, 2003).

This is very early stage investigation offering an alternative approach that considers the real issue as whether a KTOM could help new generation of students see the concrete benefits of technology usage and implementation. The current and future challenge is to recognise the complexities and nuances of the modern context, and seek to create a UK HE teaching and learning environment that recognises the need to ensure academic relationships are as equal as possible. No academic system can exist by itself in the 21st century of HE.

Chapter 75
Corporates in the Digital Age

Hammad Azzam
Independent Researcher, USA

ABSTRACT

A proposition for digital transformation of global groups into efficient enterprises is introduced. At the heart of the proposition is a transformational practice aimed at creating a customer-focused, data-driven global culture in any customer-serving company. The digital age has added a level of complexity to the way we acquire and serve customers. Doing a good job in the traditional channels is not enough anymore. Online is increasingly becoming the channel of choice with the two main customer-interaction paradigms: sell and service. And building a great customer experience is probably the most essential factor of success for both functions.

INTRODUCTION

The digital revolution is far more significant than the invention of writing or even of printing. - Douglas Engelbart

The world is flat. Global enterprises are undergoing disruptive paradigm shifts where thinking outside the box and working with cutting edge technologies will create extraordinary synergies. These synergies will help conglomerates push the envelope and will allow thought leaders to leverage human capital and technological assets to break down new barriers and make a step change in the performance of organizations.

If the above sounds like empty business-techno jargon to you, it's because it is. We will do our best in this chapter to avoid all such generic clichés and focus on pragmatic approaches to solve a monumental problem: "How is digital transformation changing with time?".

It's public knowledge that the single most important driver in any corporate transformation journey is digital transformation. If you don't already know that, then welcome back from your 3 years hibernation. Jump on your nearest WIFI so you can get up to speed with the crazy things that have been happening around the world while you were slumbering (just a teaser, Trump is president, France won the World

Cup, and Britain existed the EU). Seriously though, there is no denying that digital is on every agenda. Few stats for you to know:

- *$1.3 trillion will be spent on digital transformation technologies in 2018 (IDC, 2017)*
- *By 2019, 5% of revenue will come through interaction with a customer's digital assistant (IDC, 2016)*
- *By 2021, one third of CEOs and COOs of Fortune 2000 companies will have spent at least 5 years of their career in a technology leadership role (IDC, 2016)*
- *27% of senior executives consider digital transformation a matter of survival (Coleman, 2017)*
- *The biggest disruptive technologies, as specified by global respondents, are the cloud (58%), mobility and collaboration (54%) and data (52%) (DCO Conclave, 2018)*
- *By the end of 2018, two-thirds of the CEOs of Global 2000 companies will have digital transformation at the center of their corporate strategy (IDC, 2017)*

Self-service is the path forward. Companies are slowly transforming to serve customers by helping them serve themselves, and as companies put their new strategy statements together, digital is being mentioned in every other sentence as the main growth agent.

Growth itself is the most important goal of any corporation. To grow a business you have to constantly acquire new customers and retain them as long as possible. If your attrition rate (opposite of retention) is bigger than your acquiring rate, your business is doomed.

To acquire customers, you have to have a reasonably priced product appealing to a segment of the population.

To retain customers, you have to service your customers well once they are acquired.

Sounds simple and straightforward. It also sounds too obvious to even mention. It's like saying "to swim, you have to be in the vicinity of water" or "to have a successful business you will need to make money."

In reality however, the digital age have added a level of complexity to the way we acquire and serve customers. Doing a good job in the traditional channels is not enough anymore. Online is increasingly becoming the channel of choice with the two main interaction paradigms: sell and service.

It also became very clear even at the early stages of the digital, that the first wave of digital transformation was not very effective. Just exporting existing applications from call centers or retail locations to online does not create a successful digital solution. To truly create a great customer experience we need to enable a casual user like the customer (as opposed to a trained profession like call center reps) to successfully use the digital assets. That was the main driver of the second digital transformation wave which was all about customer experience. In the next four sections, we will explore the four important factors that are crucial to enabling a customer-driver digital transformation in an enterprise.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

AVOID THE HYPE AND STAY GROUNDED

First and foremost is tackling the most obvious question: Why are companies struggling with customer experience practices and why dream results like the ones we see in Amazon or Google are so out of reach for so many companies? Executive teams are so obsessed with these companies they have created acronyms for them -- FANG (Facebook, Amazon, Netflix, Google) or FAAMG, etc. To be fair, it's an interesting question and deserves some space in this chapter. The revenue of just four companies, Apple, Amazon, Google and Facebook, is around $600 Billion. That's equivalent to the GDP of the following countries put together:

Gabon, North Korea, Brunei, Mozambique, Iceland, Cambodia, Equatorial Guinea, Papua New Guinea, Georgia, Botswana, Senegal, Zimbabwe, Congo, Republic of the, Jamaica, Namibia, Albania, Chad, Burkina Faso, Mauritius, Mongolia, Mali, Nicaragua, Laos, Macedonia, South Sudan, Armenia, Madagascar, Malta, New Caledonia, Benin, Tajikistan, Haiti, The Bahamas, Niger, Moldova, Rwanda, Kyrgyzstan, Kosovo, Monaco, Guinea, Liechtenstein, Malawi, French Polynesia, Bermuda, Suriname, Mauritania, Timor-Leste, Sierra Leone, Montenegro, Togo, Fiji, Swaziland, Barbados, Eritrea, Cayman Islands, Andorra, Curaçao, Guyana, Maldives, Burundi, Aruba, Greenland, Liberia, Lesotho, Bhutan, Cape Verde, San Marino, Central African Republic, Belize, Djibouti, Seychelles, Saint Lucia, Somalia, Zanzibar, Antigua and Barbuda, Guinea-Bissau, Solomon Islands, Sint Maarten, British Virgin Islands, Grenada, Saint Kitts and Nevis, The Gambia, Samoa, Vanuatu, Turks and Caicos Islands, Saint Vincent and the Grenadines, Comoros, Dominica, Tonga, São Tomé and Príncipe, Federated States of Micronesia, Cook Islands, Anguilla, Palau, Marshall Islands, Nauru, Kiribati, Montserrat and Tuvalu put together!

They must be doing something right!

Looking closely at FANG, you will notice that they never relied on overhyped initiatives. Their most profitable programs are well within-the-box ventures. The differentiator is execution. All hyped efforts are done for pure research and PR.

This is what we will explore in this chapter. The lines between futuristic concepts and practical implementations is not that thin, yet frequently organizations jump that line and dive heads on into science fiction like endeavors that are good for nothing more than a Hollywood effect. We will focus on what makes business sense and what needs to be done to move the digital train forward. We believe in three main paradigms that are prerequisites for digital transformation:

- Impeccable Technology Implementation: Including customer experience, usability and stack stability
- Customer-obsessiveness
- Artificial Intelligence

This chapter will address the first two.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

FOCUS ON IMPLEMENTATION

So, why do so many fail to replicate the fantastic user experiences that these elites have mastered? Why can't every company have these capabilities? Why can't everyone have that edge? Well, for starters, if everyone has it, it won't be an edge. If all companies can do these experiences effectively, customer experience will stop being a differentiator. Remember, to mathematically have superbly performing top 1%, you need to have tons of mediocre ones. There is still a lot of room for hard working, persistent, deep-pocketed enterprises to quantum-advance their customer experience, so why are we not seeing that happening often enough? Let me put on the table my theory, most of which are really opinions from experience.

First and foremost, there is a clear misunderstanding of what constitutes customer experience. Executive are convinced of the argument that engineers cannot build anything remotely usable and they need the UI/UX teams to really take the lead and make that significant jump into usability. UI eccentrics would love to tell you it's the sexy, beautiful front end screens that matter. UX teams would swear that it's all about the experience overall (flows, interactions, etc.) not just the look and feel. Engineers would focus on the correctness, stability and scalability of the application. The reality is all three disciplines are important, but engineering takes center stage. We are not discounting the importance of usability and customer experience, but rather than bringing another standalone discipline to the game, you need to equip your engineering organizations with the right usability-focused design/engineering resources. Separation of the two disciplines is the wrong thing to do. The core of the organization needs to be great engineering teams and usability needs to be instilled in the organizations DNA, not sit outside manufacturing exquisite UI and smooth flowing flows.

Every customer facing application consists of two parts:

1. Things You See. That includes the screens you browse, the paths you traverse, the errors you come across, etc. Most of that is built by engineers and UI teams and is governed by UX teams, as it should be.
2. Things You Don't See. That includes everything that goes on under the hood to make the application run well.

Corporate executives think that good experience is about the first, "Things You See". In reality, that is barely the tip of the iceberg. The majority of poorly performing websites and applications suffer from issues related to "Things You Don't See". Sounds very theoretical and abstract, so let's roll up the sleeves and zoom in.

"Things You See" is about designing the screens, the flows and the usability of the interface. It's about creating the web pages or the mobile screens that make sense from a customer perspective. Every screen should have easily understandable language, logically progressing flows and proper exception handling.

"Things You Don't See" is about everything else. It's about the web server, the authentication/authorization engines, the security framework, the logging framework, the session tracking application, the cloud services, the internal APIs, the external APIs, the load balancer, the application servers, the ports, the firewalls, the middleware, the databases, the messaging queues, the workflow manager, the Hadoop framework, the Kafka servers, the core platforms, the mainframes, the hardware, the EMC drives, IDMZ/EDMZ, the fault tolerance platforms, the data center, etc. The points of failures are almost infinite in this complex, technology behemoth.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

My contention is that most poorly performing websites and applications get their low marks on the "Things You Don't See" while most executive teams focus on "Things You See". ***It's all about building a correctly functioning, consistent, stable stack.*** There is no argument that aesthetics matter and eye candy enhance digital applications, but that is only a tiny piece of the good experience puzzle. A website UI needs to be good looking, but not necessarily mold-breaking. We are building a business application, not the next generation Hollywood visual effect box office blockbuster. Look at the most successful innovations out there and you will clearly see that beautiful UI is not a differentiator. Google Search is almost UI-less. Amazon is nothing to write home about. In fact, their website UI is borderline mediocre and it feels like something that an 18 year old savvy high school student can put together. Facebook front end is barely ok. Apple might be an exception. They pay extraordinary attention to aesthetics and it seems to be part of the brand. Based on these few data points, correlation between UI and success does not exist. Good UI is good enough. What is more important is to build a flawlessly performing stack.

Let's take closer look at Amazon. Why do we love that company? Is it because of the sexy website? Is it because of the graphics? Is it because of user experience? Is it because of the prices? The answer is "No" to all these questions. There is nothing beautiful about their website and no mind blowing structure in its flows that stands out. And if you want better prices, just go to your nearest Walmart.

We love amazon because of the following very important and very boring features:

1. The website works every time. Every click on every page has a very predictable outcome. I have never ever seen a technical error, a "page cannot be displayed" response, or slow performance/ timeout on their site. If I want to know if there is a problem with my WIFI connection, I check Amazon or Google websites. That's how stable their stack is.
2. Their fulfillment process works every time. They give me an estimated day of delivery and almost every time the item arrives on schedule. They have never failed to deliver one single item to my doorstep. And they have rarely failed on quality. I almost always get what I expect.
3. Their customer support is a true customer support. You will almost never hang up unhappy with them.

The anecdotes about the amazing exchanges that people had with Amazon Customer Support are almost endless. Each of us has either experienced it firsthand or heard it from close acquaintances. Sometimes it's about a package that arrived late (to make up for that Amazon refunded the customer, while the customer kept the product.) Another maybe about the product that never arrived, so Amazon sent another one. When both arrived and, being the honest man that you are, you called to inform them, you were told to keep both items as a little gift from Amazon. Granted these practices might be expensive, but they have made great impact on customer base through the best marketing tool of all: word of mouth. Amazon is willing to lose great margins for the sake of keeping the customer happy.

KEEP YOUR EYES ON THE CUSTOMER

Even if you make it idiot-proof someone will make a better idiot to break it

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Getting a fully functional, stable, usable stack is not enough. A good digital team needs to also make sure that the application in place is servicing the customer well. The best way to make sure that the customer is happy is to obsessively watch every step he takes, every move he makes, and every word he says.

All tactical and strategic decisions at all levels need to be driven by the customer. In other words, the company needs to be customer-centric, which usually comes in one of two forms:

1. *Customer-centric by name*, where the company touts its focus on the customer in presentations, in meetings, in mission statements, in high level strategic discussions, around the water fountain, in executive off-sites and every other PR venue possible.
2. *Real customer-centric companies*, where every employee is engaged every day, first and foremost with the customer, whether it's directly through the traditional channels, or indirectly through extraction of reports and insights about the customer behavior last week, yesterday, and even an hour ago.

And if you had problem getting my borderline sarcastic message, let me be more explicit. 1 is bad. 2 is good. However, 1 is easy. 2 is very hard. Most companies are somewhere in the middle of these two models with tendency to be closer to 1. Given how anxious all executives teams about building a great customer experience, it's surprising how little energy is spend on that. As a CEO, to get a good sense of how customer centric your company is, ask yourself the following questions:

- **Operations:** How often do I, and everyone in my organization, look at customer feedback. In any good size enterprise, customers leave hundreds, if not thousands, of comments every day on websites, on mobile apps, in branches and in every other channel. If there exists a properly formatted, easy to read data that your management team is looking at every day (won't take more than 10 minutes) to get a feel on what's happening on the ground, then customer-centricity is on your radar screen. If not, then you are leaving the most important part of the company's strategy out of your immediate agenda.
- **Strategy:** Are all your strategic decisions driven by what your customers are telling you, directly or indirectly? Are you driving how you invest in the company through your understanding of what your customers want and need? If yes, then you are customer centric.

Customer centricity is so important that it cannot be left to a specialized department to manage. It has to be sown into the fabric of the company's operations, at every level and in every organization. Fifteen years ago, this was very hard to do. Now, it's do-able, not easily, but do-able!

The journey to really make sense of the humanely-incomprehensible digital footprints that the customers leave behind is very difficult but the prize is well worth it. Some customers leave plenty of feedback behind, but many don't. It's extremely important to digest the feedback, but what's more important is to know the state of mind of those that don't communicate at all. These silent customers that click away on apps and websites are sending, in hidden code, thousands of messages every day telling enterprises what they can do to serve them better. Every requirement, every enhancement and every feature in every project should be derived from what feels like an infinity of unstructured clutter. The fact that the digital wave sweeping enterprises come with disproportionate increase in customer traffic makes the problem even harder. Not only customers are becoming digital, they are coming to our doorsteps 10 times more often than they used to. This tsunami of footprint makes it harder and harder for the enterprises to keep

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

their arms around the customer. As less customers visit the traditional channels and more customers connect digitally, our ability to understand what customers need and want is diminishing and the pursuit to become customer focused is becoming harder. In call centers, stores, or other traditional channels, customers will communicate their intent explicitly and we learn what's on their minds firsthand. Online customers, on the other hand, are rarely verbose and we will increasingly need to do forensic work to really understand what's on their mind. The trick to successfully manage a digital stack is figuring out how to extract simplified insights from the piles of logs. These insights will be part of a continuous feedback loop that will real-time course correct the performance of the channel.

Static Insights

The types of data to be monitored will vary and new reports need to be created continuously to keep the organization informed and up to date. There are however a certain set of static reports that are essential to the performance of the company and need to be in place first and foremost. These reports will focus on four aspects of customer behavior that are critical to successfully serve the customer.

The first batch is transaction reports. These are mostly business reports detailing transactions performance on a daily basis. They reflect the business performance of the organization and need to be circulated daily to the whole organization to keep everyone on the same page.

The second batch is error reports. These reports should have detailed views of all exceptions with indicators to show which ones are spiking on the last day. There are two types of errors to track, acceptable and unacceptable. Acceptable errors are correct and valid responses to failing scenarios. For example, when a customer enters the wrong password on a website, the proper response need to be handled and an error needs to be logged into the system. The unacceptable errors are technical issues or mishandled exceptions that are completely unexpected. Usually the acceptable errors are much more than the unacceptable ones and organizations strive to eliminate the second type. However a spike in any type of error (acceptable or not) needs to be addressed immediately. A "wrong password" error spike is most likely related to a systemic issue, rather than a sudden increase in the erroneous passwords entered by the customer.

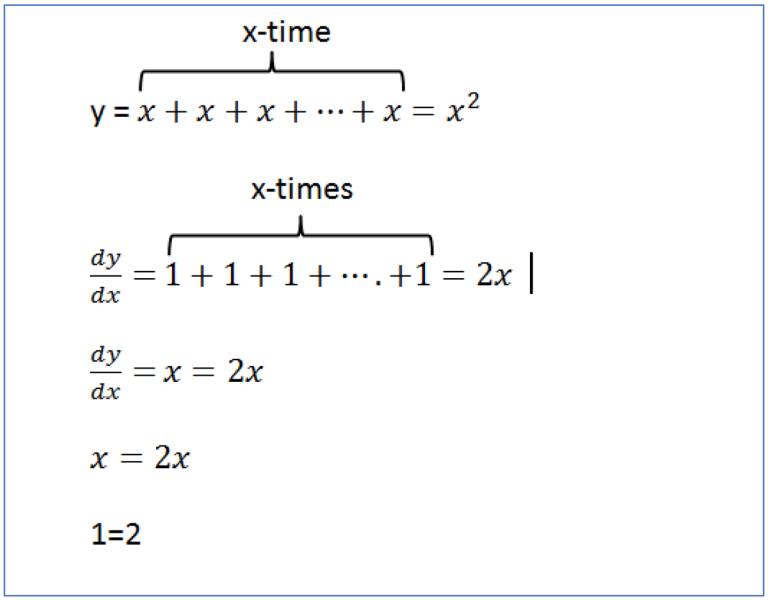
The third set is performance reports. That should include response times of backend systems and screen performance and snappiness. Properly optimized applications have a number of benefits for the company and the customer including better customer conversion, reduced hosting costs, and improved Google Search ranking.

Last but not least, customer feedback reports. These reports will show, in a structured way, the feedback customers leave behind.

Every self-respecting executive wants to constantly know what's going with the customer. The problem is that retrieving and digesting that information is just too hard. Important, properly distilled data is very hard to come by and getting that information in easy to sip doses is mission impossible. That is at the core of the concepts we propose. No matter how complex the problem, creating the easy to understand reports is a must. The skill of converting the heaps of data into a form share-able with the world is a must-have skillset for every manager.

Executive management teams need to be the first in line. The reason they don't dive daily into customer data is not because they prefer to spend their time in high level management meetings, off-sites, presentations, etc. The real reason is the lack of worthy reports.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use



When the full structure is in place, the benefits to the corporation will be immense. With executives watching the company's performance daily, the impact on the team will be great. The organization will be self-correcting. Before issues are spotted by the CEO, or the CIO, the vice president is aware and working the problem. Before the vice president picks up the phone to call the director about the issue, the coder is already fixing the code. He/she knows that everyone up the chain is seeing the problems he sees and his/her phone is about to start ringing. Before the CMO get the chance to ask about the lack of progress on sales after the campaign that launched yesterday, the business analyst is doing the investigation and working on course correction with the rest of the marketing team. This transparency in viewing the data can put everyone on the same page and align the organization behind what's important, the customer and the results.

Dynamic Insights

Obvious is the most dangerous word in Mathematics - E.T. Bell

Sometimes, hidden in the deep folds of obvious statements are false assumptions that lead to disastrous results. Instinctive reactions are helpful and true most of the time, but occasionally they are barely correct, and in some rare cases they are completely off. Take for the example the little trick we show in Figure 1. If you track the logic, you'll find it impenetrable, almost. I mean how could it be all true? It's a shot at the basic fundamentals of mathematics.

Figure 1. How to entertain a mathematician!

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

If you are the kind of person that always wants to solve the puzzle without help, then stop reading now and go bang your head against the table trying to CSI the problem. For those not in the mood, let me explain the very little and obscure hole in the logic above. The problem is in the second line. When we derived by x, we did not account for the change in the length of the right side. dy/dx is change of y divided by a change of x. As x changes, each entry in the sum changes by dx, but also the length of the series itself changes proportionally, impacting all the individual x increments.

This section of the chapter is about how to see the obscure, and how to systematically construct insights from data without falling into the trap of the obvious. Data is everywhere now. Chief Data Officers are popping up like daisies in the corporate world and they keep making their way upwards, justifiably so. The data compound is large and complex. As new data points get created, the permutations needed to extract truths grow exponentially. And the demand is growing proportionally. Hardly a day goes by without breakthrough articles being published that accentuate the importance of running data driven organizations in every company and at all levels. This borderline-unhealthy obsession with data has sent many corporations chasing dreams that are nonconcrete and, in some cases, imaginary. Worse, many groups and organizations are blindingly pursuing the abstract concept without really understanding what bottom line to pursue. The outcome, more often than not, is an organizational structure and a mission statement that do not tie, in any form, to the principal goals of the company.

To be clear, we are not discounting the significance of data. In fact we unreservedly believe that data will have more impact on the digital transformation journey than any other concept. Collecting, distilling and acting on the data is the only way to create the intelligent machinery that can help the organization run effectively and efficiently.

To less abstractly explain the benefits of running a data-driven organization, we will demonstrate the concepts of this section using a scaled down model which is devised purely for illustrative purposes. Our model, Tinymart, is a successful supermarket chain with 10 stores sprinkled on the US map. They sell 10 products called mini1 through mini10 and they are open weekdays from 8 AM to 10 PM and on weekend from noon to 6 PM. Christina Ellen Orlando is the CEO and she feels that running companies came second nature to her since early years of adulthood. Christina relies on her data officer, Douglass Oak, to get accurate details of the performance of the company.

The most basic report will have the number of items sold every day, by store and the revenue associated with every sale. That is a straightforward, easily generate-able view that makes sense. However, it's pretty much useless. It will look like a spreadsheet with product names and number of items sold by store (see Figure 2). It's actually not really completely useless, but it requires serious effort to understand what the numbers mean. Let's for example take the data point Mini1 sales in Store 2. Looking at the number by itself is meaningless. Looking at it in comparison with the rest of the stores is more insightful. The first question that comes to mind: why is Store 2 the lowest selling store for Mini1? Now data is starting to stand out. An obvious answer is maybe because Store2 is a smaller store, or maybe it's the worst location of the bunch. That theory does not hold ground. If that is the case then why are other products performing better in Store2? Store2 Mini1 sales are low because of something else. That last statement is a fantastic find. It's a vector, with magnitude and direction, pointing towards the best places to investigate, fix and improve performance.

Take this one step further. You don't want to scan the table looking for the low numbers. You want the low performing numbers to stand out. So instead of showing the raw data, Figure 4 shows the relative performance of every product in every store. This is accomplished by simply dividing each cell by the average sale for a product per store. For example, on average, Mini1 sold 6.8 units per store. That is the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

baseline for Mini1. Any store selling more than 6.8 Mini1 units is doing better than the average. Any store selling less than 6.8 Mini1 units is doing worse than average. Store 2 sold one Mini1 unit, which is 15% of the average, clearly underperforming compared to the rest of the stores. Now color code the cells and the bad performers will stand out (in red in Figure 4). The end result is a simple way to effortlessly glance at a report and spot actionable issues.

Figure 2. Corporate product sales by store and product

Average	7.1	7.4	8.3	7.4	6.7	7.3	7.6	8	7.6	7.8

	Store1	Store2	Store3	Store4	Store5	Store6	Store7	Store8	Store9	Store10
Mini1	127%	14%	60%	81%	119%	96%	132%	125%	66%	90%
Mini2	85%	122%	72%	68%	149%	96%	118%	113%	105%	115%
Mini3	70%	81%	108%	135%	104%	110%	132%	88%	132%	103%
Mini4	85%	135%	108%	68%	75%	96%	66%	75%	79%	128%
Mini5	99%	135%	120%	122%	134%	82%	66%	63%	105%	103%
Mini6	127%	95%	84%	68%	104%	96%	79%	88%	132%	115%
Mini7	113%	68%	96%	95%	75%	82%	118%	125%	132%	115%
Mini8	99%	135%	120%	95%	75%	68%	92%	100%	105%	77%
Mini9	70%	122%	120%	135%	90%	137%	92%	125%	66%	90%
Mini10	127%	95%	108%	135%	75%	137%	105%	100%	79%	64%

If what is more relevant is to compare how the products perform compared to each other in the same store, then Figure 5 is more fitting. Essentially, it shows the performance of each product baselined by the average the average number of units sold in the same store. After that, color coding will help you see which product is doing less than the rest in a specific store. An example for clarification, the third column shows the sales, by product, of Store 2. Sales of each product in that store are:

Mini1: 1
Mini2: 9
Mini3: 6
Mini4: 10
Mini5: 10
Mini6: 7
Mini7: 5
Mini8: 10
Mini9: 9
Mini10:7

The average number of units sold per product in Store 2 is 7.4. Dividing each entry for Store 2 by the average you get:

Mini1: 14%
Mini2: 122%
Mini3: 81%
Mini4: 135%
Mini5: 135%

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Mini6: 95%
Mini7: 68%
Mini8: 135%
Mini9: 122%
Mini10:95%

Finally, color coding shows the underperforming products, Mini 1 in this case.

Suppose the demographics that each store serves vary widely. Let's take Figure 6 for example. The population that Store 9 service is much larger than that of the rest and the stores. Also Store 2 population is much smaller than the rest. Any comparative views are useless. What will be useful in this case is to normalize the table by the population. Basically divide every entry by the total number of customers serviced by that store. The result is a view that differentiates the performance of a store regardless of the population served.

Figure 6. Corporate product sale normalized by population

	Store1	Store2	Store3	Store4	Store5	Store6	Store7	Store8	Store9	Store10

So, putting data in a spreadsheet and circulating it by email is a useless act. On the other hand, designing and building properly structured, insights-extracting, efficient reports can help you run a company efficiently.

The art of the reporting is also an important enabler. Data has to be shared daily, in emails (not on websites or portals) and has to be straightforward and easy to understand effortlessly. Figure 7 is an example that shows how a 30 second glance at a table will allow anyone to know exactly what is working

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

well and what's not (1 means yesterday's performance was like the average of the past 10 weeks. 1.2 means 20% better than the average. 0.5 means 50% less than the average). Nothing in the report requires explanation. It's blasphemy to use engineering terms. You cannot have a row titled "Transaction 4325", or "ord_fbr_rsd". Instead titles should be in plain terms that a person not familiar with the program can understand, like "New Fiber Residential Orders." Note the use of the word yesterday, instead of a specific date. You basically want to minimize effort when it comes to reading the data. It all has to be self-explanatory and straightforward and all data need to be actionable with no need for deciphering and analysis. This is in line with the theme of the whole chapter. Usability is not about creating beautiful art. Usability is about exerting energy in creating easy-to-understand themes across the company.

Figure 7. Corporate product sale by date with sale drops highlighted

LOOK FORWARD: AI

No data-driving digital transformation discussion is complete without a section on Artificial intelligence. No doubt we will need tens if not hundreds of data scientists running forensic jobs across all channels in order to produce new batches of intelligent reports, especially with the impending Internet of Things (IoT) at the gates. IoT is picking up steam and its market is vast and fast growing (we are quickly approaching $1trillion annual revenue.) Close to 30 million devices are plugged into the hive every month. That's like adding the population of the United States to the Internet every year. Cisco estimates that by 2020 there will be more than 3 devices per person on IoT.

With so many devices connected, the amount of data generated by IoT is enormous and borderline unmanageable which will only make data science orders of magnitude more complex. However, there is no escaping this. Enterprises will have to understand their digital customers better and those companies that will mine that data effectively will be the ones that prosper (whether the data comes directly from the customer or from IoT devices serving the customer). To do this right we need to infuse artificial intelligence in most technology initiatives and we need to change the way we view this mountains of data from being a problem to being an opportunity. Machine Learning based systems that can autonomously sift through the heaps of data deposited by the customer will thrive and help propel AI forward. Machine learning is most effective when the parameters needed are not clear. In essence, when you unleash a competent set of algorithms using machine learning on such unstructured data like, you can potentially get answers to questions you haven't even started to ask.

AI is going to be a major enabler in the future and we will need to create intelligent frameworks in every aspect of the enterprise to unlock its potential, but that is a discussion for another chapter.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

The digital transformation journey has an offspring called Customer Experience. As digital is becoming the norm and migration to digital is coming to completion, most transformed corporations are shifting the focus to perfecting the customer experience. The most successful organizations are the ones less focused on building overhyped futuristic programs and more focused on the mundane task of managing all customer interactions efficiently. Unfortunately, the volume of interactions have grown exponentially since the shift to digital. Those who mastered mining the footprints left behind by these interactions efficiently will excel in the digital age.

Chapter 76
Challenges Facing Health Service Delivery in Developing Countries and Solution Approaches:
The Case of Benin, a West-African Developing Country

ABSTRACT

This chapter describes a case study of the poor access to healthcare in the developing the countries with more focus on the rural areas and presents an adapted remote care delivery system approach for improving and increasing the access to healthcare services by overcoming certain cultural, social, financial, and linguistic barriers. The remote care delivery system integrates traditional practitioners because most people are more confident with the traditional medicine. The chapter presents the results of a practical on-site test of the proposed system. The test has shown the potentiality of the proposed system to improve the quality and effectiveness of healthcare and increase the accessibility of health-care systems. The chapter also discusses the obstacles for applying standard telemedicine systems and e-health solutions in the developing world.

INTRODUCTION

In the recent years, the burden of diseases is rapidly increasing in the developing countries. Most people living in developing countries and particularly in rural area are facing poor access to health care delivery services. The care units in rural regions lack expert medical specialists or most health professionals working there are undertrained (Thierry Oscar Edoh, 2010a). Further, existing medical infrastructures (facilities) are in a poor state. Care units are particularly scarce in rural areas and/or urban slums. Many urban areas are also facing care infrastructures issues similar to rural areas. Beyond the poor health care facilities and lack of care experts at pharmacy care units, which are underlying the poor access to health care services, the socioeconomic and cultural factors are decisive in how regularly a patient can visit a doctor (attend a health center in person). The few patients coming from remote areas who visit a healthcare facility are often hospitalized instead of being ambulatory or remotely treated and thus occupy unnecessarily hospital beds and cause unnecessary costs.

In the case of chronic infectious diseases such as HIV/AIDS and non-communicable diseases (i.e. diabetes, cardiovascular diseases, cancer.), a medical prevention, for patients living in underserved areas (region with healthcare facilities in poor state or without health unit), means regularly consulting doctors/nurses to perform certain medical examinations (i.e. blood test) and eventually re-adjusting their current medication. These medical routines at a healthcare facility are linked to relatively enormous and recurring costs for the patients or their relatives. According to the World Bank, most people in developing countries are living on less than one dollar a day. Therefore, beyond the poor state of most health care facilities, the economic situation, and poverty in the developing countries are part of the leading causes of poor health care services accessibility. Patient living on less than one dollar a day would prefer to buy food stuff instead of visiting a doctor, even in the case of chronic diseases [Results of our survey].

Most investigations carried out by the WHO have reportedly indicated that the poverty, lack of political will, poor national economy and not least the poor organization are the main challenges facing the health systems in Sub-Saharan Africa (SSA) countries. A study (Adeya & Cavanaugh, 2007) carried out by United States Agency for International Development (USAID) in Benin stated that the main problem of the poor healthcare services accessibility is due to severe lack of medical care facilities, particularly in urban slums and rural regions and additionally the lack of specialists due to brain drain. Similar conclusions have been made in studies conducted in other developing countries. A review conducted in (Harrison, Cohen, & Walton, 2015) indicates that unsafe and poor quality care such as infection, medication error or misuse and lack of patient safety skills are challenges being faced in the Southeast Asian developing countries. Another study on maternal health care (Srivastava, Bilal, Preety, & Sanghita, 2015) had concluded that, in the developing countries, safe deliveries remain a major challenge and barriers to utilization of institutional deliveries also pose a major challenge for healthcare programs.

A peculiarity of the health system in the Sub-Saharan-African countries is the wide absence of Information and Communication Technology (ICT) systems, particularly in rural areas. The weak ICT system landscape in the healthcare systems and its poor usage are discussed in Thierry Oscar Edoh, (2010a) and T.O. Edoh and Teege (2010). In nearly all cases, patient data processing is carried out manually using paper documents. Other ICT systems applications, such as data mining or communication platforms are also mostly absenting in the African health sector. Medical statistics are scarcely conducted. A group of researchers has examined the Kenyan health system and noticed a "Digital Divide" in African countries. Even for South Africa, an earlier Study (Mars, Seebregts, & Rockefeller Foundation, 2008) pointed out major obstacles for a successful introduction of ICT in the health sector. In (Scott & Mars, 2015), the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

authors discussed Health care services issues and analyze the needs of the developing world accordingly. Certain of these issues are poverty, communicable diseases, maternal and child health, violence and conflict and workforce shortages.

Launching Information and Communication Technology systems into the health care in the developing countries presents certain challenges with regards to the technology level and the existing infrastructure. The Health Information System Program (HISP) project(Scott & Mars, 2015) thus worked for more than 10 years to develop and launch the District Health Information Software (DHIS) system described in (J. J. Braa & Hedberg, 2002) and summarized in (Keeton, 2012).

In developed countries such as Ireland, there exists a Homecare system project named CASALA, which is designed and implemented for elderly people. This has shown how Homecare and Telemonitoring can increase access to the health care delivery system for old and disabled people. Telehealthcare system is launched in Ireland to improve the access to the health care for isolated people. Certain reports (Sluizer, S., Cashman, 1984; Khani, 2015) estimate that outpatients have to wait up to 2 hours before being examined by a medical doctor. The 2011 International IT and Connected Healthcare Solution Summit, taken place on 11th & 12th May 2011 in Dublin, has shown how Telehealthcare help to increase the health care services in Ireland.

Telehealthcare/Telemedicine is showing to improve health care services in developed countries like Ireland (e.g. eHealth ERA project), USA (Alaska, e. g. AFHCAN Project), Greenland (e.g. TEMS system) particularly in isolated regions (Niclasen & Mulvad, 2010; Haveman & Flim, 2007). Adapted Telemedicine/Telehealthcare Technologies and solutions could also be implemented to improve the poor access to health care services in the developing world.

This study aims at investigating the causes of poor health care services accessibility in the different health care systems in the developing world. It further pursues the objective to improve the health care services and increase access to healthcare services. An important objective of the present study is to investigate why, in the developing countries and particularly in Benin, only a few people use the health delivery services. It is reported in (Klein, 2005) that:

(…) Although in the meantime 83% of the population has access to the national health care delivery, only 36% of the population uses this.

The main point is how to tackle the challenges such as the poor health care accessibility as well as the quality of the health care services. Two major questions therefore arise:

1. Why only a few people (36% of the population) use national health care services?
2. What are the causes of the relatively poor health care accessibility in the developing world?
3. Could the access to health care services be improved as well as increased by launching information and communication technology (ICT) systems into the health care systems in the developing world?

In Thierry Oscar Edoh (2010a) the causes underlying the poor access to health care services are investigated and analyzed. It is figured out that launching Telehealthcare into the health care systems in the developing countries could be a solution to tackle the challenges mentioned above, so that expert medical specialists could remotely assist undertrained caregivers working in urban slums and/or rural health care centers in providing preventive, curative, promotional or rehabilitative health care services.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A survey on mobile health (mHealth) adoption in developing countries reported that the use of certain mHealth technologies shows improvements in health care processes and health performance indicators (KPIs) (Chib, Velthoven, Car, & Helena, 2015).

This case-study on the health care systems in the developing world with a focus on the health care system in Benin, a West African country will be described in the following sections. The study results, solution approaches, and recommendations that are implemented for Benin could be also generalized and implemented for all SSA countries as well as other developing countries with respect to cultural and traditional means as well as social, economic, and technology level. The health care systems are similar in all SSA countries. The cultural and traditional means also do.

STUDY METHODS AND DATA

We conducted a case study from May 2007 until to November 2011 in Benin. Furthermore, we evaluated the accessibility of healthcare services in Benin from 2014 to. In 2016, the poor access to healthcare remains one of the main issues in the health system in Benin. In 2010, an eHealth system to improve access to pharmaceutical care in developing countries and particularly in Benin was implemented and tested in situ. By means of an ICT system called **"**ePharmacyNet**"**. ePharmacyNet is an E-commerce based eHealth-solution designed to increase access to the pharmaceutical care in the developing world. An on-site evaluation of the ePharmacyNet has shown how a simple adapted E-commerce system can improve the care provision delivery in developing countries. According to Maurice Mars et al. in (Scott & Mars, 2015), an E-commerce (the business side) is one of four (04) main elements of e-health. The other three (03) main elements are E-learning (the training – awareness, teaching, instruction, and education – side), Health informatics (the data gathering, storage, analysis, and distribution side), and Telehealth (the interactive – real-time or store-and-forward – side).

Samples Selection

To get more insight into the diverse issues and problems the health systems are being faced in the developing world, a quantitative and qualitative evaluation of the health care in different African countries is conducted. Thus, various prospective randomized studies in several African health care systems were performed. Health professionals, health bodies and patients from five (05) sub-Saharan African (SSA) countries(Thierry Oscar Edoh, 2010b; Thierry Oscar Edoh & Teege, 2011) were interviewed. The following countries are selected regarding the cultural, linguistic similarity as well as social and economic diversity (Income level, technology level):

1. Benin
2. Togo
3. Ghana
4. Ivory Coast and
5. Cameroon

Additionally, an exhaustive and comprehensive literature research was conducted about health care systems and health care services accessibilities in the developing countries (Srivastava et al., 2015).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Among the literature we used following ones are best described the challenges facing the health care system in South Africa, in Tanzania, Nigeria, Kenya, Morocco, and Algeria (Williamson, Heywood, Williamson, Stoops, & Heywood, 2015; Mayosi et al., 2014; Thierry Oscar Edoh, 2010b; Adeya & Cavanaugh, 2007; Rotich, Hannan, Smith, Odero, Nguyen, Mamlin, Mamlin, Einterz, & Tierney, 2003; J. Braa & Hedberg, 2000; WHO Africa 2011; Development, Development, Hospital, & Hospital, 2015; WHO, 2015 -http://www.who.int/features/2014/morocco-maternal-health/en/-).

A snowball approach was used to select the relevant literature. The references in each paper are considered as the contact that links to another significant literature.

Study Data

Surveys are also conducted using questionnaires (online and paper format) and 1:1 interview. The surveys are focused on collecting data relating to:

1. Healthcare Accessibility,
2. Quality of health care services and health costs),
3. Use of traditional health care services,
4. Usage of Information and Communication Technologies and systems within the health care systems, and
5. Patient Education and Diseases Awareness.

The collected data were evaluated in the light of sociocultural influences, traditional manners, financial and familiar situation, as well as the education level the interviewees own.

The health care system in Benin was selected study's case to represent the whole SSA since a previous study had shown the similarity between all health care systems in SSA. Participants (*see* Table 1) to the study were public as well as private hospitals, clinics, district hospitals, rural health units, pharmacies.

We investigated the below questions relating to patient education. A comprehensive study has been performed, examining problems and solutions in fields of patient education, access to and quality of existing health information materials, access to the internet.

Q1: Is the Internet a source for health information materials?

Nowadays a lot of people are using the internet to get quickly informed about diseases and treatment. The survey has clearly pointed out this aspect.

Q2: *What is the quality of the health information materials from the internet?*

We investigate this question. Unfortunately, we cannot make any statement on the quality of the health information material from the internet. We just have a tendency, a lot of materials are consistent, the containing information is somehow biased. Certain materials are of good quality. In our forthcoming work, we will deeply analyze together with health care professionals an important sample of these materials to get more insight into their quality.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Q3: *How to assure the quality of the health information materials from the internet?*

Once we get more insight into the quality of the materials, we would design solution approaches to assure more quality in order to prevent health issues among the population using these materials.

Q4: *Do health systems use the internet to inform the population about diseases outbreak and how to prevent them?*

Our investigation shows that the health system in Benin has already used the internet to spread information on diseases. The recent case was during the Lassa outbreak in the north of the country.

Q5: *How to reach underserved population, that do not own infrastructure to access the internet, in case the internet becomes a secure platform for dissemination of medical information?*

An on-site test, we already conducted in the scope of previous work has shown that employing school teachers and other educated people in these regions can help to disseminate information on important subjects. These selected people could collect the information and disseminate it among the rural underserved population.

We pose a range of research hypotheses and verified them using the collected data and data analysis.

H1: *Nowadays people are getting health educated through the internet rather than by health care professionals*

This hypothesis is confirmed. Most interviewed people state to use the internet to get quickly informed, to seek for treatment methods and to compare the medication taking abroad in another health system. Most people seek health information from western countries because they are confident that these information materials are of good quality and, the medical treatment methods are better than the owner.

H2: *Highly educated people rather collect health information materials from the internet purposely for their own medical education than less educated people*

True. High educated purposely seek information on the internet. They have more ability and knowledge on how to use, to seek information on the internet. Most of them are using the internet for their daily work. Less educated with less social status only properly use the internet in their spare time. Also, they do not have the same ability as highly educated people.

H3: *Young people independently of their education level are less interesting in medical education*

We can figure out that girls are more interested in medical concerns than boys. WE have also noticed that the education is determinant here. Education girls are five (05) times more interested in medical means than less or not education.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

H4: *Young people are rather using the internet for joining social network than participating to online health communities*

This hypothesis is verified for young people, who use the internet more to attend social forums such as Facebook, WhatsApp, Skype, etc.

H5: *People living far from health care centers are more interested in online medical education*

These people behave similarly like other people. We cannot point out any difference. This hypothesis is rejected based on collected data.

H6: *Despite the collected information and materials from the internet and health communities, people more follow the doctor advises*

In the case of acute health conditions people tend to follow the collected information from the internet than the advice of a doctor, they further mostly avoid visiting doctors. Though in the case of chronic health conditions they behave differently, follow more doctors advises. They then go to traditional healers for two main reasons: (1) financial issues, (2) no satisfaction with the medical treatment at the hospital.

H7: *Most of the people whose use the internet to get educated on medical concerns cannot verify the quality of the materials they collect from the internet*

That's true. The study reveals this. The main reason is the lack of medical knowledge and capability to verify the content of the materials.

Table 1. Participants in the study

Category of health Care Units	Number of participating Units	Number of employees involved
University clinics (CNHU)	1	03
Departmental Hospitals (HD)	2	10
District and rural health care units	25	50
Individuals/Patients	495	00

Study Limitations

The main issues were the lack of information at the national level about the health care system. The collected data are mostly from academic studies carried out by non-African universities or international organization such as USAID. Less information is collected at the selected units. The Electronic Medical Records (EMR) system are most scarce or nonexistent. The few patient data found are stored on papers

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and are not complete. This leads us to conduct a survey at each selected health care system to collect complementary data in order to get a complete picture for a better analysis. The collected are therefore carefully evaluated and compared with the data from the literature.

STUDY RESULTS

Patient Education and Diseases Awareness (Health Literacy)

We adapted surveys from/of Agency For Healthcare Research and Quality (AHRQ) (AHRQ -, n.d.) to measure health literacy of the people and thus provide them with medical education materials through the system in order to improve their diseases awareness. The National Library of Health Medicine defines health literacy as the degree to which individuals have the capacity to obtain, process, and understand basic health information and services needed to make appropriate health decisions. For the measurement of health literacy, we make use the Medical Term Recognition Test (METER) that consists of 32 medical words and 27 non-medical words. We define Score as number correctly identified medical words/ number incorrectly identified words. Scoring categories are:

1. Low literacy (0-15 words),
2. Marginal literacy (16-25 words),
3. Functional literacy (25-32 words)

The results of the patient education and diseases awareness survey show that subjects between 18 and 31 years old, independently of their education level, have similar score average between 25 and 30. We noticed similar score with Subjects older than 31 years.

Similarities in the Health Care Systems in Africa

Three (03) health regions are identified in the entire Africa (Figure 1), where all countries within a health region have similar health care system, health care deliveries issues, and economic level. The health care system and the quality of care deliveries in the countries in health region III are higher than those in the health region I. The access to health care and pharmaceutical care in the region III health systems are like the health care systems in the developed countries. Beyond these aspects, the rural areas in health region III are however facing similar issues like rural areas in health region I and II.

An annual report carried out by WHO confirms this result. The report says that the: (…). Usage of primary health services has increased but remains strongly marked by the disparity between urban and rural areas (…) [WHO 2014]

The health region II presents a special health care landscape. Different health care deliveries and services are identified within the same country (Thierry Oscar Edoh, 2010b).

A common aspect of the health care services in the developing countries is that the patient living in a rural region must go (by feet) a long distance (at least 30 km) before he reaches the next medical care facility able to give to him the specialized care he is looking for. For example, in Benin, it is difficult for patients living in the north and particularly in rural regions to visit (high) specialized health centres in

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Cotonou or Porto-Novo (the two large cities in south of the countries), because of the high Transportation's expenditure and the cost of their staying in the large city during the treatment period.

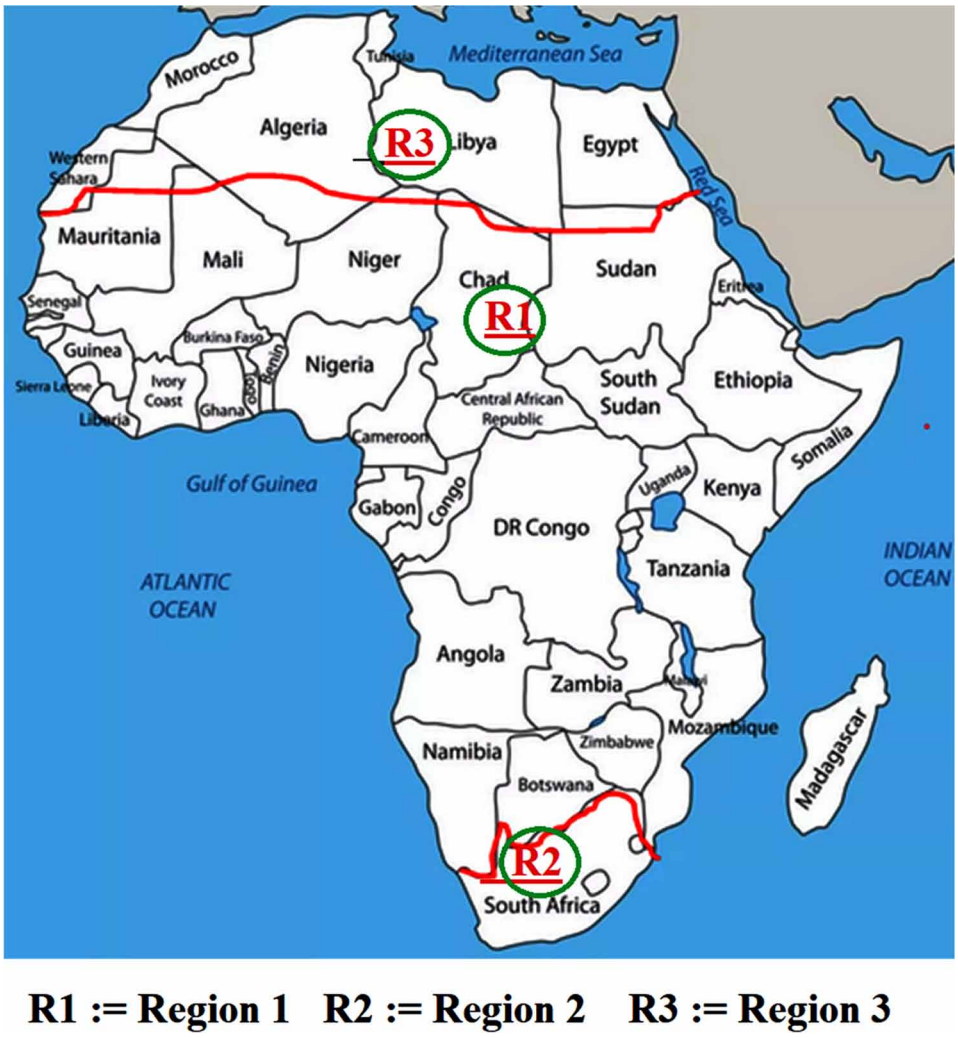
Regarding the structure (Figure 2) of the health care system in Benin, each village, city, and commune in Benin may have at least one health care facility for the primary and secondary health care services. Unfortunately, not all Benin health regions possess a health care unit. The rural health regions are severely affected by the problem of the lack of health care unit. The health system, in Benin, is, furthermore, facing the poor access to pharmaceutical care. The density of pharmacies is extremely low in the entire country. In (Thierry Oscar Edoh & Teege, 2011), the poor access to the pharmaceutical care is investigated and analyzed. As result, an adapted E-commerce system, called ePharmacyNet, was designed and implemented to solve tackle this challenge.

In terms of health care delivery issues, the major challenges the health care system in Benin is facing are similar to those the Greenlandic health system has started fighting against in 2010 (Niclasen & Mulvad, 2010). However, Benin does not have the same telecommunication and city infrastructures like Greenland. Therefore, the main question to be addressed is whether the access to healthcare particularly in rural regions can be improved using Telehealthcare systems technologies inspired by the Telemedicine system implemented in Greenland and adapt them to the technical and economic realities in Benin. Telemedicine or eHealth is understood as the use of information and telecommunications system to provide remote health care to the population. Telemedicine is usually assumed to mean curative practices. Telemedicine is playing an increasing role in health development, in education and training, in quality improvement and in the improvement of efficiency of health care services (J. J. Braa & Hedberg, 2002).

Before launching e-health solution in the health care delivery system in Benin, each of the obstacles found regarding the present context would be analyzed in the step, and the system concept would accordingly be adapted. Since the obstacles are like those, which the authors found by launching ePharmacyNet the authors only discuss here the obstacles, which particularly concern the Launch of a remote care delivery system called eHospitalNet.

Challenges Facing the Health Care System

The literature research and surveys let us to identify the major challenges facing the health system, namely the limited economic resources, demographic structure (quickly growing population), big burden of diseases, rapid epidemiological changes, increased demand for specialized treatment, brain drain of health professionals, lack of health insurance and poor access to healthcare, particularly severe in rural areas and in the urban slums.



Structure and Infrastructure of Health Care Systems in the Developing Countries

The health care systems in most of the developing countries are similar. In a previous study, we pointed out that the health care systems in all sub-Saharan African (SSA) countries present similar structures, are facing the same infrastructural challenges (Thierry Oscar Edoh, 2010a). Asian developing countries' health care systems are however more developed than the SSA ones. Though, they face at diverse level similar infrastructural issues.

This section focuses on the structure and infrastructure in SSA countries. The health care system in the SSA countries falls under the purview of the Ministry of Health (MOH) and aims at providing ap-

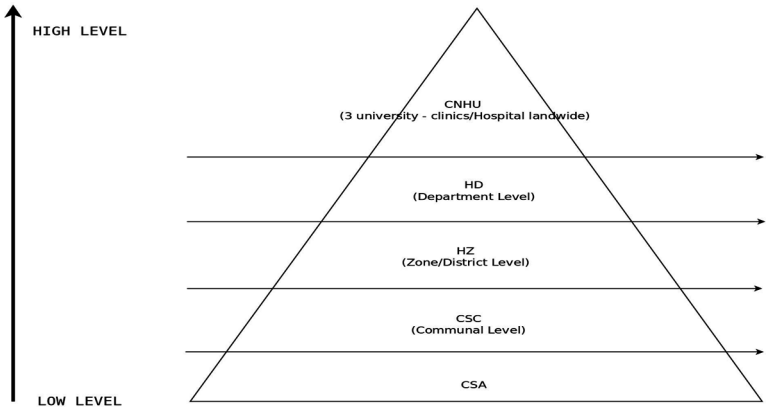
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Regions with similar health care systems and health care services accessibilities

propriate, qualitative health care services to the population even in the rural regions. Therefore, all SSA countries organize their health care systems in form of a pyramid consisting of three (03) services levels:

1. National Level is assigned with the tasks to define the national health policies.
2. Middle-Level coordinates (at least theoretically) all activities defined at national level.
3. The municipality, City, and District Level represent the decentralized unit. Medical facilities are subdivided into hospitals and a network of public or private medical services. They are intended to assure good accessibility to the healthcare delivery facilities.

The healthcare system based on two pillars, the public and the private health care sector, both parts of the system are under the responsibility of the Ministry of Health (MoH).



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In Benin, the medical infrastructure, also based on public and private health care sectors, presents a pyramid-shaped structure with five (05) levels (Maniatopoulos et al., 2009), which are, from the button to the top of the pyramid,

1. County Hospital/ Health Centre: CSA (Centre de Santé d'Arrondissement),
2. Communal Hospital/Health Center: CSC (Centre de Santé Communal),
3. District Hospital: HZ (Hopital de Zone),
4. Department Hospital: HD (Hopital Departemental), and
5. University Hospital: CNHU (Centre National Hospitalier et Universitaire).

Figure 2 illustrates the different levels of the healthcare infrastructure in Benin. The facilities of the lowest level (CSA) just provide the primary healthcare delivery, such as a small surgery (injury) or consultation for malaria infection. The next level, CSC, offers a little more health services. Therefore, the amount of the beds in a CSC is about 13 beds and more personal, and ambulance station (The third level, HZ, from below of the pyramid), can provide almost all conventional medical achievements and possesses a relatively good healthcare delivery system. The amount of the employees is higher than in a CSA and a CSC together and up to 200 beds are available in the category of hospital. The number of inpatient per year is clearly higher than in a CSA and a CSC combined. (30270 receptions per year comparing to 16996 receptions per year in the CNHU) (Adeya & Cavanaugh, 2007). Our research results reveal that these situations remain till date.

Figure 2. Structure of the healthcare system in Benin

Each Hospital of type HD has a capacity of around 300 beds. University Hospital (CNHU) disposes of up to 600 beds. The difference between both health care facilities categories HD and CNHU is about the amount of personnel and the beds, and the size of the health care delivery services: for example, radiology or cardiology department is more important and more equipped in a CNHU than in an HD. CNHU has more care specialists and is a university clinic. In comparison with HD, research projects are carried out in CNHU. There are more beds in large cities and particularly in the south of the country. A Report of the ministry of health (MoH) in 2004 had issued the disparity between different health centers

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

concerning a number of beds, care specialists and medical infrastructure. A survey conducted in 2014 in the scope of the present study, revealed that these disparity issues reported by the MoH in 2004 are not yet fixed. Table 2 summarizes the amount of existing medical facilities in the entire country as well as their density.

Table 2. Medical facilities in Benin and its distribution

Facility Categories	Facilities per Department	Total of Facilities in Benin

CNHU *(Available only in Cotonou, Porto-Novo, and Parakou At national level: [CNHU-HKM], [CNHPP l'HOMEL] [CNHNP Jaquât].)*	1	003
Facilities in medical private sector	> 400 *(In Cotonou only)*	2197 *(legal & illegal)*

Disparities in Access to Healthcare

Differences in access to healthcare across the different populations are the consequence of the structure described above and weak health care infrastructure and thus the main issues facing the healthcare system in the SSA countries. The medical facilities are often too far from the residential areas. Most rural regions lack municipal infrastructures such as streets, energy supply system, etc. The access to healthcare depends therefore on the place of residence of the patient. Thus, the rural populations have a poor access to healthcare in comparison to the urban population. In addition, the economic situation is an important factor impacting the degree of the access to the healthcare delivering services. Due to the large distance between the places of residence and the pharmacies, pharmaceutical care also remains a major challenging problem that the healthcare system is facing (Thierry Oscar Edoh & Teege, 2011).

As in most SSA countries, in Benin for example, 51% of the women are living relatively close to a hospital, more than 13% of the women live at least 30 kilometers far away from a hospital or a comparable facility, and the remainder has a poor access to medical care (Klein, 2005). About 15% of healthcare provision in Benin is provided by the private health sector. Most of the private health sector is in large cities. The quality of the services provided by the private sector is higher and more expensive than services provided by the public sector. The private health care provision is only accessible for a part of the population, namely the rich population, Government members and their families. There exists also a "cheaper private sector" in the healthcare system that is consisting of small facilities with a maximum of three employees with elementary medicine background. There are only nurses who just provide basic healthcare services like prescription in case of non-complex malaria and/or small injuries.

The healthcare provision in rural regions is almost non-existent. The causes are mainly the lack of medical infrastructure, missing of care specialists, health professionals, undertrained staff, insufficient funding of the health system (health insurance policies are scarce).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Many annual reports carried out by the World Health Organisation (WHO) have reportedly indicated that healthcare systems in the Sub-Saharan African countries are in a poor state; however, these reports have never discussed the true causes leading to the poor healthcare provisions and disparities in access to healthcare. The poverty is the most cited cause. However, the poverty is only the peak of the iceberg. The low density of pharmacies and health centers in the entire country, the lack of health insurances are the main causes of the disparities in the accessibility to health care.

Poor Pharmaceutical Care and Problems of Counterfeit Drugs

In the large cities as in rural regions, it is often difficult to purchase all medicine on a prescription in one pharmacy. Often the patient must search in several pharmacies for the medicine and sometimes the patient cannot purchase all prescribed products. All SSA countries are facing this challenge at diverse level.

The health care systems in SSA countries are also suffering from counterfeit drugs, which can be purchased at any market place. Despite the various registered adverse drug reactions, death cases, most people prefer to purchase the dangerous drugs (counterfeit drugs), because they are very low priced than the products at legal pharmacies, and are available anytime at the market while the pharmacies are often facing the drugs shortage. In South Africa, the villages and/or slums/ghetto are facing the drug stock-out more than the large cities.

Medical Data Processing, Communication Systems, and Usage of ICT in Public Health Care

A typical aspect of the health system situation in these countries is strongly limited use of information and communication technology (ICT). In nearly all cases patient data processing is carried out manually using paper documents. Other ICT systems applications, such as data mining or communication platforms are also mostly absent in the African health sector. Medical statistics are rarely conducted.

Data gathering and processing in the health care system of Benin remain largely paper-based. The paper based data management systems about the living situation of people particularly in rural areas and slums, the rate of illiteracy and the poor organization of the health care centers impact negatively the quality of the medical data, the data security and thus the medical care. The patient data are recorded in a booklet (*Figure 3*), which patients keep at home. Most of the patients, particularly in rural areas and urban slums, regularly lose their medical booklet. This influences negatively the data protection/integrity and data security.

Electronic medical records are scarcely used in the health care system in Benin. There exists no ICT based data processing system at the different health care units. This situation is more severe at all health care unit in the poor regions, rural regions, and slums. Patient medical data are recorded in a register. The information contained in such registers is incomplete and has no benefit for the care develiry. During the study, many registers were found in a bad state under the table of the nurses or in a storehouse. Each patient must buy at each medical visit a booklet to record his data into it. The recorded data are temperature, name, address, weight, and size. At the end of the medical visit, the nurse records the prescription into the booklet. At the next visit, the nurse collects the booklet but does not use the information contained in it. The patient and health care professionals contribute together to data loss in the system. More than 1000 booklets were evaluated. The evaluated booklets contain no health history or any data useful for a care delivery.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Beyond the poor patient data processing, information exchange and communication within the healthcare system is mostly paper based and takes long. The medical institutions have almost no IT infrastructure, particularly the medical facilities at the lowest level are poorly equipped.

Consequences of the situation described above are that 85% of reports and/or information within the system are wrong or contain incorrect data and are thus useless and can negatively affect the quality of the care delivery. In 1999, the USAID found out that 74% of the report contains errors. In 2014/2016, we found that the amount is higher than the one found in 1999. In conclusion, the error rate has risen at the rate of 11%. The main reason is the complexity of care delivery and the demographic factor.

(…) Data quality is still a problem because reports are not free from errors. An internal evaluation of SNIGS conducted in 1999 revealed that the proportion of errors in the reports transmitted was not significant. However, considerable errors and distortions existed in certain of the epidemiological data (for example, 74 percent of reports on new cases contained errors). (…) [USAID]

The ministry of Health (MOH) indicated in its report on May 2007 that National Information and Sanitary Management System (French: *Système National d'Information et de Gestion Sanitaires* -SNIGS) disposes of databases at the central, departmental and certain health zones level. Unfortunately, these digital databases cannot currently (in 2016/2017) be accessed through the Internet. There is a case definition for the data in it and standardized collection method. Following tasks are assigned to the actor within the system: (i) Epidemiological surveillance, quarterly meetings, (ii) Routine system (departmental team and sanitary zones) of annual meetings with the team SNIGS Central to validate the data and discuss the inconsistencies. The MOH has objectively declared that the annual meeting at the central level is insufficient and therefore has no effect on the expected improvement of the quality of the data at the departmental level (Ministere de la santé, 2007).

In 2017, we briefly investigate the use of SNIGS and find the usability tedious for people with less education level. The system contains a lot of information, but not complete, for example, we find no entry about pharmacovigilance, no entry about off-label-use, but more detailed information and statistics on malaria affection and relating death rates. Figure 4 shows a statistic on detected malaria in 2014 per region in Benin. Figure 5 illustrates the data flow in the SNIGS from low-level care unit to high-level care unit (Figure 2)

Personal Shortage

The workforce shortage a matter cause of the poor/limited access to health care delivery in certain regions of the country. So due to a brain drain from developing countries toward the developed countries, the low- and middle-income countries lack medical experts, general physician, nurse. The challenge is more severe in the rural areas than the urban areas, then the rural regions have poor medical infrastructures.

Poor Diseases Control

Infectious disease can quickly spread in a crowd such as in a supermarket, the market in Africa, festivities, dancing crowd, etc. It is therefore important to surveil crowds during their life-cycle collect and process the crowdsourced data to determine any risk of emerging infectious diseases. It is also important to collect data about infectious diseases through the health based on defined policies.

Notes: SSD (Statistics and Documentation Service) is part of the central-level DPP (Directorate of Planning and Forecasting). DDS is the regional administrative body (Health Department Directorate).
Source: DPP, Statistics and Documentation Unit.

The case of Ebola epidemic in Africa in recent years has shown the weak and poor diseases control in the developing countries. Our investigation reveals the non-existent of diseases control units in several developing countries, or weak health and technical infrastructures intended to surveil diseases outbreak. It arises thus the need of pervasive screening.

The study we carried out in the African developing countries also reveals a lack of policy and tools in the health systems to collect infections related data so that they can be analyzed. The recent Ebola outbreak in West-Africa leads the key actors in the different health systems to design and adopt diseases control and surveillance policies. However, these policies lack supporting materials such as ICT systems to collect, process, and share the information so that a quick decision would be taken.

Poor Funding and Health Insurances Systems

In 2001, in Abuja (Nigeria) the NEPAD recommended to the 53 African Countries to allocate at least 15% of total government expenditure to the health. They should steadily increase their budget allocation to meet the so-called Abuja 2001 target by 2015 (NEPAD, 2007). Unfortunately, Benin spends every

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

year 7,5% of the national budget for the health system. In 2014 Benin spends accordingly 129 million dollars for the health system. According to NEPAD Benin should allocate 258 million dollars to its health system. A health insurance system is therefore needed to help to meet the Abuja 2001 target of 15% of the national budget.

It's recommended to launch a health insurance where each inhabitant would pay 1000 Frs CFA (about $ 1,5) a month. The population of Benin is estimated to 10 million people. Such health insurance would bring each month about 15 million dollars. Launching the proposed health insurance could thus bring around 180 million dollars per year into the health care system budget, i.e. 10,5% of the national budget. The system would then dispose around 310 million dollars per year, i.e. 18% of the national budget and can thus improve a lot the quality of care services.

Further Major Challenges

Energy Supply, Frauds and corruption (Hope, 1999) *and poor health insurance* are further major challenges facing the health system. The poor health insurance is one of the underlying factor of frauds and corruption within the system.

Monitoring of and integrating *Traditional medicine and herbal treatment* into the health system remains a challenge the health system is facing. On one hand, traditional medicine can become too dangerous, since most practitioners are illiterate and additionally perform mostly wrong medical diagnosis. On another hand, traditional medicine can well cure certain diseases (Hlungulu & Thinyane, 2009).

A REMOTE HEALTH CARE IN BENIN AS SOLUTION APPROACH

To tackle the challenges described above, we propose a remote health care delivery system based on a multidisciplinary team. This kind of remote care health care delivery solution has the potential to tackle the challenges facing the health care delivery system. The example of the health care system in Greenland launching Telemedicine solutions to tackle the facing challenges lead us to also use the telemedicine to solve certain issues. We adapt the standard telemedicine solutions to needs and technology level in the country. The novelty of this approach is to adapt and use pervasive healthcare to improve access to health care tailored for a healthcare environment with a low degree of technical infrastructure in a poor state or non-existent.

The main questions arising in the concept and design phases are;

- Could telemedicine solutions tackle all facing challenges for the health care system in Benin?
- What about a personal shortage? Is telemedicine a solution approach to overcome this issue also?
- Could telemedicine help to fight against fraud and corruption?

To answer the above questions, it is a matter to know what telemedicine and/or telehealth care are and their limitations.

Telemedicine is defined as health care provided at the remote using modern information and communication technologies, such as the internet, audio/video, computer, mobile devices (mHealth) and across geographic time, social and cultural challenges.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Telehealth car**e** is according to WHO defined as the integration of tele communications systems into the practice of protecting and promoting health, and telemedicine is the incorporation of these systems into curative medicine(Darkin & Cary, 2000).

According to the above definition, a standard telemedicine solution cannot tackle all facing challenges. For example, the definitions above do not issue about a personnel shortage in health care systems. Therefore, the telemedicine solutions and systems must be adapted and extended with additional features to meet the needs and tackle the facing challenges

The adapted and extended telemedicine system will focus on pervasive healthcare, health promotion, and prevention, patient education to increase diseases awareness among the population, improve the (continuous) training for health professionals, and improve the data collection and thus the quality of the data within the health care system, and solve the workforce shortage issues.

Involving/including traditional practitioners into the proposed remote health care delivery system may help to overcome the personnel shortage issues. They will be trained to perform better diagnostic, improve their treatment methods. High-specialized health professionals and private clinics may be encouraged to move to smaller health care regions.

The proposed remote care delivery system features a Virtual Hospital-Network (VHN) solution that uses Telehealthcare technology such pervasive computing to provide mobile pervasive/ubiquitous healthcare service to the population at any time and in any region of the country by removing locational/geographical, time and other restraints. It should enable remote assistance to the undertrained caregivers, collaborating work between care professionals, provision of remote health care to the patient at home, and educate the patient. In addition, it should include traditional practitioners into the system and train them to be able to perform diagnostic, since this is the weak point of traditional medicine. Further, the system should consist of Telehealthcare system based on a network of medical centers, whereas at least one of the centers belonging to the network should be closer to the patient's place of residence.

The global aims of the proposed system is to tackle the challenges facing the health system in

1. Increasing the accessibility of professional caregivers and specialized care
2. Increasing the quality and continuity of care to patients
3. Focusing on preventive medicine through early intervention involving traditional practitioners, village nursing, and NGOs
4. Improving the Adherence to Treatment
5. Reducing the overall cost of healthcare
6. Improving the caregiver's education and training
7. Providing services to remote areas in the case of natural calamities and disasters, and Remotely monitor chronic patients.

CONCEPT AND CHALLENGES FACING THE IMPLEMENTATION

The proposed remote health care system is combining the telemedicine, telehealth, eHealth, and mHealth technology with agile project organization and management paradigm. Compared to agile development, the proposed system disposes of a team as a pedestal for supporting the remote healthcare delivery systems using mobile phone technology, a care facilitator (call scrum master in agile development) who assist the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

team during a medical treatment. The facilitator can be a remote physician with a strong background in medicine and organization. The patient and his relatives could be considered as the product-owner (scrum).

Multidisciplinary Health Care Team

The proposed multidisciplinary remote healthcare team consists of health professionals (doctors and nurses), NGOs workers (who play the role of social or community services, psychologist), pharmacists, and local communities.

Local Nursing/Village Health Centre health

The local nursing or care units at village (rural) level are the central component in care delivery services within a multidisciplinary remote health care system. At this level, primary or specialized care could be provided to the patient as far as the needed medical infrastructures and tools are available. Specialized care would be provided remotely through care specialists at large hospitals or clinics located in large cities.

Health professionals working at this level would oversee the patient-education for increasing diseases awareness, improving the disease prevention. The caregivers would inform individuals living around these care units about medical and health concerns. It is required that each health professional, working at these units, is proficient in the local language and dialects to communicate easily with the local population. A medical local dialect guide must design and implement for patient and health professional to ease the data record since the record into the system is finally done using the national working language (French in case of Benin). For example, how to translate 37°C into and from the local dialect? These communication's guides (medical local dialect guide) need to be improved.

Health professionals at this level work closely together with NGOs, community trained caregiver at many levels, for example, helping the patient in paying a part of his medical fees, visiting him at his place of residence, training him on hygiene, prevention of infectious diseases, and first aid.

Community Trained Carer (Voluntary) at Rural Level, NGOs, and Social Workers

Community trained caregiver and NGOs are mostly close to the population and work on voluntary basis and could provide first aid care to patients and organize their transportation to care units in case of emergency. They are present at the places lacking care units or health professionals. They are assisted by health professionals at rural level in giving first aid to the patients. The health care professionals at the rural level are in turn assisted by the specialist at large hospitals. Thus, the accessibility to health care and quality of the care services can be improved and increased.

Community trained caregiver and/or NGOs use a Mobile Computer Supported Collaborative Work Systems (MCSWS) to share information, data, and, a message with the health professionals at next close care unit. They can use the mobile phone for access to the patient emergency data. These emergency-data provide information about the communicable (infectious) disease the patient is suffering from, medicine that can cause adverse effects for the patient, and for chronic patients, the how-to-do for the first aid to stabilize him.

One important component of this system is the mobile emergency pharmacy the volunteer is equipped with. He can provide the patient with (all) needed medicine, then they know approximately the medical needs of each patient they are medically assisting. Regularly, surveys are conducted to state on the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

medicine used in each care area. Thus, they can refill their mobile emergency-pharmacy with necessary pharmaceutical products.

The work materials and pharmaceutical products are partially funded by the NGOs, community association, and certain foreign donors. An adapted health insurance for funding the system must be implemented.

Trained Traditional Practitioners

Rural populations in developing countries are more confident of traditional medicine than modern medicine. While poor medical diagnosis is the big weakness of traditional medicine, there are diseases, which are actually best treated by traditional medicine. Since the rural population in those parts of the world are more confident of traditional medicine, therefore it's proposed to involve the traditional practitioners into the multidisciplinary health team and train them to perform a better medical diagnosis to provide the best care. Traditional practitioners will be coached and assisted by health professionals.

It's further proposed a multimodal database to record information about traditional medicine and treatments. This would help to improve the traditional medicine, share information between health professionals and traditional practitioners, and between traditional practitioners and traditional practitioners. Because of the high illiteracy rate among the traditional practitioners a VoiceXML-application (Speech Interface Languages) is proposed so that the practitioners can use it to record information into the multimodal database. The system provides also video interface to enable to record images and video materials into the database.

Pharmacist (Using ePharmacyNet)

Most health care in developing countries are facing poor access to pharmaceutical care and the concerned populations are suffering of "Pharmacy tourism" (Thierry Oscar Edoh & Teege, 2011). ePharmacyNet was designed and implemented to tackle the challenges caused by the "Pharmacy Tourism". Pharmacies at care units and pharmacies from private health sector are chosen to be part of the multidisciplinary team and use ePharmacyNet to provide medicine and other pharmaceutical products to remote patients. A question arises here, how to deliver cost efficiently, effectively, and safely and securely the pharmaceutical products, since the road-rail network in the whole country is in a poor state? A smart drugs transportation system is presently in the testing phase. The results will be presented in our upcoming paper.

Remote Care Specialists (Tele-Doctors)

As described above, care units at rural level face a care-specialist shortage. Remote care specialists are required to be involved in the multidisciplinary remote health care system to assist nurses working at rural care units in providing care services. Care specialists from the private health sector could also be requested to participate in the system and help to minimize any eventual workload within the system. The remote care specialists are provided with MCSW systems, which they use in collaborating on a medical case. Patient-data can be shared through the MCSWS. The MCSWS enables video and voice conferencing communication. Most of the applications in use in the MCSWS are running on the mobile phone (from GSM to G3). Few desktop computer or laptops are in use in the system.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The designed MCSWS provides a training feature for the undertrained nurses and doctors. All communications, in any case, are recorded and serve as training materials for the health professionals providing an assistance and treatment protocols. Because of the privacy sensitive nature of health data, patient's personal data is erased from all training materials.

Psychologists

Psychologists will accompany the community carer/caregiver, nurses, and traditional practitioners in daily work. They will coach and train the community carer/caregiver, nurses, traditional practitioners, patients and their relatives.

Remote Care Delivery System and Diseases Surveillance

Tackling the challenges facing the health care system regarding the poor health care services accessibility means to provide the health system with an adapted telemedicine solution that helps to overcome the challenges.

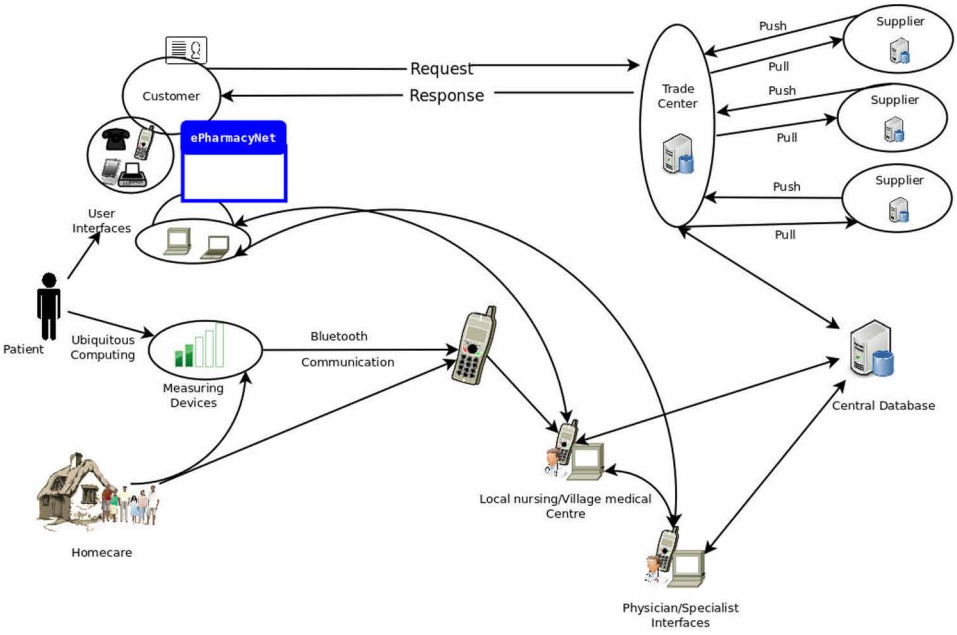
The following features, according to the defined requirements, should be provided:

1. **Diseases Surveillance and Monitoring Using IoT/crowdsensing Paradigm**: Surveillance and monitoring of health have been recognized efficient and cost effective
2. **Electronic Medical Record (EMR):** Improving the data collection, processing, and management as well as data exchange
3. **Remote Diagnostic and Care Delivery:** Bring the care service to patient
4. **Continuous Education Unit for Care Professionals**
5. **Patient Education**
6. **A Subsystem to Help Traditional Practitioners to Perform Adequate Diagnostic and Treatment:** Overcoming the personal shortage issues
7. **Pharmaceutical Care Delivery Subsystem**

The proposed system (Figure 6) consists of two subsystems:

1. ePharmacyNet and the
2. Virtual hospital network system (VHNS).

ePharmacyNet is an adapted mail-order-pharmacy (Thierry Oscar Edoh & Teege, 2011). *VHNS* is a virtual Hospital network system providing a Hospital Information system, Enterprise Resource Planning and computer supported collaborative work system for hospitals-employees, medical doctors, nurses, enabling patient data management (data record system), tele-surveillance and remote healthcare delivery systems. Electronic health cards for health care professionals and patient, called eHealthCard, are also provided for access control to the system, securing data, and combating frauds.



Chronic patients can be provided with a wireless sensor network (WSN) (i.e. Internet of Things –IoT-) that will be sensing and delivering medical data such as bio signal to *VHNS*. The WSN gateways are interfaced on the patient's mobile phone and allow each sensor in the WSN to send/receive data to/from

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

an application running on the patient mobile phone. An application transmits automatically all data from patient's mobile phone to the treating nurses/physicians.

Telehealth systems connect remote patient to doctors through ICT devices [Definition from WHO], the religiously and/or traditionally conservative population could reject the system because of the lack of a direct patient-to-doctor physical contact, therefore, the concept foresees a multidisciplinary health team that in situ works with the patient and remotely works with the treating physician. The team is an ad-hoc team that is built and committed to a precise medical treatment task.

Figure 6. Architecture overview of the proposed remote care delivery system

Barriers to Implement a Standard Telemedicine Solution

Implementing a Telehealth system as described in (Scott & Mars, 2015) implies that ICT smart devices, reliable telecommunication infrastructure, and energy are available. Furthermore, the users of the system need basic to solid ICT knowledge and awareness of IT-security in term of data protection. The present technology level and economic situation in Benin are unfavorable for implementing any standard Telehealth system. Therefore, this concept consists of two steps: first, adapt the designed system and chosen infrastructure to meet all identified obstacles and/or problems and satisfy the requirements. The second step will consist of considering the economic, financial, social, and cultural aspect of the solution.

The evaluation of the problem of the poor access to medical health care from the viewpoint of the information technology had revealed that the main issue is the lack of information and communication system and infrastructure in the Benin health system. Communication and data sharing between the different health-units remain paper based (e.g. the case of SNIGS in Health system of Benin (Figure 5*)* and the reports of MOH of Benin (Ministere de la santé, 2007) and (Mathias et al., 2013). A further

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

aspect is a large distance between the patient place of residence and next possible health care unit. The structure of the health system and the poor state of medical infrastructures particularly in rural regions are factors of the poor access to health care in Benin.

There exist obstacles for launching such a standard Telehealthcare into the health care system in Benin. Every single of these obstacles hinders the successful launch of a standard Telehealthcare system. A standard Telehealthcare system described in (Scott & Mars, 2015), is based on application, technologies using: (a) any ICT devices, (b) simple or complex multimedia to video conferencing to virtual reality. Further, it can be used for preventive, promotive and curative care; can be interactive (synchronous or asynchronous), and connects population/patients to health professionals and any person involved in care provision process.

Problem 1: (Tele) Communication

The infrastructure and the coverage of telecommunication systems (The Internet, telephone line, mobile phone system, etc.) are decisive for a well-functioning Telehealthcare system in the country. Telehealthcare requires a (large) bandwidth transmission system and a very high transmission quality for pictures (for example x-ray pictures, etc.) or video (video conference). This cannot be guaranteed today. Telephone connections must also be good. More than 90% of all regions in Benin are actually covered by mobile phone system (Thierry Oscar Edoh & Teege, 2011). However, internet connectivity is not well established in the population. Even Telephone connections have not entirely covered the country yet for the use of Mobile Data services.

Problem 2: IT Infrastructure for the System User and -Operator

A standard notebook costs more than 500 dollars against 300 dollars in the high-income countries. Fortunately, in Benin like many developing countries, the number of mobile phone subscribers reached 9.63 million in 2013. In 2015, Benin accounts about 10 million of mobile phone subscribers for 9 million populations. Our recent study conducted in 2014 showed that most people possess at least 2 to 3 mobile phones. Furthermore, GSM/2G, 3G mobile phones are more widespread than 4G capable mobile phones. Mobile phones are becoming ubiquitous. In 2017, the population in Benin is estimated to 11.516209 inhabitants. The penetrations of telecoms services, by March 2017, are summarized in below table.

87,2% mobile SIM penetration is an approximation since till to 2016, mobile phone numbers are not registered. In 2017, one can buy on the street SIM card and use it without registration. Our investigation leads us to estimate the penetration to more than 90%.

Table 3.

Penetration of Telecoms Services	Penetration
Fixed-line telephony	0.5%
Internet users	33.1%
Mobile SIM (population)	87.2%

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Problem 3: Paying the Medical Fees

There is no electronic payment infrastructure compared to what exists in high-income. Most patients do not even have a bank account. Only a few people in the country possess a bank account and there exists no obligation for the inhabitants to register with the authorities. Doctor's fees must be paid before the physician treats the patient.

How should the telemedicine services fees be paid in the case of a remote medical treatment? The issue can be solved by launching a mandatory health insurance for everyone, that will cover the most medical fees. Additionally, it is recommended to use the available mobile money solutions such as M-Pesa, MoneyGram, MTN Mobile money, etc.

Problem 4: Energy Reliability

There is no reliable electricity supply for operating ICT equipment. ICT components must have automatic recovery functions which allow a restart after an electricity outage without damage to the system.

There must be backup solutions to keep the system working when no electricity is available. This may be backup for electricity supply, such as a generator or solar power modules, or it may be a fall-back mode based on paper and mobile phones.

Problem 5: Medical Transportation in Case of Emergency

Unreliable transportation means and roads in the poor state are a factor underlying the poor access to health care too. Remote patients spend a lot of time to reach the next closer health center. Most of the time, they have to go more than 30 km and spend more than 3 hours to reach the next care unit. There is no transportation possibility available in remote areas due to the poor road-rail network. Ambulances for patient-transport are scarce in the whole country. Thus, in the case of emergency, remote patients are treated at home or delivered too late to the emergency-center. Most of the time emergency-patients are carried to the hospital using public or private transportation. The drive takes actually long. Most of the patients are dying at the place of accident or during the transport.

Problem 6: Poor Health Insurance and Underfunded Care System

There is no reliable health insurance system in the health system in Benin. A survey conducted on the topic and discussion with the key persons had figured out a government health insurance in the health care system. This health insurance is funded at 100% by the government for health care professionals and 20% for the other government employees. The remaining 80% are carried by themselves in the case of illness. Employees at the private sector or jobless have no health insurance. They have to pay 100% of the medical fees. The health care problematic also underlies the poor health care accessibility.

Problem 7: Fraud and Corruption

Fraud and corruption are also factored leading to poor access to health care in developing countries (Mackey & Liang, 2012), particularly in Benin. They further adversely impact the infrastructures, financing, and social determinants of health.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In Benin, each care unit at rural, district or national level possesses public pharmacy-infrastructures, which are intended to provide the patients with the basic medicine. Those pharmacies are often low on stock due to fraud occurring in the care units and/or because of poor planning. Caregivers sell the pharmaceutical products at black markets or use them for private concerns. Furthermore, patients are only provided with those products only if they bribe caregivers or have a relative working at the care units. This kind of corruption in any health sector, particularly in developing countries, can gravely and negatively impact the quality and the coverage of health care services. Price inflation or high medical fees could be the direct consequences and thus a barrier to access to health care delivery for resource-poor people.

ARCHITECTURAL OVERVIEW

A wireless sensor network to provide pervasive mobile healthcare and wireless health monitoring services for chronic patients is designed and implemented. This is the class of the measuring devices connected to patient's mobile phone for transferring critical measuring values to the next hospital and inform the concerned members of the multidisciplinary remote healthcare system. The communication between the measuring station and mobile phone is a Bluetooth based communication and/or near field communication technology. Today most mobile phones feature this technology to communicate with other devices nearby using device-to-device (D2D) communication paradigm. The architecture of the proposed Telehealthcare system is Service Oriented.

The system features services responsible for a defined unique task such diagnostic service, education service, payment service, etc. which use diverse communication protocols to exchange data and information. Devices using the same communication protocol such as Bluetooth, Near Field Communication follow the D2D communication paradigm. Machine-to-Machine (M2M) communication paradigm is then performed for autonomous communication between machines.

Brief Background

Device-to-Device (D2D) Communication enables devices to communicate directly without interaction of base stations or access point. It is intended to exchange data utilizing various technologies such as Ultra-wideband (UWB), Near Field Communications (NFC), ZigBee, Bluetooth, Wi-Fi-Direct or LTE Direct. The distance between the devices is relatively short and defined by the using protocol. The communication is technology(Haus, Waqas, Ding, Li, & Member, 2016).

Machine-to-Machine (M2M) Communication is an autonomous communication, based on a cellular network such as GSM, LTE, etc., where the communication past through core networks via base stations or access points and M2M Server (application server). Compared with D2D, the communication is not direct, does not matter if the devices are approximate to one other. The distance between the devices is unlimited. Furthermore, the M2M communication is application oriented and technology independent (interoperability) (Haus et al., 2016).

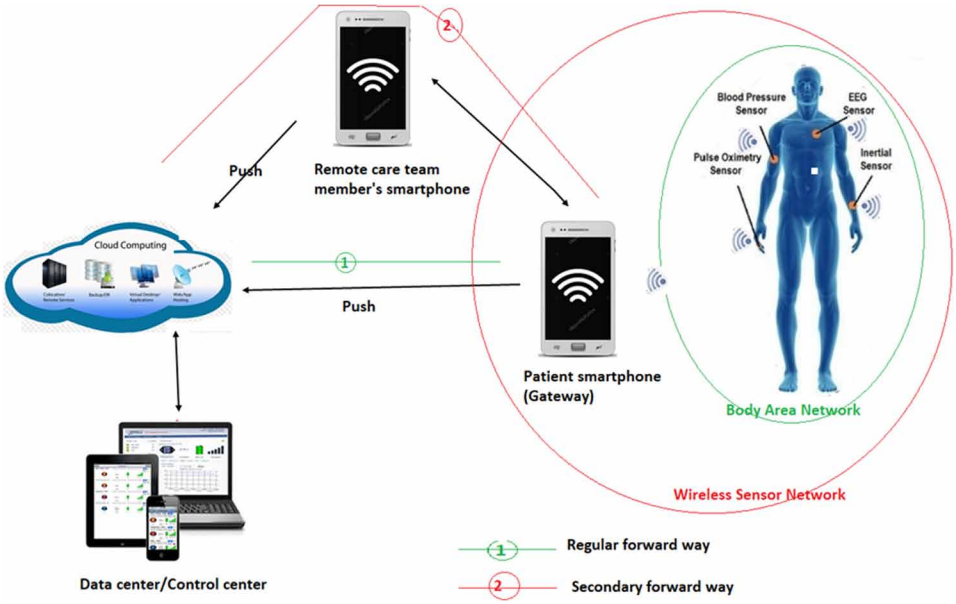
SYSTEM USER INTERFACES

User Interfaces (Devices)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In information technology, the user interface (UI) is everything designed into an information device with which a person may interact. This can include display screens, keyboards, a mouse and the appearance of a desktop. It is also the way through which a user interacts with an application or a website [Margaret Rouse]

Mobile devices such as mobile smartphones, PDA, tablets, notebooks/laptops are required as user interfaces to access implemented remote health care provision system. The applications can also run on a desktop computer. Further, for bio-signal acquisition through sensors and peripheral devices "Bio-signal Acquisition Module" will be provided. Digital Camera is additionally needed for the digital image or video capturing if requested.



Mobile (Smart)Phones

Smartphones are used as a gateway within the wireless sensors network placed at the patient to pervasively collect his bio-signals.

The collected bio-signals would partially be processed and stored at the edge. If the patient smartphone is not connected to the internet to forward the data.

Remote system team's members could also use their smartphone to call the stored data on the patient smartphone and forward them to the system for further process. Figure 7 illustrates the data collection and forwarding to the remote care center.

Figure 7. Smartphone usage in data collecting, processing, and forwarding

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Tablets

The tablet as UI enables the user to access and interact with the application or platform (Figure 6).

Desktop Computer

Like a tablet, the desktop computer enables the user to access and interact with the application or platform (Figure 6).

Laptops

Like a tablet, laptops enable the user to access and interact with the application or platform (Figure 6).

Fax-Machines

Communication over fax-machine is foreseen to overcome the internet access issues. As above described the internet is not reliable and not all regions in the country are covered. This device could then be used to send requested documents to the remote care center.

Land Phones

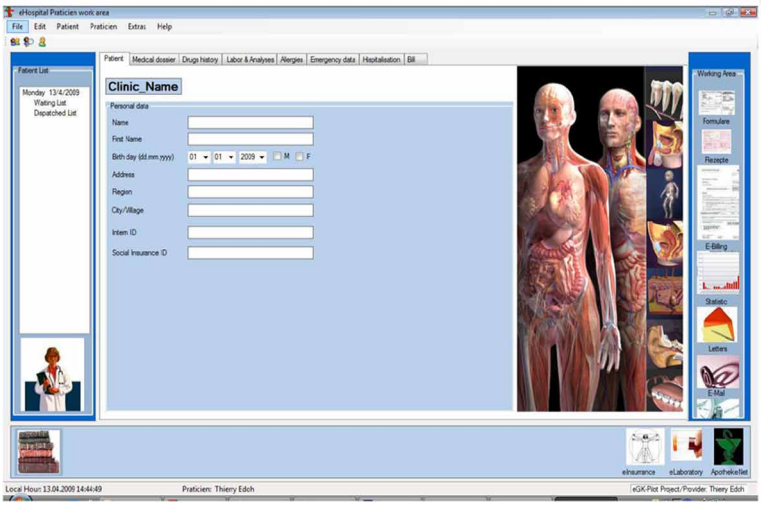
The land phone, despite that it scarcely existent, could also be used for diagnostic purposes, medicine order, etc. in the case of internet access fail.

Graphical User Interfaces

A graphical user interface (GUI) is a purely textual user interface to a computer or computer program/application. A GUI enables interactions with an application where the client (in the case of server-client architecture) or the standalone application runs on a device (User interface).

Web-browser, desktop GUI, and console are candidate GUI enabling interaction with the proposed system.

The remote care delivery application is multimodal access platform, where the user can access and interact with the application through web-browser (Firefox, Microsoft edge/explorer, Google chrome, etc.), an implemented desktop GUI, and console.



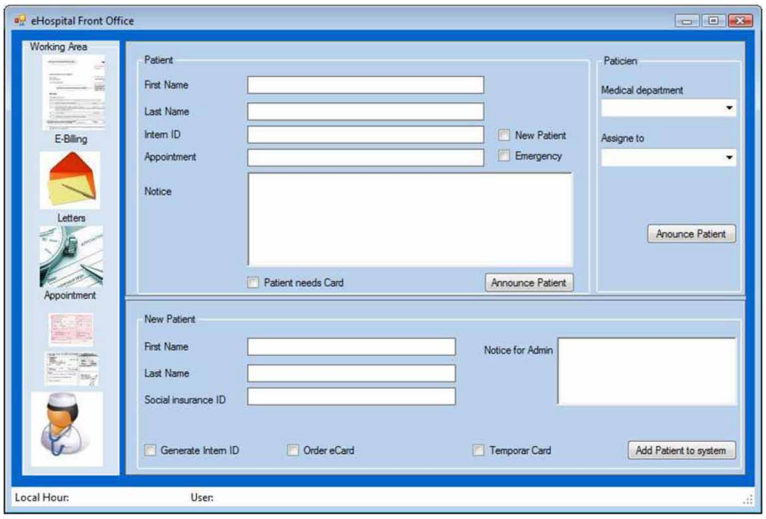
The application is a RESTful Web-Application accessible through web-browsers. The desktop variant of the is SOAP-web-service based where the client on the desktop a dot-Net client using WCF (Windows Communication Foundation) technology to communicate with the java based server.

In following certain main graphical user interfaces will be described. The further Forms could be provided by the authors on demand.

The application has more than 150 user interfaces provided by all sub-components. The application is still in implementing; thus, the amount of GUI will certainly increase presents the form to access to patient medical records. Through this form, a remote physician can see the collected data at a remote chronic patient. The collected data is pushed to the server in real-time or using the store and forward paradigm. Figure 9 presents an appointment management form. This enables to register a new patient,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 8. Electronic medical record form



to manage emergency cases, and to automatically request the concerning patient medical record from the server. New patients are patients who are not yet registered into the national central patient database.

Emergency patients are automatically assigned to an appropriate physician and his medical records are forwarded to the physician. In the case of emergency, it is often difficult to collect the patient-ID to request his medical records. The system, therefore, provides a biometric identification feature, that enables the patient to identify himself using his fingerprint. The system collects the fingerprint and requests the corresponding ID which in turn is used to request the full medical records.

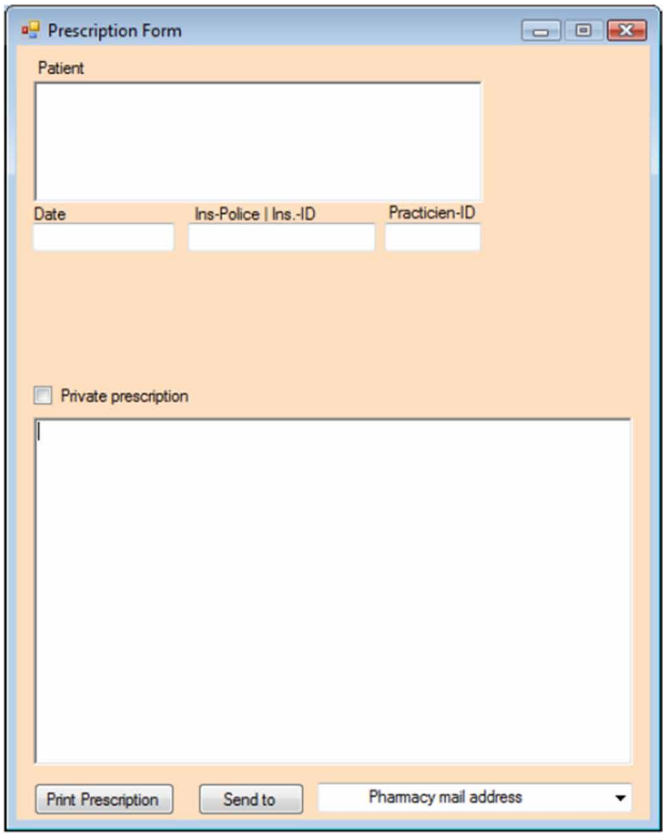
As presented in Figure 8, the treating physician can electronically prescribe medicine using this form. This form enables the physician to electronically order the prescribed products and the patient will be delivered at home.

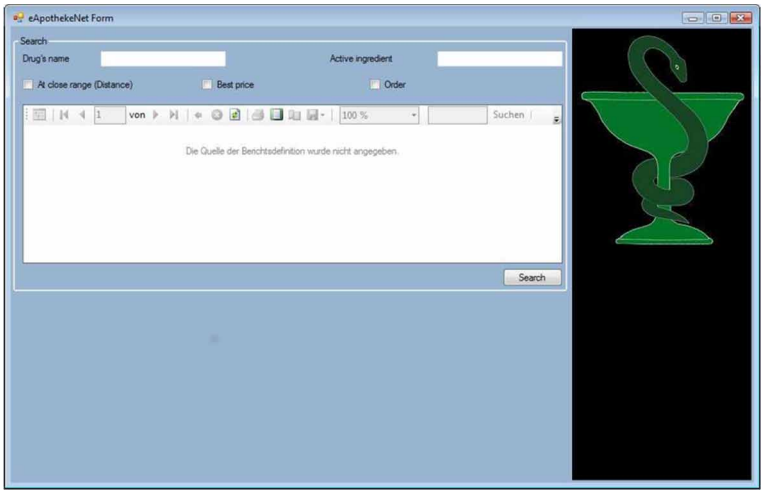
Figure 9. Appointment management form

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

To order the prescription, the system uses the another sub-component, call ePharmacyNet, whose forms are presented in Figure 9, Figure 10, Figure 11, and Figure 12

Figure 10. Medical prescription form





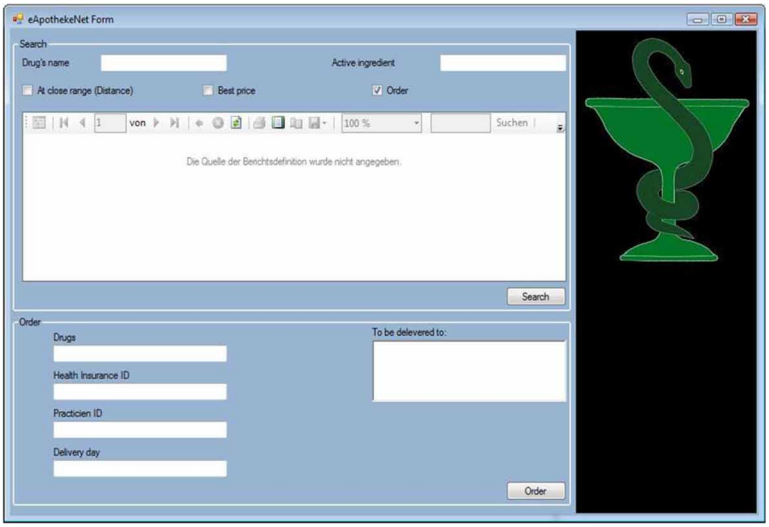


Figure 11. Drug search form

Figure 12. Drug order form

SYSTEM COMPONENTS

In this section, the system's components are presented. Figure 6 shows the high-level architecture of remote care delivery system. The payment, reminder (adherence to treatment) and MCSCW components are not shown on the overview architecture.

The system consists of below-described components, which in turn provides a set of functionalities. The components are:

ePharmacyNet

ePharmacyNet, a mail order pharmacy, that enables to prevent the patient to go through several pharmacies before he could, if any, purchase the prescription. This component is deeply described in (Thierry Oscar Edoh, 2010a; Thierry Oscar Edoh & Teege, 2011)

eDignostic and eConsultation

The two components enable to remotely be visited by a doctor and perform a diagnostic. A remote physician could also use this component to assist a traditional practitioner in performing a diagnostic at a patient.

The component further features a warehouse and data-mining based system to collect the diagnostics and consultation data such as disease data, framework, workflow, etc. These information processing and useful data are extracted for knowledge discovery using data mining technique which consists of querying, extracting, cleaning, and analyzing the data to represent the knowledge. Each system user (care team member) can access this knowledge and implement it for any similar case.

This component offers a special feature to overcome the language barriers in translating all information into local language so that the involved traditional practitioners can use the information too.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

eDataManagement

eDataManagement is a component for collecting, processing, persistent storing data. It provides a security mechanism to protect the data against any attack.

The component consists of body areas networks, wireless sensors networks that are in charge to collect medical data and send to the eDataManagement server at the cloud. It furthermore collects data from other sources such diagnostic data, medication data, etc.

eHospitalNet

eHospitalNet or Virtual Hospital Network (VHN) is a network of involved health centers. It is a virtual Hospital-network Solution inspired by the network-centric operation health care discussed in (Maniatopoulos et al., 2009). A network-centric operation as "unhindered networking operations within and among the physical, information, and cognitive domains that govern all activities conducted in healthcare space based on free, multidirectional flow and exchange of information without regard to the involved platforms or platform-systems, and utilizing all available means of ICTs to facilitate such operations" (Maniatopoulos et al., 2009). Health Care Systems in typical developing countries, particularly Sub-Saharan Africa, are facing a set of technical, organizational, informational, personal, social, and financial issues. A network-centric operation healthcare seems, therefore, to be the optimal concept to meet the challenges facing these health systems.

Logging Management

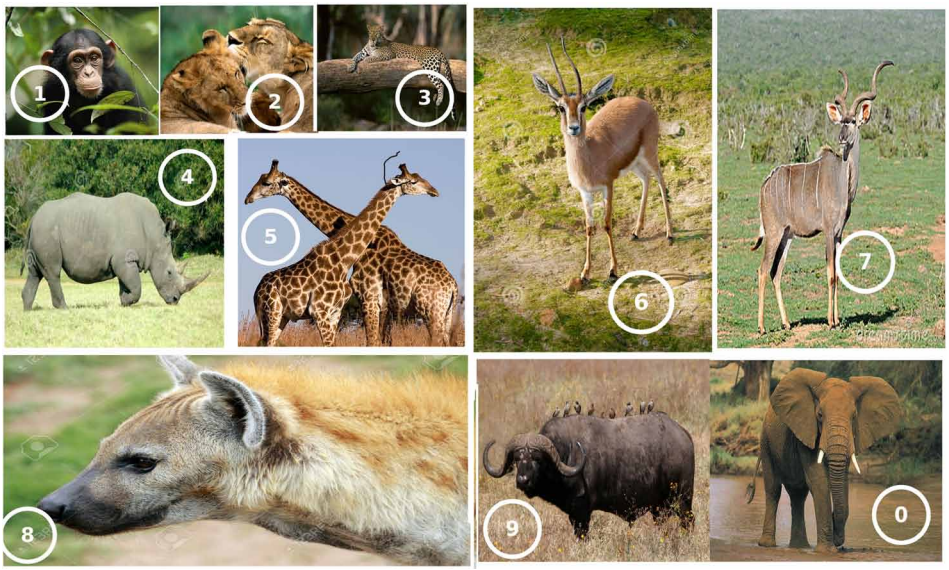
For the use of these services, a free call phone number has been arranged so that the patient in a case of emergency, particularly in rural regions can access to the system.

Each patient is required to carry an electronic medical card. In addition to the card, a personal identification number (PIN) is provided for the secure use of the medical card.

A patient can identify himself as follow: (1) The patient dials the number (the Telehealthcare system phone number), (2) the system asks him to identify himself: [name and first name, date of birth, card number, PIN], (3) the system connects him with the next hospital. Users can interact with the system using audio or text interface.

A picture-based password system, as shown in Figure 12, can be used by illiterates as well as by elderly people to access to the system. This kind of system is already used for mobile phone (e.g. SFR Password - www.sfr-password.com-). This solution approach consists of selecting pictures in certain order. Each selected picture corresponds to a digit from 0 to 9. An illiterate patient can then enter his PIN by selecting pictures in each order. Additionally, they can use the audio/voice to enter their PIN. For example, an ID like "1234" will be given as "Monkey, Panther, Lion, Buffalo". A voice-based password as described above can be considered for blind people too.

In a central database, the status of each health card owner will be stored. Based on this status, the system can verify which kind of PIN, standard or picture-based, the card owner can process and thus adapt the PIN processing to the user.



The phone number used for the call will be compared with the patient registered a phone number. If the comparison succeeds, the patient will be connected to the next closed hospital. The devices (mobile

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

phone) would be set for illiterate so that they can make call per speed dialing procedure. Biometric ID such fingerprint, iris can also be used to access the system.

An alternative solution for illiterate patients is to employ the multidisciplinary health team to assist the patients during or for processing the call. Unfortunately, this may lead to security or privacy problems. Therefore, this person must be rigorously trained and should be always available. A family member could also play this role.

Figure 13. Picture-based PIN system

Measuring Module Unit and Wireless Sensor Network

The measuring devices (Figure 13) are connected to patient's mobile phone via Bluetooth or near field communication interface and used for medical monitoring and surveillance. This component, is already implemented in (T. O. C. Edoh, Atchome, Alahassa, & Pawar, 2016), can also use the ZigBee communication protocol in order to reduce the energy consumption. As already demonstrated above, energy supply presents a challenge for the care system.

Patients suffering from chronic diseases and living at home would get the bio-signal remotely monitored using this unit. For those patients lying at a health care center, the monitoring system as implemented and described in (T. O. C. Edoh et al., 2016) would be used.

Central Database System

A central database for centralized medical data processing and promotes distributed data access for the patient's data is the system database. Distributed data access enables the storage approach which replicates gathered and recorded data at local databases at different care units that are involved in the multidisciplinary remote healthcare system. This approach also allows the queries to be processed any-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

where and at any time. The patient medical data is only replicated to the local database if the care unit requests at least once the data and configure the system to automatically replicate as soon as the patient dossier is updated in the central database.

Regarding the technical, connection issues that are facing, it is advantageous to keep patient's medical data updated at the local care unit, thus to guarantee to patient care provision at any time.

Mobile Computer Supported Cooperative Work Unit

Computer-supported cooperative work (CSCW) is a generic term covering and consisting of software tools, applications, and technology that supports a group of individuals working on projects at different sites. CSCW is based on the principle of group coordination and collaborative activities supported through computer systems.

A Mobile Computer-Supported Cooperative Work (MCSCW) as a CSCW supported through the mobile computer and/or a mobile phone (Schrott & Gluckler, 2004) is implemented to support the communication in the remote care network.

Table 3 shows the technologies used to implement the remote care system's MCSCW. Only the existing and reliable technologies in the country such as mobile telephony and the internet, services such as SMS, MMS, Email, devices such as mobile phones of the first generation (GSM) and higher, notebook, tablet, and laptop are elements of the MCSCW. Those technologies and devices are accessible for all, reliable and cost-efficient. The mobile telephony covers more than 90% (Thierry Oscar Edoh, 2010b) of the country.

Knowledge Management, within MCSCW in sharing information and data, communicating and being instructed or assisted on a medical case guarantees that right information and/or data reach the right member(s) of the multidisciplinary remote healthcare team at the right time independent of his/their stay.

Table 4. A two-dimensional collaboration framework with used technology

	Communication	Data & Information Sharing	Coordination /Instruction/Assistance
Real Time/Synchronous	Mobile phone/Line phone Video conferencing (Skype/Hangout)	Electronic Whiteboards (electronic/presence) Meeting facilitation (Trello & Slack)	Mobile phone Video conferencing (Skype/Hangout)
Asynchronous	Email SMS/MMS	Document repositories Team workspaces	Email SMS/MMS Document repositories

Billing and Payment Unit

This functionality is the same as that was described in (Thierry Oscar Edoh & Teege, 2011). Additionally, external existing payment/money-Transfer services such M-Pesa, Mobile-Money, and PayPal are called using web-service technology.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 14. Measuring infrastructure for a pervasive computing (monitoring)

Diseases Spreading Prevention

The risk of spreading diseases within (ad-hoc) crowds and the need to pervasively screen asymptomatic individuals to protect the population against emerging infectious disease request permanent crowd surveillance, particularly in high-risk regions. The case of Ebola epidemic in Africa in recent years has shown the need of pervasive screening. Infectious disease can quickly spread in a crowd such as in a supermarket, the market in Africa, festivities, dancing crowd, etc. It is therefore important to surveil crowds during their life-cycle collect and process the crowdsourced data to determine any risk of emerging infectious diseases.

Crowdsensing is a critical component of Internet of Things.(J. Liu, Shen, & Zhang, 2016) Crowdsourced data can be collected using participatory or opportunistic crowd sensing paradigms, where participants' smartphone sensors are used to collect information/data. Smartphone sensors or sensor systems are increasingly used for measuring the quality of ambient air (Dutta, Gazi, Roy, & Chowdhury, 2016), temperature and particularly sensing bio-signals within an in- or outdoor crowd. Most traditional sensors (i.e. smartphone embedded sensors (Carpenter & Frontera, 2016)) are based on electrical working principles (Van Hoe et al., 2012), where they measure the quantity items using electrical means. (Marika & Di, 2012) These sensors present limitations, that optical sensors overcome (Carpenter & Frontera, 2016)

We propose a smart health system that collects and transforms raw data into useful information, communicates with other smart devices and the people (e.g. emergency teams) to monitor ***outdoor*** (ad-hoc) crowd to prevent the spread of diseases. The proposed smart health system will integrate the physical and digital world (IOT/IOHT), where they interact with each other using object with network connectivity.

The smart health system, an Internet of Health Things, combines two paradigms: (i) crowdsensing and (i) Internet of Things. IOT is defined as a paradigm in which computing and networking are embedded in objects, (Pena-Lopez et al.) and are equipped with embedded sensors, which in turn could be used to collect crowdsourcing data.

In the scope of this project, we foresee to use balloons and drones provided with fiber optic sensors and infrared cameras. The balloons and/or drones equipped with infrared cameras (IRC) and fiber Bragg grating sensors (FBGS) will permanent overfly cities in seeking for the (ad-hoc) crowd in order to collect crowdsourcing data such as temperature. Our system application would able to detect outdoor overcrowding (congestion) and thus contextually start collecting crowdsourcing data, which would be

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

transformed into useful information. Fiber-optic sensing is an excellent solution to overcome the limitations of smartphones embedded sensors.(National Instruments, 2016). Furthermore, a pedestrian detection method in infrared images would be implemented for automatic crowd detection using the images produced by the IRC fixed on the balloon. A shape-based pedestrian detection method is presented in (S. Liu, Luo, & Yang, 2007) and a real-time pedestrian detection system that works on low-quality infrared videos is implemented in (Nanda & Davis, n.d.).

A promising test was taken place and shows the feasibility of the planned system. In the upcoming research, the experiment and results will be presented and discussed.

SYSTEM MAIN FUNCTIONALITIES

The following services and functionalities are offered in different types and manners: Patient-to-Physician/Nurse or Nurse-to-expert (physician) and Physician-to-Physician Service.

Teleconsultation, Telediagnostic, and Emergency Service

In the case of emergency or acute affection, patients can use the video conferencing component of the remote care system for a *synchronous and asynchronous* teleconsultation. The patients can, in the case of an asynchronous consultation, use Short Message Service (SMS) or Multimedia Messaging Service (MMS) technology to ask the doctor. With MMS, patients can send a small picture to the medical doctor. In the case of sending big pictures or video material using MMS technology, the client application located on the patient device such as mobile phone can chunk the picture in small package, send it, in MMS allowed package size, to the server, which would merge the received message, processes a virus scan, and send it then to the given medical doctor.

A medical doctor has the possibility to conduct a synchronous or asynchronous diagnostics. In the case of asynchronous diagnostic, the medical doctor reports his clinical findings, prescription, and recommendations to the multidisciplinary team member close to the patient. He also saves his results into the patient medical dossier. A medical dossier within the system is distributed and can be viewed and recorded from anywhere by any authorized person. The patient can read his own data but cannot change or enter new data into his dossier. Thus, patients cannot falsify the data.

An application on patient's mobile phone can dial in case of emergency the services telephone number. This application is event driven and only provided to chronic patients. The application on the mobile phone listens to the measuring devices and analyses in real time all received data according to a defined pattern. In the case of critical measured value, a standard message (Table 5) is sent via SMS and/or MMS to the treating physician, and to registered family members. The message contains additionally geolocation information so that the patient can be quickly reached by the emergency team.

Ubiquitous and Pervasive Screening and Telemonitoring Unit

A study (Hersh, JA, PK, & Al., 2001) shows that Telemonitoring particularly home care and pervasive computing, even in developed countries, can improve access to health care; increases satisfaction with delivered care, and may be cost-effective. The study report identifies health care services that could

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5. Sample of a standard message

</medication>
       </ patient provided data>
</emergency >
```

be provided using telemedicine. This report shows the existence of patient education, self-control, and summarizes scientific evidence on the efficacy, safety, and cost-effectiveness of these services.

Self-monitoring/testing telemedicine is used less frequently than the other two types of telemedicine studied in this report. It is most commonly used for management of chronic diseases or specific conditions, such as heart disease, diabetes mellitus, or asthma. As with store-and-forward telemedicine, programs operate in many clinical domains, but with little evidence from peer-reviewed studies to support its use. The best evidence comes from studies with problematic designs, and even in those areas, the benefit is inconsistent. Some studies show it improves access; increases satisfaction with care delivered and may be cost-effective (Hersh et al., 2006).

Chronic patients can be monitored anywhere anytime by using modern measuring instruments (for example, insulin measuring instrument, etc.) connecting to the patient's mobile phone. The measuring instrument will communicate with the treating physician over the patient's mobile phone. The patient's mobile phone will be used as a terminal that saves the received data into the central database using a Remote Procedure Call (RPC) for standard applications (low-level safety and security) and Restful Services for safety- and security-critical applications. A physician can see the data immediately after the entrance on his computer (a real-time system). The physician can also reroute critical values to his mobile phone if he is outside of the hospital. So, he can monitor the patient around the clock. There are two cases to be distinguished:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The case, where the patient lies at home (Homecare) and
- The case where he is hospitalized.

In the case, the patient is lying at the hospital, there will be two possibilities to collect data: the measuring instruments gather and transmit automatically the data to the system or the nurses collect the data and save them into the system. The system will automatically process the data analysis; send messages to the physician, etc.

According to the current organization of the health system in Benin, the nurses in villages will no longer treat the patient by themselves, but rather by using the Telehealthcare system to be assisted by specially trained physicians from the large cities.

In the case of a Homecare, the treatment will similarly be processed. A nurse comes to the patient only if required and on the arrangement of a physician. The patient in the Homecare treatment is also connected with a measuring instrument. If necessary, the family members must be instructed to be able to give elementary treatment to the patient. The gathered data will be sent to the next hospital. The nurses verify the values and can contact immediately a physician. For entirely urgent cases, the nurse will perform the first aid. The physician receives all values of the patient and takes decisions on immediate treatment. In the decision, the illness histories (the patient's health documentation must be retrieved) will be included/considered. The physician gets an access to the patient dossier and can initiate suitable therapy and treatments.

Telehealthcare System as Data Basis for Exchange of Experience

In the scope of the Telemedicine and eHealth system in the entire country, a database for medical intervention, treatments as well as experimental treatment procedures will be generated. This database will also contain anonymous data of patients and will be accessible for every physician. Data from the Telehealthcare system will be stored in this database, and therefore used for the experience exchange. As a multimodal database, the proposed database provides interfaces such as camcorder (for Image capturing), audio-module and Text-module. It will also provide VoiceXML based application to guide the user in inserting new data or retrieving information.

Patient Education and Continuous Education for the Medical Personnel

Every involved physician should learn through physician-to-physician communication and discussions over medical cases. Experiences would be acquired through "Learning by doing". Discussions on medical cases will be recorded and used later, on one hand for capacity building and educate. On another hand, the recorded discussion will serve as a treatment protocol. The system provides a voice over IP component to hold audio and video discussion through the system.

Improvement of Adherence to Treatment (A Reminder)

According to WHO, improving adherence to treatment results in a much larger impact on overall global health than any other improvement of specific medical treatment. (Hope, 1999).

WHO defines the adherence to treatment as the extent to which the patient's history of therapeutic drug-taking coincides with the prescribed treatment. Process-oriented or outcome-oriented are two

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

methodologies and/or definitions that can be used to measure the adherence to treatment. While end-results of a treatment, e.g. cure rate, are the outcome-oriented indicator of success used to measure the adherence, Process-oriented indicators of success are used to measure the adherence by dealing with intermediate variables such as appointment-keeping or pill counts (Scott & Mars, 2015).

Our on-site study found out that non-adherence to treatment mostly in rural areas is due to the illiteracy, poor access to pharmaceutical and/or medical care, lack of health insurance or the high medical fees patients must pay.

A reminder system is therefore designed and implemented. It is set at the start of any treatment so that it reminds the patient to take his treatment. In addition, it also reminds the caregiver to check whether the patient follows the treatment properly and visits the medical doctor for scheduled appointments. It is possible to include the patient relatives into this process so that they can also look at the patient and be sure that the patient regularly adheres to the treatment. A workflow is designed and can be adapted to each case. Patient, treating health professionals or the patients relative can record the patient's adherence to treatment. The authors are working on an extension of this component, where video-modules would be used to control and improve the adherence to treatment.

The adherence workflow requires the medication parameter such as start and end date, time and time interval where the medicine should be taken. The system calls at the set time and requests the patient to take his medicine and notify the system about this. The patient will be reminded three times. The system would then call a patient's relative or the next health center or the treating doctor/nurse. The third person should bring the patient to adhere to the medication. Once the patient takes the medicine, he has to record this into the system (warehouse) so that at the end of the medication the treating doctor can analyze the recorded data and take accordingly a decision in the case of unsuccessful treatment.

EXPERIMENTS AND RESULTS

Access to Pharmaceutical Care Services

Problem Understanding

We collected huge information during the test, both from interviews and conversations and from own experience. A major part concerned security aspects (see details in (Thierry Oscar Edoh & Teege, 2011)).

Feasibility

The mobile phone network provided a sufficient communication basis for the system. Network coverage existed in all test areas. The test showed that mobile phones are appropriate for processing an order, particularly in rural regions or regions without cyber cafés. The communication costs are reasonably low.

The test also confirmed the problems of delivery and payment, especially in rural regions. One specific problem occurred with cash payment on delivery. For security reasons, pharmacies prefer to hand out ordered medicine to a carrier only against prepayment. However, often the carrier had not enough cash. The alternative would have been to first collect the money from the customer and then fetch the medicine at the pharmacy. This may require additional tours by the carrier. The problem should disappear with an organized carrier service which is better trusted by the pharmacies.

Action Research

The test was conducted for about 2 weeks simultaneously in the test areas. During this time, a total of 434 volunteer patients used the system (Table 6). We interpret this as support for our hypothesis 95.6% of the test participants were villagers and many of them were women, predominantly mothers with small children from baby to children of 6 years of age. The highest participation was in test area I, as expected. However, the system was also used in the other two test areas and the participants were satisfied with the experience. We also succeeded in the purpose of the system implementation. Compared to the normal process, when the patients had to search and purchase the medicines by themselves, time and effort were substantially reduced.

Without the system, people, mainly in rural regions need one to three weeks to purchase a medicine. In addition, they must pay high transportation costs for traveling to several pharmacies. Using the system, the participants received the ordered medicine within two days. We thus reduced the time by up to 90%. Also, the transport expenses have been reduced.

Table 6. Test participants and results

Participants	Genre	Large cities	Villages/Slum	Total
N=434	Females	6 (37,5%)	406 (97,13%)	412 (94,93%)
	Males	10 (62,5%)	12 (2,87%)	22 (5,07%)
Total		16 (100%)	418 (100%)	434 (100%)

Resistance

We encountered relatively few resistances to EpharmacyNet usage. The women accepted the system sooner than the male patients and appeared very satisfied with it. Some cases of refusal to use the system were due to a lack of trust. We address the general aspect of trust in "The trustee concept".

Access to Healthcare Care Services

Rapid Prototyping and Problem Understanding

For the test purpose, we implemented a prototype of the proposed system. We simulate a medical case and built a multidisciplinary team (MP). Each team member received a mobile smartphone. As communication platforms, we select Skype, WhatsApp, and Google Hangout.

We involved an experienced traditional practitioner. He can read and write. He also speaks and understands French.

Scenario 1

The rural population is informed about the test. The traditional practitioner (TP) can speak and understand the local tongue, so he communicates with the villagers in the local tongue.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The population visits the TP for any affection. The TP contact the head of the MP on one hand to define the tasks and in another to proceed with the diagnostics assisted by the (remote) care expert.

The MP defines and assigns to each member a task with exactly defined workflow.

Scenario 2

The patient uses his (smart)phone to contact directly the next care unit for a teleconsultation. The patient is requested to provide pictures and supplement materials to ease the diagnostics.

The MP is built and defines, in turn, the tasks and assigns them to the team members.

Data Gathering

We collected different data during the prior stages. The collected data helped to design the present prototype of the remote care provision system. The collected data concern the care accessibility.

During the test, we collect again several data about the accessibility so that we can compare them with the previously collected data and perform a data analytics.

Feasibility

We used all selected instant message tools (skype, WhatsApp, and Hangout) for simulating the mobile computer supported collaborative work. All the tools performed good results. We could send and receive large files, asynchronously and synchronously discuss. However, sending large files consumes many resources and take longer because of too small bandwidth in the entire country. We faced also high latency issues.

The test reveals that the organization must be accurate, the tasks must be good planned and assigned to the person with the needed competence. Additionally, a workflow is needed to be presented before starting the treatment.

Obviously, the TP involved in the test faced certain understanding issues due to the weak knowledge of the French tongue. One-third (1/3) of the instructions from the remote physician were wrongly implemented. This shows the limitation of the system and the need of an automated translator and medical dictionaries for each local tongue. Beyond this, two-third (2/3) all written messages from the TP were incomprehensible. So, he was requested to only use the vocal message in his mother tongue.

We figure out that the TP could provide better diagnosis using this system and with the help of the remote physician. The treated patients (88%) have appreciated the treatment process as they were supported by a multidisciplinary team and can facilitate access to pharmaceutical products. 12% claim that a lot of people are involved in their treatment and thus fear to lose their intimacy and privacy and a lot of people would know more than necessary on the healthy.

The test is still in progress. Till now, only 35 patients and 86 medical treatment are recorded into the system.

Action Research

The challenges facing during the test are collecting and analyzing. The prototype is improving regarding the results of the running analysis.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Our goal is to attend 5000 patients and about 15000 medical treatment cases and collect significant data so that we can perform a good action research.

FUTURE WORKS

Impact of Involving the Traditional Practitioners

The focus of our future work will be to investigate the impact of involving the traditional practitioners on (i) the quality of the health care provision and (ii) workforce shortage. Since we are dealing with a multidisciplinary team, which work on a project (medical treatment), or one team member works on different projects at the same time, we could face many-to-one (many health caregivers, one patient) or many-to-many (many caregivers, many patients) relationship. So, it will be important to optimize the scaling problem that will be issued by the proposed system. The objective of the work will be to scale the agility in the care provision process. We have in mind to use the scaling agile approach practiced in IT world.

Adherence to Treatment

The adherence to treatment is a matter pre-requisite for successful treatment. It is then important to investigate how the proposed system impacts the adherence to treatment.

Understanding Barriers (Tongue Issues)

Speech-based applications and systems (spoken dialogue and multimodal systems) are actually being implemented for a broad range of domains and applications such as medical applications, tourist guide systems, and so on (Bell, 2003)(Green, 2009). These kinds of systems or applications using speech as the principal mode of interaction will become increasingly prevalent (Fitzgerald, College, Net, & Firby, 2002).

To increase the usability of the proposed system, we would design and provide a multimodal interface and spoken dialogue interface to the users.

CONCLUSION

In developing countries, the challenges facing health systems are caused by the lack of organization, poor health care infrastructure, lack of qualified personnel, and weak funding (e.g. lack of adequate health insurance). These challenges could be addressed by information technology solutions; however, it is often not possible to implement solutions from developed countries without adapting them, because of the technology level in these countries and the cultural manner.

In this chapter, the authors have proposed a virtual Hospital-network Solution that uses Telehealth-care and wireless sensor network technologies to provide pervasive/ubiquitous healthcare service to the population. It is aimed at enabling remote assistance to the undertrained caregivers, collaborating work between care professionals, provision of remote health care to the patient at home, and educate the patient. The system additionally involves traditional practitioners and trains them to perform medical diagnostic.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In a prior study (Thierry Oscar Edoh & Teege, 2011), the access to pharmaceutical care was investigated. An E-commerce solution was proposed to overcome the issues. However, the implementation faced a set of obstacles for launching a standard E-commerce system. The obstacles were then analyzed and workaround solutions were elaborated so that an adapted E-commerce system can be implemented.

A practical test has shown that the adapted E-commerce system has the potential to improve the pharmaceutical care delivery in the entire country no matter where the patient is living or resides. The adapted E-commerce system therefore extended to a multidisciplinary remote health care system to improve and increase the access to health care services.

The proposed solution approaches are based on ICT networking technology, which in turn needs a high and stable internet connection and reliable network services, high latency. However, the country is not yet entirely covered for the use of mobile internet and thus mobile data services. Though, since SMS and MMS are well implemented, available and stable, the authors combine both mobile internet, where it available, and mobile phone services to provide the telehealth care to the population.

Regarding the internet connection challenges facing, the upcoming experimental will focus on the use of LI-WI to overcome the challenges.

Further, a novel Internet of Things technology to improve the efficiency of data collection from sensors to a collector in a low-power lossy network (i.e., the sensor network) will be implemented. A de-verticalized middleware to expose the different data and services with a unique interface, on top of which vertical application can also be created.

Rashid Nawaz
University of Education, Pakistan

ABSTRACT

Information pollution, which usually refers to the overabundance of irrelevant, unsolicited, unwanted messages, is a major cause of concern for practitioners and academic researchers. Advances in the information and communication technologies has proliferated the production of information. Consequently, people are suffering from information pollution. Information pollution has made it difficult for employees and individuals to find the quality information quickly and conveniently from diverse information sources including print and electronic sources. This chapter sheds light on the relevant literature of information pollution and analyzes its causes in the Industry 4.0 era and puts forward suggestions for tackling this problem. This chapter emphasizes the significance of concrete efforts from computer scientists, academic professionals, and information professionals to devise strategies and techniques for refuting the effects of information pollution.

INTRODUCTION

Industries are undergoing a historic turning point (Laudante, 2017). People, machines, and products are now communicating with one another via the internet within the context of industry 4.0. Industry 4.0 refers to the convergence between industries and the Internet technology (Fernández-Miranda, Marcos,

DOI: 10.4018/978-1-7998-7297-9.ch077

Copyright © 2021, IGI Global. Copying or distributing in print or electronic forms without written permission of IGI Global is prohibited.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

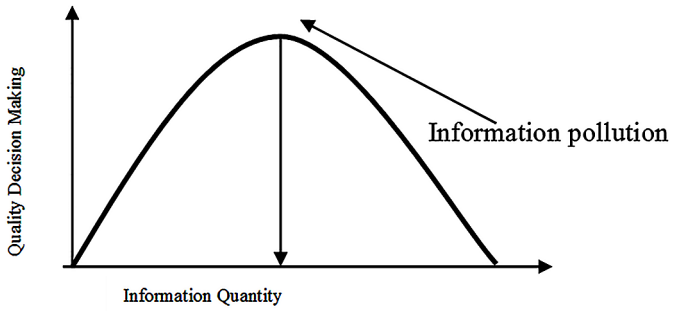
Peralta, & Aguayo, 2017). Industry 4.0 offers opportunities in the form of resource efficiency, energy efficiency, and increased productivity. It also solves industry challenges by shortening the innovation creation process; and time-to-market cycles, facilitated through horizontal integration, vertical integration and end-to-end digital integration (Kagermann, Helbig, Hellinger, & Wahlster, 2013). For the most part, both manufacturers and technology suppliers do have a very positive outlook towards industry 4.0 (de Sousa Jabbour, Jabbour, Godinho Filho, & Roubaud, 2018).

Industry 4.0 is made up of different components which includes, 3D printing, big data, Internet of Things (IoT), and the Internet of Services (IoS). These components individually and collectively facilitate smart manufacturing and logistics processes (Kagermann et al., 2013). These components enable and support the management and the production processes within Industry 4.0. The industry 4.0 context in this chapter is its managerial aspect and not the technical and automation process. The managerial aspect is discussed within the context of virtual organizations.

Industry 4.0 is driven by big data generated and used in the processes within this industry. Therefore the prospect of managing big data is this industry becomes challenging. However, currently new ways of managing big data are now evident in Industry 4.0. But these new approaches towards managing big data are not sufficient. This is because most of the information harvested from the big are not credible and useful to the management and administrative employees in virtual organizations utilizing industry 4.0. What makes big data challenging are its characteristics. Big data is made up of the 4Vs, i.e. velocity, veracity, volume, and variety of information. The 4Vs have increased significantly in the contemporary age resulting in increased information pollution or infollution. *Information pollution refers to the information that is irrelevant, outdated, inaccurate, hidden and unsolicited*. How infollution is handled in an industry is important to the value derived from big data in the context of industry 4.0. Therefore, the successful realisation of benefits associated with virtual organizations in industry 4.0 relies on how a firm's Research and Development (R&D) process is directed towards the reduction or mitigation of infollution caused by the 4Vs. This idea is supported by Prause (2015), who based on the glueing function, emphasised the management of the 4Vs to reduce information pollution or infollution within the context of industry 4.0 (see (Jay Lee, Kao, & Yang, 2014)).

The focus of this chapter is on how infollution could affect the decision makers and administrative employees working in a virtual organization delivering an industry 4.0 service. The chapter is designed in a progressive manner. Here the discussion begins with general overview of the central concepts of the chapter. This is followed by how these concepts are seen within virtual organizations and Industry 4.0. The chapter is designed as follows. The first section is the introduction. This is followed by an overview of the concept of infollution. As industry 4.0 is an ICT enabled industry, the next discussion is on the influence of ICT on infollution. This is followed by a discussion on infollution and Industry 4.0; a discussion on the interplay between infollution, virtual organizations and industry 4.0; and the conclusion of the chapter. In this chapter the words "information pollution" and "infollution" are used interchangeably.

INFORMATION POLLUTION: NATURE AND SIGNIFICANCE



In this section, a general overview on infollution as a concept and how it impacts organizations in general is discussed. The context of the discussion in this section is broad, because information pollution is assumed to emerge from divergent sources. This includes online and offline sources.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Overview on Information (Infollution)

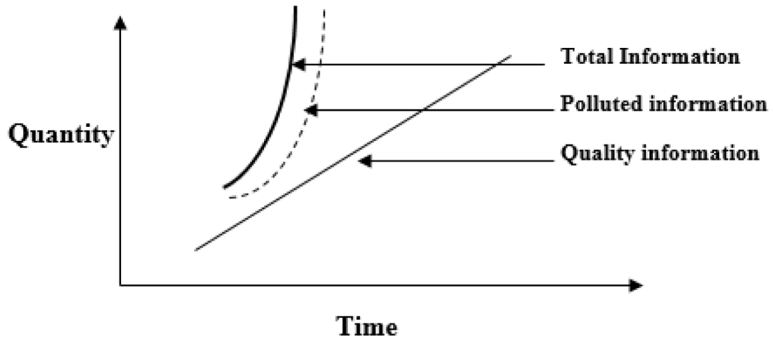
Presently, information is increasing exponentially while quality information is increasing linearly (Kirsh, 2000). Based on this fact, polluted information also increases exponentially (Iqbal et al., 2018) (See Figure 1).

Figure 1. Graph-01

The increasing quantity of information has an influence on the information processing behaviour of individuals (Swar, Hameed, & Reychav, 2017), and it also has an influence on the managerial and operational processes within an organization. Yet, the amount of information that is credible is not much because there is a great deal of polluted information available compared to quality information. These polluted information are often *irrelevant, outdated, inaccurate, hidden and unsolicited*. This actually becomes problematic when dealing with Big data.

Therefore in ordinary lingo, information pollution refers to the situation where individuals receive irrelevant, useless and outdated supply of information, resulting in dysfunctional consequences and diminished decision quality (Eppler & Helfert, 2004).

Nature of Information Pollution



Information pollution has an effect on decision makers and employees in an organization. Furthermore, it has an effect on individuals working in the organization and the organization as a whole.

1. **Individual Level:** On an individual level, once, the information supply exceeds the information processing capacity; individuals start facing problems in the sifting of relevant and updated information. Information imbibed by the individual therefore becomes overtly selective which means that it becomes incomplete. A large amount of polluted information makes it hard for people to understand the association between details and the overall perspective (Eppler & Helfert, 2004). Therefore, with increasing infollution, efforts to secure quality information is also on the increase. But the information processing capacity and response rate of humans are not always efficient resulting in a failure to secure quality information (Chen, Shang, & Kao, 2009).
2. **Organizational Level:** The effect of infollution on the organizational level stems from a spill over effect from the individual level. This is because, information acquired at the individual level is

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

used for decision making, which affects the organizational level. The adoption of lack of credible information will result in bad consequences for the organization. These effects are discussed in the next sub-section. Literature suggests that information quantity, quality decision-making and polluted information move in one direction up to a certain point. Beyond that point the quality of decision will decline (Sasaki, Kawai, & Kitamura, 2015) after which infollution becomes a critical concern (See Figure 2).

Figure 2. Graph-02

Effect of Information Pollution on Organizations

As mentioned in the previous sub-section, information pollution has an effect on the organization level. When information pollution exists, it affects the opportunity cost of the company; it affects the accuracy of the information used for decision making; it affects the organization's ability to forecast in its processes and it magnifies the downside organizations experience with imperfect information. Let's look at each effect, one by one.

1. **The Effect of Infollution on Opportunity Cost:** From an organizational perpective, infollution causes organisations to incur substantial costs. Employees waste a lot of time searching for and sorting irrelevant information into meaningful knowledge (Kutty, 2006). Managers have also reported delays in quality decision-making processes due to *"analysis paralysis"* or the presence of too much-polluted information (Jackson & Farzaneh, 2012). Infollution distracts employees from their core job responsibilities and employees and makes it hard to develop effective organisational strategies (Kutty, 2006).
2. **The Effect of Infollution on Information Accuracy:** Information pollution has been investigated in a substantial body of literature. More than 60% of 500 medium-size firms have been found suffering from infollution (Han, Pei, & Kamber, 2011). 1% to 10% of organisational information are inaccurate (Nelson et al., 2005; Klein 1997). The 30% error rate within industrial information is typical and that can rise up to 75% (Zaveri et al., 2016). 70% of orders in the manufacturing sector are based on polluted information (Preece, Missier, Embury, Jin, & Greenwood, 2008). 40% of the credit-risk management database in a New York bank was found to be incomplete (Ge & Helfert, 2008). Between 50% and 80% of computerised U.S. criminal records are estimated to be

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

incomplete, inaccurate and ambiguous (Strong, Lee, & Wang, 1997). The above literature suggests that the pervasiveness of infollution has made it difficult for organisations and individuals to make quality decisions.

3. **The Effect of Infollution on Forecasting:** Infollution facilitates the likelihood of harmful disasters. Across many organisations, many business initiatives have been delayed or even cancelled due to poor information quality (Ge & Helfert, 2008). In other areas of life, the same trend can be identified. On January 28, 1986, seven astronauts were killed in the explosion of the space shuttle challenger soon after lift-off (Madnick et al., 2009). Seventeen years later, seven other astronauts were killed when the space shuttle Columbia exploded (Mahler, 2009). In July 1988, the U.S. Navy Cruiser USS Vincennes had shot down an Iranian Airbus killing all 290 people aboard. On September 11, 2001, 19 hijackers entered an airport and converted four commercial passenger jets into guided missiles where approximately 3000 people were killed (Kean, 2011). These events occurred because they were difficult to predict due to infollution.
4. **The Effect of Infollution on the Consequences of Imperfect Information:** Infollution magnifies the consequences of imperfect information. Decision-making based on polluted information is associated with high costs. In an Australia hospital, inadequate prognostic information resulted in the fatal overdose of a paediatric patient (Madnick et al., 2009). An eyewear company faced a 15% lens grinding rework rate because of information errors that cost them at least $1 million annually (R. Y. Wang, 1998). One healthcare organisation that had consistently overpaid $4 million per annum in claims to non-eligible patients (Levis, 2011). Organisations fail to make an adequate profit due to incomplete information (Alenezi, Tarhini, & Sharma, 2015). They also lose clients because of infollution on their website (Jumin Lee, Park, & Han, 2008). A telecommunication company lost $3 million because of wrong financial analysis based on polluted information in customer bills (Kurniati & Surendro, 2010). Decisions based on poor information results in 8% to 12% loss of revenue in a typical enterprise. Service organisations bear from 40% to 60% of their expenses because of low-quality decision-making (Madnick et al., 2009). Some 599 surveyed organisations lose more than $1.4 billion annually because of infollution(Ge & Helfert, 2008). Hence, managing polluted information is beneficial to organisations.

Overall, infollution causes damages that amount to billions of dollars annually. It sometimes results in either loss of live or permanently altered life. Hence, the pervasiveness of infollution is evident (Wang et al. 2001). It is costly (Eppler & Helfert, 2004) and even disastrous (Madnick et al., 2009). The common thread in all these events is poor information quality or infollution.

In the next section, the discussion is on how Information and Communication Technologies (ICT) affect infollution. This discussion is important because, Industry 4.0 and virtual organizations are enabled by ICT.

INFORMATION POLLUTION (IP) AND INFORMATION AND COMMUNICATION TECHNOLOGIES (ICT)

ICT has a general effect on infollution. Information and Communication Technologies (ICT) is now one of the major conduits of information globally. Organizations and individuals are now depending on information extracted from ICT informational applications and services. Due to the geographical cover-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

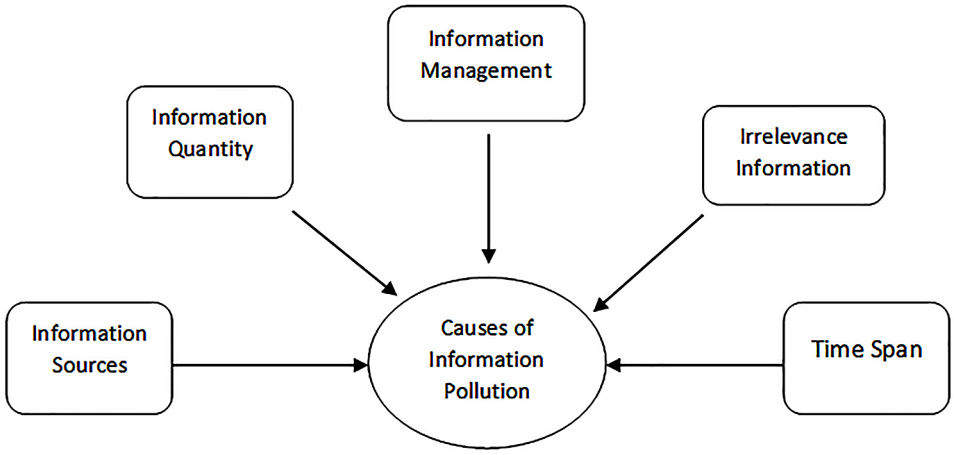
age of ICT, tons of information are available now than it has ever been. This has given rise to big data. Unfortunately, ICT informational services are a major source of infollution (Pandita, 2014) (Bawden & Robinson, 2009). In this section, the discussion is on the effect of ICT on infollution generally. This is followed by the effect of ICT on infollution and how it affects decision making in an organization.

Effect on ICT on Infollution

ICT has its various subcategories, contributing to information pollution. However, a major sub-category with a significant infollution problem is the World Wide Web. The World Wide Web is one of the largest sources of information. Most of the information it contains are unstructured and unsolicited. However, what constitute infollution on the World Wide Web is the low level of relevant information delivered either structurally or unstructurally to end users. In the case of this chapter, organization and virtual organizations in the industry 4.0. On the World Wide Web, the irrelevant information could be on Social media and via spam electronic messages etc. Spam is defined as electronic messages received from unknown senders. The abundance and frequent delivery of junk emails undermine the merits of email communication.

It is important to note that irrelevant information could result in health problems for employees which could in turn affect the organization. As an example, irrelevant information on social media has a significant association with certain chronic diseases (Soucek & Moser, 2010). Therefore the authenticity of information in cyberspace is a major concern for researchers (Iqbal et al., 2018). And this has led researchers to emphasise on individuals and organization checking on the reliability and validity of information they consume (Kelton, Fleischmann, & Wallace, 2008).

Effect of ICT on Infollution in Organizations



In an organizational context, decision makers and employees are exposed to varied channels of information delivered via ICT. In the presence of this excessive supply of information, employees find it difficult to identify the relevant information (Ozdemir, 2016). These employees and decision makers are bombarded with information from all corners. These information are presented in different format. This implies that infollution constantly takes on new shapes and manifestations, making it increasingly difficult to find the right information at the right time in the right format. What makes the matter worse is the fact that employees working with computers suffer from cognitive loads and are therefore more susceptible to interference from interruptions. These problems affects the manner in which they sift through the needed information, turning ICT into a source of interruption and distraction. As the distraction increases, there is a high probability in the decrease in decision accuracy. Such interruptions are detrimental to decision-making processes (Ou & Davison, 2011). Given the above, Eppler & Helfert (2004) identified five factors of information overload that contribute to the infollution as shown in Figure 3.

The existence of multiple information sources, over-abundance of information, inefficient information management, irrelevant information, and scarcity of time on the part of information users are factors that enable information pollution.

A solution to the problem would be that decision makers and employees in an organization possess information literacy skills. In a case where the information literacy skills are lacking, it is hard for the individual to manage the ever-increasing quantity of information acquired.

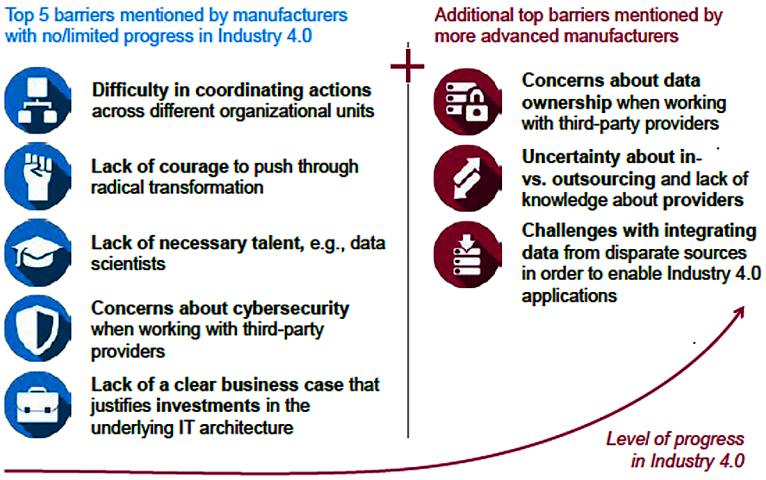
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Diagram: Causes of information pollution

Infollution has been categorised into that which provokes disruption and those that affect the quality of information. Disruption infollution constitutes unsolicited messages and instant messages particularly in the context of a workplace (Wardle & Derakhshan, 2017). Mobile phones also contribute to this category (Neilson & Chadha, 2008). Reduction in the quality of information is considered infollution because information is inaccurate and outdated (Widen, Steinerová, & Voisey, 2014).

Now as Industry 4.0 is ICT driven and the amount of information available constitutes Big data, how does Infollution affect industry 4.0. That is the discussion of the next chapter.

INFOLLUTION AND INDUSTRY 4.0



In the previous 2 sections, a general overview of Infollution and how it affects organizations and how ICT enables infollutions in organizations were discussed. In this section infollution is contextualized within the context of organizations and virtual organizations operating in industry 4.0 sector. For starters, it is important to note that infollution is not the only challenge facing Industry 4.0. The top five barriers towards the implementation of industry 4.0, as seen by manufacturers, are exhibited in figure 4, highlighted in blue. However, advanced manufacturers have added three more issues to the context of industry 4.0 as shown in figure 4, highlighted in red.

Despite these major challenges, the challenges caused by Infollution cannot be ignored. Industry 4.0 is enabled by ICT, it is data driven both in its management and operational aspects. Consequently there is a dramatic increase in the variety of information sources in industry 4.0, resulting in big data. Hence there is an increase in the risk and uncertainty associated with the quality of information available in this industry. As this industry is data driven the credibility of the information quality becomes paramount (Iqbal, Hassan, & Ahmad, 2018). Having realised this problem, academic researchers have recommended the need for an effective evaluation of information sources and information assessment (Flanagin, Metzger, Pure, Markov, & Hartsell, 2014).

In the context of virtual organizations, the credibility of the information in industry 4.0 becomes critical. Before industry 4.0, information credibility was a function of face-to-face interaction. In that setting

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4.
Source: (McKinsey Digital, 2016)

in an organization, employees depended on diverse sources of information. They even solicited personal advice from friends and family members (Samadi & Yaghoob-Nejadi, 2009) as well as rely on information channels predating the internet such as books, television, and radio. But in virtual organizations, although these functions still exist, there is a greater need to acquire credible information from remote teams. This is because, a team could constitute remote employees working together. And if the virtual organization is an industry 4.0 organization, then this becomes challenging. This is because in industry 4.0, information sources vary. Similarly, the perception on the credibility of information sources also varies along with categories of information in industry 4.0 (Iqbal et al., 2018). An information category could be that needed for machine-to-machine communication, machine-to-human communication, human-to-human communication etc. Despite the diverse perception of credibility in the Industry 4.0 context, the credibility of information sources still plays a vital role in the persuasion of quality information (Flanagin et al., 2014). And this is especially so for virtual organizations.

As most industry 4.0 applications require information from disparate information sources (mentioned in the previous paragraph), one of the major challenges in the implementation of industry 4.0 is the integration of information from disparate information sources with the prevalence of information pollution (Bauer et al., 2016). This also becomes more challenging if the industry 4.0 organization is a virtual organization. The reason for the information integration challenge is the exponential increase in infollution, resident in the big data generated an industry 4.0 organization. Currently virtual organizations are still searching for the perfect means for sifting through big data for credible information needed by virtual teams. Therefore with the exponentially increasing infollution, employees in the organizations and virtual organization are unable to integrate quality information into their decision-making processes (Eppler & Helfert, 2004). Thus, infollution is a critical problem in today's world and industry 4.0 (Iqbal et al., 2018). This is more so as organisations become more and more dependent on information to achieve their objectives. (Iqbal et al., 2018).

In conclusion to this section, poor information quality is pervasive and costly. Information within organisational stores are neither entirely accurate nor complete (Nelson, Todd, & Wixom, 2005). Error rates up to 75% are being reported, while error rates up to 30% are customary (Batini, Cappiello, Fran-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

calanci, & Maurino, 2009). Infollution may lead to real losses both economically and socially. When people select alternatives based on limited resources (information), these misinformed individuals are more likely to make poor decisions (Madnick et al., 2009). Decisions based on low-quality information can cost organisations billions of dollars (Madnick, Wang, Lee, & Zhu, 2009).

Now, let's narrow down the discussion specifically to how Infollution affects Virtual organizations in industry 4.0. So far, the aim has been to build a preamble to this discussion.

INFOLLUTION, VIRTUAL ORGANIZATIONS AND INDUSTRY 4.0

In this section, the discussion will be on how infollution affects virtual organizations in the industry 4.0 sector. The discussion begins with the description of a virtual organization. This is followed by the impact of big data on industry 4.0 virtual organizations and how infollution affects virtual organization in industry 4.0.

Virtual Organizations

Virtual organizations are made up of virtual teams or group of employees in an organization dispersed geographically, organisationally and across time zones. These teams and their employees work together collaboratively using ICT to complete one or more assignments (Corvello & Migliarese, 2007). Advances in ICT sector, have enabled the organisations to operate virtually (Chumg, Seaton, Cooke, & Ding, 2016) to achieve a common goal through the flexible allocation of resources. In the same vain, virtual teams exist in industry 4.0 organizations. These teams could be part of the management, administrative or production processes. It is important to note that the context of this chapter is not in the production processes. However, there are more virtual organizations today due to the advancement in ICT. And researchers are now recommending the establishment of more flexible organisational structures, such as virtual organisations, in order to adapt to the technological changes in the business environment (W. Y. Wang & Chan, 2010). Never the less, as industry 4.0 is driven by big data, what do virtual industries use big data for? This is discussed in the next section.

Industry 4.0 Virtual Organizations and Big Data Usage

Virtual organizations also exist in the industry 4.0 context as alluded to in the previous section. These organizations utilize a big data for their management, administrative and production processes. Big data in Industry 4.0 virtual organizations has an impact on the decision making process in the area of the organization's management, organisational structure, and the evolutionary game theory processes used in the organization. In addition, it also enables virtual organizations to identify new business opportunities. Therefore the big data creates the possibility for the virtual organisation to find more suitable partners; use technology effectively; enable industry integration; and search for business cooperation benefits. Let's take the finding of new partners as an example. The quick identification of potential partners with required competencies from a broad spectrum of possible partners is vital for any organization. This is not different in the case of an industry 4.0 virtual organization. Such a virtual organisation may use coping strategies such as filtering, and withdrawal strategies, based on the criteria of information required and the reduced number of information sources respectively, to deal with the big data. Now knowing what

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

we know now about infollution and big data. The next question is how does infollution affect virtual organizations? This is discussed in the next section.

Virtual Organisation and Information Pollution in Industry 4.0

As organizations generate big data, information pollution becomes a problem. As mentioned in the previous section, industry 4.0 facilitate exponential infollution. Nevertheless, industry 4.0 virtual organisations may not suffer the adverse effect as other organizations. This is because these virtual organizations may easily get quality information in the presence of proliferating infollution, since they themselves are producing big data themselves. They will have a mechanism for filtering the data. The challenge for them will arise in a situation where the data is externally generated and delivered to them.

In the same vain, smaller industry 4.0 virtual organizations may also fell a lesser effect of infollution. This is because they might be concerned with the organisational structure where enhanced effectiveness and efficiency of the management practices are promoted by handling them in a flexible way (Ferreira, de Lima, & da Costa, 2012). However in a larger industry 4.0 virtual organization, there are bound to be challenges due to the complexities of their internal procedure and operations.

Although infollution will affect different industry 4.0 virtual organizations in different ways, it is likely that Industry 4.0, which is advanced ICT, will further enhance some positive transformation in virtual organizations with respect to dealing with infollution. As new tools and applications are being developed, it is likely that the transformation will be focused on the delivery of more enhanced value, credible and quality information. This transformation will enhance internal operations as well as enhance the external operations of the virtual organization. It will also solidify external partnerships between virtual companies which will enable access quality information; acquisition and jointly building of information sources and risk sharing in decision-making. The internal transformation will enable the adoption of internal processes that will enable the ability to gather quality information; and the promotion of knowledge sharing activities - where employees share information through email and sometimes opt for video conferencing, thereby facilitating the redistribution of credible information within the organization.

Although certain industry 4.0 virtual organizations are expected to fare better when it comes to dealing with infollution, this does not imply that there will be no challenges. A challenge that could degrade the quality of information shared in any virtual organization could be the trust deficit among staff members (McCarter & Northcraft, 2007). Another challenge is that the internal competition among stakeholders in a virtual organisation could raise further objection about information quality. This requires balancing the self-interest of different stakeholders which can be achieved by effectively managing infollution.

CONCLUSION

The preceding discussion depicts that infollution is here to stay. As big data is generated in industry 4.0 virtual organizations, it is likely that infollution will be on the increase. This chapter focused on the managerial significance of Infollution in such organizations. However, infollution will also affect the technical aspect of virtual organizations in industry 4.0, since they are data driven as well. But as that is not the scope of the chapter, nothing is mentioned about it. However, there are a need for information professionals, academicians, computer scientists, and knowledge management specialists to develop

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

strategies to keep the adverse effects of infollution to a minimum. This will provide new effective and innovative techniques for information seekers to manage infollution and secure, reliable information.

Chapter 78
Enterprise Systems, Power and Improvisation:
Equipping Universities for Mass Production?

David W. Wainwright
Northumbria University, UK

Teresa S. Waring
Northumbria University, UK

ABSTRACT

Enterprise systems (ES) have been extensively procured in large organizations but much research fails to develop sociotechnically informed approaches that facilitate their implementation whilst understanding the impact of integrated technology on professional working practices within complex organizational environments. This chapter takes a critically informed sociotechnical approach to power and improvisation in ES implementation. The contribution is a combined "circuits of power-improvisation" (CPI) framework which can facilitate a better understanding of ES implementation, sociotechnical theory, and practice. Practical lessons learned from the study may potentially be used to avoid some of the problems experienced with the over-zealous and rapid introduction of digital technologies into university organizations where the risk is that they become a student mass production system. It highlights the important role of power and improvisation, enabled and afforded by new digital technologies, in what may be misrepresented as planned strategic and deliberate organizational change.

INTRODUCTION

In the last two decades, increasingly complex forms of organization have developed in response to the pressures from globalisation, economic uncertainty and market instability. In addition, rapid technological developments, especially in information and communications (now commonly termed digital) technologies, have provided opportunities for the adoption of new management practices - especially

those based on principles of performance monitoring, reporting, staff accountability and control. This is particularly prominent in both the private and public sectors, where objectives focusing on efficiency, competitiveness, quality, and accountability have led to an emphasis on the development of new metrics underpinned by a culture of performance management, greater centralisation and hierarchical systems. In order to facilitate and reinforce these new management regimes, deliberate organizational strategies have often entailed the procurement, adoption and implementation of Enterprise Systems (ES). This is particularly evident in sectors such as Higher Education in the UK where, in the past, there have been more professional and collegial forms of work organization, professional autonomy and localised decision making (Fowler & Gilfillan, 2003; Pollock & Cornford, 2004; Oliver & Romm, 2009; Wagner et al., 2010). The rise of managerialism, underpinned by ES technology and more recently artificial intelligence and machine algorithms, has given rise to a new form of technocracy based on key drivers of machine efficiency and effectiveness that has begun to dominate the human and social aspects of work and knowledge based systems that have been developed over many years in organizations. This raises new issues regarding the maintenance of an appropriate balance between human, social and technical aspects of work thus giving rise to the need for more informed sociotechnical approaches and methods to be adopted in ES implementations that also now extends to digital transformation strategies.

Emerging research (Wagner et al., 2010; Dong et al., 2009) would also appear to indicate that many organizations, although having ambitious Information Technology (IT) strategic plans in place, find large scale enterprise systems overwhelming during implementation and may adopt organizational actions which respond to unfolding events resulting in unexpected and unintended consequences of the implementation as it progresses. One such consequence may be the ability to engage in opportunistic re-organization strategies afforded by the assimilation of 'new managerialism' (Clarke & Newman 1997) within the organization and, with it, a culture of command and control that is often incongruent with existing management cultures and organizational structures (Deem, 2004; Deem & Brehoney, 2005). The effects of ES adoption and its relationship to the redistribution of power and the alteration of political structures may lead to new policies, strategic opportunities and threats within organizations. This is an area that appears to be under researched. However, ES, once adopted, can also act as a catalyst for organizational and work based improvisation, thereby creating new and unanticipated power relations, managerial roles and structures.

The aim of this chapter is to contribute both to sociotechnical theory and practice, by examining IS improvisation practice through the lens of a power and improvisation model that explicitly recognises the concept of power and its role in IT enabled organizational change within the wider context of enterprise systems adoption and implementation. Unlike Orlikowski's (1996) 'open-ended' highly configurable groupware IT, and Elbanna's (2006) 'successful' manufacturing ERP implementation, the ES under consideration here is one implemented within a highly complex UK Higher Education (HE) organizational environment. This critically informed and sociotechnical approach adopts the 'circuits of power' framework (Clegg, 1989; Silva, 2007) and relates this to an improvisational model of change to surface issues and actions that bring with them unintended consequences for organizations. This chapter is an updated version of our previous research study (Waring, Wainwright & Skoumpopoulou, 2016) with an extended discussion section that demonstrates the rapid acceleration of digital technology adoption in a university and the accompanying transformational and strategic changes; subsequently resulting in work force changes, deskilling and reskilling. Hence the notion of universities being increasingly viewed as a metaphorical 'production machine' to enable the mass production of students (Morgan, 2006).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The next section discusses the theoretical concepts that underpin this work and examines the fundamental ideas around improvisation and power and how the two may be linked. The primary research involved a longitudinal case study of a UK HE institution which implemented an ES and this is presented in the third section. The case is then deconstructed and analysed by relating it to the improvisation and power concepts previously formulated. The next section provides an updated account of the digital transformation strategy and its impact on the organization that was in many ways facilitated by the ongoing ES adoption. The final section presents the implications of this research for future ES adoption and implementation, and reflects on the utility of developing improved theoretical models of improvisation to surface issues of power and political relations in organizations. It is proposed that this will add to the body of sociotechnical theory and lead to a better understanding of improvisation enabling opportunities and actions to be taken that result in more ethical practice and increased value for stakeholders who may be the potential users and benefactors of ES applications and digital transformation programmes.

IMPROVISATION AND ENTERPRISE SYSTEMS

Both the research and practitioner literature concerning the implementation of enterprise wide systems (ES) in large organizations are replete with normative models, methods and guidelines providing prescriptions for implementation success. One area of research which appears to have relevance to the ES implementation debate, but which has tended to be largely overlooked, is the important role of organizational actors and improvisation during the process. This lack of formal recognition is rather paradoxical however, as it appears that no matter how highly structured and well managed the organization is, or how experienced the project teams are in terms of IS/IT implementation, improvisation is often brought to bear in situations where rubrics, formally planned approaches and methods fail (Cibbora, 1996). Research on improvisation has received increased recognition within the contexts of organizational change (Ciborra, 1996; Moorman, 1998), punctuated sociotechnical change and information systems (Lyytinen and Newman, 2008), management (Mangham & Pye 1991; Weick,1998), bricolage (Lanzarra, 1999), tailorability (Morch & Mehandjiev, 2000) and information systems development and implementation (Orlikowski, 1996; Elbanna, 2006). The literature also defines its other foundational areas as sense making (Weick 1995), innovation (Weick 1999; Kamoche & Cunha, 2001), emergent change (Mintzberg, 1994) and adaptive structuration (Desanctis & Poole, 1994). Nevertheless, what is often missing from this literature is a formal consideration of the power and political environment within which these improvisations occur.

Before considering how improvisation can inform ES implementation theory it is essential to better understand the concept, and its historical research context.

Defining the Concept and the Language of Improvisation

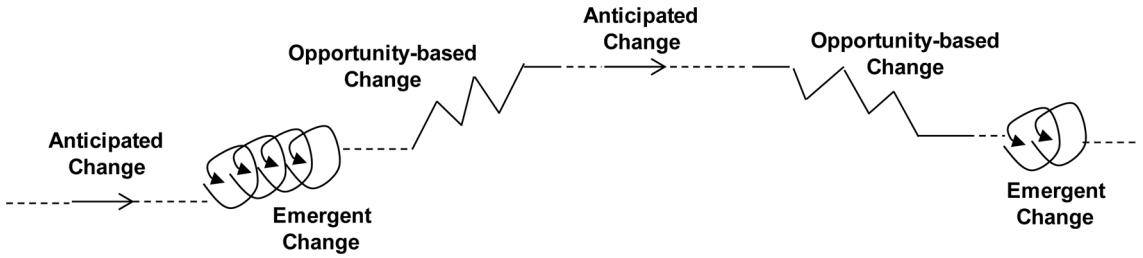
The concept and hence the language of improvisation is not only restricted to the information systems field and there has been a great deal of research carried out in anthropology, arts and management studies generally and organizational change management more particularly. Early organizational researchers grounded their studies of improvisation in the arts, especially jazz music owing to improvisation and the centrality of 'bricolage' (Cunha et al., 1999; 2012). Researchers then moved the debate away from the arts into management and organizational settings where they attempted to develop definitions of organizational improvisation and show its relevance in competitive environments (Ciborra, 1996).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

When one considers the totality of definitions available some common themes relevant to management can be identified. First, in these contexts, improvisation must be *organizational* because actions are carried out by organizational actors within teams, on their own or on behalf of the organization. Second improvisation can also be seen as the *conception of action as it unfolds* and finally improvisation implicitly suggests that it can only take place where there are *resources* and individuals able to make use of these resources. This is where the concepts of '*improvisation*' and '*bricolage*' are closely related. For example, improvisation implies the pre-existence of a set of resources, be it a 'plan of action', knowledge or a social structure, upon which variations can be built (Orlikowski & Hoffman, 1997). Also, if improvisation means to respond in real time then it follows that improvisers cannot wait for optimal resources to be deployed and have to tackle the issues at hand with what is currently available (Cunha et al., 1999). *Bricolage* on the other hand has been defined as "making things work by ingeniously using whatever is at hand, being unconcerned about the 'proper' tools and resources" (Thayer, 1998:239). These concepts build upon original notions identified in anthropology, cultural studies and the work of Claude Lévi-Strauss.

Improvisation Research and Its Context Within the IS Field

One of the most influential conceptual thinkers and writers within IS on improvisation and IS development is Claudio Ciborra. Working between the interstices of the management, information systems and organizational behaviour fields, Ciborra (2002, p.49) expands on the essential differences and nuances between the terms bricolage, improvisation and hacking. He defines this as*:*



Bricolage means tinkering through the combination of resources at hand. These resources become the tools and they define in-situ the heuristic to solve the problem. ..With bricolage, the practices and the situations disclose new uses and applications of the technology and things…….Improvisation puts an emphasis on the suddenness, extemporaneity and unpredictability of the human intervention, though highly situated….hacking is devising and implementing a program to perform a certain useful function by making use of any technology in an original, unorthodox, and often playful way….where hacking stands to software engineering tenets as bricolage stands to organizational procedures…

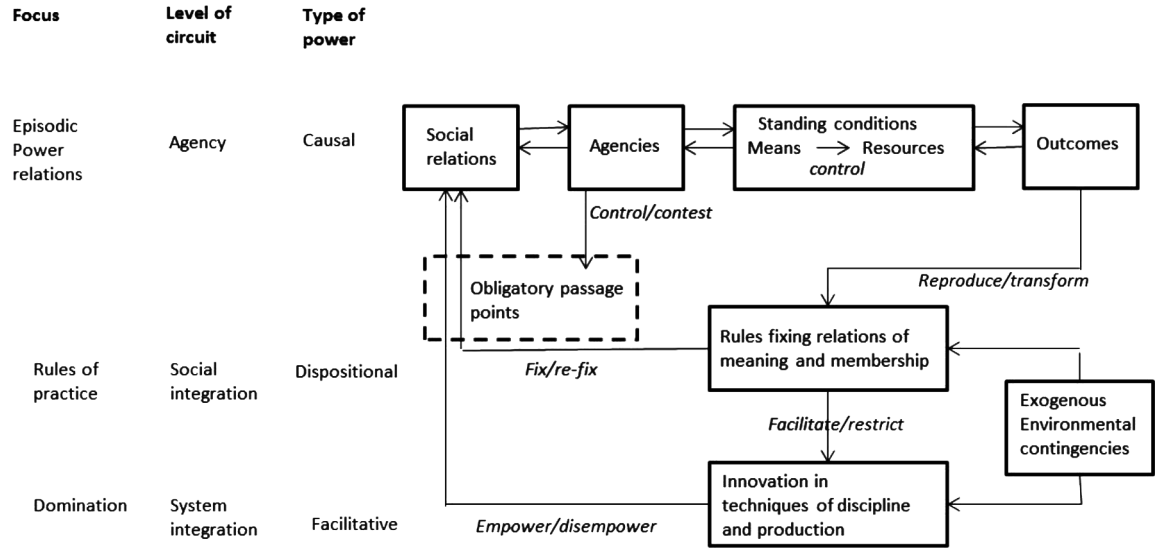
Ciborra (2002) expresses a caveat that these expressions can signify or be interpreted as derogatory practices or deviant management behaviours. He calls for a *'Copernican revolution'* where improvisation and bricolage is seen as the norm in strategy and systems implementation representing a valid alternative to rational and deterministic planning and decision making. These practices are particularly relevant to the adoption of ES providing a cognitive and organizational capability to convert these systems, applications and data into practical, situated, and unique knowledge for action. Ciborra (2002) also stresses the importance of considering 'mood' as a presupposition for improvisation as situated action. Ciborra's work, although mostly conceptual, acts as a complement to interpret more empirical studies that investigate improvisational change and methods closely related to bricolage.

Recognising that there was a need to develop better theoretical insights into large integrated IT systems implementation, Orlikowski and Hofman (1997) conducted an empirical study of organizational improvisation due to the adoption of IT groupware. Their original aim was to describe how improvised change can take place in a series of deliberate, emergent or opportunistic phases. Here three different types of change are recognised consisting of: anticipated, emergent and opportunity-based change (Figure 1).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. An improvisational model of change management over time (Orlikowski & Hofman, 1997:13)

Anticipated changes are those that are planned ahead of time and occur as intended. Emergent changes arise spontaneously from local innovations and are not planned or intended. Opportunity based changes are those that are introduced purposefully and intentionally in response to an unexpected opportunity, event or breakdown. Orlikowski and Hofman (1997) view these types of change as building on each other iteratively over time. The use of the new technology typically involves a series of opportunity-based, emergent and further anticipated changes the order of which cannot be pre-determined. This is because of the nature and complexity of change and its interaction with events and the environment within which it is taking place. They also suggest that "there is a discrepancy between how people think about technological change and how they implement it....that contributes to the difficulties and challenges that organizations face as they attempt to introduce and effectively implement technology-based change" (Orlikowski & Hofman, 1997:11). However, in their description of the case company Zeta, Orlikowski and Hofman (1997) make no mention or explicit reference to power or political actions that may influence or affect the outcomes of these improvisation types either in the supporting case study analysis or theory reviewed. In their study of groupware (open ended) technology adoption, the anticipated strategy and any unanticipated outcomes are all viewed highly positively. Negative consequences related to actual and potential user resistance, due to power and political issues, are rather 'downplayed' resulting in a 'rose tinted spectacle' view of planned and emergent organizational change. Yet, the power and political implications do not form part of the improvisation framework in Figure 1.



POWER AND IFORMATION SYSTEMS

Although there are IS studies which address power and politics it is not the intention to explore them at any length in this chapter. The intention is to focus upon IS research that is based upon Clegg's (1989) 'circuits of power' (Silva, 2002; Silva & Backhouse, 2003; Silva, 2007). Silva (2007) argues that the 'circuits of power' provides a rich analytical framework for the study of power and IS and has been derived from a number of studies on power within sociology (e.g. Callon, 1986; Law, 1986; Latour, 1987) as well as insights from Foucault's (1977) disciplinary power. This framework (Figure 2) also has the added benefit in that it relates the concepts of power to organizations.

In Figure 2, *episodic power* relates to agency, and, within the context of IS, Silva (2007) suggest that the focus of study may be on 'A's' exercise of power over 'B' (A and B are different agencies) and 'B's' possible resistance to some aspect of an IS adoption. Law (1991) views this as 'power over' or causal power and suggests that individuals have a scope of actions and that specific scope of action is given by the structural characteristics of the individual's particular context. Clegg (1989) complements episodic

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Circuits of Power (Clegg, 1989:214)

power by drawing on the work of actor-network theory and specifically the concept of 'obligatory passage points'(OPP) and the principle of 'symmetry' (Callon, 1986; Latour, 1987). Silva and Backhouse (2003) suggest that OPPs are the results of four 'translational steps', problematization, interessement, enrolment and mobilization, after which B has no other choice but to accept the OPP. The movement between steps is called displacement and involves discursive practices. When displacement occurs, power is exercised. Silva (2007) argues that information systems can be viewed as OPPs.

The 'circuit of *social integration'* addresses dispositional power. This capacity is a characteristic that distinguishes between having and exercising power. Power in this context is a facility that entitles someone to exercise power - but it does not necessarily imply its exercise (Clegg, 1989). Clegg (1989) defines social integration in terms of the relation between rules of meaning and membership. The analysis of this circuit identifies the legitimate (formal rules) and illegitimate (informal rules) dimensions of power within the organization

System integration within the context of power is viewed as facilitative and is understood in terms of its ability to produce and achieve collective goals. In the organizational context, system integration is the technological means of control over the material and social setting and the skills associated with these means (Lockwood, 1964). Besides the material means of production, Lockwood includes in systemic integration the material means of surveillance. In short, system integration is constituted by techniques of production and discipline. System integration deals with facilitative power because the material conditions of production might empower or disempower agencies in their productive activities. The circuit of system integration is the major source of change in the circuits of power framework, particularly when the material conditions of production are altered: hence its relevance to improvisation and our study. Changes in the circuit of systemic integration will entail new agencies, techniques and practices that the circuit of social integration might find difficult to resolve.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Improvisation, Power and Information Systems

Exploring the relationship between power and improvisation is challenging and, within IS, Silva (2002) has been one of the few researchers who have attempted this. Silva's (2002) case study, conducted in the context of a strategic outsourcing of information systems in two hospitals in Guatemala, took a narrow definition of improvisation as defined by Weick (1993) and through the lens of 'facilitative power' examined how the outsourcing was conducted. Although insightful it does not address more specific power issues within IS implementation. We propose that this work can be developed further by utilising Clegg's (1989) original 'circuits of power' framework and more recently Silva and Backhouse's (2003) adaption within the context of a system implementation where improvisation was an important activity at various stages of the project. Our intention is to demonstrate our approach by developing and applying a 'circuits of power – improvisation' (CPI) framework to an Enterprise System implementation within a university. We have identified in Table 1 where exploration of the data will occur.

Table 1. The 'Circuits of Power-Improvisation' (CPI) framework and our interpretation

Circuit	Type of Power	Our Interpretation of the Framework in the Context of Improvisation
Episodic	***Causal Power***: When A makes B do something B otherwise would not do.	Who are the As and Bs when the implementation is initiated? Who are the systems champions and are there resisters? What improvisations occur and who are the As and Bs? What are their objectives? What strategies are employed within the improvisation are adopted by the As and Bs? What resources are mobilised by the As and Bs within the improvisation and what are the outcomes? Can opportunity-based outcomes be explained?
Social Integration	***Dispositional Power:*** Provides the conditions for As to exercise power. Rooted in rules of meaning and membership of the organization.	What are the organizational rules and norms prior to implementation that place the As and Bs within their respective position? How do the improvisations affect these rules and norms? Are there new rules and norms? What are the meanings ascribed to these rules and norms as sense making takes place?
Systemic Integration	***Facilitative Power:*** This power causes the organization to generate outcomes and is defined by techniques of production and discipline.	What techniques are employed by As to ensure Bs compliance during/after an improvisation? What are the work tasks that are affected and how have they changed? Have the improvisations led to the system as a resource to instil discipline? How has this occurred?

IS improvisation does not take place without reference to organizational power and politics. Distinguishing the nature and circuits of power within an improvisation and the resultant changes has the potential to further our understanding of improvisation in an ES context. It is proposed that our understanding of the three types of improvisational changes (anticipated, emergent, opportunistic) identified by Orlikowski (1996) and Orliksowski and Hofman (1997) can be enhanced if examined against the combined circuits of power improvisation framework, Table 1. The three circuits of power, episodic, social integration and systemic integration may provide a richer account of the complex power and political relations within an organization type that contains both micro and macro-level improvisations and high levels of procedural memory. These typically encompass higher levels of routine knowledge

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and well defined rules (Tjørnehøj & Mathiassen, 2010) and are typically resident within a professional and academic led university and HEI culture.

RESEARCH METHODOLOGY

The study of the ES, a university student administration system (USAS), implementation began in 2007 as an ethnographic study and lasted five years. Ethnography can be defined as a 'style of social science writing which draws upon the writer's close observation of and involvement with people in a particular social setting and relates the words spoken and the practices observed to the overall cultural framework within which they occurred' (Watson 2011:205). Watson (2011) argues that ethnography should involve participant observation, content analysis of documents, stories, myths, rituals, symbols and other artefacts. This may be supplemented and strengthened by interviews, statistical analysis and even small surveys. The research began with an in-depth critical analysis of the documentation leading up to the USAS implementation. This was followed during 2008 by 22 interviews averaging one hour each, with university staff who had been in the university for no less than five years. As in the case of Doolin (1998) the interviewees were interviewed more than once over the research time period.

Interviewees were taken from across the university, Modern (pseudonym). A non-directive interviewing technique was used which allowed respondents to express their own views about organizational life in their own words rather than force them into predetermined categories (Hirschheim & Newman, 1991). The interviews involved a discussion of issues surrounding the participants' prior experience of student information systems, the implementation of USAS, life in the organization and change during and after USAS went live. Interviews were audio taped with permission, transcribed and returned to the interviewees for verification. Anything that was felt by the participants to be problematic was removed from the transcript and after one interview a respondent decided to wholly withdraw her transcript.

Participant observation took place throughout the research study and was recorded using a diary. As a member of staff one of the researchers was able to participate in the activities which contributed to the academic role in providing student data. Working alongside other colleagues it was possible to observe the action of various individuals and interpret them in order to gain insight into the cultural manifestations of the organization (Bryman, 2004). Burgess (1984) also argues that participant observation can increase the richness of the research and Waddington (2004) suggests that being part of day to day activities or important events can provide valuable understanding of organizational practice which can become ritualised over time. In order to understand administrative working practices, the same researcher spent a number of periods of observation during peak times in the academic calendar: student enrolment in October, marks recording after assessment in February and examination board preparation time in June. The research team also recorded events and further progress using participative observation and document collection to subsequently update the research programme to record significant events in the associated digital transformation programme through to 2017.

Using a general inductive approach informed by grounded theory (Crabtree & Miller, 1999; King, 2004) the interviews, documentation and diary data were coded according to theoretical concepts suggested by the data rather than imposed by the researcher. The approach used involved a process of developing initial categories, grouping data, identifying patterns and then making comparisons to uncover shared elements and properties (Barley, 1990; Van Maanen, 1979). The documentation and transcripts were also read critically to identify statements which reflected values, beliefs and assumptions about

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

USAS as well as for evidence of organizational stories, myths and rituals which may have arisen over the period of the research. The analysis of the case study is presented in a form of narrative taking into consideration the improvisations which took place and the elements of each circuit. Bearing these in mind the discussion explores what happened during the USAS implementation and the subsequent digital transformation programme. The intention is to identify those possible elements or factors that have resulted in the systems being adopted by Modern University in the manner it has. Our aim is not to arrive at a conclusion isolating certain factors or improvisations which have had maximum impact on the organization but to articulate an explanation covering a number of the power and political factors involved. The framework is a set of concepts that will support researchers of improvisation and power to collect, analyse and interpret data and practitioners to identify elements and processes that can hinder or support the introduction of a new ES and the associated digital transformations.

THE CASE OF MODERN UNIVERSITY: THE ADOPTION OF USAS

Modern University is a large city based university with over 3000 employees and at the beginning of this research was a decentralised organization consisting of nine academic faculties. In the mid-2000s Modern failed to deliver appropriate student information to central government and turned to an ES, called a University Student Administration System (USAS), solution to address their difficulties. However, where research and finance can be a major consideration in other higher education research studies, the focus at Modern was on the students, the courses offered and on the management of related data. A business case was accepted to make USAS the preferred alternative to upgrading an existing Oracle system. USAS is used by over 70% of the UK Higher Education (HE) market, by 25% of the Scottish Further Education (FE) market and has become the de facto standard for student information systems. Like many other integrated systems of its genre it has been built around an 'ideal' model of university administration consisting of modules to support admission of students to university, programmes to manage the curriculum through a standard three-year degree, a student module to manage enrolment, fees, progression throughout the degree and tools to 'enable' users to analyse, process and extract data. These enterprise systems are marketed as being highly flexible with the opportunity to customise to individual university needs. Thus, with other similar universities introducing it and at meetings with the vendors senior university managers were given assurances that the system could provide the solutions for which they were looking. Anticipated change from a senior university management perspective was centralisation of student data management and more efficient use of both academic and administrative staff resources.

Improvisation and Episodic Power

'Episodic power' focuses on the relationship between resources and outcomes and is intrinsically linked to the improvisations which occurred as organizational members drew upon available material, cognitive, affective and social resources (Cunha et al., 2012). Led by the Director of Finance, and supported by the university registrar and two other senior staff as well as representatives from the vendors, the plans for the implementation of USAS started in 2005. In order for USAS to be introduced into Modern University a budget was set up, a number of new groups or teams were established, and material resources released. The two groups that played a major role in the project were the USAS implementation team (technical

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

staff employed from internal university resource and external agencies) and the USAS liaison group (senior administrative staff seconded from each of the departments) both of which were intended to be temporary structures to be dismantled after the system was up and running. There was little academic staff involvement. The USAS implementation team were seen as the technical experts, housed in their own suite of offices, trained by the USAS vendors, who would lead the technical aspects of the implementation. The USAS liaison group would support departments in getting the data into the system and extracting the requisite information. Examination of minutes of their meetings suggest the focus prior to 'going live' was on USAS technical issues and not on organizational change. This approach is not unusual within these types of information technology projects as the initial focus is to ensure that the physical resources are in place and being accessed by the appropriate staff (Coombs, Knights & Willmott, 1992; Parker, 2000). Nevertheless, the decisions on who has access to the new technology are political and subject to control of the dominant group (Doolin, 1998).

The USAS implementation team and the USAS liaison team worked closely together from 2005 until the system went live in 2007 and shared an excellent working relationship. One example of an area that they jointly worked on was student data migration from all the department systems to the new USAS system. USAS has a very rigid set of data structures which cannot be altered. It was the responsibility of the USAS implementation team to transfer the current university student data into the structures available in USAS. This was not easy as each department kept their student records according to their own needs. The USAS team were also faced with determining how the standardised approach to student data collection would be managed going forward. The Director of Finance and his advisors anticipated this would be a simple transfer of common data into structures congruent with university requirements and facilitated by the USAS vendors. However, Pollock and Cornford (2004) suggest that enterprise systems such as USAS overwhelm organizations so that they have little option but to implement 'default' settings which tend to emphasise similarities between organizations and not their differences. Thus, individual departmental needs are disregarded in the quest to be 'up and running'. The USAS liaison group was asked to assist and advise on new degree programme codes which they did without reference to the academic colleagues who actually managed the students. Nicolini (2007) sees this assumption of 'knowing what is best for the rest' as a feature of many ES implementations as a dominant group, in order to make sense of their identity, imposes a view of practice intended to enhance their credibility and competence. Nevertheless, this improvisation within USAS illustrates the use of affective resources where the two teams felt the need to support one another in overcoming a problem. In fact, the lack of academic knowledge was not seen to be an issue (Briefing paper from USAS Project Manager, 2005). What occurred was an unanticipated emergent change which only became visible when the system went live.

Although academic staff had not been consulted in the lead up to 'going live' with USAS it was the administrative staff who were feeling the stress in relation to the new role they were expected to play. It was anticipated that all administrative staff who dealt with student data would be trained on USAS in time for 'going live'. The USAS vendors had a specific approach to training which they passed on to the USAS implementation team. This approach ensured that everyone used the system in the same way. However, this training by the vendors was expensive and could not be rolled out across the university. Therefore, the USAS project manager decided that the USAS implementation team would provide training for all. The problem was there were insufficient trainers to cover every administrator who needed training on USAS. Hence the improvised training was done in large groups in information technology laboratories with little interaction. Staff complained about the content and quality of that training.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Added to this training issue the USAS implementation team would not allow cascade training *'in case the wrong message was given'* so tensions were high as August 2007 approached. The power to determine the nature of the training is an opportunity based improvisation and is indicative of the growing internal credibility of the USAS implementation team not just with the senior management of the university but also over the departmental staff taking part in the training. These staff may never have encountered the USAS team prior to training and this acts to transform and re-enforce their identity and position in the organization (Coombs, Knights, & Willmott, 1992).

Academic staff knew little about USAS until they returned from annual leave in September 2006. Student enrolment had taken place without their input and when term began there was chaos: staff were in the wrong rooms, students were on the wrong degree programmes, class lists were inaccurate. This was a result of a previous decision taken by the USAS implementation team and the USAS liaison team when developing degree programme codes for the system. When the Academic Heads of department approached the USAS implementation team they were told it was 'teething problems' or that they were the only department with that particular problem. The USAS liaison team were overworked trying to sort out problems within the departments; problems that had not been anticipated.

In the context of the USAS system, looking exclusively at the episodic circuit of power provides insight into the strong position of the Finance Director, based on numerous resources, and his ability to manage his expectations for USAS through his appointed teams. Nevertheless, by devolving responsibility, improvisations are made at points in the project which may not be congruent with the sentiment of what is ultimately the target outcome. Also, the result of an improvisation may not be felt for some time when it impacts on another aspect of organizational life. This is dealt with here through looking at the circuit of social integration.

Improvisation and Social Integration

This circuit deals with rules of meaning and membership. The USAS system influenced the way both academic and administrative staff interpreted the management style and priorities. The emphasis on the spending on USAS sent a strong message to all that USAS would be the only way that student data would be managed, that local discretion around student data was not to be tolerated and signalled the end of a more participatory approach to management. Here, we show how new social groups have become important within Modern University as well as the reactions and interactions of other staff with them. Tension between academics and administrative staff were high during 2007 and this was also the case within the administrative teams who were dealing with USAS on a day to day basis. Academic staff began to complain about their lack of information and inability to access the system. When they then tried to contact the USAS team for help they often found the phones 'off the hook' and emails not answered. Even going to their offices was impossible as the USAS team were in a suite of rooms protected by a digital lock. The eventual response of the USAS team was the development of 'rules of access'. Any enquiry or request for information had to be made through appropriate channels and only certain staff had access rights to the USAS team. Even though data was urgently needed to be entered onto USAS they enforced their training and access policy. Nevertheless, even those who had been trained still found USAS difficult to work with.

The improvisation of 'good housekeepers' as an informal group of USAS experts with advanced skills to support early system difficulties has proved to be a very powerful influence within Modern and this group has grown to over 100 strong in 2012. Although in some HE institutions academic staff are able to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

enter their marks into USAS, Modern University have chosen to only allow administrative staff to have direct access to the system. Licence costs have been raised as an issue - yet other more political aspects have been identified e.g. 'good house keepers' have some strong opinions about the ability of academics to deal with USAS if given access and it was not unusual to hear criticism of academics especially with regard to providing correct and timely information and inputting marks.

Improvisation and System Integration

This circuit concentrates on techniques of control, discipline and production and explores who has benefited or been empowered by the improvisation and who has been disempowered. From our research USAS is a system which is not easy to use and has caused a number of challenges for Modern University that were not anticipated at the start of the project. During the two years within which the system was introduced the USAS team built up a lot of technical knowledge and it became obvious that their skills could not easily be lost to the organization. They became a permanent group when departmental staff recognised they needed increasing amounts of student information not readily available without some degree of USAS programming. They play a major role in the university and even have their own newsletters which are sent out to departments when new changes to USAS are to be implemented. Academics have little knowledge of this. The improvised processes and control introduced in 2007 have also impacted upon academic staff. For example, at that time, academics no longer had access to the 'system' for recording of marks for examination boards and have found themselves much more regulated by the departmental USAS administrative requirements:

Examination boards are also conducted in a different manner. USAS uses algorithms to calculate marks for modules and then the overall year average:

Using USAS to calculate degree classifications has allowed management (both academic and administrative) to control academics behaviour at examination boards. Academics find it difficult to challenge the logic of the system and USAS as to do so would be to argue for paternalism and self-interest and deny students fairness (Clarke & Newman, 1997). Added to this are penalties for not abiding by the USAS procedures and rules. Administrators report academics to their managers when they fail to meet USAS marking deadlines and it can be seen from our research that academics are increasingly becoming subjugated to a system that challenges their sense of meaning, identity and reality through their participation in an increasing range of disciplinary practices (Coombs, Knights, & Willmott, 1992).

Within departments administrative staff who work regularly with USAS data have seen their status increase as managers require more information from the system. IT literacy is an essential skill for many administrative roles in Modern University and is reflected in salary levels. These new types of staff appear happier sitting at a computer than interacting with the student body and this is a cause for some concern with a number of academic staff. It is also divisive amongst administrative staff whose alternative skills are not recognised to the degree they once were.

Finally, it can be seen that management have used an opportunity based improvisation to replace academic staff roles with those of administrators. Prior to USAS, academics ran the student management systems and had access to all of the data. They also enrolled the students on their degree programmes and managed many of the processes around assessment periods. USAS and its centralising ability has facilitated the removal of the academic from many of these roles. To many academics this has been viewed negatively and some feel they have lost their status in the University. Even feeding back marks to students has been changed without academic staff consultation: students can now access their module

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

marks from USAS (and latterly, post 2016, from the electronic Learning Platform (eLP) and electronic plagiarism and electronic marking assessment system (Turnitin)) almost as fast as the administrators are entering them.

Although it may be considered good practice to allow access to personal data it also involves communicating new processes to staff so that they can be prepared. Students are now more assertive than ever - and this is putting even more stress on university staff. This is not helped by the university documentation that continually refers to students as customers and, as is often the case, with that status comes new expectations.

Integration of USAS Beyond 2007: The New Digital Transformation Programme

USAS at Modern University was procured and implemented between 2005 and 2007 when it went fully live. This heralded a time of significant acceleration in terms of the adoption of new digital technologies, loosely coupled to a deliberate university 10-year corporate strategy and vision. This focused on increasing both efficiency and effectiveness in terms of streamlined administrative bureaucracy, enhancement of teaching and learning delivery and quality, as well as increased levels of research output and impact. External factors driving this strategy included: The Research Excellence Framework (REF) to assess and rank research quality, Border Control Agency (BCA) government immigration policy to monitor overseas student attendance, the National Student Survey (NSS) to rank universities on student experience, and more recently the Teaching Excellence Framework (TEF) to assess and rank teaching quality. USAS could therefore be viewed as being at the core of an ambitious digital transformational programme enabling the proliferation of new key performance indicator (KPIs) targets and measurement tools, computerised monitoring and business intelligence systems – all requiring aggressive organizational change initiatives. A plethora of new digital technologies and information systems were (opportunistic change) able to be spun off from the new ES and potentially integrated (emergent change) or used in a complementary manner (anticipated change) with the core system. Table 2 provides an illustration of these policy initiatives and the corresponding digital technologies/information systems that were adopted at Modern University.

Table 2. Digital Transformation Programme at Modern University

2007	2008	2012	2013	2014	2015	2016	2017

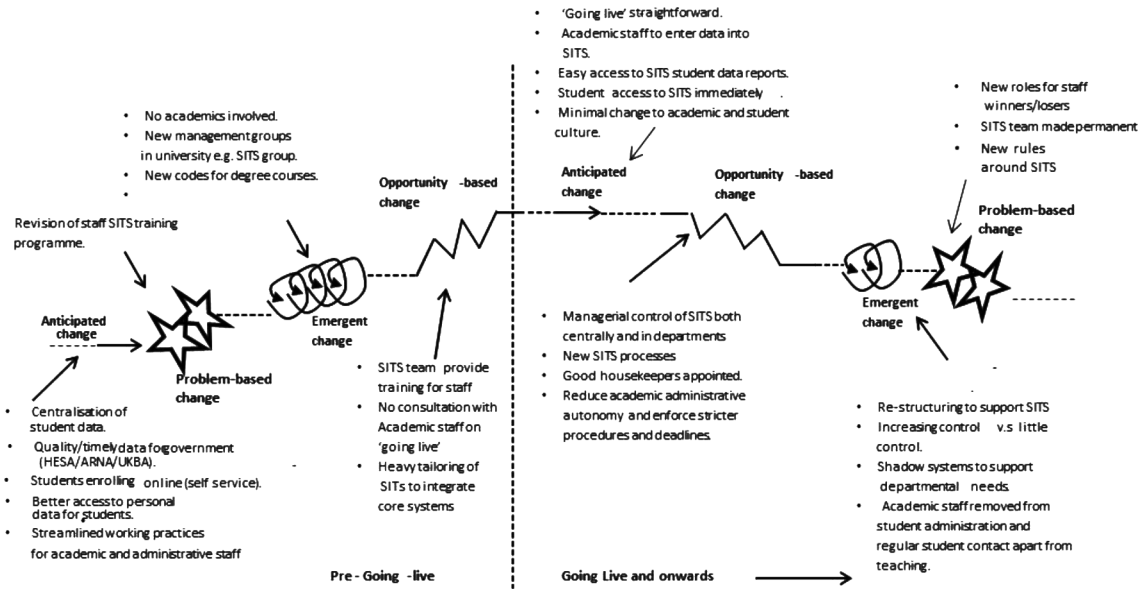
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

As can be seen in Table. 2, USAS has enabled a new generation of integrated systems to be developed in an opportunistic manner – whereby they have precipitated emergent changes in administrative procedures and work flow systems. This has rapidly changed the role and status of academics (centralised administration controlled procedures and policies resulting in less academic staff autonomy) in terms of programme/module development, teaching and learning management and pedagogic delivery. Key amongst this is the move towards making USAS and its additional HR and Finance modules self-service for both administrators and academics. This shifted the administrative work on to academics whereby an attendant effect was then to disestablish faculty administrative services and recentralise/physically relocate them to fit within a 'One University' strategy. Many long and traditionally established roles then disappeared in what was in effect both a rapid and major business process transformation. This was mirrored by a new wave of performance monitoring and control systems aimed at academic staff. These new digital technologies included mandatory electronic Performance Development and Appraisal (PDA), Performance Review and Innovation Plans (PRIPs), Institutional Research Repository (to monitor staff research publication outputs) and a Research Grant monitoring system (to monitor staff grant proposals and bidding activity). More recent technologies also included electronic marking and assessment (EMA) for streamlining the assessment process and personal monitoring of staff timeliness and consistency in the performance of mark submissions and feedback, as well as video recording of main lectures and electronic student rating of programme modules. Many of these systems have been opportunistically integrated with USAS, a significantly more functional Electronic Learning Portal (eLP), and then accessed through a new Corporate website and intranet system.



DISCUSSION

In this section we explore how our work provides further insight into improvisation and how it relates to previous theoretical models. Orlikowski's (1996) work on improvisation is very insightful but it does not really address the very nuanced nature of improvisation and the difficult issue of power within it. Even the detailed work on power and institutionalization of IS discussed by Silva (2007) does not focus on the improvised actions which brought about the embedded IS. Thus, it has been our intention to surface these concerns and to explore them through the case study presented here. Figure 3 provides a timeline view of anticipated, emergent, problem and opportunity based change identified over the duration of the USAS (SITS technology) project.

This represents a literal adaptation of Orlikowski's improvisational change model. Although useful in terms of providing an overview of the major events and changes affecting academics and administrators, it still does not provide sufficient means of analysing the deeper power relations and causal effects of agents (human, organizational and technology) that may determine outcomes and result in new embedded and institutionalized routines, practices and structures. The original model did not show problem based change as distinct from emergent or opportunity based changes. Problem based changes can be equally significant triggers for improvisation requiring rapid actions and use of available materials to hand. This is more characteristic of bricolage as opposed to anticipated changes where there is a timeframe for planned actions according to some pre-determined goals and plans. In our analysis we have therefore included a new category for problem based improvisational change as opposed to focusing on anticipated changes. The anticipated changes can be seen in Figure 3 alongside the identified sequence of emergent, opportunistic changes and problem- based changes over both the (pre) and (post) go live

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. A timeline showing improvisational change for the USAS (SITS) system

phases of the project. Added to this we have further deconstructed improvisational types related to emergent, opportunistic and problem based changes and mapped them to the various agencies and standing conditions as described by Clegg's (1989) circuits of power framework.

The Circuits of Power- Improvisation (CPI) Framework

It is evident from our research that improvisations are actions which do not occur without some reference to episodic power as actors adopt a bricolage approach to drawing on material, cognitive, affective and social resources (Cunha et al., 1999). At the start of the project, USAS was viewed as the OPP on to which actors from across the university were enrolled to join the USAS team and USAS liaison team. The Finance Director presented no alternative solution to Modern University's data issues (problematization). The two teams were socialised alongside the vendor team and became very close sharing a specific USAS suite and shared goals (interessement and enrolment). Thus, as the project progressed they became project champions and gained in credibility within the university (mobilisation) (Callon, 1986; Latour, 1987).

The nature of the improvisations during the lead up to 'going-live' and their link to episodic power can now be seen. Most of the improvisations outlined here were undertaken by agencies that drew on the financial support of the USAS project budget as well as the affective and social resources of being part of a team. They did not need at that time to refer to anyone outside the USAS project. Nevertheless, the teams were faced with issues that could not be addressed by financial resources e.g. codes for degree programmes or training of staff and at that point the improvisations called on other resources such as mental models and affective support of the other teams (Cunha et al.,1999). This is where episodic power comes to the fore as action is legitimised through standing conditions, resources and control (Figure 2). The mental models employed by the USAS teams for both the training and degree programme codes

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

were limited as can be seen from the outcomes in our case study - yet they were still able to determine that action.

Training was a major issue in this implementation and even when the USAS team took control it was quickly realised that they had insufficient human resource to undertake the level of training that was required for all the administrators and academics across the university. Thus, new improvised rules emerged which targeted certain staff and not others. Now these rules have become embedded within the organization and have further emerged over time through the social and systemic integration process.

Although there are many examples of how certain actors called on a variety of resources to support them in their actions during the USAS implementation what is not apparent initially is the link between improvisation and social integration. For the circuit of social integration in which rules fix relations of meaning and membership, certain fixtures of meaning are privileged and certain membership categories are aligned with these meanings (Clegg, 1989). Although social integration began prior to going-live it is clear that once the USAS system was in place it became more evident. To illustrate, it is apparent from our study that prior to USAS being introduced into Modern University academic staff led on most student related activities. When the system was introduced into the faculties in August 2006 only administrative staff had had training and hence were the only ones with access to the data and student information. The difficulties at 'going live' led to faculty registrars and Deans exercising their dispositional power in order to 'get things sorted out'. Thus, new relationships emerge between the faculties and the USAS team which are determined by the dispositional power (Clegg, 1989) of the technologists. Yet within the faculties it is the administrators by virtue of their superior USAS knowledge which determines how USAS will be used, by whom and when access to it will be granted. The emergent nature of the Good Housekeepers improvisation has been useful to the faculties as they now have their own resource on which they can call for most USAS related business and therefore do not need to access the USAS team as frequently.

Clegg (1989: 224) views system integration as the circuit of power which is concerned with the empowerment and disempowerment of agencies' capacities, as they become "..more or less strategic as transformations occur which are incumbent upon changes in techniques of production and discipline" Improvisations which have taken place within Modern University have led to the empowerment and disempowerment of a number of staff. The centralised nature of the USAS system has led to a concentration of control at the centre of the university with little localised discretion in the faculties. Rules about all academic matters have ensured that conformity is the norm and intense monitoring is undertaken. Some of these rules are embedded within the USAS data structures and others have emerged through improvisations at key points in the academic year. Within the academic departments it is evident that there has been a power shift and in our interviews academic staff expressed concern about their perceived status and the increasing power of certain administrative staff.

The adoption and implementation of USAS was used to force through major centralised administrative and structural changes that then continued through later years through to 2017. Integration technologies building on enterprise application integration platforms have enabled ambitious automation of existing administrative workflows and business processes. This has been driven by opportunistic change to enable and consolidate the downsizing of core (lower skilled) administrative staff with a deliberate strategy for centralisation of services (with an increasing administrative management cadre) and the adoption of a new public management and performance monitoring (targets and league table driven) culture. Problem based change could also be identified, specifically related to the development of class based and online student attendance monitoring systems to comply with government immigration and BCA policy. Problem based change could also be seen as a driver for the rapid adoption of electronic marking and assessment

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(EMA) integrated with plagiarism detection software (Turnitin) in order to centralise the assessment administrative process and monitor staff performance with respect to achieving mandatory 21 working day feedback turnaround targets (to improve student feedback for NSS scores). Taken as a whole, the 10 year cycle from 2007 to 2017 might be seen as demonstrating emergent change driven by incremental integration of USAS, SAP and the eLP and then punctuated by rapid opportunistic and problem based changes reacting to government policy for immigration control and the competitive marketisation of the UK university sector.

The new digital transformation programme at Modern could also be seen to mirror significant changes in power relations – both between core academic staff and senior executive academic management and also academic staff and the rise of the new managerial administrative and centralised service functions. In terms of episodic power, resources were increasingly siphoned from faculty budgets who had to pay very high financial overhead costs/contributions to support the increasingly centralised university service departments. These new service departments expanded rapidly, especially functions such as Corporate Marketing, based on a deliberate change strategy that focused on raising the university standing in published university sector league tables. This follows a general international trend where administrative staff now outnumber academic staff at over two thirds of UK universities (Jump, 2015) with an increasing number of higher level managers brought in to manage the expanding administrative service departments! (Ginsberg, 2012). In Modern University, the deliberate strategy to expand student numbers and increase teaching and research quality ratings precipitated a culture of performance management, enabling greater hierarchical control paralleled by new academic reward and incentivisation regimes. Alvesson and Spicer (2016) also note the effects of coercive power and the embracement of neo-liberalist agendas. They identify other effects such as manipulation and mainstreaming (game playing to optimise institutions positions on the university ranking league tables with recruitment drives to develop 4* by 4* research factories), domination (reshaping of academic norms and values), and subjectification (incentivising the creation of new academic and managerial identities). Disturbingly, along with Martin (2016) they identify an increasing culture of defeatism (and willingness) amongst academics to go along with the increased managerialism and production factory ethos. Academics are seen to either delude themselves or justify this by an acquiescence to a 'game playing' culture based on self-preservation and personal career advancement (what they term subjectification).

At Modern, this 'academic gamification culture' could be seen to be accelerated due to the overwhelming roll-out of the new digital technologies enabling new levels of performance management and hierarchical control. The circuit of social integration was enabled by changed job descriptions, new centralised policies and procedures and structural organizational change both for academics and also administrative staff. Systems integration was also responsible for moving towards a new 'one university' culture and only made possible due to the enterprise application integration innovations. It was now 'one size fits all' heralding a loss of academic integrity, autonomy and control in traditional decision making involved with faculty strategy, programme development, management and assessment processes.

The CPI Framework and Sociotechnical Theory Development

A number of studies have researched ES from a sociotechnical perspective, specifically to better understand ERP implementation (Lyytinen et al., 2009; Kwahk & Ahn, 2010) as well as investigating the role of improvisation and change in Information Systems development and implementation (Lyytinen & Newman, 2008). Mumford (2003, 2006) stated that sociotechnical systems should emphasise qual-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ity of working life and humanism at work. This approach should facilitate new forms of organizational innovation, often as a result of the adoption of new technologies that remove elitism, promote flatter hierarchies, develop multiskilling and facilitate more democratic processes of decision making. However, existing methods for sociotechnical design, such as ETHICS (Mumford, 2003), PSIC (Lyytinen & Newman, 2008) or SPRINT (Wastell, 2011), treat technology as neutral and do not explicitly deal with complex organizational power relations, neither focus on the challenges of improvised strategies and working practices often enabled by rapid new technology adoption typical of enterprise systems projects. Stahl (2007) recognises and critiques some of these limitations and proposes that sociotechnical approaches can be enhanced through adopting principles and theory associated with critical research in IS and computer and information ethics. The CPI framework proposed in our research and illustrated in this paper is 'critically' informed and can be used to surface issues of power, domination and control whilst taking a pragmatic view of ES implementation and digital transformation projects. This is where planned and deliberate strategies are supplemented by periods of opportunistic, emergent and problem based organizational change. This also responds to recent critiques and identified challenges for sociotechnical theory, methods and approaches relating to its inherent idealism and inability to influence IS innovations during design, use and implementation whilst neglecting power dynamics and the inability to legitimize and sustain spontaneous innovation (Avgerou & McGrath, 2007; McGrath, 2005).

CONCLUSION

IS research in general, and sociotechnical research in particular, must be prepared to build on theoretical models and frameworks that have the potential to provide better insight into the complex area of digital technology adoption and implementation. This must involve consideration of the power and politics which envelop these types of projects and recognition that improvisation is a reality when implementing them. Clegg's (1989) theoretical exploration of power offers great explanatory potential for large scale information systems adoption and implementation. Its later adaptation and use as a model by Silva and Backhouse (2003) demonstrates how it can be used to provide much deeper insight and a rich narrative for the institutionalization of an IS. Similar parallels can be drawn with the case of Modern where there were very obvious exogeneous factors associated with government policy that could be seen as triggers for rapid change and also a source of system integration and facilitative powers. Digital transformation projects are characterised by the importance of improvised change as opposed to a reliance on more rational strategic and anticipated plans for the new developments. In the case of Modern, the administrative staff seized an opportunity to redevelop their skills and knowledge to operate and redefine the new systems whilst simultaneously utilizing dispositionary and facilitative powers for new forms of both social and systemic integration. This is seen to be increasingly the case in organizations characterised by minimal structures and low procedural memories (Tjørnehøj & Mathiassen, 2010) but also perhaps more surprisingly in professional and administrative led organizational cultures where there might be high procedural memory and large bureaucratic structures but also opportunities for radical shifts in roles and responsibilities; hence the growth of managerialism (Deem, 2004), new public management, marketisation and neo-liberalist agendas (Alvesson & Spicer, 2016).

Within the context of ES implementations, and even more recently digital transformation projects, there are relatively few sociotechnical, ethnographic and longitudinal studies that have been undertaken or published. Those that are published tend not to adopt a critically informed stance but focus on impro-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

visation and bricolage as a means of effecting strategic change and innovation as demonstrated by the use of bricolage for IS and business strategy alignment (Ferneley and Bell, 2006), improvisation for health information systems success (Heeks, 2006), rapid adoption of groupware technologies (Orlikowski & Hofman, 1997), and the effective management of outsourcing (Silva, 2002). Our exploration of the use of an adapted CPI framework more closely follows the later work of Silva and Backhouse (2003) but places additional emphasis on the types of improvisation undertaken as the ES project unfolds and how they relate to the different circuits of power identified. Our study is also relevant for professional and administratively intensive organization cultures such as universities but may also be applicable to other types of organization that exhibit similar characteristics. Besides being a tool for academic researchers to analyse and understand ES adoption and implementation post hoc, the CPI framework might also be used by more critically aware or ethical practitioners. This may be used more in real time as events unfold and materials to hand are utilised.

Change can happen extremely rapidly resulting in social, technical and systemic integration. Understanding the consequences of actions earlier in the ES implementation might negate undesirable effects and the over hasty institutionalization of potentially inefficient and damaging work practices and reorganization. The case of ES adoption and implementation is still live and on-going at Modern university. The student administration system has now been effectively institutionalized where academics no longer question its existence, its extension or its role within the academic decision-making processes. It has now become the centre-piece or core of a highly ambitious digital transformation strategy and project. This heralds a new dawn for universities to become mass producers (production machines) of students with increasingly centralised bureaucratic processes and more worryingly, less academic freedom and autonomy. This may lead to professional deskilling resulting in heavily formulaic teaching and learning strategies and standardised content delivered by lower paid associate academic staff. New digital technologies have provided the embedded agency to make this possible and are reinforced by both the social and systemic integration circuits of power.

In the future we anticipate that the CPI framework will be evaluated for its potential to identify improvisation types as they occur and assess the potential changes needed for a more ethical exercise of episodic, social and systems integration circuits of power.

Chapter 79
Digitally Empowered Workers and Authentic Leaders:
The Capabilities Required for Digital Services

ABSTRACT

The digital era has catalyzed the contemporary workforce and workplace. Employees are now required to develop skills that may be outdated in a matter of years, and be consciously aware that their society is evolving rapidly. This Chapter conceptualizes the characteristics of a digitally empowered worker to encompass awareness, creativity, agility, and a positive learning orientation. In doing so, the authors consider the way in which an authentic leader and authentic follower may influence the development of the digitally empowered. Authors present a model and its impact on digital innovation and digital productivity.

INTRODUCTION

The digital era has catalyzed the contemporary workforce and workplace. Employees are now required to develop skills that may be outdated in a matter of years, and consciously aware that their society is evolving rapidly. Themes of disaggregation, competition, and incentivization are driving new forms of management (Dunleavy et al., 2006). Electronic forms of human resource management have shaped the way in which organizations and their managers can influence employees to achieve their targets (Bondarouk & Ruël, 2009). The rate and scale of change is unprecedented, and employees are expected

to keep pace with the unfolding innovations. In fact, they are often expected to participate in shaping such innovations. Yet, for the most part, employees receive very little training to create the digital fluency skills necessary to achieve desired digital outcomes.

A digitally empowered workforce is prepared for their present needs through hard skills. LinkedIn (2018) identified cloud computing, artificial intelligence, analytical reasoning, people management, and user experience design as the top five most demanded hard skills in their annual survey of 4,000 professionals. Yet, 57 percent of senior leaders recognized that soft skills such as creativity, persuasion, collaboration, adaptability, and time management were more important than hard skills. Senior leaders globally recognize the need for their employees to be ready for the future, not just able to complete their day-to-day responsibilities.

For a workforce to be empowered, it requires three antecedent factors. The first is leaders willing to develop and empower their employees (Cheong et al., 2018). Leaders who are effective at motivating their employees can provide agency to those employees to enact their knowledge, skills, and attributes in the workplace. Leadership has evolved. The focus of behavioral research has been on the development and application of knowledge and theory in traditional contexts. The digital era has forced evolution. For example, leadership is enabled or hindered through videoconferencing (Hambley et al., 2007) and social media (Barbera et al., 2014). Complex technology enhanced environments (e.g. virtual, immersive, and augmented reality) are providing new opportunities for development, productivity, and wellbeing. Leaders are only just beginning to come to terms with what this means for their workplace, and their ability to lead.

The second is employees who are developmentally ready to be empowered. An individual's developmental readiness is based on the belief that individuals can create positive self-fulfilling prophecies about their future (Avolio & Hannah, 2008). That is, individuals who are willing to develop and better understand their own self-concept are better able to respond positively to have agency. The Organization for the Economic Cooperation and Development (OECD, 2001) identified a digital divide between those in lower and higher socioeconomic statuses. In the workplace, those in higher socioeconomic statuses tend to be in management, with a higher remuneration. This would suggest there is an existing digital divide in the workplace between managers and their subordinates (Ayanso et al., 2010). Understanding, therefore, the role of follower behaviors in this context could enable the exploration of bridging the digital fluency gap that may exist.

The third is an organizational culture or climate suitable to enable agency. Important, organizations with poor organizational climate can lead to negative long-term performance outcomes (Crawford et al., 2017). Organizations that embed digital innovation into their culture can change their market landscape (Butler-Henderson, 2014). Organizational culture is defined by many elements such as involvement, consistency, adaptability, and mission (Denison & Mishra, 1995). Earlier research defines organizational culture as the synthesis of assumptions, values, and artefacts (Schein, 1985) with adaptation to also include symbols and processes (Hatch, 1993). We do, however, distinguish organizational culture from this Chapter. While an important part of this discussion, which we encourage others to pursue, there was no scope to discuss with enough depth in this Chapter.

This chapter draws on the three antecedent factors (leaders, employees/followers, and culture) to explore the capabilities that digitally empowered employees require. Scholars are increasingly recognizing the role of behaviors and climate in successful change transitions (Martin et al., 2005), divergence in positive perceptions between leaders and subordinates (Martin et al., 2006), and digital innovation requires

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a consistent aptitude for change. In this Chapter, we propose a model between authentic leader behavior, authentic follower behavior, digitally empowered workers, digital innovation, and digital productivity.

The structure of this chapter has been set-out to enable the exploration of the relationship that authentic leader behaviors, authentic follower behaviors, and digital fluency have. In the next section, we begin by providing a summary of, and justify the use of, the critical review method in this chapter. In the literature review, we explore the context of digital services, and define the authentic leader and their five behaviors (awareness, sincerity, balanced processing, positive moral perspectives, and informal influence). Next, we define the authentic follower and their behaviors (psychological capacity for authenticity and positive organizational engagement). We also define the characteristics of digital fluency (creativity, social and emotional awareness, agility and adaptability, and a continuous learning orientation). Following, we synthesize the authentic leader, authentic follower, and digital fluency into a model and explain the relationships.

CRITICAL REVIEW METHOD

Critical review methods are commonly used as a 'catch-all' in semi-structured literature reviews. Take for example, a seminal critical review in organizational research (Podsakoff et al., 2003). Aside from the mention of a 'critical review' in the title, the only other place in text that presents the words 'critical review' is a title in the reference list. In the development of a typology of literature reviews, a critical review "aims to demonstrate writer has extensively researched literature and critically evaluated its quality. Goes beyond mere description to include degree of analysis and conceptual innovation" (Grant & Booth, p. 94). This literature review approach differs from systematic reviews and meta-analyzes by their clearly defined rules. Where a critical review seeks to identify the most significant pieces of work in the field, a systematic review would identify clear scoping conditions (e.g. search phrases, temporal periods, and specific journals).

The value in conducting a critical review in this piece of work is that several key areas of the literature are being examined, and codified search terms may limit the knowledge that can be extracted. In this critical review, we examine a series of disperse literatures before synthesizing their parallels and exploring their differences. The aim of which is to enable knowledge sharing across a divide. On the one hand, authentic leadership literature explores the enablers created by developing leaders (some of which are likely enablers of digital services), and on the other is the emerging literature on the digital era and the individuals seeking to operate within an innovative and evolving space. We group our critical review into the next section, with the subsequent section synthesizing the disparate parts.

LITERATURE

Today, terms such as digital disruption and digital transformation are no longer business jargon, but part of the organizational strategy. With consumers expecting to receive information from their lounge suites, any business who does not have a digital presence risks being left behind. It is the scope of that digital presence that will shape the skill requirements of the workforce. A one-person plumbing business servicing a small local area may only have an online listing on a trade website, and therefore their digital capability needs are minimal. But what are the needs of the workforce in business that offer digital

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

services. And what attributes in both the leaders and followers will encourage digital innovation and productivity? This summary of the literature defines digital services explores the future trends that will shape workforce needs. The authentic leader and follower are introduced and the behaviors of each are examined. We conclude by delving into the literature about the digitally empowered worker.

Digital Services

Digital services are defined as "an activity or benefit that one party can give to another, that is, provided through a digital transaction" (Williams, Chatterjee, & Rossi, 2008, p. 507). They are different from normal services in that interactions with clients are, at least in part, through a digital experience. The sense of what is tangible may differ and ownership is more elusive. For example, a digital design company is hired to design a new logo for a company. They may complete all relational elements digitally with the customer. Ownership of the product, a logo, needs to be clearly defined in the service agreement, including the right for the company to modify the logo in the future. Digital services can be personalized, contextualized. and adapted in real-time to meet the client's needs. The power of the client has increased in today's market, with clients expecting services to be available anytime through one click. Client loyalty has also changed in the digital era, with clients seeking services that are client-focused and easy to access (Leimeister, Österle, & Alter, 2014). Organizations with maturing digital services share common features. These features include increased risk taking and experimentation, and investment in talent, across the workforce and leadership behaviors. Digital service employees require the behaviors of a leader to effectively engage with their clients and employees, by influencing and enabling positive outcomes. 90 percent of digitally maturing organizations are integrating their digital strategy into their organizational strategy, yet 44 percent of companies state they are not adequately preparing for digital delivery of services (Kane et al., 2016).

There are six identified megatrends predicted for the future that should shape organizational digital strategy (Hajkowicz et al., 2016). The first is an exponential and rapid technological and data growth reshaping services and the workforce. This includes significant developments in the Internet of Things, growth in interconnectivity technology shaping how we work, increases in big and small data informing business strategy, and rapid advances in artificial intelligence and automation. The second area will be where this growth impacts on changing employment markets and organizational structures. This includes increases in globalization of workforces, a change in work practices, flattened organizational structures, growth in contract or freelance workers, and an increase in co-working environments or remote offices. The third megatrend is the opportunities for entrepreneurship. With the change in organizational structures and increased opportunities for freelance work, the small business environment will see rapid growth. This will create opportunities for enterprise and entrepreneurs to drive innovation and productivity. Digital entrepreneurialism is low cost and lean, with many start-ups today established to quickly turn ideas into innovations.

Fourth, economic and population analysis shows we have an intergenerational workforce. In western cultures the average life expectancy has increased, with improvements in health and lifestyles resulting in people living longer. Whilst people are staying in the workforce for longer, participation rates are declining as people reduce their work hours. This trend will result in a higher proportion of people retired than those in the workforce, leaving many industries with an unsustainable workforce. Digital services, particularly automation of low skilled or operational jobs, will somewhat address this issue. This will result in an increasing need for higher skills-set, which is the fifth megatrend. Education and skills will

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

have increasing importance, particularly postgraduate education. There will be a growth in science, technology, engineering, mathematics, and medicine (STEMM) areas to address industry gaps. In turn, the cost of higher education will continue to increase. Learners will seek different ways to engage in study whilst remaining in the workforce, and as such there will be an increase demand for online education delivered in more accessible formats, such as short courses, micro-credentials and massive open online courses (MOOCs). Lastly, the skills sets required for the workforce will change, due to digital empowerment. The attributes of the digitally empowered worker are addressed later in this chapter.

Education and training will become more important, particularly to upskill the existing workforce through times of automation and innovation. Digital capabilities such as digital literacy and fluency will become assets through a time of changing importance in STEMM (science, technology, engineering, mathematics and medicine). Service industries, particularly education and healthcare, will continue to drive job creation, but these workforces will shift as digital innovations alter roles and processes. In turn, the attitudes and beliefs of the digitally empowered worker will change, as will the very definition of the traditional work day. Flexible work environments will become the norm, and digital service teams will no longer be located geographically in the same location. Digitization and the intergenerational impact on the workforce will result in people staying in the workforce longer, but with decreased participation. Therefore, job transitions will shift and new job forecast models will be required.

Digital transformation of business services requires a digital capable workforce to deliver services. Digitalization has been characterized with six dimensions: interconnectedness, diminishing time lag and abundance of information, increased transparency and complexity, hierarchical removal and dissolvement of personal barriers, decision enabler and integrity enhancing, and humanizing effect (Khan, 2016). While these are not exhaustive, and the methodology is fraught, they do provide a positive initial set of ideas that we will draw on.

Authentic Leaders

Authentic leader theory was created to enable an antidote to prevailing ethical challenges of our society (Luthans & Avolio, 2003). Nested within the field of positive organizational behavior (Luthans, 2002), authentic leaders enable positive development within their followers and those around them (Avolio & Gardner, 2005). Since then, a large series of positive outcomes has been identified for followers of the authentic leader. For example, follower empowerment, performance, satisfaction, commitment, trust, engagement, and happiness (Gardner et al., 2011). Authentic leader behaviors are defined in Table 1 (Crawford et al., 2019).

The authentic leader has an important role in motivating employees, although this relationship has been underexplored in the literature. Empirical relationships exist between authentic leaders and job satisfaction (Wong & Laschinger, 2013) and work engagement (Joo et al., 2016). To some extent, it is possible to theorize that if employees are engaged in their work and they express their satisfaction with their role because of their authentic leader, then it is also likely that such a leader must do so through motivating their employees.

The digital era has caused complexity in the role of the leader, and requires careful consideration to way in which leader behaviors manifest. Motivating an employee, for example, is likely to be more difficult when a leader only sees that employee by way of video-conferencing and the annual staff Christmas party. Drawing on some of the earlier referred to digitalization characteristics (Khan, 2016), we identify the role of the authentic leader as an enabler of transparency in a complex world. Authentic

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Defining authentic leaders and their dimensions

Authentic leader	Influences and motivates followers to achieve goals through their sincerity and positive moral perspective, enabled through heightened awareness and balanced processing.
Awareness	Having insight into the behaviours of one's self, other individuals, and groups.
Sincerity	Presenting one's true self to others, honestly and openly in all relationships and with consideration for the context.
Balanced processing	The tendency to consider all relevant information available, and using this to make decisions that benefit the collective (e.g. followers).
Positive moral perspectives	The commitment to one's intrinsic ethical framework, and a willingness to subdue personal interests and ego to facilitate collective interests.
Informal influence	The ability to inspire and motivate individuals to accomplish goals of their own volition, regardless of rank or position.

Definitions quoted from multiple pages in Crawford et al., (2019b).

leaders engage in sincere interactions with others, and seek to be transparent in their behaviors (Rego et al., 2017). Complexity as an inherent element of the contemporary and dynamic environment that we are situated within, and authentic leader behaviors create the conditions to co-create a vision in times of chaos (Vitello-Cicciu, 2019).

Importantly, within a digital environment, is recognition that hierarchies are harder to sustain. Digital innovation can empower individuals, but also disempower those who leverage information power (Mansell, 2016). The growth in transparency stemming from faster access to information removes significant formal and positional power from managerial staff. In transition, coercive effects can be hindered and informal power enhanced (Powell et al., 2017). The authentic leader relies on their informally developed influence to achieve their shared vision, rather than the power granted by their position. Some leaders reliant on their position are likely to struggle during the digital transformation. Digital transformation requires more than leadership, it requires leaders with behaviors that enable them to consciously understand their changing environment and cope with the ethical and emotional pressures faced.

In discussing a positive leadership theory, it is equally important to consider the low authentic leader. Dark side (Liu et al., 2012), Machiavellian (Rego et al., 2017), corporate psychopaths (Boddy, 2011), and unethical leadership (Brown & Mitchell, 2010) theories are a few examples. Dark sides of leadership are identifiable as those who score low in their authentic leader behaviors. For example, in a typology, the Machiavellian leader is low in authenticity and high in Machiavellianism (Rego et al., 2017). Early psychological evidence focused on prescription for negative psychological conditions over promotion of positive psychological solutions (Seligman & Csikszentmihalyi, 2014). Fredrickson and Joiner (2002) describes this as positive spirals, whereby positive emotions predict the creation of more positive emotions. Likewise, the reverse is true: negative emotions predict more negative emotions (Garland et al., 2010). We recognize, therefore, that the promotion of positive leader behaviors has the capacity to mitigate the negative and dark sides of leadership. For example, bullying behaviors of leaders is possible

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to eliminate by high integrity, sincerity, and awareness. A leader who is aware of the impact of their behaviors on others is likely to have greater empathy and therefore be more considerate of their actions.

Authentic Followers

Followers have been commonly neglected in the leadership literature, with a constant emphasis on the follower as an extension of the leader. There have been some emerging work that has challenged the status quo, but very few significant enough to penetrate the bias towards the leader. In an evolutionary conversation of leadership, authors highlight "it is less obvious what benefits ultimately exist for followers" (Van Vugt, 2006, p. 357). Arguments of 'everyone cannot be a leader, so some have to be followers' are common in the assumptions of the literature, along with recognition that a leader requires a follower to influence. The confusion in the literature exists from an overreliance on the formal positional authority of a manager and the role of the leader. Some studies, albeit limited numbers, attempt to separate formal and perceived authority with leadership style and focus (Eglene et al., 2007). Changes in the contemporary leadership landscape have drawn attention away from positional power and authority towards informal and relational power bases (Ridgeway, 2001). In leadership theories with informal influence bases, there is importance in understanding the nature of the follower. Such an understanding should go beyond questioning how a follower is best influenced to achieve goals, but to consider how followers can be best developed, empowered, and enabled. Followers in one situation may be a leader in another (Gilstrap & Morris, 2015), so developing followers is one mechanism to develop future leaders.

In many theories of followership, engagement is a key component of consideration. In one typology, the follower goes from 'isolates' to 'dieharts' (Kellerman, 2008). The isolates are typically detached and uninterested in engaging in the organization beyond their minimum requirements. The bystander is more engaged, but usually opts to be on the sideline. Participants are engaged and supportive, but may be value-neutral in their followership. Activists are energetic and have high engagement, and diehards are heavily engaged. The challenge with this typology is the lack of recognition that followers can influence through their engagement. This model is insightful but lacks a key component, indeed it explicates the first component of an effective follower but misses the psychological capacity for authenticity.

Another popularized model of followership (Kelley, 2008) identifies two characteristics of followers: the degree to which they are independent thinkers, and the degree to which they are actively engaged in creating positive energy. In this model, there are sheep (passive and non-thinking), yes-people (positive energy, but blindly follow), alienated (think independently and negative energy), pragmatics (fence sitters, but tends to follow the status quo), and star followers (think for themselves and have positive energy). The model articulated by Kelley (2008) is more advanced than the previous, but is still limited. It recognizes the value in thinking critically and challenging the leader when they disagree, but it withholds ethics and indeed a sense of self in the followers. Followers can think critically, reflect and develop a sense of self, and engage with their organization (Crossman & Crossman, 2011). They can also be ethical, and have well defined ethical frameworks (Carsten & Uhl-Bien, 2013).

In studies of authentic followership, authentic followers have a need to be recognized and valued, with a desire to be challenged and excited (Goffee & Jones, 2006). While such notions continue to treat the follower as secondary. Mutual transparency was important however (Avolio & Reichard, 2008). The assumptions in these papers is heavily reliant on the notion that followers are subservient beings rather than demonstrative of their own independence (de Zilwa, 2016). de Zilwa (2014) defines authentic followership through the system in which they would operate. In her work, she considers positive culture

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and political conditions as a key element of the model. The leader-follower relationship is nested within a broader socio-political environment, and such an environment has implications for the leader and the follower alike. A careful explication of what it means to be an authentic follower is lacking however, beyond their psychological capacity for authenticity.

Authentic followers have been far less explored than authentic leaders (Agho, 2009), despite their value in the context of considering what it means to be a digitally empowered employee. Crawford et al. (2018) synthesizes the preexisting research to explain the authentic follower by psychological capacity for authenticity (e.g. de Zilwa, 2014) and positive organizational engagement (like Kelley, 2008). In their work, Crawford and colleagues (2018, p. 274) define the authentic follower by their psychological capacity for authenticity (awareness, sincerity, balanced processing, and a positive moral perspective) and positive organisational engagement:

An authentic follower is an individual who, through their capacity for authenticity and positive organisational engagement, are self-managing and follow leaders with whom they share values.

We draw on this conceptualization to consider how the digitally empowered worker shares characteristics with the authentic follower. Indeed, the literature on authentic leaders and authentic followers provides insights into the enablers of the characteristics of the digitally empowered worker, and we discuss this further in the next section.

Digitally Empowered Workers

The changing landscape in digital services described above will change the worker of the future. The worker will need to maintain engagement in constantly changing environments, largely with and through technology, in data-driven roles. The digitally empowered worker needs to be not only digitally literate (know how to work with technology), but digitally fluent. Digital fluency is described by Briggs and Makice (2012, p. 68) as "the ability to reliably achieve desired outcomes through digital technology". A digitally empowered worker needs to possess a new set of skills, knowledge, and mindset to deliver digital services. But what are the skills, knowledge, and mindset required to be an effective and digitally empowered worker? Among our critical examination of the wealth of published literature on the topic, we identify four dynamic attributes: awareness, creativity, agility, and learning orientation.

Awareness

Awareness, or consciousness, is the ability to perceive, feel, know, and understand people and events. Whilst everyone has level of self-awareness, the digitally empowered worker requires awareness of how others perceive events and the needs of others. Awareness includes a broad range of skills that can be collectively grouped as social and emotional skills. Social and emotional skills include communication and negotiation skills, interpersonal skills and empathy, leadership and managing others, entrepreneurship and initiative-taking, adaptability and continuous learning, and teaching and training others (McKinsey Global Institute, 2018). The McKinsey Global Institute (2018) predicts there will be a 26 percent increase in the number of work hours utilizing social and emotional skills. Furthermore, people management, coordinating with others, and emotional intelligence are amongst the top ten skills required by the future workforce (World Economic Forum, 2016). Interestingly, the World Economic Forum (2016) predicted

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

negotiation skills would drop out of their top ten list as they rationalize that you cannot negotiate with a robot or artificial intelligence (AI).

Emotional intelligence is being aware of and managing your own emotions and the emotions of others, including interpersonal and communication skills (Murawski & Bick, 2017; van Laar et al., 2017). Emotional intelligence comprises emotional recognition and expression, emotions embedded and understood in decision making, awareness of others' emotions, regulation and management of emotions of self and others, and ability to function and flourish in conditions where emotional states are heightened (Gardner & Stough, 2002). Both individual and team emotional intelligence enriches creativity and team cohesion through collaborative communication and negotiation. Similarly, team emotional intelligence is connected to the organizational climate, which can influence individual and team creativity. Moreover, Barczak et al. (2010) conclude the relationship between emotional intelligence, team trust and a collaborative culture are precursors to creativity. In a digital service, emotional intelligence will enable workers to work and communicate with others in a positive and productive way. This is particularly necessary when teams are geographically dispersed and interpersonal and communication skills are through digital technologies instead of in person.

Equally, empathy is an important attribute in the digitally empower worker. Empathy is the cognitive awareness of the perspective of others and how we react to other experiences with an affective response (Colbert et al., 2016). Creativity is enhanced through information and ideas sharing, so being empathetic enables individuals to be focused on the user needs and desires. As such, empathy underpins human-centered design. Within digital services, being empathetic online and building healthy online social networks will become required attributes.

A strong social conscience also featured in the literature (Pricewaterhouse Cooper, 2017; Van Laar et al., 2017). The future digitally empowered workforce will need to have an awareness about the environment, ethics, culture, diversity, and human rights. Economic and social developments will impact innovations, and therefore the workforce must account for these when developing new ideas.

Creativity

Creativity involves forming solutions to bring one's ideas, thoughts and dreams into reality in ways that are novel and useful. It can be looking at the world in a different way to see the potential for a solution. It is creative and sometime complex, problem-solving, where innovation cannot begin without creativity. As such, the ability to be creative features strongly in the literature examining the future workforce needs (Neumeier, 2014; McKinsey Global Institute, 2018; Pricewaterhouse Cooper, 2017; Van Laar, 2017; World Economic Forum, 2016).

Creativity and innovation are often mistakenly used synonymously. Whilst creativity is the process or creation, such as thoughts and ideas, innovation is the use of those ideas to improve the way we do things, whether that be processes, products, services, or procedures. All individuals have some degree of creativity, and creativity is not limited to only innovation (Hoerl & Gardner, 2010). Therefore, creativity is a necessary attribute for the digitally empowered worker. Creativity can be encouraged in individuals by providing them with the space and time to allow people to brainstorm ideas. Continuous learning, rewarding curiosity, encouraging risk taking (within reason), and positive encouragement should be part of the cultural norm. Over time, this will improve the confidence in digitally empowered workers, leading to greater creativity.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Team culture can also facilitate or inhibit creativity, which in turns impacts innovation. Whilst individual characteristics or attributes will influence creativity, the team creativity process will influence the innovation (Somech & Drach-Zahavy, 2011). Functional heterogeneity in teams will result in diverse expertise, skills, and attributes. This richness of diversity will result in either a positive or negative impact on team creativity, depending on the team's cohesion. Furthermore, the external network of the team and individual members will further enrich this diversity as it broadens the information sources, increases members' skills, and reshapes perspectives, lending to new ideas, thoughts and dreams. Somech and Drach-Zahavy (2011) reports there is a positive relationship between personal attributes, functional heterogeneity, and team creativity. Where there is a high level of individual creativity and a high level of heterogeneity in the team, there is high level of team creativity. Individual creativity attributes are a good predictor of the level of team creativity, and therefore team creativity could be enhanced through the selection of creative personalities.

Lastly, the climate can also influence creativity. The climate informs members the expected behaviors and attitudes for the team and organization. Elements within the creative climate include psychological safety, positive team relationships, the degree of individual freedom, encouragement of creativity and setting of the vision and mission, and available resources (Denti, 2011). Denti (2011) proposes the six components of a creative climate include: i) challenging and creative tasks to motivate creativity; ii) intellectual debate to share diverse viewpoints; iii) flexibility and risk taking to push the margins; iv) top management support to challenge the norms; v) positive supervisor relations with the team to encourage creativity; and, vi) positive interpersonal exchange to create joy and togetherness. Most importantly is a climate that empowers individuals to be creative.

Agility

The ability to be flexible and quick will become important skills for the digital workforce (World Economic Forum, 2016). This includes cognitive flexibility and judgement and decision making (World Economic Forum, 2016). Individuals must be agile, demonstrating an ability to think and move quickly (McKinsey Global Institute, 2018; van Laar et al., 2017). Digital services need to be adaptable to continuously meet the demand of clients, and as such the workforce needs to be equally agile. Individuals and teams need to quickly generate new ideas, making team culture even more critical in digital services. The ability to acknowledge and manage change will be an important skill. People with adaptive leadership skills aim to understand a diversity of viewpoints, using empathy and awareness, and enhancing creativity. Those who become part of the change process will benefit the most in the digital world.

Critical thinking (World Economic Forum, 2016; Van Laar et al., 2017) and higher cognitive skills (McKinsey Global Institute, 2018) will enable the digital workforce to interpret information quicker, enabling faster problem-solving. McKinsey Global Institute (2018) forecast between 2016 to 2030 there will be a 25 percent decrease in the number of work hours requiring physical and manual or basic cognitive skills, and an increase in higher cognitive skills (9% increase) and technological skills (60% increase). The ability to think quickly, be cognitively flexible, and be part of the change process will be critical skills in the digitally empowered worker.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

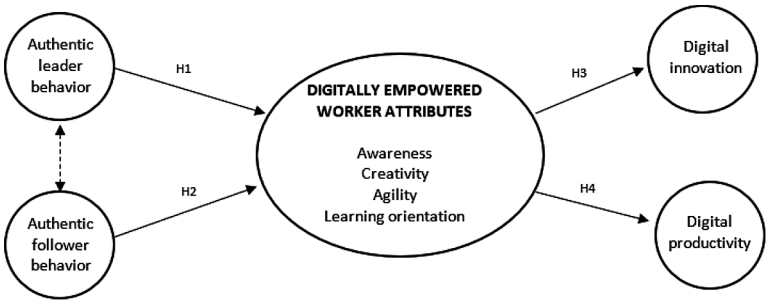
Positive Learning Orientation

Lastly, the digitally empowered workforce needs to be able to identify and set their own learning goals, and be open to new ways of working and learning (Pricewaterhouse Cooper, 2017; Van Laar et al., 2017). Learning orientation, or continuous learning, enables individuals and teams to expand their knowledge and skills and remain current across contemporary developments. Being agile allows digitally empowered workers to integrate new skills into their roles and strong interpersonal skills allow the translation of this information to the team. The establishment of a learning organization is critical in enabling employees to have a positive relationship with their learning experience. Indeed, authentic leaders have a significant role to play in enabling the creation of a learning organizational culture (Milić et al., 2017).

Continuous learning can take place through formal learning, social learning, or self-directed learning. As discussed above, self-actualization is an important element in continuous learning. Individuals need to be able to identify areas for growth and improvement within their own skill set and gaps within the team and organization. A culture that supports continuous learning, or a learning culture, will support individuals and teams. Self-direction and lifelong learning are critical elements in creating a workforce that is creative, socially and emotionally aware, agile, and adaptable. Leadership that supports continuous learning through demonstration and empowerment will create an environment where improvement in knowledge and skills is encouraged. The digitally empowered workforce will maintain currency of contemporary practices, enhancing cognitive agility, encouraging creativity, and heightening awareness.

SOLUTIONS AND RECOMMENDATIONS

Through the critical review of digital services, authentic leaders, authentic followers, and the behaviors of digitally empowered employees we have developed the foundation for a synthesis. We identified six megatrends that are likely to have great influence on the organizational ability to engage in digital strategies (Hajkowicz et al., 2016). These include rapid technological/data growth, where such growth will influence employment and organizational structures, new opportunities to be entrepreneurial and innovative, a more diverse employee age profile, a need for higher capabilities, and the rapid evolution of the required skills of the workforce. Each of these offers significant challenges, but underlying an effective response to each is effective leaders and effective follower behaviors.



We position authentic leaders and authentic followers as a possible enabler of greater digital empowerment. To this end, we provided a critical review of the two constructs in the context of research that parallels to digital empowerment. We also begin to examine the possible behaviors of a digitally empowered worker. These include creativity, awareness, agility and a learning orientation. At this stage of the Chapter, we believe the reader should have a grasp of the four underlying theoretical lenses we adopt in the establishment of a model of hypotheses (see Figure 1). The subsequent sections begin to explicate the nature of each of these relationships, and we continue further to explore the implications of such a model in practice.

Authentic Leader Behaviors and Digital Empowerment

The authentic leader, through their informal influence and sincere interactions with their followers, creates the conditions by which their followers are developmentally ready to engage with new information

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The nomological network of the digitally empowered follower

and new knowledge. In the leadership literature, developmental readiness has grown in its usage (Avolio & Hannah, 2008). Through the guise of a positive organizational culture, authentic leaders seek to create the conditions by which followers *want* to engage with self-improvement and assessment of their current conditions. Some negative forms of leadership that leverage information power or fear stifle the follower's desire to improve their work conditions and remain relevant (e.g. Blasé & Blasé, 2002). Power distance has a negative relationship with empowerment (Çakar & Ertürk, 2010), and thereby leaders who are sincere and are willing to engage in positive relationships with employees will create greater employee empowerment.

Authentic leaders can create the foundations for digital empowerment by being supportive and enable knowledge sharing, rather than harboring information. For authentic leaders, a key aim of fostering a psychological capacity for authenticity and positive organizational engagement in followers is paramount (Crawford et al., 2018). This, as discussed in the next hypothesis, is an enabler of digital empowerment. Authentic leaders have a strong influence on enabling both innovation and creativity. In the innovation and entrepreneurship literature, creativity is typically identified as a critical component of early stages of entrepreneurship (Mulgan, 2006). This includes the notion of identifying a problem, generating ideas for solving the problem, and identifying the most suitable idea to pursue. Innovation is required at the latter stages of entrepreneurship, from developing prototypes through to entering the chosen market for the first time (Anderson et al., 2014). For authentic leaders, there are established relationships with outcomes of higher individual creativity (Ribeiro et al., 2019) and individual and team performance (Luu, 2019; Shirey et al., 2019).

In digital innovation, a parallel can be drawn. The authentic leader, by facilitating an environment where individuals feel safe to take risks and explore alternate ways of operating, empowers their followers to be creative and innovative (Černe et al., 2013). When considering dark sides of leadership, evidence indicates abusive behaviors towards employees results in declines in creativity (Liu et al., 2012). To this end, a leader who engages in positive and supportive behaviors is likely to also enable creativity and innovation in their followers. For authentic leaders, the ability for employees to engage in social innovation is also important. Social innovation is creating new ideas for wider benefit and is often linked to social entrepreneurship models (Crawford et al., 2020). The ability for employees to engage in digital innovation in for-profit and for-purpose organizations is strengthened by an authentic leader creating an employee willingness and ability to learn and take calculated risks. We posit, therefore, that:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hypothesis 1: That authentic leaders will have a direct influence on the degree to which employees are digitally empowered.

Authentic Followers as the Foundation of Digitally Empowered Workers

The authentic follower, who has a psychological capacity for authenticity and positive organizational engagement, to be aware of themselves and their environment (de Zilwa et al., 2014). By being aware of their environments, they can regularly conduct environmental scans (which includes technology changes and usage). An authentic follower uses their balanced processing to critically review options and needs to make informed decisions. This process, along with recognition of individual strengths and weaknesses creates conditions where followers are better able to engage in the use of innovative digital technologies.

In contemporary society, there is a constant bombardment of digital technologies. Some of these are exceptionally relevant, and some are not. Authentic leaders are cognizant of the strengths and weaknesses of their followers (Avolio et al., 2004). This leads to an understanding of the characteristics that might hold back a follower from being digitally empowered. For example, an older follower may have significant resistance to new piece of technology, particularly when younger employees are able to intuitively understand the new technology. The divide between digitally native employees born from the late 90s will have difficulty in empathizing with older employees who can recall times before computers, phones, and similar. These challenges, an authentic follower can overcome with sincere engagement and careful assessment of the situation. This is just one way in which an authentic follower can create the conditions for digital empowerment in their organization. We posit, therefore, that:

Hypothesis 2: That authentic follower behaviors will have a predictive effect on employee digitally empowerment.

Digitally Empowered Workers and Digital Innovation

For digital workers, their creative self-efficacy has an impact on their perceptions of personal idea generation and objective ratings of creative output. In the same study, when psychological entitlement was high, this was no longer true (Černe et al., 2019). These employees, with the kind of self-regulation and self-efficacy that an authentic follower is likely to engage in, creates the conditions for greater digital innovation. Where digitally empowered employees are empowered to be creative, innovative, moderate their sense of entitlement, and learn, we posit that they will engage in higher levels of digital innovation.

In a study of 743 employees over 93 small/medium enterprises, collective attitudes and uncertainty avoidance had an association with empowerment and innovation (Çakar & Ertürk, 2010). Therefore, employees who have awareness of their environment, are more open in conversations and interactions with others, and seek to process information in a balanced manner are likely to better engage with innovation generally. The capabilities of the digitally empowered are likely to further strengthen the application of innovation in digital settings. We propose therefore that:

Hypothesis 3: That digitally empowered workers will have higher rates of digital innovation than employees who are not digitally empowered.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Digitally Empowered Workers and Digital Productivity

Having a high level of awareness, creativity, agility, and learning orientation will better position workers in digital services compared to those who have minimal awareness beyond their immediate self, lack creativity, are rigid, and do not take part in continuous learning. To return to the digital services example earlier. A designer who creates logos is likely to work with clients across the globe. These clients will have needs that vary, and cultural norms that are diverse. Such a designer will need to demonstrate high degrees of other and situational awareness to navigate such complexities, beyond a designer that only worked with domestic clients. They would also need higher agility to manage deadlines across multiple time zones, and a positive learning orientation to acknowledge that their competitors are not two nearby design firms, but rather any design firm with a well-developed digital presence. These attributes will enable the worker in a digital environment to be more productive as they are able to develop new ideas and adapt to rapid change. Dynamic management can encourage creativity and innovation in workers to the benefit of organizations (Helfat & Martin 2015).

Hypothesis 4: That digitally empowered workers will have higher rates of digital productivity than employees who are not digitally empowered.

FUTURE RESEARCH DIRECTIONS

The implications of this chapter are extensive, but still infant in their development. Our Chapter highlights a set of implications for emerging research with significant opportunities for empirical testing. The model we propose (Figure 1) highlights the potential for a series of relationships between the authentic leader and authentic follower to digitally empowered workers, and subsequent increases in digital innovation and productivity. If this holds true, managers should seek authentic leader behavior training and development, and seek to cultivate authentic follower behaviors in their subordinates. Doing so has wide implications already discussed in the literature (see Gardner et al., 2011 for an extensive list of outcomes), and we propose that digital empowerment is produced as an outcome of authentic leaders and followers. We also believe that there may be direct effects of authentic leaders and followers on digital innovation and digital productivity, but further research is required for such a proposition.

This research, while encompassing a wide suite of literature, has its limitations and opportunities for future research. The first limitation is that our work is theoretical. While it is critical that theoretical developments inform empirical research (Crawford & Kelder, 2019), at present our hypotheses are untested outside of their logical consistency and potential for significance. We encourage scholars to continue this exploration of the role of authentic leaders and authentic followers in enabling digital outcomes (e.g. empowerment, innovation, and productivity). The second limitation is that we only reviewed one type of leader behaviors. Most evidence indicates a significant list of leadership styles, and to provide the strength of argument, and to explore in depth, we selected one that had logical consistency based on past work. This assumption, while we believe is true, could also be true of other theories of leadership such as transformational leadership (e.g. Özaralli, 2003), top management teams' theory (Ugboro & Obeng, 2000), and empowering leadership (Srivastava et al., 2006). Each of these theories have relationships to empowered employees, among others, and could also contribute to digitally empowered leadership.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Future research could examine such relationships and continue to theoretically and empirically explore the comparative effects of leadership styles on digital outcomes.

CONCLUSION

This Chapter evaluated the role of the authentic leader and authentic follower on digital empowerment and began to theorize what a digitally empowered worker might look like. Through a critical review of four underlying constructs (authentic leaders, authentic followers, digital services, and digital empowerment) we sought to develop a better understanding of each of their roles in enabling digital outcomes. In our discussion, we explicated a model of digital empowerment that views authentic leaders and authentic followers as antecedents, and digital innovation and digital productivity as outcomes. In a world that is characterized by significant growth in the use of technology, being able to understand and shape its usage for positive outcomes is critical in enabling human flourishing. We believe that authentic leaders and followers have a role in enabling the conditions of digital empowerment, and such empowerment creates the conditions that can shape and continue to innovate digitally.

KEY TERMS AND DEFINITIONS

Authentic Follower: An individual who, through their capacity for authenticity and positive organisational engagement, are self-managing and follow leaders with whom they share values (Crawford et al., 2018, p. 274).

Authentic Leader: A leader who "influences and motivates followers to achieve goals through their sincerity and positive moral perspective, enabled through heightened awareness and balanced processing" (Crawford et al., 2019, n.p.).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Digital Era: "Characterized by technology which increases the speed and breadth of knowledge turnover within the economy and society" (Shepherd, 2004, p. 1).

Digital Innovation: The creation or application of technology to enhance existing practices and solve emergent problems.

Digitally Empowered Worker: A digital worker who is aware, creative, agile, and willing to learn.

Digital Productivity: The digital output value of workers.

Digital Services: An activity or benefit that one party can give to another, that is, provided through a digital transaction" (Williams, Chatterjee, & Rossi, 2008, p. 507).

MOOC: Massive open online courses.

STEMM: Science, technology, engineering, mathematics, and medicine.

This research was previously published in Leadership, Management, and Adoption Techniques for Digital Service Innovation; pages 103-124, copyright year 2020 by Business Science Reference (an imprint of IGI Global).

Chapter 80
Understanding the Effect of Digital Literacy on Employees' Digital Workplace Continuance Intentions and Individual Performance

Elizabeth Marsh
Coventry University, Warwickshire, UK

ABSTRACT

While a growing body of literature suggests that employees' digital skills are important to enable both individuals and organisations to make the most of the digital workplace, empirical understanding of their effect on technology adoption and performance is currently limited. Drawing on prior models of technology acceptance and continuance, the present study investigated the effect of digital literacy on behavioural intention to continue using the digital workplace and, ultimately, on individual performance. Linear regression was used to analyse the conceptual model using survey data from 142 employees of a major UK charitable organisation. Results partially supported the model, demonstrating that employees' digital skills effect continuance intentions and individual performance via their perceptions of ease of use. The findings suggest an important role for digital literacy, both as an antecedent to the more general determinants of technology adoption, and in organisational interventions designed to encourage digital workplace adoption.

INTRODUCTION

Digital technologies (such as productivity suites, mobile devices, and collaboration platforms) are now an integral part of most workplaces (Cascio & Montealegre, 2016). Implementing such technologies, however, does not guarantee their success (Schallenmueller, 2016), it is essential that individuals adopt and use them as intended for benefits to be realised (Venkatesh et al., 2003). The digital literacy of the

workforce can contribute to this outcome (Mohammadyari and Singh, 2015). While a growing body of literature suggests that employees' digital skills are important to enable both individuals and organisations to make the most of the digital workplace, empirical understanding of their effect on technology adoption and performance is currently limited.

The present study investigates the effect of digital literacy on behavioural intention to continue using the digital workplace and, ultimately, on individual performance. Data was gathered from the workforce of a major UK charitable organisation. A new conceptual model was developed (see Figure 1) and the pathways within it assessed. It takes as its base model the Unified Theory of Acceptance and Use of Technology (UTAUT; Venkatesh et al., 2003), adapting it using measures of information systems (IS) continuance intention and individual performance (Bhattacherjee, 2001), as well as including digital literacy (Van Deursen, Helsper and Eynon, 2016) as a new antecedent.

Figure 1. Conceptual Model

Findings have the potential to advance current understanding of technology acceptance in the workplace. Greater understanding of the relationship between digital literacy and digital workplace acceptance may also have important implications for organisations and the design of interventions to help employees make optimal use of digital tools at work.

BACKGROUND

Prior Research on the Digital Workplace

The workplace, and the way that we work within it, has been fundamentally reshaped by technology in the last 30 years, a process that is continuing and gathering pace (Cascio, 2014; Cascio and Montealegre, 2016). The growing consumerisation of technology has seen the migration of new capabilities, such as social platforms and mobile devices, from the consumer market into the workplace (Harris, Ives and Junglas, 2012; Loose, Weeger and Gewald, 2013). In his seminal 2006 paper, McAfee coined the term

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

'Enterprise 2.0' to describe the new wave of social and collaborative technology inside of organisations, pointing out their potential to better facilitate knowledge work where legacy knowledge management systems had largely failed. Writing a decade on from McAfee's paper, Schallenmueller (2016) notes the deep impact that such technologies, as part of an extended range of information technology capabilities in enterprises, have had on the workplace. Mobile, big data, cloud computing and search-based applications have been, and continue to be, particularly significant in this respect (White, 2012).

While the term 'digital workplace' has been in use since around the turn of the century (e.g. Beir, 2000; Benson, Johnson and Kuchinke, 2002) it has become increasingly popular in a business context in the 2010s as a way of describing the broad set of connected technologies that employees use on a daily basis to do their jobs. This is evidenced, for example, by Gartner's publication of an inaugural 'Hype Cycle for Digital Workplace' (Cain, Austin and Gotta, 2014), as well as the launch of specific digital workplace offerings by major consultancies (e.g. Avanade, 2014; Deloitte, 2014,).

The digital workplace is an integrative concept that reaches across enterprise tools and, in one definition, has been described as: "The aggregated set of technology services that enable us to do our work, including: intranets, unified communication, microblogging, HR systems, email, mobile applications, collaborative spaces, supply chain and customer relationship management systems." (Miller and Marsh 2014 as quoted in Wiggins, 2015, p. 607). Among these technologies, the intranet is sometimes viewed as a "precursor to" (White, 2012, p. 208), "front door to" (McConnell 2011), or "core component of" (Miller and Marsh, 2014, p. 78) the digital workplace, descriptions which highlight its potential to act as an integration point for all of the digital tools that employees' need.

Dery, Sebastian and Van der Meulen (2017) take a different approach to describing the digital workplace, highlighting its relation to the digital, physical and cultural aspects of designing work in complex, dynamic organisations that help to streamline the way in which work happens. This speaks to the need to focus not only on the technologies of the emerging digital workplace, but also to fundamentally redesign work for the digital age (Colbert, Yee and George, 2016), enable advances in the people, collaborative and contextual aspects of knowledge management (Hobert, 2015), develop a culture that is conducive to digital work (Oxford Economics, 2017), and help employees develop the new behaviours and competencies that working in such a way demands of them (Kiron et al., 2016).

Organisations are making large investments in digital workplace technologies, as indicated by the anticipated market size of digital workplace transformation which, in one estimate, is expected to grow to USD 18.06 billion by 2021 (Markets and Markets, 2017). Expected benefits resulting from such investments include: employee productivity and satisfaction, talent attraction, accelerated innovation and increased revenue (Avanade, 2014; Deloitte, 2014). However, simply installing the technology is not enough to guarantee that such technologies will be successful (Schallenmueller, 2016), as the mixed results of technology implementations in the field of knowledge management have demonstrated (e.g. Schmidl et al., 2011, Coakes, Amar and Granados, 2013). Organisations need to invest not only in the technologies, but also in the people and skills that enable the workforce to use them optimally (Oxford Economics 2017), thereby enabling 'digital dexterity', or the ability for the organisation as a whole to move swiftly to exploit new digital opportunities (Soule et al., 2016).

In a literature review of digital workplace research, Köffer (2015) notes that there is, as yet, no particular academic research stream for the digital workplace as an integrated concept, although the associated technologies have received extensive attention individually. The recent publication of an edited book 'The New Digital Workplace: How New Technologies Revolutionise Work' (Marks et al. 2017) may signal that academic interest in this field is growing and that such a dedicated research stream is indeed

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

now emerging. In addition, Cascio and Montealgre (2016) underline the importance, for occupational psychologists in particular, of investigating and understanding how technology is impacting on work and organisations.

Prior Research on Technology Acceptance and Continuance

Information systems research reaches back to the 1950s and covers a range of issues such as decision support, human-computer interaction and the value of information (Banker and Kauffman, 2004). Relatively early on in its development, user acceptance of technology was identified as one of its most challenging issues (Swanson, 1988, cited in Davis, Bagozzi and Warshaw, 1989, p. 982) and is today considered one of its most mature research streams (Venkatesh, Davis and Morris, 2007). It focuses on users' willingness, or lack thereof, to use information technology in the way it is intended in order to enable tasks (Dillon and Morris, 1996). Insights from this research stream are important for organisations as expected benefits from technology investments may not be realised if such systems are not adopted by users (Sharma and Mishra, 2014).

As early as the 1970s, researchers seeking to understand acceptance behaviour among technology users recognised the need to go beyond the technology itself to gain an understanding of user attitudes and perceptions towards it (Banker and Kauffman, 2004). Drawing on psychological theories such as the Theory of Reasoned Action (Ajzen and Fishbein, 1975), Self-Efficacy Theory (Bandura, 1982), the Theory of Interpersonal Behaviour (Triandis, 1977), and the Theory of Planned Behaviour (Ajzen, 1985), a range of models have been developed to understand user acceptance. These approaches seek to predict technology usage by focusing on the human decision-making processes that cause a user to either accept or resist a new technology (Dillon and Morris, 1996).

The proliferation of technology acceptance models led Venkatesh and colleagues (2003) to propose a new, unified view of user acceptance using Ajzen's (1985) Theory of Planned Behaviour as their conceptual framework. They integrated elements from eight prominent models, the most robust and widely used of these being the Technology Adoption Model (TAM; Davis, 1989) which predicts behavioural intention based on the constructs of perceived usefulness and perceived ease of use (Sharma and Mishra, 2014).

The resulting Unified Theory of Acceptance and Use of Technology (UTAUT), for which the authors found strong empirical support, incorporates three direct determinants of intention to use technology (performance expectancy, effort expectancy, and social influence) and two direct determinants of usage behaviour (intention and facilitating conditions). Effort expectancy and performance expectancy have been defined respectively as the extent to which an individual believes that system use will be easy and lead to job performance gains (Venkatesh et al., 2003, pp. 447-450). Both constructs build on those used in the original TAM. The other determinant of intention to use technology, social influence, draws on a later extension of the TAM (Venkatesh and Davis, 2000) and relates to an individual's perception of whether important others believe he or she should engage with and use the system.

The researchers also identified that experience, voluntariness of use, gender and age were significant moderating factors, although as they themselves acknowledged, gender and age may have less impact as a younger cohort of employees progressively enters the workplace. Venkatesh, Thong and Xu (2016) express disappointment that so few UTAUT studies have included these moderating factors as this weakens the ability to understand the generalizability of the model.

The extensive UTAUT literature that has developed in the last 15 years has not only replicated the model but also sought to extend it, both through using it in conjunction with other theories and models,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and also by exploring the potential antecedents of its general determinants (Venkatesh, Thong and Xu, 2016). Chan et al. (2011) suggest that such extensions offer a valuable way of applying the model in different contexts as well as helping to identify interventions that will increase acceptance within them.

One of the reasons that the UTAUT has been used in conjunction with other theories is to understand technology use beyond initial acceptance (Venkatesh, Thong and Xu, 2016). A number of studies (e.g. Miltgen, Popovi and Oliveira, 2013; Sun et al., 2014) have taken this approach using, for example, Rogers' (1962) Diffusion of Innovations theory to understand how technology spreads throughout the user population, and Bhattacherjee's (2001) IS Continuance Model to understand users' intentions to continue using technology over time.

A review by Venkatesh, Thong and Xu (2016) highlights the range of technologies and contexts in which the UTAUT has been used, including: citizens' use of e-government services (Chan et al., 2014), physicians' use of digital systems in a hospital (Chang et al., 2007), customers' use of mobile banking (Oliveira et al. 2014), and employees' use of an e-learning system in the workplace (Sarabadani, Jafarzadeh and ShamiZanjani, 2017). It is interesting to note that although none of the studies they highlight specifically explore the digital workplace as an integrative concept, the UTAUT has been used to investigate some of its component technologies. These include: workplace e-learning (Yoo, Han and Huang, 2012), Enterprise 2.0 applications (Wang et al. 2014), desktop applications (Al-Gahtani, Hubona and Wang, 2007), a knowledge management system (Bourdon and Ollet-Haudebert, 2009), and BYOD ('Bring Your Own Device'; Loose, Weeger and Gewald, 2013).

UTAUT studies have also investigated a range of antecedents to the general determinants of behavioural intention to use technology (Venkatesh, Thong and Xu, 2016). These include: computer self-efficacy (Chiu and Wang, 2008), organisational culture (Ciganek, Mao and Srite, 2010), perceived threats (Loose, Weeger and Gewald, 2013), intrinsic motivation (Yoo, Han and Huang, 2012), and perceived innovativeness with IT (Wang et al., 2014). The inclusion of digital literacy as an antecedent to the general determinants represents a novel extension of the UTAUT (Mohammadyari and Singh, 2015).

In their UTAUT study of e-learning technology, Mohammadyari and Singh (2015) use the model in conjunction with the IS Continuance Model (Bhattacherjee, 2001) as well as extending it by including a measure of digital literacy (Hargittai, 2005). The authors found that digital literacy had a direct positive impact on both effort expectancy and performance expectancy, and the latter significantly impacted on continuance intentions and individual performance. Based on their findings, the authors argue that digital literacy facilitates e-learning use and its ultimate impact on individual performance, validating the significant investments that many organisations are making in this technology.

Prior Research on Digital Literacy

The term 'digital literacy' was first used in the 1990s (e.g. Gilster, 1997; Lanham, 1995), although work to extend the notion of 'literacy' for an increasingly technological age stretches back to the 1960s (Belshaw, 2011). In the intervening years, visual literacy, computer literacy, and information literacy attracted a great deal of research interest and a substantial body of literature had developed by the time the concept of digital literacy was introduced (Chinien and Boutien, 2011; Martin and Grudziecki, 2006). In the present, research on digital literacy sits alongside and sometimes overlaps with that on new media literacy, e-literacy, e-skills, digital skills, ICT literacy, digital competence, technological literacy and information literacy (Chinien and Boutien, 2011; Covello, 2010; Van Laar et al., 2017) meaning that this is far from being a simple or unitary field (Belshaw, 2011).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

An early conceptualisation of digital literacy by Gilster (1997, p. 17) as "being about ideas, not keystrokes" remains popular and relevant to the present, perhaps because it implies a much broader set of skills than just being able to operate a computer (Eshet, 2012). Underlining the breadth of the concept, Gilster (1997, p. 33) further elaborated his definition of digital literacy as "the ability to understand and use information in multiple formats from a wide range of sources when it is presented via computers.". Reflecting on this early definition nearly a decade later, Bawden (2008) points out that digital literacy continues to be an integrative concept that relates to an extended range of skills and abilities.

Indeed, some researchers argue that it is more appropriate to talk about 'digital literacies' in the plural in order to encompass the wide range of skills, competencies and practices involved (e.g. Jones and Hafner, 2012; Lankshear and Knobel, 2008). For others, digital literacy is, itself, just one dimension of the wider concept of new or twenty-first century literacies or multiliteracies that aim to cover an all-encompassing set of practices related to living in a global, technological society (e.g. Leu et al., 2009). The digital literacy concept is likely to remain fluid as technologies continue to change (Chinien and Boutien, 2011), indeed Covello (2010) remarks on how much it has already changed with the emergence of Web 2.0 (i.e. the social, collaborative web).

Given the multiplicity of definitions of digital literacy, accounts and models also abound (Belshaw, 2011). These tend to range in breadth from a relatively narrow focus on technical skills and competencies ("mastering keystrokes" in Gilster's phrase) through to a broad focus on ideas, social practices and mind-sets (Gilster's "mastering ideas"). Martin and Grudziecki (2006, p. 255), defining digital literacy as part of the DigEULit project, encapsulate the latter view:

Digital Literacy is the awareness, attitude and ability of individuals to appropriately use digital tools and facilities to identify, access, manage, integrate, evaluate, analyse and synthesize digital resources, construct new knowledge, create media expressions, and communicate with others, in the context of specific life situations, in order to enable constructive social action; and to reflect upon this process.

The definition is underpinned by a layered model which depicts technology users as advancing through three stages: digital competence (in which a range of skills are gained), digital usage (in which these skills are used in an applied setting), and finally digital transformation (in which the application of skills leads to innovation and creativity).

Later work emanating from the European Commission, known as DIGCOMP, further elucidates the components of digital competence and shows how it applies in different contexts such as leisure, education, society and work (Kluzer and Pujol Priego, 2018), thus demonstrating the important point that digital literacies can only really be understood when contextually situated (Lankshear and Knobel, 2008). DIGCOMP takes a broad view, going beyond device or software use to encompass the use of digital technology in a critical, collaborative and creative way. As such it identifies twenty-one competences (e.g. managing digital identity, protecting health and well-being, identifying digital competence gaps) that are organised into five areas (information and data literacy, communication and collaboration, digital content creation, safety, and problem solving) and assessed across eight levels of proficiency.

Eshet (2004, 2012), also taking a broad view of digital literacy, provides a skills-based theoretical framework to understand the wide and complex range of abilities that it involves. In a 2012 revision to his original model, Eshet sets out six skills that he argues constitute digital literacy: photo-visual, reproduction, branching, information, socio-emotional and real-time digital skills. This is a view that acknowledges that digital literacy involves a complex range of cognitive, technical and social-emotional

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

skills, a view set out in detail by Ng (2012a), who emphasizes critical literacy (i.e. evaluating motivations behind content) as being at the centre of all these skills.

Although theoretical research into digital literacy is abundant, many of the available assessments are inadequate, focusing too narrowly on technical skills (Calvani et al., 2008). Covello (2010), in a review of digital literacy assessment instruments, points out that the fragmented nature of digital literacy research as well as its overlap with other related domains make it difficult to select a suitable instrument. He argues that an understanding of the underlying definition and concept, as well as how it is evolving based on new technologies, is essential to making such a selection. This is particularly important as instruments may be labelled with a number of related terms such as ICT literacy (Martin and Grudziecki, 2006), digital competence (Calvani, Fini and Ranieri, 2009), and internet skills (Van Deursen, Helsper and Eynon, 2016).

In developing a new measurement tool for digital literacy, Van Deursen, Helsper and Eynon (2016) acknowledge a number of shortcomings of previous measures (e.g. Hargittai, 2005; Van Deursen, Van Dijk and Peters, 2012) such as only focusing on technical skills and not reflecting recent changes to technology (e.g. social and mobile developments). The authors propose a new measure, the Internet Skills Scale (ISS), which is based on a broad conceptualization of digital literacy that goes beyond just technical competencies to encompass social, critical and creative skills.

Their framework consists of five types of internet skills: operational, information navigation, social, creative and mobile. It is specifically designed, according to the authors, to retain relevancy as new and novel platforms and applications appear, although they acknowledge that the scale will need further development in areas such as information seeking and mobile skills as technologies continue to evolve. Van Deursen, Helsper and Eynon (2016) argue that the skills covered in their measure are a prerequisite for engagement with digital technologies and Van Laar et al. (2017), building on their work, argue that they are essential for people to be successful in the workplace.

Digital skills have been highlighted among the elements required for employees to operate effectively in the digital workplace (Briggs and Makice, 2012; Kiron et al., 2016; Soule et al., 2016), with employees potentially losing nearly 8 percent of productive time due to poor IT resources or inadequate digital skills (Van Deursen and Van Dijk, 2012). A high level of digital literacy, on the other hand, can help to reduce cognitive load for individuals when using technology, thereby freeing them to focus on the task at hand (Ng, 2012b). It can also enable them to quickly and conveniently access information, collaborate with others, and share knowledge (Kasemsap, 2018).

In addition, digital skills can aid inclusion and well-being in the workplace (Collard et al., 2017) as well as the management of social relationships and identities in a virtual workplace (Jones and Hafner 2012). In fact, digital literacy is seen as essential for the modern workforce (Briggs and Makice, 2012) and is thought to be one of the top ten workplace skills for future organisations (Senter and McClelland 2015).

A lack of such skills among the workforce can reduce the organisation's ability to benefit from digital workplace technologies and participate fully in the knowledge economy (Jones and Hafner, 2012; Kiron et al., 2016; Mitrovic, 2010). The House of Commons (2016) reports that almost 50 percent of UK employers have a digital skills gap in their business and that this gap is costing the UK economy an estimated GBP 63 billion a year in lost additional GDP.

Despite evidence of the importance of digital skills at both an organisational and individual level for positive digital workplace outcomes, there is a lack of empirical studies investigating the digital skills needed by the workforce as a whole (rather than just ICT specialists) potentially compromising organisations' adaptive capacity in the face of fast evolving technologies (Chinien and Boutien, 2011).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In addition, there is limited research examining the impact of digital skills on technology acceptance and continuance (Mohammadyari and Singh, 2015).

MAIN FOCUS OF THE ARTICLE

A substantial body of literature has demonstrated that users' attitudes and perceptions towards a technology significantly impact on their behavioural intentions to use it (e.g. Venkatesh, Thong and Xu, 2016). This literature has explored a range of antecedents to the general determinants in the UTAUT model, however research on the impact of digital literacy on technology acceptance and continuance is as yet immature. The literature has also explored acceptance for a range of different technologies, however this does not yet encompass the digital workplace as an integrative concept. In addition, the digital workplace research stream itself is emergent, with only a small body of dedicated literature to date.

A new conceptual model was developed (see Figure 1) and the pathways within it assessed. Given that prior research has indicated the potential importance of digital literacy for effective adoption and use of technology, it is expected that similar associations will be found in the current sample. It is anticipated that digital literacy will be positively associated with higher performance expectancy and effort expectancy, and that these measures will in turn be positively associated with users' continuance intentions and individual performance. Social influence is also expected to be positively linked to continuance intentions as per prior studies. Prior research on technology acceptance has also suggested that the control variables of age, gender and experience may mediate these associations, and it is therefore expected that such effects may be identified in the present study. In summary, the research hypotheses are:

- Digital literacy will be positively associated with both higher performance expectancy and higher effort expectancy.
- Performance expectancy, effort expectancy and social influence will be positively associated with users' digital workplace continuance intentions.
- Users' digital workplace continuance intentions will be positively associated with individual performance.
- The control variables of age, gender and experience will mediate the hypothesised associations.

METHOD

Participants and Procedure

Participants for this study (N = 142) were recruited using opportunity sampling from among the employees of a major UK charitable organisation headquartered in London. 119 females (83.8 per cent) and 23 males (16.2 per cent) participated in the study. Their ages ranged from 22 to 68 years (M=38.36, SD=11.15) and their length of tenure ranged from 1 to 32 years (M=5.33, SD=6.57).

The study was reviewed by the School of Psychological, Social and Behavioural Sciences, and approved by the University Research Ethics Committee at Coventry University. A gatekeeper email was sent, and approval given, in order to gain access to participants in the organisation. Employees at the organisation were invited to complete an online survey (run using Bristol Online Surveys) available via

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

its intranet. Participation was on a voluntary basis and the survey took around 10 minutes to complete. Participants were provided with a Participant Information Sheet prior to completing a Survey Consent Statement and commencing the survey, as well as a Debrief page immediately following completion. A paper version of the survey was also prepared but not used as sufficient responses were forthcoming via the online method.

Measures

Participants completed a questionnaire with items relating to digital literacy, the determinants of behavioural intention to use technology, continuance intention, and individual performance. The technology under investigation was the intranet as the "front door" (McConnell, 2011) to the organisation's evolving digital workplace. In addition, participants responded to questions about their age (in years), gender, and length of tenure (in years). Voluntariness of use was not measured as use of the technology in question was mandated for all employees. Descriptive statistics for all core measures in this study are presented in Table 1 in the Results section.

Digital Literacy

Participants' digital literacy was measured using the Internet Skills Scale (ISS; Van Deursen, Helsper and Eynon, 2016). The scale comprises 23 items assessing five types of internet skills: operational (e.g. 'I know how to open downloaded files'), information navigation (e.g. 'I find it hard to find a website I visited before'), social (e.g. 'I know which information I should and shouldn't share online'), creative (e.g. 'I know how to create something new from existing online images, music or video'), and mobile (e.g. 'I know how to install apps on a mobile device'). A Likert scale was used for the response format, with respondents requested to rate their skills for each item on a scale of 1 (not at all true of me) to 5 (very true of me). 5 items required reverse scoring. While both short and long versions of the ISS are available, the short version was deemed suitable for the present study as no analysis of the individual types of internet skills was involved. Van Deursen, Helsper and Eynon's (2016) study suggests that the ISS framework is a reliable measure (CR > .70) with a robust theoretical foundation. In the present study, the Cronbach's alpha was .86.

Determinants of Behavioural Intention to Use Technology

Determinants of participants' behavioural intention were measured using a number of constructs from the Unified Theory of Acceptance and Use of Technology (UTAUT; Venkatesh et al., 2003). 12 scale items from the UTAUT were included in the questionnaire to assess the three direct determinants of behavioural intention: performance expectancy (e.g. 'I find the intranet useful in doing my job'), effort expectancy (e.g. 'I find the intranet easy to use'), and social influence (e.g. 'People who influence my behavior think that I should use the intranet'). A Likert scale was used for the response format, with respondents requested to rate each item on a scale of 1 (strongly disagree) to 5 (strongly agree). Minor wording changes were made in order to (a) replace the generic word 'system' with 'intranet', and (b) modify the tense of the statements to reflect that the system being studied is already in use (e.g. 'I find the intranet easy to use' instead of 'I would find the intranet easy to use'). Venkatesh et al. (2003) found

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

that reliability across all elements in the UTAUT was acceptable (CR > .70). In the present study, the Cronbach's alpha for the determinants used was .88.

IS Continuance Intention and Individual Performance

Participants' intentions to continue using the intranet and anticipated individual performance as a result of doing so were measured using constructs from Bhattacherjee's (2001) Information Systems Continuance model (ISCM). 7 scale items from the ISCM were included in the questionnaire to assess IS continuance intention (e.g. 'If I could, I would like to discontinue my use of the intranet') and Perceived Usefulness (e.g. 'Using the intranet improves my performance in doing my job'). A Likert scale was used for the response format, with respondents requested to rate each item on a scale of 1 (strongly disagree) to 5 (strongly agree). Minor wording changes were made to replace the generic word 'system' with 'intranet'. One item required reverse scoring. Bhattacherjee (2001) found that reliability across all elements of the ISCM was acceptable (CR > .80). In the present study, the Cronbach's alpha for the constructs used was .90.

RESULTS

The model was analysed in IBM SPSS Statistics (Version 24) using linear regression.

Descriptive Statistics

Table 1 shows means and standard deviations for all variables. It also shows skewness and kurtosis z-scores for the constructs. Mild violations of normality were found in some of them. As there were no compelling reasons not to transform the data (Tabachnick and Fidell, 2014) transformations were attempted and were found to be successful in the case of Digital Literacy and IS Continuance Intention. Following these transformations, all measures had skew and kurtosis z-scores within ± 1.96 (Field, 2009) and standardised z-scores within ± 3.29 (Tabachnick and Fidell, 2014). These indicators, along with visual exploration of the graphs (Field, 2009), suggested that the data were broadly normal and acceptable for parametric analyses.

Bivariate Correlation Analyses

The relationships between the variables were investigated using Pearson product-moment correlation coefficient following preliminary analyses to ensure no violation of the assumptions of normality, linearity and homoscedasticity. Bivariate correlations between all variables are presented in Table 2.

The relationships between Digital Literacy (as measured by the ISS) and both Performance Expectancy and Effort Expectancy (as measured by the UTAUT) were investigated. There was a moderate, positive correlation between Digital Literacy and Effort Expectancy ($r = .32$, $n = 142$, $p < .001$) with high levels of digital literacy associated with high effort expectancy (i.e. a high degree of ease is associated with use of the intranet). There was no correlation found between Digital Literacy and Performance Expectancy ($r = -.01$, $n = 142$, $p = .90$).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Summary statistics for modelled variables

	Mean	SD	Skewness (z-score)	Kurtosis (z-score)
Age	38.36	11.15	-	-
Gender	1.84	0.37	-	-
Tenure	5.33	6.57	-	-
Digital Literacy	93.80	11.80	-2.99	.39
Performance Expectancy	12.46	3.23	-.99	.39
Effort Expectancy	14.85	3.20	-1.91	1.05
Social Influence	11.72	2.89	-1.46	1.20
IS Continuance Intention	11.23	2.03	-3.84	4.55
Perceived Usefulness	12.82	3.81	-1.26	-1.12

Notes. Age and Tenure were measured in years. Digital Literacy was scored from 1 to 115; Performance Expectancy, Effort Expectancy, Social Influence and Perceived Usefulness were scored from 1 to 20; IS Continuance Intention was scored from 1 to 15; higher scores correspond to higher levels of the construct in all cases. Z-scores (prior to noted transformations) are presented for skewness and kurtosis.

Table 2. Bivariate correlations between modelled variables

	1	2	3	4	5	6	7	8
1. Age								
2. Gender	-.09							
3. Tenure	.45**	-.04						
4. DL	-.13	-.13	-.18*					
5. PE	-.06	.11	.11	-.01				
6. EE	-.19*	-.06	-.05	.32**	.48**			
7. SI	-.12	-.03	.01	-.05	.55**	.33**		
8. CI	-.18*	.09	.02	.03	.60**	.45**	.41**	
9. PU	-.02	.06	.04	-.04	.84**	.49**	.57**	.63**

Notes. DL Digital Literacy, *PE* Performance Expectancy, *EE* Effort Expectancy, *SI* Social Influence, *CI* IS Continuance Intention, *PU* Perceived Usefulness. * $p < .05$, ** $p < .001$.

The relationships between the determinants of behavioural intentions (Performance Expectancy, Effort Expectancy, and Social Influence; as measured by the UTAUT) and IS Continuance Intention (as measured by the ISCM) were investigated. There was a strong, positive correlation between Performance Expectancy and IS Continuance intention ($r = .60$, $n = 142$, $p < .001$). These results indicate that high levels of Performance Expectancy (i.e. using the intranet is expected to help improve job performance) are associated with high intentions to continue using the intranet. There was a moderate, positive correlation between Effort Expectancy and IS Continuance Intention ($r = .45$, $n = 142$, $p < .001$) and between Social Influence and Continuance Intention ($r = .41$, $n = 142$, $p < .001$).

The relationship between Continuance Intention and Perceived Usefulness (both as measured by the ISCM) was investigated. There was a strong, positive correlation between IS Continuance Intention and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Perceived Usefulness ($r = .63$, $n = 142$, $p < .001$) with high intentions to continue using the intranet associated with higher expected performance.

Although there were weak, negative correlations between age and effort expectancy ($r = -.19$, $n = 142$, $p < .05$), as well as tenure and digital literacy ($r = -.18$, $n = 142$, $p < .05$), no other significant correlations were found between the control variables and constructs.

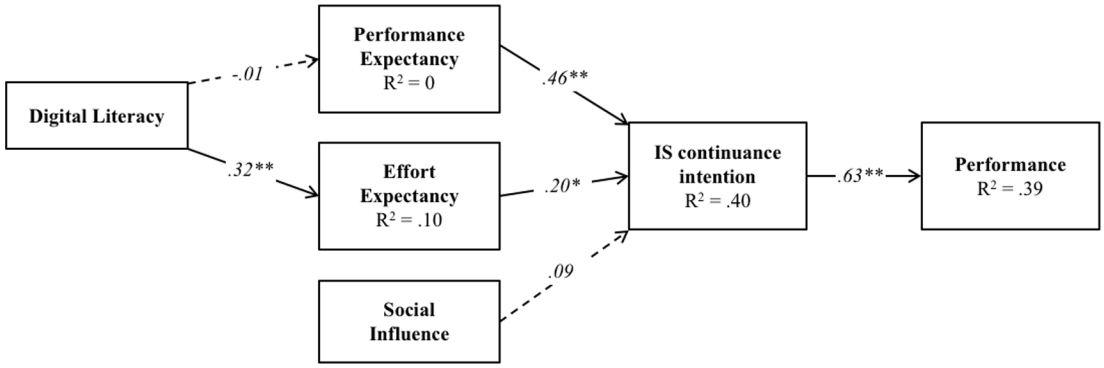
Given that correlations between the control variables (age, gender and experience) and the constructs were either non-significant or very small, they were excluded from the conceptual model with results from the linear regression analyses that is depicted in Figure 2.

Regression Analyses

Linear regression was used to explore the paths in the model. Results are presented in Figure 2. Preliminary analyses were conducted to ensure no violations of the assumptions of normality, linearity and homoscedasticity (as well as multicollinearity, in the case of the multiple regression analysis).

Simple linear regression analyses were used to assess the ability of Digital Literacy to predict users' levels of Performance Expectancy and Effort Expectancy when using the intranet. It was found that Digital Literacy made a statistically significant contribution to Effort Expectancy (beta = .32, $t(140) = 3.96$, $p < .001$) explaining 10%, $F(1, 140) = 15.65$, $p < .001$), of the variance in the dependent variable. However, Digital Literacy did not make a statistically significant contribution to Performance Expectancy (beta = -.01, $t(140) = .13$, $p = .90$).

Multiple regression was used to assess the ability of the three determinants of behavioural intention (Performance Expectancy, Effort Expectancy, and Social Influence) to predict users' intentions to continue using the intranet as measured by IS Continuance Intention. The total variance in IS Continuance Intention explained by the model as a whole was 39.9%, $F(3, 138) = 30.56$, $p < .001$. Performance Expectancy (beta = .46, $t(138) = 5.35$, $p < .001$) and Effort Expectancy (beta = .20, $t(138) = 2.62$, $p < .05$) made statistically significant unique contributions to explaining IS Continuance Intention. Social Influence did not make a statistically significant contribution (beta = .09, $t(138) = 1.14$, $p = .26$).



Simple linear regression was used to assess the ability of Continuance Intention to predict users' expected performance (as measured by Perceived Usefulness) when using the Intranet. The total variance explained by the model was 39.1%, ($F(1, 140) = 89.91$, $p < .001$). Users' intention to continue using the intranet made a statistically significant contribution to Perceived Usefulness (beta = .63, $t(140) = 9.48$, $p < .001$).

DISCUSSION

Drawing on prior research on the digital workplace, technology acceptance, and digital literacy, the present study set out to investigate the relationships between digital literacy, digital workplace continuance intentions and individual performance. A conceptual model was developed, and pathways therein were tested using a series of linear regression analyses. The conceptual model, which was adapted from the UTAUT (Venkatesh et al., 2003), was partially supported. Findings revealed that digital literacy is positively associated with higher effort expectancy. However, no relationship was found between digital literacy and performance expectancy. Both performance expectancy and effort expectancy positively predicted behavioural intention to continue using the digital workplace. Social influence, however, was

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Figure 2. Linear regression results for the conceptual model. Notes. Non-significant paths are represented by dashed lines. * p < .05, ** p < .001*

not found to be predictive of continuance intention. As expected, continuance intention positively predicted performance. Key findings are discussed below.

Employees' digital literacy was significantly positively associated with effort expectancy. In other words, higher levels of digital literacy mean that employees are more likely to perceive the intranet as easy to use. This supports the conceptual positioning of digital literacy as an element that can help employees to operate effectively in the digital workplace (e.g. Kiron et al., 2016). It is likely that this occurred because digitally literate employees are better able to focus on tasks due to reduced cognitive load when using technology (Ng, 2012b), as well as easily and speedily carrying out common digital workplace tasks, such as accessing and sharing information (Kasemsap, 2018).

Despite indications in the literature (e.g. Kiron et al., 2016; Van Deursen and Van Dijk, 2012), no association between digital literacy and performance expectancy was found in the present study. In other words, employees' digital literacy did not impact on their perceptions of how useful the intranet would be to do their job, accomplish tasks, be productive, or get a raise. Mohammadyari and Singh (2015) found a significant positive association between digital literacy and performance expectancy, although it was considerably weaker than the association with effort expectancy. They highlight the relevance of Brown, Dennis and Venkatesh's (2010) study on collaboration technology use, in which the authors found that computer self-efficacy (i.e. individuals' beliefs about their ability to use technology effectively) was positively associated with effort but not performance expectancy. Insights from their study indicate a possible explanation for the lack of association between digital literacy and performance expectancy in the present one: as with the collaboration technologies they investigate, intranets are familiar, frequently-used tools inside most organisations and therefore additional digital skills may not significantly add to their usefulness for employees accessing them regularly to perform repeated tasks.

Together, the amount of variance in behavioural intention predicted by the determinants (performance expectancy, effort expectancy and social influence) in the present study (40%) is very similar to that found by Dwivedi et al. (2011) in their meta-analysis of 43 UTAUT studies (39%). Both performance expectancy and effort expectancy were found to predict continuance intentions, a finding that is consistent with other comparable adaptions of the UTAUT (e.g. Sun et al., 2014). In light of the literature, it is unsurprising that employees who perceive the intranet as useful and easy to use are likely to want to continue using it. Performance expectancy had a stronger effect than effort expectancy on continuance intentions. Again, this is in line with prior studies in which performance expectancy was consistently

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

found to be the strongest predictor of technology acceptance (e.g. Davis, Bagozzi and Warshaw, 1989). The weaker effect of effort expectancy on continuance intentions may also be explained by it being thought to be more salient in the initial stages of adoption (e.g. Venkatesh et al., 2003) when users may face a steep learning curve before they become comfortable with the system.

In a finding that was contrary to expectations, social influence was not found to make a significant unique contribution to continuance intention. This is inconsistent with the technology acceptance literature, particularly in a mandatory use setting (e.g. Venkatesh et al., 2003). This may have occurred because social influence is less salient in a continuance as opposed to initial adoption context. For instance, Venkatesh and Morris (2000) found that after three months using a new system, social influence no longer significantly affected participants' behavioural intentions to use the technology. It is possible that digital workplace continuance is more strongly related to the individual's usage experience (i.e. effort required and performance gains) than normative beliefs (Chan et al., 2010).

In line with Bhattacherjee's (2001) IS Continuance Theory, continuance intention was strongly predictive of individual performance. This finding indicates that employees who intend to continue using the intranet believe that it will improve their performance, increase their productivity and enhance their effectiveness in their job. As per Mohammadyari and Singh (2015) this finding legitimates the large investments that organisations are making in the digital workplace technologies.

Although previous studies (e.g. Venkatesh et al., 2003; Venkatesh and Morris, 2000) have found that age, gender and experience significantly affected behavioural intentions to use technology, this was not supported by the present study. A possible explanation is that, as a younger cohort of employees have entered the workplace, these demographic factors have become less salient, as anticipated by Venkatesh et al. (2003). It may also be due to the wide adoption of intranets in large organisations (Oliveira et al., 2014).

Overall, the present study validated some aspects of the UTAUT model as well as demonstrating the value of including digital literacy in studies of digital workplace adoption. It also contributed new data to the emerging digital workplace research stream and associated need to investigate digital tools in the workplace as an integrative concept.

Practical Implications

Köffer (2015) suggests that practitioners may be able to gain valuable insights from the emerging academic literature on the digital workplace. The present study contributes to these insights by empirically testing the determinants of individuals' behavioural intentions towards using the digital workplace. It also investigated the role of digital literacy as an antecedent to these general determinants. The findings suggest that there is scope for organisations to consider employees' digital literacy as part of wider efforts to encourage effective use of digital tools at work. Supporting employees in improving their digital skills may help to reduce their cognitive load and enable them to more easily perform tasks when using the digital workplace (Kasemsap, 2018; Ng, 2012b). Soule et al. (2016) emphasize that such interventions are critical to support overall organisational digital dexterity across customer experience, operational efficiency, and workforce enablement. In addition, Kiron et al. (2016) suggest that a large proportion of employees expect their organization to help them gain digital skills for work.

Limitations and Future Directions

There are several limitations in the present study that need to be considered when interpreting the results and generalising them to different organisations. First, this study investigated the intranet as the "front door" to an evolving digital workplace, rather than a mature, fully integrated digital workplace (e.g. McConnell, 2011; Miller and Marsh, 2014). This may have implications for the generalisability of the findings to organisations with a higher level of digital dexterity (Soule et al., 2016). Second, the sample was relatively homogenous in terms of gender. This may limit the generalisability of the findings as males and females can exhibit different technology acceptance profiles (e.g. Venkatesh et al., 2003). Third, this study examined digital literacy using a measure of internet skills. Although this measure provided a broad view of the components of digital literacy, it may not cover all of the specific digital skills required in the workplace (e.g. Chinien and Boutien, 2011). Fourth, digital workplace continuance intentions and perceived performance were measured at a single point in time for this study. These measures provide indicators of future behaviour and outcomes but are not the same as measuring actual behaviour and performance in a longitudinal design (e.g. Bhattacherjee, 2001; Venkatesh et al., 2003). Fifth, although the model was able to explain a proportion of the variance in the core criterion variables of continuance intention (40%) and performance (39%), this does suggest that other important factors are involved that were not considered by the present study. Finally, the present analysis, although appropriate in assessing the pathways within the model, was not able to assess model fit.

Several directions for future research are suggested by the findings, implications and limitations of the present study. Future research that investigates digital workplace adoption could be enriched by considering organisations with different levels of digital dexterity (e.g. Soule et al., 2016), actual adoption and performance data, as well as multiple time points in the technology acceptance journey (e.g. Bhattacherjee, 2001; Venkatesh et al., 2003). The conceptual model was based on the UTAUT and some of its pathways were supported by the findings. There may be other adoption models such as Venkatesh, Thong and Xu's (2016) multi-level framework of technology acceptance and use, that could furnish future digital workplace adoption studies with potentially valuable constructs and pathways for further exploration. Such studies could benefit from a digital literacy measure that is specifically designed for the workplace, something on which Chinien and Boutien (2011) and Van Laar et al. (2016) provide useful background insight.

CONCLUSION

The aim of this study was to investigate the relationships between digital literacy, digital workplace continuance and individual performance using data gathered from the workforce of a major UK charitable organisation. It took as its base model the UTAUT and adapted it using measures of digital literacy and continuance intention. Findings partially supported the conceptual model. The results demonstrated the influence of digital literacy on employees' effort expectancy, which in turn influenced their digital workplace continuance intentions and ultimately individual performance. Several findings differed from prior research. In particular, digital literacy was not associated with performance expectancy. The most important implication of this study is to suggest an important role for digital literacy both as an antecedent to the more general determinants of technology adoption, and in organisational interventions designed to encourage digital workplace adoption. For organisations investing in digital workplace technologies,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

consideration should be given to how such interventions can support employees in gaining and applying digital skills to their day-to-day tasks. Findings from the present study suggest avenues for future research into the nature of digital literacy at work and its association with digital workplace adoption and use.

ACKNOWLEDGMENT

The author would like to thank the staff of Coventry University for their support and feedback on this article. The author would also like to acknowledge and thank the participating employees from the UK charitable organisation that got involved in the research. This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

Chapter 81
Impact of Online Teamwork Self-Efficacy on Attitudes Toward Teamwork

ABSTRACT

The lack of professional skills in project teams is one of the most important factors contributing to the high failure rate of Information Technology (IT) projects. Therefore, preparing students for increasingly complex IT projects has been an important learning objective in information sciences and technology programs. This article investigates the relationships between face-to-face students' self-efficacy of managing project tasks through online processes and their attitudes toward teamwork. The relationships among student engagement in learning experiences related to teamwork, self-efficacy of technology-mediated teamwork, and attitudes towards teamwork are investigated using confirmatory factor analysis on a data set with 344 participants. The analysis shows that self-efficacy of technology-mediated teamwork mediates the effect of learning engagement on attitudes toward teamwork. Therefore, the article postulates that mastering technology-mediated teamwork skills helps face-to-face students develop positive attitudes toward teamwork, which can be transferred to the workplace.

INTRODUCTION

IT projects are complex undertakings that are known to have high failure rates due to many reasons. In the literature, this high failure rate of information technology (IT) projects has been mainly attributed to the lack of professional skills in IT project teams rather than the deficiencies in the technical skills of the project teams (Keil et al., 1998; Whittaker, 1999). IT projects involve high levels of uncertainty due

to complex interfaces between technology and people. Technology and user requirements can change during the course of the project. IT project teams usually involve members with diverse background from various departments of the organization and are usually geographically distributed. IT projects typically have a high degree of virtual components. Therefore, team members of an IT project should have the flexibility to adapt dynamic project requirements and technology. In addition to the technical knowledge, career resiliency in the 21st century demands excellence in teamwork, effective communication, adaptability to change, positive and flexible attitudes, continuous learning, self-confidence (Collard et al., 1996). To improve the readiness of their students for the ever-increasing complex IT challenges of the 21st century, information sciences and technology programs have integrated teamwork knowledge, skills, and abilities (KSAs) into their curricula through new course offerings, embedding them into existing courses, or extra circular activities such as workshops and seminars. Furthermore, the use of virtual teams in IT projects has become so pervasive that not only distance learning classes but also face-to-face classes incorporated virtual team projects to introduce IT students virtual teamwork skills (Chen et al., 2008; Kulturel-Konak, Maurer, & Lohin, 2010; Falls et al., 2014; Brewer et al., 2015).

In this paper, we study the effect of students' self-efficacy of applying teamwork KSAs using online mediums on their attitudes toward teamwork. We define self-efficacy of teamwork KSAs using online mediums as students' beliefs in their abilities to perform teamwork KSAs such as resolving team conflict, solving problems collaboratively, communicating effectively, establishing team goals, scheduling and coordinating project tasks using online communication and collaborative technologies. We will refer to this definition as self-efficacy of technology-mediated teamwork for avoiding confusion with virtual teamwork self-efficacy. The target population of the study is information sciences and technology students who attend traditional face-to-face classes. The motivation of this research focus stems from the fact that even in face-to-face team projects, project tasks increasingly take place in online settings. In particular, commuter and non-traditional students have limited time on campus for face-to-face team meetings. Such student groups usually rely on online technologies to perform many components of face-to-face team projects. Therefore, it is important that students are well versed in managing team projects using online mediums for effective teamwork in face-to-face classes as well. Based on this premise, the main research question of the paper is to investigate whether face-to-face students exhibit more positive attitudes toward teamwork if they have self-efficacy of technology-mediated teamwork. In the literature, technology-mediated teamwork KSAs expected from information technology teams are mainly discussed in the context of virtual and distributed teams (Nunamaker, Reinig, & Briggs, 2009; Kulturel-Konak, Maurer, & Lohin, 2010; Schulze & Krumm, 2017). On the other hand, we emphasize the importance of technology-mediated teamwork KSAs for face-to-face student teams. This point is a unique contribution of the paper.

Attitudes toward teamwork can be defined as to the extent that a person is agreeable to work in a team. It is important that students develop a positive attitude toward teamwork because people's attitudes influence their future behavior (Ajzen & Fishbein, 1977). If students develop negative attitudes toward teamwork during their education, they may carry these negative experiences to the workplace. For example, Riebe et al. (2010) note that negative teamwork experiences can discourage new graduates to participate in real-life workplace teams. Cannon-Bowers, Salas, & Milham (2003) state that having positive attitudes toward teamwork is among the factors that determine the success of transferring teamwork skills learned in a training into practice. Furthermore, effective teamwork requires that team members perceive teamwork as an attractive work arrangement. Chapman and Van Auken (2001) investigate the factors affecting students' attitudes toward teamwork and report that students' understanding of the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

benefits of teamwork is one of the important factors for developing positive attitudes toward teamwork. This observation is the first hypothesis of the research model used in the paper.

Hypothesis One: Students' perceived value of teamwork has a positive effect on their attitudes toward teamwork.

The engagement of students in learning activities related to teamwork may help them avoid the pitfalls of teamwork, reduce the negative aspects of teamwork, and develop an appreciation of teamwork. As results of a meta-analysis, McEwan et al. (2017) report that teamwork training interventions have a positive effect on teamwork and team performance. Naveh et al. (2015) report that active learning in a team environment improves individual's work performance in medical fields through teamwork related KSAs such as feedback seeking and discussions. Konak et al. (2015) also report a positive correlation between engineering students' teamwork training and their attitudes toward teamwork. Therefore, engagement of students in teamwork related learning activities may help them develop positive attitudes toward teamwork. This observation is the second hypothesis of the research model.

Hypothesis Two: Students' engagement in learning teamwork KSAs has a positive impact on their attitudes toward teamwork.

The main research question in this paper is to study the relationship between self-efficacy of technology-mediated teamwork and students' attitudes toward teamwork. This relationship has not previously been investigated in the literature for face-to-face teams as self-efficacy of technology-mediated teamwork has been mainly defined and studied in the context of distributed teams (Hertel, Konradt, & Voss, 2006; Hardin, Fuller, & Valacich, 2006; Fuller, Hardin, & Davison, 2006; Krumm et al., 2016). As IT projects are increasingly conducted in virtual environments, students' ability and knowledge of using online technologies to conduct team tasks are becoming increasingly important. Research also points out that collective efficacy of team members is closely associated with team resilience (Rodríguez-Sánchez & Vera Perea, 2015), which is important for the success of an IT project that includes a high degree of uncertainty and risks. Team members should know how to cope with failures, be flexible in changing directions, and maintain a positive attitude. Gray (2012) reports that building self-efficacy of teamwork KSAs through informal and formal learning can enhance team member resilience. Gray (2012) also notes that self-efficacy influences the individual performance of team members by improving individuals' satisfaction with the team environment, in particular in the case of low performing teams. Eby and Dobbins (1997) note that higher self-efficacy of teamwork skills is related to an individual's effective orientation toward working with others in a team setting. The findings by Falls et al. (2014) support that learning essential teamwork skills may make a positive change in students' perceptions of teamwork. Based on these earlier researches, we postulate the following hypotheses.

Hypothesis Three: Students' engagement in learning teamwork KSAs enhances their self-efficacy of technology-mediated teamwork KSAs.

Hypothesis Four: Self-efficacy of technology-mediated teamwork KSAs improves students' attitudes toward teamwork.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Combining Hypothesis Three and Hypothesis Four, the main claim in this paper is that students' learning engagements related to teamwork KSAs will increase their self-efficacy of technology-mediated teamwork KSAs and in turn improve their attitudes toward teamwork. In other words, self-efficacy of technology-mediated teamwork facilitates the relationships between students' engagement in learning teamwork KSAs and their attitudes toward teamwork.

BACKGROUND

An extensive number of papers in the literature discuss expected teamwork KSAs from students in face-to-face and virtual teams. Stevens and Campion (1994) define five major areas of teamwork KSAs: (*i*) Conflict Resolution; (*ii*) Collaborative Problem Solving; (*iii*) Communications, (*iv*) Goal Setting, and (*v*) Performance Management and Planning/Task Coordination. Within each area, several specific KSAs are defined. Schulze and Krumm (2017) organize virtual team KSAs into six major categories: (*i*) Knowledge about functionalities of a medium, (*ii*) Communications, (*iii*) Developing and maintaining interpersonal trust, (*iv*) Intercultural awareness, (*v*) Self-management, and (*vi*) Conflict management. Schulze and Krumm's (2017) categorization emphasizes KSAs to cope with the challenges of virtual teams. In this section, we only highlight teamwork KSAs that are particularly important to be effective in face-to-face team projects with a high degree of online components. Further, we provide the conceptual definitions of the variables used in the research model of the paper.

Among planning/task coordination KSAs, self-management skills become particularly important in online settings because guidance and control by other team members are reduced in online team tasks. Hertel et al. (2006) argue that individuals need to develop an aptitude for planning and organizing their activities independently without motivation and support from others in virtual teams. Kankanhalli et al. (2006) also suggest that having the aptitude of independence is important for team members if the majority of project tasks are completed in virtual environments. It should be noted that self-efficacy is a precursor of developing an aptitude for independence in virtual teams (Hertel et al., 2005). Hertel, Konradt, and Orlikowski (2004) note that the quality of goal setting processes is an important factor determining the effectiveness of virtual teams. Although face-to-face teams have opportunities to coordinate team tasks in team meetings, IT students frequently rely on web-based tools (e.g., GitLab, Lucidchart, and Slack.com) to manage team projects (Boyd et al., 2017).

As face-to-face team processes are increasingly replaced with virtual ones, team goal setting and performance management increasingly rely on self-regulation, which is individuals' ability to set standards for their own performances, seek and evaluate feedback, and take remedial measures to correct discrepancies in their performance (Driskell et al., 2003). In team projects with a high degree of online components, students need to learn how to give and receive feedback actively on team performance. This feedback allows team members to refocus on project tasks in the case of distractions. In addition, Kankanhalli et al. (2006) note that persistence, which includes aspects of self-motivation, the endurance of goal striving and continuing activities after interruptions, is a critical attribute of team members in virtual teams because they are subject to external distractions more frequently compared to face-to-face teams. Persistence and independence are important attributes of resilience in online teamwork.

Effectively using electronic communication media is a fundamental skill for teamwork. Synchronous (text, video, voice) and asynchronous (email, discussion forums, document management systems) electronic media are frequently used to facilitate communication and coordination among team members in

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

not only virtual but also face-to-face teams. Students should be clear and disciplined about electronic communication to avoid pitfalls such as lack of non-verbal cues, slow development of relationships, delay in information exchanges, lack of social presence (Warkentin et al., 1997). Students should also know various types of online collaboration technologies so that they select the most appropriate one for the project tasks (Havard et al., 2008) and have the competency of using them. Furthermore, students should have self-efficacy for experimenting with online collaboration technologies that tend to change rapidly.

Conflict resolution is one of the challenging KSAs for students to master. Rather than seeking win-win solutions, students tend to avoid conflict in virtual teams (Kankanhalli et al., 2006). Delay in asynchronous communication can cause problems in the development of a mutual team understanding and knowledge (Cramton, 2001). Electronic communications can also exacerbate misunderstandings due to cultural differences among team members (Dubé & Paré, 2001). Therefore, resolving conflict through online communication is more challenging compared to face-to-face communication.

Problems related to the asynchronous electronic communication may result in subpar team problem-solving processes. A slow development of mutual team knowledge through online communication affects teams' ability to formulate the problem precisely and clearly as well as reach consensus. For example, Jacob and Sam (2008) report that discussion forums fail to generate productive arguments in problem-solving without interventions from the instructor. Even high-quality video conferencing technologies may not lead to productive problem-solving sessions compared to face-to-face meetings in the case of complex projects with a high level of task interdependency such as software development (Andres, 2002). Therefore, soliciting input from and giving constructive feedback to team members through electronic communication in an unbiased and clear manner is a critical teamwork skill that students should learn to be an effective problem solver in online environments.

Attitude is an internal state that influences a student's decision on whether to participate in group work or not (Gardner &, 1998). Attitudes toward teamwork can be broadly defined as how apt a student is to work in a team with others (Ulloa & Adams, 2004). If a student has a positive attitude toward teamwork, then the student is expected to participate in a team more willingly. Students' negative attitudes toward teamwork is a frequently discussed topic in the literature. Particularly, many articles aim to discover the underlying reasons for negative attitudes toward teamwork so that appropriate interventions can be applied. Among the factors affecting students' attitude toward teamwork include rewards (Bacon et al., 1999; Pfaff & Huddleston, 2003), team size, workload, cooperation versus competitiveness, peer evaluations (Pfaff & Huddleston, 2003), level of participation (Bacon et al., 1999; Pfaff & Huddleston, 2003) myths about teamwork (Pauli et al., 2008), online settings (Vance et al., 2015), and the level of instructor's involvement (Chapman & Van Auken, 2001). Pfaff and Huddleston (2003) note that expected grade, perceived workload, class time, and absence of free rider play important roles in shaping students attitudes toward teamwork. Beigi and Shirmohammadi (2012) also report a moderate relationship between team evaluation concerns and attitudes toward teamwork in a study involving students from Iran. Konak et al. (2015) report that engineering students' attitudes toward teamwork are negatively correlated with their GPA, which also suggests that students are concerned with their grades being affected by underperforming team members. Ulloa and Adams (2004) report positive relationships between the characteristics of effective teams and students' attitudes toward teamwork. These characteristics included conflict resolution, communication, goal setting, purpose, psychological safety, role clarity, and accountability. Chapman and Van Auken (2001) state that positive attitudes could be nurtured by instructors who are actively involved in teamwork by providing students with timely feedback on their team progress, introducing team management techniques, and monitoring team performance by

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

peer evaluations. Bacon et al. (1999) also identify instructor guidance on team processes as an important factor affecting students' teamwork experiences. According to Rawlings (2014), students' attitudes and perceptions toward online teamwork began in college after their first online team experience. Therefore, it is suggested that for effective online teamwork, instructors should include methods to ensure both team and individual accountability, promote team cohesiveness, and foster frequent communication among team members. Huitt et al. (2015) observe that including team-based learning in anatomy laboratories improve students' overall attitudes toward teamwork.

Bandura's self-efficacy theory (Bandura, 1982, 1991) states that self-confidence determines how successful one will be. Parallel to this definition, collective-efficacy refers to the shared beliefs of the team members in their team's capabilities to achieve the expected outcomes of the team's tasks (Gibson et al., 2000). In order to assess team forming and responsibility through the self-efficacy theory, the Personal Efficacy Beliefs Scale (PEBS) can be used. The PEBS assesses each team member's comfort and motivation to achieve the team's expected tasks (McClough & Rogelberg, 2003; Riggs et al., 1994). Huh et al. (2014) report three approaches to measuring collective efficacy. One approach is to collect self-evaluations regarding a particular set of group tasks, which enables an effective method for both individual and teamwork self-efficacy. Another approach is to evaluate individual perceptions of the whole group's capabilities. The third approach involves reaching a consensus through a comprehensive discussion among group members communicating about the overall team efficacy. The Collective Efficacy Beliefs Scale uses a seven-point Likert scale (Huh et al., 2014) through various questions and statements regarding the group's ability to work together (Riggs et al., 1994). Overall, the recent research supports that collective-efficacy has a positive impact on team performance (Gibson et al., 2000; Huh et al., 2014; Katz-Navon & Erez, 2005; Tasa et al., 2007).

In this paper, the focus is on self-efficacy of technology-mediated teamwork KSAs which can be defined as a team member's confidence in performing the tasks related to team processes (McClough & Rogelberg, 2003). In this respect, teamwork self-efficacy is independent of the efficacy related to the tasks that the team undertakes. To study the role of self-efficacy in team processes, Tasa et al. (2007) use a research model in which self-efficacy of teamwork KSAs mediates collective-efficacy, which in turn determines the team performance. A longitudinal study based on this multi-level model supports that self-efficacy of teamwork KSAs plays a significant role in the formation of collective-efficacy, and both self-efficacy and collective-efficacy are instrumental for effective team performance. Gully et al. (2002) also report that team-efficacy and potency are positively related to team performance. Lent et al. (2006) surveyed two groups of engineering college students during a team project and asked them to evaluate the overall group's confidence in performing tasks. The results of their survey indicated that self-efficacy and team cohesion were strong predictors of collective-efficacy. Eby and Dobbins (1997) provide an eight-item scale to measure teamwork self-efficacy and report that teamwork self-efficacy leads higher collectivism orientation in individuals. In the literature, self-efficacy of technology-mediated teamwork KSAs has mainly been discussed in the context of virtual teams (Hertel et al., 2005). Staples et al. (1998) report that self-efficacy of remote work skills is correlated with overall productivity and satisfaction of team members in virtual teams. In Staples et al.'s (1998) study, participants with high self-efficacy tend to have training in remote work and good information. Fuller, Hardin, and Davison (2006) define virtual team efficacy as a virtual team's belief in its ability to work together successfully in a non-collocated, technology-mediated environment. The authors measure virtual team efficacy in two dimensions: Computer Collective Efficacy and Group Potency. The empirical findings of Fuller, Hardin, and Davison (2006) support that virtual team efficacy is predictive of team outcomes in distributed teams.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Wang and Haggerty (2011) define virtual self-efficacy as one's belief in his/her competence to work in virtual settings and measure virtual self-efficacy in two dimensions: computer self-efficacy and remote work self-efficacy. Their findings show that an individual's remote work self-efficacy is correlated with his/her virtual competence and affects work outcomes positively in virtual settings.

Although developing positive attitudes toward teamwork is an important objective of teamwork work training programs, the relationship between teamwork self-efficacy and attitudes toward teamwork has not been studied in the literature. Chen, Donahue, and Klimoski (2004) study the effect of teamwork training on teamwork KSA, teamwork self-efficacy, and attitudes toward teamwork. They report a low but positive correlation between teamwork self-efficacy and attitudes toward teamwork. However, they do not directly investigate the relationship between these two variables. Interestingly, Chen, Donahue, and Klimoski (2004) report that while teamwork training was able to improve students' teamwork knowledge and skills in their study, they observed little improvement in attitudes toward teamwork after the training.

While the benefits of teamwork have been widely discussed in the literature, only a limited number of papers investigate how students perceive the value of teamwork. First of all, teamwork allows students to experience complex and large-scale projects which cannot be completed individually. Students may consider the value of teamwork in four main dimensions (Walker, 2001): (*i*) learning how real-life teams' function, (*ii*) learning how to run teams effectively, (*iii*) developing and practicing interpersonal skills, and (*iv*) creating collaborative learning opportunities. Chapman and Van Auken (2001) study the effect of students' perceived benefits of teamwork on their attitudes toward teamwork. In their study, Chapman and Van Auken (2001) measure the perceived benefits of teamwork using several items indicating how teamwork prepares students for real-life projects. Bailey et al. (2015) investigate the factors promoting the benefits of teamwork to students and report instructor contribution as a significant factor. Shankar and Seow (2010) note that students' perceived usefulness of teamwork depends on their personality. Students with lone-wolf tendencies generally perceive fewer benefits from teamwork. Nonetheless, the literature agrees that the perceived value of teamwork is an important factor influencing students' future engagement with teamwork.

METHOD

Participants

Participants in this study were undergraduate students from Information Sciences and Technology programs at several campuses of a public university in the northeast United States. Although the participants were geographically distributed, they were all enrolled in face-to-face programs that follow the same curriculum. In addition, the program courses require a significant amount of teamwork at all academic levels. After data cleaning, $n = 344$ responses were used in this study. The distributions of the responses across various demographic metrics are as follows: Female ($n = 86$), Male ($n = 257$), First Year ($n = 80$), Second Year ($n = 65$), Third Year ($n = 85$), and Fourth Year ($n = 114$).

Procedures

Participants were recruited via email. An anonymous URL link to the online survey was emailed to the target population. The participation in the survey was voluntary, and no incentives were provided for

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

participation. We collected limited background information about participants per the IRB requirements. The survey intended to measure students' overall attitudes toward teamwork during their education, without being specific to a course or a single project.

Measures

The measures of the study included four latent variables: overall attitudes toward teamwork (Attitude), self-efficacy of technology-mediated teamwork (TMT Self-Efficacy), Perceived Value of Teamwork (Perceived Value), and Learning Engagement related to Teamwork KSAs (Learning Engagement). In the following discussion, these latent variables are referred to as Attitude, TMT Self-Efficacy, Perceived Value, and Learning Engagement for the presentation brevity. The survey items associated with each latent variable are given in Appendix. The average scores of the items related to each latent variable were used to measure the variable.

The TMT Self-Efficacy latent variable intends to measure how confident a student is in his/her capabilities to accomplish team forming, team management, and team coordination tasks via online communications and technologies. We developed items for TMT Self-Efficacy based on the learning outcomes areas defined in (Alexander, 2006; London, 2013; Lurey & Raisinghani, 2001). The items related to this latent variable were operationalized with a four-point Likert scale as (1)-Very Unconfident, (2)- Unconfident, (3)-Confident, and (4)-Very Confident.

The Learning Engagement latent variable measures how frequently students engage in learning activities related to teamwork KSAs. The survey items related to this latent variable were operationalized using four-level rating scales as (1)-None, (1)-Once, (3)-A few times (2-3), and (4)-Several times or more (>4). As given in Appendix, the items to measure Learning Engagement are action-oriented such as reading a book about teamwork or attending a speaker event. Students who perform such activities frequently are expected to have a higher level of teamwork KSAs.

As previously discussed, Attitude toward teamwork is defined as how agreeable a student is to work in a team. Based on this conceptual definition, the Attitude latent variable measures students' preference of working in team settings using three items operationalized by four-point Likert scales as (1)-Strongly Disagree, (2)-Disagree, (3)-Agree, and (4)-Strongly Agree.

Perceived Value is defined as the degree to which a student believes that teamwork usually enhances the outcomes of a project and helps them grow professionally. The Perceived Value latent variable was also measured by five items operationalized by four-point Likert scales as (1)-Strongly Disagree, (2)-Disagree, (3)-Agree, and (4)-Strongly Agree. We adapted teamwork attitude questions from (Beigi & Shirmohammadi, 2012; Pauli et al., 2008; Payne & Monk-Turner, 2006; Pfaff & Huddleston, 2003).

Validation of the Measurement Model

Before testing the path models to study the formulated hypotheses, we used a confirmatory factor analysis to evaluate internal consistency, convergence validity, and discriminant validity of the latent variables of the measurement model. The measurement model had CMIN/DF = 1.87 (< 2.5), CFI = 0.954 (> 0.90), TLI = 0.95 (> 0.95), and RMSEA = 0.05 (< 0.05), supporting a good model fit to the data for the measurement model. Table 1 summarizes Cronbach's Alpha (α), Composite Reliability (*CR*), and Average Variance Extracted (*AVE*) of the latent variables. In the measurement model, all standardized factor loadings of the survey items exceeded 0.50 and were significant ($p < 0.001$). The individual fac-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tor loadings and *p* values are not provided in the paper for the brevity of the presentation. In addition, all CR and α values were greater than 0.70, indicating an acceptable level of internal reliability of the latent variables. The Cronbach's Alpha value of the Attitude latent variable is slightly higher than the commonly accepted threshold of 0.70 (Nunnally, 1978) while it has a high CR value. The main reason for the discrepancy is that the Cronbach's Alpha measure assumes that standardized regression coefficients (factor loadings) are identical for all items. In the case of the Attitude latent variable, the factor loading of one of the three items was lower than the other two items as given in Appendix. Therefore, the Cronbach's Alpha value of this variable was lower. In such cases, CR provides a better a measure of internal reliability (Peterson & Kim, 2013). The AVE values of the latent variables were very close to or larger than 0.50, indicating their convergent validity. However, the AVE value of Learning Engagement was lower than 0.50. Because of the fact that the AVE of Engagement was close to 0.50, the low correlations between Learning Engagement and other variables and a strong CR value, the convergent validity of Learning Engagement was considered as acceptable.

Table 1. Summary of the metrics for the internal reliability and convergent validity of the measurement model

Latent Variable	α	AVE	CR
Attitude	0.73	0.52	0.95
Learning Engagement	0.83	0.46	0.84
TMT Self-Efficacy	0.88	0.60	0.88
Value	0.91	0.60	0.88

We used heterotrait-monotrait ratio (HTMT) of the correlations to provide evidence of discriminant validity for the latent variables. The HTMT ratio is the average of the heterotrait-heteromethod correlations (i.e., the correlations of indicators across constructs measuring different phenomena), relative to the average of the monotrait-heteromethod correlations (i.e., the correlations of indicators within the same construct). Henseler et al. (2015) suggest that discriminant validity is supported between the two latent variables if the HTMT ratio between them is less than 0.85. Based on this criterion, discriminant validity was established for all latent variables of the measurement model as shown in Table 2.

Table 2. The heterotrait-monotrait ratio of correlations (HTMT) to assess discriminant validity (baseline value: HTMT < 0.85)

	Learning Engagement	TMT Self-Efficacy	Perceived Value
Attitude	0.33	0.22	0.83
Engagement		0.13	0.31
TMT Self-Efficacy			0.14

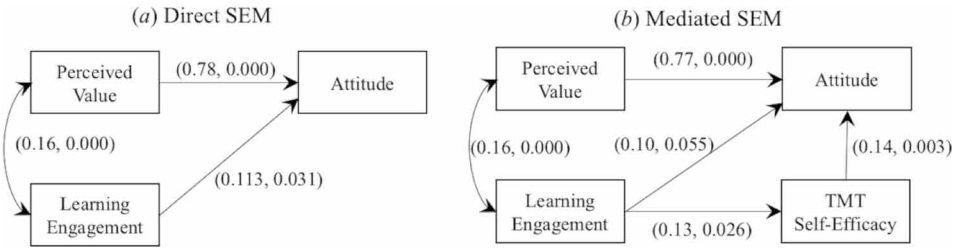
Validation of the Path Models

After establishing the psychometric validity of the latent variables based on the measurement model, we evaluated the validity of the structural pattern models underlying the research hypotheses. The first hypothesized structured equation model (SEM) states that Learning Engagement and Perceived Value has a direct causal effect on Teamwork Attitude (i.e., Hypothesis One and Hypothesis Two). This model is referred to as the Direct SEM. The second hypothesized SEM states that the effect of Learning Engagement on Attitude is mediated through TMT Self-Efficacy. As stated before, our main hypotheses are that the more students are engaged in learning activities related to teamwork skills, the higher self-efficacy of technology-mediated teamwork they will have (Hypothesis Three), and self-efficacy of technology-mediated teamwork leads to positive attitudes toward teamwork (Hypothesis Four). This model is referred to as the Mediated SEM. As seen in Table 3, the goodness of fit for both direct SEM and mediated SEM was found to be acceptable.

Table 3. Goodness-of-fit statistics of the research models

	CMIN/DF	CFI	TLI	RMSEA
Measurement Model	1.87	0.95	0.95	0.050
Direct SEM	1.68	0.97	0.96	0.045
Mediated SEM	1.87	0.95	0.94	0.051
Baseline Values	< 2.5	> 0.9	> 0 .95	< 0.05



DISCUSSIONS

Figure 1 illustrates the standardized regression coefficients and *p* values of the direct SEM and mediated SEM, respectively. Hypothesis One was strongly supported by both models, i.e., students' perceived value of teamwork had a significant positive effect on their attitudes toward teamwork. Even after including TMT Self-Efficacy in the direct SEM, the strength of the path from Perceived Value to Attitude remained virtually unchanged in the mediated SEM. This result indicates that students should appreciate the value of teamwork in order to develop positive attitudes toward the teamwork. Although this result is expected at some level, it has several practical implications. Firstly, teamwork should be used for tasks that are worthy of a team effort. Managing a team is itself a time-consuming process. Students need to schedule meeting times, meet as a team, collaborate on ideas, share the work, and coordinate tasks. Teamwork can unnecessarily complicate the tasks that are simple enough that can be performed by individuals. As students are regularly involved in teamwork in multiple classes, they may feel overwhelmed by the demand of managing teamwork and develop a negative attitude toward teamwork (James et al., 2002). Therefore, instructors should be aware of the negative effects of overusing teamwork. As indicated by Bailey et al. (2015), active involvement of instructors in team processes can also help students better understand the value of teamwork.

It is seen that Hypothesis Two was supported by the direct SEM ($p < 0.05$) but not by the mediated SEM ($p > 0.05$). Both Hypothesis Three and Hypothesis Four were supported by the mediated SEM. The indirect path (Engagement →TMT Self-Efficacy→Attitude) had significant positive relationships.

Figure 1. The standardized regression coefficients and p values of (a) direct SEM and (b) mediated SEM (standardized regression coefficient, p-value)

In addition, the direct path (Learning Engagement →Attitude) became insignificant when TMT Self-Efficacy was added to the model. These findings supported that the main research hypothesis of the paper, i.e., the TMT Self-Efficacy mediates the relationships between Learning Engagement and Attitude. This particular research finding has implications for the design of the programs to increase students' teamwork KSAs through formal and informal learning. First of all, formal learning in teamwork KSAs should emphasize building self-efficacy. The findings suggest that the impact of learning activities to develop and improve teamwork KSAs is realized more effectively if the activities lead students to build their self-efficacy. According to Bandura (2000), training employees in how to manage failure through informative processes is important for building self-efficacy. Bandura (2000) argues that if people are faced with only easy challenges, they tend to expect quick results and are easily discouraged by failures. In teamwork training programs, participants should experience overcoming challenges through perseverant effort in order to build resilient self-efficacy. The recommendations by Bandura (2000) certainly are applicable to educate students in teamwork KSAs as well. In addition, our findings support the role of informal learning in developing students' self-efficacy of technology-mediated teamwork KSAs. Our results suggest that students who engage in informal learning activities often are likely to have higher self-efficacy of technology-mediated teamwork KSAs.

The results showed that there was a positive relationship between students' self-efficacy of technology-mediated teamwork KSAs and their attitudes toward teamwork. This result suggests that technology-mediated teamwork KSAs should be incorporated into existing face-to-face curriculum to instill positive attitudes toward teamwork in students. IT students are likely to work in virtual teams when they join the workforce. Incorporating virtual teamwork in existing face-to-face classes can prepare students for the demands of jobs in our global economy (Falls et al., 2014; Brewer et al., 2015). Based on our findings, we suggest that face-to-face students can observe the benefits of developing self-efficacy of technology-mediated teamwork KSAs not only in their future careers but also in their current team projects. Foremost, our results show that there is a relationship between self-efficacy of technology-mediated teamwork and attitudes toward teamwork. Having positive attitudes toward teamwork can improve team processes and outcomes, increasing students overall learning experience in team projects. When students have positive experiences in team projects, they tend to transfer their learning into practice more effectively. Furthermore, positive team experiences can lead to more collaborative learning opportunities for students. Instructors can help students to nurture positive attitudes toward teamwork through appropriate teamwork training and practice (Hamer & O'Keefe, 2013; Rawlings, 2014). In particular, the involvement of instructors in early steps of establishing team leadership and roles as well as reducing free riders is important for developing positive attitudes toward teamwork (Rudawska, 2017). Our results also

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

suggest that teamwork training for face-to-face students should also incorporate virtual team KSAs. In particular, knowledge about functionalities of web collaboration technologies, such as when to use a specific collaboration technology and their pros/cons (Schulze & Krumm, 2017), is quite important for face-to-face students as well.

CONCLUSION AND LIMITATIONS

It is evident from the mediated SEM that self-efficacy of technology-mediated teamwork KSAs is a factor in developing positive attitudes toward teamwork. While the importance of teamwork KSAs such as goal setting, team forming, performance evaluation, team coordination, communications, conflict resolution, and problem-solving have been widely discussed in the literature, the research in this paper draws attention to the self-efficacy of performing these KSAs in online settings for face-to-face students. As the project management processes increasingly take place in online environments for even traditional face-to-face teams, the strong relationship observed between TMT Self-Efficacy and Attitude reaffirms the need for increasing students' online teamwork KSAs.

In this research, we focused on the self-efficacy of technology-mediated teamwork KSAs. This is one of the limitations of the research. To expand the findings of the paper, a broader set of teamwork KSAs can be considered as further research. Studying other teamwork KSAs will also substantiate the main finding of the paper. In addition, the target population includes only information sciences and technology students. The validity of the research model should be tested in other fields in order to generalize the findings.

APPENDIX

Attitudes

- I would rather work on team projects than on my own
- I like to participate in teamwork
- I am usually motivated to participate in teamwork

Value

- Teamwork improves the quality of the final project outcomes
- Teamwork keeps me more engaged and interested in project tasks
- Teamwork helps me learn new concepts from others
- Teamwork makes it possible to complete class projects in a timely manner
- Teamwork helps me to improve my communication skills

Technology-Mediated Teamwork Self-Efficacy

- Communicating effectively with other team members using the available online technologies
- Communicating effectively online with your team members without observing their social cues and body language
- Resolving conflict through online communication
- Developing team goals using the online technologies
- Encouraging team participation using the offered online communication technologies
- Providing, seeking, and accepting feedback well through communicating with the online technologies
- Participating in an online team discussion, such as discussion boards and online forums

Learning Engagement

- Read a book about teamwork
- Read an online article about teamwork
- Attended a speaker event about teamwork
- Performed a web search to learn about effective teamwork
- Watched a documentary or training video about teamwork

Chapter 82
Virtual Leadership:
How Millennials Perceive Leadership Attribution and Its Impact on Database System Development

Christian Graham
University of Maine, USA

Harold Daniel
University of Maine, USA

Brian Doore
University of Maine, USA

ABSTRACT

This chapter is an updated review of the results of a study completed in 2015 on leadership's impact on virtual team effectiveness and the quality of the completed virtual team project. Findings in 2015 suggested that leadership style and virtual team effectiveness did predict project quality, and specific leadership styles had a negative relationship with virtual team effectiveness. After summarizing the results of the studies purpose, methodology, and findings, the chapter concludes with a literature review of virtual team's leadership research between 2015 and present. It provides a discussion on the relationship between the previous studies' findings and what has been found since with recommendations on future research on shared leadership and relationship building in virtual teams.

INTRODUCTION

Virtual spaces continue to infiltrate themselves into various aspects of both our personal and professional lives. Millennials in particular know this having lived their whole lives immersed in the Internet. Some of the activities Millennials have done and continue to do include: social networking, synchronous real-time video gaming with friends who are geographically separated from them, and retrieving answers to every

imaginable question they've ever had thanks to Internet search engines. Millennials have now reached the age in which they are graduating from colleges and joining the workforce. Giving the ubiquitous nature of the Internet as a platform to communicate, coordinate, collaborate, and share information the research reviewed in this chapter sought to answer the question: "what is the effect of three leadership types on the quality of virtual team projects and what is the effect of these same leadership types on virtual team effectiveness?" This chapter is a review of the original research done by Graham, Daniel, and Doore (2015) titled: *Millennial Leadership: The Oppositional Relationship between Leadership Type and the Quality of Database System's Development in Virtual Environments*. The chapter also updates the literature review on the subject to better understand leadership types and its impact on database systems development and virtual team effectiveness in virtual environments.

The Millennial: The Net Generation

According to Williams and Chin (2009) Millennials, also referred to as "the Y generation" are those people who were born between 1977 and 2003. Another common term for Millennials is that they are the "net generation" (Tapscott 1998, 2008). Tapscott (2009) defined the net generation as:

- "People who grew up shaped fundamentally by technology and they are shaping it" (Tapscott, 2009);
- "People who use computer technology naturally and easily" (Tapscott, 2009);
- "People who prefer to learn and work collaboratively" (Tapscott, 2009);
- "People who anticipate fast and frequent communication" (Tapscott, 2009);
- People who judge corporations by their integrity, workplace practices, and concerns for the environment" (Tapscott, 2009);
- People who want to be evaluated on performance, not seniority or loyalty (Tapscott, 2009);
- People who don't make sharp distinctions between work and play, or their public and private spheres" (Tapscott, 2009).

Jones, Ramanau, Cross, and Healing (2010) reported that previous generations such as baby boomers (individuals born between 1946 and 1964) were "at least one step behind using new technologies than Millennials" and "unable to reach the kinds of natural fluency that comes with having grown up with new digital technologies".

Another interesting attribute of Millennials according to Bracey, Bevill, and Roach (2010) is that they have been discovered to be much more accepting of diversity and are more global-centric. All of this information demonstrates clear distinctions from previous generations. For example, Oblinger (2003) reported that while Millennials were more accepting diversity and global centric, baby boomers just beginning the civil rights movement and many were drafted into the Vietnam war. According to Billington and Billington (2010) in terms of working, baby boomers used experience and perspective to complete work or perform job tasks while Millennials who were more technically inclined preferred to use technology to complete tasks.

BACKGROUND

Failure in Information Systems Development

To begin, Hannola and Ovaska (2011) stated that a systems development project goal is to "develop and modify systems that satisfy customers and end users needs on schedule and within budget." (p. 66). Hannola and Ovaska added that "early activities involved in information systems development are critical and important steps. Poor execution of these activities will almost guarantee failure of the final information systems project. Dalcher and Drevin (2003) reported that "the greater part of database systems development projects end in failure. This is a problem not limited to database systems development, but most information systems development of any type. Warkentin, Moore, Bekkering, and Johnston (2009) added that "up to 80% of all systems development projects failed for a number of different reasons. Almost two decades ago Ewusi-Mensah (1997) found that these failures or cancellations of information systems projects can be attributed to any combination of the following factors:

- A lack of general agreement on a well-articulated set of project goals;
- A weak or problematic project team;
- Lack of clear project management;
- A deficiency in technical expertise, experience, or relevant application-domain knowledge;
- Current information technology infrastructure within the organization not able to support the system being developed;
- Senior management delegating decision-making at critical junctures in the development to the technical experts and not investing themselves into the project;
- The project costs and time going well beyond the original project plan.

Virtual Teams and Virtual Team Challenges

Today, many systems development projects are being done by teams that are physically separated by geographic space and time. That is, many members of systems development team projects work remote from one another. This remote team work is facilitated by telecommunication technologies that are no longer just limited to computers. Graham et al. (2015) stated it this way:

"People working together from remote locations can also use other electronic devices for communication such as tablets and the telephone. Today, the telephone would include smart phones with texting capabilities, email, and social networks. Kock (2005) added that Internet-enabled technologies such as smart phones have made collaboration significantly more mobile (p.35-36)."

Telecommunication technologies in its many forms, Internet connected computers, tablets, or smart phones to name just a few, have made possible the creation of virtual teams. In the original research, Graham et al. (2015) described virtual teams this way.

"According to Brandt, England, and Ward (2011), the ability to construct extremely adaptable and effective virtual teams is becoming essential to firms. Brandt et al. stated that virtual teams can be individuals working together who have never met in person and often will not meet face-to-face during the assigned project. There are variations of this definition. Virtual teams, according to Green and Roberts (2010), are geographically separated teams that have little face-to-face contact and are dependent upon computers and telecommunication technologies to communicate with each other. (p.31). In research that

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

followed the Graham et al. 2015 publication, Graham and Daniel (2016) further expanded the definition of virtual teams by citing the existing literature on the topic between 2004 and 2011.

"There are many variations of the definition of virtual teams. Virtual teams, according to Green and Roberts (2010), are geographically separated teams that have little face-to-face contact and are dependent upon computers and telecommunication technologies to communicate with each other. Martins, Gilson, and Maynard (2004) developed their own definition of virtual teams as "teams whose members use technology to varying degrees in working across locational, temporal, and relational boundaries to accomplish an interdependent task" (p. 808). Martins et al. (2004) added that virtual teams are teams first, and that the 'virtualness' is a team characteristic. Powell, Piccoli, and Ives, (2004) stated that virtual teams are "groups of geographically, organizationally, and or dispersed workers brought together by information and telecommunication technologies to accomplish one or more organizational tasks (2004; p. 7)."

It should be noted that these virtual teams bring with them certain value to the organization that use them. For example, Zivick (2012) stated that organizations are using virtual teams to accomplish business goals. Martins et al. (2004) reported that the use of virtual teams that use technology to interact with each other across geographic, organizational, and other boundaries are becoming very common in organizations (p. 805). Not only are virtual teams used more frequently in organizations, Brandt, England, and Ward (2011) stated that firms report these teams must have the ability to be constructed rapidly and be extremely adaptable to meet each individual project's goals. Kayworth and Leidner (2000) reported that many benefits are derived from these virtual teams: cost reductions, cycle-time reductions, integration of distant members, and improved decision-making and problem-solving skills. Arguably, the significance of virtual teams is best stated by Hargrove (1998) who stated: "in the future, the source of human achievement will not be extraordinary individuals, but extraordinary combinations of people."

That said, virtual teams, like information systems development, come with their own set of challenges that must be overcome or mitigated to achieve their goals. Some of the challenges associated with virtual teams include:

- Difficulty in establishing trust among team members that may have never met face to face (Brandt et al., 2011);
- Cultural and language differences become more pronounced and can result in increased distrust in virtual teams (Brandt et al., 2011);
- Lack of rules for communication, combined with cultural and language differences, can lead to a "break down" of communication amongst virtual team members. Like cultural and language differences, a lack of rules for communication can also result in increased distrust in virtual team members (Brandt et al., 2011);
- Inadequate social skills. Brandt et al. (2011) reported that expertise should not be the only reason for assembling a virtual team. Social skills are required for the effective exchange of "know how" among virtual team members;
- Like one of the reasons for any information systems development projects cancellation, a lack of clear well-articulated set of project goals keep virtual teams from performing effectively as well (Brandt et al., 2011);
- Ruggieri (2009) stated that another challenge virtual teams must overcome is the ability of team leaders or managers to "encourage, reward, and motivate" their employees through physical presence and comments. In virtual teams, the lack of physical presence makes rewarding employees

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

more difficult. Differences in cultural norms can contribute to this as well as it makes it harder to create a common award system for all virtual team members;

- Decreased time. Sridhar, Nath, Paul, and Kapur (2007) reported that trust and relationships between virtual team members and team leaders improves over time and this more mature relationship among virtual team members and team leaders has been shown to impact the quality of outcomes both for virtual team projects and virtual team cohesiveness. Shorter term virtual projects do not get the opportunity to mature their relationships and resultant team cohesiveness;
- Blackburn, Furst, and Rosen (2003) report that in addition to what is listed above, that certain "knowledge, Skills, and Abilities (KSAs)" are also required in successful virtual teams. According to Blackburn et al. these KSAs include: comfort with technology and technology change.

Bhat, Pande, and Ahuja (2017) found that virtual teams face problems that face-to-face teams do not. Specifically, they found that virtual teams experience "decreased social interaction, communication and emotional expression (p. 35)". The findings presented by Bhat et al. (2017) state that virtual team may suffer a consequence for this. This is supported by research conducted by Brandt et al. (2011) and Hoegl and Muethel (2016) that have emphasized the importance of quality communication within virtual teams as requirement for successful virtual team project outcomes. Pozin, Nawi, and Romle (2016) report much of the same. Pozin et al. (2016) investigated he effect of communication on difference project stages and identified key factors to enhance virtual team communication. The findings primarily supported previous research that virtual teams are an effective way to have project teams communicate but add that the ability to rapidly develop communication technology that is flexible enough to support multi-national communication is necessary.

Virtual Leadership Impact on Virtual Teams Study

The original study conducted by Graham et al. (2015) was described this way:

This was a cross-sectional study that examined the impact of the type of leadership among Generation Y leaders and the effectiveness of leadership on virtual team project quality and virtual team effectiveness. The study was conducted with sophomore students at the Maine Business School. Millennial students worked in randomly assigned teams on the design and development of an MS Access database management system. The quality of the completed team project was defined as one that met the team project criteria which included:

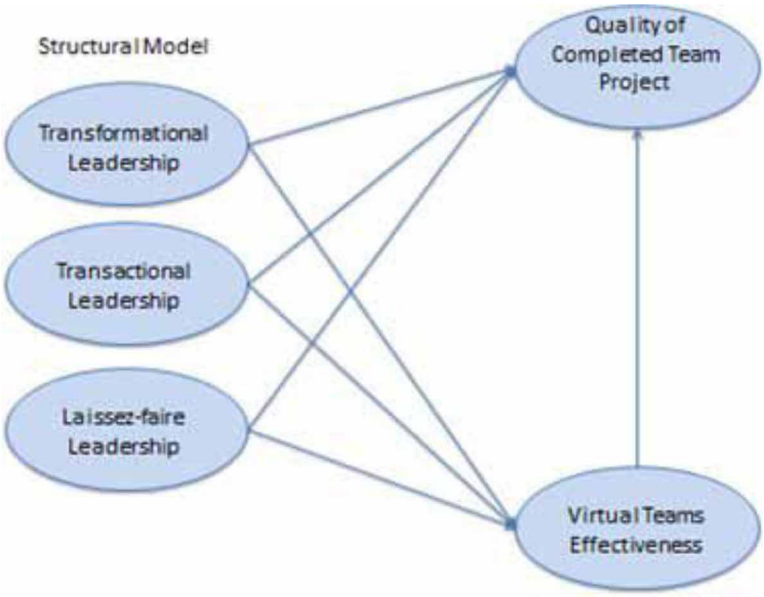
- *Creating a list of three to five business requirements which state how the database management system should work;*
- *An entity-relationship (ER) model that graphically represents specific database management systems entities such as tables, relationship types, fields, and field data types;*
- *The completed database management system itself which would need to include physical tables, relationships, forms, queries, and reports.*

The Virtual Environment

According to Graham et al. (2015), the virtual environment was described this way:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The environment available for use in this study was Google Sites. Google Sites allowed students to work on the group / team project in a virtual environment. This virtual environment allowed students to communicate, asynchronously and synchronously; upload and download files such as word documents and database files; and collaborate on documents. Students were told at the beginning of the study that they must conduct all communication within the Google Sites. (Graham et al., 2015)



To determine leadership types impact on both virtual team project quality and virtual team effectiveness, Graham et al. (2015) developed three hypotheses for the study. They were:

H1: In comparison to Transactional and management by exception leadership types, Transformational leadership type will be most effective in leading a virtual team in developing a database management system.

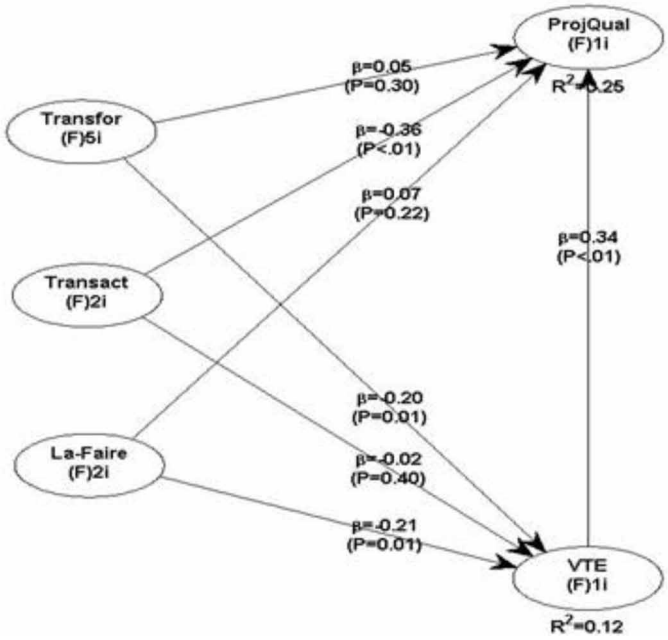
H2: In comparison to Transformational and management by exception leadership types, Transactional leadership type will be most effective in leading a virtual team in developing a database management system.

H3: In comparison to both Transformational and Transactional leadership types, Management-by-Exception leadership type will be most effective in leading virtual team in developing a database management system. Figure 1 shows the structural model used in this study (Graham et al., 2015).

Figure 1. Structural model for determining the effect of leadership type impact on virtual team effectiveness and quality of completed team project

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Instruments Used to Measure Leadership Type and Virtual Team Effectiveness



Graham et al. (2015) described the instruments used in the study to measure leadership type and virtual team effectiveness this way:

At the end of the study period, team members and leaders were required to complete the Multifactor Leadership Questionnaire (MLQ) survey and the Virtual Teams Survey (VTS) instruments through Qualtrics, a web-based survey tool. The MLQ measured leadership attributes and ascribed a leadership type to the team leaders based on leader attributes. Leadership types as measured by the MLQ are Transformational leadership, Transactional leadership, and Management-by-Exception (passive-avoidant) leadership. Virtual Team Effectiveness was measured by the global average of measurements of Team Formation, Team Member Relations, Team Leader Processes & Attributes and Overall Performance & Satisfaction with Team Members on the VTS. The resulting data were analyzed to understand which leadership type resulted in a successfully completed team project.

Study Findings in 2015

Graham et al. (2015) analyzed the data using a combination of descriptive statistics and Partial Least Squares – Structural Equation Modeling with WarpPLS. Figure 2 presents the findings of PLS-SEM analysis of the effect of leadership type on virtual team effectiveness and quality of completed team project.

Figure 2. Findings of PLS-SEM analysis on the effect of leadership type impact on virtual team effectiveness and quality of completed team project

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Graham et al. (2015) in their original publication of this research reported the findings of the three hypotheses investigated in the study. The results for each hypothesis is below:

H1: In comparison to Transactional and Management by Exception leadership types, Transformational leadership type will be most effective in leading a virtual team in developing a database management system. Upon data analysis, the study found that H1 was not supported. Rather, Transformational leadership style achieves a statistically significant and negative relationship with Virtual Team Effectiveness (β=-.20).

Factors of Transformational leadership that were significant included idealized influence and intellectual stimulation, however, they showed an inverse relationship, meaning they negatively influenced database systems development in a virtual team environment. One interpretation of the negative correlation of idealized influence associated with Transformational leadership on the quality of completed virtual team projects is that in the virtual environment, leaders do not get the opportunity to arouse and inspire those they lead due to the lack of face to face interaction. According to Purvanova and Bono (2009) Transformational behaviors exhibited by leaders are "emotional in nature and may occur less frequently in virtual teams" (p. 344). Purvanova and Bono (2009) went on to state that idealized influence in particular employ nonverbal and para-verbal cues and as such it may be hard to display and perceive those Transformational behaviors in computer mediated communication settings. Thompson and Coovert (2003) stated that an additional problem for Transformational leadership in virtual teams is that communication is much more labor intensive and more cognitively taxing than face to face communication. Purvanova and Bono (2009) stated that, for example, it takes at least four times longer to type than to speak and as a result these Transformational leaders may engage in less intellectual stimulation because "challenging team members to re-think their assumptions and engage employees in the decision-making process may prove too difficult and time consuming in virtual environments" (p. 345). One explanation of the negative correlation of intellectual stimulation associated with Transformational leadership on virtual team effectiveness is that according to Hambley, O'Neill, and Kline (2007) in the virtual environment leaders tend to use a one-way, top-down approach to communication and these leaders tend to micromanage. This suggests, according to Hambley et al. (2007), that virtual followers will not find their leaders to be very intellectually stimulating. Additionally, Chidambaram (1996) suggested that managers think of computer-mediated communication as a tool to achieve goals rather than a tool for relationship building. As such, if socio-relational communication is displaced by a more task orientated communication, Transformational leadership behaviors may suffer as well. In virtual environments both idealized influence and intellectual stimulation proved to have a significant and negative influence on database systems development. The rationale for these outcomes was stated above and suggests that virtual team leaders cannot successfully convey much of the required communication, verbal, nonverbal, and para-verbal, in the virtual environment necessary to inspire and arouse team members to follow them, much less motivate team members to think on their own about problem-solving. This finding reinforces Purvanova's et al. (2009) findings that "technology-deterministic communication theories predict and preliminary data from qualitative studies reveals, that each of the Transformational leadership behaviors will be harder to display in virtual than in face to face teams" (p. 345). This study's research on leadership types agreed with Purvanova et al. (2009) Technology-facilitated communication has been shown to have an overall negative effect on leadership behavior, as well as on followers' perceptions of leadership behaviors."

Graham et al. (2015) Reported Findings on H2:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In comparison to Transformational and management by exception leadership types, Transactional leadership type will be most effective in leading a virtual team in developing a database management system. Upon data analysis, the study found that H2 was not supported. Transactional Leadership Style achieved a statistically significant and negative relationship with Project Quality (β=-.36).

Graham et al. (2015) Reported Findings on H3:

In comparison to both Transformational and Transactional leadership types, Management-by-Exception leadership type will be most effective in leading a virtual team in developing a database management system. This Laissez-Faire leadership style achieved a statistically significant and negative relationship with Virtual Team Effectiveness (β=-.21).

Additional Findings Reported in 2015

- Leadership style and Virtual Team Effectiveness predict Project Quality (R2 = .25);
- Virtual Team Effectiveness achieves a statistically significant positive relationship with Project Quality (β=.34);
- Leadership style predicts Virtual Team Effectiveness (R2 = .12).

All three leadership styles influence project quality. Transactional Leadership style influenced project quality directly, while Transformational and Management-by-Exception styles influenced project quality indirectly through their direct influence on virtual team effectiveness.

Summary of Graham et al. (2015) Findings

The 2015 findings proposed that leadership type and virtual team effectiveness did predict project quality and virtual team effectiveness. However, the relationship yielded some surprising outcomes such as:

- Transformational leadership had a negative relationship with virtual team effectiveness;
- Transactional leadership has a negative relationship with project quality;
- Management-by-Exception (Laissez-Faire) had a negative relationship with virtual team effectiveness.

Recent Findings on the Topic of Leadership and Virtual Teams

The findings of Graham et al. (2015) study provides a few interesting associations for those leading millennials in the development of database management systems and more generalizable, information systems as a whole, in virtual environments. The first finding that leaders should take away is that the more they assert specific leadership attributes, the quality of the completed system goes down. What does this suggest in terms of leadership in virtual teams? Gilson, Maynard, Jones-Young, and Hakonen (2015) reported that in terms of transformational leadership, leaders that focused on relationships instead of project tasks were "perceived as more intelligent, creative, and original (p.7)." While Graham et al. (2015) study focused on team effectiveness and project quality, the leadership attributes measured did not address relationship building. The research proposed by Gilson et al. may suggest that if transfor-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

mational leaders focused more on relationship building among virtual team members they may create a more positive result on virtual team effectiveness. That research is supported by previous research by Sridhar et al. (2007) that found that virtual teams could be more effective if they had the time to develop better relationships among the virtual team members.

In another recent study, Carlson, Carlson, Hunter, Vaughn, and George (2017) investigated the moderating role of experience with instant messaging on team cohesion and openness had on virtual team effectiveness. Carlson et al. found that team cohesion had a major effect on virtual team effectiveness and that experience with instant messaging had a major effect on team openness; i.e., *this type of communication strengthened relationships among virtual team members*. This research by Carlson et al. (2017) reinforces finding presented here by both Gilson et al. (2015) and Hoegl et al. (2016) that relationship building in virtual teams seems paramount to improving virtual team effectiveness which should result in improved virtual team project quality.

Developing better relationships within virtual teams however will be more difficult for leaders than those leaders who benefit from co-location. For example, Liao (2017) stated that leadership in virtual teams is more challenging than face-to-face teams and building trust, forming shared mental models, and managing conflict will require more effort. Liao pointed out that "while relationship development in traditional teams can be organic and natural, virtual leaders might need to proactively guide the relationship building process, given the reduced richness of social information through computer mediated communication tools (p.649)".

In a more recent study, Hoegl et al. (2016) reported that many virtual teams perform better when leadership is shared. Their findings suggested that virtual team leaders who asserted more of their individual authority often tended to underestimate virtual team member's ability to lead themselves. Hoegl et al. (2016) goes on to state that this underestimation creates an environment in which virtual team members may feel that they do not have sufficient levels of autonomy to complete their specific tasks and that this lack of autonomy contributes to lower quality on the project. This research conducted by Hoegl et al. (2016) appears to reinforce the negative influence leadership styles had on both virtual team effectiveness and virtual team project quality as reported by Graham et al. (2015). Paradoxically, Hoegl et al. (2016) reported that "it is thus team leaders themselves hindering leadership effectiveness in virtual teams. (p.7)."

Hoch and Dulebohn (2017) define shared leadership as "a collective leadership process, whereby multiple team members step up to take the lead or to participate (p.681)." Hoch and Dulebohn (2017) go on to state that shared leadership is a mutual influence process carried out by team members where they lead each other toward the achievement of goals. According to Bell and Kozlowski (2002) and Hoch and Dulebohn (2013) this shared leadership in virtual teams makes sense since most virtual teams are made up of team members who possess skills and abilities that include: collaborative decision-making processes, foster motivation, take responsibility for project outcomes, and can influence and support other team members.

CONCLUSION

The Graham et al. (2015) original study on leaderships impact on the successful completion of database management systems and team effectiveness in virtual environments found that all three leadership styles influence outcomes (project quality). Transactional Leadership style influenced project quality directly,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

while Transformational and Laissez-Faire styles influenced project quality indirectly through their direct influence on Virtual Team Effectiveness. The research literature since 2015 suggests several reasons why this is but really appear to point to traditional styles of leadership as not being effective when leading virtual teams. Some of this is likely the result of the obvious differences between teams that work remotely from one another and teams that are co-located. The research literature in this area has plainly stated that the lack of physical presence in leaders diminishes traditional leadership attribution and that perhaps new approaches to leadership in virtual teams should be investigated more and developed. For example, research in the area of shared leadership approaches within virtual teams makes sense since each member of the team is likely a subject matter expert in their area and would not benefit from managers trying to assert themselves into how something should be done that they themselves are not experts in! Additionally, the research literature on relationship building among virtual team members appears to point towards better outcomes in virtual team projects as well. Intuitively this makes sense as well. We as human beings generally like to know that our leaders, managers, and teammates care about our well-being and have some emotional investment in us. Having a more stable relationship with us appears from the recent literature to lend themselves towards more successful project outcomes. Future research should investigate the relationship between shared leadership and improved relationships between team leaders and team members, improved relationships amongst virtual team members, and the links between them.

Another area of future research could investigate the linkages between improved collaboration technologies that create a greater sense of presence within virtual teams. The use of avatars for example in synchronous environments that allow for the acknowledgement and communication of non-verbal cues and its resultant impact of the quality of completed virtual team projects and or its impact of virtual team effectiveness.

QUESTIONS FOR PROFESSORS TO ASK

1. What are some challenges that virtual teams must overcome to successfully complete assigned tasks?
2. Why does the author of this chapter feel that shared leadership can benefit the performance of virtual teams?
3. Why does the author of this chapter feel that improved relationships among leaders and teammates can improve both the rate of successful virtual team projects and improve virtual team effectiveness?
4. Is the author of the chapter missing something? Beyond concepts related to shared leadership and improved relationships, what else could improve the success rate for successfully completed virtual team projects and improve virtual team effectiveness?

Chapter 83
Critical Thinking of Human Resources in the Goal:
A Research Note

ABSTRACT

Recently, changes within the business industry have led to human resource management (HRM) positions and structures being reconsidered. Human resources (HR) used to be centralized, but the constant changes to organizational culture has caused HR to become decentralized. The HR operations have been incorporated into other departments, as well. Now, HRM is essential to business processes that mirror other departments, such as accounting and finance, but HR is still centralized in specialized areas, such as recruitment and compensation. Examining Goldratt & Cox's "The Goal" reveals its involvement with HRM. This study evaluates the implication of HRM on a business, its relationship to the Theory of Constraints (TOC), and the ways in which these concepts can aid a business in reaching its main objective.

1. INTRODUCTION AND BACKGROUND

The Town of Bearington had been losing major employers. Many companies left to escape the union politics and economic pressures. They also started paying lower wages to make more money. This increased the town's unemployment rates. Also, Uni-Co had some major layoff six months prior, adding to unemployment rates. The impending plant closure meant that there will be layoffs. As a symbol of the town's resurrection and the anchor that unites the company, the plant symbolizes vitality, but Uni-Co is a unionized plant with consistently good union relations and labor. The book did not address any significant complaints or filings of grievances.

Bearington is the hometown of Alex Rogo, a plant manager of Uni-Co. He had been away for many years, and was transferred there six months earlier inheriting the plant in its current state. His boss Bill Peach sees potential for improvement in the plant and believed Alex could turn it around. Alex Rogo came from a different culture. Peach was his manager, open to innovative ideas, and a strong belief that employees must feel good about their work to be productive, but that was when sales and budgets were doing well. With a promotion, the profit in his division's plants are decreasing, so he relies on Rogo to make improvements to save his job. Essentially, Alex is responsible for the plant's failure, and he feels responsible for Uni-Co helping to advance his career.

In the factory, there were no sufficient performances, timely shipments (a warning sign in manufacturing plants) or profits. The root of many of these issues was competition. High quality products cannot be manufactured at a cheap price when competing in aspects like price, deliveries, and product design. However, Uni-Co's technology was a benefit, as it has the best computer systems, machines, and it has the most advanced robots of any other plant. Also, Uni-Co has excellent HR with exceptional employees and an absence of union issues. Uni-Co has great quality and they never ship an item without testing it, but they need money, so they also need to be competitive.

Therefore, this discussion focuses on a critical analysis of the human resource management perspective, based on the decisions made by several figures in the company's management positions. This paper also focuses on the implications and learned lessons from the book regarding effective HR management in global corporations (Schindlholzer et al., 2011). Section 1 presents key background information about The Goal and the major factors in the book. Section 2 presents the key findings of applying human resource management principles to the scenario in The Goal, while section 3 outlines the managerial relevance and implications of the role human resource management plays in any organization. Section 3 also concludes the paper by presenting the limitations and future research of the topic, while also presenting the originality and contribution of this research to different research areas and topics.

2. ANALYSIS AND INSIGHTS

2.1. HRM Role in the Original State of the Performance

HR uses performance standards (for each job position) as a tool to measure employees' performance, set goals, and identify development needs and potential improvements. The same concept can be applied to factory performance. Any organization without performance development and improvement can die. The performance perception is that employees are always working, resulting in company productivity and profitability (Schindlholzer et al., 2011). Measurements were needed to review processes and determine if the company is productive and profitable or not. Traditionally, management reduces capacity to decrease costs and increase profits (Galli, 2018; Nabi et al., 2015; Schindlholzer et al., 2011).

The problem with Uni-Co was that they were just meeting the performance standards and the status quo. That is not an improvement. According to Rogo, measures of productivity and efficiency were up, and costs were down in his plant. This disregarded the overall performance measurements on the divisional level. The only thing that mattered was reducing cost and boosting revenue. However, according to Jonah, those measurements were just a game of numbers and words (Galli, 2017). A realistic evaluation of the factory's progress was not performed nor measured. Moreover, the goal was not understood, so productivity is meaningless unless the goal is known (Kaoud, 2017).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Bob Donovan, the production manager for nine years, is portrayed as a conscientious employee, responsible for controlling labor costs; creating and maintaining employee morale; protecting employee's health and physical conditions; improving job performance, and creating cooperation and smooth working relationships (Schindlholzer et al., 2011). However, at first, just to get things done he suggested putting everyone to work on delayed orders regardless of the rules. He did not think that policies exist for a purpose and have consequences, such as increased costs and decreased efficiencies (Badsi et al., 2017). He assumed that driving productivity would increase the urgency to produce (Galli, 2017; Nabi et al., 2015).

HRM's tools challenge managers and employees in their creativity and capacity to develop plans to address the causes of problems. Moreover, HRM adds value to a company, in this case, Alex's plant, which is considered a profit center, because its techniques are needed to manage issues and to help improve performance, productivity, and profitability by evaluating checking progress regularly (Svejvig & Anderson, 2015). In addition, HRM is related to the management process of planning, organizing, staffing, leading, controlling, and improving performance, as well as formulating and executing policies and practices to produce (employee) performance improvement and effectiveness (Schindlholzer et al., 2011Therefore, a few sacrifices were required to reduce expenses, increase productivity, and to maintain consistent and standard parameters. The problem with the division was that sales and efficiencies were down, costs increased, and the division's cash flow was low (Nabi et al., 2015).

2.2. HRM Principles and Improvement in Operations

According to Jonah, productivity has no meaning if the goal is not known Goldratt & Cox (2016). Therefore, once Alex learned the goal, he started applying HR principles to improve his management style and hopefully performance. He realized that to achieve the goal he must have cost-effective purchases, good employees, high technology, quality products, market share, communication, and customer satisfaction (Svejvig & Anderson, 2015).

Alex managed diversity well. Although the selection of his team was made using halo effects, Alex did not discriminate against age, sex or race. Each overall member's contribution to the plant was reviewed regarding competencies and behaviors that the factory needed to achieve the goal. Alex Rogo and his selected managers (Bob, Stacey, Lou, Ralph Nakamura) worked together to identify and execute a plan to match the plant's capabilities with the demands of its market to reach the goal (Galli, 2017; Tinnilä, 2013). Alex used workforce management to encourage his team's involvement, commitment, and self-management (Svejvig & Anderson, 2015). The team experienced a high level of connectivity to their tasks – this drove performance and productivity, which translated, into sales increase, higher quality, revenue growth, and less expedited orders. He also maintained communication with workers to make them understand how their units contribute to achieving the goal (Svejvig & Anderson, 2015).

The team used evidence-based management to (1) support proposals, decisions, practices, and conclusions and (2) to drive performance, communication, and leadership. They also evaluated the plant using a SWOT (Strengths, Weaknesses, Opportunities, Threats) analysis. Strengths: market leadership, high-quality products, costs advantages. Weaknesses: large inventories, weak market image, lack of management depth. Opportunities: new overseas markets, competitors failing, and diversification. Threats: the threat of closing, low-cost foreign competition, slow market growth, unions (Svejvig & Anderson, 2015). These principles helped improve the operation of the plant and competition by generating more productivity and higher quality products (Badsi et al., 2017). Alex's continuous process to manage operations was:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Define Current Business:** PLANNING
- **What are the Challenges Faced? Weakness and Strengths:** PLANNING
- **Formulate a New Direction:** PLANNING
- **Translate the Mission into the Goal:** PLANNING
- **Formulate Strategies to Achieve the Goal:** PLANNING
- **Implement the Strategies:** EXECUTION
- **Evaluate Performance:** EVALUATION

Moreover, three measurements Jonah gave him and defined – throughput (sell more), inventory (should decrease), and operational expenses (should decrease) – were used as measurements. According to Goldratt & Cox (2016), measurement not defined is worse than useless.

2.3. Stakeholders Role in Improving Operations, Quality and in TOC

A stakeholder is any person with interest in the business (Snyder, 2014). Their involvement level and roles vary, depending on the type of stakeholder: internal or external. HRM describes ways to manage people by staffing, employee compensation, benefits, and defining/designing work with the purpose to maximize the productivity of an organization by optimizing the effectiveness of its employees (Galli, 2017; Tinnilä, 2013). People are considered the most important asset for any company and no business can do without effectively acquiring, motivating, developing, and managing that resource. HR managers are committed to managing the productivity and development of workers whose talents and desires are consistent with the organization's needs and goals (Svejvig & Anderson, 2015).

However, some stakeholders can be categorized as constraints that prevent achievement of the organization's goal. Consequently, stakeholders and TOC can play a decisive role regarding operations and quality of the organization. TOC focuses on identifying and eliminating bottlenecks (constraints) that limit the company's profitability by measuring inventory, throughputs, and operational expenses performance to improve product quality and profit.

- **Company Employees (Internal Stakeholders):** top management set the direction for the company and company's employees to carry out the tasks by working directly with products. Success depended on their skills, knowledge, and dedication to reach profits (Margulis & Galli, 2017; Tinnilä, 2013). Managers motivated employees and improved their efficiency. Improving employee skills and maintaining a positive, productive work environment contributed to improving operations and ability to fill orders on time with the highest quality. The TOC does not highly focus on cutting expenses, but more on boosting sales. Large amounts of idle inventory were turned over and efficiently utilized (Elloumi et al., 2017). Machines with bottlenecks (the weakest link and the constraint), that were preventing better performance, were identified and put to work at its highest potential compared to non-bottleneck machines (Galli, 2017; Margulis & Galli, 2017). The improvements led to a decrease in inventory, an increase in throughput (more productivity and sales) and improved profitability. The order in which quality control was performed was changed, contributing to less waste and rework and ultimately, an increase in quality product (Tinnilä, 2013; Alfes et al., 2013).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Alex Rogo and his team's role were to build competitive advantage by differentiating their product turnaround from those of the competitors thus increasing product quality, market share and profits on a functional level. Alex worked with managers from other departments and used their input to hammer out a plan to accelerate deliveries and improve the quality of the output. He took the advice of Jonah and successfully changed the order in which quality control was performed and achieved not only better quality but also more productivity (Alfes et al., 2013). Alex and his team, with the help of Jonah's advice, figured out how to take care of bottlenecks against non-bottlenecks to boost sales and profitability and to reduce inventory while maintaining on-time deliveries of high-quality products (Schindlholzer et al., 2011). Stakeholders on the organizational level resisted Alex's plant procedures for improving operations and quality because Alex's plant was not following protocol and not in compliance with the mandated laws and procedures of accounting. They only paid attention to productivity improvement with emphasis on cost reduction, which was not emphasized in the TOC (Galli, 2017; Schindlholzer et al., 2011).

- **External Stakeholders:** Rogo's family. His wife Julie was a big influence on decisions that Rogo made at the plant. Julie can also be portrayed as a constraint because of the problems (inventory) that occurred at home that prevented the household from achieving complete happiness (throughput) (Elloumi et al., 2017). Rogo's mother can be portrayed as a non-bottleneck.
- **Customers:** Customer's role is critical to the factory's existence and success. The product has to meet the customer's needs. Customers determine the success or failure of a product or company through feedback. This feedback enables a product to improve its quality and a company to produce more orders if more orders if the customer is satisfied with the product quality and delivery timelines. Customers influenced the demands regarding sales because of delivery delays (Tinnilä, 2013). However, after the application of the TOC, they were pleased, not only with the fact that they were receiving their product by or before the deadlines, but that the product had better quality. This led to a better customer relationship and more sales (Schindlholzer et al., 2011).
- **Vendors:** play a role when companies need supply of raw materials or components. If vendor's activities are interrupted, a major disruption in manufacturing, scheduling and deadlines are the result. Vendors can also be innovative, in that they can offer more efficient and productive items causing the company to offer various products. The more raw materials that were sold to the plant (decreased inventory) not only increased their internal sales and profits, but also the cost of the factory (Agrawal and Sharma, 2014; Schindlholzer et al., 2011). Above noted stakeholders' roles reflected had a major influence in achieving the (plant's) goal.

2.4. How Did (Does) HRM Impact Goldratt & Cox's TOC?

HRM mainly focuses on employee commitment; the human factor and the TOC influenced the plant's decision-making. Organizations are now able to identify employee constraints and adequately apply HR strategies such as training programs and compensation plans to compensate for the constraints (Margulis & Galli, 2017). HRM can influence the TOC in a day-to-day process in manufacturing by enhancing skills, communication, and cooperation (among workers) that help operate in a unified manner to sustain employee development. Development of quality employees increases productivity and efficiency resulting in more sales and profits (Margulis & Galli, 2017; Tinnilä, 2013).

Building a cohesive team by enhancing member participation, commitment, involvement, and leadership skills contribute to satisfactory productivity, motivation, morale, and discipline. Working together

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

towards a common goal decreases constraints and increases the ability to reach the goal much sooner (Baumgartner, 2014). Incorporating a plant's cultural transformation regarding new processes and improvement in the attitudes of the workers helps them become more efficient and oriented towards the goal "to make money" (Felfel et al., 2017).

2.5. How Does "Herbie" (aka the Bottleneck) Impact the Use of HRM

The idea of "Herbie" was brought at the time when Alex went on a boys Scout hiking trip with his son and the troop and became the only boy's scout leader on the hiking trip. This trip became an analogy of Alex and his plant. Alex, the plant manager, and his plant resources were the boys' scouts. As the hike went on, Alex compared and analyzed the hike performance with the plant performance (Tinnilä, 2013). A boy scout represented each machine in the plant, and each is a link (resource) of a chain (organization). Herbie was one of the boys in the troop, and it is impressive how Alex made used the halo effect to describe him and to imply that he was going to be trouble (Baumgartner, 2014; Svejvig & Anderson, 2015). He was the slowest one from the troop (Tinnilä, 2013).

He identified Herbie's performance and determined that he was the limiting factor that prevented the others from reaching their destination within timeframes. The idea of "Herbie" was born and used for constraint analysis. "Herbie is the one who is governing the throughput for the troop as a whole" (Galli, 2017; Goldratt & Cox, 2016, p. 115). The idea of dependent events and statistical fluctuations became clear to Alex. He understood, then, that he had to identify and assess the Herbies at the plant and stop spending time optimizing non-bottlenecks because they will only add to the constraint and hinder achievement of the goal (make money). He used that theory to manage the resources at his plant and identified two bottlenecks (Herbies) at the plant, which were addressed in collaboration with his team (Tinnilä, 2013.). The successful synchronization of the links will satisfy the company's goal. Identifying and assessing the Herbies (the weakest links) helped HR implement new strategies such as training programs, working conditions (example: break time) and, most importantly, performance improvement (Felfel et al., 2017; Galli, 2017; Svejvig & Anderson, 2015).

2.6. What Is the Role of Management and Leadership in HRM?

Leadership is about leading people. Management is about managing tasks or requests resulting in changes in HR policies. Managers work with their employees regularly. Leaders manage the group of managers in the business units. While leaders provoke changes, managers prefer the stability. While the leader gives the vision, the managers (followers) make changes happen. However, initiatives and changes must be supported by HR (Singh & Vyas, 2016; Armstrong & Taylor, 2014).

This excerpt shows the difference between a leader and a manager. "Managers have not yet internalized the conceptual difference in guiding operations to concentrate on improvement throughput rather than concentrating on reducing cost" (Goldratt & Cox, 2016, p. 347). Nowadays, companies need managers with strong competencies, in particular, leadership skills so they can be groomed for higher roles and responsibilities and career advancement. In the case of Alex Rogo, he allocated for career progression based on his skills and capability assessment (Kaoud, 2017; Svejvig & Anderson, 2015). Therefore, HRM plays a vital role throughout the employee lifecycle regarding skill development and profitability (Armstrong & Taylor, 2014).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Alex is a leader (a coaching type of leader), and his team is managers. Alex innovates, inspires trust, motivates, asks, explains, and gives direction. He was a significant contributor to the cultural change in his plant that affected day-to-day activities and changed perceptions of employees. On the other hand, a manager administers, relies and controls short-term views, asks (how and when), and executes (Singh & Vyas, 2016). Managers, especially Ralph Nakamura, were inspired and motivated by the Theory Y. According to this theory, people like to work and are motivated by a greater responsibility and engagement in problem-solving. They take pride in a job well done. Thru motivation based on improvements, Alex gets better outcomes, more accountability, and more efficient use of resources (waste and defect reduction). This helped in job amplification and enrichment to boost productivity (Storey, 2014).

Leading change: that journey required lots of communication and associations with history, current status, and who is to be impacted by the change (Tinnilä, 2013). CHANGE= MOTIVATION * VISION * NEXT STEPS. Alex's vision included building a long-term competitive position in the marketplace. The motivation was there, and his team progressively learned his vision. The steps to take next, to progress toward the vision, had to be explained, as they each will fit into that vision. The team was able to adapt to changing needs. Changes were done in small parts and measured accordingly to keep interest and motivation, and to unfold self-learning using problems as precursors to come up with solutions. Changes are good, but they caused stress in Alex's life not only at work and but at home (Kaoud, 2017; Singh & Vyas, 2016; Storey, 2014).

2.7. How Does a Bottleneck Impact HRM?

Bottlenecks limit the ability to improve throughput. Bottlenecks can be a capacity constraint, market constraint, physical constraint, policy constraint, behavioral constraint, and so forth. For example, "no overtime" policy is a constraint put upon the company (system) (Gera et al., 2017). Physical constraints are resources, which can be a machine or a person, whose capacity is less than the demand placed on them (Tinnilä, 2013). So how do we identify the constraint to control the flow of a product? In applying the TOC, companies can control the pace of the system, so an hour gained by the physical constraint is an hour gained for the entire organization (Kaoud, 2017). If the concept is applied on non-bottlenecks, then the concept has no impact. Rogo and his team discovered that some machines represented the bottlenecks, and, through the process of on-going improvement, they evaluated the capacity of the machines, the machinists, and the inputs and output of inventory to improve the performance of that bottleneck (Soderlund & Bakker, 2014).

2.8. Relationship Between Technology and HR

Technology has changed the business world because most of businesses cannot function without the use of technology, including HR. Technology has made recruiting and training new staff members (locally or remotely) more efficient and effective. Moreover, the use of technology has assisted HR with practically an elimination of paperwork (Agrawal and Sharma, 2014). Storing it and retrieving files has been very efficient and it is easy to reproduce and available on-demand. Employee performance assessment and company measurements have been used for the betterment of the organization (Singh & Vyas, 2016; Gera et al., 2017).

However, technology alone does not generate improvement and cannot set its own pace. Technology is dependent on another area. The idea of dependent events from the TOC is re-introduced, where

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

technology can be the bottleneck and HR the area that feeds it. The idea of garbage in garbage out comes to mind (Gera et al., 2017). The results of technology can be as good as the input and are useful in providing projections, improved employee (Kaoud, 2017). Technological changes affect the nature of jobs, but robots create precision. Alex was not sure of the effect of robots on throughput (without applying the TOC) because not only did inventory increase, but robots increase depreciation (new equipment), operational expense, and efficiencies. Technology, along with HR, plays an essential role in any organization because a bottleneck can be easily highlighted with the use of software (Kaoud, 2017). Thus, companies can act proactively, and improvements can be implemented, thereby increasing performance and revenue (Singh & Vyas, 2016; Soderlund & Bakker, 2014).

2.9. HRM Role in Quality

HRM provides training, employee empowerment, team-based reward systems, and communication of workers' role in quality. The concepts of TQM applied to HRM can have positive results, generating good product quality and organizational growth (Gera et al., 2017).

The need for quality improvement allows HR to contribute to the bottom-line and to add value to the products like other departments (production, accounting, and marketing) add value. It brings senior managers and HR executives together to involve and empower them in the decision-making and problem-solving of how to provide training, reduce error and mistakes, and provide quality products (Galli et al., 2017; Gera et al., 2017). This empowerment is achieved through training and, not only requires skills, but makes executives responsible and accountable for accomplishing the task. This task, if successful, accomplishes high quality, customer satisfaction, and ultimately profits. Therefore, HRM impacts quality products by having employee involvement and commitment (Gera et al., 2017). HR, with the help of technology, record metrics related to activities required to achieve the goal, quantify them later, and measure them to get performance results. Prioritization of improvement activities is the goal to reach to increase quality and profits, which help with getting fast improvements, better capacity, and less inventory (Singh & Vyas, 2016; Nabi et al., 2015).

3. CONCLUSION

3.1. Relevance anf Implications for Management and Project Environments

Based on the acquired skills and management strategies from the research, there is a need to utilize human resources in conducting business projects and in project management. This can be achieved by ensuring well-functioning human resources, where distinct skills are combined to create a team that envisions and realizes the company's or project's ultimate goals. In this case, there is a need to invest substantially in human resources before thinking of the mode of technology to use in the project or management (Galli et al., 2017; Soderlund & Bakker, 2014). The findings from this research study of *The Goal* helps to identify several managerial implications. More specifically, these results highlight the importance of a top-down and bottom-up approach to leadership and strategic planning, especially with regards to elements of operations management and process improvement. The results of this study highlight the criticality of integrating human resource principles into the leadership styles and tools used by leaders to manage their human resources (Margulis & Galli, 2017).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The findings from this study also highlight the importance of human resources throughout all aspects of an organization; obviously HRM is one element in an organization's business model, but this study shows that the human resource element directly impacts many other elements of an organization. Management and leadership of any organization need to have the training and skill sets to, not only manage their human resources, but to effectively do so. This study has shown that many of the current-state issues seen within the factory of *The Goal* stemmed from the leadership's lack of effectively leading and managing their employees. If the leadership is equipped with the tools and knowledge to effectively manage their human resources instead of focusing on the bottom line (i.e. profits and costs), then the performance of an organization will improve and, as a result, the profits and costs will also improve. Highlighted in this study is that business leaders tend to focus mainly on the financial elements of their business, at the expense of ignoring or minimizing the human resource element (Galli et al., 2017; Gupta & Boyd, 2008). This might work in the short term, but the factory in *The Goal* shows that it is not a good long-term strategy. Over the long term, leadership must have a multi-faceted approach where they manage operations, human resources, financials, performance, and strategy from one overarching understanding that all of these elements are critical and they are all related. By understanding this view, a business leader will be better equipped to lead a successful company in both the short term and long term.

3.2. Contributions to the Literature

Many researchers agree that organizations have a high likelihood of improving their business profitability when they promote and implement TOC. The companies' human resources through strategies of continual improvement develop TOC. However, it would be advisable for companies to follow the five steps of the thinking process of TOC. Based on the analysis of *The Goal*, much can be derived about the need for proper management skills that boost the company's production and profitability. Good management should be based on the fact that, for a company to achieve the ultimate goal of profit maximization, there is a need for well-established coordination that ensures both the human capital and technology are adequately used. Human capital should be nurtured to foster performance at the most efficient and optimal levels. There is also the need to ensure the company produces the product that will create and maintain customer loyalty. In this case, the quality of the product must be taken into consideration throughout all processes and decision-making. This quality can only be ensured through standards set by the human resource and proper planning on the step-by-step strategies to be employed. The book, therefore, demonstrates the management techniques that engage the human resource in achieving the goals of a company.

Review of the literature shows that there is limited research that explored the concepts and their relationships. Therefore, this study sought to further analyze these concepts and the relationships between them in general. In an effort to fill a void in the research identified earlier on this study and alleviate previously preconceived risks and uncertainty. The results of this research study contribute to several different fields of research and topics, including: human resource management, theory of constraints, project management, and process improvement. By performing this study, the results help to enhance and evolve these fields of research and topics since this study, not only built on existing research, but attempted to expand and fill a gap in the research that was identified earlier on this study. By more thoroughly understanding these concepts and their relationships, we can understand their advantages and disadvantages, which in turn should help improve their effectiveness.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

This study also contributes, since it introduces new ideas and avenues for future research in each of these fields of research and topics. This study not only sought to explore different concepts and their relationships, but it also sought to understand the relationships and identify new ways of thinking about the variables under study. The results of this study were also valuable from a practitioner perspective, since the understanding of these variables and relationships helped to introduce ideas and strategies that a practitioner can deploy to be more effective in their profession. The results from this study help a practitioner to understand the relationships and variables but also the implications related to these variables and relationships.

3.3. Limitations

Some research limitations restrict the study and results. Mainly, there was a limited sample size of only one book that only focused on this sample's key factors. Such a small sample size leaves the validity and conclusions open to bias and validity. To avoid this, a larger sample size is necessary. Additionally, the research only studied the relationship in reference to project environment between key factors. As a result, the conclusions and analyses can only be applied to project environments, but the findings cannot be applied to other areas (strategic management, operations management, etc.). Seeing as the conclusions and analyses are only applicable to these factors, one cannot confidently say that the findings can be used for other managerial settings or businesses.

3.4. Recommendations for Future Research

This report finds that the implementation of HRM strategies such as training, recruitment, and safety programs build effective teamwork. Performance appraisal may also improve the performance of businesses because employees can feel more motivated and engaged with the company. As a result, the company's profit can increase, which is the main goal of every company. After all, "The company exists to make money" (Goldratt & Cox, 2016, p. 46) as it is described in *The Goal*.

This paper recommends companies to follow the five steps of thinking of TOC. They are: (1) identification of constraints, (2) address and fix the constraints, (3) prioritize management of the constraints, (4) prevent its occurrence, and (5) be prepared for the next bottlenecks and go back to step one to repeat the process. This process will support companies in improving their performance and profitability. Also, the author strongly recommends for future researchers to include more strategies from Goldratt's other book *The Theory of Constraints.* This book can expand the viewpoint of HRM as an integral part of companies (Gera et al., 2017).

Future research should explore a few different arenas. For example, future research could investigate the HRM-TOC relationship, but in the context of other industries and managerial settings. In these settings or contexts, it would be interesting to study the strength of these variables and the relationship, as well as the factors that impact them. Another avenue of research could be to explore these strategies and their relationship from different perspectives, such as an organizational, strategic, or cultural point of view. This would shed further light into the how this relationship is perceived across many different views and further understand the depth of the impact that factors such as culture, strategy, human resources, operations have on the key variables and their relationship (Gera et al., 2017).

Chapter 84
Impediments in Healthcare Digital Transformation

Robert Furda
Department of Information Systems, Faculty of Management, Comenius University, Bratislava, Slovakia

Michal Gregus
Department of Information Systems, Faculty of Management, Comenius University, Bratislava, Slovakia

ABSTRACT

This article is addressing the specific impediments that appear in the process of healthcare digital transformation. Enterprise architecture provides the framework for investigating the behavioral and active structural aspects that apply to business and application layers. This includes an analysis of, including inherent relationship between, selected scopes such as strategy, business, and education to standard elements such as process, service, and function of an application. The presented classification and assignment of individual impediments indicate to healthcare managers where they may potentially struggle during different stages of digital transformation. Among others, they facilitate strategic planning and managerial decisions during implementation of the emerging information technologies and techniques. In addition, the idea is to contribute to the successful implementation of healthcare digital transformation, thereby delivering business value within healthcare sector, and consequently to a better quality of life.

INTRODUCTION

Healthcare digital transformation (HDT) was already widespread globally. Within this context this article focuses on business dimension in continuous optimization across processes and the entire business ecosystem that embraces the managerial view as well. This affects not only the conjunctions of Information Systems (ISs), emerging information technologies (IT) and techniques, and other resources in processing of massive amounts of health information. To facilitate further developments in HDT the authors addressed the impediments that include challenges and gaps. The Open Group Enterprise architecture

standards comprise the TOGAF and/or ArchiMate frameworks for investigating the behavioral, and active structural, aspects that apply to business and application layers (The Open Group, 2014, 2017). This includes an analysis of, including inherent relationship between, selected scopes such as strategy, business and education to standard elements such as process, service, and function of an application. The classification and assignment of individual impediments indicate to healthcare managers where they may potentially struggle during different stages of HDT. Among others, the findings facilitate strategic planning and managerial decisions during implementation of modern IT, emerging techniques, and developments of supportive ISs.

BACKGROUND

The business processes during digital transformation have increasingly significant impact on organizations' operations where ISs play strategic role. Within context of business and IT Arvidsson et al. described three critical dimensions (Figure 1) to consider successful implementation of IS strategy (Arvidsson, Holmström, & Lyytinen, 2014). In healthcare, the proper adoption, and effective use, of strategic IS can be the key component of business strategy within HDT in achieving a competitive advantage in patient's care (Bharadwaj, El Sawy, Pavlou, & Venkatraman, 2013; Chesney, 2003).

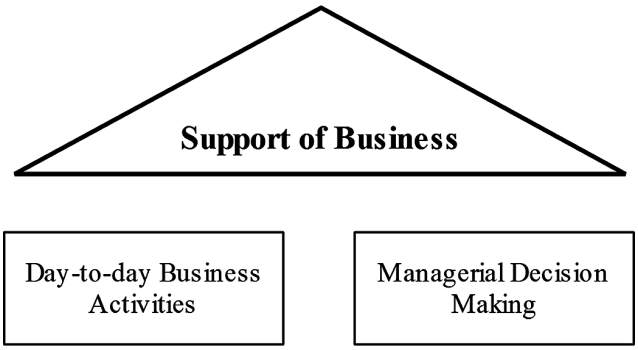

Figure 1. Three critical dimensions within IS strategy implementation [source: (Arvidsson et al., 2014)].

In providing the real-time decision support during process of digital transformation the businesses should rely on business ISs. In healthcare the composites of many applications, functions, technology, and people (both developing and using) include Electronic Health Record (EHR) in order to ensure clinical, and financial, information functions (HIMSS Enterprise Information Systems Steering Committee, 2007; Møller, 2006). The business ISs (Figure 2) on one side support an organization's day-to-day business activities and on other side they support managerial decision making (Hardcastle, 2011).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Two fundamental roles of business ISs

Healthcare management has been challenged by decades of institutional reforms and, more recently, by the emergence of new forms of patient–doctor relationships. This is often struggled with cost and proper information deficiency. However, healthcare management is responsible and should boost own competitiveness in improving the healthcare. To achieve strategic business goals in that dimension it should either increase a competitive advantage or decrease a competitive disadvantage. The strategic and business ISs can become the valid facilitators in achieving the strategic business goals, including proper enablement of organizational transformation (Besson & Rowe, 2012; Chesney, 2003; Tran & Voyer, 2015; Wang, Kung, & Byrd, 2018).

MATERIAL AND METHODS

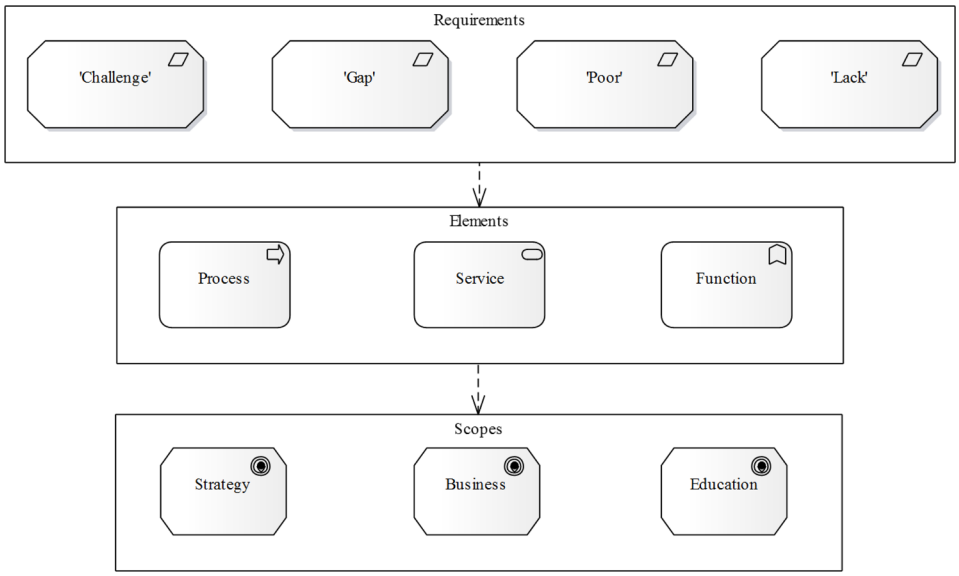
The production of new knowledge by designing the innovative artifacts, by improving and understanding the behavior of ISs can be facilitated with Design Science Research (DSR) methodology (Peffers, Tuunanen, Rothenberger, & Chatterjee, 2007). In previous research the authors focused on HDT and its conjunction with modern technologies such as Big Data and analytics (Furda & Gregus, 2017). The corpus of the previous research served to pull out various impediments, for example, challenges, gaps, and others. The pulled out list of impediments the authors sorted to groups that are result of classification and assignment of individual impediments. This included an analysis of, including inherent relationship between, selected scopes such as strategy, business and education to standard elements such as process, service, and function of an application. (Figure 3).

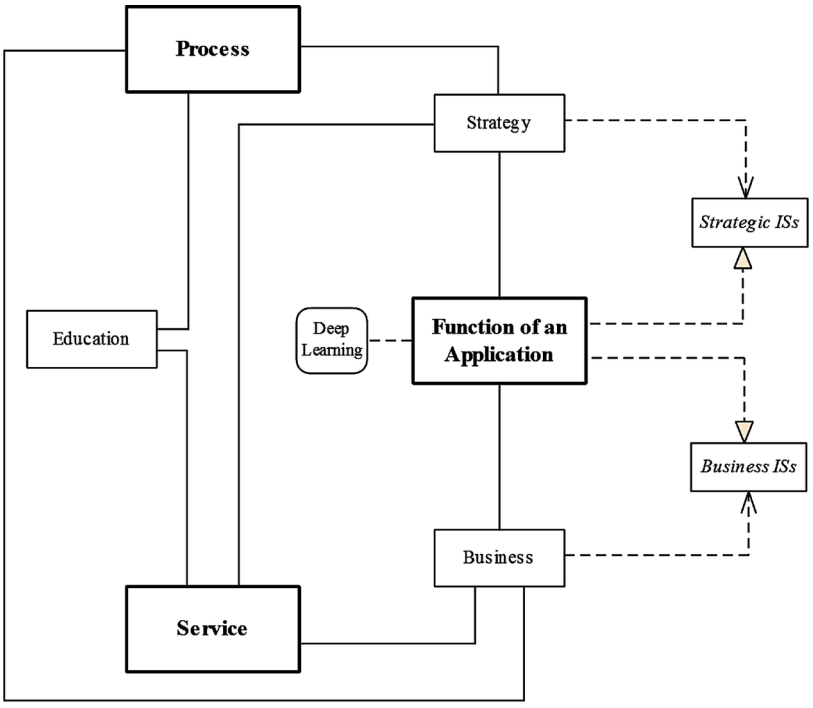
RESULTS

The result of analysis was interconnection between selected scopes, standard elements, and supportive ISs (Figure 4). There is shown that the education scope does not have direct relationship to the function of an application element. However, if artificial intelligence (AI) capabilities were included in the education scope, for example, the deep learning in using a layered structure of algorithms, called artificial neural networks, then the relationship between the function of an application element and the education scope can be substantiated. The function of an application element contributes to developments of strategic ISs (strategy scope), and to developments of business ISs (business scope) as well.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. DSR flow





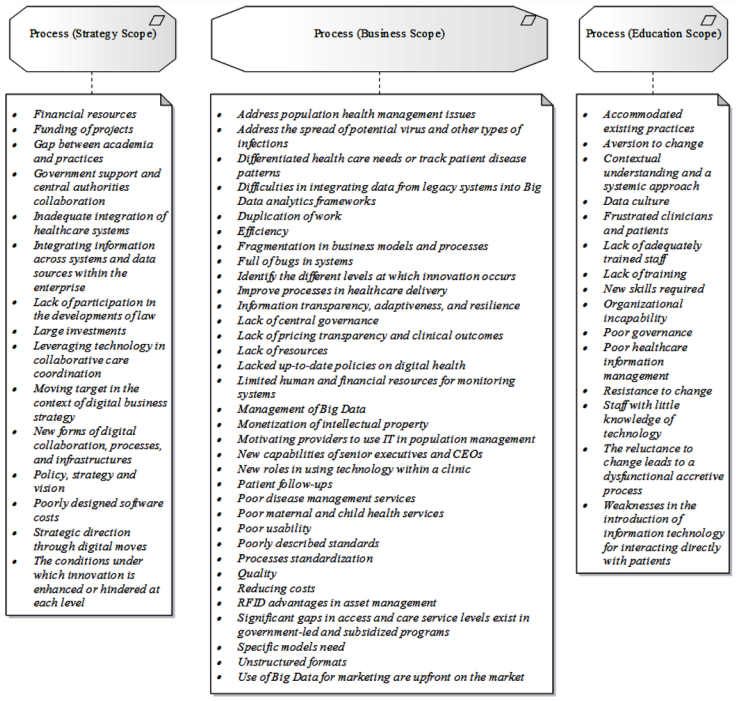


Figure 4. Schematic map of relationships between the researched elements, scopes, and ISs

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

From the corpus the authors pulled out altogether 114 impediments that were finally classified and assigned to eight groups. The process, and also the service, element contains three groups (Figure 5, 6). The function of an application element contains only two groups (Figure 7). This element has, as mentioned above, limitations with relationship to education scope.

Figure 5. List of impediments falling within process element to the scopes of strategy, service, and education

Evaluations and Findings

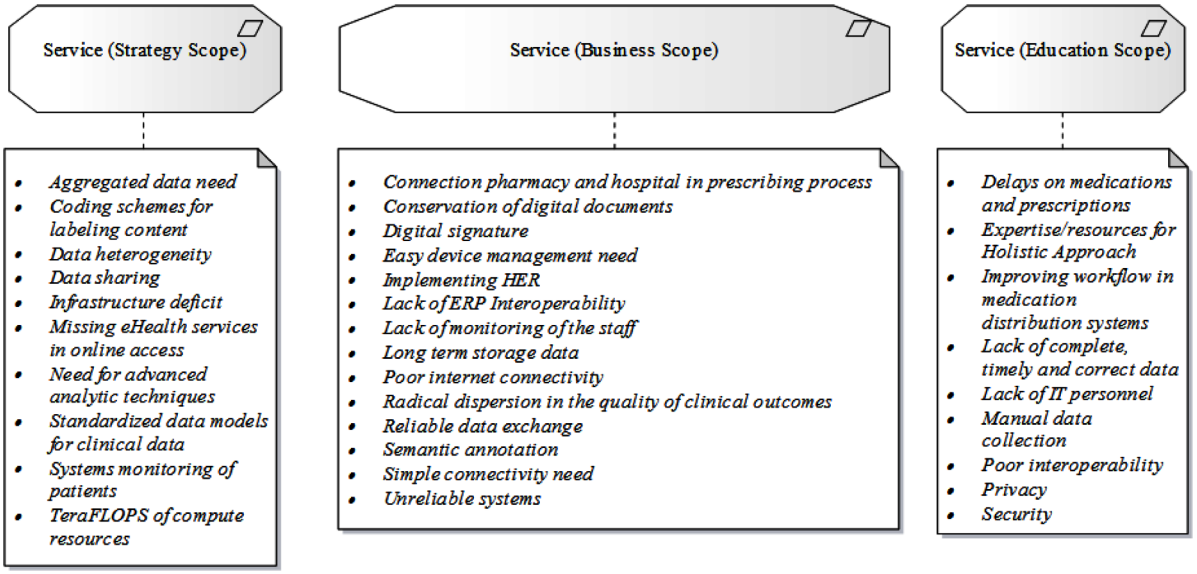
Process Element

In the three groups of process element, 64 (56%) impediments were classified and assigned: the strategy scope group with 15 (13%) impediments, the business scope group with 34 (30%) impediments, and the education scope group with 15 (13%) impediments.

Strategy Scope Group

The financials are significant factor that cannot miss in strategic planning. The role of government is important factor in support process of HDT - from country perspective and including visions, laws, and governance. The central point of decision must ensure the conditions, extension of collaboration, leading integration, and others, that the proper policy can be guaranteed from the government or healthcare institution management.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use



Business Scope Group

The significant need for various business services at operational level of healthcare institution/company is presented. The importance of healthcare management is shown in activities of perpetual innovation, monitoring, and motivation of the people, that are strongly involved in healthcare business processes. The role and tasks of healthcare management should be oriented to the de-duplication, efficiency, integration of legacy healthcare ISs, optimizing services, keeping adequate IT resources, standardization, the Big Data management, and manage costs through the entire healthcare organization.

Education Scope Group

The innovation in HDT brings huge demands in investments to people. It should cover not only the perpetual healthcare staff education but also their perpetual motivation and trainings. It is the role of management to suppress the natural reluctance, frustration, and resistance to change. Often physicians understand the HDT activities as a hindrance in their daily work.

Figure 6. List of impediments falling within service element to the scopes of strategy, service, and education

Service Element

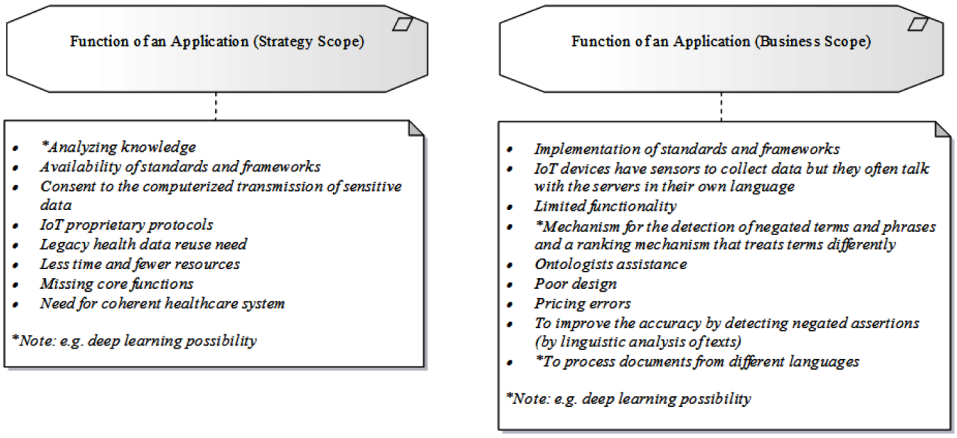
In the three groups of service element, 33 (29%) impediments were classified and assigned: the strategy scope group with 10 (9%) impediments, the business scope group with 14 (12%) impediments, and the education scope group with 9 (8%) impediments.

Strategy Scope Group

The strategy planning of new services should ensure the planning of investments into new services to cover standardization, interoperability, enhanced monitoring, and perpetual infrastructure modernization.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Because of constant complexity grooving this should ensure deployment of modern technologies such as Big Data analysis and advanced analytics techniques, new standards deployment, extended monitoring of patients, and planning for new compute resources.



Business Scope Group

The healthcare management should ensure the daily healthcare operations are working with reliable ISs, enough storage, permanent availability of proper information about the patients, treatment and drugs, uninterruptible connectivity with monitoring, and recovery capability that are available 24/7.

Education Scope Group

In the healthcare the medical education is crucial factor. The management in healthcare should not forget to incorporate also IT based education for medical staff. The expected outcome of this activity can avoid mistakes or errors while healthcare staff is using an IT for patients' data collection. Often the lack of IT personnel moves more responsibility and work to medical staff. So its awareness in the area of patients' data privacy and IT security in process of HDT should be regularly complemented by education about current and newly prepared IT healthcare services. It is the role of healthcare management to continually monitor the education status in its healthcare organizations that the medical staff is trained and has the latest knowledge.

Figure 7. List of impediments falling within function of an application element to the scopes of strategy, service, and education

Function of an Application Element

In the two groups of service element, 17 (15%) impediments were classified and assigned: the strategy scope group with 8 (7%) impediments, and the business scope group with 9 (8%) impediments.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Strategy Scope Group

In HDT process the modern technologies need constant attention. In connection with that the strategic planning should consider what is or can be the suitable to deploy in future healthcare ISs. The vendors of IoT (Internet of Things) use proprietary protocols so the transmission of the sensitive patients' data should calculate with additional investments. The healthcare management should ensure in strategy planning the interoperability, to reuse of legacy health data, and processes optimization due to the less time and fewer resources. The strategic ISs could reuse the previous analysis based on Big Data collected in healthcare systems. As mentioned above, although the traditional education is not bounded with function of an application element the education via adopting AI technologies is already making its way forward with real results in healthcare area.

Business Scope Group

In HDT is often missing the implementation of standards and frameworks, the functionality of ISs is limited, modern IoT devices use proprietary protocols, and the natural language processing needs assistance from ontologists. The speed in HDT often causes the deployment of ISs with poor design, not enough tested applications that cause the pricing errors. The healthcare business ISs should incorporate the education role via AI technologies such as natural language understanding, sentiment analysis, machine learning, and others, in computing environment. This leads to enhancing the existing function of an application element, for example, in detection of negated terms and phrases, ranking mechanisms, in processing and understanding documents from different languages.

DISCUSSION

Planning

Healthcare is a crucial and growing sector of the world's economies. This industry needs to ensure better quality of healthcare, and to bring value for money, because billions of dollars are spent on improving healthcare ISs. Fundamental changes in health care financing and delivery have resulted in an unprecedented need for data and information. To achieve the goals and objectives in healthcare organizations, to make informed decisions, the strategic ISs in planning are needed. The strategic planning process is critical within healthcare reform to develop strategic plans for three-to-five years. It is because of the new technology with personnel issues in industry are becoming more and more common (Drewniak, 2010; Lee, Ghapanchi, Talaei-Khoei, & Ray, 2015).

Decision Making

The quality of strategic decisions, though, is dependent upon the quality of the data that is delivered by the various ISs deployed for healthcare delivery and management. There are questions about healthcare data quality how to measure and control data quality in strategic ISs used for decision making. Most healthcare organizations frequently struggle with cost for data storage. The rapid changes of technology reveal Big Data issues that lead to increase in data-intensive operations. Thus the healthcare organizations need strategically resolve new challenges related to data storage, analysis, backup, recovery, interoper-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ability, and others. The decision making processes in healthcare need to access different formats of data, including the 3D printed models, by using innovative solutions, for example, where traditional storage servers do not cover new requirements. The services of cloud computing could offer powerful and timely processing and analyzing computing for healthcare, including the advantage of Big Data analytics. The data from legacy systems in most healthcare organizations meets issues in integrating with new Big Data analytics frameworks. The known challenge of IT adoption lag in the healthcare, in comparison with other sectors, requires pragmatic analysis of Big Data analytics. This needs to enable the transformation of analytical and decision support capabilities (Bean, 1994; Furdova, Furdova, Sramka, Furda, & Kralik, 2018; Furdova, Sramka, Thurzo, & Furdova, 2017; Wang et al., 2018).

Big Data Impact

The HDT seems to concentrate on data such as the trend toward Big Data. There large amounts of data are made available through the Internet and analyzable in the cloud. This kind of digital data itself represents a model of the world that it describes. Most of the data collected explicitly describe artifacts of the real world, often in a raw and unstructured format. With a growing amount of diverse and unstructured data, there is an urgent need for advanced analytic techniques such as deep learning that allows computers to detect items of interest in large quantities of unstructured data and to deduce relationships without needing specific models or programming instructions. To generate any IT business value the three core dimensions must be linked: process, IT, and people. Many business cases demonstrate that Big Data analytics could be an effective IT artifact in creating IT capabilities and business benefits. The healthcare organizations can leverage Big Data analytics as a means to create business value for healthcare. Five strategies that healthcare organizations could use to implement their big data analytics initiatives are: implementing (Big) data governance, developing information sharing culture, training key personnel to use Big Data analytics, incorporating cloud computing into the organization's Big Data analytics, and generating new business ideas from Big Data analytics. (Gray & Rumpe, 2015; Wang et al., 2018)

Realizing personalized medicine for every patient around the world would result in Big Data challenges of unprecedented scale. Large investments in computing and storage facilities are required. All stakeholders, including patients, doctors, nurses, insurers, lawmakers and the public, need to get involved, educated and trained. Cloud computing systems offer during digital transformation in healthcare sector a solution for the Big Data challenge by accommodating flexible storage resources, by facilitating the process of sharing healthcare data between providers, and by accessing Big Data sets via broad network from managed resource pooling. Big Data applications expect in the seamless health data sharing. The availability of frameworks and standards are increasing the impact of Big Data applications, especially if the acquiring of data is accessible from various data sources that can be combined to gain new insights. This combination of administrative, financial, and clinical data, used by Big Data technologies, can improve the efficiency and quality of healthcare delivery. It is important for clinicians to get data from registries, for example, oncology registries. New websites were developed for researchers to examine the descriptive oncology data produced by the population-based oncology registries. The modeling approach generally provides reasonable estimation of prevalence of oncological diseases. These estimates can be useful because that are more representative than previously obtained and reported. Analyses can be used in many types of oncological diseases such as carcinoma or melanoma. The EHR has the potential to become the central digital fingerprint of a patient and it will be the basis for optimal personalized treatment decisions. It could provide valuable information for a learning healthcare system. Completeness

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and accuracy of information is a precondition that interventional causal conclusions can be derived. A tight and timely integration of EHR information, for example, real-world data, can ensure that newest findings can immediately be transported into clinical practice (Furdova & Lukacko, 2017; Furdova, Olah, Svetlosakova, & Kusenda, 2012; Gu, Li, Li, & Liang, 2017; Tresp et al., 2016; Zillner et al., 2014).

Data Normalization

The challenges fall into two main categories: fiscal/policy and technology. Fiscal and policy issues cover a fee-for-service environment where healthcare practitioners get paid is to have face-to-face encounters with patients. This creates heavy bias against promoting technologies that streamline non-face-to-face interactions. The existing state of health data, created by legacy EHR systems, is the technical barrier to achieving vision. Health data is often largely fragmented into institution-centered silos. More and more people in the health information exchange arena are seeing that the next generation of health technology is around aggregating data but not simply exchanging copies of individual records (the traditional query-response approach). Not only collecting the data from many different sources but also normalizing it into a consistent structure can resolve that the data around unique patient identifiers as well as unique provider identifiers could lead to status "the data become truly useful". The healthcare delivery at the Micro Health Centers can be monitored through cloud computing, thereby providing highly efficient and quality healthcare. Centralized and normalized health records will further aid in provisioning of health insurance to the masses. Thus it can dramatically increase the reach of healthcare and bridge the gap in healthcare. Clinicians expect the EHR applications can store and retrieve information of one or more patients by including multimedia content. Although the use of cloud computing the enterprise ISs lack the capability to integrate images and multimedia data as a component of the data sourced of EHR applications (Bhattacharya, Ghosh, & Nanda, 2012; Dimitrov, 2016; Li, Li, & Shih, 2014).

Time and Resources

If anybody asks any doctors about the biggest challenges facing them today they are likely to say that they are under constant pressure to do more, with less time, and with fewer resources. They need help. IT is coming to aid in many different ways, making the health tech industry a hotbed of growth and innovation. EHRs may be an effective answer to the concerns when patients and/or doctors fail to remember their own (or their patient's) case history. Moreover, EHRs have the potential to easily overcome language gaps. The journey of continuous healthcare system reform is at a turning point. Also it is faced with contrasting elements. On the one hand an effective EHRs management could satisfy new needs in healthcare services, but on the other hand the pressure to reduce costs might undermine the very effectiveness of its functionality. It is possible, at least partly, to face the current and future challenges of national, and transnational, healthcare systems by expanding the reach of modern IT. However the most common barriers in implementation are the lack of funds, the risk of a malfunction in the system, the resistance to change, and the lack of training and proper information (Bonis, 2016; Comandé, Nocco, & Peigné, 2015; Pędziński et al., 2013).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

E-Health

The development of a national e-health strategy aims, at the digitalization of patient records, to enable better connectivity among health care professionals, and to improve value of healthcare delivery and overall care given to patients. In addition, the e-health strategy aims to completely digitalize all in country health records to facilitate the spread of specialist knowledge. An example, where the strategic information is fundamental, is the formulation and delivery of effective HIV (Human Immunodeficiency Virus) programs. But generating that information is a complex process. For example, most countries in south and south-east Asia lack capacity and supporting structures. Although these countries have made tremendous strides in collecting relevant data, advances in the ability, to translate that data into strategic information and evidence for action, have not kept pace. Capacity building of the national HIV strategic information system is a core component of the response to the HIV epidemic because it enables understanding of the evolving nature of the epidemic. It is critical for program planning and identification of the gaps and deficiencies in HIV programs (AlShammery & others, 2015; Azim, Saidel, & Brown, 2010; Bozicevic, Handanagic, Cakalo, Rinder Stengaard, & Rutherford, 2017).

IoT

The IT is a key component of healthcare strategy in HDT process that can facilitate the HDT. The healthcare management is expecting better patient management, enhanced service quality, improved operational efficiency, and enhanced patient care. All this can be achieved in deployment of new technologies and concepts such as IoT. These new technologies brought challenges in implementing. Many devices often talk with the server in their own language and devices by different makers can't necessarily speak with each other (Dimitrov, 2016; Wamba & Ngai, 2013).

New Skills

The IT products and services offered in digital age can lead to questions that are concerning to their development, implementation, or deployment. HDT process brought the need to perform further management tasks that often require new skills. The motivational interviewing, goal setting, and coaching support are often not core skills in healthcare trainings, but the traditional model of education is still mainly focused on diseases (Hart & Eastman, 2016; Leimeister, Österle, & Alter, 2014).

The agenda of HDT is becoming more and more familiar with local politics and the strategic direction of international organizations. The missing contextual understanding and system approaches to deploy successful digital solutions and to avoid incorrect project funding need to be addressed in process of HDT. Perpetual education and consequent intellectual efforts are needed to highlight the importance of a long-term, systematic approach to addressing persistent inefficiencies in expanding the transformation potential of IT in healthcare. The new skills and knowledge can help to resolve one of the major challenges faced by hospitals. They face with long delays in prescription. Benefits in identifying delays in drug distribution systems and further preventing drug mistakes could be achieved by implementing the modern IT and techniques in the process of HDT (Bara-Slupski, 2016; Ker, Wang, Hajli, Song, & Ker, 2014; Leimeister et al., 2014).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In strategic direction should be intendant to encourage students, researchers and collaborators considering a foray into IT education and research area. There is still demand for experts from Data Science and Big Data Analytics, and demand for solutions in Data Science for different business areas such as strategic decisions, marketing, sales, logistics, and others. IT education needs to eliminate the lack of understanding about digital transformation of primarily physical industries whose products cannot be completely digitized, for example, automotive industry. In addition to the internal challenges associated with HDT in the organization such as leadership, deployment of users, design and development of technologies there are several external challenges that need to be addressed through education and research. These challenges include patients' expectations in a mobile and technically healthy population about the desire to manage their own health. Demographic changes with an increasing number of patients entering the healthcare market with little or no maturity on how to efficiently use IT healthcare to promote prevention and adherence to medication after exclusion, evolving government mandates. That will continue to be regulated through sanctions and incentives. The adaptation of IT delays can be attributed to two specific knowledge gaps: (1) behavioral (organizational) focus: poor understanding of how IT systems can provide patient care value to healthcare professionals, and (2) insufficient understanding of the complex care environment that IT systems must operate and which provide value to those who build these systems (Hanelt, Piccinini, Gregory, Hildebrandt, & Kolbe, 2015; Khuntia, Karimi, Tanniru, & Meyers, 2014; Molnar, Molnar, & Gregus, 2017).

CONCLUSION

In this article, authors investigated the specific HDT impediments such as challenges, gaps, and others. The authors used Enterprise Architecture framework for investigating the behavioral and active structural aspects that apply to business and application layers. They analyzed of, including inherent relationship between, selected scopes such as strategy, business and education to standard elements such as process, service, and function of an application. The collected and presented information can facilitate and optimize the managerial activities in process of HDT. The healthcare managers can apply the collected information in gathering, processing, and reuse the healthcare data. Within process of HDT the development and further research of strategic and business ISs can benefit as well. Among others the provided results can help in minimizing negative impacts of modern IT deployment and in optimizing of HDT strategy and business models.

Chapter 85
Domestication of Telecentres by Malawian Rural Women

Sellina Khumbo Kapondera
Mzuzu University, Mzuzu, Malawi & Royal Holloway University of London, London, UK

Wallace Chigona
Department of Information Systems, University of Cape Town, Cape Town, South Africa

ABSTRACT

The potential of telecentres to bridge the digital divide can only be realised when their services are appropriated by all groups in the community. Previous studies show that in Malawi only a few women use telecentres. This article used Domestication Theory to explain the processes through which women in rural Malawi encounter technologies, deal with them and integrate them into their lives. Data was obtained via interviews with women (both users and non-users) and a Telecentre Manager. The study shows that: i) commodification was influenced mainly by word of mouth; ii) the women who appropriated the Telecentre used it for instrumental and hedonic purposes; iii) the appropriation was influenced by convenience, compatibility with the needs of women and perceived usefulness of the Telecentre; and iv) non-use was due to lack of awareness, illiteracy, limited financial resources, cultural roles and perceptions about the telecentres. The findings could help policymakers in maximising use of telecentres among women.

INTRODUCTION

Access and use of Information and Communication Technologies (ICTs) have the potential to develop communities (Chisango, 2014). For instance, ICTs improve skills, enhance social life and offer economic opportunities (Chikumba, 2011). Despite the benefits of using ICTs, access to these ICTs is low in Malawi. In 2014, of the total 16 million people, only 5,590 people were broadband internet subscribers, while 6,487,304 were mobile phone subscribers (Nyirenda, 2014). As such, over the past two decades, just as in many developing countries, the government of Malawi, with aid from various international organisations, has been establishing telecentres (Chikumba, 2011). A Telecentre is a public facility of-

fering access to ICT services for educational, social and economic purposes (Chisa & Hoskins, 2016). Telecentres offer access to ICT services such as the internet, phone, fax, computer and, sometimes, library services (Chisa & Hoskins, 2016).

The potential of telecentres to bridge the digital divide can only be realised when the services they provide are appropriated and used by all groups of people in the communities they serve. However, research studies in many developing countries show that usage of telecentres does not cross all categories of people. Specifically, only a few women, as compared to men, use the facilities (Chisango, 2014; Kumar & Best, 2007). In Malawi, previous studies on usage of telecentres show that only a few women use these facilities (for example, Kapondera & Hart, 2016). This paper focuses on domestication of telecentres by women in rural communities in Malawi. In this study, our concern is to understand the process through which telecentres are appropriated in women's lives in rural Malawi. Specifically, we ask the following questions:

- How do rural women in Malawi integrate telecentres in their lives?
- What influences the use or non-use of telecentres by rural women in Malawi?

This study contributes towards generating information aimed at helping ICT policymakers regarding domestication of telecentres by women in rural communities in Malawi. Domestication theory was used to guide the research in understanding how women adopt and integrate telecentres into their lives. Malawi is particularly interesting because there are limited studies on the use of ICTs in Malawi and Malawi is one of the countries with low technology uptake; it is interesting, therefore, to see how communities in that environment deal with technology. Domestication refers to the processes through which people encounter technologies and deal with them by either rejecting them or accepting and integrating them into their everyday lives (Haddon, 2006). The use of Domestication Theory allowed us to explore the adoption as a process and not as a binary phenomenon.

BACKGROUND

Malawi is classified as a low-income country (The World Bank, 2016). On the 2016 Human Development Index, the country is ranked as number 170 out of 185 countries (Human Development Report, 2016). The country has a population of 17.2 million and more than half of the population live on less than $1 a day (Malawi, 2012). The majority (83.9%) live in rural areas (Human Development Report, 2016) which have few roads and means of transport, low income levels, limited access to ICTs and electricity, and high dependence on fishing and farming (International Fund for Agricultural Development (IFAD, 2017).

The ICT penetration level in Malawi is low and there are disparities in ICT access between urban and rural areas; the rural areas of Malawi have limited access. In 2014, of the 64,247 people who had access to fixed telephones, only 18.7% were from rural areas (Nyirenda, 2014, p. 7). The national survey on access to and usage of ICT services in Malawi in 2015 shows that in the rural areas only 42% of the households had access to mobile phones as compared to 85.1% of households in urban areas; in rural areas 30.6% of the population had access to mobile phones as compared to 71.8% in urban areas; only 13.9% of people in rural areas owned a computer device as compared to 36.1% in urban areas; and 2.9% of people in rural areas accessed the internet, while urban areas had 23.7% access (Malawi Communications Regulatory Authority (MACRA, 2015).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The government of Malawi has been engaging in various initiatives to bridge the digital divide by increasing the penetration of ICTs in rural areas. Some of these initiatives include the formulation of the Rural Telecommunications Policy which enabled the provision of cellular phones at cheaper prices, and the formulation of the Malawi ICT Policy and the Malawi Growth Development Strategy which facilitated the establishment of telecentres in rural areas (Kapondera & Hart, 2016).

The idea of establishing telecentres in Malawi emerged in the early 2000s, with the aim of bringing the benefits of ICTs to rural areas and bridging the digital divide through universal access to, and affordable, ICTs (Chikumba, 2011). The first Telecentre started operating in 2007. There are currently more than 51 telecentres in rural areas of the country (Malawi, 2013) and the country is establishing more.

LITERATURE REVIEW

Overview of Telecentres

Telecentres are mainly established in rural and marginalised communities to enable individuals who cannot afford ICTs such as computers and the internet to have access to ICTs (Mbangala & Samzugi, 2014; Owen & Darkwa 2000); they offer access to services at low costs as compared to the alternatives (Gcora et, al., 2015).

The concept of telecentres was born in the early 1980s. Telecentres may be established by individuals as commercial ventures and by governments as a social good. Telecentres are known by different names in different countries (Owen & Darkwa, 2000) and exist in different models offering different services. Despite the difference in models, all telecentres aim at bridging the digital divide, thereby developing disadvantaged communities.

Telecentres have the potential of transforming and developing disadvantaged communities due to the numerous roles they play. They provide economic opportunities to the communities by providing users with information on available jobs; by helping users save money by bringing the services closer to people and at lower costs (Kapondera & Hart, 2016; Kumar & Best 2007); by employing people to work within the telecentres (Kapondera & Hart, 2016); by helping the users expand businesses thereby increasing their finances; and enabling farmers to communicate with buyers and allowing people to advertise their farm products through the internet and radios within the telecentres (Roman & Colle, 2002). Telecentres play an educational role by improving the skills and knowledge of the users through computer tutorials and providing access to information for educational purposes (Kapondera & Hart 2016). Telecentres facilitate social interaction among community members. The ICTs within telecentres enable users to communicate with their families and friends (Mbangala & Samzugi 2014) and telecentres are considered as social spaces where bonds and ties are formed among users (Attwood, Diga, Braathen & May, 2013; Kapondera & Hart, 2016). Telecentres also help rural communities to access government services on different areas including education, health and agriculture (Chapman & Slaymaker, 2002). Furthermore, telecentres play a role in improving the health of the users; some people use telecentres to find information on how to deal with health problems (Roman & Colle, 2002). This, eventually, helps develop communities as only healthy people can contribute to development of these communities.

ICTs and Rural Women

Most rural women in many developing countries are poor, oppressed, deprived of many things, less educated, discriminated against with opportunities and dominated by the patriarchal system. In other words, in most rural communities, women are marginalised (Chapman & Slaymaker, 2002; Chisango, 2014) and this affects their self-efficacy negatively (Madima, 2007). Provision of access to ICTs through facilities such as telecentres in rural areas, which target all categories of people including women, has the potential to empower women. ICTs have the potential to transform women's lives. The previous section demonstrated the benefits of ICTs available within telecentres to members of the communities, including women.

Although ICTs offer several benefits to rural women and have the potential to transform the lives of these rural women, women's usage of and access to the ICTs are low. In the main, women access and use ICTs that require a low level of skill, are free to use and do not require literacy, such as radios and televisions; women shun ICTs such as the internet (Bakar, 2011; Kwake, & Adigun, 2008). Many studies have also found that only a few women benefit from ICTs available within public access venues. In a study by Kapondera and Hart (2016) on usage of telecentres in Malawi, out of 130 respondents, only 27% were females. There are a number of factors that hinder women from accessing and using ICTs. One of the factors is education. In many rural areas, women are less educated as compared to men. This has a negative impact because literacy is fundamental to ICT access and use (Best & Maier, 2007). The low educational levels of women also lead to women having a negative perception that ICTs are for men who are more educated than they are (Dlodlo, 2009; Gcora et al., 2015).

Cultural factors also affect women's access to ICTs in rural areas. In many developing countries, women are predominantly occupied with family care-giving roles; they are responsible for taking care of the children, the elderly and also caring for the needs of their husbands. This leaves women little time to access ICTs (Best & Maier, 2007; Mbangala & Samzugi, 2014). The costs of ICTs also affect women's usage of ICTs in rural areas. Many rural women are uneducated and are not employed, so do not earn an income which they would use to access ICTs, both at an individual level such as cell phones (Kwake & Adigun, 2008) and from the shared facilities such as telecentres (Mbangala & Samzugi, 2014; Roman & Colle, 2002). The situation is exacerbated by the fact that most women in the rural areas in developing countries have limited control over finances at household level (Dlodlo, 2009).

Perceptions that computers are complicated to use (Dlodlo, 2009; Gcora, et al., 2015); distances to the facilities with ICTs such as telecentres (Gcora, et al., 2015; Kwake & Adigun, 2008); and lack of interest in ICTs (Best & Maier, 2007) also contribute to the low usage of ICTs by rural women.

Malawian Rural Women

Rural Malawi has a higher female population of 51.7%; in urban Malawi the figures are reversed. The number of female-headed households is also higher – 24% in rural areas of Malawi as compared to 15% in urban Malawi (Food and Agriculture Organisation (FAO 2011). Most Malawian rural women are illiterate. Women in rural areas are occupied and dedicate their time to unpaid domestic work which leaves them with no time to participate in paid economic activities (FAO, 2011). They rely on farming and wage jobs (*ganyu*) to earn their living (FAO, 2011) and the majority of Malawian women engage in subsistence farming (Greco, Skordis-Worrall, Mkandawire & Mills, 2015). Furthermore, many Malawian rural women have limited say on reproductive choices which may result in having a high number

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of children; this, in turn, negatively impacts on their economic as well their health situation (Greco, et al., 2015).

DOMESTICATION THEORY

Domestication Theory outlines and explains the processes through which innovations or technologies are adopted and become part of individuals' daily lives (Chigona, Mudavanhu, Siebtriz & Amerika, 2016; Habib & Sønneland, 2010). The theory was firstly used in media studies and later widely applied in science and technology studies (Haddon, 2006; Chigona et al., 2016). In ICT studies, the theory focuses beyond the adoption and use of ICTs to find out what the ICTs mean to people, how people experience them and the roles that these ICTs can come to play in their lives (Haddon, 2006). Furthermore, the theory emphasises that "domestication, essentially, is about giving technology a place in everyday life. The concept catches the practical, temporal, spatial place, but most importantly, it underlines how this is mixed with the cultural as an expression of lifestyles and values" (Hynes& Richardson, 2009, p. 483). The theory was deemed appropriate for the study as it helped to understand how Malawian rural women make telecentres, which are usually not part of their daily routines, become integrated and be part of their lives.

The theory has three main concepts also known as stages: commodification, appropriation and conversion (Frissen, 2000; Silverstone & Haddon, 1996).

Commodification, also known as imagination (Chigona, Chigona, Koyongo & Kausa, 2010), is concerned with the acquisition of the technology by the potential user which could be an individual, a household or an institution. Here the potential users come to know about the technology. It is the stage through which a technology emerges in a public space of exchange values, which could be through advertisements (Silverstone & Haddon, 1996), and is given an image by the potential user (Chigona et al., 2010). In many studies (e.g., Chigona 2015; Chigona et al., 2016) this has focused on how the individuals began using the ICTs and the factors that influenced the use of the ICTs.

A*ppropriation*, the second stage, is about purchasing the material, taking it home and integrating the technologies in users' daily routines and lives. This stage is when a technology is accepted or rejected (Silverstone & Haddon, 1996). Silverstone et al. (1992), as cited in Habib & Sønneland (2010), divide the stage into objectification and incorporation. The objectification phase is when the technology or innovation is displayed or exhibited, thereby integrating it in the user's environment while incorporation is when the user uses the technology and integrates it into their daily routines and lives (Habib & Sønneland, 2010; Hynes & Richardson, 2009). In the context of telecentres, this can be understood by examining when people make a decision to use, the purposes for using, how they engage with the telecentres and their services, and factors influencing the use and non-use of the telecentres.

The third and last stage, *conversion*, is about activities that users engage in and display to signal to others such as friends, peers and families their participation in adopting and using the ICTs (Habib & Sønneland, 2010; Silverstone & Haddon, 1996). Conversion helps to give feedback to the producers, marketers or regulators of the technology, as the users in this stage engage themselves in showing technological competence and talk about how useful or not useful the ICTs are with others (Frissen, 2000). In the context of telecentres, conversion could be seen when users display the benefits of using the telecentre and recommend the use of telecentres to others.

METHODOLOGY

The research used an interpretive paradigm. Studying domestication of telecentres by Malawian rural women required in-depth understanding of the context. Therefore, the study employed a qualitative case study approach (Thomas, 2006). The study targeted Vikwa Community Telecentre. The case was purposively selected for two reasons: it is the oldest community-managed telecentre and it is the one that is mostly used (confirmed by MACRA officer in private communication in 2016).

Sampling and Data Collection Procedures

Data were collected from Vikwa Community Telecentre women users, women non-users and the Telecentre Manager of Vikwa Community Telecentre, using semi-structured interviews. For the purpose of the study, a user is defined as every woman who comes to the Telecentre to access the services offered in the Telecentre, except for the kiosk. Non-users were those who either came to the Telecentre to buy items from the kiosk or those who did not even come to the Telecentre. Purposive sampling was used to select the respondents; 11 users and 10 non-users were interviewed. The authors acknowledge that the sample size is small enough to allow them to make generalisations. However, this is not the intention of the study. The aim is to gain insights into the patterns of use–the study is primarily exploratory. The interviews with women were in Chichewa, the language spoken in the area, while the interview with the Manager was in English. The interviews were conducted by one of the researchers who has an understanding of the culture of the area.

The authors opted for interviews for data collection because they allowed for getting participants involved, allowed for participants to give expression from their point of view and allowed for probing. Furthermore, interviews allowed for getting responses from those with limited literacy (Kajornboon, 2005). This was important, especially as most women, especially the non-users, are illiterate.

Data Analysis

The collected data were transcribed and analysed using thematic analysis techniques (Fereday & Muir-Cochrane, 2006). The analysis allowed identification of themes which were linked to Domestication Theory. Due to ethical considerations, codes were used to identify the respondents. For users, prefix US (followed by sequential number) was used while, for non-users, prefix NU (followed by a sequential number) was used. For example, code for user respondent number 1 was US1 and code for non-user respondent number 1 was NU1.

Ethical Consideration

Consent was sought from all the respondents before they participated in the interviews. Respondents were assured of confidentiality and anonymity and were not asked to give their names. Participation in the study was voluntary.

Case Study Description

Vikwa Community Telecentre is one of three community-managed telecentres in Malawi. It is located in Mphepo Village, Traditional Authority Wimbe in Kasungu District. The community is about 25 kilometres from Kasungu Municipality. The community is characterised by poor roads, limited access to electricity and difficulty in accessing clean water. It has a catchment area of about nine villages whose population is approximately 180,000 people. There are about eight secondary schools, over 30 primary schools, and three health centres in the area. The community is dominated by subsistence farmers, mostly engaged in tobacco farming.

The Telecentre was established by the Government of Malawi through MACRA. It offers various services to the community including the internet; printing; photocopying; book binding; lamination; library services; identity card design and printing; scanning; a tuck shop and computer training on basic computer literacy. The Telecentre started operating in May 2010. It is managed by the community which set up a committee of nine people of which only three are females; the committee is male-dominated.

FINDINGS AND DISCUSSIONS

Table 1 summarises demographic data of the respondents. The users' ages ranged from 16 to 55 with the majority (9) being below 30; the age range of for non-users was between 18 and 45. The users were more educated than the non-users. Most of the users were students with a junior secondary school qualification. There were only two primary school dropouts among users. Seven non-users did not complete primary school; two non-users had junior secondary school qualification; and one had not attained any education.

Table 1. Demographic information of users and non-users

		Number of respondents	
		Users	**Non-users**
Education	No education	0	1
	Did not complete primary school	2	7
	Primary school qualification	2	0
	Junior secondary school qualification	6	2
	Senior secondary school qualification	1	0
Occupation	Student	7	1
	Farmer	2	3
	Business	2	2
	Wage jobs (*ganyu*)	0	4
Marital status	Single	7	1
	Married	3	9
	Widow	1	0

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Most of the women users were single while nine of the ten non-users were married; this is consistent with previous studies suggesting that single women are more likely to use the telecentres than those who are married (Madima, 2007). Married women are usually preoccupied with family-care roles, leaving them little time for the Telecentre (Mbangala & Samzugi, 2014). Regarding occupation, the majority of users (seven) were secondary school students, mostly in senior secondary school; two were business women and two were farmers. The majority of the non-users, four, earned their living through wage jobs (*ganyu*); two were business women; three were farmers and one was a student.

Commodification of Telecentres by Malawian Rural Women

Table 2 summarises the results based on the constructs from the Domestication Theory. Under Commodification, the authors identified two themes: publicity and word of mouth. Consistent with other domestication studies (Silverstone & Haddon, 1996), the authors noted that advertisements contributed to the commodification of the Telecentre. Advertisement was associated with the publicity of the Telecentre through an opening ceremony. Some users stated that they knew about the Telecentre from the opening ceremony of the Telecentre in 2010. The ceremony involved a high-profile cabinet minister and other national politicians coming to the rural area. This made it a big event and attracted the attention of the community:

The main driver for awareness of the Telecentre was by word of mouth. The majority of users heard from their friends, and some from the Telecentre Manager. The findings suggest that word of mouth is critical to commodification of telecentres in rural communities in developing countries. This may be attributed to the fact that Malawi is considered an oral society where information is passed on from one person to the other by word of mouth (Lwanda, 2003); there is also a lack of media (e.g., newspapers) in rural areas. Furthermore, word of mouth could have played a great role in creating awareness of the Telecentre because people in communities are more likely to adopt an innovation when they become aware of it through associates such as relatives and friends who are likely to persuade them (Mark & Poltrock, 2001). Word of mouth has also contributed to the use of ICTs in previous studies on marginalised communities (Chigona et al., 2016; Kapondera & Hart, 2016; Mark & Poltrock, 2001).

Appropriation of Telecentres by Malawian Rural Women

Appropriation is associated with purchasing and ownership of technologies such as computers (Chigona et al., 2016). In this study, appropriation is associated with the use of the Telecentre.

Period and Frequency of Use

As depicted in Table 3, the women users' period of use ranged from two weeks to seven years. The results show that the Telecentre received new women users almost every year.

The majority of the women users used the Telecentre every day. The ones who used it on daily basis were all students – two used it once a week; one used it once a month; and the other one was not certain – she used it when the need for use arose, which could range from a month to three months. The student users used the Telecentre as one of their daily routines and it was integrated into their lives. These findings differ from the findings by Best and Maier (2007) on women's usage of ICTs in kiosks in India. In their study, the majority reported low usage of once a month or less. The higher usage in our study

Table 2. Stages of domestication of telecentres by Malawian rural women

Aspect of domestication	Units of meaning	Selected quotations
Commodification	• Publicity-opening ceremony	• This other day there was an opening function for everyone to know that it is a telecentre [US5]. • I just saw them building this house and this is when people were saying it is a telecentre. Thereafter they came for an opening ceremony. This is how I came to know about it and its functions [US6].
	• Word of mouth	• I heard about it [telecentre] when I asked my friends the place they go to for studying. So, this is when they told me about the Telecentre [US11]. • I heard about the Telecentre from the Manager. This other day I met the Telecentre Manager who told me they have a nice place for studying. So, I came to see the place and like it [US8]. • I heard about the Telecentre from the Telecentre Manager [US9].
Appropriation	**Purposes of using** • Academic purposes • Leisure purpose	• Since I have just started using the Telecentre, I only come here to study because it is conducive environment for my studies [US1]. • …the Telecentre to photocopy pamphlets for academic work [US2]. • This Telecentre is useful in various ways… it helps to photocopy materials. When, say, there is a wedding in my community and would want… to print wedding invitation cards, we come here to print them. [US4].
	Factors influencing the integration of telecentres by Malawian rural women • Compatibility with their needs • Convenience • Perceived usefulness	• I use the Telecentre because it stocks materials necessary for my education [US8]. • I like coming here because the place is always quite which is ideal for reading [US8]. • Because when studying here, one can concentrate because there is no one to disturb you here unlike home where parents would want you to help them with some household chores [US10]. • [We use] it is because it is closer to the school as compared to other places. So, when we knock off from school, we just come here [US10]. • I would like be computer literate so that I can have a computer certificate because most jobs these days require people who are computer literate [US5].
	Factors influencing the non-integration of telecentres by Malawian rural women • Lack of awareness of the functions and benefits • Illiteracy • Cultural roles • Perception that telecentres are for the educated	• It is true that some women do not use the Telecentre because they lack knowledge… because most women just see it as a house and do not know what it is all about[US3]. • In this community I think it is because most women do not know that everyone can use the Telecentre. They just say that, aah let those who use it continue using it, it is not for everyone… they lack knowledge [US1]. • It is just that we [women], do not know its benefits [NU3]. • Because of the household chores we are expected to do at home, by the time the chores are done one finds that it is late and cannot make it to the Telecentre… so yeah, lack of time [NU2]. • I think it is due to the fact that those women say that place [Telecentre] is for the educated and for me who never went to school I cannot go there [US3]. • The telecentre] should introduce adult literacy programme so that we become literate… [NU8] • As I have said, this is for the educated. Like for '*Komvuters*'. Do you call them Komvuters? How do you expect me to operate them? [NU9]
Conversion	Recommend to friends	• The Telecentre is useful to me… I tell my friends that you should be visiting the Telecentre where you will find such materials in the library that you can use [US2].
	Teach others	• I use the skills that I gain from using this Telecentre to show and teach my friends who do not know anything about the Telecentre and on the topic I have studied here [US2].

Table 3: Users' period and frequency of using the Telecentre

		Number of respondents
Period of use	Two weeks	1
	Three months	1
	Six months	1
	One year	4
	Two years	1
	Three years	1
	Four years	1
	Seven years	1
Frequency of use	Every day	7
	Once a week	2
	Once a month	1
	When need arises	1

could be due the fact that, in our study, most of the users were students who needed services such as the library on a regular basis for their academic work.

Purposes of Using the Telecentre

The majority of the women users used the Telecentre for academic purposes. Being students, they needed a space for reading. In addition, homes and schools in rural Malawi may lack ideal space and facilities for doing academic work. Some users also used the Telecentre for social and leisure purposes. A 55-year-old user said she uses the Telecentre services to print and photocopy wedding invitation cards. Some students also used the Telecentre to read non-academic books. The services that the women used were consistent with the literature which states that women mainly use the ICTs that do not require skills or literacy (Bakar, 2011; Kwake & Adigun, 2008), as most of the users did not use the services such as computers. Nine of the participants indicated that they used library services: to read the books in the library and or use the reading space. As much as some women (five) used the ICTs, the ICTs that they used were photocopiers and printers that did not require skills; while only two of the women came to the Telecentre for computer classes.

Factors Influencing the Integration of Telecentres by Malawian Rural Women

Several factors influenced the use and non-use of the Telecentre and its services, as depicted in Table 2. When women users were asked why they used some particular services and not others, the most common reason was compatibility with their needs. Most women, especially students, used services like the library because it provided the materials that they needed in their education, as well as a conducive environment for reading or studying. In addition, the students felt that there were no disturbances, compared to studying at home where girls would be sent to do household chores. A number of studies have shown that, in

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

rural Malawi, parents burden girls with household chores at the expense of their education (Valentini, 2004). In this way, the Telecentre offered a space to "*escape*" from home and focus on their studies.

Convenience also influenced the women's use of the Telecentre. Women used the Telecentre because it was closer than other facilities providing similar services. The effect of distance on the usage of telecentres by women has been reported in previous studies (e.g., Gcora et al., 2015). Perceived usefulness, which is the belief that the use of computers will result in achieving personal goals (Umrani & Ghadially, 2003), also influence women to use the Telecentre, especially those attending the computer course. The two women who indicated that they attended the computer classes said that they had decided to acquire computer skills because that would enable them to find jobs which normally demand people who have computer skills.

Factors Influencing Non-Integration of Telecentres by Malawian Rural Women

Women non-users were asked why they do not use the Telecentre. Women users were asked to give their views on what they think affects other women who do not use the Telecentre. All the ten non-users were aware of the Telecentre in their community. This is in line with findings by Chisango (2014) which found that most rural women are aware of the existence of ICTs but do not use them. Several factors contributed to the women's non-use.

Lack of awareness of the functions of the Telecentre was the main reason why women did not use the Telecentre, as the majority, 15 (users and non-users) of the participants, gave reasons related to lack of appreciation of the functions and benefits of the Telecentre and stated that women did not know that everyone could use the Telecentre. Similar findings have been reported in the literature (Attwood et al., 2013; Mbangala & Samzugi, 2014). It is recommended that the management work on sensitising women about the Telecentre, its functions and its benefits. Findings further suggest that the Telecentre make more efforts to raise the awareness of the Telecentre in the community. According to the Telecentre Manager, the only publicity the Telecentre had promoted was the opening ceremony in 2010 (seven years prior). Although the Manager also told people within the community about the Telecentre, community leaders should be involved to raise more awareness in the community. Kumar and Best (2007) argue that in rural communities like this, local leaders should be involved in the promotion of telecentres because they are respected and have substantial influence on their communities.

As in many studies (Best & Maier, 2007), illiteracy negatively affected the use of the Telecentre by women because it affected their use of the Telecentre. This could be due to the fact that literacy levels of most Malawian rural women are low (FAO, 2011); and that eight of the ten women non-users had not completed primary school and hence were not functionally literate. At the same time, there are no literacy programmes in the Telecentre and in the whole community. This finding implies that the Telecentre benefited only the women who were already empowered through literacy, thereby exacerbating the inequalities which might have existed in the community prior to the existence of the Telecentre.

Cultural roles also affected the integration of telecentres in women's lives. Most women were responsible for most of household chores and this limited time for accessing telecentres. This result is consistent with the literature (Best & Maier, 2007; Mbangala & Samzugi, 2014).

Perception of women about telecentres being a place for the educated affected their use. Since most of the non-users had not completed primary school, they felt inferior and excluded from the Telecentre. Non-user NU9, who had dropped out of primary school (Standard Two), also perceived the Telecentre to be for the educated. The respondent struggled to say the word "computer"; she called them "*Komvut-*

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ers" (instead of the correct Chichewa word which is Kompyuta). The perception of the Telecentre to be only for the educated in the community could be attributed to the fact that people who usually visit the Telecentre are students. The perception of telecentres has also affected use of ICTs by women in other countries such as South Africa (Dlodlo, 2009; Gcora et al., 2015).

The financial situation in the rural communities affected the domestication of telecentre services. All the services offered in the Telecentre including library services are offered at a fee. Even those using the Telecentre could not access all of the services because they could not afford them. A user explained that she could not complete her computer course in the Telecentre because she did not have enough money. As stated above, most of the women engaged in wage jobs (*ganyu*) and earned only a small amount of money. This hindered their use of the Telecentre. Similar findings were reported in other ICT studies (Kwake & Adigun 2008) and from the shared facilities of telecentres (Mbangala & Samzugi, 2014; Roman & Colle, 2002).

Conversion of Telecentres by Malawian Rural Women

The results show that some users have reached the conversion stage. Most women users started using the Telecentre after their friends or relatives who had been using it recommended it to them. In the appropriation stage, it is clear that some users had made it part of their lives as most users made use of the telecentre and visited it on a daily basis.

Some users also stated that they recommended the Telecentre to others. Conversion is also reflected in how users used the skills they gained from using the Telecentre. Most users, especially students, used the skills to teach others who were facing challenges in their academic life.

CONCLUSION

The study sought to understand the process through which telecentres are appropriated in women's lives in rural Malawi. The study employed Domestication Theory as a theoretical lens. The study shows that commodification was influenced by a number of factors that included advertisements and word of mouth. The users used the Telecentre for a variety of reasons, both instrumental and hedonic. The students used the Telecentre mainly for academic purposes. The findings provide insights into the services that women use and the factors that determine the services that they use. The women primarily used services that did not require ICT skills, such as photocopiers, printers and books, and reading space in the library. A number of factors influenced the appropriation of the Telecentre and its services. Convenience, compatibility with the needs of women and perceived usefulness influenced women to use the Telecentre. On the other hand, lack of awareness, illiteracy, lack of money, cultural roles and perception that telecentres are for the educated made some women not use the Telecentre. The results show that some users, especially students, have integrated the use of the Telecentre in their daily routines; some have reached the conversion stage so that they could recommend the Telecentre to others.

The study recommends that telecentre management should create awareness in the community on an on-going basis. The awareness campaigns should focus on sensitising women on the functions of the telecentre and its benefits. This will also help to minimise the perception that telecentres are for the educated. The study also recommends that telecentres should start offering literacy classes to facilitate the use of telecentres by the women. The committee should be gender-balanced. A gender-balanced

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

committee would be more sensitive to women's needs and women would feel the centre is for women's needs as well. The study also recommends continuation of establishing telecentres in rural communities, as they have the potential to transform the rural communities. This study was limited to a small sample size; future studies should be conducted using larger sample sizes.

ACKNOWLEDGMENT

Chapter 86
Strategic and Business-IT Alignment Under Digital Transformation:
Towards New Insights?

Nabyla Daidj
Institut Mines-Télécom Business School, France

ABSTRACT

Digital transformation is at a very early stage. Digital transformation has several impacts on business, on organization and process and raises several questions. Over the years, the aims of strategic fit and IT-business alignment have remained constant but the environment in which companies operate has changed significantly becoming more dynamic, very competitive and global. This chapter attempts to analyse how the digital transformation could affect more specifically strategic and IT-business alignment.

INTRODUCTION

The digital economy marks a historical shift in the approach to businesses and potential commercial activities. In the digital environment, a competitive firm should constantly be able to reposition itself in terms of its value proposition, resources and competences, financial capacity in light of the changing entry (and exit) barriers, the disruptive technologies and business models and periods of evolving competitive dynamics. Hypercompetitivity and digitalization presuppose permanent transformation of competitive advantages and critical success factors (CSFs). D'Aveni et al. (2010) thus have proposed "the age of temporary advantage" as an alternative concept to sustainability. This idea is also shared by McGrath (2013) who has called into question the relevance of sustainability in today's fast moving and hypercompetitive marketplaces.

The digital transformation has several impacts on business, on organization and process and raises several questions. "A digital transformation strategy impacts a company more comprehensively than an IT strategy and addresses potential effects on interactions across company borders with clients, competitors and suppliers" (Hess et al., 2016, p. 1). This chapter attempts to analyse how the digital transformation could affect more specifically strategic and IT-business alignment.

LITERATURE REVIEW: DIGITIZATION, DIGITALIZATION AND DIGITAL TRANSFORMATION

Digital transformation is a polysemous, buzz word (Sugahara et al., 2017, p.71). There are many dimensions of digital transformation sometimes confused with other terms such as digitization or digitalization (Table 1).

Digital transformation is often considered as the next step of digitization. Digitization is the process of converting information from an analog to digital format. For example, in the entertainment industry, the dematerialization of content has had repercussions not only on production, but also importantly on exploitation, broadcasting and distribution. In the context of convergence, these technological changes are also accompanied by changes in common practices adopted by consumers and strategies of the main firms involved (Daidj, 2015; Danowski & Choi, 1998).

The term "digitalization' closely related with computerization was used first by Robert Wachal in 1971 who discussed the social implications of the "digitalization of society". In the Oxford English Dictionary (OED), digitalization refers to "the adoption or increase in use of digital or computer technology by an organization, industry, country, etc." Gartner's IT glossary defines digitalization as "the use of digital technologies to change a business model and provide new revenue and value-producing opportunities; it is the process of moving to a digital business."

As regards digital transformation, definitions are numerous elaborated by both practitioners and academic scholars. Keyur Patel and Mary Pat McCarthy (2000) have been among the first authors to address the digital transformation issue by highlighting three questions as follows: What is digital transformation? How does it change business? What are the challenges for B2B companies and B2C companies in making a digital transformation?

Table 1 presents an overview of definitions of digital transformation summarizing key focus words contained in the definitions.

The digital transformation was first associated with technologies. "Within an enterprise, digital transformation is defined as an organizational shift to big data, analytics, cloud, mobile and social media platforms. The current business environment is witnessing a radical altering of the business landscape fueled by the emergence of digital innovations and opportunities. Firms are increasingly adopting various opportunities such as analytics, big data, cloud, social media and mobile platforms in a bid to build competitive digital business strategies" (Nwankpa & Roumani, 2016, p. 2). Then, according to most definitions, emphasis has been placed on one or two main concepts developed both in the strategic area and the IS/IT literature including (IT) capabilities, process, value (creation and capture), business model and organization. Several scholars have underlined the impact of the digital transformation on performances (Westerman et al., 2011; Peppard, 2016). Very little information and analysis can be found in academic papers on the relevance of new KPIs. Kotarba (2017) presented an analysis of metrics used to measure digitalization activities. Digital KPIs are numerous and there are already too many metrics and

Table 1. Overview of definitions of digital transformation

Authors	Definition	Key Features/Words
Dörner and Edelman (2015)	Digital transformation is "creating value at the new frontiers of the business world, create value in the processes that execute a vision of customer experiences and building foundational capabilities that support the entire structure". (p. 1)	Marketplace Capabilities Agility
Hess et al. (2016)	"Digital transformation is concerned with the changes digital technologies can bring about in a company's business model, which result in changed products or organizational structures or in the automation of processes. […] (The) conceptual framework for formulating a digital transformation strategy identifies the four key dimensions of every digital transformation endeavor: *The use of technologies* reflects a firm's approach and capability to explore and exploit new digital technologies. *Changes in value creation* reflect the influence of digital transformation on a firm's value creation. *Structural changes* refer to the modifications in organizational structures, processes and skill sets that are necessary to cope with and exploit new technologies. The *financial aspects* dimension relates to both a firm's need for action in response to a struggling core business as well as its ability to finance a digital transformation endeavor." (p. 124)	Strategy Changes in business models organization, process, skills Value creation
Schuchmann, and Seufert (2015)	"Digital transformation is one of the major challenges in all industries. It embraces the realignment of technology and new business models to more effectively engage digital customers at every touchpoint in the costumer experience lifecycle. Therefore, successful digital transformation begins with an understanding of digital consumer behavior, preferences and choices. It then leads to major consumer-centric changes within the organisation that address these needs". (p. 31)	Realignment New business models Consumer experience

Source: elaborated by the author, based on analysis of the articles cited.

targets. As Kotarba (2017, p. 136) mentioned it, "the overall number of digital KPIs already exceeds 100 items raising a problem of selecting the best metrics to monitor with limited control budgets (cost of data acquisition and processing). Further work should be conducted to select the metrics with the highest descriptive/statistical potential to pronounce the development of digital performance". A number of key metrics should be identified according to industries and should be followed by companies accordingly.

The digital transformation is a multidimensional phenomenon that can be studied from many different perspectives and thus requires the decompartmentalization of disciplines, particularly of economics, strategic management, digital marketing and information systems. As the digital transformation may take a variety of forms for company and have diverse (positive or adverse) consequences, several levels of analysis are required as shown in Table 2.

The digital transformation has a direct impact on the enterprise both internally (Abrell et al., 2016; Libert et al., 2016; Porter & Heppelmann, 2015; Yoo et al., 2010) and externally (Markus & Loebbecke, 2013; Porter & Heppelmann, 2014; Von Leipzig et al., 2017). In addition, its business relationships (with its main suppliers, competitors, and customers), partnerships and practices (for example within business ecosystem and/or networks a company belongs to) will change because of the transformation. Value creation mechanisms, value chains and business models (Bock et al., 2017) are expected to be renewed (even disrupted) enabled by the increasing development of cloud computing, data analytics, machine learning, artificial intelligence (AI) and IOT (Internet of Things).

What will drive competitive advantage in the future? The 'traditional' sustainable competitive advantage (based on cost reduction and/or differentiation) is already questioned. The notion of "transient advantage" is more and more used (McGrath, 2013). 'Classical' CSFs such as financial resources, in-

novation, marketing and promotion should evolve towards an increasingly customer satisfaction and user experience thanks in particular to a more efficient strategy and IT alignment.

As the digital transformation is a very broad notion, in this chapter,the authors have therefore decided to analyze and to focus on its impact on strategic and business-IT alignment. This issue has not yet been fully explored by scholars. On the business side, companies are aware of the fact that strategic and business-IT alignment could support successful digital transformation. This view has been expressed in several reports and studies. In 2016, MIT Sloan Management Review and Deloitte Digital published their Digital Business Global Executive Study and Research Report (July 2016). Based on a survey of 3,700 executives across 131 countries and 27 industries, the report entitled 'Aligning the Organisation for Its Digital Future', highlighted the key concern of IT alignment called also congruence. "Digital congruence is the crux: To navigate the complexity of digital business, companies should consider embracing what we call *digital congruence* — culture, people, structure, and tasks aligned with each other, company strategy, and the challenges of a constantly changing digital landscape". This is the focus of the next sections.

FROM STRATEGIC FIT AND IT-ALIGNMENT TO DIGITAL BUSINESS STRATEGY

As the notion of alignment has several meanings according to the approach adopted (strategic focus or IT oriented), it is helpful to review how this concept was created and then adopted by scholars from various disciplines.

Strategic alignment dates back to the 1980s and 1990s with the work of several researchers in strategic management (Hamel & Prahalad, 1989; Porter, 1996). Hamel and Prahalad (1989) began to address the issue of strategic intent question then leading them to the analysis of the concept of strategic fit. Creating competitive advantages and (re)gaining competitiveness requires a 'strategic intent' that drives the entire corporation. They made a distinction between 'strategic intent' and 'strategic fit' in their model of strategic leadership and strategic vision. Traditional strategic management involves a search for the strategic fit between business portfolios, market niches and products, customers and distribution chan-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

nels. Strategic fit is related to the degree to which a company is matching its resources and competencies with the opportunities in the external environment. Strategic fit is based on the resource-based view (RBV) of the firm which explains that the key to profitability is rather through unique characteristics of the company's resources and competencies in order to develop a sustainable competitive advantage. The idea of considering firms as a large set of resources goes back to the seminal work of Penrose (1959). This concept received renewed attention in the 1980s in particular by Wernerfelt (1984, 1989) and has become an influential framework for analysing corporate strategy (Barney, 1991; Hoopes et al., 2003; Peteraf, 1993). In 1996, Porter has pursued Hamel and Prahalad' work (1989) and has explained that strategic fit drives both competitive advantage and sustainability. According to him, the success of a business is explained often by the implementation of strategic fit. "Fit locks out imitators by creating a chain that is as strong as its *strongest* link (…). One activity's cost, for example, is lowered because of the way other activities are performed. Similarly, one activity's value to customers can be enhanced by a company's other activities. That is the way strategic fit creates competitive advantage and superior profitability." (p. 70).

The well-known strategic alignment model (SAM) proposed by Henderson and Venkatraman (1993) was the first to clearly describe the relationship between business strategies and information technology strategies. IT has evolved from its traditional role as a support function to a strategic role. The SAM model relies on four key domains of strategic choice: business strategy, information technology strategy, organizational infrastructure and processes, and information technology infrastructure and processes. They illustrated this model in terms of two fundamental characteristics for strategic management: strategic fit (the interrelationships between external and internal components) and functional integration (integration between business and functional domains).

IT-business alignment has been expressed using various words such as 'harmony' (Luftman et al., 1993), 'fusion' (Smaczny, 2001), 'integration' (Weill & Broadbent, 1988), and 'linkage' (Henderson & Venkatraman, 1993). Several IT alignment models have been elaborated and different methodologies have been adopted (Avison et al., 2004; Coltman et al. 2015; Gerow et al., 2014; Gerow et al., 2015; Henderson & Venkatraman, 1993; Luftman et al., 1993; Maes et al, 2000; Marchand et al., 2001; Reich & Benbasat, 1996, 2000) to identify key elements that need to be aligned for business IT alignment. Luftman (2000) developed a framework called the Strategic Alignment Maturity Model (SAMM) based on the twelve components of Business/IT-Alignment, which can be recognized in the model of Henderson and Venkatraman (1993). "Alignment addresses both how IT is in harmony with the business, and how the business should, or could be in harmony with IT. Alignment maturity evolves into a relationship where the function of IT and other business functions adapt their strategies together. Achieving alignment is evolutionary and dynamic. IT requires strong support from senior management, good working relationships, strong leadership, appropriate prioritization, trust, and effective communication, as well as a thorough understanding of the business and technical environments". (Luftman, 2000, p. 6-7).

IT has played a fundamental and powerful role in facilitating business activities and has become a catalyst of fundamental changes in the structure, operations, and management of organizations (Brown & Magill, 1994; Kearns & Sabherwal, 2006; Luftman *et al*., 2006). This place is being strengthened today in the context of digital transformation. Strategy and business-IT issues are closely related and should be more combined in order to achieve a competitive advantage that might be called a 'digital competitive advantage'. Several scholars have stressed the need for companies to take into account all these dimensions in a digital strategy (Bharadwaj et al., 2013; Drnevich & Croson, 2013; Mithas et al., 2013; Pagani, 2013). As explained by Bharadwaj et al. (2013, p. 471), [they] "argue that the time is

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

right to rethink the role of IT strategy, from that of a functional-level strategy—aligned but essentially always subordinate to business strategy—to one that reflects a fusion between IT strategy and business strategy. This fusion is herein termed digital business strategy". This is the purpose of the next section.

Managerial Contributions and Recommendations

The importance of strategic alignment (business-IT) has been recognized for a long time. "The best performing companies are often the best aligned" (Trevor, 2018, p. 2). Digital transformation does not imply the end of alignment but requires addressing new challenges in relation with digital business strategy. As mentioned previously, digital transformation is not only digital upgrades (Libert et al., 2016). A real digital business strategy aligned requires redesigning the "big picture" (Mintzberg, 1994, p. 111) and rethinking the strategic vision in relation with several key pillars as follows:

- **Value Creation & Capture:** "Firms investing in digital transformation are able to align digital insights about customers with innovative processes and investments leading to improved customer experience and performance" (Nwankpa & Roumani, 2016, p. 10). Approaches like co-conception, co-design, co-creation, co-production all emerged in the early 2000s and have grown without interruption ever since. In varying degrees, they all imply a collaborative, collective and interdisciplinary dimension. Instead of relying upon a "technology push" philosophy, which prevailed for a long time, they confide in a "market pull" outlook, which seeks to integrate market needs with the expectations of final users. Co-conception and co-design specifically acknowledge the context in which the goods are consumed to collect information and thus be able to improve and enhance customers´ experience. These collaborative practices transform the relations between the company and its customers, because the latter are now involved in the design of new products, services, applications, information systems before or during the development stage. These different players become "co-producers" of value (Prahalad & Ramaswamy, 2004; Vargo & Lusch, 2004).
- **Organization/Culture:** "Digital business strategy is different from traditional IT strategy in the sense that it is much more than a cross-functional strategy, and it transcends traditional functional areas (such as marketing, procurement, logistics, operations, or others) and various IT-enabled business processes (such as order management, customer service, and others). Therefore, digital business strategy can be viewed as being inherently transfunctional. All of the functional and process strategies are encompassed under the umbrella of digital business strategy with digital resources serving as the connective tissue." (Bharadwaj et al. (2013, p. 473). This new organization requires to hire "digital" workers and managers. It means also the development of an agile culture. The "agility" concept was created in 1991 by a group of researchers at the lacocca Institute (Lehigh University, USA). The agility concept is defined as "a manufacturing system with extraordinary capabilities (Internal capabilities: hard and soft technologies, human resources, educated management, information) to meet the rapidly changing needs of the marketplace (speed, flexibility, customers, competitors, suppliers, infrastructure, responsiveness). A system that shifts quickly (speed and responsiveness) among product models or between product lines (flexibility), ideally in real-time response to customer demand (customer needs and wants)." Principles of agility have been then applied to other functions of enterprise, and the "agile enterprise" concept has been launched (Goldman et *al.*, 1995; Nagel, 1992).

The "traditional business-IT alignment" framework should progressively evolve (Table 3).

Table 3. Towards a renewed alignment framework in the context of digital transformation

	Previous Model **Strategy Drives Technology Towards Alignment**	**Renewed Model** **Technology Drives Strategy Towards the Implementation of a Digital Business Strategy Leading to Alignment**
Internal Level (Organization)		
Organization (structure, management, resources and competencies)	Silos / Functional structure	"Transfunctional structure" Emergence of new functions (e.g. DEV/OPS) Agility Digital skills (chief information officers - CIO)
IT	Information system / Process	Development of dynamic IT capabilities (architecture, data management services, application platforms)
External Level		
Market	Mainly competition	Co-existence of rivalry and cooperation
Relationships with other external stakeholders	Customers Suppliers (subcontracting relationships)	Customers (co-conception, co-creation and co-design practices) Suppliers (real partnerships)
Business Models		
		Data-driven business models

Source: elaborated by the author.

FUTURE RESEARCH DIRECTIONS

Digital transformation is at a very early stage. Multi-disciplinary approaches will be required to address this issue in a comprehensive manner. Further work is required to understand the impact of digital transformation on IT-business alignment and related performances. It includes also case studies with different types of impact assessments (value chains, dynamic capabilities, organizational processes, business processes and managerial models). Among other consequences, digital transformation reshapes also business models. Advanced analytics tools ("business analytics" or "big data analytics") enable an easier access to infinite data and could lead to the adoption of business intelligence (BI) strategies for many kinds of public and private organizations. Advanced business intelligence tools thus contribute to the value creation for the organization and, in addition, an incremental transformation (Loebbecke and Picot, 2015). Business models which are increasingly digitalized and 'BI-Based' (Davenport, 2006) should replace less efficient business models.

CONCLUSION

The 'old' debate on strategic fit is not closed. Since the beginning of the 1980s, the alignment has been more and more linked with IT/IS facilitating the business operations and ensuring that the strategy was implementable. Most of scholars presented previously have stressed the role of IT/IS in creating

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

value. Over the years, the aims of strategic fit and IT-business alignment have remained constant but the environment in which companies operate has changed significantly becoming more dynamic, very competitive and global. Competitors are more innovative and new entrants are more digitally focused (Von Leipzig et al., 2017). As mentioned by Smaczny (2001, p. 797), "…the alignment concept is about a sequential development of strategies and a sequential operationalisation. Unfortunately, now that reliance on IT has increased to the level where a lack of IT agility and responsiveness can create a competitive disadvantage, the sequential model is too slow. [We] promote a notion of fusion. Today's chief information officers are increasingly becoming company strategists who help their chief executive officer colleagues to steer companies. Business and IT strategies have to be developed simultaneously and implemented simultaneously." The digital transformation requires higher value at each chain of the internal and external value chain for the organizations.

KEY TERMS AND DEFINITIONS

Competencies: They include knowledge, know how, skills, abilities, and behavior.
Digital Business Strategy: Fusion between IT strategy and business strategy.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Digital Economy: The digital economy marks a historical shift in approach to businesses and potential commercial activities thanks to ICT and to new technologies (artificial intelligence, big data analytics, cloud computing, IOT, machine learning).

Digital Transformation: This new trend (in relation with new technologies) will entirely transform organizations, value capture models, current business models, customer experience and will lead to the implementation of radical changes.

Disruption: Often associated to technology or innovation, this phenomenon can create also major changes in industry frontiers, business processes and business models.

IT Alignment: Fit between organization/strategy and IT/IS capabilities.

Resources: They include two main categories tangible (human, physical, technological etc.) and intangible assets. Data are considered as resources and data analytics as skills (see above).

Strategic Fit: Match or congruence between a firm's organization/strategy and environmental issues (internal and external consistency).

This research was previously published in Business Transformations in the Era of Digitalization; pages 93-105, copyright year 2019 by Business Science Reference (an imprint of IGI Global).

Chapter 87
Organizational Change Management:
Perceptions, Attitude, Application, and Change Management Practices in Nigerian Universities

Nwachukwu Prince Ololube
Department of Educational Management and Planning, Faculty of Education, Ignatius Ajuru University of Education,Port Harcourt, Nigeria

Dennis Ogutum Ololube
Department of Public Administration,Faculty of Management Sciences,Ambrose Alli University, Ekpoma, Nigeria

ABSTRACT

Change management is a continuous method used in transitioning individual employee, groups, and organizations to an anticipated future change. It focuses on the change management processes that addresses individual employee, groups and organizational factors that acts as catalyst for possible changes in organization. The purpose of change management is ultimately to make use of initiatives and ensure that every employee in an organization is willing and ready to switchover to an anticipated new role in the proposed business environment. This current study evaluated the relationship between leadership perception, attitudes and application towards organizational change. Using a structured questionnaire, principal officers, their deputies and faculty perceptions were analyzed and the results revealed that though change matrix are often painful and chaotic, however, significant relationship was found between employee perception, attitude, application and organizational change. The study recommends that Nigerian universities should be proactive in the implementation of changes to improve their employees' perception, attitude and application towards organizational change.

INTRODUCTION

Administration implies organization influence through a number of persons efforts geared towards achieving certain lay down objectives. It is certain that those involved must be well organized to be able to satisfy and achieve the expected goal. All their efforts must be channeled towards actualizing the same goal through cooperative energy. This can only be possible if there is an organizational structure to channel their effort for organizational development. Therefore, for any administrative action, there must be an organization because no administrative action can be implemented without an organization (Vishoo & Vidya, 2007).

Organizational change is as old as organizational development, what this implies in this context is that organizations find ways to improve and change its current status to a better-developed status. The universities just like any other organization change as they grow. The study of organizational change, its application, effect and management practices in goal attainment in Nigerian universities is a means aimed at higher education reform. If educational reform/change or development was to become effective and yield measurable output, element of quality management needs to be present in the improvement efforts (Detert & Jenni, 2000).

Stakeholders in education and university administrators are responsible for developing a vision and strategy for the understanding and development of university education. Universities as public sector agencies should identify the significance of leadership and management as instrument of quality improvement and sustainability in university system (Julius, 2005). We may have leadership, or in other words leaders (university administrators) either because they do not have what to offer which may be as a result of the means they attain or got to the level they are in the field of academics, professorship is the apex level in academic profession, surprisingly, there may be some who are professors, yet do not have anything to offer in a particular academic domain, this sometimes pose challenges in the process of change since most people believe that once you are a professor, you know it all.

For so many decades, there has been vociferation for improvement in university education, especially in south-south Nigerian. This implies a severe and ever challenging but of vital importance for university management/administrators to ensure that there is organizational change from its current state to a better developed state. It is an established fact that since the year 2000, perceptions on the standard of university education in Nigeria has declined, resulting in universities producing low quality or half-baked graduates that are not generally accepted by both private and public organizations globally (Ololube, Kpolovie, Egbezor, & Ekpenyong, 2009).

University administrators and lecturers no longer adhere to lay down rules, and innovation to enhance goal attainment. Similarly, it would appear that the problem of organizational change, its application, and the effects of management practices in organizational development remains crucial for management to contend with. Therefore, a decline in organizational change in Nigerian universities especially in the south-south has posed a very serious problem in the achievement of the set goals of the universities, such as quality of program, conducting researches, to widen the frontiers of knowledge available to humanities and producing different categories particularly high level human resources for the economy and political system. The notable deficiencies and the need for organizational change are no longer in doubt, what appears uncertain is the effective application, attitude/reaction, effect and management practices. The study identifies the major components of organizational change perception, attitude and application towards goal attainment. This article is written to inform higher education administrators, managers, lecturers, policy makers, and university students of the relationship and advantage of organizational

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

change and goals attainment. The purpose of this study is to relate the findings from research studies to the current situation facing university administration in Nigeria. The zeal to write this research paper was born out of the desire to examine how organizational change perceptions, attitudes and application affect university as an organization.

This brings to mind the touching question of how effectively can organizational change be achieved in Nigerian universities. Specifically, the study addressed three basic objectives:

- Examine leadership perceptions toward organizational change;
- Examine the attitudes of principal officers of the universities and faculty members towards organizational change;
- Examine the application of organizational change and how effective it can be put into practice.

The under listed research questions were used to guide the study:

- To what extent does leadership perception influence change?
- To what extent does attitude of principal officers of the universities and faculty members influence change?
- To what extent does the application of change influence change in universities?

To address the above objectives and further our analytical information, three hypotheses were formulated:

- There are no significant relationships between leadership perceptions and organizational change.
- There are no significant relationships between the attitudes of principal officers of the universities and faculty members towards change.
- There are no significant relationships between the applications of change and how effective can it be put into practice to influence change in universities.

LITERATURE REVIEW

The Concept Organizational Change

Every organization, be it private or owned by government is established for a particular purpose. Organizations are being managed by group of people to achieve the set goals through their day-to-day activities. Julius (2005) states that the administrative system of every Nigerian tertiary institution is design to facilitate efficient attainment of the goals of the institution. Organizational change is an irreversible adaptation of any feature of its structure, personnel, products or processes (Naylor, 1999). Every organization is established to provide solution(s) to certain problems identified in the environment. The expressed solutions constitute the goals of the organization.

Organizational change is a concept rather than a specific technique. Behavior is strongly influenced by context: factors such as culture, rewards, recognition, incentives and established norms play a vital role in organizational change. Therefore, managing the context of organizational change is critical as much as it is crucial where change initiatives are concerned (Terry & Dinsinore, 2006). Behavioral change

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

involves people doing things differently, therefore particular attention need to be directed at projects specifically aimed at stakeholder engagement, employee involvement and communication (Julius, 2005; Ololube, Agbor & Kpolovie, 2016a). Also, in the management of the organizational context, Terry and Dinsinore (2006) argued that specialist in the field of industrial and organizational psychology and organizational development should be an inclusive right at the beginning of the initiative so as to develop change management programs integrated into the initiative. Organizational change is inevitable and organizations that manage change effectively will pull ahead of their competitors.

In ensuring successful organizational change, the leading responsibilities of the administrative sponsor is to communicate and lead, followed by clarifying direction and target. The broad goals of Nigerian universities are first to widen the frontiers of knowledge, followed by impartation of knowledge (Julius, 2005). He went further to state that the first is done through research whereas the second is done through lecturing, teaching and supervising students. Three key features according to Ahiauzu and Ololube (2016), goals, people and influence are necessary when we talk about leadership. Since leadership is a process of influencing people towards achievement of organizational goals, it implies that leadership is a social process that involves interaction with others to achieve goals (Naylor, 1999; Ololube, Agbor & Agabi, 2017).

University administrators (leaders) play vital role in the performance of their institutions. Their major role is to lay down the infrastructure, policies and guidelines for the sub-system of the institution to function at its best. University administrators can help achieve organizational change by being creative, innovative, inspiring and visionary to enhance the institution to work together with their sub-systems to provide a very best service to students and the economy (Julius, 2005). Administrators who understood the importance of working together with their sub-system would develop a cooperative culture for working with their sub-system (Wong, 2001).

Efficient management strengthens success in a university's core business of teaching and researching. In higher institutions, administrators are closely identified with the fortunes of the institution because they adapt styles, approaches that can enhance change to the circumstances facing the university. Modification of their leadership styles and approaches to enhance appropriateness to the organizational context should not be overlooked (Wong, 2001).

University administrators are responsible for the day to day running of the universities, determining academic activities in conjunction with academic board and senate, and managing the budget, resource and proper use of funds. Administrators find themselves under great pressures. They are responsible for setting the key values and direction of the universities with regards to its position in higher education and the wider economy. Strategic planning are key functions of the administrators (Bargh, Bocock & Smith, 2000; Ololube et al., 2016a). The size of an institution, resource generation and allocation, institutional acquisition, investment and disposal, the recruitment and reward of academic and other staff, the creation, closure and merger of department, and external roles and relationship are vital decision to be considered in the change process (Henkel, 2002).

Organizational change is an approach to transformation, which encompasses the organization as a whole when compared to other localized efforts or means to promote change. Organizational change is basically a strategic activity that is founded on a system-concept of organization. This implies that change is seen as a function of (1) the external environment and (2) the internal environment among the sub-system within their organization (Ololube, Aiya, Uriah & Ololube, 2016b).

Leadership Perceptions Towards Organizational Change

Leaders, managers and employees perceptions shape the climate and effectiveness of organizational change. Perception can be viewed as the ways leaders, managers and employees interpret their experiences. It is the most difficult part of human behavior; consequently, organizational leaders should realize that individuals have divergent perceptions (Otara, 2011).

According to Elsbach (2003), perception simply means the way in which we see a particular situation. Our perception is our reality because humans interpret things the very way they see them. When humans see things as they are made to see them, instead of the way they really are, it constitute a barrier to communication. This is due to the fact that our previous experiences, current moods, peers, among other similar factors, obviously influence how humans interpret a given message (Otara, 2011). Credibility gaps are common between management and employees in organizations, which poses communication barrier especially when people have made up their minds and processing information objectively will be very difficult. As such, all sub-system of any organization should be properly communicated on the needs for change (Ololube et al., 2016a; Xie, 2013).

One thing is to initiate change and another is to the extent to which such change can be perceived, applied and sustained. Terry and Dinsmore (2006) argued that delivering strategic change is only half of the story, the other half is all about sustaining the change permanently in other to deliver the strategic benefits in which an organization make case for the initiative. Even though change is inevitable in organization, does it usually have to be so injurious and so badly managed? (Barling & Cooper, 2008). Good communication should not be overlooked because people-related issues constitute the basic reasons for the failure of organizational change efforts (Atkinson, 2005; Smith, 2005; Ololube et al., 2016a). People related issues are not to be viewed as occurring only among the lower-level employees if change must be implemented by management. The fact remains that gaps in the understanding of organizational change and responses occurs among different levels of management (Bartunek, et al., 2006). Employee related issues involve in organizational change may result from organizational culture and the negative impact that changes often have on employees because people are considered the critical factor in the success of organizational change efforts (Belias & Koustelios, 2014).

In university administration, human resources management is a strategic and more coherent approach to the management of the sub-system which includes the academic staff (lecturers), and students work individually and cooperatively to contribute to the attainment of the university set objectives especially during and after organizational change process. The academic staff of a university is the pivot of the system. Akpotu (2000) states that the type and quality of lecturers that a university has is used to measure the development of the university, therefore just like every other organization, university system depends heavily on the administrators and lecturers (faculty) to effect change to enable the attainment of its goals. This implies that improving university standard is possible through administrators and faculty. However, Akpotu (2000) further observed that lecturers are the major focus of change as well as the anchor and determinant of quality in the university system. According to Smith (2005), managing organizational change is a huge task besides managing the people in the processes of change. This in particular impacts the psychological and physical aspects of organizational change. Most employees are not detached from their work but experience a range of emotional involvements through membership of their organization (Adeyemi, 2004). Putting into considering the business side of change, the human side is not entirely rational. It involves emotions like fear, uncertainty and doubt. However, in spite of this, management practices are still grounded in the theory of the rational man (Karp, 2004).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Organizations' failure to address the human side of change often results in detrimental psychological impact on employees (van Dijk & Van Dick, 2009). The study of Paruk and Singh (2012) revealed that as soon as an organization embark on major change efforts, employees find themselves stressed up and confused. It is obvious that stress is one of the major primary psychological consequences of organizational change that employee are subjected to. Stress in the context of the article involves the challenge to a person capacity to adapt to inner and outer demand, which may be physiologically arousing, emotionally tasking and cognitively and behaviorally activating (Okafor & Bode-Okunade, 2005; Gabriel & Oburu, Aduba, 2013). Therefore, stress is as a result of the impact of job demands on employees due to the existence of a stressor, or organizational condition that may require an adaptive response from employees (Ekundayo, 2014; Yaacob & Long, 2015). According to Woodall and Winstanley, a study in 1997 indicated that for most Americans, their jobs are the greatest stressor in their lives. Research further indicated that the most contributors to job stress are time pressures (60%), work overload (54%), threat of job loss (52%), lack of consultation and communication (51%) and understaffing (46%) (Woodall & Winstanley, 2001). It is therefore consequent on this logical review that we are obliged to hypothesize that:

- There are no significant relationships between leadership perceptions and organizational change.

Attitudes Towards Organizational Change

Globally, universities are progressively improving their ability to enhance their staff backing and acceptance of their change initiatives. However, there are fundamental conditions for an intended change to be supported by employees. Most researchers focus on various forms of attitudinal paradigms of employees' attitudes toward change such as employee sincerity towards change, readiness for change, commitment to change, and skepticism about organizational change, which are valuable means to measure employee's assessment and/or concerns about any change move (Choi, 2011). Employees come into organizations with certain needs, skills and expectations. They come into the organization with the hope that they will find the work environment where they can use their abilities and equally satisfy their wants. With these expectations in mind, and if the organization can provide them with the opportunities they desire, there is likelihood that the employees will increase commitment to an intended organizational change (Herscovitch & Meyer, 2002). Employee commitment is characterized into three related factors: strong acceptance of the organization's values and goals, willingness to put forth considerable effort on behalf of the organization and strong desire to sustain membership of the organization. As a result, commitment is determined by a range of individual factors such as personal attitude, characteristics, experience and role related features (Vakola & Nikolaou, 2005).

According to Orobor et al. (2006), attitude is the predisposition to act or not to act in a certain way. It is a mental position regarding a situation that is closely related to perception. Vakola and Nikolaou (2005) defined attitude as certain consistencies in someone's feelings, thoughts and predispositions to act toward aspects of his environment. It reflects someone's propensity to feel, think or conduct him or herself in a positive or negative manner towards change. Attitude toward change consist of an individual's perceptions about change, emotional reactions to change, and behavioral predisposition toward change. To Wittig, employees' reactions to organizational change may be influenced by a number of factors. And it is practically reasonable to see employees react because the process of organizational change involves going from the known to the unknown (Wittig, 2012).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Attitude may be positive or negative. Positive attitude to organizational change means that change is essential for the organization to succeed, while negative attitude to organizational change means that an individual or group believes that change might ruin the organization. For this reasons, change can be received with excitement and happiness or anger and fear while employees' response to it may range from a positive intention to support the change to a negative intention to oppose it. Positive attitudes to change were found to be vital in achieving organizational change (Eby, Adams, Russell & Gaby, 2000).

According to Oparanma and Zeb-Obipi (2012), Gabriel, Oburu and Aduba (2013) and Elrod and Tippett (2002), organizational change efforts tends to be stressful. Specifically, they are of the opinion that emotional conditions and factors like denial, anger, bargaining, chaos, depression, resignation, openness, readiness and re-emergence will emerge for organizational change to take place. To Eby et al. (2000), employee attitude toward change impact their morale, organizational productivity and turnover. Attitude is strongly influenced by contextual factors such as culture, reward, recognition, incentive and organizational norms. To this end, several factors influence university leadership, lecturers and students, and they see change differently within the context of their operational environment (Orobor et al., 2006).

The conditions that favor the change process is determined by financially viabilities secured by the employees, significant room for change, awareness of the value of change, considerable amount of trust between management and employees, degree of commitment by the leaders and the employees, deficiencies in conditions of service and employment, the way university leaders, lecturers and students see change influences their attitude towards change (Barling & Cooper, 2008). It is therefore consequent on this logical review that we are obliged to hypothesize that:

- There are no significant relationships between the attitudes of principal officers of the universities and faculty members towards change.

Applications of Organizational Change

Change is an alteration in an employee, group and organizations production and service processes and the way organizations do business (Oparanma & Zeb-Obipi, 2012). An alteration or initiative in the way organizations do business can be time consuming and costly, especially when it tends to impact and drive organizations towards success. Globally, nearly half of the organizations fail, as a result, change is inescapable and organizations need to resolve how to successfully adapt and sustain change. Completely, strategic change in organization is driven through programs, activities and projects. Unsurprisingly, effective programs, activities and projects by their nature create change that will successfully implement organizational change. For example, in universities, programs, activities and projects managers like top university Administrators, Deans, Heads of Departments and Lecturers with requisite skill drive and navigate change. They are saddled with the responsibilities of making sure that the intended drives towards change are strategically planned and are aligned to the goal(s) in which the change is targeted.

The success or failure of a change initiative is not just about initiating, planning, monitoring, executing and evaluating the projects that will drive the change (Oyebanji, 2009). It also involves preparing organizations for transformation, ensuring the sub-system (stakeholders) buy into it, and engaging administrative sponsors to champion and support the change before, during and after its implementation. Like every organization the success or failure of a university in the change process is determined by the relevant skills, abilities and knowledge of the academic staff (Deans, HODs, Lecturers), non-academic staff and students.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Successful organizational change is dependent upon the need for change, little resistance to change and readiness for change. According to Ramakrishnan (2014), organizational change is only possible when employees display little resistance and readiness for change, accept the need to change and display wiliness to engage in the processes of change, which may be difficult and challenging. Factors such as divergence in opinions, the effectiveness of the intended change, appropriateness and the timing of change and employees support are all fundamental components for transformational change aimed at creating readiness for change (Armenakis, Harris & Feild, 2002).

Organizations, universities inclusive are comprised of people with different perceptions, attitudes, abilities, knowledge and skills when properly channeled and managed determine the success of the university (Abiodun-Oyebanji, 2012). Motivation and training of lecturers enhances improvement of educational standard, quality is sure especially during the process of change (Emechebe, 2009). Appropriately trained and motivated teaching staff are important in the university system and their roles cannot be substituted. If university education is to grow and make progress in consonant with organizational change, it will require greater allocation of competent and qualified humans including adequate material resources. However, the most valuable resources required for change within the university system are its human resources base (Akpotu, 2000; Oyebode, Ajayi & Oyeyipo, 2007). Human resources are fundamental and indispensable agent in the improvement of the potentialities for organizational change.

The effective management of Nigerian universities depends on the availability of competent and adequate staff seems to be critical and possess difficulty in the change processes especially for the academic staff. Abiodun-Oyebanji (2012) suggests that in many Nigerian universities the situation seem to be clear as academic staff appears to be in limited supply. Okebukola (2002) argued that the huge expansion of university education sectors worldwide, added with the increasing diversity of the student base and the very need for university to engage and compete in the global academic arena has made many institutions to re-evaluate how they manage and support their staff. However, employees (academic and non-academic staff) tend to resist change especially when it is not attractive. Worldwide, the growth of universities in the last decade alone has substantially increased the number of academic and administrative staff required to meet the challenges of expansion. Institutions adopt diverse ways to do research, teaching and learning and the delivery of university business. University systems have come virtually to recognize that success is dependent on effective administration and planning for their future staffing needs for organizational change to take place (Daysh & Kubler, 2008). Therefore, it beholds on us to expect that university's administrative capacity, research, teaching and learning are the actual or predictable stimuli in its environment that can drive change. It is therefore consequent on this logical review that we are obliged to hypothesize that:

- There are no significant relationships between the applications of change and how effective can it be put into practice to influence change in universities.

METHODS

Research Design

Most educational management and planning research methods are descriptive. Descriptive research in this context is the conditions or connections that exist; the practices that exist; opinions and attitudes that

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

are held. The descriptive research method applied in this study is primarily concerned with portraying the prevailing conditions and connections that exist. In fact, the descriptive research method applied here is exactly a method because many approaches of data analysis were grouped together. However, the analyses have one thing in common—individually and collectively they endeavor to represent the present position of organizational change situation in Nigerian universities. Nonetheless, the main difference between various forms of descriptive research method is not in the process of describing the situation that prevails; it goes beyond just the collection and tabulation of data; but attempts to obtain facts and faculty members opinions about the current condition of organizational change in Nigeria higher education.

The fundamental purpose of this study is to expose to view new knowledge about organizational change. More precisely, the purpose of this study is to evaluate leadership perceptions, attitudes and applications of organizational change in Nigerian universities.

Research Population

The population of this study defines the limits within which the research findings are applicable. In other words, it is defined in such a way that the results of the study are generalizable unto it. The target population of this study are all the academic and non-academic staff of all the universities in Nigeria, whereas the accessible population are the academic and non-academic staff within the reach of the researchers.

The research population for this study is drawn from faculty members of some selected universities in the south-south geo-political zone (accessible) of Nigeria (target). The population comprised of academic and non-academic staff of Nigerian universities: principal officers of universities, senior lecturers and heads of departments (HODs), readers (associate professors) and professors.

The reasons for choosing principal officers of universities, senior lecturers, readers (associate professors) and professors is that they are directly involved in organizational change matrix of universities, therefore, they stand better chance of measuring change in Nigerian universities.

Sampling/Sample Size

The researchers' of this study made a choice of using purposeful sampling procedure for senior lecturers, principal officers and their deputies and simple random sampling was employed in the case of readers and professors because it is by far the easiest and simplest sampling method in terms of conceptualization and application. Simple random sampling does not require knowledge of the exact composition of the population.

Universities in the south-south geo-political zone are many from which ten (10) were randomly selected. The names of all the public universities in the zone were written and selected randomly. The ten (10) selected universities are different in types and in sizes. The researchers considered them representatives of the different universities. A total number of four hundred and fifty questionnaires (450) were distributed, out of which three hundred and twenty-five (325) were returned, from which three hundred and eleven (311) questionnaires were selected. Fourteen of the questionnaires were discarded because of errors in the ways they were completed. The ages of the respondents were between 41-69 years. Responses were limited to three faculties and management staff of the ten selected universities (see Table 1 for further details).

Table 1. Descriptive analysis of respondents demographic information

Age	Number of Respondents	Percentages (%)
35-44 years	45	14.5
45-54 years	180	57.9
55-64 years	51	16.4
65-70 years	35	11.2
Total Number	311	100
Gender	**Number of Respondents**	**Percentages (%)**
Male	182	58.5
Female	129	41.5
Total Number	311	100
Respondents Status	**Number of Respondents**	**Percentages (%)**
Principal Officers and their Deputies	40	12.9
Senior Lecturers and (HODs)	140	45.0
Readers (Assoc. Prof.)	86	27.6
Professors	45	14.5
Total Number	311	100
Units/Faculty of Domicile	**Number of Respondents**	**Percentages (%)**
Management Staff	40	12.9
Arts and Humanities	80	25.7
Education	108	34.7
Management Sciences	83	26.7
Total Number	311	100

Data Collection

Questionnaire

The researchers structured a suitable design (questionnaire) along a four-point Likert-type scale of strongly agree (4), agree (3), disagree (2) and strongly disagree (1), which has approximately equal "value" for all the items on leadership perceptions toward organizational change, attitudes towards organizational change, and applications of organizational change. The respondents responded with the degree of agreement or disagreement. The questions were made simple and direct. The questionnaire comprised two sections:

Section A of the Questionnaire (Contents)

Section "A" of the questionnaire focuses on items such as age, gender, respondents' status and units/ faculty of domicile.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section B of the Questionnaire (Contents)

Section "B" focuses on possible factors that may or may not be perceived as being capable of influencing organizational change, such as:

- Leadership perceptions towards organizational change
- Attitudes towards organizational change
- Applications of organizational change

Validity of the Study

The instrument used for this study was validated. First, the research instrument was valid because the researchers took time to act in accordance with the principles and processes of designing an academic questionnaire (see Ololube, 2006). Second, the questionnaire was given to professional colleagues that are experts in instruments evaluation; they read through and made necessary corrections. Third, the questionnaire was pre-tested on a population (20 persons) outside the sample size and their responses were used to improve on the items.

Reliability of the Instrument

The quality of this research depended on the consistency with which the research was carried. And its consistency in turn is depended on the precision with which description is quantified. Therefore, the strength of the instrument we used in this study was reliable because it elicited the required information on leadership perception towards organizational change, attitudes and application of organizational change in Nigerian universities. However, an accurate measure of reliability was based on the statistical data obtained. To statistically test the reliability of the instrument to provide non-random results, a quantitative measurement to assess the reliability was seen as proper in this study since the respondents were directly affected because the study focused on them with regards to their perception, attitude and application of organizational change. A quantitative analysis of the respondents' answers was performed using the Statistical Package of the Social Sciences (SPSS) version 23 to statistically test the reliability of the instrument because in research when a research instrument's reliability has been secured it builds the foundation for further inquiry (See Ololube, 2006).

The result from the reliability estimates showed a cumulative reliability of .842, which showed a strong reliability of the questionnaire. According to Bryman and Cramer (2012), reliability estimate should be termed to be sufficient if it varied between 0–1, and preferably at 0.8-.

Data Analysis

The first step in the data analysis process was to present the results of the study in its raw form, which is followed by the analyses of the data using SPSS version 23. The analyses involved the use of multiple statistical procedures: Cross tabulation and Regression, cross tabulation was used to answer the research questions, while regression was used to test the hypotheses for relationships. The second step is the discussion of the results from the respondents and making use of evidence from literature to support

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

them. The clear value of this section in the researchers' opinion is that the results are connected to the information in the literature review.

RESULTS AND ANALYSES

Research Question 1

Research question one was aimed at determining the extent to which university leaders perceive change in the university system. The research question states "To what extent does leadership perceptions influence organizational change"? Data were tallied along agree and disagree, and they revealed (see Table 2) that 299(96.1%) agree that employees perceive good and effective communication as great tool for organizational change, as against 12(3.9%) who disagree. On credibility gaps between management and employees, 217(69.9%) are of the opinion that communication barriers stands against organizational change. Likewise, respondents 275(88.4%) against 36(11.6%) agree that employees related issues may result from negative impact because employees are considered the critical factor in the success of organizational change efforts. Overwhelming majority of the respondents: 307(98.7%) equally agree that the quality of lecturers that a university has is used to measure the development and change in the university; and 303(97.4%) are of the opinion that managing change is a huge task besides managing the employees in the processes of initiating change. Same is true when respondents 305(98.1%) against 6(1.9%) agree that employees associate emotions like fear, uncertainty and doubt influences organizational change. And 309(99.4%) contrary 2(0.6%) are of the view that organizations' failure to address the human side of change often results in detrimental psychological impact on employees.

Research Question 2

Research question two was intended to examine the extent to which attitudes influence change in the university systems. Research question two states "To what extent does attitude of principal officers of the universities and faculty members influence change"? The Cross tabulation analysis in Table 3 were matched along agree and disagree, and the responses depicted that 214(68.8%) against 97(31.2%) agree that Nigerian universities are progressively improving their ability to enhance their staff backing and acceptance of their change initiatives. Surprisingly, 224(72.1%) disagree that employee are sincere towards organizational change and are ready for it at all cost. Contrary, 208(66.9%) against 103(33.1%) agree that employees are committed to organizational change, while 236(75.9%) believe that employees are skeptical about organizational change. 212(68.1%) agree, while 99(31.8%) disagree that employees are willing to put considerable efforts on behalf of the university. Correspondingly, 209(67.2%) agree that employees come into organizations with certain needs, skills and expectations, and when these are absent they tend not to support change. 304(97.8%) of the respondents agree that employees attitude towards change consist of an individual's perceptions about change, emotional reactions to change, and behavioral predisposition toward change. Approximately 156(50.1%) agree and almost half 155(49.9%) disagree that employees anger, fear and frustration are determinants of change. 209(67.2%) agree, while 102(32.8%) disagree that organizational change efforts tend to be stressful, as a result, employees tend not to support with all sincerity, and majority, 300(96.5%) of the respondents agree that employee attitudes

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

towards change are influenced by contextual factors such as culture, reward, recognition, incentive and organizational norms and values.

Research Question 3

Research question three was projected to survey respondents' opinion on application of organizational change. The research question states that "To what extent does the applications of change influence change in universities"? To provide answers to the items raised, data from the Cross tabulation analysis conducted (see Table 4) showed that 275(88.4%) of the respondents agree that the application of change is an alteration in production and service processes and the way organizations do business, this is in contrast to 36(26.6%) who disagree. 302(97.1%) agree, against 9(2.9%) who disagree that changes are intended to impact and drive organizations toward success. 300(96.5%) of the respondents were of the view that strategic change in organization by their nature create change that will successfully implement change. 246(79.1%) agree, against 65(20.9%) who disagree that principal officers, deans, heads of departments, readers and professors have requisite knowledge and skills to navigate change. However, 295(98.1%) of the respondents agree that applying change involves preparing organizations for transformation, and ensuring that the sub-system buy into it. In the same vein, 292(93.9%) agree against 19(6.1%) who disagree that engaging administrators is vital in championing and supporting change before, during and after its implementation. Equally, majority of the respondents, 270(86.8%) agree, against 41(13.2%) who disagree that the success or failure of a university in the change process is determined by the relevant skills, abilities and knowledge of its academic staff. Correspondently, 272(87.5%) agree, while 39(12.5%) disagree that university systems should virtually recognize that success is dependent on effective administration and planning of its future staffing needs for organizational change to take place.

Hypotheses Testing

The need to triangulate data was necessary to further verify our analytical information. The regression analysis conducted as depicted in Table 5 showed that most of the relationships were significant and positive with an R square of .638 and an adjusted R square of .630 of the entire variables entered.

The ANOVA analysis depicted the sum of square for the regression to be 34.272 and that of the residual is 19.419, and a degree of freedom (df) = 7, with an F-value of 76.393 and a significance of .000. This implies that perceptions, attitudes and applications have significant relationships between change management practices within the university systems in Nigeria.

The estimated Coefficient analysis for organizational change is positive. This implies that perceptions towards organizational change with a significance level of .000 and a calculated t-value of 4.159; attitudes towards organizational change were significant at .000 with a calculated t-value of 11.052; and application of organizational change were significant at .001 with a calculated t-value of 3.617. Thus, hypotheses 1, 2 and 3 were rejected because there are significant relationships between leadership perceptions and change; there are significant relationships between the attitudes of principal officers of the universities and faculty members towards change; and there are significant relationships between the applications of change and how effective it can be put into practice.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Cross tabulation analysis of respondents demographic information on perceptions towards organizational change

S/N	Perceptions towards Organizational Change	Strongly Disagree	Disagree	Agree	Strongly Agree	Total
1	Employees perceive good and effective communication as great tool for organizational change	4 (1.3%)	8 (2.6%)	112 (36.0%)	187 (60.1%)	311 (100.0%)
2	Credibility gaps between management and employees / communication barriers stands against organizational change	3 (1.0%)	91 (29.3%)	137 (44.1%)	80 (25.7%)	311 (100.0%)
3	Employees related issues may result from negative impact because employees are considered the critical factor in the success of organizational change efforts	5 (1.6%)	31 (10.0%)	169 (54.3%)	106 (34.1%)	311 (100.0%)
4	To what extent do you believe that the quality of lecturers that a university has is used to measure the development and change in the university	4 (1.3%)	- -	228 (73.3%)	79 (25.4%)	311 (100.0%)
5	Managing organizational change is a huge task besides managing the employees in the processes of initiating organizational change	5 (1.6%)	3 (1.0%)	134 (43.1%)	169 (54.3%)	311 (100.0%)
6	Employees associate emotions like fear, uncertainty and doubt influences organizational change	6 (1.9%)	- -	230 (74.0%)	75 (24.1%)	311 (100.0%)
7	Organizations' failure to address the human side of change often results in detrimental psychological impact on employees	- -	2 (0.6%)	161 (51.8%)	148 (47.6%)	311 (100.0%)

Table 3. Cross tabulation analysis of demographic information on attitude towards organizational change

S/N	Attitudes towards Organizational Change	Strongly Disagree	Disagree	Agree	Strongly Agree	Total
8	Universities are progressively improving their ability to enhance their staff backing and acceptance of their change initiatives	5 (1.6%)	92 (29.6%)	183 (58.8%)	31 (10.0%)	311 (100.0%)
9	Employee are sincere towards organizational change and are ready for it at all cost	12 (3.9%)	212 (68.2%)	81 (26.0%)	6 (1.9%)	311 (100.0%)
10	Employees are committed to organizational change	6 (1.9%)	97 (31.2%)	202 (65.0%)	6 (1.9%)	311 (100.0%)
11	Employees are skeptical about organizational change	8 (2.6%)	67 (21.5%)	170 (54.7%)	66 (21.2%)	311 (100.0%)
12	Employees are willing to put considerable efforts on behalf of the university	39 (12.5%)	60 (19.3%)	150 (48.2%)	62 (19.9%)	311 (100.0%)
13	Employees come into organizations with certain needs, skills and expectations, and when these are absent they tend not to support change	11 (3.5%)	91 (29.3%)	41 (13.2%)	168 (54.0%)	311 (100.0%)
14	Attitude towards change consist of an individual's perceptions about change, emotional reactions to change, and behavioral predisposition toward change	7 (2.3%)	- -	190 (61.1%)	114 (36.7%)	311 (100.0%)
15	Employees anger, fear and frustration are determinants of change	31 (10.0%)	124 (39.9%)	132 (42.4%)	24 (7.7%)	311 (100.0%)
16	Organizational change efforts tend to be stressful, as a result, employees tend not to support with all sincerity	4 (1.3%)	98 (31.5%)	147 (47.3%)	62 (19.9%)	311 (100.0%)
17	Attitudes towards change are influenced by contextual factors such as culture, reward, recognition, incentive and organizational norms and values	5 (1.6%)	6 (1.9%)	208 (66.9%)	92 (29.6%)	311 (100.0%)

DISCUSSION OF FINDINGS

The three research questions were answered and the three hypotheses were tested and verified with respect to their significant relationships. The research questions were aimed at determining the influences of the sub-variables of perceptions, attitudes and applications on organizational change as applied to the uni-

Table 4. Cross tabulation analysis of demographic information on application of organizational change

S/N	Application of Organizational Change	Strongly Disagree	Disagree	Agree	Strongly Agree	Total
18	Application of change is an alteration in production and service processes and the way organizations do business	5 (1.6%)	31 (10.0%)	209 (67.2%)	66 (21.2%)	311 (100.0%)
19	Changes are intended to impact and drive organizations toward success	- -	9 (2.9%)	129 (41.5%)	173 (55.6%)	311 (100.0%)
20	Strategic change in organization by their nature create change that will successfully implement change	11 (3.5%)	- -	156 (50.2%)	144 (46.3%)	311 (100.0%)
21	Principal officers, deans, heads of departments, readers and professors have requisite knowledge and skills to navigate change	34 (10.9%)	31 (10.0%)	68 (21.9%)	178 (57.2%)	311 (100.0%)
22	Applying change involves preparing organizations for transformation, ensuring that the sub-system buy into it.	6 (1.9%)	- -	170 (54.7%)	135 (43.4%)	311 (100.0%)
23	Engaging administrators is vital in championing and supporting change before, during and after its implementation	19 (6.1%)	- -	127 (40.8%)	165 (53.1%)	311 (100.0%)
24	The success or failure of a university in the change process is determined by the relevant skills, abilities and knowledge of its academic staff	14 (4.5%)	27 (8.7%)	161 (51.8%)	109 (35.0%)	311 (100.0%)
25	University systems should virtually recognize that success is dependent on effective administration and planning of its future staffing needs for organizational change to take place	9 (2.9%)	30 (9.6%)	78 (25.1%)	194 (62.4%)	311 (100.0%)

versity environment in Nigeria. The extent to which university leaders perceive change in the university system was determined with respect to good and effective communication as a tool for organizational change, and the role of communication barriers to organizational change. This study's findings support that of Otara (2011), Ololube et al. (2016a), Xie (2013), Atkinson (2005) and Smith (2005). This could be due to the importance of effective communication on the overall good of the university system because poor or good communication constitutes the basic reasons for the failure or success of organizational change efforts. The study revealed that the quality of staff in a university determine its organizational change efforts. This is in line with Akpotu (2000) findings that the type and the quality of lecturers that a university has are used as yardstick to measure the development and changes in the university. The perceptions remain that 99.4% of the respondents agree that an organization failure to tackle the human aspects of change often results to negative psychological influence on employees. This finding is in line with that of van Dijk and van Dick (2009) and Paruk and Singh (2012). Their respective studies revealed that organization change efforts get employees stressed up and confused.

The findings that employee attitudes influence organizational change did not depart from the findings of the studies of Herscovitch and Meyer (2002), Vakola and Nikolaou (2005), Orobor et al. (2006), Eby et al. (2000) and Wittig (2012). Their studies revealed that positive attitude towards organizational changes depict that the desirable changes are essential for organizations to succeed, whereas negative attitudes to organizational changes show that employees do not welcome the intended changes, which they believe might ruin the organization. Surprisingly, 72.1% disagreed that employee are sincere towards organizational change and are ready for it at all cost.

Significant influence was observed in the respondents' answers that the application of change impacts change in the universities. The evidences were strong and they support the study of Oparanma and Zeb-Obipi (2012), Ramakrishnan (2014) and Abiodun-Oyebanji (2012). Their views are that universities are comprised of staff that have abilities, knowledge and skills and if properly directed and managed will

a. Dependent Variable: Organizational change
b. All requested variables entered

determine the success of the university. Applying change involves preparing organizations for transformation, and ensuring that the sub-system embraces such change.

The triangulated analyses for this research investigation, revealed the extent to which significant relationships existed between leadership perceptions, attitudes, and applications of organizational change. These relationships are functions of the principal officers of the universities and faculty members. For the three hypotheses, significant results were present for the regression analysis at .000, .000 and .001 respectively. As such, the results from this empirical investigation were in agreement with previous investigation (e.g., Daysh & Kubler, 2008; Okebukola, 2002). Thus, Nigerian university systems need to practically recognize that success is dependent on effective administration and planning, and the quality of the future staffing requirements necessitates organizational change.

CONCLUSION

This study has clearly shown that relationships exist between leadership perceptions, employees' attitudes, applications and organizational change. The study holds the view that change management are continuous

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

method used in transforming employees and organizations to an anticipated future change. Perceptions, attitudes and effective application of organizational factors act as catalyst for possible changes in organization applicable to the university systems. The drive for change management will eventually make use of initiatives and ensure that employees are willing and ready to embrace the anticipated change. University principal officers, their deputies and faculty members have a lot to do, because change management is often painful and chaotic. The study recommends that Nigerian universities should be proactive in the implementation of changes to improve their employees' perceptions, attitudes and applications towards organizational change.

This study has expanded the scope of the knowledge and practice of organizational change by informing university leadership, professionals, researchers and scholars about the theme of this study, and those who are considering related studies about the needs to integrate other variables to boost the intellectual base of organizational change.

The future research direction of this study should be to facilitate studies that will extend the findings of this study, and the number of variables that equally represent a large proportion of the disagreement in this study.

Chapter 88
Leading, Managing, and Facilitating Organizational Change

Paul Steven Turner
Paul Turner HR Limited, UK

ABSTRACT

This chapter focuses on organizational change and development and how leadership behavior impacts upon the delivery of the desired change, in terms of implementation, effectiveness, and performance. The reflective perspective seeks to explore learning insights gained via business and academic approaches within transformational change programs in two dimensions: first, the author's PhD research project investigated leadership behavioral approaches designed to deliver organizational change and increased engagement and performance; and second, the author's involvement as a business consultant and executive coach, acting for private sector companies on transformational change programs designed to deliver strategic change to drive increases in efficiency, effectiveness, and performance. The purpose of this chapter is to inform professionals involved in organizational change and development within their own or their client organizations and facilitate learning to help better understand the potential of leadership behavior in delivering successful organizational change strategies.

INTRODUCTION

This chapter provides different perspectives through the multiple lens of academic researcher, HR practitioner and business consultant and supports the argument for evidence-based organizational change and development (EBOCD) practice. The assertion by Hamlin and Stewart (2011) that HRD has the potential to facilitate organizational change supports earlier examples of Human Resource Development (HRD) practitioners, such as training and learning consultants operating as organizational change consultants (Phillips & Shaw, 1989). The author experienced this dual perspective in his role as an internal HR practitioner and later as an external HR consultant supporting HR practitioners undertaking similar multi-perspective roles.

The period covered spans from 2002 to 2018 encompassing the author's career journey as an HR executive/practitioner, PhD researcher and independent business consultant/coach. The insights gained benefitted from internal 'insider' and external 'outsider' reference points which provided both challenge and opportunity. The author has contextualized these findings within two time-based periods. Firstly, a view compiled from the author's PhD research project, conducted as a sole researcher and based on a single company case study over a six year period (2002 to 2008). This case study investigated how strategic leadership approaches impacted upon organizational culture including employee engagement and performance. Secondly, from a broader perspective which considers the author's involvement as an independent business consultant and executive coach from 2008 onwards acting as a change agent for private sector companies, including large multinationals, on transformational programs. In this role the author facilitated the delivery of programs designed to deliver high performance through organizational change, increased efficiency and greater effectiveness.

The central threads from the two perspectives are considered and key insights developed with the aim of informing CEOs, HR practitioners, senior leaders and business consultants involved in EBOCD within their own or their client organizations and, in so doing, help to deliver successful organizational change strategies in the future.

BACKGROUND

The business environment has changed dramatically in recent years. Whilst commercial change drivers are often created by political and economic imperatives, both local and global, this is not always the case. The need for change is often related to more mundane change factors, such as an organization's strategic positioning in its own market sector, the emergence of a 'maverick' business leader into a market place or the failure of internal talent management processes which fail to deliver a 'conveyor belt' of talented individuals. The introduction of a new product or service by a competitor may also require a strategic response whether this be an aggressive or collaborative approach. The strategic types of organizations identified by Miles and Snow (1978), that is *prospector, defender*, *analyzer* and *reactor,* remain broadly relevant in today's marketplace although there appears to be a much more fuzzy view some forty years on from their conception, with many organizations adopting multiple strategic approaches, particularly across inter-group boundaries.

Against a background of political, economic and market forces, organizational leaders are grappling with implementing change strategies designed to realign their business model to continually changing circumstances. Leadership teams now require an outstanding capability for juggling multiple priorities as they strive to continuously update their key strategic focus, the shape of which will be driven by differences in geography, industry sector, market place and corporate strategy. Leadership agility and resilience are *de rigeur* terms in global board rooms (Joiner & Josephs, 2006). Yet, several years after the global recession of 2008, the leading CEOs in financial services remain heavily focused on their last critical strategic challenge of regulation and governance. Will this rear view strategic perspective end in another financial meltdown for different reasons? Across the board, irrespective of industry, the biggest change challenges continue to relate to technology, people and communications (Swaim, 2010). The differentiating factor in recent times is an unrelenting increase in the pace and exponential nature of change.

The fast changing business environment demands that the C-suite team of 2018 cannot behave in the same way as the C-suite team of the early 2000s. The increasing pace of change has overtaken the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

successful strategies of just a decade ago. The pursuit of strategic change solutions has led to change management theory being part of a major academic industry, based on new tenets of groundbreaking principles or short-lived fads, dependent on viewpoint. Re-engineering, total quality, downsizing, management by walking around, centralization and decentralization have all been fashionable as change trailblazers in academic and corporate circles before slipping into midlife obscurity (Micklethwaite & Wooldridge, 1996).

Many change management approaches proposed by business gurus around 'best-in-class' organizations are insubstantial as these rely very little, if at all, on evidence-based research, in addition to a lack of practical and pragmatic business insights. However, based on book sales, many appreciate the knowledge and insight such writers bring to the discussion, irrespective of academic rigor and/or business experience. From an evidence-based perspective Hamlin (2001) describes root failings of managers and HRD practitioners when undertaking organizational change and development; namely a lack of change management expertise, the use of quick fix or simple solutions, a failure to recognize the critical contribution of HRD, trainers and developers lacking internal credibility and most tellingly, a lack of appreciation of the importance of leadership, culture and people aspects of change.

Whilst this chapter relates to all these areas, there is a focus on the leadership, cultural and people management aspects. Insights are offered primarily through the conceptual lens of Evidence-Based Human Resource Development – EBHRD (Hamlin, 2002) and HRD professional partnerships (Hamlin, 2006). This reflective journey commences with an overview of the author's PhD research project, a single company case study which investigated how strategic leadership approaches based on a coaching behavioral paradigm, impacted upon organizational culture including employee engagement and performance (Turner, 2010).

MAIN FOCUS OF THE CHAPTER

This section explores EBOCD from both academic research, HR practitioner and business consultancy perspectives, identifying solutions and recommendations for EBOCD programs before discussing emerging trends and the potential for future research direction.

EBOCD, A Financial Services Case Study History: Academic and Practitioner Perspective – 2002/2008

Background and Context

The organizational context relates to a UK based building society and financial services provider. The early 2000s involved a period of intense change in the financial services sector, created largely by the introduction of the Financial Services and Markets Act which heralded a stronger regulatory regime. These regulatory changes were largely in response to a changing retail banking environment. Over the previous 10 years the old retail banking delivery methods, based on 'bricks and mortar' high street outlets, had begun to succumb to a voracious consumer appetite for more flexible 24/7 service channels starting with postal accounts and progressing to telephone and internet based banking.

The first building society was formed in 1775 and by 1930 their number stood at 1,026 before starting a rapid descent from the 1960s onwards, until in 2002 their number had fallen to 63 (Building Societies

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Association, 2016); to further fall to 51 in 2017 (Building Societies Association, 2017), with the vast majority regionally based organizations. The case study organization was formed in the mid-19th century and consequentially has a rich history of tradition and mutuality responding to the growing aspirations for home ownership of the working classes. In 2002 it had been thriving for 150 years without any merger or takeover and was a leading building society in the UK employing over 800 staff across Head Office and approximately 50 branches. Committed to mutuality, the Society invested approximately £700k annually in local communities. Within the wider financial services market place, the building society movement was under pressure from traditional banking and newly formed competitors, the increasing cost of regulation, new technology and aggressive takeover challenges from bigger market players. Thus the case study organization was trading in a very pressured and competitive marketplace with a host of change-driven challenges.

In 2002 the organization's CEO, a charismatic leader, had led the building society through a series of strategic challenges. During his tenure as CEO he championed visionary and values-driven people strategies to deliver record financial performance and wide ranging industry and HR recognition, evidenced by national and international awards, which eventually totaled over 100 by 2006; at that time a rare if not unique achievement for an organization of this size.

In 1999 the author was appointed to a new and innovative role in the case study organisation, responsible for all aspects of the people agenda across the organization, including culture. In terms of business performance much had already been achieved by 2002 yet the future remained challenging with the introduction of external regulatory measures, the need for new income channels, the growing volatility of markets and the resulting internal organizational changes. These challenges required more flexible, adaptable and innovative approaches to be delivered by highly engaged, committed and empowered employees. This strategic requirement for organizational change identified a leadership skills capability 'gap' revolving around a need to encourage and inspire the workforce. To achieve this it was recognized the leadership and management team throughout the organization needed to realign their leadership style to one based on transformational leadership behaviors described as leadership coaching (Turner, 2015b). A culture-change program was commenced incorporating a leadership development program designed to realign and reskill the organization's managers towards a leadership coaching style and to achieve increased employee engagement and business performance. This program was to be designed within evidence-based parameters and measured by return on investment indicators such as product sales, service levels and cost effectiveness, all linked to the business strategy.

To refine the emerging strategic focus an organizational analysis review was agreed. In parallel, the undertaking of a PhD research case study was approved to support the evidence-based criteria and to critically evaluate leadership coaching as an effective way of facilitating organizational change and development, and enhancing employee engagement and performance. The linking of an academic research study and a 'live' business transformation program created the opportunity to view organizational change through an evidence-based lens, broadly aligned to the collaborative HRD Professional Partnership a joint academic and practitioner partnership approach undertaken by Hamlin and Cooper (2004).

Organizational Analysis and Research Framework

A series of facilitated employee workshops, informed by evidence-based research including the work of Burke and Litwin (1992) reviewed the areas of strategy, leadership, culture, external environment, structure, processes, systems and performance. A range of strategic organizational development models

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

were utilized including a SWOT analysis, a visioning approach and process mapping, together with references to transformational change and related models (Kotter, 1996; Kotter & Cohen, 2002). From the workshop outputs a 'route map' was developed which set out the existing 'current' and desired 'future' states and identified the 'gaps' relating to organizational structure, systems and people. These critical strategic elements were reviewed and driven forward by three sub executive groups reporting to the board with each responsible for an element.

The culture change group (CCG), chaired by the author, was responsible for the desired cultural change and oversaw evidence-based approaches including an informal network of employees from across the formal hierarchical structure (Kotter, 2014). The CCG was informally responsible for developing and implementing people and leadership related change strategies, including the leadership development program, as opposed to the formal responsibility for delivery which lay with the HR division. Through review and discussion of evidence-based research a leadership coaching approach based on a transformational leadership style (Bass, 1985, 1997; Bass & Avolio, 1993) was deemed to represent the most appropriate leadership style to drive the desired cultural change and an aligned leadership behavioral framework was created to facilitate management development.

The development of the leadership coaching program was set against a background of reports of corporate coaching programs not delivering evidenced value with clear measurable outcomes. The development of coaching within organizations was, and still often is, based on 'acts of faith' promoted by internal and external coaching advocates. When the question 'Does organizational coaching work?' is asked, the answer very often excludes the context, constraints and specific, detailed objectives and linked outputs surrounding the coaching activities. What was different about the case study leadership coaching program was the parallel longitudinal action research framework, which enabled continuous learning and ongoing assessment, both in cultural and performance terms.

By its nature this interactive action learning organizational research case study involved complexities and uncertainties and created challenges driven by a range of issues, some research based constraints and others more organizational based. These included internal politics, the singular nature of the case study, qualitative versus quantitative data inputs/outputs, defining the return on investment and, probably the most challenging, the longitudinal approach, which resulted in a backdrop of changing sociological and cultural factors, including employee changes. The key objectives were to (i) explore the view that sustained coaching in the workplace, supported by a strategic coaching framework, is an effective means of enhancing employee engagement and individual/organizational performance; (ii) identify key characteristics and barriers to building a leadership coaching capability able to deliver an improved quality of performance in the workplace and (iii) develop a coaching framework that identifies conducive organizational attributes, initiatives and capabilities that can act to enhance coaching effectiveness.

KEY LEARNING AND FINDINGS

The research study findings indicated that employee engagement and performance will benefit from an organizational coaching program underpinned by a network of factors focused on supporting coaching activity. These evidence-based factors relate to a *culture* built on common shared values, high performance, trust, openness, support, mutual respect and inclusiveness; *leadership* that role models the coaching culture through all levels of a management team that is *skilled* in coaching technique and relationship

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

management; a *learning environment* that provides an appropriate setting for coaching activity, and *HR processes* that develop, monitor, and reward coaching behaviors.

To support this culture change formula a process was developed, the 'Eight Steps of Achieving an Organizational Coaching Culture' (Turner, 2010, p. 351; Turner, 2013), which set out a strategic approach to creating an organizational coaching culture and recognized the importance of both human dynamics and the organizational environment. In developing this model the author recognized the impact of evidence-based transformational leadership behavior and wider organizational change (Kotter, 1996; Kotter, 2008; Kotter & Cohen, 2002). Whilst there may be a benefit in viewing the elements in a linear stage frame to enhance understanding, a flexible phased adaptation should be adopted dependent on the organizational context. The 'eight steps' are listed below.

1. Set out the leadership coaching vision and develop a sense of purpose.
2. Form a coaching coalition of advocates through engaging key stakeholders.
3. Generate a coaching strategy plan, key ROI measures and drive implementation.
4. Integrate and align coaching activity with organizational structure and processes.
5. Communicate the coaching message to 'spread the word' and engage employees.
6. Create a quality process to evaluate and accredit internal coaching activity and measure outcomes.
7. Plan the next wave of coaching activity to ensure the strategy is sustained.
8. Chalk up the coaching outcomes and ROI results via the evaluative process and identify improvements so as to make ongoing refinements. (Adapted from Kotter, 1996)

Within this transformational change framework resided a range of transactional methodologies, including processes and tools, to support the framework and link it practically and pragmatically to the workplace. One such coaching tool was the 9R Model, which set out nine phases of a performance oriented coaching process for line managers; Review – Rationalize – Refine – Reframe – Relate – Remedy – Reflect – Record – Revisit (Turner, 2010, pp. 368-369, Turner, 2013).

This integrated transformational – transactional organizational culture change approach was designed to inspire and motivate through a leadership vision and active role modeling from top-down whilst delivering and implementing via bespoke change management execution processes. Both approaches were designed to be complementary and to create a performance coaching focus which significantly impacted favorably on the organization's bottom line through increased sales, improved customer service and greater productivity, achieving a net annual return of £3.7m. Other non-tangible benefits related to skills, knowledge, behaviors, personal confidence, ideas generation, effectiveness, improved working relationship/atmosphere, career development, self-awareness and motivation which could arguably have had an indirect impact on performance through increased employee engagement. The case study research evidence suggests the combination of a transformational and transactional approach to the organizational cultural change program played a large part in delivering these benefits.

The case study provided evidence of relationship links between organizational culture, leadership behavior, employee engagement and performance. The Cultural Change Levers model (Turner, 2010, pp. 261-263) recognized that a change momentum was created when leaders adopted aligned leadership coaching behaviors, which favorably impacted upon employee performance in a direct manner through a causal relationship to specific role objectives, as well as showing a strong predictor of increased employee engagement. This organizational cultural change 'code breaker' can be expressed as follows:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- *Organizational Culture* is a facilitator of *Leadership Behavior.*
- *Leadership Behavior* drives improved *Employee Performance* and is a predictor of *Employee Engagement.*
- *Employee Engagement* is a predictor of high *Employee Performance.*
- *Employee Performance* sustains and develops the *Organizational Culture.*

As the research study neared its completion a UK government report was published highlighting the importance of employee engagement and its strategic importance in terms of the UK economy (Department for Business Innovation & Skills, 2009). The author's case study research backed up in quantitative terms many of the practitioner based qualitative conclusions presented in the government report. It also offered strong indications that effective coaching in the workplace is a key predictor of employee engagement, with the potential to maximize the benefits of an organization's performance management system and drive improvements in both the 'hard' factors of sales, and the 'soft' factors of employee engagement and commitment, through the development of appropriate skills, knowledge and behaviors (Turner, 2012). By the time these research studies had been published, the author had left the case study organization and was working as an independent business consultant and executive coach, primarily in the UK's private sector and then globally.

Personal Reflective Insights

Some several years on from the completion of the organizational case study the author now has a less intense view of events and, from a more distant stance, new reflective insights. For example, the critical importance of core purpose and values as it is these that drive an organization's mantra and the predominant behavioral characteristics of the organization's leadership (Turner, 2017). In the case study example the strategic purpose and related values helped to create the organizational culture surrounding and impacting upon the coaching activity.

The nature of the case study organization's community purpose and founding values based on the philosophy of mutuality provided a strong platform on which to develop an inclusive and participative culture. How did this authentic purpose-driven legacy impact upon the culture change? It could be argued that the historical values-driven legacy greatly supported the strategic intent, yet in many other organizational examples such traditional legacy cultures create barriers and blockages to desired change. The key practical and pragmatic evidence-based insights taken forward and developed by the author within a consultancy career were the importance of:

- Analytical assessment at the start of the cultural journey to understand the 'As Is' position and enable the development of a focused 'To Be' strategy, together with measurable change indicators.
- Leadership taking ownership and responsibility for the desired change and 'buying-in' to actively role model the appropriate leadership behaviors.
- Organizational change being enabled at two levels, macro via a strategic transformational change process and micro via supporting transactional execution processes.
- An ambietic change philosophy (Turner, 2010) which recognizes the impact of the organizational environment including leadership behavior within a framework of flexible processes which balance empowerment with control.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The critical role of CEOs (and boards) in facilitating the desired organizational culture so it can act as a catalyst to aligned leadership behavior, which in turn will drive employee engagement and employee performance and create the potential to facilitate change.
- An awareness of the impact of individual and team personality (as well as organizational culture) on leadership behavior and the value of evidence-based 360 degree and psychoanalytic approaches for identifying development areas.

The next section provides the author's reflective views of how, following a change in role from an 'insider' practitioner and change leader to an 'outsider' consultant and change facilitator, the author gained further experience and learning whilst working with 'change leaders' across several organizations, all seeking to achieve organizational cultural change and increased performance.

EBOCD Case Studies: A Consultancy Perspective – 2008 Onwards

The author's consultancy career commenced in 2007, gained pace in 2008 and has continued strongly to the present day. During this time the author has worked in both the commercial and academic sectors, thus enabling practitioner and academic perspectives. Academic appointments by the nature of the author's commercial work commitments have been restricted to visiting roles and one-off short-term associate contracts with six university business schools in the UK and internationally. These have added value to the business consultancy offering the latest evidence-based knowledge through access to the academic community. The potential for learning has encouraged the author to contribute to business management thought leadership via peer reviewed academic papers, business articles, blogs and podcasts for consultancy firms as well as book publications. In the commercial sector, consultancy assignments and projects have involved the author working with over 100 companies, including large national, multinational and SME UK based companies, as well as overseas based companies, including commercial operations in Australia, China, France, India, Spain, Sweden and UAE. These clients spanned several markets and sectors including retail, consumer products and FMCG, aerospace, pharmaceutical, manufacturing, IT, logistics and transport, building products and construction, social housing, mining, education, legal, financial services and professional sport. This extensive, diverse and cross-sector client portfolio has enabled the author to practically test academic theory and develop new evidence-based pragmatic business oriented approaches.

The consultancy work undertaken has involved a range of leadership development strategies including the facilitation of board/senior leadership development, visioning strategy activities and executive coaching, most of which has involved either leadership 360 degree feedback, including the Multilevel Leadership Questionnaire (MLQ) 360 degree assessment survey (Avolio & Bass, 2004; Bass & Avolio, 1993, 1997; Bass & Riggio, 2006) and/or psychometric assessments, including the well-established Hogan Leadership Forecast Assessment (Hogan Assessment Systems, 2015, 2016; Hogan & Kaiser, 2005) to a more recently validated assessment, the Resilience Quotient Inventory™ (Critchlow, 2018).

The duration of assignments has varied from a few hours to several years, with the latter longer term assignments often involving the author as a principal consultant and member of a wider consultancy team in the ongoing facilitation of strategy visioning, organizational analysis, and leadership development including assessment feedback and coaching, and/or HR specialist consultancy.

For the purposes of this reflective contribution the main focus will be on the author's work with larger companies in the private sector as his work in these organizations involved a longer time span, generally

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

between one year and 18 months and therefore a greater degree of consultancy change interventions. These assignments provided the learning space for the original themes from the earlier PhD research to be developed and they often involved organizational cultural change projects sponsored by the client CEO and the executive leadership team. This type of leadership sponsorship is essential to the ongoing delivery of organizational change (Kotter, 1996; Turner, 2010). The common thread across all such change assignments was the focus on transformational leadership behavior in driving organizational change driven by external market forces such as a market movement created by a change in customer behavior. These change challenges included an increase in customers' shopping online; the impact of acquisition and/or merger strategies or internal restructuring driven by competitive forces. In all cases the respective CEOs and, on most occasions, their top teams recognized the need for a new leadership style to drive a culture which enabled their organizations to be flexible, adaptable and responsive to change.

This reflective contribution will focus on how the author's change leader work, in a single organization, has developed over recent years working as a change facilitator for numerous clients in many market sectors. Reflective insights, with reference to two organizational case studies, are set out in the next section and provide an overview of evolved thinking developed when undertaking organizational change assignments. The case studies illustrate how the author's earlier PhD case study research and evidence-based learning has evolved in real business scenarios and organizational challenges. These case studies were chosen to represent real and relevant examples of today's business environment and atypical organizational change and development challenges faced by today's boards, CEOs and senior leadership teams. The first case study is anonymous due to the client preferring to maintain confidentiality at the time of publication. The second case study relates to Peel Ports Group (PPG) one of the largest UK ports companies. In both case study examples the author worked with Jennifer Jones (Parratt), at the time Client Director of an independent search and consultancy company. Jennifer, an experienced consultant and coach, has worked across the globe with C-suite executives, helping them to transform their organizations' leadership and culture.

Case Study 1: Transportation Infrastructure Sector

This case study organization is the UK subsidiary of an international company, present in over 50 countries which in 2017 recorded over €10bn sales worldwide. The UK subsidiary operates across multiple sites and employs circa 3,000 people. The drivers for change were strategic. To take advantage of an expanding market created by a change in government strategy, a transformational realignment of the organization's structure was required. This organizational change created a different risk profile, including technology and cultural profiling, thus increasing operational complexity.

Initial consultancy support was provided to the CEO and the senior leadership team, aimed at building company knowledge and trust in the client – consultancy partnership. As a result, a facilitated process helped the leadership team develop a deeper understanding of the strategic direction of the organization and the evolving strategic leadership role needed to drive through the required changes to ready them for the change journey ahead.

This involved the creation of a one team ethos around a core purpose and vision within a refocused culture and supported by a revised organizational structure, process and procedures which would enable rigorous approaches to accelerate the rate of change. The leadership community explored their new vision and what it meant for them; individually, as a team and as a new business. The 'stake in the ground' reality workshops defined and created the new organizational structure through an organizational analysis

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to establish the 'As Is' position as well as providing a 3 year view via a structural, strategic and cultural lens, before moving on to reviewing the plan of 'what' to do to get there, 'how' to achieve it and identifying key risks along the journey to the 'To Be' vision. This stake in the ground exercise was critical to ensuring the follow up organizational change actions were focused, effective and ultimately successful.

The organizational analysis involved undertaking an effectiveness evaluation which clearly defined the organizational state of play and identified a strategic and operational route map of actions, including leadership capability, to improve organizational performance and profitability. This involved the executive team in analyzing and evaluating quantitative and qualitative data gathered from across the organization. The approach and methodology framework were developed by the author via analysis of the available research literature and the application of adaptive innovation to align and bespoke to the client's need.

The Burke-Litwin performance and change diagnostic framework model was used as a core framework to assess the factors affecting organizational effectiveness (Burke & Litwin, 1992) namely:

- **External Environment:** Reputation and brand image.
- **Mission and Strategy:** Strategic vision in place which is understood and 'lived'.
- **Leadership:** Evidence of transformational leadership behaviors.
- **Organizational Culture:** Positive, motivating and empowering culture.
- **Structure:** Flexible and cross-functional structure rather than functional, silo-driven.
- **Management Practices:** Evidence of transactional management behaviors practices.
- **Systems:** Appropriate strategic and operational policies and procedures.
- **Work Unit Climate:** Based on cross functional teamwork, respect and friendliness.
- **Tasks and Skills/Abilities:** Task requirements matching individual skills and abilities.
- **Needs and Values:** Employee needs/values aligned to organizational needs/values.
- **Motivation:** Motivated, engaged, committed and empowered employees.
- **Individual and Organizational Performance:** High performance management system.

However, the actual organizational analysis and effectiveness review process adopted was adapted from the Burke–Litwin model through investigative research by the author which identified refinements driven by aligning to client need and the bespoke changes required. Refinements to the organizational analysis evaluation process included additional elements relating to Governance and Risk and changes to the Individual and Organizational Performance element, which was refined to also cover three perspectives, namely personal, team and organizational. Empirical research indicates that utilizing an evidence-based organizational diagnostic across an organization within the change process can have a substantial impact on the resulting financial productivity of an organization (Cummings & Worley, 2005). Additionally, a well-executed organizational diagnostic process fosters and promotes a continuous learning environment that not only impacts on the organization's ability to rapidly adapt to change but which also positively affects its bottom-line organizational performance and overall effectiveness (Kontoghiorghes, Awbrey, & Feurig, 2005; Martins & Coetzee, 2009).

Through facilitative inputs the leadership team considered two distinct sets of organizational dynamics. One set was primarily associated with *transactional* behavior, or the everyday interactions and exchanges that manage the process and create the climate of everyday organizational behavior. The second set of dynamics was concerned with *transformational* behavior, which leads and drives change to a desired future state.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The outputs of the organizational analysis provided a platform on which detailed planning of the strategic pillars could be progressed, as well as hardening the key messages and themes for certain stakeholders and reviewing the outline governance structure. The next stage involved the leadership team exploring how to bring the strategy to life, enabling the leaders to understand the importance of their role modeling transformational behaviors so as to drive through the changes needed. Together the series of interventions created an increase in the sense of urgency, a belief that the transformation was achievable and a clear understanding of what was needed to be done to make it happen. There was also an increased sense of 'team' aligned to the new direction and an awareness of individual leadership journeys while together owning the overall future plan.

Further workshops followed which included discussion and activities around transformational change models including the VUCA Prime model (Johansen, 2011) and Kotter's research on change accelerator drivers (Kotter, 2014). These team workshops maintained the momentum of the transformational leadership learning and helped leaders to understand how to transform by embracing core values and linking the three dimensions of a personal, team and organizational (PTO) development focus to deliver an integrated and holistic change plan.

The post program review provided feedback to the effect that everyone entered into the workshops positively and were 'on the pitch.' The sense of trust in the team increased, together with morale, against a background that many individuals would be personally impacted by this change. The team originally gave highly divergent responses to all questionnaires indicating a strong lack of alignment on some key issues and the process helped to resolve these variances in readiness for communicating a consistent message with authenticity and impact across the organization. It was noted that the sense of urgency increased over the duration of the events and that a guiding coalition had been formed by the end of the assignment.

The CEO of the case study organization offered a personal perspective of the value of adopting an external evidence-based consultancy change approach '… the process adopted really helped gel the team around a common purpose and beat rate. This accelerated the change process… and the resulting organization was built to maximize opportunity whilst reflecting on risk – it was expertly facilitated. I truly believe (without external facilitation) the process of defining our Vision, Culture and Organization Structure would have been far more difficult, taken longer, and not have had the same staff engagement and understanding'.

Case Study 2: Peel Ports Group (PPG)

This case study organization is Peel Ports Group (PPG), one of the largest UK ports companies and an ideal example of a business whose whole is more than the sum of its parts. The company works as a strategic network of ports, terminals, hubs, shipping lines and services and is a vital link in an expert logistics chain, at the leading edge of transport and handling facilities. PPG connects major population areas across England, Scotland and Ireland through its Irish Sea hub, and has the only water freight route, delivering cargo right to the heart of the UK via the Manchester Ship Canal.

PPG's vision of transforming industries and regions to foster economic growth came dramatically to life with the decision to invest £400m in the development of Liverpool2, one of the best equipped and connected deep water container terminals in the UK. In line with market driven themes there was an emphasis on market growth, risk management and cost optimization. At the time PPG's Group CEO, Mark Whitworth, cited the vast potential offered by the new capability to handle the world's biggest

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

container ships via a world class port located in the North West of England 'Powerhouse' region. Whitworth was clear that such a transformational innovative strategy and the supporting investment, made sense and said 'It is less expensive to bring a container from China to the UK (via Liverpool) than it is to move it from one of the southern ports to the North of England. When you start to look at the story around critical mass, the market is there, the population is there, the consumers are there. I think the story starts to become quite compelling. That's why we have confidence.' (Mann, 2016).

PPG's bold transformational approach to achieving the strategy of providing 'Port Centric Distribution Solutions' was backed by significant investment, showed a clear exciting vision and a belief in their future marketplace based on innovation, technology, people and a strong client focus. PPG recognized that whilst the £400m investment was focused largely on transforming infrastructure and physical assets, the major challenge concerned cultural change and this, in turn, required transformational leadership.

Jennifer Jones (Parratt) and the author provided consultancy inputs to PPG focused on helping them sustain their sales growth curve and focus on future top line growth so as to realize the returns required from their significant investment in the future. The drivers for organizational development were commercial yet the cultural levers to achieve this required a change in sales leadership behavior. Following the initial engagement a strategic leadership analysis process was undertaken to fully understand the current reality and the desired commercial outcomes and to set working guidelines for the trust in our client – consultancy partnership to develop. In leadership terms the evaluative assessment provided individual and team leadership profiles through psychometric assessment tools and experiential activities facilitated via workshops. Outputs of the strategic leadership evaluation were created in the form of PTO development objectives, designed to integrate and accelerate performance in all three dimensions.

The evidence-based leadership evaluative approach employed incorporated the following five phase consultancy framework developed by Jennifer Jones (Parratt):

1. **Discover:** Gain understanding of the outcomes, objectives, strategy and context of the organizational change program.
2. **Define:** Quantitative evidence-based assessments of the leadership team in the context of the business environment.
3. **Develop:** 1-1 feedback sessions to provide heightened self-awareness of leadership behaviors and opportunities for performance improvement.
4. **Deliver:** Bespoke workshops to review evaluative data feedback and identify ways to improve organizational capability and effectiveness.
5. **Debrief:** Structured report identifying recommendations for accelerating performance and increasing value.

This strategic sales leadership evaluative process developed individual and strategic awareness and focus, identified performance risks and aligned leadership actions to PPG's vision and mission. This process helped facilitate understanding of how the leadership team worked on three levels; in their individual teams with their reports, in the respective Director and senior manager peer leadership teams and as a cross functional team working together in an integrated way.

As a result of this evaluation it was identified that two dovetailed development solutions offered the most appropriate way forward; one for the director/leadership community and the other for those undertaking the sales growth activity on a day to day basis; with integrated development activities between the two dimensions to ensure alignment and cross working. The Port Directors' dimension focused on helping

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

them to develop further their transformational sales leadership behaviors and skills whereas the Sales Managers dimension focused on more transactional processes to deliver the sales plans and outcomes, with the two dimensions overlaid throughout the delivery process. Development insights adapted from the Full Range Leadership model (Avolio, 2011) informed this approach.

This structured and integrated program helped accelerate the performance of the organization and equipped the leadership community with increased change management knowledge and skills to effectively guide the upcoming growth in the business. Those with commercial responsibility undertook personality diagnostics to increase their individual self-awareness of personal preferences, including those behaviors which were naturally, and often unconsciously, avoided. As individuals and as a team these aspects were explored in terms of performance and behavior and what changes were needed to maximize the opportunities created. Skills development was undertaken in sales techniques such as negotiation and closing, as well as behavioral development including interpersonal psychology, questioning and relationship capability. As part of the program there was a clear focus on evaluating and benchmarking sales leadership as well as sales performance, behaviors and cultural markers.

The use of PTO development plans by all participants at the end of each development phase ensured that momentum was maintained and sustained and everyone viewed and progressed their focused development in relation to performance on three levels; the individual, their team and the organization. The impact of the PTO development plans was monitored at strategic level and this enabled return on investment measures to be adopted. All targeted benchmarks increased positively during the project and the program objectives were clearly met, including increases of (i) 40% in the overall commitment to the organization's strategic charter of actions; (ii) 50% in the implementation of improved and refocused individual sales behaviors and (iii) over 100% in team working behaviors and communication effectiveness.

Patrick Waters, Chief Operating Officer and Group Commercial Director of Peel Ports Group, provided this view 'We realized that a project to determine clearer roles between operational and commercial needed complementing with a focused program designed to improve the sales leadership capability within the commercial team. Significant time was taken to develop a true understanding of our needs and developing a program specifically for PPG. The consultants balanced first class knowledge with participative sessions which kept the process fresh and alive. It was clear to us that the expert external view of the consultancy team, in relation to our challenges, could greatly accelerate the pace of the implementation process as well as the change program's level of effectiveness and positive impact'.

Concluding Comments

The author is probably too fond of quoting the saying attributed to Confucius 'Knowledge without practice is useless, practice without knowledge is dangerous'. The two worlds of business and academia are interdependent on each other with coexistence essential to both. It is within this contextual mindset that the author presents learning, distilled from the case studies, in the form of evidence-based solutions and recommendations before discussing emerging trends and the potential for future research. These concluding comments are not framed in a philosophical or intellectual sense, rather, these thoughts are presented in ways that may be interpreted, used and practiced in the business world whether leading, managing and/or facilitating change.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

SOLUTIONS AND RECOMMENDATIONS

When reviewing the three cases studies discussed within this chapter, two significant evidence-based platforms emerge in relation to leading and managing organizational change; that is Organizational Change Evaluation and Leadership Alignment and Development. Several of the key EBOCD solutions referred to in the case studies are considered within these two organizational change phases.

Organizational Change Evaluation

Let's start at the beginning. Organizational culture change journeys often start from the wrong place. Like the story about an American tourist who, lost in rural Ireland, asks a local farmer for directions to Killarney. The farmer humorously responds 'If I was you, I wouldn't start from here'. A scenario, albeit in a business context, that the author has encountered on most consultancy engagements. To create a route map not knowing where the organization is on the map, never mind not knowing what each leader thinks, is at best foolhardy. Very often the CEO and their senior leadership team, having created a strategy, are just keen to get on and action the vision and mission by telling their people all about it and what they need to do! However, at this stage, their view of the organization's current position and situation is often diverse, sometimes to an extreme level. Whilst 'hard' data areas such as financial, sales and productivity measures are generally pinned down, there is a lack of evidence-based clarity and understanding around the 'soft' factors such as the level of skills capability, engagement and commitment. Thus the biggest challenge for a consultant is to slow the process down in the early stages and help the senior leadership team undertake an organizational analysis and effectiveness review. How this is progressed will vary dependent on client context and nature of the change and investment budget yet, whatever the resources, some form of joint quantitative and qualitative approach should be considered.

Rarely is an executive or senior leadership team on the 'same page'. The need for some form of commonality of view requires facilitated discussion to ensure there is a 'one team' view of the 'As Is' position. This phase could also include a way to capture views from a cross range of employees. To better understand different perspectives of a workforce the author often utilizes a broad diagnostic framework based on a Head, Heart and Hand approach to gather benchmark data at the start and throughout the change journey. This threefold approach can be illustrated by asking the following questions:

- **Head:** Do employees understand and agree the rationale and intellectual argument for the change?
- **Heart:** Are employees engaging with, emotionally buying-in to and personally committing to making the changes happen?
- **Hand:** Are employees 'living the values' and actions supporting the changes?

Whilst this interactive experiential evaluative approach is valuable with or without other methods, a more rigorous and robust framework can add greater value by ensuring clarity and providing benchmarks and measures to monitor the change journey. A well-executed organizational diagnostic process fosters and promotes a continuous learning environment that not only impacts on the organization's ability to rapidly adapt to change, but which also positively affects its bottom line organizational performance and overall effectiveness.

Different approaches were adopted within the case study examples described earlier in this chapter including high level and primarily qualitative approaches such as the Head, Heart and Hand framework

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

or the Discover and Define parts of the consultancy framework described within the Peel Ports Group case study (2). In the Financial Services and Transportation Infrastructure case studies more detailed qualitative and quantitative approaches were adopted including bespoke organizational analysis techniques relating to evidence-based methodologies such as the Burke–Litwin model. There are also established proprietary products, which are particularly suited to large organizations with large workforces and these offer value to any interactive and experiential feedback and evaluation analysis. One example is the Holistic Organizational Effectiveness Survey© (HOE) which was primarily designed by Howard Deutsch (2017). The HOE survey and similar surveys may be utilized as an off-the-shelf and/or bespoke approach to provide the opportunity to gain a detailed data-driven 'stake in the ground' and thus a clearer understanding of organizational realities.

Following the organizational evaluation stage and the pinning down of the 'As Is' position, the next step is to define the desired 'To Be' position, including the purpose, vision, mission, delivery channels and outcomes that need to be created, or refined if already existing. There are various approaches to achieving this and multiple facilitative frameworks and approaches dependent upon the organizational scenario. All three organizations described in the case studies had in place a strategic plan, which was used to frame and position the desired future change state. Whatever approach is adopted the process will need to enable the definition of or take into account the existing overarching organizational *purpose* and *vision* benchmarked by a *mission* and key *measures* within a framework of strategic delivery *foundations* and *values.* The task of setting out these strategic dynamics on 'one page' is a valuable organizational change activity, particularly when involving the wider workforce. From this a strategic communications framework can be created, involving a range of 1-1, team and organizational employee events to engage the workforce and stimulate passion. The focus then turns to supporting the leadership team and aligning leadership capability.

Leadership Alignment and Development

Following the evaluation phase and the identification of the gap between the current reality and the future desire change, leadership behaviour can be aligned. Within the case studies emphasis was placed working with the respective leadership teams to develop transformational (leading) and transactional (managing) behaviors and capabilities. The concept of evidence-based transformational leadership and transactional management was a constant development thread throughout the organizational change case studies. The author views transformational leadership (Bass, 1985, 1997; Bass & Avolio, 1993) as a key strategic change driver, being focused on creating step change to achieve a desired future state, whereas transactional management aims to effectively maintain or incrementally progress the current state. For a step change in culture and performance there is a need to encourage employee empowerment. Hence senior leaders need to act in a transformational, motivational and inspirational way, rather than adopt a transactional leadership style through a compliance-driven approach of contingent reward or punishment which is generally more suited to maintaining stable situations. Transformational styles are found to be more effective when connected to a compelling purpose and vision aimed at generating high employee commitment through personal involvement (Turner, 2017). To understand where senior leaders are on the transformational – transactional leadership paradigm, then leadership assessment and evaluation is required.

Leadership evaluation is an area which benefits from specialist evidence-based analysis. There is largescale research evidence relating to pre and post development evaluation for individual leaders,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

such as 360 degree feedback and psychometric assessments, yet there are fewer examples of holistic and validated evaluations of executive teams as a team entity, focusing for example on how they work together and how their behavior aligns to the organization's culture and strategy. Leadership behavior can be evaluated and should be an integrated part of a strategy for managing leadership development. In most areas of business procurement e.g., IT, capital assets or insurance; there is a rigorous evaluation process to assess the organization's current position in the specific area which is then compared to future requirements. Why doesn't this happen more often in procuring a leadership development program? Generic leadership development requirements are generally of critical importance to organizations, hence the value of a rigorous and validated evaluation process before, during and after the program.

A clear understanding of the organization's leadership DNA is becoming critically important in a business environment which is increasingly *volatile, uncertain, complex* and *ambiguous* (VUCA). Personal experience and research evidence suggests that executive strategy and leadership development, with a few notable exceptions, has largely failed to keep in line with these rapid and wide-ranging changes. New thinking is emerging as evidenced by the VUCA Prime model (Johansen, 2011) which flips the original VUCA model to create a leadership 'antidote' to VUCA and, in doing so, proposes that the best leaders in a VUCA environment are characterized by their *vision, understanding, clarity* and *agility*.

By helping organizations focus on these change characteristics an aligned leadership strategy can be created that recognizes a VUCA environment and aligns the skills, attributes and behaviors of the leadership team to steer the organization through the turbulent waters of change and deliver sustainable success. Change scenario planning utilizing a *strategic* and a *leadership VUCA lens* enables organizations to identify challenges and dilemmas that are invisible due to these being of an intangible, indefinable and/or unpredictable nature. Once identified and addressed these strategic risks may provide a competitive advantage and potential benefits. Such strategic dilemmas are an ongoing fact of organizational life and therefore must be continuously addressed and the tension managed. The author found the VUCA Prime model particularly well suited to the case study 1 scenario enabling facilitated discussions designed to align senior leadership development to strategic intent and the major strategic challenges faced (e.g., external environment changes requiring internal realignment and a major restructure).

Based on the author's experience, including the case studies described, the favored delivery combination in senior leadership development consists of formal business education, classroom facilitation, role assignments, coaching and mentoring. These elements are often progressed in a random way without an over-arching development framework. The author has sought to bring the various strands together in a holistic and integrated systemic delivery wrapper so as to build continuous development and reduce the negative impact of leadership overload. The 70-20-10 model is a way of achieving this and offers a proven evidence-based way to facilitate leadership development in an effective and impactful way.

The 70-20-10 leadership development model is a research-based, time-tested guideline for developing leaders and focuses on three types of learning experience (i) practice via on-the-job experiences and challenging assignments (70 percent); (ii) developmental relationships including coaching, mentoring, feedback and networking (20 percent); and (iii) focused knowledge and education-based training and development (10 percent). According to Lombardo and Eichinger (1996) leadership development is best achieved through applied learning and on-the-job learning has three times more impact on individual performance than formal training.

The 70-20-10 model sets out 'where' and 'how' development can be progressed yet equally important is the 'why' or the purpose, setting out the development focus. One way to describe the development focus is via the concept of integrated strategic learning based on PTO development mentioned earlier in this

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

chapter. This has been an emerging developmental theme for many years and is now breaking strongly into the collective corporate and academic consciousness as demonstrated, for example, by the MSc in Organizational Development run by the Metanoia Institute (2018) and validated by the University of Middlesex in the UK. The MSc addresses the challenges of leading, managing, facilitating and consulting in the midst of an increasingly VUCA world and actively explores the systemic interconnections between individuals, teams and organizations.

The author is an avid proponent of a PTO development framework to ensure a systematic results-driven approach and achieve return-on-investment outcomes. This approach involves linking four learning phases in the *development zone* and these are *evaluation*, *action-orientation*, *development facilitation* and *monitoring results* (followed by revisionary continuous improvement actions) to personal, team and organizational areas.

The aligning of the 70-20-10 model to the PTO development framework brings together two evidence-driven approaches within a *best fit* practical and pragmatic framework rather than relying on *best practice* abstractive concepts (Turner, 2016b). By conjoining the developmental approaches of 70-20-10 with a PTO development focus, leadership evaluation and development is aligned to organizational change and is therefore more effective, strategic and positively impactful on the bottom line. The author predicts a surge of interest in the *70-20-10 PTO* development model and similar conjoined strategic development approaches. In the next section other emerging trends and potential areas of research are considered.

EMERGING TRENDS AND FUTURE RESEARCH DIRECTION

The changing environment continues to shape the strategic priorities of organizational leaders with CEOs citing fostering *innovation* (21%) as heading their priority list, followed by achieving a stronger *client focus* (19%); implementing *new wave technology* (18%); better *people and talent management* (18%) and improving *branding/communications* (17%). Innovation is clearly in the sights of C-suite leaders, so much so that 82% are concerned that their existing current products and services will not be relevant in three years' time (KPMG, 2016).

The strategic challenges of technology, innovation and talent are dominating the US CEO agenda with their UK CEO counterparts focusing on similar themes with an emphasis on globalization, growth, automation and the increasing challenge of digital trust, particularly in the area of cyber technology (PwC, 2018). Another leadership survey (CMI & the Conference Board, 2015) offers a broader European perspective which identifies Client/Customer Relationships as the top priority followed by Human Capital, Innovation, Operational Excellence and Corporate Brand/Reputation. In the UK the survey reveals similar findings but also identified UK tactical short-term 'hot button' issues of Social Media, Customer Behavior and Cyber Security. As for high performing organizations the survey indicates that these are focused on achieving a culture of customer centricity and employee engagement. Other trends in global strategic priorities highlight the growing importance of corporate purpose and value-driven direction (Turner, 2015a). The author's experience supports the aforementioned research in terms of alignment to the on-the-ground strategic challenges, with a noticeable organizational desire for leaders to facilitate increased innovation and transformational change (Turner, 2016a).

Yet whatever the priorities the biggest challenge for C-Suite leaders is not *what* needs fixing or changing but *how* it can be fixed or changed. Inevitably, whatever the strategic challenge, the effectiveness of the response will mostly succeed or fail dependent on the leadership bench strength as it is leadership at

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the top and throughout the whole organization that will be required to deliver the desired changes. As the challenge of change continues to multiply and intensify, the leadership development response often remains the same. The author's experience working with UK based multinational companies indicates that spending on the 'soft' area of leadership development rarely receives the same profile or priority, as 'hard' capital investment. The gap between the leadership development need and the actual spend appears to the author to be widening. Therefore how the strategic leadership development budget is spent becomes critical.

The author proposes, and the case studies herein support, that the key characteristics of successful programs are buy-in and role modeling from the board, CEO and executive team; rigorous and robust evaluation and analysis; EBOCD methodologies delivered in a practical and pragmatic manner; engaging delivery facilitation to inspire and engage; beginning to end development; aligned performance action plans; key change and performance indicators related to development interventions; interim checks and balances to review and refine progress and a clear commitment by investment action that the program will be sustained and is not a standalone 'flavor of the month' project.

There is a common view that standalone non-strategic leadership development interventions are cost effective. Organizations adopt these incremental, often non evidence-based approaches, in an attempt to, at best, maintain and, at worst, contain gaps in critical leadership bench strength areas. This is not the case in every organization, as is evidenced by the case studies highlighted. Yet it is clear that many board's and CEOs are still not totally sold on EBOCD practice and delivery as much as they are on IT systems or on 'harder' productivity tools which are backed up by similar statistical evidence. Much of the challenge and pressure in progressing strategic leadership development within an organizational change and effectiveness context falls to HR Directors. Yet very often successful entry into the cultural change space through a strategic leadership development lens is more often via the CEO and/or board level team. This appears to be improving as HR Directors are seen to be an executive first and an HR expert and functional head second, yet there is much more progress to be made from a professional HR perspective.

It falls to strategic organizational change and leadership development consultants to make a much stronger case for integrated, evidence-based approaches which are bespoke designed to provide a practical best fit approach rather than best practice. Change consultants can fall into the trap of offering a 'product' for all seasons, irrespective of the organizational challenge and environment. It is therefore not just the CEOs of this world that should seek for their organizations to be adaptable, flexible and innovative, but those consultancies who seek to help them achieve this.

CONCLUSION

The ideas, principles and suggestions described in this chapter are distilled from the author's 'insider' business experience as a change leader and 'outsider' business consultancy experience as a change facilitator. Both careers have been progressed against an academic backdrop of learning which enabled 'on the ground' practical business experience to be tested and compared with the 'in the classroom' theoretical knowledge, supporting the philosophical perspective that 'There can be no learning without action and no (sober and deliberate) action without learning" (Revans, 1983, 2016; McLoughlin, 2004).

The author has spent most time in the corporate world rather than the academic one and, as such, there may be both conscious and unconscious biases favoring intuition, pragmatism and practicality rather than rigor, idealism and perfection. This perspective recognizes the differences between the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

business practitioner and business academic worlds. Notwithstanding, the author has sought to apply a practitioner approach which is largely evidence-driven rather than over relying on personal experience, gut feel and intuition.

In today's evolving world of business, the quality of executive leadership can make or break the success and sustainability of any organization. Organizations with high quality, highly effective strategic leaders are more likely to outperform their competitors in key metrics such as quality of products and services, employee engagement, customer satisfaction and financial performance. That being the case, the ways in which organizations develop and improve their leaders is critical to effective strategic organizational change.

In concluding, the author proffers that strategic leadership development needs to change to keep pace with the external environment it operates within. Investment is significant yet effectiveness and value is difficult to gauge. There is a need for a more defined focus to ensure content and cultural alignment to organizational purpose, vision, mission and strategic execution. Leadership work overload often gets in the way of sustainable development and the impact of personality in managing pressure is largely ignored.

To overcome these barriers to effectiveness it is recommended that rigorous pre and post evaluation is undertaken; strategy development is aligned more closely with leadership development; development delivery is designed on a continuum learning wave so as to achieve sustainable development and tangible ROI investments, and a framework of a personal, team and organizational development focus is linked to specified outcomes vertically and horizontally throughout the organization. It is proposed this evidence-based approach will create 'best fit' strategic leadership development and achieve successful organizational change and a positive impact on the bottom line.

Chapter 89
Organizational Change and Development:
The Case for Evidence-Based Practice

Robert G. Hamlin
University of Wolverhampton, UK

ABSTRACT

This chapter first discusses the complexities of change in organizations and why so many OCD programs fail and makes the case for change agents to become evidence-based in their change agency practice. The author then offers a definition of evidence-based organizational change and development (EBOCD) and outlines the types of "best evidence" that can be used to inform and shape the formulation and implementation of OCD strategies and to critically evaluate the associated processes and change agency practices. Various distinctive evidence-based initiatives for OCD are discussed and several case examples from the United Kingdom are presented. The chapter closes with a discussion of the specific merits of "design science," "professional partnership" research, and "replication" research.

INTRODUCTION

Since the 1980s, organizations in all organizational sectors have had to react to huge environmental pressures for change, the main drivers of which have been: *Technology*, particularly IT; *Governments*, which in all parts of the globe have until recent times increasingly embraced notions of deregulation, privatization and free trade; and *Globalization*, where private sector companies have had to compete more aggressively, and public sector organizations have had to deliver more value for money services and products (see Barkema, Baum, & Mannix, 2002; Champy & Nohria, 1996; Dess & Picken, 2000; Smith, Lewis & Tushman, 2016; Yukl, 2006). These pressures have resulted in mergers, acquisitions, amalgamations, decentralization, flatter structures, downsizing, multidimensional restructuring, increased flexible work practices, drives on quality and value, greater emphasis on customer/client/consumer orientation and care, and increasing stress levels at work (see, for example, Hamlin, 2001a; Gunnigle, Lavelle & Monaghan,

DOI: 10.4018/978-1-7998-7297-9.ch089

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2013; Shook & Roth, 2011). Furthermore, since the early 2000s most organizations have been operating increasingly in VUCA (volatile, uncertain, complex, ambiguous) environments where: *Volatile* refers to the pace of change which is rapid and unrelenting, and the associated challenges which are unexpected or unstable; *Uncertainty* refers to the difficulty in getting clarity and certainty about what is going on in business contexts through incomplete or insufficient information, which is complicated by opposing views and opinions; *Complexity* refers to the many interconnected parts and variables that can have a 'cause-effect' impact in a given situation, and to the volume or nature of the available information that can be overwhelming to process thus making diagnosis difficult; and *Ambiguity r*efers to causal relationships which are completely unclear because no precedents exist and leaders/managers are faced with 'unknown unknowns' (see Bennett & James Lemoine, 2014; Mack, Khare, Kramer & Burgatz, 2016).

In response to these trends of change, most executives in the 21st century recognize that their respective organizations need to adapt continuously to constantly changing environments. However, they tend to struggle with the transformational changes that are necessary for ensuring the survival of their respective organizations, or they fail to raise their game to the higher levels of performance that are required (Rogers, Shannon, & Gent, 2003). Therefore, when they initiate programs of organizational change and development (OCD) they tend to rely on lower level managers to facilitate and implement the change processes. Thus, in a very real sense, most managers in most organizations are agents of change (Axley, 2000). Furthermore, in some organizations where the modern-day conceptualization of human resource development (HRD) is well embedded into the fabric of managerial thinking and management practice, managers proactively use the services of HRD colleagues possessing strong change agency capabilities to help them formulate and implement OCD plans, strategies and interventions. In so doing they treat them as 'strategic partners', just as they do with external OD specialists and management consultants whose change agency services they use.

However, as I have discussed elsewhere, "one of the major challenges facing contemporary managers and HRD professionals is how best to help people through the transitions of change, and to survive or thrive in working environments that are in a constant state of flux." (Hamlin, 2016a, p.121). Hence, this chapter is concerned with: (a) the challenges that confront managers and the various 'strategic partners' they turn to for help in bringing about effective and beneficial organizational change, and (b) the practical contribution that management research and specific OCD-related research can make toward improving the efficacy of their respective change agency endeavors. The specific purpose can be summarized as follows:

1. To outline the extent to which organizational change programs fail and why they fail.
2. To argue that managers and their strategic partners should adopt an 'evidence-based practice' (EBP) approach to organizational change agency.
3. To highlight certain obstacles to 'evidence-based' OCD, and to describe and illustrate how these may be overcome through 'professional partnership' research and empirical generalization 'replication' research respectively.
4. To highlight and discuss other 'evidence-based' initiatives for facilitating effective and beneficial OCD programs.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

BACKGROUND

Although it may be widely recognized that most managers in most organizations are to a greater or lesser extent agents of change, this cannot be assumed to be the case for most HRD practitioners. However, as Stewart (2015) claims, modern-day HRD professional practitioners are change-agents skilled in advising and helping managers with the facilitation of OCD programs, either in their capacity as a colleague or as an external consultant. Indeed, Stewart and others have argued that HRD is of itself a strategic function which, when fully utilized, can have a significant impact on the survival and long-term business success of organizations (see Fredericks & Stewart, 1996; Stewart & McGoldrick, 1996). This view is reflected in an 'all-embracing', 'catch-all', 'composite' but 'non-definitive' statement of HRD offered by Hamlin and Stewart (2011) which asserts that, in essence, *"HRD encompasses processes, activities or interventions" which "enhance organizational and individual learning, develop human potential, improve or maximize effectiveness and performance at either the individual, group/team and/or organizational level, and/or bring about effective, beneficial personal or organizational behaviour change and improvement"* (p. 213*)* within, across, and/or beyond the boundaries of private, public and third sector organizations, entities, and other types of host system. This understanding of HRD is consistent with Phillips and Shaw's (1989) 'consultancy approach for trainers' which involves HRD practitioners increasingly operating not only as 'training consultants' and 'learning consultants' but also as 'organizational change consultants'. Thus, both in theory and practice, the contribution of appropriate HRD consultancy type practices can be a major influence on the interplay of culture, leadership, and commitment of employees through: a) shaping organizational culture; b) developing current and future leaders; c) building commitment among organization members; and d) anticipating and managing responses to changed conditions (Gold, Holden, Iles, Stewart, & Beardwell, 2009). This view accords with McKenzie, Garavan and Carbery's (2012) observation that "the shift from operational and tactical HRD to *strategic* HRD has witnessed a metamorphosis for HRD practitioners increasingly becoming partners in the business tasked with aligning people, strategy, and performance rather than simply promoting learning and development" (p. 354). It also chimes with Kohut and Roth's (2015) view that "HRD practitioners and scholars need [increasingly] to enter the fray of the discussion on change management" (p. 231).

As happened during the last three decades of the 20th century, the need for managers to initiate and facilitate 'organizational change' (OC) and 'organization development' (OD) programs effectively and beneficially in the 21st century is increasing in frequency, pace, and complexity (see Hamlin, Keep & Ash, 2001). In this context, a major challenge facing modern day managers and HRD professional practitioners is how best to help staff cope effectively within working environments that are in a state of constant flux and with the transitions of major change programs. Unfortunately, many OCD programs fail because managers and their HRD colleagues, as well as many external professional change-agents (e.g. OD specialists, management consultants, executive coaches, etc.) whose services are used in support roles, find themselves unable to rise to the challenge. However, for those organizations that do facilitate OCD programs effectively and beneficially, change initiatives become welcomed as opportunities for increasing efficiency and for building new organizational success.

MAIN FOCUS OF THE CHAPTER

This section explores the reasons for the failure of so many OCD programs, and then discusses the case for EBP approaches to OCD change agency.

Past and Current Failure Rates of OCD Programs

It is of crucial importance to all those who have a stake in the success of an organization that OCD processes are managed effectively and beneficially. Sadly, the success rates of planned OC strategies have been poor with over two thirds or more of OC and OD programs having failed to achieve their intended aims (Beer & Nohria, 2000; Burnes, 2004; Choi & Ruona, 2011; Stanford, 2016; Szabla, 2007). As I have claimed elsewhere, based on a comprehensive review and synthesis of OCD context and practice that I conducted in 2001, "the majority of 'downsizing' and 'delayering' initiatives were unsuccessful, with few ever reaching the aimed for goals of increased competitiveness and profitability, and with many ending up with lower profit margins and poorer returns on assets and equity than achieved by equivalent firms that had not downsized" (Hamlin, 2016a, p.122). Furthermore, based on a review of more recent literature "downsizing (now more frequently referred to as 'right sizing') brings with it largely negative outcomes that adversely affect the entire workforce in a profound manner" which include, for example, "the destruction of morale and organizational commitment; decreased levels of productivity, efficiency, job performance, innovation, employee effort and quality of work, and increased levels of staff absenteeism, staff turnover, sabotage, fraud, embezzlement and theft (see Fong & Kleiner, 2004; Gandolfi, 2006; Nutt, 2004; Thornhill, Lewis, Millmore, & Saunders, 2000)" (In Hamlin, 2016a, p. 122). Similarly, during the 1980s and 1990s, over 50% of Business Process Re-engineering (BPR) and Total Quality Management (TQM) programs were reported as having failed, with a further 20% or more failing to produce the full benefits (Hamlin, 2001a). As will be discussed later, there is little contemporary evidence to indicate there has been any substantial increase in the success rate of OCD programs during the first two decades of the 21st century. However, although the historical success rate of IT-related change programs has been dismal with less than 30% of new project investments succeeding in meeting their performance goals (see Hamlin, 2001a; Sirkin, Keenan, & Jackson, 2005), in the USA the success rates have increased somewhat over time-from 27% in 1996 to 39% in 2012 (Standish Group, 2013).

According to Pfeffer and Sutton (2006), most organizational mergers fail to deliver the expected benefits; instead, the ways they are facilitated tend toward a destruction of the combined economic value of the merged businesses. Walker and Price (2000) had earlier suggested that such failures are caused not so much by financial issues but rather by the incompatibility of the merging cultures, the clashing of management styles, and the lack of skill of those managers implementing the change. Furthermore, they argue that these problematic issues are not addressed early enough or effectively enough in the merger process.

Recent literature also reports that overall 70% or more of rightsizing, mergers acquisitions, and other types of organizational change programs, either fail or are just partially successful, and that the workplace challenges posed by OCD initiatives typically have a negative impact on employees (Carnall & Todnem By, 2014; Shook & Roth, 2011; ten Have, ten Have, Huijsmans, & Otto, 2017). However, the volume of empirical evidence supporting such reports has been questioned by Hughes (2011) who claims that the 70% OC failure rate rhetoric has been informed more by magazine articles and practitioner books than by academic studies. Indeed, as Candido and Santos (2015) revealed from their comprehensive

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

review of the literature, recorded failure rates of OC programs have spanned from as low as 7% to one as high as 90%, with some rates having been derived from outdated or fragmentary empirical evidence lacking in scientific rigor, or based solely on subjective opinion. Nevertheless, they argue that strategy implementation failure is a persistent problem which remains an important and ongoing concern for researchers and practitioners.

However, as Stanford (2016) observes, although leaders, talent management professionals and others within organizations may realize that change is needed, they often fail to grasp the complexity of what change management entails. Furthermore, they tend not to recognize that their expectations are not aligned with what is feasible within the organization, particularly when the change leaders fail to take the time necessary to understand the scope of the change, the involved stakeholders, the environmental complexity, and the impact of the change from a systems perspective. Unfortunately, many OCD programs fail badly with unintended and damaging consequences which increasingly take a psychological toll on both the 'victims' and the 'survivors', not least the surviving managers (see Hamlin, 2001a; Hareli & Tzafrir, 2004; Worrall & Cooper, 1997-2001, 2007).

From the foregoing it is unarguably the case that too many organizational change initiatives fail and/or lead to outcomes that are largely negative. As I have claimed elsewhere, the "weight of evidence suggests that the process issues associated with formulating and implementing organizational change initiatives are far more complex and difficult than is often supposed, and that both managers and HRD practitioners [and those other OCD-related strategic partners] are generally insufficiently skilled in the practice of organizational change agency" (Hamlin, 2016a, p.123).

Reasons for OCD Program Failure

Bearing in mind the plethora of books on 'organizational change management' authored by management consultants and high-profile academics who offer 'how to' advice and guidance, it is surprising that so many OCD programs fail. Some of the books can be criticized for being too pragmatic, prescriptive, or simplistic, whilst others for being too theoretical and philosophical. All can be of some help when change agents are thinking through the issues that need to be considered, and/or when they are developing and implementing an OCD intervention strategy. Many of these books describe 'planned change management' approaches based on Lewin's '*unfreeze-move-refreeze'* model and incorporate a processual 'stage by stage' procedure for managing the change. Drawing upon the various models offered in the 1990s, Hamlin (2001a) created a composite 'generic model for managing planned organizational change' comprised of six phases, adapted versions of which are as follows:

Phase 1: Diagnose/explore the current organizational state and define what the future organizational state should be
Phase 2: Create a strategic vision that gives focus to the intended direction of travel
Phase 3: Plan the change management strategy
Phase 4: Secure ownership, commitment and involvement from all stakeholders affected by the change, and ensure there is support from top management
Phase 5: Project manage the implementation of the strategy and sustain the momentum
Phase 6: Stabilize, integrate and consolidate to prevent regression and perpetuate the change

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The implicit assumption when managers and their strategic partners utilize any change management model is that they have the knowledge and expertise to apply it effectively. However, the rates of OCD program failure discussed in the previous section suggest they do not, and that most managers are perhaps deficient in the requisite change agency skills. Although most if not all offered models are basically sound with high face validity, in many cases their simplified diagrammatic/summary formats can appear overly simplistic and just plain common sense. Regrettably, this can lead to important phases being 'skipped' or to a lax application of the model; and this can be made worse by the manager's and his or her strategic partner's lack of change agency expertise. Based on a review of organizational change management studies from various researchers in the USA, the UK, and from various other European countries I have identified six root 'failings' of managers and HRD practitioners which help explain why OCD programs fail (Hamlin, 2001a). Five of these 'failings' relate to managers and the sixth to HRD practitioners, as follows:

Failing 1: *Managers not knowing the fundamental principles of change management.*

Managerial 'complacency' and 'ignorance' are two of the most significant factors which can contribute to the failure of OCD programs; yet this should not be the case when professionally qualified managers are acting in the role of a change agent. A significant reason for their failings can be attributed to insufficient attention having been given during their professional education and training to the 'soft stuff' of management, to the 'behavioral aspects' of change management, to the training and development of their people, and to the interpersonal communication skills required for managing change effectively. As various writers have claimed, much of what is taught and delivered in university business schools is not perceived to be part of the manager's real world, or of practical relevance (Bones, 2007; Mintzberg, 2004).

Failing 2: *Managers succumbing to the temptations of the 'quick fix' or 'simple solution'.*

Going through all six phases of the change process normally requires a substantial amount of time if the change strategy is to be implemented successfully. However, driven by 'short termism', many managers are tempted to adopt 'simple' or 'quick-fix' solutions that skip through the phases. Such approaches rarely deliver the results required, but instead lead to failure. As Kotter (1996) argues, although the skipping of phases can create the illusion of speed it never produces satisfying results; and omissions or critical mistakes in any of the phases can devastatingly impede or even negate further progress.

Failing 3: *Managers not fully appreciating the significance of the leadership and cultural aspects of change.*

The three factors that many expert commentators regard as most important in a fully functioning organization are 'the leadership', 'the culture' and 'the management of change'. In the absence of strong strategic/organizational leadership, and managers who lead effectively using the right style of supervisory leadership, OCD related initiatives and interventions designed to change and improve the organization will underachieve the desired outcomes and will most likely make things worse. To bring about significant organizational change requires the commitment of top management; but this needs to be clearly in evidence, consistent, and sustained throughout the change process. Additionally, managers need to recognize that if they pay insufficient attention to the cultural issues of change, the organization

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

could risk suffering from 'cultural lag'- a term coined by Bate (1996) to describe the condition when a culture becomes 'out-of-fit' with the needs of the changing organization and thus impedes the change process. For OCD programs to succeed, adequate attention must be given to the 'cultural' issues and to the style and quality of the 'leadership' manifested by managers.

Failing 4: *Managers not appreciating sufficiently the significance of the people issues.*

In many OCD programs insufficient attention to the associated people issues is given by those who develop the change strategy and those who implement it. These issues include the psychological processes that employees experience in dealing with change and in coping with the change transition. Employees need to be enabled: a) to let go of the past ways of working and their memories of the old culture (*endings)* whilst holding on to certain still relevant aspects; b) to engage with the required new ways of working (*in-between time*), and c) to fully embrace the new direction and organizational culture (*new beginning*). This means managers need to understand the distinction between 'change' and 'transition' and recognize the critical importance of paying sufficient attention to the 'soft' human aspects in the change management process.

Failing 5: *Managers not knowing the critical contribution that the HRD function can make to the management of change.*

When managers strive to address the 'soft' human aspects of change management they tend not to use to best effect the services of HRD practitioners. This is despite the acknowledged critical importance of preparing employees adequately for change by giving sufficient time to training them (Cornell HR Review, 2013). The reason for the omission is because too many managers and HR professionals view HRD as one of many sub-sets of administrative activities that constitute the HR function, with the training specialism responsive only to immediate knowledge and skill deficits. Indeed, for many if not most organizational leaders, HRD does not register very much on their radar screens and is very much a third or fourth order consideration (Gold, Rogers, & Smith, 2003). Furthermore, this is exacerbated by the fact that although HR has long been claimed to be strategic in focus, evidence suggests it remains more rhetoric than reality (Hamlin, 2001a; Power, 2011). As Power observes, it is hard to find leaders of the HR function who are active in helping their organization improve the way it works, and this is because: a) top management often view HR as an expense with a transaction focus rather than an adding value contribution with a strategic focus; b) historically HR has been mainly engaged in personnel, compliance, and transactions, and c) HR professionals without operational experience have less credibility and are not comfortable giving operational advice.

However, as discussed briefly above, and in considerable depth elsewhere (Hamlin, 2001a, 2002), it has long been the case that various HRD professional practitioners have practiced at a strategic level, have made pivotal contributions towards the achievement of organizational effectiveness and success, and have helped create the critical capabilities and competencies required for the organization to change and develop. Unfortunately, "many managers have 'blind spots' regarding HRD, seeing it only in terms of high-cost external training courses, or long-term development/qualification programmes for young and new employees" (Hamlin, 2001a, p. 27). Furthermore, managers remain largely ignorant of modern day conceptualizations of *strategic* HRD. Yet there are HRD implications implicit in all organizational change whether at the individual, group, or organization level. As Hamlin also argues:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

For every change, both large and small, either 'new' knowledge, attitudes, skills and habits (KASH) have to be acquired, as in the case, for example, when new products, services, technologies, structures or systems are introduced; or alternatively 'existing' knowledge, attitudes, skills and habits must be re-distributed, as in the case of downsizing or when mergers or acquisitions take place. Unless the KASH gaps flowing inevitably from organizational change initiatives are bridged efficiently and effectively, whether at the organizational, group or individual level, the organization will not develop the critical capabilities [and competencies] required to make a successful transition from an [undesired] present state to the new [desired] future state. (Hamlin, 2001a, p. 27)

The extent to which appropriate HRD effort is incorporated into OCD programs will critically determine whether a planned change program succeeds or fails. Hence, for managers to be in control of OCD initiatives they must be 'learning focused', which means being in control of the KASH issues associated with change itself. Thus, sufficient time and attention needs to be given to the 'soft' HRD aspects of managing the change process (Hamlin, 2001a, 2002; Ning & Jing, 2012; Thornhill et al., 2000). For managers to manage change effectively and beneficially they need consciously to incorporate HRD into the very 'fabric' of their everyday management practice, and to use it as a tool for managing change. However, if they have not already done so, they need to stop thinking of HRD merely as traditional 'training and development', and instead recognize the 21st century understanding of the whole HRD domain of study and practice, as reflected in the following definition:

Contemporary HRD is: the study or practice concerned with the diagnosis of performance-related behaviour change requirements at the individual, group and organizational level within any host entity, and the design, delivery and evaluation of formal and/or informal learning activities to meet the identified needs. (Copyright © r.g.hamlin, 2017)

The sixth failing relates to HRD practitioners in general:

Failing 6: *Trainers and developers lacking credibility in the eyes of line managers.*

Historically, many if not most HRD practitioners have lacked high 'credibility' in the eyes of line managers. For some, this has not been helped by being part of HR departments which have also lacked status due to: a) the dominant focus on personnel administration, and b) line managers being frustrated with their experience of HR staff who are too rigid, do not understand the business, and who seem always about to say 'no' when they need them to figure out how to make things work (Hamlin, 2001a; Cardillo, 2012). Thus, managers have placed uniformly low role expectations on the HR function (Thornhill et al., 2000; Ulrich, 1997), and by association also on the HRD function. Additionally, this lack of credibility has been exacerbated in countries such as the USA where HRD-related postgraduate professional qualifications offered by universities are predominantly delivered by Schools of Education rather than by Schools of Business or Management as in the UK. In those countries, HRD practitioners are often perceived more as 'adult educationalists' or 'specialized teachers/instructors' rather than as 'people and organization development specialists'. Furthermore, as Gubbins, Harney, van der Werff and Rousseau (2018) suggest, the HRD function has not yet made sufficient inroads in demonstrating its ability, competence and value from a business and management perspective, and the perception of many if not most executives and managers is that the costs of HRD outweigh the benefits. Consequently, it behoves all

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

HRD professionals, both practitioners and scholars, to become concerned with the mainstream business and management of organizations if they are to maximize their contribution to organizational effectiveness and sustainable business success (see Stewart & Hamlin, 1990).

One of the most significant ways of achieving this is to engage in the change management process of: a) initiating and conducting organization wide performance diagnostic 'health' checks to identify required changes and the concomitant learning and development needs at the individual, group, and organizational level, b) providing 'expert' advice on how best these needs should be met; c) taking or recommending appropriate action to meet these needs, and/or to needs relating to 'top down' organizational change initiatives; and d) developing the ability and skills of managers and others to facilitate the associated change processes, and to handle effectively the intended and unintended consequences of the planned changes. But to do so, much depends upon how successful they can be at improving their 'credibility' in the eyes of line managers. Hence, it is incumbent upon HRD professional practitioners to 'sell' themselves as worthy strategic business partners of managers in the formulation and implementation of OCD programs.

Unfortunately, traditional approaches to the education, training and development of managers have not addressed adequately the five manager-related OCD 'failings' outlined above. Although some in-house and commercial management and leadership development (MLD) programs are effective, many others are not and result in little or no noticeable change or improvement in managerial effectiveness and performance (see Alimo Metcalfe & Alban Metcalfe, 2003; Collins & Holton, 2004; Gurdjian, Halbeisen, & Lane, 2014; Hamlin, 2010). Furthermore, as previously mentioned, much of what is delivered on management and leadership in business schools is not perceived to be part of the manager's 'real world' or of practical relevance (Bones, 2007; Mintzberg, 2004). Hence, the 'leadership' and 'culture' manifested in many organizations are not conducive for HRD professional practitioners to operate strategically as change agents.

More recently, informed by their empirical research, Burnes and Jackson (2011) have argued that a significant reason for the failure of so many change [OCD related] initiatives is the lack of alignment between the values held by those organizational members undergoing the change, the values that underpin the objectives and content of the change intervention, and the value system of the selected approach and processes by which the OCD is facilitated and managed. As these writers have claimed, the difference between the values may explain many of the problems that can arise during an OCD initiative, and "the value system alignment may be an important factor in the success of organizational change initiatives." (Burnes & Jackson, 2011, p.133) (See also Chapter 11 of this book).

The Case for Evidence-Based Organizational Change and Development

Drawing upon the views of numerous well-respected writers, I have argued in the past that for managers, trainers, and developers (including other 'people and organization developers' such as OD specialists and executive coaches) to become truly expert, they need to use the findings of high quality 'management' and 'HRD-related' research to inform, shape, and evaluate the effectiveness of their change agency practice (Hamlin, 2001b). More recently, I and other authors have argued that HRD professional practitioners should strive to become more critically reflective and truly evidence-based so as to improve their effectiveness and credibility in the eyes of senior executives and managers (Gubbins, Harney, van der Werff & Rousseau, 2018; Hamlin, 2007; Holton, 2004; Kearns, 2014). Similarly, Rousseau and Barends (2011) have argued the case for HR [HRM] practitioners in general to become evidence-based, and Grant

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(2003) has called for evidence-based approaches to practice in the field (and business) of professional coaching. Subsequently, Grant coined the term *evidence-based coaching* to 'distinguish between professional coaching that is explicitly grounded in the broader empirical and theoretical knowledge base, and coaching developed from the "pop psychology" personal development genre' (see Stober & Grant, 2006). According to the latter writers, applying evidence to coaching practice allows for improved practice; and understanding is a valuable aim in the development of coaching as a discipline.

Similar calls have been made for managers and leaders to advance their professional practice using high quality research to become evidence-based practitioners, and there are many advocates of evidence-based management (EBMgt) including Axelsson (1998), Brewerton and Millward (2001), Briner, Denyer and Rousseau (2009), Latham (2009), Pfeffer and Sutton (2006), Rousseau (2006, 2012), and Stewart (1998). Bearing in mind the various understandings of the term 'evidence-based practice' (EBP) within different occupational fields, including medicine, nursing, healthcare, and management, I offered in 2002 a working definition for *'evidence-based HRD'* as follows:

Evidence-based HRD is the conscientious, explicit and judicious use of current best evidence in making decisions about the development of individuals, groups, and organizations, integrating individual HRD practitioner expertise with the best available external evidence derived from systematic research. (Hamlin, 2002, p. 97-98)

Now, based on my past and current on-going personal experience of using research to inform, shape and evaluate HRD, as well as my understanding of what is currently happening in other fields, I have concluded that 'best evidence' in support of evidence-based human resource development (EBHRD) could and should include: a) Mode 1 research which is concerned with *conceptual knowledge* production and the testing of theory, b) Mode 2 research which is concerned with *instrumental knowledge* production to solve real-life problems, and in some cases contribute to theory development, and c) individual descriptive studies or the consensus of experts in the field. Thus, as in the field of medicine, the concept of EBP in the HRD domain including OCD does not need to be predicated on bodies of 'best evidence' derived solely from 'normal science' (Kuhn, 1996) based on positivist philosophical/paradigmatic assumptions. Instead, lesser strengths of 'best evidence' can be used including the findings of any good/high quality research that has been based either a) on the ontological and epistemological assumptions and methodologies/methods privileged by any one of the four main research paradigms, namely: '*Positivism/Functionalist'*; '*Post positivism/Radical structuralist'*; '*Critical-idealogical/Radical humanist'* and '*Constructivism-interpretivism',* or b), on the philosophical choices of particular researchers who are guided by pragmatism and the 'pragmatic approach' (Morgan, 2007) which allows the nature of the particular research purpose and the posited research questions to determine the particular paradigmatic assumptions to be adopted, whether for 'mono-method' or 'mixed-method' research designs (see also Hamlin, 2015). Furthermore, following the example of what applies in the field of EBM, other types of lower strength 'best evidence' can be used including: a) 'descriptive studies and/or self-report stories' and 'the opinion of respected authorities or expert committees without additional data', which are regarded as the weakest types of evidence in EBMgt (Reay, Berta, & Kohn, 2009), and b) 'situated expertise' based on the proficiency and judgment that individual managers acquire through experience and practice (Morell, 2008). These various understandings of what can constitute the differing strengths of *best evidence* are consistent with Tourish's (2013) view that evidence-based managers should "make use of a wide range of evidence types-including qualitative and quantitative research, case studies, journalistic

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

accounts and anecdotes" (p.13); and with the opinions of various other experts as reported in Rynes and Bartunek (2017) who argue that "a much broader view of evidence must be taken for many of the problems confronted in EBMgt if advocates hope for a positive reception by practitioners and non-positivist researchers" (p. 251).

Thus, in the absence of large and significant extant bodies of relevant Mode 1 and Mode 2 research in the field of 'evidence-based' OCD practice, there is a strong need for gathering from nationally and internationally renowned OCD practitioners such as the contributors to Section 2 and Section 3 of this book who offer and critically reflect upon examples of *situated expertise* regarding what works and does not work in practice. From such evidence 'new' generic insights and common lessons about effective and ineffective change agency practice can often be identified.

Coupled with the insights gained and lessons learned in 2001 from the 'reflections on practice' of eighteen research informed managers, trainers, and developers who had facilitated significant OCD programs within a diverse range of private, public and third sector organizations in the UK, Ireland and the Netherlands, as reported in Hamlin, Keep and Ash (2001), I concluded that *critical reflection* is a very important feature of evidence-based change agency. However, to give recognition to the fact that *action research* had been an integral and essential part of the change management process of some of the afore-mentioned 'reflections on practice' case histories of OCD programs, I offered subsequently a working definition of what I termed *'research-informed HRD',* as follows:

Research-informed HRD is the conscientious and explicit use of research findings and the research process to inform, shape, measure and evaluate professional practice. (Hamlin, 2002, p. 98)

This conceptualization of 'research-informed HRD' can be regarded as an aspect of Hamlin's (2002) working definition of 'evidence-based HRD', and is also reflected in the definition of evidence-based management (EBMgt) as offered by Briner, Denyer and Rousseau (2009):

Evidence-based management is about making decisions through the conscientious, explicit, and judicious use of four sources of information: practitioner expertise and judgment, evidence from the local context, a critical evaluation of the best available research evidence, and the perspectives of those people who might be affected by the decision. (p. 19)

The argument that managers and HRD professional practitioners should be critically reflective and evidence-based in their professional practice is compelling bearing in mind the increasing complexities, contradictions and paradoxes of organizations which make the tasks of facilitating OCD complicated (Hatton, 2001; Vince, 2014). These tasks invariably include the taking of action to: a) understand and make sense of the organization and what is going on; b) formulate appropriate well-informed change strategies; c) implement these strategies effectively and efficiently; d) critically evaluate the effectiveness of the change process; and e) reflect critically upon their own professional practice to draw lessons for the future. Some commentators have argued that there is nothing difficult or intellectually demanding about managing and facilitating major change, and that what needs to be done is usually obvious (Rogers et al., 2003). However, organizations and the people employed within them are far more complex than can often be inferred from much of the change management literature. Furthermore, the proffered 'solutions' to OC 'problems' are also more difficult to grasp than many practitioner 'experts' imply.

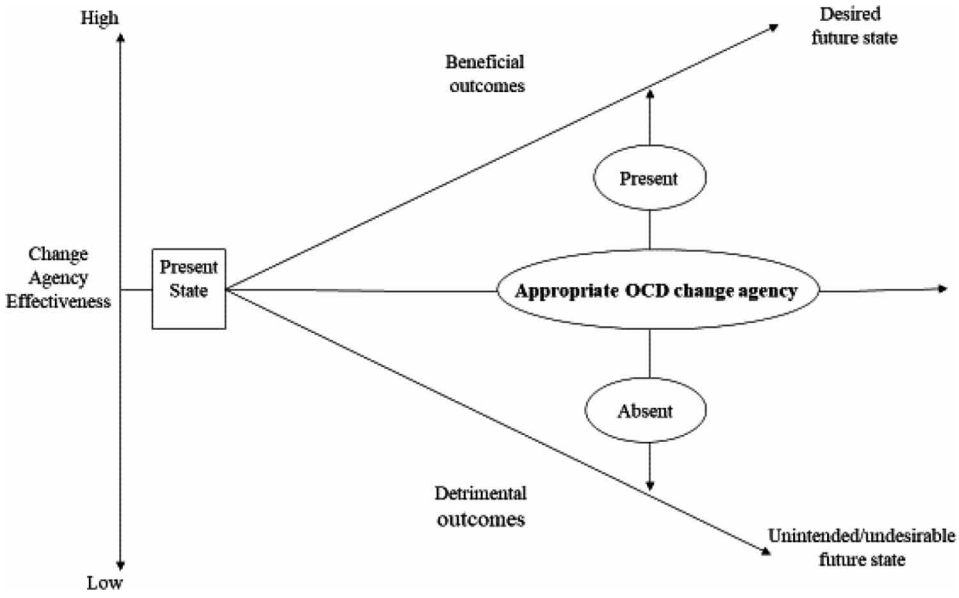
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

To meet the challenge of implementing complicated change agency tasks caused by the potential complexities, contradictions and paradoxes of OC settings, evidence-based managers and evidence-based HRD practitioners (including OD consultants and executive coaches) need increasingly to consider: a) adopting *action research* approaches to OCD, and b) using not only the findings of extant Mode 1 'scientific research' but also conducting (or instigating) internal Mode 2 'applied research' for the purpose of better informing, shaping, and evaluating their change agency practice. Furthermore, regardless of the approach they adopt to facilitate an OCD program, they need in general to build into their planned change agency activities sufficient time for review and critical reflection. From such reflection new theoretical insights can be gained as to why particular aspects of OCD programs succeed or fail. Furthermore, new ways of approaching the problems of change may emerge through the development of 'lay theories' informed by their own professional practice. These are the types of key lessons that resulted from the practitioner 'reflections on practice' reported by Hamlin (2001b) in Hamlin, Keep and Ash (2001). The practical importance of internal/in-company Mode 2 research, and in particular 'design science' research as defined by van Aken (2005, 2007) and advocated by this and various other writers (Hamlin, 2007; Kuchinke, 2013; Sadler-Smith, 2014) to generate *instrumental knowledge* to better understand the change context and help solve context-specific real-life problems, cannot be over stated.

The case for evidence-based approaches to OCD practice is supported by the recent research of ten Have et al. (2017). These researchers examined the extent to which the assumptions underlying modern 'best practice' prescriptions and dominant beliefs about OC management practice are based on solid and convergent [scientific] evidence, and thus hold true in all or most change circumstances. Their research involved critically reviewing 23 of the top 100 bestselling 'popular press' books on change management, plus 31 other relevant books from which they identified 18 common assumptions that influence professional change consultants' approaches to change management practice. They found that 6 of these claims are not supported by any scientific evidence at all, which suggests these assumptions do not hold true; and the evidence supporting 7 of the other claims appear weak, limited, or conditional upon the described circumstances, which suggests these assumptions are only somewhat likely to be true. More details of ten Have et al.'s (2017) research will be found in Chapter 3 of this book. Their findings indicate that 'best practice' approaches to managing change are based mostly on assumptions that are either untrue or unlikely to be true. This brings into question the change agency effectiveness of many if not most managers and change consultants who rely on 'bestselling' books to inform and guide them on what works and does not work for managing change. Adopting change management prescriptions and beliefs based largely on invalid or only partially valid assumptions might explain why so many OCD interventions fail; and this provides a further argument for adopting 'evidence-based' approaches when facilitating OCD programs.

In summary, as I have asserted elsewhere (Hamlin, 2016a/b), if managers, HRD practitioners, and other professional 'people and organization' developers consciously use good/high quality Mode 1 and Mode 2 research, whether conducted from the philosophical perspective of a particular research paradigm or the pragmatic approach, or if they use other forms of lower strength 'best evidence' to help inform, shape, and evaluate their change agency practice, then it is more likely that their resulting 'evidence-based OCD' interventions will be more effective in bringing about beneficial change that leads to the intended desired state, rather than to an undesired and unintended state (see Figure 1). In support of this assertion, I have offered a working definition of 'evidence-based OCD' as follows:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use



Evidence-based OCD is the conscientious, explicit and judicious use of current best evidence and/or of action research to inform, shape, critically reflect upon, and iteratively revise decisions made in relation to the formulation and implementation of OCD interventions and the associated change management processes. (Hamlin, 2016, p.129)

This definition, in which 'current best evidence' implicitly refers to both Mode1 and Mode 2 research, individual descriptive studies and the consensus of OCD experts, is consistent with the most recent and most comprehensive definition of EBMgt as offered by the Center for Evidence-Based Management:

Evidence-based practice is about making decisions through the conscientious, explicit and judicious use of the best available evidence from multiple sources by: asking an answerable question; acquiring research evidence; appraising the quality of the evidence; aggregating the evidence; applying the evidence in decision-making, and assessing the outcomes of the previous steps. (see Rynes & Bartunek, 2017, p. 239)

However, a major obstacle to implementing evidence-based OCD is the continuing paucity of relevant and usable management and OCD related research. How this obstacle to EBP in the field of OCD might be overcome is discussed in the following section.

Figure 1. Critical contribution of EBOCD related change agency

Evidence-Based Organizational Change and Development Practice

Attempting to overcome the afore-mentioned obstacle begs the question as to what research topics and what types of research are most likely to be of greatest relevance to managers in performing their respective evidence-based change agency roles, and also to those OCD-related professionals who advise and support them.

Relevant Research Topics

Of primary importance in this regard is the need to better understand the factors within specific organizational contexts, including those aspects of the prevailing *organizational culture*, *management culture* and *leadership* that have the potential either to help or hinder the OCD process (see Chapter 2). Extant OCD-related 'best evidence', albeit limited in range and scale, can provide valuable *context-general* knowledge to inform OCD strategy formulation regardless of an organization's context specificities. For example, there are small bodies of literature that have explored 'employee resistance to change' (see Garcia-Cabrera & Hernandez, 2014; Szabla, 2007), 'employee readiness for change' (Choi & Ruona, 2011), 'coping with the stress of transformational change' (Robinson & Griffiths, 2005), 'the use of social support to cope during organizational change' (Lawrence & Callan, 2011), and 'how employees perceive the emotional intelligence (EI) of change leaders' (Smollan & Parry, 2011). And there are larger bodies of literature that have explored the related issue of *organizational dynamics* in general, and other research on the specific issue of *emotion*, *power relations* and *political dynamics* in the context of HRD which can either enhance or inhibit the learning and development that needs to take place, and thus either support or undermine the possibility of planned OCD transformations arising effectively (see Vince, 2014).

However, such generalized knowledge can only go so far in helping to identify and better understand the many specific complexities, contradictions, and paradoxes that tend to limit the successful implementation of an OCD program within particular organizational settings. Hence, what is called for is *context-specific/case-specific* internal research that is instigated as part of the design of an OCD initiative and conducted either by managers and/or those HRD colleagues who are 'scholar-practitioners' with sufficient research expertise, or in partnership with qualified academic researchers or by commissioned outside professional researchers. Such research can help make change occur; and when conducted with appropriate academic rigor it can lead to deep seated fundamental issues concerning the effective functioning of the organization being brought to the surface and being confronted. Surfaced issues can be those ineffective aspects of organization and management culture and of managerial and/or employee behavior which impede or block organizational change and innovation. Sponsored in-company research that is recognized and accepted by employees and other managers within the organization as being relevant, rigorous and of a high ethical standard is most likely to 'strike a chord'. And in research designs where strict anonymity rules are applied, managers and employees are more likely to admit in public their own individual performance or behavioral deficiencies contributing to identified generic ineffective features of organizational life that impact or are likely to impact negatively on the OCD process; this is because there is no possibility of direct personal attribution. Furthermore, employees are more likely to advance personal theories, reactions, and opinions which otherwise would not be revealed. Such research gives managers and evidence-based HRD practitioners the empirical evidence (the 'hard facts') required to hold a mirror up to the organization that will reflect accurately the truth and realities of organizational life, and thus help surface organizational taboos or latent and un-discussed sensitive

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

issues that need to be addressed (Bruce & Wyman, 1998). Becoming 'evidence-based' with the ability to think and act like an academic researcher can give managers, HRD professional practitioners, OD consultants, executive coaches and other OCD practitioners the additional skills and expertise required to be fully effective as change agents.

Types of Empirical Research

Most of the management and OCD-related empirical research that is currently available as 'best evidence' has been derived from Mode 1 "normal science" studies (Kuhn, 1996, p. 5) that generate bodies of context-general *conceptual knowledge* which Pelz (1978) defines as 'knowledge for understanding'. Most of this research has been conducted in the USA and other Western countries. Of the few studies that have been conducted in non-Western countries, most have been imposed-etic deductive inquiries using extant Western theories, constructs and methods (see Leung, 2007; Tsui, 2006; White, 2002). This has been a cause of concern because, as various writers claim, researchers risk making discoveries that only fall within the domain covered by the applied theories, and these may have very limited applicability in non-Western economies and cultures (Tsui, 2009; Zhang et al., 2012). Indeed, various writers have argued that management and leadership are culture-specific/context-specific (Brodbeck et al., 2000; Wendt, Euwema, & Emmerik, 2009). However, other writers have argued that logic suggesting the cultural and context universality of management and leadership is compelling (Bass & Riggio, 2006; House & Aditya, 1997; Robie, Johnson, Nilsen, & Hazucha, 2001), though empirical evidence demonstrating the reality of this is quite sparse. Consequently, there is a paucity of extant OCD-related generalized 'best evidence' that can unreservedly be translated and transferred to nations and societies other than those where it has been generated. This means that, for several years to come, evidence-based managers and OCD practitioners will need to instigate and/or conduct Mode 2 studies within their own (or host) organizations to generate 'best evidence' for informing their change agency practice. Unlike Mode 1 research, Mode 2 studies generate bodies of context-specific *instrumental knowledge* which Pelz (1978) defines as 'knowledge for action'. Besides *action research* involving *critical action learning* as advocated by Vince (2008) and *collaborative management research* (CMR) as a modality within the broad family of action research approaches (Canterino, Shani, Coghlan, & Brunelli, 2016), this author strongly commends *design science* as advocated by van Aken (2005). And from his personal experience he advocates the merits of *professional partnership research* and *replication research* as discussed below. These approaches are wholly consistent with the recent thinking of Brown and Latham (2018) on 'how we bridge the practitioner-scholar divide within human resource development', which by definition includes OCD as one of its core components.

Design Science Research

Design science research is primarily aimed at developing 'general substantive and procedural design science' to solve common field problems within a particular discipline/field of study and practice, but can also be used in the explanatory sciences to develop 'general solution concepts' and field 'tests' (van Aken, 2007). van Aken provides a compelling case for using design science research in the field of organization and management to generate *general knowledge* that can be used in organizational contexts other than the ones in which it has been produced, as happens in medicine and engineering. He explains that Mode 2 *prescription-driven* research based on the paradigm of the *design sciences* can produce

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

solution-oriented knowledge comprised of *technological rules.* These rules are *general statements* based on stable patterns of human conduct observed in one or more specific contexts; and through a process of redesign from the general to the specific they can be translated and transferred to other specific contexts (van Aken, 2005). He defines a *technological rule* as "a chunk of general knowledge linking an intervention or artifact with a desired outcome or performance in a certain field of application" (van Aken, 2004, p. 228). This means it is not a specific prescription or solution to a specific problem in a specific organizational setting, but rather a general prescription or solution for a class of field problems manifested in multiple organizational settings. Thus, a *technological rule*-which van Aken and Romme (2009) alternatively refer to as a *design proposition*-is a mid-range theory, the validity of which is limited to a certain field or domain of practice.

The significance and viability of design science concepts in relation to HRD in general [and by inference to OCD] have been well articulated by Kuchinke (2013) and Sadler-Smith (2014). Indeed, van Aken (2007) argues design science is highly relevant to OD because of its interest in applying behavioral science to solve [field] problems, and because there is far greater interaction between researchers and practitioners than found in most other subfields of management. And according to Rynes and Bartunek (2017), drawing upon the work of various essayists, design science research "might work harmoniously with EBMgt to improve the relevance of management research for practice" (p. 244) including, it is suggested, evidence-based initiatives for OCD. In Chapter 5 of this book Joan Ernst van Aken elaborates further on the relevance of EBP and 'design science research' within the context of OCD.

Based on the experience of the author of this chapter, another Mode 2 research approach well suited for exploring OCD related problems within specific single organization settings is collaborative *professional partnership-research* as conceptualized by Jacobs (1997). Should the problems be occurring also in other organizations, then conducting *empirical generalization* replication studies (Tsang & Kwan,1999) in those organizations and subjecting the results to *multiple cross-case comparative analysis* (Eisenhardt, 1989) in search of commonalities can lead to the emergence of mid-range theories, which can then be further developed into bodies of OCD related generalized 'best evidence'.

Professional Partnership Research

In this type of partnership-research arrangement which is different from a research service agreement, a university and an organization engages in a collaborative partnership within which individual scholars and practitioners jointly conduct programs of pragmatic research focused on issues of concern to management. However, they do so with their own mutually exclusive yet complimentary goals. Maintaining the integrity of both sets of goals for the common good is considered important. Thus, there is a dual goal to change and improve the organization through the application of academically rigorous but timely applied Mode 2 research. Depending upon the focus of such research, the results can be used either to inform the initial design of an OCD program or inform the subsequent critical evaluation and redesign that should take place at each iterative stage of the OCD process until the planned desired future state has been reached. If the research focus is not uniquely context-specific, then the scholar partner can adopt a *design science* orientation with an expectation to test the validity of any emergent technological rules/design propositions in different but comparable specific contexts.

The author has been involved as the scholar partner in several professional partnership research studies carried out in various UK public, private, and third (non-profit) sector organizations, all of which have been reported in the academic literature. Each study generated *instrumental knowledge* that was used by

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the respective practitioner partner to inform directly or indirectly an OCD initiative, and/or some other aspect of management or HRD policy and practice within his/her respective organization. To illustrate the nature and impact of professional partnership research, four of these collaborative studies, which are referred to here as cases, are presented below. For each case the research focus, goals, and process are briefly described including where the study has been published. To illustrate the practical relevance and impact of the research within the respective collaborating organizations, each case also includes 'testimonial evidence' from the respective practitioner partner(s).

Table 1. Case testimonial

Case Testimonial
HM Customs and Excise: Anglia Region This was primarily a collaborative study of perceived managerial and leadership effectiveness commissioned by Dick Shepherd, the Head of the Executive Unit of HM Customs and Excise (Anglia Region)-a major department of the British Civil Service-which I carried out in partnership with his Research Officer (*and OD Consultant*)- Margaret Reidy from 1994 to 1998. During this same period Margaret Reidy was undertaking a parallel program of doctoral ethnographic longitudinal qualitative research into cultural change. The application and practical impact of the results of the replicated managerial behaviour research have been published in several academic journals and conference proceedings (see Hamlin, & Reidy, 1997; Hamlin, Reidy, & Stewart, 1998; Hamlin & Reidy, 2005).
Extract from Personal Testimonial of Dick Shepherd "I was accountable to the Board of Customs and Excise for achieving operational targets within the region. To cope with the demands for ever-increasing outputs and for more openness in our dealings with the public I needed to change the culture of the organization. I used seminars, walking the floor, publishing my *Expectations* document and was making progress and lifting outputs. But I felt that I did not really know how deep the changes were penetrating- there was always an element of telling me what I wanted to hear in the feedback I was receiving. I commissioned the Critical Incident/Factor Analytic Research [on managerial and leadership effectiveness] from Bob Hamlin at Wolverhampton University, [and it was] my initial hope to find the patterns of strengths and weaknesses among the managers and team leaders. The results exceeded my expectations for I felt I was getting the real behaviors and attitudes prevalent in all the various parts of the organization for the first time. I was able to use the emerging results very quickly at my annual management conference where it made a big impact. This was no consultant's abstract interpretation using the latest business management technique. This was real. This was us. I had a profile of the attitudes and behaviors in the organization for the first time based on fact rather than intuition. A key factor right through this whole process was the close partnership between me and the research team. The clear understanding was that the research should be carried out independently with rigour and integrity to as high an academic quality as was necessary to provide provable results. My part was to commission it, facilitate its freedom in operation and ensure that the [research process and] results were directly related to the working life of the Department. In fact the research team went on to develop a set of (*management*) competencies that we were able to use in our local appraisal system to improve managerial effectiveness. They also developed specifically targeted team building and managerial effectiveness workshops". **R. C. Shepherd** Date 21st May 2002
Extract from Personal Testimonial of the Practitioner Partner- Margaret Reidy The data that resulted from the professional partnership-research "was so rich that it's preliminary findings were immediately and effectively used by Dick Shepherd and Margaret Reidy to inform and shape a number of OCD/HRD interventions for managing the (*organizational*) change, including workshops and local initiatives"…… "The preliminary findings helped people to assess their behaviors and attitudes in newer and more in-depth ways. This was invaluable to the everyday work of the organization as managers could effectively identify and curtail or harness those behaviors (*associated with effective or ineffective management respectively*). This was achieved with the support of [OD/HRD] tools developed from the research findings to improve the rapidly transforming organization. The finalized data took this further. As a direct result of the managerial [and leadership] effectiveness research, a new set of behavioral management competencies were developed exclusively for the organization"……. "The findings of the overall research [i.e. the ethnographic 'cultural change' study and replication 'managerial behavior' study], that were both positive and negative in terms of people's attitudes and behaviors, were accepted in a highly positive manner by the (*Anglia*) people. The reason for acceptance was because the research had been conducted in an impartial and objective manner, and names were never used. This created, on the whole, trust between the interviewers and the interviewees and elicited interest and co-operation in the research on a wide scale"…… Over the four years of study and practical application "the research found that the culture was adapting and changing in a very real and measurable sense. This was reassuring for the management *(in particular for Dick Shepherd*) who had doubted that cultural change could be effectively measured. The research also helped to prove to management that an in depth knowledge of their organizational culture was one of the most effective tools in organizational change. It became understood that cultural change was not a 'soft issue', but an integral practical issue with very real rewards in bringing about successful organizational change". **Margaret Reidy** Date June, 2002
Note: Full details of these testimonials can be found in Hamlin (2009, pp 125-131)

Table 2. Case testimonial

Case Testimonial
Wolverhampton City Council This local government example of collaborative partnership research, which was a managerial behavior study carried out within the Social Care Department of the Wolverhampton City Council in the UK, had two aims. The first was to explore what behaviorally differentiates effective managers from least effective/ ineffective managers as perceived and judged both by managers and non-managerial employees of the organization. The second aim was to compare and contrast the findings against those obtained from the near equivalent study carried out within the Anglia Region of HM Customs and Excise in search of commonalities and relative generalizations across the two cases (see Hamlin & Serventi, 2008)
Personal Testimonial of the Practitioner Partner-Susan Serventi By undertaking the partnership–research study I was able to validate the credibility of the 'Leadership and Management' framework within the social care service area within Wolverhampton City Council. The evidence-based practice approach underpinned by robust collaborative research methods served to help me gain the confidence and commitment of managers and employees within all social care disciplines to the framework and the development activities that followed. This was evidenced in the feedback from contributors and participants who felt the framework offered them reassurance that they were clear about organizational expectations and culture. They were also able to recognize the transferability of the behavioral expectations into their generic rather than service specific role as a manager. As an HRD practitioner I was confident that I could evidence that on the whole the identified effective and least effective/ineffective managerial behaviors were not unique to the social care setting, and could be transferred across the wider council. It was difficult to influence the corporate center as the senior managers in post at the time were reluctant to believe that a framework developed within a service group could have validity across the wider council despite the evidence of underpinning research. Although disappointing, it did prompt me to reflect upon the reasons why it was difficult to engage senior council leaders at the time. I was able to recognize that the senior leadership was not ready to engage and therefore not receptive to the concept. Timing is important. In more recent times in my current role [within the council] I have been able to use my earlier partnership research experience to confidently negotiate and develop the procurement of a leadership program intended to support the council to reinforce the transformation agenda. The learning from the previous partnership-research experience has allowed me to plan, evidence, and present my case with confidence and clarity. This has helped me to secure buy-in from current senior leaders in the council to embark on a program that will build on previous learning and experience in developing the organizational behaviors and culture for the future. It is already recognized that many of these behaviors will be generic and that the program will be transferable and deliverable across all service sectors. Timing is everything! **Susan Serventi**, ***Strategic Workforce Development Manager, WCC*** Date 18th October 2013

As will be appreciated, the focus of all four cases was on the topic of perceived *managerial and leadership effectiveness,* and the respective researchers adopted the same methodology and methods which had also been used for previous single organization replication explorations of the same topic. However, because the research focus is not organization-specific but common to many other private, public, and third sector organizations interested in and concerned with understanding better what behaviorally distinguishes 'good/effective' managers from 'bad/ineffective' managers, the phenomenon explored could be described in van Aken's terms as a 'management and HRD' field problem. *Professional partnership research* of the kind illustrated here is consistent with recent "encouraging developments in EBMgt and A-P gap research" which sees an "increase in field studies examining the co-creation of evidence by academics and practitioners" (Rynes & Bartunek, 2017, p.252)

Replication Research

Being the respective scholar partner in the four cases outlined above, the author's long-term goal has been to search for evidence of the existence of generic or universalistic *behavioral criteria of perceived managerial and leadership effectiveness* through a process of derived etic research (Berry, 1989) based on replication logic and *multiple cross case comparative analysis* (Eisenhardt, 1989). Consequently, each new and cumulative study has replicated as closely as possible an earlier equivalent replication study

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Case testimonial

Case Testimonial
TLFN Group plc This collaborative professional-partnership research was conducted within a large UK-based multi-national retail telecommunications company which, for purposes of anonymity, is referred to as the TLFN Group PLC. The primary goal of the study was to gain a better understanding of the managerial culture at the executive leader level of the company, and the results have been published in the academic literature (see Hamlin & Sawyer, 2007)
Personal Testimonial of the Practitioner Partner-Jenni Sawyer The trigger for this research was the need to conduct a research project as part of the MSc in HRD and Organizational Change study program that I was undertaking at the University of Wolverhampton Business School. At the time I was employed within the HR department of TLFN Group PLC. I chose to conduct a replication study of 'managerial and leadership effectiveness', and I found the extensive experience and knowledge gained through the process of selecting this research topic and methods of great benefit when it came to building a business case for conducting the research within my organization. This was a highly commercial environment, so it was important that I was able to demonstrate a projected return on that investment in time and resource. Following the identified need for a 'one-company' organizational and management approach, we needed to acquire a better understanding of the evolving culture within our UK business, as reflected by the behavior of senior people. The key aim was to identify a set of behavioral criteria of managerial and leadership effectiveness that reflected 'best practice' within the company. The findings of the research challenged various aspects of the existing company-wide competency framework and raised a number of important questions to be explored. Most significantly 'customer focus' was found to be so core to the culture and values that the associated behaviors had become inherent and were therefore no longer recognized by senior people as indicators of managerial and leadership effectiveness. The findings were used to inform and shape the ongoing development of the company's Executive Leader Development Programme. This research-informed program was then planned to be applied across Europe. **Jenni Sawyer,** ***Senior HR Manager: TLFN Group plc*** (when the research took place) Date 25 October 2013

Table 4. Case testimonial

Case Testimonial
ABC Charity This collaborative professional-partnership research was conducted within a large registered charity in the UK which for purposes of anonymity is referred to as the ABC Charity. The organizational goal was to identify what was seen as effective and least effective/ineffective managerial behavior at the senior levels of management within the organization. The research design replicated as closely as possible the approach and methods adopted by the practitioner research partner for a study which she had conducted in her previous organization-TLFN Group PLC. Full details of this ABC Charity study can be found in Hamlin, Sawyer & Sage (2011)
Personal Testimonial of the Principal Scholar-Practitioner Partner-Jenni Sawyer This research took place when I was employed within the HR department of a large not-for-profit organization providing housing and care for older people (ABC Charity). When it became apparent to our Board that there was a need for more corporate leadership and for de-centralized business units to adopt a more centralized approach, I was well placed to instigate a piece of internal applied management research to help inform the development of a bespoke 'evidence based' management development program for over 400 senior and middle managers. This led to a partnership-research arrangement consisting of Professor Bob Hamlin as the HRD scholar partner, me as the HRD practitioner partner and an assistant co-researcher. Without my practical experience of conducting academically rigorous research within my previous organization in the UK private sector, plus the credibility that an academic research partnership brings, this piece of in-company applied research would have been outsourced at considerable expense. I am currently employed at Centro, the passenger transport executive for the West Midlands in the UK. My previous partnership research experience has shaped and informed our ongoing Operating Board Development Program and Leadership Team development. The research is a constant source of reference in my work as OD Manager, and has given me the confidence to challenge the use of 'off-the-shelf' competency frameworks and management and leadership development in preference for bespoke, tailor-made products. Effective leadership and management within this organization has led to external recognition and accreditation of Centro as a best in class organization. In 2012 we achieved Investors in People Gold status and were recognized as one of The Sunday Times Best Not-for-Profit Companies to Work For in the UK. **Jenni Sawyer,** ***OD Manager, Centro, Birmingham*** (when the research took place) Date 25 October 2013

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

carried out in the same organizational sector, the aim being to maximize the comparability of findings obtained from each study. This type of replication research is consistent with what Tsang and Kwan (1999) refer to as *empirical generalization* replication. This involves studying the same phenomenon in multiple contexts using the same research focus, philosophical perspective, methodology, and methods to develop mid-range theory. It is also consistent in some respects with van Aken's (2009) notion of *design science research* in which emergent design propositions (technological rule) arising from one or more specific contexts are tested and refined in other specific contexts to develop *general design propositions* and mid-range theory.

Based on the author's original study of managerial effectiveness within UK secondary schools (Hamlin, 1988) and 8 subsequent UK replication studies, including the 4 already mentioned, an emergent *British taxonomy of perceived managerial and leadership effectiveness* has been developed by Hamlin and Hatton (2013). In addition, using the findings from 4 of these 8 UK studies plus 2 replication studies carried out in Germany and Romania respectively, an emergent *EU related taxonomy of perceived managerial and leadership effectiveness* has been developed by Patel and Hamlin (2012). These two behavioral taxonomies, plus a previous precursor taxonomic structure offered by Hamlin (2004), can be regarded as sets of technological rules (design propositions) which could be used to support the design and evaluation of management and leadership training interventions in a range of public and private sector contexts (Sadler-Smith, 2014). As design propositions, these taxonomies could also be used either directly or indirectly as 'best evidence' in support of OCD interventions within various organizational contexts. For example, as in the case of the 'Anglia' case testimonial, they could be used by managers and HRD professional practitioners acting as change agents to help challenge and change a management culture associated with the 'traditional bureaucratic management paradigm' of command, control, compliance and coercion, to that associated with the 'new management paradigm' of openness, involvement, participation and delegation. Alternatively, they could be used by management and leadership development (MLD) practitioners to maximize their contribution to improving organizational effectiveness and performance through the formal training of managers and leaders. Such MLD interventions could or should result in the type of 'leadership' and 'culture' that are conducive to learning and effective OCD change agency. In summary, the cumulative series of replication studies outlined above support: a) Barends, Janssen, ten Have and ten Have's (2014) call for 'the production of replication studies' as one means for improving the quality of the 'organizational change management' research base; and b) the notion that cross-case comparative analysis of evidence resulting from multiple replication studies is particularly generative for mid-range theory development (Eisenhardt & Graebner, 2007)

CONCLUSION

A key message for both managers, HRD professional practitioners, OD professionals, executive coaches and other OCD-related change agents is that by being at least 'critically reflective' and 'research informed' but ultimately fully 'evidence-based' in their change agency practice through engagement in professional partnership research as illustrated in this chapter, or through action research, or through design science research, it is likely they will be even more effective in facilitating and bringing about beneficial OCD. Another key message is that the context-specific *instrumental knowledge* resulting from replication research carried out in multiple specific organizational settings, whether through professional partnerships or other approaches, can potentially lead to theory development and the generation

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of *conceptual knowledge*. Hence, by adopting these approaches, OCD practitioners can not only enhance their professional change agency practice but also advance the OCD-related knowledge base and body of 'best evidence'. In addition, by so doing they can make a significant contribution to 'bridging the scholar-practitioner gap' that currently exists in management and HRD related fields. However, this is unlikely to become a reality unless line managers overcome the five OCD 'failings' as outlined earlier in this chapter; and unless HRD practitioners significantly improve their 'credibility in the eyes of line managers' and thereby become accepted as strategic business partners. Herein lies a major challenge for all those involved with the education, training and development of managers and HRD practitioners and other 'people and organization' developers, particularly those in higher education institutions who teach on professional qualification programs including the MBA and other management, leadership and HRD-related Master level degree courses (see Hamlin, 2002). They themselves need also to become evidence-based in their professional practice as management and HRD scholars if they are to act as role models. An important message for business/organizational leaders and other top managers who are change leaders is that they need to: a) become more cognizant of the 'soft' issues of management that should be considered when formulating OCD strategies; b) give those line managers who implement their OCD strategies sufficient time to attend to the 'soft' human side aspects of the change management processes; and c) increasingly recognize the value of evidence-based management and evidence-based HRD for bringing about effective and beneficial strategic organizational change and development. However, it may fall to you, the reader, to ensure that this message gets conveyed to and 'strikes home' with the top management of your own [or host] organization. In conclusion, this author strongly urges line managers, HRD professional practitioners and external HRD/OD professionals, executive coaches and other professional change consultants who wish to maximize their contribution to the effective and beneficial facilitation of evidence-based OCD initiatives, to embrace the concepts of evidence-based management, evidence-based HRD and evidence-based coaching.

ACKNOWLEDGMENT

With permission of the respective publishers this chapter draws heavily upon the previous published work of the author in Hamlin (2016a) and Hamlin (2016b).

Chapter 90
Are Managers Making the Right Choice?
IT Investment for Smart Work

Hyojeong Kim
Department of Hospitality Management, Kyung Hee University, Seoul, South Korea

Chang Juck Suh
Department of Management, Sogang University, Seoul, South Korea

ABSTRACT

Smart work has been credited with providing flexible supply capabilities to meet customer demands in service businesses operations. Effective operations of smart work need huge investment of technologies implementations. The authors use Delphi techniques and survey method to identify implementation factors of importance of home-based work which is a representative type of smart work. Seven technologies were identified to be important (Knowledge Management, Real-time monitoring, Remote IT assist, Online testing, Online training, Workforce management, Agent performance management technologies). Different from general expectations, control-based technologies were found not to have positive effects, but support-based technologies to have positive effects to the performance. Smart work technologies in service business affect employees' job satisfaction, and further retention of remote agents. Careful planning of how to implement technologies for smart work is needed in service business in order to identify the best working environment design.

BACKGROUND

The service industry is the largest and fastest growing sector of the economy (Fitzsimmons & Fitzsimmons, 2010). It is also the basis of global economic growth and employment. However, while the importance of the service sectors is striking, low productivity causes service employees to suffer from low wages and poor quality of work in most service sectors. The low productivity of service sectors makes service jobs unattractive for employees and could result in low productivity of the whole economy (Suh & Kim, 2013).

Smart work has been instrumental in raising productivity in organisations in the service business (Podnar & Golob, 2010). Many authors (e.g. Bloom et al., 2013; Ye, 2012) illustrated the reasons why home-based work which is a representative type of smart work is more productive and efficient than office-based work. More experienced and older employees tend to choose to work remotely. They are usually more skilled at their jobs and can handle the tasks faster than employees in an office. Further, employees who work remotely show less turnover ratio than employees in offices, thereby reducing training and recruitment costs. Companies are also able to reduce costs related to space and equipment in the office.

Still employers are afraid of adopting smart work due to lots of challenges and concerns (Kim, 2013; Suh & Kim, 2012; Pyoria, 2011; Neirotti et al., 2013). Information technology challenges are one of major concern to many employers. Deciding what kind of technologies to purchase, and what kind of functions do they have to have affects the success of a smart work program (Cha & Cha, 2013; Suh & Kim, 2013).

The authors of this study focus on the following issues to find out whether the managers are making the right choice: (1) What kind of system is required to ensure competent home-based work? 2) What kind of system can improve the performance of employees? (3) How well the managers predict the system's effectiveness and impact on the employee's perception and performance?

The authors will review related articles of home-based work about success and failures in the service business context. Section 2 briefly outlines our methodology. Section 3 introduces success factors of implementing and operating home-based work. Section 4 discusses home-based work technologies of importance through Delphi techniques. Section 5 will verify key factors of home-based work technologies from two perspectives- control based and support based. Section 6 will provide conclusions.

RESEARCH METHODOLOGY

The methodology used in this study combined Delphi technique with survey method. Delphi technique is useful for getting consensus from a group of experts on a specific topic, generate ideas, and extract important factors in the professional domain (Hsu & Sandford, 2007; Okoli & Pawlowski, 2004).

Our study used Delphi technique to extract seven technologies of home-based work implementation that is supported by industry experts. And the authors used survey method to verify key factors of home-based work technologies from two perspectives; control-based and support-based technologies.

Our approach included the following steps:

- review refereed cases of home-based work operations from the published literature
- identify success factors of home-based work operations
- make an initial version of Delphi questionnaire
- get a consensus from industry experts about successful home-based work technology
- synthesize industry expert opinions and frontline employee surveys.

SUCCESS FACTORS OF HOME-BASED WORK IMPLEMENTATION

Smart work is a nontraditional working arrangement in which employee makes changes of where to work by using IT and performs the task under an employment contract (Pyöriä, 2011; Baruch, 2001). Smart

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

work includes home-based work, teleworking, telecommuting, home-working, and remote working. These terms are all interchangeable and have similar meanings (Baruch, 2001). Smart work is usually classified into two categories, home-based work and nomadic mobile work (Neirotti et al., 2013). Nomadic mobile workers have little limit in terms of workplace as they can work anywhere using mobile communication technologies, while the major workplace of home-based workers is likely to be their home. In the study, the authors identified implementation factors of importance of home-based work which is a representative type of smart work.

Though Butcher-Powell (2006) illuminated the concerns of ICT network security, information and communication technology (ICT) will help remote work increase (Boell et al., 2016; O'Sullivan, 2013) and is the enabler that would increase employee engagement and meet customer expectations (Beaumont Pate et al., 2009). Belanger et al. (2001) investigated how three constructs – availability of IT, communication technologies, and communication patterns of remote workers – affect the performance of home-based work operations. The results indicate that technology affects productivity, performance, and employee satisfaction positively. Gupta et al. (2000) identified patterns of computer and communication technology usage by studying IT usage levels. They found that highly educated employees are more likely to use computer and communications technologies, and that individual background, employment, residential, and occupational characteristics determine the usage of these technologies. Kylin (2007) found that advances in telecommunication structures and the linkage of IT networks provided opportunities for many individuals to perform work from their homes. She also suggested that organizations need to develop policies that support the combination of work and other life domains.

A supportive organizational culture and role of remote worker managers are also regarded as important organizational characteristics (Poissonet, 2002). Previous researchers also emphasize that managers should care employees emotionally to feel belonging to the organization, support them to use better techniques, and communicate effectively by giving the timely feedback (Guimaraes & Dallow, 1999).

Two types of tasks are fit for home-based work: tasks that require a low level of autonomy and are simple and easy to control remotely, and tasks that require a high level of autonomy and are complex (Poissonet, 2002). The frequency of information exchange relates negatively with home-based work, but positively with the associated management of the work-life balance, lower stress levels from interruptions, and less exposure to self-interested and unjust behaviours (Fonner & Roloff, 2010).

Ye (2012) argue that the persons most suited to the home-based work are those who are professional, able to work alone, resourceful, self-reliant, and knowledgeable about the technologies for home-based work.

GETTING KEY SEVEN TECHNOLOGIES FROM INDUSTRY EXPERTS

The authors performed a three round Delphi study from service industry experts to get consensus of critical technologies for home-based work. The authors delivered and gathered survey questionnaire and responses by email. From initial questionnaire to final round, research was performed for around three months.

The Delphi method was first used at Rand Corporation in the early 1950s to determine the possibility of attacks from Russia (Dewar & Friel, 2013). The method is designed to obtain consensus from a group of experts on a specific topic, generate ideas, and extract important factors in the professional domain (Chiravuri et al., 2011). It uses repeated questionnaire responses and controls feedback in a structured

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

manner. Panel members respond to a series of questionnaires by letter or telephone, and increasingly by e-mail.

The Delphi method is useful when studying new concepts or variables that have not been studied in previous research. Research on the home-based work in non-face-to-face service is in the introductory stages. Therefore, a Delphi study was used to elicit the key factors.

Thirteen call centre service operations managers from eight different firms participated as a panelist in the study. The titles of the respondents ranged from department director or senior manager to vice-president. They worked in industries like telecom, insurance, and home shopping. (Table 1). The combined experience of all the panelists in call centre work totaled one hundred nineteen years, and the combined home-based work experience totaled forty-four years.

Table 1. List of panelists

No.	Gender	Industry	Service dept. experience (years)	
				Home-based work
1	M	Telecom	11	1
2	F	Insurance	5	2
3	M	Telecom	8	2
4	M	Telecom	12	5
5	F	Retail	6	6
6	F	Telecom	12	3
7	F	Telecom	11	5
8	M	Insurance	11	2
9	M	Telecom	7	5
10	M	Insurance	9	5
11	M	Retail	9	6
12	F	Retail	9	1
13	F	Retail	9	1
Total			119	44

By asking same questionnaire repetitively, the authors got consentaneous results from panels. And the content validity ratio (CVR) value, devised by Lawshe (1975), was used to validate the results as shown in Figure 1:

When the Delphi panel is composed of 13 members, a minimum CVR of 0.54 is required to satisfy the five percent significance level.

The overall responses to round 3 are shown in Table 2. Knowledge management, real-time monitoring, remote IT assist, online testing, online training, workforce management (WFM), agent performance systems, these seven technologies were identified to be important by CVR value.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Equation 1: Results from panels

$$CVR = \frac{n_e - N/2}{N/2} \quad (1)$$

where: n_e = number of panellists indicating an item is 'essential' and N = total number of panellists.

Table 2. Final results of Delphi (round 3)

Item	Function	CVR	Remarks
Online training System	enables remote employees to get training course through online.	1	Higher than 0.54
Knowledge Management system	enables the process of capturing, developing, sharing organizational knowledge.	1	
Remote IT assist system	enables IT managers to help agents remotely fix IT related problems.	1	
Agent performance system	provides individual performance information.	1	
Real-time monitoring System	can monitor phone conversations between agents and customers in real-time.	1	
Online testing System	enables remote employees to access the knowledge test.	0.85	
Work Force Management system (WFM)	provides functions for labor management (e.g. attendance, absence, vacation, etc.), forecasting & scheduling and task management.	0.69	
Video conferencing system	uses visual art equipment to conduct a live conference between agent and manager.	0.08	Lower than 0.54
Community system	helps to create a social unit of any size that shares common values.	0.08	

* Values higher than the minimum are in bold

Two Perspectives - Control Based vs. Support Based Technologies

The authors performed multiple regression analysis to find the effect of each technology on the performance. The authors controlled the variables of age, tenure, working time, and response type (inbound/outbound). Service Quality and Work Engagement were used as a measurement of performance/outcome. Service quality and work engagement are critical elements for a service organization. Service quality is a prerequisite element for customer satisfaction (Heskett, 1994), while work engagement is a parameter that influences work satisfaction as well as the intention of turnover (Schaufeli and Bakker, 2004). In

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the same vein, this study examined service quality and work engagement as performance factors. The employees perceive the usefulness of the system as an organizational support which motivates them affecting their performance in a positive way (Salanova & Llorens, 2009). Under the circumstance, this study examined how the perception on the usefulness of the system in a service organization affects the employees' performance.

To measure usefulness of each technology, the authors asked three items about the perceived usefulness, productivity, and increase chances of getting good results based on Van Raaij and Schepers' (2008) study. All items were scored on a seven-point Likert Scale ranging from 1 ('strongly disagree') to 7 ('strongly agree'). To measure employee satisfaction, work engagement was used. Based on Lieke et al.(2012)'s study, work engagement was assessed using four items from the Utrecht Work Engagement Scale (UWES; Schaufeli, Bakker, & Salanova, 2006). To measure service quality, call quality score were used. Companies monitor and evaluate the agent call by their internal quality specialist (Lewig & Dollard, 2003). The participant companies provided the call quality score of home-based and office-based agents who responded the survey.

The respondents were 161 home-based agents from three organizations. The industry association of the respondents was as follows: 50 (31.1%) insurance, 52 (32.3%) retail, and 59 (36.6%) telecom (Table 3).

Table 3. Descriptive statistics

Category		No.	%
Industry (N = 161)	Insurance	50	31.1%
	Retail	52	32.3%
	Telecom	59	36.6%
Tenure at current company (N = 145)	Less than 1 year	52	32.3%
	1 to 2 years	44	27.3%
	More than 2 years	49	30.5%
Age (N = 143)	18 to 29 years	13	9%
	30 to 39 years	91	62.8%
	Older than 40 years	41	28.3%

The mean, standard deviations, and correlations of the research variables are presented in Table 4. All variables were correlated positively significantly with performance.

Cronbach's reliability coefficient was calculated for each construct, as suggested in many studies on operations research (Smith & Reece, 1999). Cronbach's α values over 0.7 is acceptable to have reliability of the internal consistency (Nunally, 1978). All of the values in this study were over 0.8. Factor analysis, which gives evidence of a single latent construct, was used to check the unidimensionality of the scales (Flynnet al., 1990). The exploratory factor analysis with VARIMAX rotation extracted nine factors that explained about 85% of the variance (KMO: 0.895; Bartlett: chi-square: 13426.963; d.f.: 595; significance: 0.000, Table 5).

Regression analysis was conducted to analyse the relationships among the constructs (see Table 6). The remote IT assist, WFM, and agent performance technologies were found to have significant positive effects on work engagement ($p < 0.05$, $p < 0.01$, $p < 0.10$, respectively). The remote IT assist technology was also found to have a significant positive effect on service quality.

(6) Remote IT assist system	5.1	1.3	.589**	.565**	.374**	.558**	.571**	1	
(7) Agent performance system	5.2	1.1	.447**	.444**	.396**	.370**	.522**	.652**	1
(8) Work engagement	4.9	1.2	.310**	.286**	.492**	.358**	.363**	.439**	.404**

**$p < 0.01$

Table 5. Results of reliability and exploratory factor analysis

	WFM	Online training	Online testing	Work engagement	Real-time monitoring	KMS	Agent performance	Remote IT assist
Standardized Factor Loading	0.742-0.82	0.655-0.817	0.826-0.849	0.738-0.79	0.795-0.867	0.798-0.853	0.759-0.843	0.748-0.806
Eigen Value λi	15.471	3.059	1.871	1.664	1.485	1.296	1.209	1.017
Cum. Variance Explained	44.203	52.944	65.897	70.651	74.893	78.595	82.049	84.955
Cronbach's α	0.945	0.923	0.927	0.931	0.927	0.942	0.945	0.852

KMS, Online testing and Online training technologies showed any significant effects on work engagement and service quality. Different from the general expectations, the real-time monitoring system was found to have a significant negative effect on service quality ($p < 0.05$).

CONCLUSION

This study reveals key factors of technologies for home-based work as a representative of smart work. Using Delphi techniques, the authors identified seven key technologies from industry expert opinion (see Table 7). With those seven technologies, the authors verified the relationship between technologies and performance. The result was very interesting that technologies implemented primarily for company needs, that is, control-based technologies such as the real-time monitoring system, do not affect performance significantly or positively. However, technologies that has basic goal to support agents such as Remote-IT assist, WFM, and the agent performance system, affect performance positively. Remote-IT assist technologies help agents when they are in trouble with the computer, applications, and other equipment for effective working. WFM technologies help agents not to ask routine thing to the manager such

as their break time, off schedule, payroll record, and other HR related information. Agent performance management technologies help agents manage their performance by themselves through providing the performance status information of their own and peer group.

Managers are afraid of losing their control power. So, they are reluctant to adopt the home-based work program and take into account using control-based technology instead in order to lessen their concerns about the limited power to check the performance of the unseen employees. (Morgan, 2004; Pyöriä, 2011).

However, Valsecchi(2006) argued that monitoring practices cannot help to resolve the issues regarding control, suggesting a new management style which is more effective than just controlling home-based workers. The result of this study agrees with Valsecchi's perspectives. The findings of current study add more insights to the previous studies. The authors can conclude that supporting and having trust to remote worker is more important to manage them than controlling. Another contribution of this study relates to scarcity and rigor. To the best of our knowledge, this study is the first to elicit key factors of home-based work operations from industry managers and verify them with frontline employees. Shin et al. (2000) argued that home-based work research has lacked rigor in various ways, including reduction of

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

sampling bias, data collection, and so on. They also argued that most empirical studies on home-based work use self-reported surveys to collect data from home-based agents. The gap between perceptions and actual behaviour is very significant. Moreover, self-reported surveys could have many problems, including common method bias (Shin et al., 2000).

This study contributed to provides guideline for managers to make an effective decision for technology implementation. Managers should make it a higher priority to adopt support-based than control-based technologies.

Chapter 91
The Information and the Strategy Business

George Leal Jamil

FUMEC University, Brazil

ABSTRACT

In recent years we have witnessed a major transformation in society. We went from a society based on industry and transport to another based on information and knowledge. A major challenge for managers is to understand what the information is for formulation, definition, implementation, and control the strategy. The strategy for any organization can be set from the outside in. According to the schools of positioning, the offer of products will have to adapt to changes in the environment. Or from the inside out. According to the movement's schools, the organization influences the middle engaging with your innovative product offerings, since it has skills and capabilities that competitors don't have and that are difficult to imitate or buy. This chapter explores information and business strategies.

INTRODUCTION

Managers are people who occupy a large part of their time to make decisions of various nature and dimension. The requirements in relation to the time available for the decision-making always seem to be greater than the total time available. Decisions of great importance mingle with trivial decisions. This diversity of decisions tends to increase with the level of responsibility and becomes particularly pronounced in the case of the highest hierarchical level managers.

The function of Manager involves a very broad set of activities, including analysis, decisions (including the strategic), communication, leadership, motivation, evaluation and control. Of all these activities, we isolated the strategic decision-making process, as it is the "foundation stone" of a Manager. Peter Ducker (1958), States that "decisions and actions are the final product of managers' work".

Strategic decisions made explicitly or implicitly by managers precede any action, regardless the organizational process, by which they are taken, either through the formal hierarchy or through the broad participation of middle managers (managers) or by omission. The strategic decision-making process

is complex, so put some problems to managers, in terms of methodology of approach, to choose the preferred strategy among the various alternatives.

Strategic decisions involve aspects of external and internal problems, that is, involve the choice of the set of products and/or services that companies can offer to their customers, looking to develop and take advantage of their position, vis-à-vis application of resources among possible alternatives, so that they can achieve their objectives.

The companies' employees are concerned with the operational problems, the hierarchies are concerned with finding ways to increase efficiency, reduce costs and sell more. The problems are automatically generated at all levels of the hierarchy and are in addition to the lower levels of this, they become cause for attention of top managers (administrators) and have to do with the future.

The issue relating to the strategy is one of the tasks of the functions of the directors of the companies. This idea is in line with one of the premises on which the *Design* school is based (Andrews et al., 1965), which considers that the responsibility for the definition of the strategy is the Manager (the leader).

The problems are very complex, and it is very difficult for an administrator to resolve the problems of the strategy alone. Consequently, the responsibility for strategic management tasks disperses through the organizational structure. Some companies create very specialized structures to support strategic decision making, such as departments and or agencies of *staff* to draw up strategic analysis.

These support structures are in accordance with the Carnegie school (Ansoff, et al. 1965) when considering that the role of managers is to make decisions, but that they are not responsible for their formulation, but they are the planners. The positioning school (Porter et al., 1980) follows a similar approach methodology, in which analysts formulate the strategy and managers approve it.

The Strategy

The strategy in companies is typically set: at the economic group level; managers and investors are involved in defining / revising the strategy and some of them rely on the support of external consultants;

The fact that the strategy is defined / reviewed at the economic group level means that the objectives and the strategy are defined globally by top managers of the Group and that each business unit (company) is limited to implement the strategy to achieve their objectives. These describe what the Group wants to achieve in the long run, in terms of some specific performance indicators, such as market share and return on investment.

The objectives of each business unit (company) translate the medium-and short-term objectives, as a way of measuring the progress to achieve the overall objectives. Each business unit (company) is an element of the *portfolio* of the Group's businesses. There is a hierarchy of objectives, strategies, budgets and plans. This assumes that the "trick" is to take relevant information up to the managers, "at the top", can be informed about the consequences of the details, "down there", without having to engage in them.

The operationalization of the strategy gives rise to a set of hierarchies, at different levels and with different temporal perspectives. At the top are the "strategic plans" and include the long term (economic group), followed by the medium-term plans which in its time give rise to short-term operational plans (companies). The group chooses a market positioning and strategies coming out of this process to be articulated and implemented. The strategy is divided into sub-strategies (companies) for success in implementation, giving rise to a whole set of hierarchies with different levels of duties and responsibilities and with different temporal perspectives.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In Portuguese companies there is a clear separation between the formulation of the strategy and its implementation. The formulation of the strategy (design) is a divergent and open process; some companies involve administrators, the middle managers (managers) and shareholders, in which the imagination can flourish, while the implementation is closed and convergent, to subject the new strategy to the problems of operationalization.

The objectives drive the formulation of the strategy, which in turn evokes the programs, the results of which influence the budgets for control purposes. Top managers remain as the architects of the strategy, but they are not who conceive the strategic plans, but rather who approve them. Strategic plans often are reduced to a "game of numbers" of performance control that has little to do with strategy.

A metaphor can be defined for the multiple businesses: "there are different roles within the family, the father (Group) and the children (companies-business units). The father needs to recognize that the children (business) change and mature with time and that a relationship in the early years works fine, but it probably need to be changed, as they grow. The children (business) like to know, as they are in relation to parents and what will be a good or bad behavior. The father has an important behavior in the creation of the family environment, "(Goold, Campbell and Alexander, 1994).

The fact that some of the managers participate in the definition of the strategy means that the process of formulation of the strategy is seen as an analytical and planning process, in which analysts (internal and/or consultants) play an important role in the process, passing the result of the analysis for top managers to formally make the decisions. This concept conforms to the Carnegie schools (Ansoff et al., 1965) and positioning (Porter, et al 1980) in which the planners or analysts are those that formulate the strategic alternatives (design) and top managers take the decision (approve them).

Some companies also tend to consider the strategic, as a collective learning process over time, through the involvement of the top managers manage men in addition to other resources, so collective action goes through the human brain of factors definition, as there are in the collective system many potential contributions. These initiatives aim to develop and exploit existing skills difficult to imitate. This concept is in line with the school of resources in which the role of the leader (s) is to manage learning (Prahalad and Hamel, 1990).

Top managers manage men in addition to other resources, so collective action goes through the human brain of actors (top managers, intermediate and shareholders). This action is subject to the filter of the cognitive capacities and to the "game" of influences, alliances and maneuvers, and the process of strategy formulation can also be seen as a process of negotiation and concession between managers, and investors. The strategy emerges from the "wars", negotiations and maneuvering in pursuit of power, between the parties concerned. The middle managers and managers conceive the strategy and shareholders approve it. This concept conforms to the power school that emphasizes the use of power and politics to negotiate strategies in favor of certain interest groups (Pettigrew, 1977 and Bower and Davis, 1979).

Enterprises are organizations with a set of representations, symbols, values, beliefs and rules lived in common by the members of the group that enable the convergence of interests of the various parties and to facilitate the harmonious evolution of social group to achieve their objectives, we can call the company's culture. The definition of the strategy can also be seen as a process that takes the form of a perspective rooted in the collective intentions and reflecting the patterns of use of resources and capacities as a competitive advantage, such as the school of culture (perspective Prahalad and Betis, 1986).

Some companies adopt two types of strategies: the deliberate that takes the form of plans or patterns, positions or perspectives as a way of adaptation to the surroundings and the emerging answer to the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

surroundings at the time and appropriate context. This concept is identified with the school of model configuration (Mintzberg et al, 1985, 1994).

The fact that the strategy in some companies be defined based on regular intervals and with annual reviews means that the process of strategy formulation is scheduled, with a schedule by which all process steps are performed. The strategy is deliberate and follows a planning that every year is repeated (Steiner, 1979).

Information Surveillance for Strategic Decision-Making

The process of "surveillance" of information is essentially a process of observing the behavior of the market and competitors and is intended to monitor the development of the surroundings and of the private sector. That "surveillance" is ensured in most cases, by an organic unit (organ of *Staff*- the "analysts" or the planners) that conforms to the model of the Carnegie schools (Ansoff, 1965 et al), and positioning (Porter, 1980 et al).

The process of "surveillance" on economic activity of many Portuguese companies focuses essentially on the monitoring of the evolution and economic predictions about the European Union and Portugal, in particular the countries with highest expression in the European economy (Germany, France and United Kingdom), as well as on the countries with which there is a greater affinity, such as Italy, Ireland and Greece, and their evolution is accompanied by the internal structures of the companies (the "analysts").

This information is collected, selected, processed and analyzed by the "analysts". These in their treatment use techniques of forecasting by extrapolation and analysis of problems, as a way to understand the structure of domestic, European and international economy as well as the interdependence between the various sectors of the economy as a way to identify possible future scenarios. Information about the foreseeable development of the European economy and of Portugal thus becomes critical in defining the strategy of each economic group or of the company.

The process of "surveillance " about socio-cultural and demographic changes in some companies is an irregular process of, temporary and periodic evaluation, mainly on social and demographic changes in Portugal and includes the demographic patterns, lifestyles, the social structure, social trends and is intended to determine the changes in this time interval, such as the birth rate, the level of education, debt capacity, being assured by the "analysts" of each company (internal and/or consultants).

However, the importance given to this information is less when compared with the information on the economic aspects, but it is important in the implementation of the strategy of each company, as a way to identify which customers to target for each product and or service, to the extent that allows them to understand local needs, available resources, legal requirements and funding adjustments. For the treatment of this information, the "analysts" use simple techniques of analysis.

The process of "surveillance" related to policy issues is a permanent process that is intended to "continuously "monitor, the Government's policy decisions with an impact on the sector, such as the unemployment policy, employment policy, taxation policy, so as the Community directives which may have impact on the sector and society in General (e.g. Basel II agreement), is ensured by the "analysts" and or consultants.

The information collected, selection, processing and analysis is the legislation on various aspects, such as economic, fiscal policy, education, employment, health, tourism, as a way of identifying potential opportunities and threats to the sector. In the treatment of this information the companies resort to simple techniques of analysis to understand the political influence in the business.

Information in Support of Strategic Decision-Making

There is a significant difference between the quality and quantity of information in which managers rely on strategic decision making. The fact that the value of qualitative information is recognized, is however the quantitative information that has more meaning to the "analysts" and to the managers of the companies. It is easier to get and allows them to make comparisons of performance and also because the "analysts" and managers want to know to what extent their organization is performing well, as this will help them decide more easily what to do about the future.

Information in support for strategic decision-making by the managers of the companies is a very important subject in this globalised world, to the extent that strategic decisions are taken based on that information. The quantified information is collected, selected, treated and analyzed by internal and / or external "analysts" (consultants) and presented in the most favorable way to managers, since they make the decisions according to the numbers presented in each alternative. Business managers want to know how their organization is likely to have a superior performance, as this will help them better understand the current situation and to decide the future, namely to define the positioning.

There are various dimensions of quantitative information that are collected, selection, processing and analysis. Managers are much more satisfied with the amount of information about the economic and financial context than with the information about the other contexts, as this is qualitative information and that is quantitative information that determines the current performance in the scope of objectives such as customer satisfaction with greater or lesser efficiency and effectiveness than their competitors

The managers believe they can be informed of a formal way by the "analysts" internal (*Staff* or agencies of planning) and or by consultants. They believe that the turbulence of the environment needs to be reduced to quantified and firm information, aggregated in such a manner that they can be provided regularly and in a digestible format (Mintzberg, 1995, pp. 257-266). However, the factual information (quantitative) has some shortcomings:

- Are mainly historical, lacking in wealth and often do not cover important non-economic information;
- Are concrete and accurate however.
- Are used in the formulation of deliberate strategies;

Some qualitative information is worthy of little credibility and confidence. Intangible (qualitative) information is subject to all kinds of interpretations and emphasizes the individual perspective of the "analyst and / or decision maker" in the "reading" of the environment and the sector as well as its the trends.

The intangible information analyzed by the "analysts" and companies or by internal consultants is speculative and may be distorted. The informal (qualitative) information, for example about the dissatisfaction of one or more customers, can be worth a lot more, because it can suggest a solution, against for example, information about a market survey (quantitative) that just might identify a problem. The factual information (quantitative) informs the intellect, but is the intangible information that builds the wisdom (Mintzberg, 1998).

The "analysts" internal companies, in extreme case, may in about 1 hour, assessing the environment, identify distinctive skills, generate alternative strategies and discuss which of them should be selected on the basis of the information collected on the day before or on the same day, through a formal and analyti-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

cal exercise that focuses attention on the selection of factual information (quantitative) considered most relevant and sorted according to its degree of importance. This concept is approaching the case studies in the classroom (Christensen et al., 1982). This process conforms to *Design* schools (Andrews et al., 1982) (the leader), Carnegie (Ansoff et al., 1965) (planners) and positioning (analysts) (Porter et al., 1980).

The consultants (external analysts) that some companies resort to, come to a company without any knowledge of the business, conduct a SWOT analysis in several ways, which allows them in a few days of work (discussion), formulate the strategy, over a period of two or three months (analysis and design), ie two or three days are sufficient for the review and annual update of the strategy (Tregoe and Zimmerman, 1980).

This means that gathers, select, treat and analyze factual information (quantitative), "play" with a set of generic strategies from participation and growth matrices of experience, write the report, send the invoice and leave (BCG, 1974-79, ADL, 1974-79, Mckinsey, 1976-79, PIMS, 1972).

There are a number of variables on which the managers of the companies have special attention in the process of formulating the strategy, such as the position on the market, the quality of products and services, the intensity of the investment, the return of investment and profit. This set of strategic variables is according to the PIMS model (1972), in: (Schoeffer et al., 1974, 1980, Buzzell et al., 1975). "All situations of the companies are basically similar, in obedience to the same market laws, so that a quarterback trained can operate profitably, in any business" (Schoeffer, 1980, pp. 2-5).

The strategic plan adopted by some firms requires not only the predictability to formulate the strategy, but also stability, during its formulation. Although certain repetitive patterns can be predictable (e.g. seasonality), the estimate of the discontinuities are virtually impossible to predict (Spiro Makridakis, 1990, p. 115). Strategic planning adopted by some companies is the extrapolation of the past, based on the recent past or historical information (quantitative) as a way to anticipate future trends and hope for the best. Long-term forecasts (two or more years) are notoriously inaccurate (Hogarth and Makridakis, 1981, p. 122).

In military strategy, this approach is also very common, "we need to determine what will be our foreign policy, formulating a *strategy* to implement this policy and then form the military forces to conduct successfully the strategy" (Robert McNamara, in: Smalter and Ruggles, 1966, p. 70).

The traditional military art emphasizes the importance of being informed of the enemy and the location of the battle and identifies a set of relevant information such as the location of the army against the mountains and rivers, fight downhill and occupy horizontal or tall lands, anticipating the advantage of the first man who moves and who occupies the battlefield and who awaits his enemy, is an advantage, for whoever arrives after the scene and hastens to fight is tired (Sun Tzu, 1971).

Information on the art of warfare are firstly the measurement of space, secondly the estimation of quantities, thirdly the calculations, fourth comparisons and fifth the odds. With many calculations can win; with a few do not. There's much less likelihood of victory that it doesn't make any calculation (Sun Tzu, 1971). Comparatively few companies also measure their position by market share, and make performance simulation exercises (calculations) to determine the most favorable scenario. This concept is in line with the positioning school (Porter et al., 1980) which makes emphasis on the study of industry in which the company operates.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Importance of Strategic Surveillance Process

The idea of the existence of a surveillance process in companies is in accordance with *Design* schools, Carnegie and Positioning. At the school of *Design* the surveillance process is ensured by the leader, once the strategy is the result of a *design* process for the identification of threats and opportunities, externally and the strengths and weaknesses in internal terms, through the preparation of tables/matrices with the concept of SWOT analysis (Learned, Cristensen, Andrews and Guth, 1965).

The managers are the architects of the strategy, but in practice they do not conceive the strategy, but they approve it. The design of alternative strategies is the responsibility of the planning team or "analysts" (internal and or consultants). The strategy is the result of a controlled process and conscious (deliberate), formal, broken down into distinct steps and supported by a comprehensive list of variables (information) and quantitative forecasting techniques. This concept conforms to the Carnegie school (Ansoff et al., 1965).

The study of competition is done by the "analysts" (internal and or consultants) to determine a set of competitive forces that influence or may influence the sector and identify the competitive advantages and thus be possible to determine the generic strategies: cost leadership, differentiation and the niche or focus. This concept is in line with the school's positioning, (Porter et al., 1980).

Some companies, especially the most recent are resulting from the entrepreneurship (s) their (s) leader (s), by which the process of formulation of the strategy focuses on the leader (s), by which the process of "surveillance" is ensured by the mind of the leader (s) and is associated with his intuition, to his knowledge (the information feeds the knowledge) and his experience in the construction of strategic vision, which will guide them in future terms (Schumpeter, 1947, Drucker, 1970).

The Change in the Face of Turbulence and the Complexity of the Environment

The continuity of change happens at the level of science, to the extent that innovation depends on the existing accumulated knowledge about that fact. The speed of innovation is more common at the level of the particular technologies of information and communication technologies, to the extent that today practically it is possible to have access to some information about facts or events that occur anywhere in the world. The speed of the changes at the level of political and economic market is a result of policy decisions of the Governments of the developed countries and is related to the ongoing globalization process.

For managers, changes that are easier to predict are demographic, economic, and policy changes. This "predictability" is associated with the government policies of the different countries that are driving economic development, as demographic movements are the result of labor shortages in certain regions and the economic, social and defense policies of the governments of these countries.

The fact that consider themselves as predictable economic changes, those are associated to the Government economic policies of the countries of market economy boosters, such as the United States and the European Union and the econometric models (provisional) of industrial economy, which no longer correspond to the current situation, since such models are no longer able to predict how once the global economic development and the respective countries, since its predictability has become unreliable, so it will be necessary to take into account other variables (information) in the current models.

The predictability of change depends on the magnitude of the impact and the time required for a company affected answer the change. If the impact is small and the response is fast, predictability is of no

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

importance. An enterprise can react after having felt the full impact. However, a company well in advance can prepare for change when it is sequential. Response time is a function of the knowledge in which the company initiates the response of change.

This concept is in accordance with the models of *Design* schools (Andrews et al., 1965), Carnegie (Ansoff, et al., 1978) and Positioning (Porter et al., 1980), through the definition of deliberate strategies in which the focus is the control of the implementation of the strategy that is, making sure that their intentions are carried out in action. This is contrary to the emerging strategies of the school of learning, in which the focus is on learning, i.e. come to understand the changes through the implementation of actions governed by the intent (Mintzberg, 1972, 1978).

The predictability of the changes in the surroundings in perspective by managers is contradicted by the schools and learning resources in the "early signs for strategic change rarely provide formal information systems of horizon scanning or reports of companies (quantitative information) "(Quinn, 1982). Instead, the initial signs of the need for major strategic changes are "something that people do not feel well", "inconsistencies" or "anomalies" (Normann, 1977).

There is a strong relationship between the concept of organizational culture and strategy of organizations. That culture acts as a perceptive filter, which sets forth the assumptions of decision-making. Culture gives life to the interpretative wing of the collective world that is an organization. As a result organizations develop a "dominant logic" that acts as a filter of information, leading to a focus on certain information (the economic and technological in nature) for the creation of the strategy, to the detriment of other information (Prahalad and Betis, 1986).

The characterization of the policy changes as unpredictable and discontinuous by managers is in accordance with the school of power in the formulation of the strategy depends on individual or group interests, sometimes antagonistic and decisions emerge from "wars", negotiations and maneuvers in search of positions between the different interested (Zald and Berger, 1978). This characterization distances us from the idea that the formulation of the strategy is the product of a single "architect" of the school of *Design,* or a team of "homogeneous" Carnegie school strategy and positioning.

Companies are partially dependent on the behavior of their competitors, so the selection of the correct competitive movement involves the discovery of a result that is rapidly "inclined" to the interests of the same, overcoming and surviving retaliation (Porter, 1980).

With the rapid rise of the cooperative relationships, the formation of the strategy leaves the exclusive limits of businesses and becomes a joint process, to be developed with partners. Companies do business through a network of relationships and they formulate a collective strategy. There are clearly part of planning and positioning in this formulation, but the power, negotiated aspects of the strategy are many (e.g., alliances, partnerships) as defined by the school of power (Elfring and Volberda, 1998).

It can be said that the process of formulation of the strategy of companies is based on models of schools whose strategy is based on concept suitability/adaptation of the internal capabilities of organizations with external possibilities (outside to inside), as described by the schools of *Design*, Carnegie and positioning. The "rational strategy (economic)" is seen as the Union between the skills and opportunities to position companies in the surroundings.

The process of formulation of the strategy in some companies is a process of designing, not learning. The organizational structure follows the strategy and is determined for her (Chandler, 1962). The key variables (exhaustive list) most influential in the process of formulation of the strategy of the companies are mainly external macroeconomic and financial variables as opposed to socio-cultural variables, not

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

political and economic quantifiable. The objectives to be achieved are quantitative in nature, so the formal information (quantitative) is privileged to respond to the organization structure and their relationships, that is, companies use as approach methodology, models in which the strategy is deliberate, as described by the schools of *Design,* Carnegie and of positioning.

Models of Strategic Adjustment vs. Models of Strategic Intent

Some managers in the definition of the strategy chosen by the models of strategic adjustment to the detriment of strategic intent, that is, the function of which is to approve one of the deliberate alternative strategies that "analysts" (internal and or consultants) formulate, in the expense of the emerging strategies. Managers continue to remain as the architects of the strategy and they orchestrate the resources at their disposal and have an overview.

The process of strategy formulation follows a sequence of steps that are repeated periodically, although with different periodicity and the definition of new strategies, or for the annual review of the same and is associated with the principles of adaptation and the positioning, this is the strategy assumes an adaptation to surroundings that allow acquiring a dominant position and then to their defense. There is a clear tendency to be based on the place of supply over demand, in the definition of the strategy.

Some managers, in addition to the "analysts", tend to involve also the intermediate managers (middle managers or executives), in the process of formulation, thus approaching the model of the resource and learning schools (models of strategic intention) that assume that the process of formulating the strategy is a moment of transformation and renewal (rupture with the past) and aim essentially at the permanent transformation of competition and organization.

Some managers develop or acquire premium features or a combination thereof to obtain competitive advantages, once a feature is "any jealousy that can be thought of as strength or a weakness of a given company," (1985, Wernerfelt in., Antonio, Nelson, 2003). The "specific assets of a company are difficult to acquire and to imitate, if not impossible. Such assets are difficult to transfer from one company to another, due to transaction costs and transfer these assets contain some tacit knowledge ", (Teece, Pisano and Shuen, 1997 in: Antonio, Nelson, 2003).

The fact that some companies involved the managers (intermediate managers) in the definition of the strategy seek to create a "nuclear competence" through collective learning, especially on how to coordinate different competences (knowledge) and integrate multiple chains of opinion (Prahalad and Hamel, 1990, Antonio, Nelson, 2003).

Some managers regard the information as a "*substance*" which can be acquired, stored and possessed by an "analyst" or jointly by a group of "analysts" and that can be transmitted from person to person or from group to group, having for such created formal structures of *Staff* or planning to take the process of strategy formulation. The information gives them a certain stability and comfort. The "analysts" to internalize the information to the point that they can use in new situations acquire knowledge about the industry and about the surroundings (Davenport and Prusak, 1998).

The "*warehouses*" of knowledge of the "analysts" are the information that was selected and structured. The information that the "analysts" have is not knowledge, but there is no knowledge without information. Knowledge is the mix of information, experience and understanding which provide a structure that can be applied in the evaluation of new information or new situations (William Zikmund, 2000).

The most relevant information currently used by the "analysts" of the companies are mainly the financial and economic. The information is historical, but allows them to compare the level of performance (e.g.,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

growth rate, results, market share) and serve as well as a basis for the definition of future positioning (products/markets), through supply rather than demand. The macroeconomic forecasts are the prime source of the "analysts" to the formal construction of the alternative strategies (deliberate), through the use of simulation techniques, in order to serve as a basis for defining the overall objectives and specific to each business or organizational unit. We can thus conclude that the non-quantifiable information of the surroundings (e.g., weak and / or strong signals) are not yet considered in the strategy formulation process. We can also conclude that this information shall not be regarded as a strategic resource for managers, as defined by Wernerfelt (1985).

The formal forecast of alternative scenarios of the banks is subject to the limitations of prediction filter of the "analysts", i.e. the methodology, techniques and technologies adopted. If the "analysts" have an attitude and a conservative behavior relies on experience and probably do not realize any formal forecasting. If the attitude is reactive extrapolate the future on the basis of information about the past, even if booked. If the attitude is characterized by the anticipation, then incorporate the extrapolation of past performance to predict the future.

"Analysts" adopt increasingly elaborate methodologies and are based on the assumption that the future tends to be a natural extension of the past and not to incorporate significant changes in trends as well as possible discontinuities, which is in line with the models of schools of strategic adequacy (*Design,* Carnegie and positioning) to use in the process of strategy formulation.

There are other limitations beyond forecasts and lagging awareness of bank managers regarding to major changes that occur in cycles (economic, technological, etc.), such as the limitation of non-quantifiable information, the "signs" of the changes that develop quickly in the environment. The "analysts" and managers are used to analyze only the results of past performance and have some difficulties in understanding and interpreting the new information (ex: weak and strong signals of the surroundings) and therefore their challenges. So, as a result of a change in turbulence and on the complexity of the environment, the expectations of managers change suddenly, and the perception of expectations suffers a gap (Ansoff, 1980).

Some "analysts" in the process of strategy formulation tend to give greater emphasis to the analysis and insufficient emphasis to the real strategic criteria, since even the strategic thinking to strategic planning that is; the process focuses on the Middle engaging in detriment of competences and of the internal capabilities, what becomes critical to the implementation of the strategy.

In the process of formulating the strategy, some managers give little emphasis to social and cognitive processes, since they use all kinds of informational inputs, many of which are not quantifiable and accessible only to the strategists who have their feet on the ground, since they do not follow predetermined schedules, or fixed routes. The process requires *insigth*, creativity and synthesis, exactly what the formalization of planning discourages.

Some of the managers are not happy with the quality of information to support strategic decision making, reflecting the contradictions in the process alternative strategies formulation, in which the information about the economic and financial aspects is quantified and can be compared and serve as a basis for simulations about the future scenarios, while the social and cognitive information (qualitative) is difficult to quantify, as such cannot be compared or object of simulation, and so managers are satisfied with the quantity and dissatisfied with the quality.

To improve the quality of information to support strategic decision-making is fundamental the existence of a strategic information monitoring process that includes not only the factual information, but

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

also the qualitative information (cognitive and social), which assumes the need to include some variables (information) not covered in the formulation of the current strategy used by some of the managers.

About the characterization of the environment change profile related to the speed, predictability and continuity there is a tendency to consider economic issues first and political issues secondly, once the sector traditionally has been driven more by supply than by demand. For such economic forecasts (quantitative information) has been instrumental in defining the strategy, over the inclusion of qualitative information in its models.

So the "analysts" resort to the techniques of analysis and simulation to predict the alternative scenarios, based on the most credible economic forecasts in world terms, such as the World Bank, the European Union, the OECD and the Bank of Portugal. Yet some companies use the "analysts" (consultants) their national and / or global experience.

Strategic decisions of some enterprises have a sequential nature, namely decisions are influenced by business opportunities identified by the "analysts". These opportunities are identified in the context of uncertainty and are a function of knowledge (the information feeds the knowledge) of the "analysts" to formulate the strategic alternatives after present managers. Through this information managers may agree or not with the alternatives.

STRATEGIC INFORMATION

In economic theory taking account of perception by the managers of the surroundings was successively ruled by the function of the information leading to corresponding anticipations and underlying beliefs. On the theory of managing these same concepts were gradually introduced and acquired around the strategy, because the environment is composed of other "actors" acting similarly.

The belief of managers is increasingly formalized on help from cognitive science, as well as on epistemic logic (hierarchical beliefs) and in cognitive psychology (review of beliefs). The exchanges of information between the managers are also studied in conjunction with the cognitive sciences, regarding the coordination that allow (distributed cognition) and how the dynamics that they induce (learning process).

After having recalled the relevant typologies of information in management theory, some issues linked to the believers are progressively discussed and illustrated. The structure of individual believers which translates a uniform probabilistic uncertainty finds its explanation on the information value.

The Imperfections of Information

Although there are types of market imperfections (Yao, 1988), the strategic information theory focuses only on the competition of the imperfections of information. The theory focuses and elaborates the principles of basic features of neoclassical assumption of complete and perfect information. These imperfections of information create opportunities for the called return of information that companies can explore and take advantage of the meaning of strategic information. The theory immediately gives emphasis to the information resource and the capabilities to:

- Identify the imperfections of information on product and market factors;
- Maintain or change the perceived information imperfections.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In order to be possible to identify the imperfections of information and its origins it is necessary to first understand them. The imperfections of information are derived from the behavior of the assumptions of rationality and opportunism and two types are distinguished: the incomplete information and asymmetric information.

Incomplete Information

Incomplete information is associated with the bounds of rationality that explain the limits of rationality of human behavior information. Asked to complete the survey to all relevant information, the only decision-maker tries to reach the subjectivity of incomplete information level satisfaction (Wigand, *et al.,* 1997, p. 75).

This type of behavior is known as satisfactory. Satisfactory behavior and incomplete information are part of strategic decision making in both product and market factors. About market factors, for example about the incomplete information from suppliers that offer private resources, whose search for the competitors is, what price they are willing to practice and that there are quality differences between the capabilities of different suppliers.

About products for example, incomplete information about what customers should be interested to buy the products, what competitors are competing for, what is the demand for a particular product, what price are customers willing to pay and how do they differ from the competitors' products. Not only companies, but also all or part of the market, including competitors, customers and suppliers face imperfections of incomplete information.

The Asymmetric Information

Due to incomplete information and fragmentation of knowledge in society as described by (Hayek, 1945), information can be asymmetrically distributed through parts of the market. Asymmetries of information have been reviewed extensively in all the risks of economic transactions (Nobel Foundation, 2001); however, according to Nayyar (1990), rarely information asymmetries have been looked at as a strategic opportunity. This assumes that the asymmetries of information provide opportunities under two conditions:

- High costs to obtain equality of information;
- The trend for opportunistic behavior (Williamson, 1975, p. 31).

Asymmetries of information may result from a situation favorable to the supplier or to the client, depending on the one that has the advantage of the information and which explores this advantage opportunistically.

Keep or Change the Imperfections of Information

Strategic information focuses attention on the way the companies do business with incomplete information and or with asymmetric information. Companies that identify the moments of incomplete information and market factors or product, decide what their strategic information is and what is desirable:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Right now there is incomplete information;
- At this point develops information asymmetries, meaning both, advantages or disadvantages vis-à-vis competitors, suppliers or customers. Companies decide on dedicated resources and informational capabilities for:
  - Keep or change the incomplete information in product and market factors, influencing the positive or negative transparency;
  - Keep or change information asymmetries and create advantages or disadvantages of information or of information equality.

Having taken the decision to change a particular asymmetry of information in relation to competitors, suppliers or customers, managers must understand that these economic actors are also characterized by having rational and opportunistic behaviors. That is why organizations must use their resources and their capacity to identify the imperfections of information, creating equal information and should take advantage of their expertise in the information asymmetry and the differences of interpretation (Williamson, 1975, pp. 32).

The theoretical contribution of this study is to be based on the empirical basis of the recent development of the concepts of strategic information and information profitability. The theory was available to examine and analyze the contribution of strategic information.

The concept developed in this research is based on current economic theory and based on contemporary theories about the functioning of the market. The capabilities of organizations appear to provide a basic approach to examine how organizations expect realize the economic return based on the market imperfections. By adding the informational perspective, the role of information and information imperfections in business strategy can be explained through the base capabilities of organizations according to Barney (1986) and Itami (1987).

Identification of Information Imperfections

To understand how the economic profitability can be identified and suitable for strategic intelligence is through the knowledge of the origin of information imperfections. The costs of economic transactions (CTE) describe these origins and three types of information imperfections result of them (Williamson, 1975).

The transaction costs theory assigns two behavioral appropriations to the man: the limits of rationality and opportunism. We assume that men are intentionally rational, but are limited by this. The limits of rationality are out of the inability of the human brain. "This involves neuron-psychological boundaries of a skill, on the one hand, and on the other, the limits of language. Physical limits take the form of value and the storage limits of the power of individuals to receive, store and process the information without errors "(Williamson 1975, p. 21).

"The human cognitive capacities are as a rule insufficient, to understand particularly complex tasks, to recognize the need for relevant information and to render completely all relevant information" (Wigand, Picot et al., 1997, p. 75). It explains the limited rationality of rational information behavior (Simon 1955). "Its Instead of a full search of relevant information the only decision-maker attempts to get a subjective satisfaction, incomplete level of information" (Wigand, Picot et al., 1997, p. 75). This type of behavior is known as "satisfactory": looking for a solution which meets the aspirations of the decider level and therefore the acceptable.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Humans are not only rational; they also assume some opportunistic behavior. Williamson (1975) describes how opportunism "for own interests shrewdly" involving "disbelief of the threats and opportunities", in order to perform the individual advantages (Williamson, 1975, p. 26). These advantages are also suitable for "select and distort the information discovery or discredit the opportunities that lead to future" (Williamson 1975, p. 26). The claim is that, although not all humans to behave opportunistically, is difficult to predict in advance whether they will behave as such.

These two types of behaviors reflect the relationship between suppliers and customers in the market. The combination of opportunistic and rational behavior is the main cause for the three types of information imperfections in the market of transactions:

- **Asymmetric Information:** An asymmetric distribution of information from the parties involved in a transaction causes a strategic opportunity. "The critical impact of information on optimal allocation of risk, it is not merely its presence or absence, but its inappropriateness between economic operators" (Arrow 1969, p. 55). Williamson (1975) joins two conditions under which the asymmetry of information provides a strategic opportunity for transactions:
  - High costs to obtain equality of information;
  - Propensity to opportunistic behavior (Williamson 1975, p. 31). In other words, the asymmetric information occurs when one of the parties has information that is unknown by the other and difficult to obtain by the other party and an opportunity to exploit this information advantage through strategic alternatives.

The asymmetric information may result in a favorable situation for suppliers or customers depending on the one that has that information. The opportunity is caused by hidden information for the current transaction. One of the parties in a commercial transaction is better informed about a relevant variable than the other. Is the invisibility of this private information which constitutes the essence of the imperfections of information and introduces the risk for the other party (Douma and Schreuder 1992, p. 54).

Considering the possibility of opportunistic behavior, the part that has the hidden information, has no incentive to reveal information if it is detrimental to her. As a result, some vendor who enters the market with a product or service that is particularly suitable for a specific market segment, with the major benefits of competitors who benefit from this hidden information. The imperfections of information are known as enemies of the selection (Arrow 1984).

- **Ambiguity of the Information:** The ambiguity of the information in a commercial transaction could cause a strategic opportunity. Although in the case of complete information, different interpretations on the same information may occur. As a result of opportunism, these representations can be opportunistic in the sense that they can lead to a single advantage to any supplier or customer.
- The strategic opportunity for one of them is discovered, when such an opportunistic interpretation is not recognized by the other and results in:
  - Customer will pay a high price for a product;
  - The willingness of the supplier to offer a product at a low price.

As a result of this opportunistic behavior, the part with the opportunistic interpretation has no incentive to share this information, if it becomes a disadvantage to it.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Incomplete Information:** The strategic opportunity of incomplete information is tightly related to the assumption of rationality. "The limits of rationality are interested certainly in the extension of the limits of rationality are achieved-I mean under conditions of uncertainty and complexity. In the absence of any of these conditions of appropriation of contingent actions can be completely specific of this principle. (Williamson 1975, p. 22).

In an environment characterized by a high degree of complexity and uncertainty, the possibility of certain events occurs quickly, become numerous. Under these circumstances, it is impossible for humans to acquire and analyze complete information relevant to the strategic decision-making. As explained before, this inability leads to "satisfactory" behavior. The opportunity of incomplete information occurs when a client is not fully informed about the range of possibilities of the transaction and the products offered and vice versa.

Therefore, a client that allows an incomplete comparison of suppliers and their mutual differences can start a transaction with the worst supplier. For the supplier this opportunity could be exploited by the establishment of a brand and advertising, in order to become part of the subset of suppliers in incomplete comparison of clients.

Appropriation of the Profitability of Information

After have been identified the imperfections of information in two relevant factors products and markets, organizations decide how to manage your strategic information. Organizations choose to keep or take advantage of these imperfections of information, with the purpose to take ownership of their profitability or to anticipate other forms of ownership. Strategic information helps keep information imperfections in unknown markets on the one hand and on the other, to undo information imperfections and increases the transparency of the market.

The theoretical work of strategic information results in 12 basic choices to maintain or alter the choices. Briefly, these choices are related to three types of information imperfections both to the Organization and to the suppliers in the market factors and to the Organization and to customers in the products/market. The choice for any of them to maintain or alter the existence and identification of information imperfections depends on the volume of the profitability of information which may be held by any of them.

Transaction Costs and the Imperfections of Market Information

The transaction costs theory does not allow information problems to exist. So is the theory that last the objectives to ensure that the most efficient way to coordinate financial transactions, information problems will be solved, because they cause an increase in transaction costs, that is, a lower efficiency (Williamson, 1999).

However, in practice the problems of information are the basis for the competitive advantages for many organizations and form the basis for their strategy and business model. However, the resolution of the problems of the information may result in a decrease of competitiveness.

On the other hand, if the transaction costs theory allows the existence of problems of information as the basis for the strategy, will be needs to work the concept of strategy. This reveals a critique, which according to Williamson, (1999) the theory of transaction costs need to understands the concept of

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

strategy. The concept of strategic information can fill this gap and bridge the gap between the theory of transaction costs and the thought of strategic management.

Considering criticism rose above, the theory of the base organizations resources allows information problems that exists and contributes to the concept of strategy. The theory of basic resources is an attempt to explain and predict that some companies are able to establish sustainable competitive advantages position and therefore obtain higher return.

The view base resources understands the companies as a single set of idiosyncratic resources and capabilities where the first task of management is to maximize the value through the great development of existing resources and capacities (Grant, 1996, p. 110). Developing existing resources and capacities are believed to be the rationale of the strategy in the medium and long term, because the built-in features and capabilities provide the basic direction for the company's strategy and are the first source of competitive advantage (Grant, 1991, p. 5).

With respect to the problems of information, that implies you don't solve the problems of information definition of low transaction costs. Instead, the path of the behavior with the problems of information can be inspected as the source of competitive advantage, and so the theme of the formulation of the strategy. The problems of information provide strategic information resource-based opportunities and capabilities of specific organizations.

Strategic Information

Organizations when formulating the strategy of outside to inside tend to be more aggressive and restless. The wording from the inside out is based on the strategic move (sociological) and that is why organizations are less dynamic, that is, they tend to be more passive and inclined to react to events (Mintzberg, 1998). These models represent the two extremes between which there is a range of behaviors. Based on the concept of opening the organizational systems theory, this is determined by the (Ansoff, 1978):

- Perception of strategic information that describes the Futurity (trends);
- Perspective of action that describes the familiarity of an organization, about their past experiences.
- The opening feature and the prospect of action correspond generally to information perspective:
- The retrograde nature managers prefer the successful alternatives in the past and rely on known historical information;
- Managers whose attention is focused on the present are willing to shut down the past, as long as it's not too different from the present, that is, seeking support on information relevant to the environment;
- Managers who seek to predict the threats and opportunities tend to be active in nature, so the search for new paths, based on past information and using forward-looking models, bearing in mind that the future will be an extrapolation of the past;
- The managers Beyond extrapolation of the past, in order to realize new worlds and discontinuities, seek opportunities that are new and unusual, that is, assume that the future is not an extrapolation of the past;
- Entrepreneurs are also the creators of deliberate actions. Looking for markets that have never been explored, human needs that were never met, and their motto is: "inventing in the future".

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The range of possible answers and behavior are determined by the skills and abilities of organizations. There are two factors that determine the capacity of managers:

- The competence (knowledge leading to strategic behavior);
- Capacity (volume of strategic work).

One of the main attributes is the strategic problem solution approach comprising the individual skills, personal knowledge along with group dynamics. The reactive method of solution the problem demands through strategic systematic analysis of the causes, with the use of analytical procedures to identify all the possible alternatives and to establish explicit and quantified relationships between variables, and select the best alternative ("great") (Ansoff, 1978).

Another attribute of the empowerment of managers is the leadership in the definition and implementation of the strategy, requiring dexterity to capture and direct social energy. A fourth element of the competence of the Manager is to support in decision-making, which assumes the existence of a surveillance process of future-oriented strategic information and we can call the *informational skills* of Manager

The information about the future possibilities comes from the surroundings and the company's performance capabilities, and industry or in the field, which means that the company has access to information about your performance and that of its competitors. It also has access to information about the events and forces that determined the performance, as well as what the capabilities and skills that has developed within a specific period of time.

Strategic information this is relevant information that enables organizations to have a better *performance* through active exploration of *information imperfections* of the market and product factors (Truijens, 2001).

Strategic Information Research

The behavior is influenced by external factors, such as the turbulence of the surroundings, the addiction resources, organizational factors, such as the nature of the business and the strategy adopted, informational factors (availability and quality of information) and personal factors, such as knowledge or cognitive style. The study of situational dimensions organizational strategies, information needs and personal characteristics of the behavior.

The situational dimensions are studied for the measurement of perception of uncertainty about the environment, a concept that is strictly related to the perception of the environment analysis of the search template-interpretation. The organizational strategy refers to the positioning or to the attitude of the organization before the surroundings (Ansoff, 1965, Porter, 1980, Andrews, 1965, Grant, 1996, Prahalad and Hamel, 1990, Pfeffer and Salancik, 1978, Miles and Snow, 1978, Mintzberg et al., 1976, Grant, 1996, Daft and Weick, 1984).

The characteristics of managers include the specialties, the level of the hierarchy and the cognitive style. The note as a behavioral form comprises the information needs, information and use of information. In the context of the observation of the surroundings, the information needs are often restricted to the focus and scope of the research, particularly the sectors of the environment where research is more intensive. The research of information is examined in terms of the sources that are used for observing the surroundings, as well as the organizational methods and systems adopted for the note. Finally, the use of information is seen in support of strategic decision making.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

What can be determined from a survey that was completed through observation of the surroundings, as a learning model of organizational strategy? A summary can include the following observations (Choo, 2002):

- **Situational Dimensions:** *The effect of perception of uncertainty of the surroundings*. The managers who understand the uncertainties of the surroundings will tend to search better. The uncertainties are indicated by the complexity, dynamics and importance of the sectors that comprise the surroundings.
- **Strategy:** *The effect of perception of the uncertainties of the surroundings*. The organizational strategy is related to the sophistication and scope of activities. This should provide the information that allows defining the strategic alternatives and the choice of the optimal strategy.
- **Characteristics of Managers:** *Effects of managers' work and the cognitive characteristics of observation.* Top managers seem to observe more than lower level managers. Functional managers observe beyond the limits of their expertise.
- **Information Needs:** *The focus of the observation of the surroundings*. Many studies observe various contexts of the surroundings: customers, competitors, suppliers, technology, social, political and economic conditions. The focus of the note related to the strategy is industry-related markets.
- **Sources of Information:** *Usual and preferred sources*. Although managers use many sources, they prefer the formal personal sources, impersonal sources especially when researching information about the development of potential markets in this sector.
- **Information Search:** *Methods of observation*. Organizations use a variety of methods, depending on their size, dependency and perception of surroundings, observation and experience in the industry in which they are competing.
- **Use of Information:** *Strategy and organizational learning*. The information under observation is used increasingly in the definition of the strategy. The effective observation is related to the improvement of organizational learning and performance.

The Analysis of the Surroundings and the Organizational Intervention

Each change in surroundings passes through a natural evolution that progressively increases the knowledge. In the initial stage, it is possible to identify weak signals of the General State of the changes and the consequences of these signs are still subject to uncertainty, since the signs are based on conjecture and not on performance.

This means, that as the escalation of change and the complexity of the surrounding environment develops, knowledge increases (or decreases the ignorance), associated with all the changes, if explicit through one or more information and whose content is taken into consideration in the elaboration of alternatives to evolution.

Another factor that characterizes the new phenomena related to changes in the environment are the successive States of knowledge whose speed of evolution differs, becoming one of the useful measures of speed, the time that elapses until the full impact on organization, in each successive State of knowledge.

Changes are increasingly coming from sources of information that are outside the historical boundaries of industry and becomes more and more difficult to recognize them and their implications. The predictability of change of surroundings has been decreasing steadily. The importance of predictability

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

depends on the magnitude of the impact and the time required for the affected organization respond to change. If the impact is small and the response quick predictability is of no importance.

However, the detection of a signal of change with enough anticipation, allowing time for strategic decision making, can be important when the change is sequential. If the change is completely new requires additional time to assemble the appropriate resources to change. In any case the response time is always a function of knowledge that organizations have to start their answer.

In the case of change be known all the information is available and the various components of the response can be planned and executed in an efficient sequence. If the answer is initiated in advance, the strategies possible alternatives will be limited by the available information. More and more managers are pressured to shorten response time, by analyzing and interpreting the information available and or of the signs (weak or strong).

By extrapolation forecast techniques and the related decision-making methods used become inadequate, the fact that only work when the results of the responses can be quantified. Non-extrapolation prediction techniques (opportunities and threats analysis) uses new information (signals), but less complete (qualitative).

For changes that occur today, a timely response is only possible if the change is perceived before formulating the strategy, namely, enabling organizations to respond to weak signals (information) produced by a change in the initial state of their development. The appropriate methods for the collection, selection, analysis and interpretation of information (signs) about the evolution of the environment, as well as the necessary skills to deal with this information reveal the State of knowledge that the Organization has to start the reply, the in order to respond effectively to changes in the environment- *awareness* of the need for strategic decision-making or the identification of opportunities (the discovery phase).

Learning in advance enables organizations to prepare to face the changing processes, through the adjustment of its capabilities and competencies to the turbulence and the complexity of the environment, in order to lessen the impact.

One of the key points for effective strategy formulation process is, on the one hand, the use of a filtering process of strategic information about the surroundings and on the other, the establishment of a prospective vision of the set of challenges with which the Organization will be faced in the future, in order to enable the Organization to anticipate the opportunities and threats in new opportunities (Prahalad and Hamel, 1994).

The signs (information) early warning turn into competitive advantages for the organization that earlier can "detect", so it is important to adopt methods that help detect signs of change (weak or strong signs) and to react to the first signs in order to improve their competitiveness.

Strategic information filtration focuses on the set of economic changes, technological, socio-cultural, legal, environmental, political and other affecting global and immediate surroundings of the Organization (competitors, customers, suppliers, products surrogates and other).

The sources of information are two: the surroundings characterized by the level of turbulence and complexity and their own organizations. Companies that do not record the information about their performance (past), nor are they aware of the evolution of the surroundings, there are typically a point of satisfaction, whose threshold is a crisis. They are facing the problems of everyday life and the managers do not have any shared expectations about the future.

The companies that record the historical information, but who are not attentive to the evolution of the environment, have a sense of history, thanks to the records of historical information about the past performance or memory shared by managers. There is a third set of companies that are aware of both the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

history and the future environment and record information about the various events and transactions from the past. Information can be obtained through informal contact with the surroundings, to the sophisticated systems that seek to identify the significant signs, in addition to the immediate perceptions of managers.

Typically, only a part of the available information is collected, analyzed and treated by the companies, since they are filtered through the filters of thorough analysis (research). Organizations that have no formal system for information support in strategic decision making, the filters are personal limitations of dexterity of the "analysts" and or of the managers, in order to observe, analyze and interpret the information. If there are formal systems, filter characteristics are determined by the system support technology.

If the observation capacity of managers or "analysts" is more limited or narrower than the target of turbulence and the complexity of the environment, the research filter deletes important opportunities. As a result the vision of external reality is incomplete and inaccurate. If the organization does not have a strategic information monitoring process, it will go directly to the decision maker, who will interpret and analyze it in detail.

The decision-maker will use the information to form his own personal expectations about the possible future of the company. In doing so, he judges the validity and reliability of the information being researched and thus subjects it to the perception filter. The limits of this filter are established by the personal strategic culture, by personality and previous experience of managers. The cultural filter determines the richness of the information used by managers in making strategic decision.

The perception of changes in the surrounding environment uses both historical information and the conversion of detected signals into information and knowledge of potential future demand. This provides a more reliable basis for predictable performance than a direct extrapolation of the past (Prahalad and Hamel, 1994). If the filtering process of strategic information is not sufficiently adequate to address the full extent of the changes would not be able to realize all the wealth (potential) (Ansoff, 1978, pp. 140-144).

The Quality of Strategic Information

The strategy is concerned with attuning, on the one hand, to what is within the organizations and on the other hand what is outside the organizations. The quality of this tuning is limited by the *quality of strategic information* that is fed, the main function of the strategic is a "*survey*" of the surroundings in order to detect the changes, analyze them and interpret them in terms of performance potential of the Organization (opportunities). This is a complex process, based on information and or signs (weak and strong) both objectives as subjective. The result is the objective perception of the reality of the environment, a set of beliefs (performance expectations) about what is going to happen, that is, the performance that managers believe to be possible (Ansoff, 1990).

There are two sources of *strategic information* that contribute to expectations. One source is the inside information about the abilities and skills (often called strengths and weaknesses) to deal with the aspects not characterized by the perception of the future environment that is, allows:

- The transformation of industry and / or sector;
- Increase the results through new niches beyond market share;
- Provide a *Strategic Architecture* – dreaming about what you can do with the knowledge and with the known resources;
- Designing the strategy as an override, any more than an adaptation of ambitions to the surroundings;
- Make progress on the competitors, in the diffusion and commercialization of the products;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Striving for leadership on key skills for business,

The second source is the environment that provides the information (weak and strong signals) about the changes and the complexity. When the changes are significant is "important to be informed about the enemy and the battle, allowing the first advantages that moves, that is, one who occupies first the battlefield and awaits your enemy is at ease; who comes to the scene and rushes to fight are tired "(Sun Tzu, 1971). This information allows the Organization to search for shaping the future; however, the intentions may be frustrated by chance and by ignorance (Clausewitz, c., 1989).

In small organizations, the process is informal, the manager says, and at the same time does not clarify the sequence and interaction between the various elements. The main element is the *strategic culture* of the Manager, which determines both the temporal perspective in which he realizes the surroundings, as the alternatives he accepts as credible. The culture acts as a lens or filter perceptive, which, in its turn, establishes the assumptions of decisions of managers (Snodgrass, 1984).

If the temporal perspective coincides with the time horizon required by the speed of change and the complexity of the environment, the perspective of the Manager is in tune with the turbulence of the surroundings. If the time perspective of the Manager is lower than the speed of change have a myopic perspective, otherwise we have a thoughtful perspective. A myopic perspective is caused by poor quality of strategic information and the Manager will have inaccurate performance expectations. The advantage of a prescient perception allows the Manager to understand the trends of the turbulence of the surroundings and avoid surprises, predict and respond to threats and opportunities (Ansoff, 1990).

There are other factors besides the culture that contributes to the vagueness of the expectations formulated informally, such as the limited power of observation of the surroundings, the limitations of the Organization, of the knowledge and experience of managers. Immersive media stable and reactive intuition and experience are useful, but they become inadequate in environments characterized by anticipation and exploration/creation.

The surveillance of strategic information (collection, sorting, processing and analysis) can be carried out by specialized teams who then submit the alternative decision-makers for strategic decision making and or by their own managers. The formal process is explicit and sequential. The insights are drawn up by the technical teams and or by the managers, being then converted in visions by the managers.

The formal forecast is subject to the same limitations inherent in the informal process, IE is limited by the filter forecasting methodology used to make predictions. Stable competence relies on experience and does not perform any "poll" or formal forecast. Reactive competence goes beyond past performance formally. The competence characterized by anticipation incorporates the extrapolation of formal performance (Ansoff, 1978).

These approaches are based on the assumption that the future will tend to be a natural extension of the past and are unable to understand the significant changes, as well as the possible discontinuities. The skills characterized by inquiry and creation using techniques that make the prediction of likely deviations from the past. However collect some information about the potential future.

So the technology used for the prevention interposes a filter between the decision-makers and the surroundings. A myopic filter that is narrower than the turbulence and the complexity of the environment, will present inaccurate information to the Manager. A filter tuned to reflect adequately the surroundings, since the turbulence level is stable. A thoughtful filter will make a forecast of changes in turbulence (Ansoff, 1978).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The tuning filter with the surroundings is used through the cultural perspective of the decision-makers. If the cultural perception filter is narrower than the prediction, the Manager will restrict further the perception of surroundings future, rejecting as inaccurate or irrelevant information that are inconsistent with your experience.

The accuracy of the performance expectations of an organization is limited or for prediction filter or the filter of perception, depending on which of the two is narrower. When the narrower filter deletes environment important trends and probable events, performance expectations are inaccurate, regardless of the computational and refinement of forecasting methodology.

Knowledge and awareness of expectations whatever their quality, are limited to a small number of participants who are the most knowledgeable about the environment or about the capabilities and distinctive competences of organizations. Usually the most numerous group of managers dealing with internal operations, have little concern about what will happen with the Organization, for which they have little knowledge of what will be its future.

The communication opportunities of important strategic information managers are considerably higher in large organizations than in small and medium-sized. However there are some limitations. One is the limitation of prediction systems, which slows down the organizational awareness with regard to major changes in the environment. Another is the limitation of information to "strong signals", which deprives the Organization of an appropriate notice of changes (weak signals) that develop quickly.

The Problems of Strategic Decision Making

The fact that all organizations are a more or less coherent whole and whose dynamism depends on the people who work in it, that is, make decisions to solve problems, shows clearly the relationship between the concepts of decision and of system. This means that the science of organizations is based on two theoretical foundations: theory and systems theory. However, most of the theorizing in the field of strategic management has evolved from the concept of the Act or decision from open system.

The model of decision of economic theory of the firm, with the linear concept of input-processing-output, always used a mechanical model in which entries are the inputs and the outputs are the products and or services. This template is very far from what might be called a model of open system. This is rather a model of circular nature. Linearity combined with efficiency, that is, profit maximization goal will be the limit.

The model of decision making is too rational and cognitive, insofar as a person or at best a group of homogenous decision can make strategic decisions. The decision model is strongly linked to the rational Manager (s) (s) who know (m) all even when the Act of deciding is considered sophisticated and bad structured. The decision-making model points to the Manager (s) who takes (m) decisions, but at the cost of excessive simplification of the organizational model.

The market structure or in other words, the global environment (affects all or almost all organizations of any industry) and immediately (only affects the industry or sector in which the organization is inserted) is too important to survival and to the autonomy of the organizations, that is, so that they do not lose the relative freedom and flexibility to react appropriately to the needs of society.

The clear separation between the Organization and its surroundings, which fits this half or top placement, maintains through its capacities and skills, give us clues about the role and the place that organizations should occupy in society and on how they should be managed in order to carry out your function properly. However, there is another dilemma that is the exercise of power, that is, the generation

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of changes and acceptance of the influence, i.e. the absorption of change. It is an approach to strategic decision-making in type-out or outside-in.

There are some models of strategic analysis from the analysis of the environment for the adaptation of the Organization to that same media that is, from the outside in, that is, the chosen strategic alternative adapts to the changing and tendencies of the surrounding environment (ex: Andrews, 1965, Ansoff, 1965, Porter, 1980). These models assume that the "*organizational structure follows the strategy*", who means that the internal structure of an organization is dictated mainly by strategy and those priorities, are reoriented in the sense that strategy formulation is the most important task of management, which allows the organization:

- Leave from the situation of the environment as it is for decisions that in fact are based on subjective interpretation and analysis of the situation;
- Keep alive the institutionalization of values, in order to generate certain consensus about what to do;
- Select in advance the portion of the surroundings (segmentation that is important at the moment) (Porter, 1980);
- Differentiate the internal system in order to approach the stability by building different types of boundaries between subsystems;
- Flexibility in changing from one strategy to another.

Other models from the analysis of the capacities and skills of internal resources for the definition of the most appropriate strategic alternative to existing resources, i.e., from the inside to the outside, so as to influence the structure of the industry, namely, seek to build their own future (ex: Barney, 1987, Robert Grant, 1987, Gary Hamel and Prahalad, 1995, Mintzberg, 1976).

Managers need relevant information, but often are victims of abundance of irrelevant information, generated by the macro-economic system and by organizations and the inadequacy and inappropriateness of the necessary information for decision making strategic (Ackoff, 1967, Smith, 1978). The more information the human brain attempts to receive less information gets in reality (Streufert, Driver and 1969).

In this context, the managers are currently with very serious problems relating to information, since it is scattered by the Organization and requires great effort to locate and integrate. The important information, sometimes, are retained exclusively by other managers and usually arrive late and sometimes unreliable.

The power to make decisions does not give anyone, neither the information nor the cognitive capacity necessary for decision-making. The decision-making process consists of a series of steps: the selective collection of information to pass to the decision maker, the treatment of information to advise the decision-maker, the exercise of choice (strategic alternatives), that is, determining what to do (take the strategic decision), the permission to do what you chose and finally the implementation of what has been decided and authorized (implementation of the strategy).

The power related to the decision-making process tends to stay at the level at which the necessary information can be accumulated in an effective way, to various levels of management. Regardless of the model of internal configuration top managers always retain the power of decision related to the strategic management.

Are multiple factors, both internal and external organizations that influence in a way important decision-making. This situation is forcing top managers to a constant analysis of these factors, in order

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to achieve the objectives. To achieve the desired balance, one of the stocks that the managers practice with appropriate diligence is the strategic decision making.

This action requires a process of reasoning by which, from the detection of changes in the environment, collecting information in a selective way that allows to clarify its characteristics, both as exogenous and endogenous impact in your organization and that allows take the strategic decision. The collection of information and the treatment your present no great difficulty. About the internal situation the organizations have today-management information systems, whose usefulness to the operational management and coordination has been widely demonstrated, although to the level of top management is only applicable in some cases.

The final product of strategic decisions is simply misleading, insofar as they choose a combination of products and markets is obtained by the addition of new products and markets, abandonment of old products and markets and the expansion of the current position. The change requires a redistribution of resources of the company – a pattern of disinvestment and investment in acquisition activities of other companies, in the development of new products, distribution channels, advertising, etc.

The solution of any problem of decision making requires an awareness of the need for a decision or opportunity (discovery), the formulation of alternative actions, the evaluation of these alternatives in terms of their respective contributions and the choice of one or more alternatives for the purposes of execution. The perception of needs is an important aspect of strategic decision making, since it is a method that allows conditions to choose between a continued concern with the operational problem and some attention to the strategic problem, leaving a key part to intuition and subjective judgments. A method is needed that creates conditions for a permanent research activity and a diagnosis of the need for strategic decision making.

The search for alternatives is an iterative process which covers the products and the traditional markets of the company, the research and development projects already running, and a list of the companies interested in a merger. Other alternatives may include market opportunities and joint ventures with other organizations.

Partial ignorance conditions pose two problems: a leading the company in an active search of attractive opportunities and the other is the allocation of the limited resources of the company between the opportunities that have been identified and those that are to arise. The evaluation uses the long-term profitability as evaluation standard. However, there are some difficulties to make projections regarding the company's position in terms of products and markets.

CONCLUSION

Although it is recognized for long time, many strategic decisions are made with incomplete information, the tendency is to give more weight to internal information and over competitors, than to information about the environment (surrounding), which can often lead managers ' preferences in making strategic decision.

Decision-making of managers considers only the variables that are less susceptible to influence, by lack of information. The decision on the lack of information can have immediate impact and or in the medium and long term. In decision making, and managers or customers rarely have all the information.

However, when complete information is available for all the alternatives, it is possible to make comparisons between variables and it is much easier to make the decision. The most widespread problem

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is that managers do not have complete information of all variables. Although the importance of this problem has been recognized for a long time, we know very little about the decision-making under incomplete information.

Strategic decision-making under incomplete information has important practical implications. Managers today have greater control over the information they provide or not to customers and how this information is presented. For example, comparing the traditional distribution channels, with those who use the *Internet* or catalog, administrators have more control over the information made available on the *Website* (complete or incomplete).

Given the abundance of information available, the managers can "draw" the information they consider as the most attractive to strategic decision making. Incomplete information can often lead to inadequate alternatives preference, although the effect may not be easily observed, since the managers choose, at the time, one of several alternatives. The lack of information may have systemic effect comparative trials.

The strategic decision is based on scientific principles and lies between the right and the uncertain commitment. The strategic add a hyphen process absorbs the time decision-makers. The effectiveness of the strategic decision is intrinsically based on the use of the highest level of conceptual knowledge, the actions that are deduced fall within the limited scope of the capacity of those who have the responsibility to implement them, ie decision making has its own systematic process and its clearly defined elements.

In a historical perspective, the relationship between the ecosystem of the company its strategy and the organizational structure gave rise to the development of the theory of the company from the point of view of the decision-maker (Chandler, 1962, Sloan, 1964, Cyert and March, 1970). Regardless of differences in point of view and of the concepts, these complement each other because each one is concerned with a different aspect of the general problem of *making decision*.

Rational decision making requires the acquisition of information and the processing thereof, in addition to the capacity of organizations. In practice, organizational add a hiffen part of a rational idea and depends on:

- Clarity of objectives of the organization which run counter to the preferences and choices (objectives ambiguity or conflict).
- Uncertainty or quantity of information about methods and processes by which the objectives are defined (technical or procedural uncertainty).

We can consider four modes: rational decision-making, political, procedural and anarchic. Rational mode, when the objectives and the procedures are clear, the choice is guided by the performance of programs. Makers simplify their representations of the strategic problem, satisfy more than maximize information search and follow routinized procedures or actions programmer.

Procedural mode, when the strategic objectives are clear, but the methods to achieve them are not, policy-makers are divided the process into three phases: the ID that recognizes the needs of information for decision making and develop an understanding of issues of decision. The active development of information research and develops one or more strategic alternatives. The selection it is the phase evaluates the alternatives and chooses the alternative best suited to be implemented. This process is highly dynamic with many internal and external factors stopping and changing the time and the direction of the decision-making process.

Political objectives mode are contested by individual or group interests, but the procedural sequence leaves between the groups: each group believes that your preferred alternative is best for the organiza-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion. Decision-making and actions are the result of negotiating power between the groups, in pursuit of its interests and in handling the evaluation of instruments of influence.

In the anarchic way, when the objectives and procedures are highly uncertain, decision-making consists of very varied forms, number of participants in decision-making, choice of identified and abandoned opportunities. Decision making happens when the choice and the participants coincide, have the interest, time and energy to do so.

ACKNOWLEDGEMENT

The strategic management and the information is a little science developed, in which the information (in broad sense) is treated as a potential strategic resource. Obviously, you're not thinking in cases where the information is a commodity asset, e.g.. in companies that sell information.

The Profº George Leal Jamil asked for my help in the study and participation in the drafting of this chapter. If we consider realistically that the operation in perfect competition is a utopia so the opacity or asymmetry of information can be sources of competitive advantage. For that market imperfections are managed, the Organization has to provide specific capabilities for the collection and processing of data, selective dissemination of information, and creation of specific knowledge that will have to be carefully managed. After all, the secret is the soul of business.

The emergence of "competitive intelligence", always distinguished by the military and diplomats, must not only enable understand others, including rivals, as the abilities and motivations permitting to anticipate future behaviors, but also regarding the ignorance and the idiosyncrasies of their myopia underlying visions.

Instead of the theme of the chapter is consideration of standardized information management support. In this context, information is the raw material of the decision-making process, whether strategic, operating either. To your collection and treatment procedure are target of numerous scientific disciplines associated with decision theory, information systems, etc. The strategic management encompasses both the strategic decision, concerning the relationship between the Organization and the surroundings, whether the operational decision.

ABSTRACT

To reduce the complexity intrinsic to LD manipulation, software tools are used to publish or consume data associated to LD activities. However, few developers have a broad understanding of how software tools may be used in publication or consumption of Linked Data. The goal of this work is to investigate the use of software tools in Linked Data publication and consumption processes. More specifically, understanding how these software tools are related to process of publication or consumption of LD. In order to meet their goal, the authors conducted a Systematic Literature Review (SLR) to identify the studies on the use of software tools in these processes. The SLR gathered 6473 studies, of which only 80 studies remained for final analysis (1.25% of the original sample). The highlights of the study are: (1) initial steps of the publication process are fairly supported by the software tools; (2) Non-RDF serialization is fairly supported in publication and consumptions process by the software tools; and (3) there are non-supported steps in consumption and publication processes by the tools.

1. INTRODUCTION

In last decade, the evolution of the Web has increased the consumption and production of content. This growth implies in several challenges such as a longer time required to perform searches or browsing, data consistency problems, and misinterpretations. The users and machines perceive these challenges, as they are necessary to access a set of web pages to find relevant information. In addition, most of the data available on the Web are unstructured (images, blogs, web content, etc.), which means that machines are not able to automatically understand such data content. Therefore, it is essential to provide alternatives for structuring data in a machine understandable manner.

Linked Data (LD) is an effective option to structure such data, presenting a set of best practices for guiding publishing and connecting these structured data on the Web (Hyland & Wood, 2011). LD adopts a generic abstract data model for describing resources called Resource Description Framework (RDF). This framework is responsible for describing terms and their relationships, by using triples of subjects, predicates and objects. Additionally, ontologies may provide enrichment to Linked Data by adding semantics to their RDF statements (Heath & Bizer, 2011). Moreover, LD brings some benefits which may be applied in multiple research fields, such as data interoperability and terms definition (Bauer & Kaltenböck, 2011). Some applications of LD include Open Government (Ding, Lebo, Erickson, DiFranzo, Williams, Li, & Hendler, 2011; Shadbolt, O'Hara, Berners-Lee, Gibbins, Glaser, & Hall, 2012) (e.g. to improve of transparency and provenance), Education (Dietze, Yu, Giordano, Kaldoudi, Dovrolis, & Taibi, 2012) (e.g. to improve education repositories and content sharing), and Business (Barnes & Martin, 2002) (e.g. to improve business opportunities and business value).

LD is defined by both publication and consumption processes. Recently, W3C (2014) has published a list of 10 steps to fulfill LD publication requirements: (1) to prepare stakeholders; (2) to select dataset for reuse; (3) to model the data to represent data objects and their relationships; (4) to specify a suitable open data license; (5) to define URI for linked data; (6) to describe objects with standard vocabularies; (7) to convert data to a linked data representation; (8) to provide machine access to data; (9) to announce to the public; and (10) to establish a social contract of a linked data publisher. On the other hand, Bauer and Kaltenböck (2011) have published a list of 7 steps related to LD consumption process: (1) to specify concrete use cases for new services or applications; (2) to evaluate relevant data sources and datasets; (3) to check licenses for use and reuse provided by data owners; (4) to create consumption patterns to specify what data are reused from a certain data source; (5) to manage alignment, caching and update mechanisms; (6) to create mashups and applications to provide user-friendly graphical user interfaces (GUIs) and powerful services for end users; and (7) to establish sustainable partnerships.

Both aforementioned processes are essentials to improve data quality, interoperability, and discoverability of data, as well as to support the development of rich applications. Additionally, considering the number of steps and activities, it is important the development of tools for supporting Linked Data publication and consumption processes. Considering the huge number of Linked Data-related tools proposed recently (Bizer, Heath, & Berners-Lee, 2009), it is a time-consuming task, for publishers or consumers, to know the available features of each tool in order to make properly decision about software tools that should be used according to each step. For this reason, a high-level question was raised: Which software tools have been used to support the publication and/or consumption of Linked Data? In this context, our purpose is to identify what tools have been used to perform the aforementioned tasks, providing a broad vision about Linked Data software tools to publish and/or consume linked data. Additionally, we use the categories provided by W3C[1] to classify the software tools according to their features.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

There are some similar works that investigated the use of software tools to publish or consume Linked Data (Corlosquet, Delbru, Clark, Polleres, & Decker, 2009; Bizer et al., 2009). However, these studies do not capture all the aspects and evidences that we are interested, such as support and formats. Moreover, their work is somewhat limited, as they do not systematically review the literature to investigate the works that jointly cover software tools and Linked Data Publication and Consumption Process.

Therefore, in this paper we use the Systematic Literature Review (SLR) method to understand which software tools support publication and consumption of linked data. We utilize the method defined in (Kitchenham & Charters, 2007) to identify, evaluate, interpret and synthesize the available studies in order to answer particular research questions on the symbiosis of software tools for publication and/or consumption of linked data, and to establish the state of evidence with an in-depth analysis. Thought the analysis we generate six questions. These questions may guide new research line, software solutions, and discussion.

The rest of this paper is organized as follows: Section 2 describes the SLR method used in this review and primary results. Section 3 presents the quality assessment. Section 4 presents results. Section 5 presents a discussion about the results. Section 6 presents threats to validity. Finally, in the last section we present the conclusions and future work of this SLR.

2. SYSTEMATIC LITERATURE REVIEW

A systematic literature review (SLR) demonstrates the state of the art in some particular research field, evaluating findings related to a given research issue, a topic area, or even a phenomenon. It is worth to differentiate a SLR from a Systematic Mapping. According to Kitchenham et al. (2007), Systematic Mappings or Scoping Studies provide a wide overview of a research area. The results of a mapping study can identify areas suitable to conducting a SLR and areas where a primary study is more appropriate.

In this work, we adopt the guidelines proposed by Kitchenham et al. (2007) to conduct our SLR. We also adopt the tool called StArt (State of the Art through Systematic Reviews) (LaPES, 2012) to conduct our SLR, reducing errors inherent to the SLR process. This tool is validated in (Hernandes, Zamboni, Fabbri, & Thommazo, 2012), obtaining a high performance on the execution of a SLR.

In this work, we investigate the following research Main Question (MQ):

MQ → Which software tools support the publication and/or consumption of Linked Data?

According to Kitchenham et al. (2007), the main step for any systematic review is the definition of the research questions, since they are responsible for guiding the whole review process. Based on such assumption, and similarly to other systematic reviews (Dermeval, Vilela, Bittencourt, Isotani, & Brito, 2014), we elaborate three research questions in order to enable us to answer the MQ.

- **RQ1** → *Which are the linked data-based publication / consumption steps utilized by software tools in current literature?*
- **RQ2** → *Which serialization formats does the tool support?*
- **RQ3** → *Is the usage of software tool empirically evaluated?*

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

RQ1 provides a starting point to understand the software tools and the main approach (publish/consume) supported by them. This question is responsible for identifying the steps of the publication and of the consumption process supported by the software tools. RQ2 identifies the main serializable formats (RDF, OWL, JSON, CSV, XML and others) used for publishing or consuming linked data. Finally, RQ3 intends to analyze if such studies provide an empirical evaluation of the software tools. Besides, Table 1 presents the central motivation for each research question.

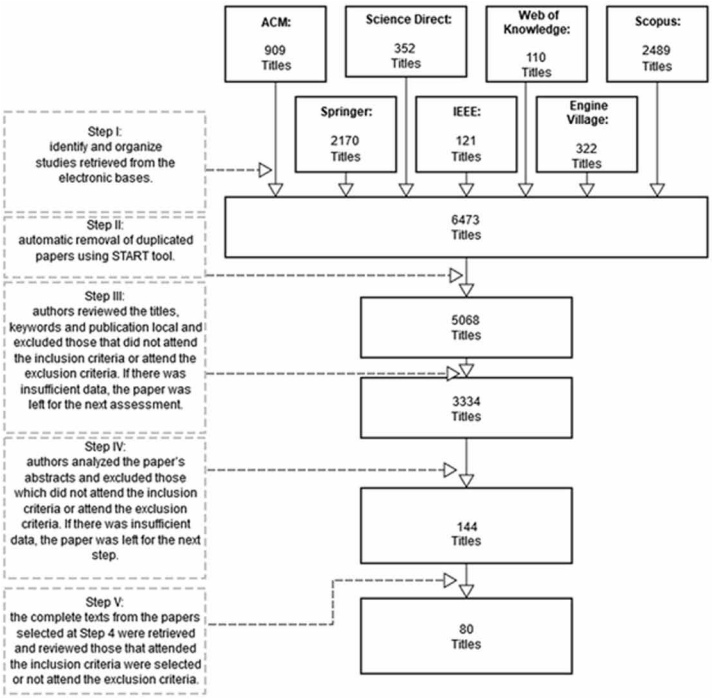
Table 1. Research Question Motivation

RQ	Motivation	Research Question
RQ1	In general, tools support only some steps of the publication/consumption process. In this context, it is important to determine for each analyzed tool the exact set of supported steps.	Which are the linked data-based publication / consumption steps utilized by software tools in current literature?
RQ2	Considering there are different serialization formats available, we want to determine the formats that each analyzed tool supports.	Which serialization formats do the tool support?
RQ3	The evaluation of a publication / consumption tool is essential to quantify the effectiveness of the analyzed tool. So, we intend to verify which empirical evaluations were applied for each tool.	Is the usage of software tool empirically evaluated?

The step II defines inclusion and exclusion criteria adopted in this work. According to Kitchenham et al. (2007), criteria in the SLR process identify those papers that provide direct evidence about research questions, reducing a possible bias. We adopted two types of criteria in the SLR: (1) inclusion criteria; and (2) exclusion criteria. The former defines all the necessary requirements in order an article must be considered in the SLR process. The latter defines all the requirements for an article not to be included in this process. We considered primary papers (those that present some proposal in the area) in the inclusion criteria whereas secondary papers (i.e. those that only review an area topic such as a SLR) in the exclusion criteria. Regarding to publication date, studies are eligible for inclusion in the SLR process whether they were peer-reviewed and published from January 2006 until December 2015. In the other hand, a paper is excluded from the process whether it belongs to some exclusion criteria defined in Table 2.

Table 2. Inclusion and exclusion criteria

#	Inclusion Criteria	#	Exclusion Criteria
1	Papers about tools for publishing and/or consuming linked data	1	Papers in other language than English
2	Primary Studies	2	Short Papers
3	Computer Science Papers	3	Duplicated Studies
4	Only Papers in English	4	Secondary Studies
5	Papers between Jan. 2006 and Dec. 2015	5	Papers only about tools
6	Papers which answer the research questions	6	Papers only about linked data
		7	Papers only about software tools focused open data (without Linked Data)



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

To perform the step III, we considered the following electronic databases:

- Science Direct (http://www.sciencedirect.com);
- ISI Web of Knowledge (http://apps.webofknowledge.com);
- Scopus (htttp://www.scopus.com);
- Springer Link (http://link.springer.com/);
- ACM Digital Library (http://dl.acm.org);
- IEEE Xplore (http://ieeexplore.ieee.org);
- Engine Village (http://www.engineeringvillage.com).

Figure 1 shows the systematic review process and the number of papers identified at each stage.

Figure 1. Paper selection flow chart

It is worth highlighting the steps related to the paper selection process. Thus, at the Step I, We extracted the papers from electronic databases using the following search terms: (1) software tool terms, containing "Environment" OR "Authoring" OR "Architecture" OR "Framework" OR "Software" OR "Application" OR "Program"; (2) linked data terms, containing "Linked Data" OR "Linked Open Data"; and (3) ontology terms, containing "Ontology" OR "Ontologies". From the search results (6,473 papers), we automatically accessed, downloaded and organized with aiding of the StArt tool. These terms were combined as follows:

(1) AND (2) AND (3)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

At the Step II, we detected and removed duplicated papers using the StArt tool, remaining a set of 5,068 papers.

At the Step III, we reviewed titles and keywords of each paper and excluded those not related to the research questions (1,733 papers). The remaining set of papers (3,335) were considered for the next step since data was insufficient to decide on removal.

At the Step IV, we analyzed the abstracts and excluded papers according to the exclusion criteria (3,190 papers). Similarly to Step III, the papers with insufficient information to be classified on the exclusion criteria remained in the list to be analyzed in the next Step.

At the Step V, we retrieved the complete text from the remained papers (144), and read both introduction and conclusion sections and, additionally, performed a full-text screened of each one of the selected papers. From this step, 64 papers were excluded in this step according to the exclusion criteria.

After finishing Step V, 80 papers remained to the data extraction process, which has two activities: (1) reading the full-text of each paper and (2) saving extracted data (i.e. in a spreadsheet, database, text file, etc.). Therefore, all remaining papers of Step V were submitted for full-text reading. To save the data, we used StArt tool. Additionally, during this stage, we extracted data according to an extraction form (see Table 6 in Appendix), which enabled us to record details about the reviewed papers.

3. QUALITY ASSESSMENT

The quality assessment of the selected studies is useful to increase the accuracy of the data extraction results. In addition, it is important to determine the validity of the inferences and in ascertaining credibility and coherent synthesis of results. Table 3 presents the quality assessment (Kitchenham et al., 2007) criteria. Criteria 2, 4 and 8 only receive Yes (Y) or No (N) as score. Additionally, we allowed only Yes (Y) and Partially (P) scores to the last criteria since we are interested in the possible benefits to industry.

The raw data of the quality assessment is presented in Table 7[2] of the Appendix, according to assessment question described in Table 3. The scores of 11 papers are less than 50% and the average score is 7.08 see Figure 2. Regarding the score of proposed criteria, Q1, Q2 and Q3 received the highest averages scores (>0.9), while Q4, Q5, Q8, Q9, Q10 and Q11 received intermediate scores between 0.55 and 0.83. Criteria Q6 and Q7 received the lowest average score, 0.14 and 0.13 respectively.

4. RESULTS

This section presents the results obtained by running the SRL method previously described. We provide a detailed overview of general features of these studies: source types, year of publication, and application context. The reviewed papers were published between January of 2006 and December of 2015. Additionally, the distribution of selected studies over publication sources, including publication name, type, count (i.e. the number of selected studies from each source), and the percentage of selected studies are available[3]. The 80 selected studies are distributed in 49 publication sources, suggesting that linked data tools have been a widespread concern in the community. The studies included in this review belong the following categories: (1) journal; (2) conference; (3) workshop; or (4) book chapters. We identified that most studies belong to the category (2) (38.75% or 31 studies), followed by category (4) (27.5% or 22 studies), category (3) (17.5% or 14 studies) and category (1) (16.25% or 13 studies). We also observed

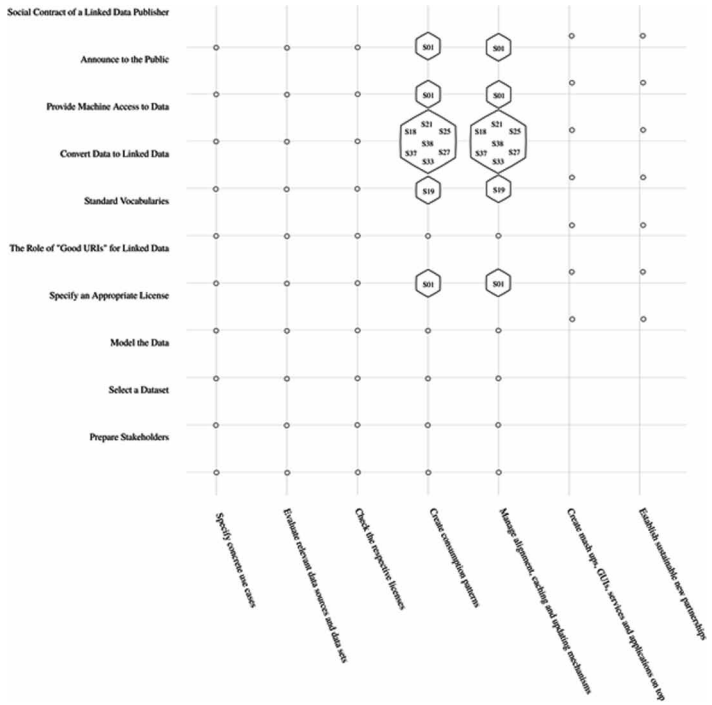
Table 3. Quality assessment criteria

#	Questions	Possible Answers
Q1	Is there a rationale for why the study was undertaken?	Y = 1, N = 0, P = 0.5
Q2	Is the paper based on research?	Y = 1, N = 0
Q3	Is there a clear statement of the research goals?	Y = 1, N = 0, P = 0.5
Q4	Does the study reuse some framework (software, source code)?	Y = 1, N = 0
Q5	Is there an adequate description of the context in which the research was carried out?	Y = 1, N = 0, P = 0.5
Q6	How many steps of the publication process does the study support?	$\frac{\text{Number of publication steps}}{\text{Total of publication steps}}$
Q7	How many steps of the consumption process does the study support?	$\frac{\text{Number of consumption steps}}{\text{Total of consumption steps}}$
Q8	Was the study empirically evaluated?	Y = 1, N = 0
Q9	Is there a discussion about the results of the study?	Y = 1, N = 0, P = 0.5
Q10	Are the limitations of this study explicitly discussed?	Y = 1, N = 0, P = 0.5
Q11	Does the research also add value to the industrial community?	Y = 1, P = 0.5

that most of these selected works were published in 2012 (22.5%) followed by 2010 (15%), 2013 (15%), 2014 (13.8%), 2011 (12.7%), 2009 (6.3%), 2008 (3.8%), 2000 (1.3%), 2007(1.3%).



The question RQ1 identifies the purpose of each software tool. We classified the tools into two categories: publication and consumption (see Figure 4). The software tools can be classified in one or both categories, according to the supported steps. Figure 3 depicts that 9 software tools (11.11%) provide

Figure 2. Overview of the studies. Paper quality assessment distribution.

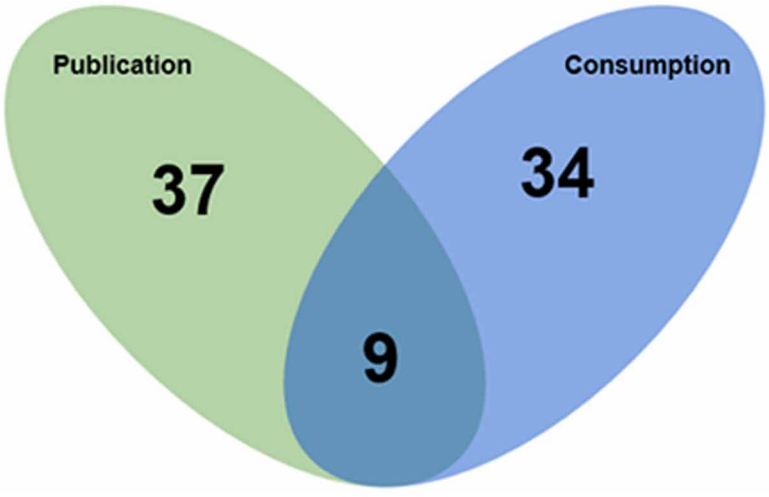
Figure 3. Classification of software tools in publication and consumption

support to one or more steps of both linked data consumption and publication processes. These tools can be classified, under Publication point of view, according to the following features: RDF publisher (S01, S19, S25, S37, and S38), RDF synchronizer (S33), RDF compactor (S18), Linked Data consulting language (S21) and search federated engine (S27). Table 4 describes details such as source-code language, platform, publisher, supported serializable formats, evaluation method and publication year. Figure 4 depicts the distribution of these 9 studies, in publication and consumption processes. Most solutions (77.77%; 7 studies) are focused on providing machine access (endpoint, publishing data sets, etc.) to data (SPARQL, RDF and RDFa). On the other hand, only one software tool (11.11%, 1 study) is concerned with the conversion of structured data to linked data and another one (11.11%) is concerned with three steps: definition of URIs for Linked Data, announcement of data sets and to establish social contract of a linked data publisher.



The question RQ2 identifies serializable formats supported by software tools. Figure 5 shows the relation between serialization formats and publication, as well as consumption process. We can note the growing support to RDF serialization formats, where the greatest amount of software tools related to publication process focuses on providing machine access (27 studies). On the other hand, regarding to the consumption process, the consumption patterns (28 studies) and alignment (28 studies) are the two main steps handled. It is also important to pay attention to the low support to non-RDF serializations in Step vii (Convert data) of the LD publication process. In Figure 5, it is worth to note the support is concentrated in the steps 4 and 5 of the consumption process. In fact, the most supported serializations are RDF (33.75%, 27 studies) and SPARQL (12.5%, 10 studies). On the other hand, the most supported non-RDF are XML (8.75%, 7 studies), CSV (7.5%, 6 studies) and JSON (5%, 4 studies).

The question RQ3 enables the identification of evaluated-empirically software tools. The classification of these evaluations is obtained from each paper. The number of studies for each category is shown in Figure 5. According to the results, 40% of the studies (32 studies) were not evaluated, and the other studies are distributed between experiment (36.25%, 29 studies), use case (11.25%,9 studies), proof of concept (2.5%,2 studies), benchmark (1.25%,1 study) and simulation (1.25%,1 study). Figure 7 depicts how the evaluations are distributed along publication and consumption. It is worth to note that 50% (23 studies) of the works dealing with the publication process were not evaluated.

Figure 5. Evaluation distribution

5. DISCUSSION

This section presents a discussion on the obtained results. We intend to provide our perspective about each research question, highlighting the faults in the current state of software tools for publishing and consuming Linked Data.

The results indicate an uneven distribution of software tools among the publication steps. We note that 63.82% of the studies were focused on providing machine access, followed by data conversion to linked data and the definition of URIs for linked data (with 34.04% each). On the other hand, we have detected a gap on solutions to prepare stakeholders, support open data license specification (2.12%, one study), select a dataset for reuse (10.63%, five studies), use standards vocabularies for describing objects (12.76%, six studies) and model the data to represent data objects and their relationships (24.89%, seven studies). As we can see, most of the proposed software tools support only the final steps of the publication process (44 studies) while only 24 studies support the initial steps.

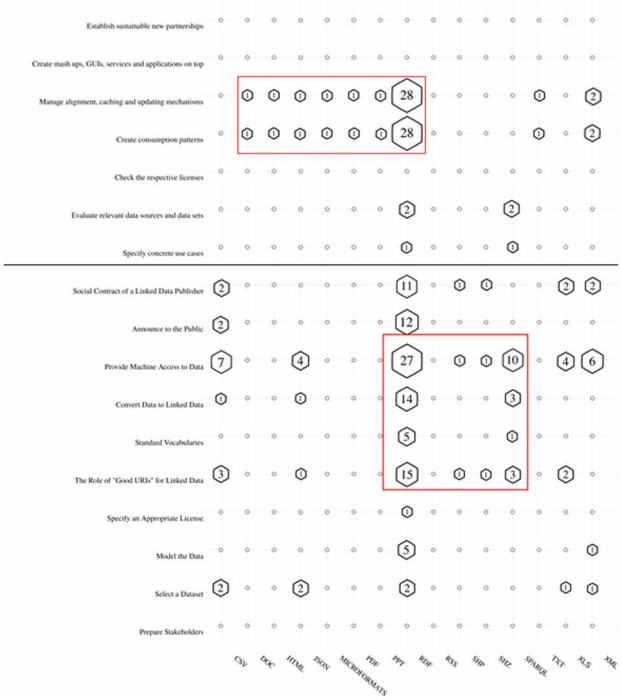
Figure 6. Relation between publication and consumption processes and serializable formats



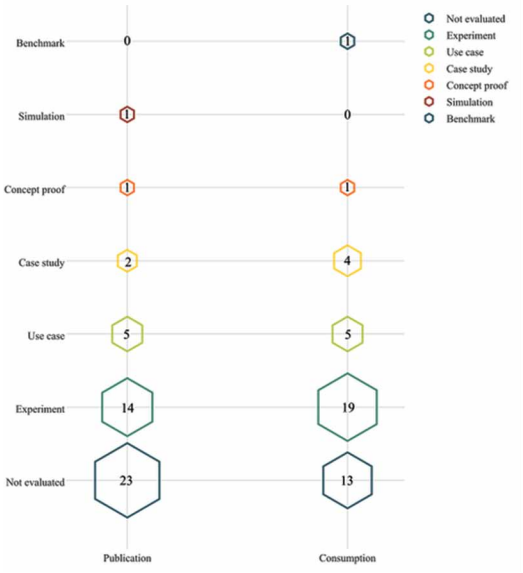


Figure 7. Evaluation by purpose

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The results are partially explained by the high-level vision of the publication process details provided by W3C documents. Although W3C (2014) points out the importance to use/determine data license, it lacks discussing details on how to implement such task or which vocabulary to adopt. As none analyzed tool covers the initial steps of the publication process, there is no tool able to fulfill the whole publication process. Based on the aforementioned discussion, we can point out two questions that can be raised for a research agenda.

1. How to develop software tools to cope with the initial phases of the publication process of Linked Data?
2. How to provide an integrated solution to simplify the publication of Linked Data?

Regarding the LD consumption process, the present results indicate that consumption software tools are concentrated in creating consumption patterns to specify what data are reused from a certain data source (85%, 34 studies), followed by managing alignments (85%, 34 studies). Further, the specification of use cases for new services or applications (2.5%, 1 study) and data sources and datasets evaluation (5%, 2 studies) are supported by few studies, while the remaining steps were not covered by the reviewed studies. Since developers and companies usually have specific objectives to reuse a dataset, they develop their own consumption patterns and alignments. Consequently, we can draw a third question for a research agenda:

3. How to develop and share reusable consumption patterns to facilitate the consumption of Linked Data?

In addition, it is important to provide good URIs[4], convert data to linked data, and provide machine access in publication process. Considering that these steps support a higher quantity of serialization formats, the results point out a disperse use of serializable formats in both processes. Thus, the results indicate that the support of serializable formats impacts directly on how institutions publish their data, as well as consumers reuse the published data on the Web. Another important point is the low support provided by the software tools to previous and subsequent steps of "to create consumption patterns to specify what data are reused from a certain data source" and "to manage alignment, caching and update mechanisms".

Similarly, to the publication process, we were not able to determine any tool capable of supporting the whole consumption process. Thus, it brings us an important challenge that we summarize in the following question to the research agenda:

4. How to provide an integrated solution to simplify the consumption of Linked Data?

The creation of consumption patterns and the management of alignment mechanisms are the steps of LD consumption process that more support the serialization formats. It is worth to note the two rectangles presented in Figure 6, since they contain the highest number of supported steps and serializable formats. Therefore, the low support for serialization formats impacts negatively in the consumption process, thus it is necessary to propose approaches to increase the number of supported formats (structured and RDF serialization). This leads us to a fifth question:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

5. How to provide a solution to supports RDF and non-RDF serialization formats in Linked Data Publication and Consumption process?

The empirical evaluation of any tool is essential to ensure quality, as well as to highlight the tool features. Nevertheless, almost half of evaluated tools (45%, 36 studies) do not present any kind of evaluation (empirical or not). Therefore, it is important to quantify the effectiveness of each analyzed tool to perform the intended task properly, which brings us to the last question:

6. How to validate the effectiveness of the proposed studies according to supported steps?

In the big picture, we can point out an increasing, albeit badly distributed, offer of software tools to supply the publication and consumption of Linked Data. In addition, a considerable part of these tools does not consider existing production and consumption processes during development. Thus, it is important to provide a new set of software tools that take into account the current Linked Data state of the art.

Throughout this study, we presented a considerable number of tools to assist the publisher in both processes of publishing and consuming linked data. Though the important contributions presented, according to Bizer et al. (2009) the following questions are still open: 1) the support of licenses (Heath & Bizer, 2011; Schmachtenberg, Bizer & Paulheim, 2014), 2) the automatic evaluation of data quality (Maα & Qi, 2013; Moss, Corsar, & Piper, 2012), and 3) the data alignment (Bleiholder & Naumann, 2009; Homoceanu, Kalo, & Balke, 2014). Besides, it is noteworthy the need of an integration environment to simplify the process execution.

6. THREATS TO VALIDITY

As threats to the validity of this SLR, the main constructs in this review are the three concepts “Software Tools”, “Linked Data” and “Ontologies”. For the first concept, we used the terms “environment”, “authoring”, “architecture”, “framework”, “software”, “application” and “program” to collect studies related to software tool approaches. For the second concept, the terms “Linked Data” and “Linked Open Data” were used to cover the potentially relevant studies on Linked Data from the database search. For the third concept, the terms “ontology” and its plural “ontologies” were used to collect studies related to ontology approaches. However, we did not use control papers during the search on digital libraries, which may be considered as the main threat to validity. Additionally, we did not perform a complementary manual search.

7. CONCLUSION

In this work, we conducted a SLR to investigate the support of software tools to publish and consume Linked Data. Our goal was to improve the understanding of how these software tools support each step of both processes.

Eighty studies were fully investigated, of which nine provide support in one or more steps of the consumption and publication processes. In regards to the publication process, it is possible to evidence

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the low support in the initial steps. Moreover, in the consumption process, it is possible to evidence the software tools focus the support of the development of consumption patterns, as well as data alignment.

As previously discussed, we raised a set of questions, which involves the steps in processes, software tools, serialization formats and the relations among them. Finally, we highlighted some important questions that are revised and summarized in Table 5 in order to suggest a research agenda on linked data.

Table 5. Questions and motivation

Motivation	Question
The initial step of the publication process is badly explored by the available tools.	How to develop software tools to cope with the initial phases of the publication process of Linked Data?
None solution supports the whole process of publication of connected data.	How to provide an integrated solution to simplify the publication of Linked Data?
There is not a standard and in-depth approach to the consumption process of connected data.	How to develop and share reusable consumption patterns to facilitate the consumption of Linked Data?
None solution covers the whole process of data consumption.	How to provide an integrated solution to simplify the consumption of Linked Data?
There is need to increase the number of supported serialization formats for both publication and consumption processes.	How to provide a solution to supports RDF and non-RDF serialization formats in Linked Data Publication and Consumption process?
Low number of software tools was evaluated. Additionally, these evaluations ware not focused on support publication or consumption process.	How to validate the effectiveness of the proposed studies according to supported steps?

Based on (Kitchenham et al., 2007) we can highlight some contributions provided by this study. Such contributions include:

- The identification of gaps in current research in order to suggest areas for further investigation;
- The provision of a framework/background in order to properly position new research activities;
- The summarization of existing evidence, benefits and limitations.

The result presented in this Systematic Literature Review can be very useful to linked data community, since it gathers evidences from primary studies included in the review, forming a body of knowledge regarding the use of software tools to publish or consume linked data. We can outline the contribution of this work as follows:

- Research agenda based on SRL observations and according to gaps in both processes. Besides, we pointed out the need of an integration environment to simplify the process execution.

As future work, we intend to further investigate the software tool integration. Moreover, we intend to extend this systematic review aiming to clarify the communication interface among software tools between steps in each process.

Chapter 93
A Discussion on the Relationship Between Information and Communication Technologies (ICT) and Entrepreneurship

Mehmet Eryılmaz
Uludağ University, Department of Business Administration, Bursa, Turkey

ABSTRACT

Entrepreneurship has recently become one of the hot topics in several disciplines such as business administration, economy, sociology, etc. Thus, several studies in several fields focus on antecedents and consequences of entrepreneurial intentions and activities to get deeper insights about the phenomenon. Furthermore, another rising field of study is Information and Communication Technologies (ICT). Thus, the main objective of the present article was to discuss possible relationships between these two crucial concepts, namely entrepreneurship and ICT.

1. INTRODUCTION

Scholars in several fields discussed about a crucial question that whether the related field was transformed into a "scholar discipline". Finding some examples for this type of discussion is possible in the fields of "business history" (e.g. Kurt, 2016), "organization theory" (e.g. Davis & Marquis, 2005), "strategic management" (e.g. Booth, 1998; Barney, 2002), etc. Furthermore, as in the example of "strategic human resource management" (Wright & McMahan, 1992), disciplinary status of certain integrated fields was questioned.

Fields largely accepted as a scholar discipline share certain common characteristics such as widely shared beliefs by a group of scholars on limits and fundamental questions related to the field and recommended methodologies for addressing these questions (Eryılmaz, 2016), etc. In addition to those mentioned-above, increased complexity in the theoretical and methodological infrastructure of a field may be another indicator (Phelan et al., 2002). These discussions on the fields stated above were similar in the field of entrepreneurship. As a result of some assessments, despite the doubts of certain scholars (e.g. Rauch & Frese, 2006), some studies (e.g. Vesper, 1988; Filion, 1998; George & Wadhwani, 2006; Urban, 2010) heralded that the field of entrepreneurship was institutionalized and achieved the status of "scholarly discipline."

Information and communication technologies (ICT) is another popular subject. ICT is a prerequisite of the current era of knowledge. These technologies transform several societal dimensions such as political, social, technological, etc. dimensions (Yusuf, 2005). The impact of ICT is also inevitable on economic life. Thus, entrepreneurial intentions and activities, which are considered as one of the engines of economies by many scholars, will both affect and be affected by developments in the ICT. Therefore, the present study aimed to examine possible interactions between these two recent hot topics.

Initially, the present study will review the historical roots of entrepreneurship. Then, some factors, which are the antecedents and consequences of entrepreneurship, will be examined. In addition, brief information on ICT will be presented. In the third section, certain possible interactions between these two concepts will be discussed. Following this section, in the part of conclusion and directions for future research, the study will provide information on possible future trends in the field.

2. LITERATURE REVIEW

2.1. Entrepreneurship

2.1.1. Historical Roots of Entrepreneurship and Certain Definitions by the Pioneers

According to certain scholars (e.g. Stevenson & Jarillo, 1990), the concept of entrepreneurship was coined by *Richard Cantillon* (1680-1734), an Irish-French economist. He derived the concept of "entrepreneur" from the French word "*entreprendre*" that means "to undertake" (Matlay, 2005). Furthermore, Cantillon identified the origin of three main intellectual traditions (e.g. Austrian, Chicago and German) in the field of entrepreneurship (Hebert & Link, 1989) and named by Jevon as "the cradle of political economy" (Hayek, 2005). He also emphasized that entrepreneurial activity included buying at a certain price and taking the risk of selling for an uncertain price. For example, when an entrepreneur leases a farm from a landlord, money paid to landlord is definite. However, the price of products that would be harvested on that land cannot be known. The notion of uncertainty made him to identify even robbers and beggars as special types of entrepreneur. Finally, according to Cantillon, there are three classes of economic actors; the landlords, entrepreneurs and hirelings, and the entrepreneurs play the most central role among these classes in the economy (Hebert & Link, 1989).

A French economist, Jean Baptiste Say (1767-1832) improved the definition of entrepreneurship by Cantillon, adding a new element of "combining the factors of production" (Stevenson & Jarillo, 1990). In addition to these two pioneers, English political economist and philosopher, John Stuart Mill (1806-1873) professed that the main element that distinguishes an entrepreneur from a manager is risk taking

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Carland et al., 1984). Similarly, Gartner (1989, p. 62) defined entrepreneurship as "the creation of new organizations". Furthermore, Francis Amasa Walker (1840-1897), an American economist and educator, was another pioneer in the field. According to him, an entrepreneur was a person who was born with above average talent in the organization and coordination of factors of production. Walker considered that there was a difference between the investor who supplies the required funds for an investment and receives a certain amount of interest against these funds and the entrepreneur who profits from his/her managerial capabilities (Balachandran & Sakthivelan, 2013).

An Austrian-born American economist, Joseph Alois Schumpeter (1883-1950) also brought a breath of fresh air into the field. Schumpeter, who was inspired by certain intellectuals such as Böhm-Bawerk, Marx, Menger, Walras, Weber and Wieser (Hebert & Link, 1989), defined entrepreneurs as agents of change in an economy (Jones & Wadhwani, 2006) and considered the agents as a vehicle that improves the economy as a whole. According to Schumpeter, innovation is at the center of entrepreneurship. In parallel, Schumpeter defined "enterprise" as forming new combinations. Entrepreneur is the individual who invents these new combinations. At this point, Schumpeter seemed to feel that it was necessary to clarify the term "new combination". According to Schumpeter, there may be several types of new combinations such as: 1) introducing a new commodity or service to the market; 2) utilizing a new production method; 3) entering into a new market that does not have information on the present commodity; 4) discovering a new input source (e.g., raw material / half manufactured goods) and finally; 5) changing the structure of market by creating or breaking a monopoly in the market (or industrial reorganization). For example, three years ago, a Japanese company announced that it will start to generate electricity using bamboo (Milliyet, 2015). This may be regarded as an example of Schumpeterian entrepreneurship. He also distinguished the entrepreneur and the businessman (Carland et al., 1984; Stevenson & Jarillo, 1990).

Another important contributor to field of entrepreneurship is Israel Meir Kirzner (1930 -), who is a British-born American economist inspired by Austrian school of economics. According to Kirzner, the fundamental characteristic of an entrepreneur is alertness. He underlines the importance of quality of perception, in other words, recognition of profit opportunities by the entrepreneurs. Furthermore, according to him, the entrepreneur is the individual who does not possess capital (Hebert & Link, 1989). Entrepreneur is a pure decider without possession of capital (Cadar & Badulescu, 2015). This view by Kirzner is often criticized by certain scholars. According to the critics, if an individual does not own capital, it cannot be proposed that the same individual takes a risk (Hebert & Link, 1989).

In 1985, an American entrepreneur, Gifford Pinchot III (1942-) coined the concept of "intrapreneurship". "Intrapreneurship can be defined as the development, within a large corporation, of internal markets and relatively small autonomous or semiautonomous business units that produce products, services, or technologies by employing the firm's resources in a unique way" (Dollinger, 2008: 384, cited by Hisrich et al., 1985). Intrapreneurs are different from entrepreneurs since they use organizational resources and their main obstacle is the organizational culture (Cadar & Badulescu, 2015). The best condition for intrapreneurship have always been a topic of discussion. For example, certain scholars claimed that large scale organizations and dynamic environments were the most fertile conditions for intrapreneurship (Cadar & Badulescu, 2015).

As seen above, there were two main traditions that conceptualized the entrepreneur and entrepreneurship. The first one associates entrepreneurship with the risk-taking behavior. On the other hand, the second tradition that Schumpeter principally argued mainly emphasized the innovative behavior of entrepreneurs. Some eclectic approaches in the literature also attempted to combine these two approaches. For example, Johnson (2001, p. 137) defined the entrepreneur as "an individual who takes agency and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

initiative; who assumes responsibility and ownership for making things happen; is both open to and able to create novelty; who manages the risks attached to the process; and who has the persistence to see things through to some identified end-point, even when faced with obstacles and difficulties". Consistent with this, according to Shane and Venkataraman (2000), entrepreneurship may be associated with both new and extant organizations. According to the author of the present study, since behaviors of risk-taking and innovation are interrelated and complimentary, it could be more adequate to conceptualize entrepreneurship with a combination of these two approaches. Almost every innovation bears a certain amount of risk. For example, the Siemens pen phone seemed to attract less attention than expected.

2.1.2. Antecedents and Consequences of Entrepreneurial Behavior

There may be several triggers of entrepreneurial intentions, behavior and causes of entrepreneurial successes and failures at macro, meso and micro levels. Even though it was often objected by certain scholars, certain macro variables such as national culture, educational system, financial system, legal institutions, political institutions and religion may have certain effects on the entrepreneurship process (Jones & Wadhwani, 2006; Gohman, 2012; De Clercq et al., 2013; Valdez & Richardson, 2013). For instance, De Clercq et al. (2013) hypothesized that the relationship between individual resources (e.g., human, social and financial capital) and new business activity was moderated by formal institutions (educational and financial systems) and informal institutions (culture and trust). The study revealed partial support for the hypotheses. In a similar vein, Hefner claimed that overseas success of Chinese businesses may be explained by traditionally strong ties among the members of Chinese families and the requirement for success in a minority group. Similarly, Walker demonstrated that how slavery and institutionalized racism in the US before the civil war limited entrepreneurial opportunities of African American entrepreneurs. The same study also indicated that African Americans conducted certain entrepreneurial activities to delegitimize these institutions (Jones & Wadhwani, 2006, cited by Walker, 1986 and Hefner, 1998). In a similar vein, Turkey is 53rd and 66th in the "2017-2018 Global Competitiveness Index" and "innovation and sophistication factors" subbranch of the same index, respectively (Schwab & Sala-i Martin, 2017). According to the author of the present study, this relative failure of Turkey in innovation and entrepreneurship stemmed particularly from certain problems in the higher education system of the country.

On the other hand, another approach, primarily supported by the field of psychology, investigated correlations between micro factors such as personality traits[2], gender, etc. and entrepreneurial intentions, behavior and success/failure (Stevenson & Jarillo, 1990). For instance, Rauch and Frese (2007) found a positive and significant correlation between entrepreneurial behavior and certain personality traits such as generalized self-efficacy, innovativeness, need for achievement, need for autonomy, proactive personality and stress tolerance. Similarly, Engelen et al. (2015) examined the correlation between overconfidence of CEOs and orientation for entrepreneurship. They found a positive correlation moderated by the dynamism of the market. Certain studies criticized the personality traits approach to entrepreneurship. According to Gartner (1989), there were no significant differences between the personalities of entrepreneurs and non-entrepreneurs. Therefore, the adequate question is not "who the entrepreneur is". Instead, the behavioral approach to entrepreneurship recommends that the question that should be asked is "what does an entrepreneur do?" and entrepreneurship skills should be improved with education and training. On the other hand, a meta-analytic research on the correlations between personality traits and entrepreneurial behavior demonstrated that personality of entrepreneurs was significant. Previous

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

studies could not determine a direct correlation between personality traits and entrepreneurial intent, behavior or success/failure, since some of the scrutinized variables mediated the correlation (Rauch & Frese, 2006). Finally, family environment and parenting style (even toys that are provided for a child) may affect future success of a child in entrepreneurial career. For example, majority of parents in certain countries exhibit an interventionist style in their interactions with their children. This style may adversely affect the decision-making skills and future entrepreneurial capacity of children.

On the other hand, emphasizing one group of factors without considering the other could be inadequate. For example, if only macro factors were sufficient to understand entrepreneurship, how could we explain the differences in the success levels individuals who experienced similar conditions in the process of entrepreneurship? However, entrepreneurial behavior in certain countries, where it is supported by certain macro level factors, is stronger. Therefore, a combined set of factors (at macro, meso and micro levels) may be the best alternative to examine and explain entrepreneurial intent and behavior (Rasmussen & Sorheim, 2006).

Furthermore, entrepreneurial intentions and behavior may have consequences at macro, meso and micro levels as well. For example, Schumpeter claimed the essence of entrepreneurial activities in the economic development of a country (Carland et al., 1984; Shane & Venkataraman, 2000). Similarly, certain scholars discussed or empirically supported the impact of entrepreneurial activities on competitive advantage of a nation (Matlay, 2005). In addition, it may be expected that entrepreneurs may stimulate productivity at a national level by advancing the competition (van Stel et al., 2005). Finally, various studies assumed and empirically supported that entrepreneurial activities were associated with regional and local economic development as well (e.g., Malecki, 1993; Baptista et al., 2005; Rasmussen & Sorheim, 2006). At a micro level, one of the possible consequences of a successful entrepreneurial activity is personal accumulation of wealth.[3] Indeed, wealth accumulation is used in academic research as an indicator of entrepreneurial success (Jones & Wadhwani, 2006). Naturally, entrepreneurial behavior may generate a good or bad personal reputation for the entrepreneurs.

2.2. Information and Communication Technologies

"Information and Communication Technologies (ICT)" can be defined as 'electronic means of capturing, processing, storing, and communicating information" (Heeks, 1999, p. 3). It is possible to categorize ICTs in three main categories; "information technologies" (e.g., computers), "telecommunication technologies" (e.g., facsimile machine, mobile phone, videoconference and teleconference facilities) "network technologies" (e.g., Internet, intranet, extranet (Mirrezaei et al., 2013; Okurumeh, 2016).

ICT became an indispensable part of the contemporary world. As a natural result of this development, ICT transforms political, social, legal and other elements in a society. For instance, Yusuf (2005) mentioned the impact of ICT on teaching and learning in conventional and distance education institutions and emphasized the need for a national level educational policy on ICT. It is also certain that countries have different levels in ICT. For example, television and telephone services are still considered as luxury items in Cameroon. Similarly, Internet penetration rate in Cameroon was about 4% in 2009 (Linden, 2011).

There is no doubt that ICT would affect and be affected by the developments in economies and entrepreneurship. For example, previous studies suggested that ICT enables economic development by increasing the speed of information diffusion and introducing new practices in workplaces (Lee & Lio, 2017), developing the business environment and enhancing competitiveness and productivity (Martinez & Nguyen, 2014), and creating new job opportunities (Mirrezaei et al., 2013) such as computer program-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

mers, cyber cafe assistants, data communication analysts, network and system security specialists (Okon & Nyoku, 2016), and thus, augmenting employment rates, etc. However, the focus of the present study is limited by the interaction between ICT and entrepreneurship.

3. ENTREPRENEURSHIP AND INFORMATION AND COMMUNICATION TECHNOLOGIES

ICT might be an input, an output or a part of the entrepreneurial process. As an input, ICT may be used to improve the knowledge and skills of entrepreneurs. For example, Sinkovics et al. (2004) claimed that entrepreneur candidates require three competencies such as intrapersonal, interpersonal and organizational competencies to be successful. Certain ICT tools such as mobile phones, internet discussion groups, video conferencing and computer simulations can enable the achievement of certain interpersonal competencies by students. According to Sinkovics et al. (2004), uses of ICT tools in international entrepreneurship education provide certain benefits such as familiarity with the values of their counterparts in other countries and being acquainted with new ICTs for the students. Furthermore, ICTs can create new areas of business for entrepreneurs. These new business fields add new types of entrepreneurship such as "infopreneurship" (Khosrowjerdi, 2914), "netpreneurship (or "ontrepreneurship" or "e-entrepreneurship")" (Reddy & Singh, 2014). Infopreneurship is a type of entrepreneurship that is mostly based on services such as information brokering and consulting (Du Toit, 2000). Basically, the concept of infopreneur refers to in individual whose primary business is collecting and selling information (El-Kalash et al., 2016). On the other hand, as can be seen above, some alternative concepts were recommended for the concept of infopreneurs. For example, Guthrie (2014) preferred using the concept of "digital entrepreneurship" for infopreneurship. According to him, the former captures better the product and the processes related to the product such as production, marketing and distribution. However, since the use of "infopreneur" is more common in the literature, it was also preferred in the present study. Finally, due to the increasing significance of information among the factors of production, future of infopreneurs is considered to be prosperous. In addition to infopreneurs, netpreneur, which is as another type of entrepreneurship related to ICT, is a special type of entrepreneur with the ability to run a business extensively on the Internet (Balachandran & Sakthivelan, 2013). Furthermore, several studies emphasized the significance of social capital for entrepreneurial success. Huo (2013) discussed the role of ICT in building social capital by female entrepreneurs.

ICTs may be a part of the entrepreneurial process (or production technology) as well. Extant entrepreneurs can access data and information via ICT to increase their performances. For example, a foreign entrepreneur, who aims to enter to the Turkish market, can collect data and information about the Turkish market and on the consumer behavior using the Internet. Consistent with this example, literature review demonstrated that Ongori and Migiro (2010) asserted that small and medium sized organizations utilize ICTs to easily penetrate international markets. Similarly, Pelse and Zeverte-Rivza (2015) found that Latvian entrepreneurs limitedly utilized the ICTs and recommended the use of ICT at higher levels to increase the effectiveness of entrepreneurial activities. ICT is not only common among business organizations, but also among social organizations. For example, several aid organizations in Africa benefited from ICTs in their operations (Molony, 2007). Therefore, ICT may be a beneficial tool for social entrepreneurship as well. Finally, majority of the above-mentioned studies often reported the positive effects of ICT on the entrepreneurial process. However, certain studies also discussed adverse

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

effects of ICT as an input on entrepreneurship. For example, Lee and Lio (2017) claimed that use of ICT by extant firms discouraged new entrepreneurs to enter the market and it could create a barrier of entry.

Finally, ICT may be the output of an entrepreneurial process as well. Certain organizations may choose to produce either tangible or intangible (e.g., hardware, software, web sites) ICTs as an output (Heeks, 1999). WhatsApp, which was bought by Facebook in 2014, is a good example of ICT as an output of the entrepreneurial process. Similarly, robotic autonomous cameras developed by IBM will collect data about water quality in lakes and oceans. It is anticipated that these tools would help solve water shortage problems (Marr, 2018).

4. CONCLUSION AND DIRECTIONS FOR FUTURE RESEARCH

In the present study, the relationships between two popular concepts, "entrepreneurship" and "information and communication technologies", were discussed. According to the study findings, ICT can be an input, an output or a part of the entrepreneurial process. On the other hand, the present study was mainly based on a positive interaction between entrepreneurship and ICT. However, this interaction may have some negative aspects. For example, when an ICT is used in an adverse way, it can be harmful for entrepreneurial success. Therefore, adequate ICT use should be assured.

This relationship is creating a fertile ground for future studies. For example, several studies investigated the correlations between entrepreneurship and personality traits. Future studies could be conducted to determine whether infopreneur and netpreneur candidates require different psychological traits and educational backgrounds when compared to traditional entrepreneur candidates. Furthermore, it was observed that the time period that the individuals were born was another significant factor that might determine infopreneurship and netpreneurship tendencies in individuals. Thus, further studies could investigate whether there were significant differences between members of generation X and Y based on infopreneurship and netpreneurship tendencies.

Furthermore, forgetting is considered a disease in organizations. Therefore, some authors recommended several tactics to remove forgetting in organizations. However, recent studies indicated that forgetting may be useful in certain cases. On the other hand, when it is used in an adequate manner, ICT appears to be an instrument that supports organizational memory. Thus, future studies could focus on organizational behavior solving this problem of balance.

Finally, one of the popular approaches in entrepreneurship studies focused on the relationship between entrepreneurship and economic development. On the other hand, as far as it is known, there are a limited number of empirical studies conducted with large datasets that integrated infopreneurship (or netpreneurship) and economic development.

ENDNOTES

1 This study is partially based on a previous chapter entitled "entrepreneurship" that was published in Khosrow-Pour (Ed.), Encyclopedia of Information Science and Technology, Fourth Edition, 2018, pp. 2998-3006.

2 This stream seems to attribute a positive meaning to personality to a large extent. However, there are some studies (e.g. Klotz & Neubaum, 2016) that attract our attention to the darker side of

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

personality (such as Machiavellianism, psychopathy, narcissism etc.) and their relationship with entrepreneurial consequences. In addition, some scholars (e.g. Miller, 2015) discussed that certain personality traits (such as being energetic and having a high self-confidence) that seems to be positive for entrepreneurship may be transformed into negative ones (such as aggressiveness and narcissism) later.

[3] In effect, there also seems to be a reverse correlation between these variables. For instance, Kerr and Nanda (2011) discussed that a desire for personal wealth may trigger the choice of being an entrepreneur.

This research was previously published in the International Journal of E-Entrepreneurship and Innovation (IJEEI), 9(1); pages 13-22, copyright year 2019 by IGI Publishing (an imprint of IGI Global).

Chapter 94
Continuous Improvement Maturity Models:
How to View Them Effectively

Brian J. Galli
https://orcid.org/0000-0001-9392-244X
Assistant Professor and Graduate Program Director, Master of Science in Engineering Management Industrial Engineering, Hofstra University, USA

ABSTRACT

Maturity models seek to enhance a business with the passage of time. The purpose is to attain a competitive advantage. Various maturity models are accessible, including the continuous improvement maturity model (CIMM). The model offers outstanding techniques and practice models in addition to tools, skill sets, and a proper mindset to process improvement. This article analyzes the need for Continuous Improvement Maturity Models in a company. Hence, the current maturity of a company cannot be indicated by this model. There is a need for progress and knowledge to combine and improve the company's level of maturity. The model assessment refers to an instrument that is research-based and assists the users to set a goal assessment of the maturity level. The purpose of designing this model is for it to be utilized by any manufacturing company. A series of repetitive phases are required by this instrument, and its moderations and validation are based on various case-studies and semi-structured interviews conducted with experts.

INTRODUCTION

For the past decade, there has been growing pressure for companies to attain and maintain a competitive advantage. To do so requires reducing time to the market, cutting cost, improving quality, and more. Therefore, companies ought to enhance processes on a continuous basis (Agrawal & Sharma, 2014; De Bruin et al., 2005). Organizations must make various changes in their programs and software to enhance their capacity to work and deal with increasing expectations and requirements of stakeholders and the market (Lepmets et al., 2012).

Development models are ordinarily acknowledged to cultivate a competitive advantage by both businesses and scholars. They delineate the present development level of a part of the association with the goal that partners can distinguish qualities, change focuses, and organize what they can do to achieve higher development learning and demonstration. For instance, in IT, outsourcing or project management are two areas. The partners will be empowered when the results authenticate the action required to accomplish increased amounts and results in a superior business and spending improvement.

The demand for maturity models is increasing among companies since they support the achievement of company goals. An important fact that needs to be considered is that there is no actual description or definition of the maturity model. Additionally, there is no shortage of the model (Bititci et al., 2015). Regardless, it is noted that these models are utilized for comparison and evaluation so that further improvements can be made (Fisher, 2004). Another and more apparent purpose are to provide a clear approach through which a company can improve its performance (Galli, 2017; Ahern et al., 2004).

The Continuous Improvement Maturity Model (CIMM) provides a proper framework and wide range of practice methods and strategies for companies to achieve various maturity levels. These levels demonstrate onsets and mature organizations (Lockamy III & McCormack, 2004). The Capability Maturity Model (CMM) was developed by the Institute of Software Engineering at Carnegie Mellon University (Agrawal & Sharma, 2014; Paulk et al., 1993). Various development models are created to explore fields like business process administration, data innovation, execution management, learning administration, and undertaking administration.

BACKGROUND

McDermid and Bennet (1999) contended that the human variables to Software Process Improvement (SPI) had been overlooked, which harms their adequacy. Hall & Wilson (1997), likewise, proposed that involvements, feelings, and impressions of programming experts are affected because of the nature of programming created. This suggests such properties impact how programming experts carry on towards SPI execution approaches. In this manner, it is vital to distinguish the perspectives and views of diverse professionals about components that play a positive or negative part in the usage of the SPI program (Galli, 2017). These perspectives and encounters may furnish specialists with adequate information about the idea of issues that play a positive or negative role in the usage of SPI programs. Undoubtedly, this would help them in arranging SPI execution techniques.

Various empirical studies considered the aspects that negatively or positively impact SPI (for example, El-Emam et al., 1999; Rainer & Hall, 2003). A study of 138 people in 56 programming associations (Goldenson & Herbsleb, 1995) recognized the components vital for executing an effective SPI program. The creators distinguished related variables to effective as well as unsuccessful SPI programs (Goldenson & Herbsleb, 1995). Research of 56 programming associations that either executed an ISO 9000 quality framework or led a CMM-based process change activity. Based on this research, there were ten factors that influence hierarchical change in SPI (Stelzer & Mellis, 1998).

El-Emam et al. (1999) researched a portion of the essential achievement variables and obstructions for SPI. This examination is a subsequent report to Goldenson & Herbsleb (1995). They utilized information from 14 organizations engaged in SPICE trials, bearing in mind the end goal of distinguishing which components are most emphatically identified with achieving SPI endeavors and which have no effect. A questionnaire survey was conducted containing participants from 85 UK organizations (Rainer & Hall,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2003). This survey identified vital achievement factors affecting SPI usage. The outcomes demonstrate experts considered four factors that majorly affected effectively actualizing SPI, including surveys, guidelines and processes, preparing and tutoring, and experienced staff. The creators likewise distinguished four other factors (inner authority, investigations, official help, and interior process possession) that developed organizations considered majorly affected achievement of completely actualizing SPI.

The work discussed and reported in the current paper extend the work of previous ones. Most studies mentioned herein implemented the survey method to obtain their findings and knowing which factors create the need for CIMM in a company.

There is a disadvantage linked with the survey method since a specific list is provided to the participants, to which they had to respond accordingly. This persuaded the researchers to acquire the components researched and restrict them to those detailed in existing investigations. It is also conceivable that respondents may misjudge the variables in the survey. These issues are exacerbated if the respondents do not have an adequate idea of the CSF approach. With the goal of improving trust in the investigation, it is vital that professionals' encounters and recognitions be investigated freely and with no proposal from the analyst.

Little consideration has been paid to the change of SPI execution processes. Diverse advances are made for the improvement of SPI measures and models. However, these advances have not been coordinated with the reception of these guidelines and models in programming advancement (Badsi et al., 2017; Leung, 1999). This brought about constrained accomplishment for some SPI endeavors. This proposes the present issue with SPI is not an absence of a standard or model, but instead an absence of a compelling technique to effectively actualize these principles or models. In writing, much consideration is paid to ''what exercises to actualize'' rather than ''how to execute'' these exercises. It is trusted that distinguishing proof of just ''what exercises to execute'' is not adequate and that information of ''how to actualize'' is likewise required for fruitful usage of SPI programs.

The current study discusses what factors bring forth the need for CIMM in a company and make an organization implement it for their success. Moreover, is it able to solve the issues related to productivity and performance?

Problem Statement

The paper intends to understand the need for CIMM in enhancing the performance of companies.

Research Hypothesis

- Identify the correct Continuous Improvement Maturity Model tool.
- Identify the key elements of the Continuous Improvement Maturity Mode
- Identify the need for Continuous Improvement Maturity Mode to boost the performance of an organization.

Originality

The purpose of this study is to contribute to existing literature regarding the effectiveness of CIMM. Moreover, it seeks to compare CIMM features with other maturity models by focusing on their assess-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ment tools. Data is derived from different studies and combined in a well-mannered approach. This paper is based on original research conducted to check the hypotheses.

The study has taken the viewpoints from different researchers and recommend new ways to resolve already existing issues. The purpose of the study and hypotheses are described. In the paper, the methodology is discussed along with its findings. A valid assessment model of CIMM is developed by using a design-science-investigate strategy, authorizing a valuable growth reveal for both reasonable and hypothetical applications. This paper initially provides an outline of development models with attention to their evaluation instruments as an answer to the examination question. An explanation is provided about the strategy utilized for the outline and assessment of the evaluation instrument. The consequences of the meetings are also laid out in the Analysis. This is trailed by the initial discoveries and suggestions in the conclusion, which also plots investigative limitations and future research ideas.

Contribution to the Industrial Engineering Profession and Research Field

The current study is a significant contribution to the Industrial Engineering (IE) profession and research field. The study saves engineers' time, so they can work more effectively and focus on their goals. It helps engineers in organizing and maintaining the system with the use of the latest technologies. Moreover, it helps engineers save time, materials, machine time, money, energy, work hours, and other resources that hinder generating productivity. Finally, the research helps engineers improve the productivity and quality of their overall work. This model helps organizations make innovations in their products and other essential aspects. It would assist industrialist engineers in finding effective strategies that provide benefits to the organization.

Hence, in the research field, this study is helpful. First, it would be a beneficial piece of writing providing information and awareness to industrialists and all readers. Easy to understand and user-friendly vocabulary and writing are utilized to accommodate all readers. This research reveals a new side of the CIMM model and sheds light on the effectiveness and requirement of this model for the management and production of companies. Moreover, a clear theoretical framework is provided in this research to help readers know the relevant information. Additionally, readers and researchers can use this study as a reference in future studies. It would be helpful for companies to boost their performance and achieve a competitive advantage in commerce. Undoubtedly, this paper is a valuable contribution to the IE profession and research field.

LITERATURE REVIEW

CIMM is a new model and is regularly updated and maintained by the Lean Six Sigma Academy (LSSA). The model consolidates not just the prescribed procedures, strategies and methods of process change, quality administration, and new item advancement, but also the attitude, range of abilities and device set for process change. This system is profitable as it guides associations through the development levels of organization and supervision, and can turn into a world-class association in the long run (Badsi et al., 2017; Lindemulder, 2014). It is contended that CIMM provides an exhaustive procedure change system, of which every development level is described by Lindemulder (2014). Be that as it may, there is minimal hypothetical comprehension on how the different development levels can be surveyed.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Information about development models and their evaluation instruments is scattered. Different research concerning development models have been completed. Harmon (2004), for example, looked at different business process administration development models. Such type of research has concentrated on looking at the appraisal instruments of development models. It is likely that different investigations can be utilized as a reason for a CIMM appraisal. There appears to be a significant gap between the coveted and genuine hypothetical base and, in this manner, the utility of CIMM. This is particularly critical since Bititci et al. (2015) showed that development models could empower productive and successful appraisal of the execution administration hones. Evaluation is therefore important as it shapes the premise of using development models to support associations in achieving the upper hand.

Numerous companies utilize development models to measure and enhance their presentations. A maturity model enables an association to have its strategies and procedures surveyed by the best administration improvement and against a unique arrangement of external benchmarks. Critical advantages have been acknowledged by utilizing these models for business change and in framework advancement applications. However, these models have two issues. First, the vast majority of these models are exceptionally complete and complex for some. Second, they do not consolidate the full arrangement of process change systems and strategies (Elloumi et al., 2017).

Most models have been produced at the season of 'Add up to Quality Management' (TQM), yet do not consolidate the full arrangement of Lean and Six Sigma standards. Enhancing forms inside an association is depicted by the 'Persistent Improvement Maturity Model' or CIMMTM. It is a structure that depicts an approach to process change from making a strong establishment to creating World Class items and administrations. CIMM joins the accepted procedures, strategies and systems of process change, quality administration and new item advancement. It incorporates components from TQM, Kaizen, TPM, Lean, Six Sigma, and Design for Six Sigma.

The CIMM Model is not intended to replace other development models, but rather to assist them. Same as the more significant part of the development models, CIMM incorporates five distinct levels. The CIMM Model can be used as a remain solitary system to direct the procedure of Continuous Improvement from a beginning time to the level of World Class. Picking the correct procedure change strategy and apparatuses relies upon the real development level of the association. If an association chips away at getting to the following level, it ought to also maintain the levels beneath. For example, if an organization is going for 'Able' procedures, it ought to maintain the establishment, culture, and consistency. In the accompanying areas, we survey the five levels and disclose the ideal approach to accomplish the following development level. The levels will be recognized as 'Persistent Improvement Level 1' (CIMM Level-I) through to 'Consistent Improvement Level 5' (CIMM Level-V) (Galli, 2017).

Improvement ought to be a persistent application. It is anything but difficult to predict the end of an SPI scheme, when a researcher tallies his triumphs and failures. It is similarly evident that enhancements are somewhat endless: as a few issues are found, others become noticeably distinct. The key factors in a persistent approach are stepwise change, top-administration duty, and a practical change association. Development models, for example, CMM, Bootstrap, and SPICE (Software Process Improvement and Capability Determination) typify the substance of stepwise change. All encounters recommend that such stepping stools take a long time to climb. A consistent approach in this manner requires duty from top administration. A nearby or base up activity can be successful for some time, yet it effectively loses force. Over the long-term, the attention on SPI activities reduces unless they prevail with regards to winding up some portion of the key factors of the organization (Elloumi et al., 2017; Felfel et al., 2017).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

To effectively climb the development step, the researcher should introduce and maintain changes in the model where required. To do this, the researcher requires a maintainable change association that is versatile to evolving conditions. The administration should straightforwardly assign assets to such an authoritative unit and must enable it to make and maintain organization-wide SPI mindfulness. Elements that undermine the persistent approach are deficient outcomes and a negligible SPI exertion. On the off-chance outcomes are not archived, or the arrival on speculation is weak, the SPI exertion is probably not going to make due past the principal venture. By and large, the researcher cannot archive enhanced development on a regulating scale. Functional persuading is required, and it is commonly best to set up a basic measurements program that can enable the researcher to contend for proceeding with the accomplishments (Kaoud, 2017; Schön, 1996). Even when an SPI exertion comes about, indicating authoritative, legislative issues or other hierarchical issues can underestimate it (Gera et al., 2017; McFeeley, 1996).

Research reveals five standards that are emphatically reliant for the improvement of a strategy or model. If the company neglects to improve one, it genuinely lessens its odds of effectively actualizing the others. For instance, in the event it neglects to concentrate on issues, new knowledge cannot be made by the products of a specific company. An essential inspiration for having specialists take an interest vanishes. The administration will probably decrease change activities to customary help capacities with minimal key significance (Galli, 2017). Also, when the researcher is left with a general concern, there would not be continuous and long-term benefits for improvement efforts. In a situation where the researcher neglects to receive different standards, comparable shortcomings would arise. The five standards are a conscious theory of SPI that are created through training. The hidden esteems are unique in relation or even conflicting to the estimations of conventional change approaches.

Learning SPI is a requesting procedure; it questions individual and expert convictions and difficulties regarding existing conventions. If SPI activity is initiated as a progression of tasks, it can keep up the concentration of the researcher and take into consideration dynamic changes as the development of a specific procedure. Most importantly, SPI requires submitted, persistent members (Kaoud, 2017). According to research, if a person wants to learn SPI, the person should be set up to enhance both programming rehearses and existing change conventions. To set the person up for such a test, the person needs to get some specific training and follow specific instructions as well as suggest the exploitation of learning. Eventually, be that as it may, every association must locate its particular way to SPI achievement (Kaoud, 2017). The essential and most critical part will be that of a progress operator. The best change specialists abstain from becoming plainly closed-minded SPI devotees. Alternatively, they realize what they can, tune in to the many voices inside their association, and, given both, diagram the best way towards change.

Research conducted by Larrucea et al. (2016), revealed there is a requirement to improve process management and strategies in an organization to enhance performance. When employee performance is increased, there is the possibility that the company enhances its productivity and increases profit. Specifically, when a company is small, the need for process improvement increases. The international standards should be followed to get assistance here. The CIMM can help organizations gain success by developing a strategic concept and following it.

RESEARCH METHODOLOGY

A qualitative method is used to conduct the study. Content analysis is also performed. The study is linked with a naturalistic inquiry and explores the need and effectivity of the CIMM directly. A collec-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion of studies were used. The theoretical point of view regularly connected with subjective analysts is phenomenology. Following the content analysis, specialists try to comprehend the significance of using CIMM. The setting is also critical to understand the information. This approach requires the analyst " focus on the industry to accomplish a feeling of the suggestions that others provide for their particular circumstances."

The information gathered in a subjective report incorporates more than words, states of mind, emotions, vocal, and outward appearances, and different practices are likewise included. The information is gathered by using previous researches and the annual reports of companies. The findings are generated by the in-depth analysis of the content emerging from this real information.

To perform this study, 20 companies were interviewed. Semi-structured interviews were conducted to know if they work well or if they need improvement in productivity, software being used, techniques currently boosting productivity, the criterion to assess creativity and productivity, and thoughts on the future of the company's competitive advantage. Random sampling was done by connecting these companies via mail and getting their consent through a consent form.

It is further imperative to recognize the experts sampled within organizations are representative of specialists in associations overall. A genuinely representative sample is very difficult to accomplish, and the specialist should attempt to abandon much of the sample biases. In this exploration, with a specific end goal to make the specimen genuinely illustrative of SPI professionals specifically association, one to three specialists from every association self-chose partaking in the research. The sample incorporates engineers, business examiners, methodology investigator, specialized executives, project administrators, and senior administration.

20 companies used include 6 CMM level 3 companies, 5 CMM level 2, and nine implemented a general formal program of internal quality assurance. Additionally, almost 20 published reports, articles, and case studies are analyzed to assess the aspects that may play an imperative role in applying CIMM model.

The setting (industry or business) that is using CIMM and maturity models also plays an important role in analyzing the information and findings identified from previous research studies. The context or setting that companies are using CIMM required us understand the context since that setting could have played a factor or role in the findings or conclusions found in the previous research studies; therefore, setting (industry or business) is a factor that could not be discounted in our research study.

FINDINGS

The results of the questions mentioned above are discussed below. This section reveals the essential barriers cited in the literature and discusses previous empirical studies. The method of content analysis is performed to obtain findings.

The findings related to question 1 reveal that Continuous Improvement Maturity Model is valid. The work is performed by using specific levels. When the checking is done through a proper criterion, then it would provide valid results. The validity of a tool is important to know how well the software can work. Validity is fundamentally done by analyzers through testing. While approving the item, if some deviation is found in the final findings from the normal outcome, then a bug is accounted for or an occurrence is raised.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Not all occurrences are bugs. Be that as it may, all malfunctions are occasions. These occasions can be a sort of 'Question' where usefulness is not clear to the analyzer. Consequently, approval helps in unfurling the correct use of highlights and causes the analyzers to comprehend the item in a better way.

Findings regarding question 2 reveal the essential and key components of CIMM model. These elements include maturity-based transformation, sustainability through a three-tiered system, and functional integration. First, an initiative is taken, and after that, the process is repeated to know the reaction of specific organizations and projects. Then, the project is properly defined. In the next step, the procedures are measured and controlled, and in the last step, the focus is on improving that strategy. If there is any need to improve, the improvement is made, and again the process is repeated (Kaoud, 2017; Hart, 2017). It is necessary to know the basic steps to understand the effectiveness of a tool. The CIMM is a software program that helps in knowing the effectiveness of activity during a company's progress. There is the necessity to find the ways and strategies that become helpful to the success of a company and assist in increasing the productivity (Galli, 2017).

Regarding the findings of question 3, it is important to know the needs of a company and where there are loopholes. In this age of technology, the level of competition is very high among companies, so they are adopting the latest technological tools to enhance performance. When a company implements CIMM model to boost its performance, this model works remarkably. It assesses the needs and requirements of a company and provides a strategic plan that would lead the company towards success. When everything has been clarified to the administration about the loopholes, timesaving measures, strategies that could be adopted to boost the productivity, and other vital factors, then it would be natural for the company to maintain its competitive advantage (Kaoud, 2017).

It is necessary to keep checks and balances of the strategies a company uses for increasing its productivity and changing technology. The companies should check new trends in the industry. There are obvious explanations for remaining fully informed regarding what is going on in the specific vocation field, like keeping a focused edge in the active market or situating one deliberately for advancement. Remaining educated and exploring a specific profession to be balanced on the borders of information can expand the validity, relevance, and encouragement among associates in a specific industry. Publication, events, seminars, forums, mentors, and social media are effective ways to keep updated with technological advancements. The content analysis reveals these findings that make sure companies need to implement Continuous Improvement maturity models to boost their productivity.

In-Depth Research and Information

The CIMM model is very important in maintaining consistency, saving time, improving performance, increasing marketing demand, and overall process improvement of a company. Numerous associations utilize maturity models to gauge and enhance their exhibitions. A maturity model enables an association to have its strategies and procedures surveyed by the best administration. Noteworthy advantages are acknowledged by utilizing these models (Nabi et al., 2015).

There is a need to perform in-depth research and get proper information regarding the Continuous Improvement Maturity Model. This information can be gathered by using in-depth research. It is one of the best tools for planning and evaluating a program. When in-depth research is performed, then it allows the researcher to explore both basic and expert aspects of the specific criteria. In-depth research is performed to conduct the present study. As a result, more amount of information is gathered that also

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

helped in getting the findings and knowing the assessed the effectiveness of the CIMM (Nabi et al., 2015; Wilkerson, 2015; Agrawal & Sharma, 2014).

DISCUSSION

A high development association where all people perceive their part and duty regarding business achievement is an association that will probably make progress. Companies with attention on merely winning the CIMM affirmation barely locate the substantial advantages of embracing the quality structure. High development, with its emphasis on quality and process execution targets, put associations and activities in a place to succeed (Galli, 2017).

Empirical investigations which utilize the artifacts of software are famous in the last century because of the accessibility of archives from open source projects. The current paper studies examinations over the past three years of ICSE, FSE, and maturity models and procedures, order these investigations regarding open source versus restrictive source ventures, and the decent variety of subject projects utilized as a part of these examinations. The overview demonstrated that half of the examinations utilized exclusively open source schemes. Existing studies either reach general implications from these outcomes or renounce any conclusions that stretch past particular subject programming (Hatch & Cunliffe, 2013).

It is concluded that analysts in observational programming design must consider the outside acceptability issues emerging from utilizing a few plainly understood open source programming projects, and that dialog of information source choice is an essential theme in programming building research (Singh & Vyas, 2016). The paper discussed the need for making continuous improvements in the strategic model required in a company. When there are changes regarding the advanced technology in the model, only then is it possible for the company to achieve progress and be first among the competitive companies. It is essential for a company to fulfill the competitive advantage to gain more progress and profit as compared to competitors (Galli, 2017; Singh & Vyas, 2016).

In this paper, the discussion of continuous improvement maturity model is displayed that can enable organizations to evaluate and enhance their execution forms. CMMI model depends on CSFs and primary obstructions distinguished through writing and an experimental examination. For the advancement of this model, we investigated the encounters, assessments, and perspectives of professionals to distinguish factors that have a positive or negative effect on the usage of SPI programs (Galli, 2017). In any case, this model needs change and assessment. A specialist board audit will be directed to keep in mind the end goal and gather input from various professionals. Given the assessment input enhanced rendition, the development model will be delivered. A contextual investigation will likewise be directed to approve and test the development and usage of this mode.

Implications to the Field of IE (Industrial Engineering)

The implication of this study is remarkable in the field of IE (industrial engineering). The companies would know the importance of CIMM model for performance. The findings revealed a significant improvement in the performance of companies using this model for their strategic development. Moreover, the model is important to know essential strategies beneficial for the company, and the improvements required to boost the company's performance (Tinnila, 2013).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The implication of this study is for the development of solutions, for enhancing the purchasing of services and products required to boost productivity, and for boosting the delivery of creation of service systems and services. Furthermore, its implications to the field include checking how much time is required to complete a task, what products are used to enhance the capability of a specific program, what can result, and other factors. Conclusively, its implication plays a vital role to make a company successful among its competitors (Galli, 2017; Caffyn, 1999).

Applications to IE (Industrial Engineering)

The application of continuous improvement maturity model to IE is apparent. There is a need to apply this model. The companies that accomplish long-term investigation sustainability by effective challenging for research funding would not just generate their quality science. Hence, they also generate human resources to eliminate the risk of turning into a security threat. Real difficulties to these associations incorporate recognizing and organizing financing facilities, securing and directing outside allow honors, and distributing both the results of research and applicable observation information.

The absence of an established assessment method to evaluate institutional research capacities poses challenges for recognizing and focusing on, repeatable procedures that prompt authoritative changes. Long and short-term objectives, which are tested by inquiring about quality, financing, and HR, should be set up to accomplish complex missions, such as diminishing worldwide wellbeing security dangers. When pattern capacities are built, a predictable assessment method gives a target view to supplement different advances that upgrade abilities (Tinnila, 2013).

The capacity development display, which is regularly utilized as a part of business and innovation segments for setting up life cycle and arranging sustainment is a strategy that improves execution by characterizing three levels of ability (beginning, oversaw and enhanced). An association can survey its present condition of ability (‘as may be’) and build up a noteworthy procedure for its next movement (‘to be’). What is more, use of CIMM helps to make a technique for understanding a more repeatable and upgraded process. Research programs regularly depend on fundamental measurements, such as the quantity of associate investigated distributions, and give subsidizing credits to quantify their quality.

Our investigation recommends an approach that incorporates references and devices, particularly those that are chance based, which can be utilized to set up beginning accepted procedures, characterize measurements, measure yields, and rates of achievement in a stepwise way. Also, we give a pilot case from an overview of research organizations in under-resourced regions (Yeh et al., 2017; Tinnila, 2013).

CONCLUSION

Maturity models are expanding in popularity as an instrument to control associations towards the upper hand. Different development models exist with fluctuating appraisal instruments. It was discovered that there is an unmistakable direct thought between process thoroughness and confirmation bolster. Instruments which score high on the two perspectives regularly envelop more significant evaluation groups, incorporate both inside and outer assessors, and make more association than instruments which score low on these viewpoints. It can in this manner be presumed that the pointed consequence of an appraisal is critical to consider while settling on choices amid the advancement of an evaluation instrument. The planned CIMM appraisal needed to demonstrate the current CIMM development status of an association.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Besides, it must be usable by any assembling association. The instrument accomplishes this by focusing on general subjective articulations (just proposing effective devices and strategies). Also, the instrument is meant to be a reasonably confirm-based appraisal with negligible process thoroughness. This was set up by building an inspection/appraisal instrument and proposing to incorporate various (external and internal) assessors amid the evaluation. The current perspective of how inspection/appraisal instruments are developed was inadequate. This paper sought out to present the different maturity appraisal/inspection instruments and it also sought to develop an approach to analyze the different maturity appraisal instruments. From this analysis, a CIMM evaluation instrument was created. In turn, this instrument, with a strong logical premise, was used to show the association of how maturity helps an organization to develop its status of project success; this in turn adds to the utility and value of CIMM. The assessment of the appraisal instrument let different upgrades concerning detail, structure, and other components.

Moreover, it is discovered that associations and specialists see the additional estimation of an appraisal and support the proposed strategy for the CIMM evaluation instrument. Findings contributed to understanding different assessment tools. A unique diagram of development appraisal instruments was inadequate. This paper depicts existing development show evaluation instruments and provides a system which analyzes investigated appraisal instruments. A CIMM evaluation instrument was created. This instrument, with a strong logical premise, shows the association's present development status and adds to the utility of CIMM.

The definitive point of leading the experimental investigation and creating development was to build up an SPI usage system. It is essential to utilize the exact discoveries and compose a structure for managing the de-indication of viable usage techniques for programming process change (Aurum et al., 2013). It is important to identify and follow the essential components required for bringing improvement in a maturity model. These components provide an exceptionally logical structure with which to actualize SPI programs.

Keeping in mind the end goal to viably design SPI execution systems, the goal of ''SPI usage design'' is to furnish experts with adequate learning about the idea of issues that play a positive or negative part in the execution of SPI programs and to help them in successfully arranging SPI execution procedures. ''SPI execution guide'' objective is to give a development model to SPI usage with a specific end goal to control associations in surveying and enhancing their SPI execution forms. In ''SPI execution demonstrate,'' the perspectives and encounters of professionals concerning SPI usage are experimentally investigated, and a model is created to successfully actualize SPI programs. This paper secured the structure and execution of the model that is the exact guide to the implementation of it.

Limitations

The study contains some limitations. This examination investigated the encounters and view of experts concerning the use of a maturity model. These insights, awareness, and encounters have not been checked specifically. This may imply that what specialists say regarding basic elements may not be the basic variables for execution of this model. Moreover, viewpoints of experts may not be exact. The findings of this study are trustable that come in the shape of information and awareness in the light of the fact that the information is gathered from previous researchers that were conducted to know the usage of CMMI model in companies.

Moreover, practitioners' encounters and observations were explored autonomously and with no recommendation from the analyst. The qualitative approach that is the method of content analysis is

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

used to know the findings. There can be another approach used for this research to get more obvious results. Though the product advancement industry is characterized by worldwide rivalry and interest, our investigation is restricted to programming development associations. This eradicates the problem of relational correspondence and tends to advance a more institutionalized gathering of associations.

Recommendations for Future Research

In the future, if there would be the need of conducting research, the researcher ought to find ways through which more effectivity can bring to the model. Moreover, he should take a larger sample so that more objectivity can be found in the results. To overcome the above-mentioned limitations, more qualitative research ought to be performed.

Chapter 95
New Trends and Tools for Customer Relationship:
Challenges in Digital Transformation

Ana Lima
Polytechnic of Porto, Portugal

Jorge Pacheco
Polytechnic of Porto, Portugal

ABSTRACT

Digital transformation is leading companies to change their business and adjust the strategies to the new market reality – an era of constant customer connectivity focus on transforming the customer value and the use of digital technologies for greater customer interaction and collaboration. This is putting the customer first in many organizations' strategies to leverage the customer journey and experience with brands. Digital transformation is the combined effect of the main digital innovations responsible for changing structures, practices, and values within companies. In terms of customer, it means changing the way business interaction occur during the customer journey. The digital era faces a tremendous growth of customer empowerment, so companies need to structure news ways to be innovative in terms of customer support, anytime, anywhere, and with the proper device – text, video, instant messages, and unexpected ways. The authors strongly recommend any company or organization to bring the customer experience to the early stages of the implementation of a new tool.

INTRODUCTION

This chapter presents a broad perspective of how new tools are emerging from digital transformation aiming to better reinforce the interaction with customers. This means new ways to follow customer preferences in terms of customer support and building emotional boundaries with target groups. Nowadays, customers in digital era are more demanding, expecting a real time response and innovative approaches. Digital transformation is highly in progress and it provides new ways to interact with customers in a

digital way. The market is growing fast in digital era and companies are forced to move faster and update the communication among customers and stakeholders. It has transformed the way customers buy and the experience exchange. Today, customers are driving the buying process among websites, blogs, and social platforms According to this real time changes, this chapter describe some of the main concepts of digital transformation, trends and tools to develop close relations with customers, and also considered benefits to companies. The chapter is structured in a simply way, with a literature review in the section one, presenting some of the main concepts - digital transformation, customer relationship and customer experience. Section two and third present some of the trends and tools that support the relation between companies and customers in the growth of digital era. Final section is concerned with the challenges and issues faced by companies when embracing digital transformation in their process of relationship with customers, aiming to differentiate customer service and innovate the customer journey. The author's motivation is based on their experience with mapping customer experience journey in some fields of work and industries in digital era. Our contribution is to present an organized approach and list of the main trends and tools that can support companies to leverage the digital transformation among customer service departments able to face the fast growing industries.

PART 1: DIGITAL TRANSFORMATION AND CUSTOMER EXPERIENCE

Digital Transformation

Nowadays, more and more people use digital channels and devices in their interactions with brands and companies, so there is an exponential attention for digital customer experience.

Digital transformation is one of the strongest trends in the past few years and those in leadership positions must plan to move ahead of these organizational, technology and social shifts to stay competitive or they could be left overdue as digital business disruption becomes a requirement. This digital transformation is considered a methodology that uses digital technologies to transform and create new business models and cultures. Is also connected with the development of the World Wide Web and all around it, from communications to ecommerce and government management. Digital transformation is known as the integration of digital technology with all areas of a business, resulting in several changes in the business, mainly in managerial operations and the value delivered to customers. In simply words, we can consider that the focus is to change the way companies interact with the market, the customers, and how they deliver and improve a particular consistent customer experience in real time. According to Fitzgerald et al (2013) digital transformation is the use of new digital technologies (social media, mobile, analytics or embedded devices) to enable business improvements such as customer experience, streamlining operations or creating new business models.

World Wide Web has grown at an overwhelming pace from less than 10 million sites in 1998 to more than 500 million in 2008. There where 2.4 billion users in 2014, now there are 4.1 billion users, with Asia leading the way with 2023 million users followed by Europe with 704.8 million and 3.3 billions searches every day on Google alone and more than 2,1 Billions active social media users, only on Facebook (Statista, 2018).

The most commonly performed activities online are: instant messaging, like Whatsapp, Skype or Facebook chat (85%), use of social networks such as Facebook, Instagram or Snapchat (77%), use of e-mail (60%), voice or video call conversation, such as Skype or WhatsApp (54%), watch videos, pro-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

grams, movies or online series (64%), listen to music online 59%), share texts, images or videos 66%, post texts, images or videos (38%) and create or update blogs, websites (16%) according to Linhares (2017).

65% of Portuguese online surveys are done through mobile devices, standing new challenges to public and private institutions that seek to interact with current or potential clients. With the Internet, consumers access to a vast sources of information that have transformed the way decisions are made, and at the limit, it can be stated that even the purchase process itself has changed due to this technological evolution, giving rise to the ROPO effect (Dionísio, Rodrigues, Faria, Canhoto & Nunes, 2009).

The companies who actually play digital transformation are creating a strong bond with customers, resulting in engaged customers. And even so, customers are: six times more likely to try/buy a new product or service from their preferred brand; four times more likely to start referring the brand to friends, family and network; two times more likely to make a purchase with their preferred brand, even when a competitor has a better offer. In the digital world, firms are recognizing the huge power of the Internet as a way for co-creating value with customers. They are excited for new formats and ways to communicate and interact with friends, family and government, at school, at work, at everything that is connected. They shifted from "consumer" to "prosumer," increasingly stimulating communication by embracing the use of new technologies to communicate, learn, evaluate, buy, and sell (Ritzer, Dean, & Jurgenson, 2012). But, this concept of "prosumer" is not a new word from digital era, Toffler (1980) defined prosumers as people who produce some of the goods and services entering their own consumption. In his book, The Third Wave, the author argues that consumers are a phenomenon born from the Industrial revolution, as the number of pure consumers declined, they were replaced by "prosumers" – those who produced their own goods and services. The essence of being a prosumer is prefer producing one's own goods and services. Progression from traditional marketing to digital marketing happened abruptly for most businesses, especially small and medium-sized businesses.

From Relationship Marketing to Customer Experience

Defining a relationship marketing strategy is being leverage by new tools and digital mechanisms. The process is that:

relationship marketing is to identify and establish, maintain, and enhance relationships with customers and other stakeholders, at a profit, so that the objectives of all parties involved are met; and this is done by a mutual exchange and fulfilment of promises. (Grönroos, 1996, p. 11)

One of the major driver of digital transformation of any company is the customer experience (Solis, 2013). Meyer and Schwager (2007, p. 118) argue that "customer experience is the internal and subjective response customers have to any direct or indirect contact with a company". Customer relationship management (CRM) is the process of identifying the company's best customers and maximise the value from them by satisfying and retaining them. From a historical perspective, in its initial concept (between 1960 and 1970) it was sought to understand the decision purchasing process, accepting it, as a repetitive and purely rational process. From the 1970s onwards, elements such as customer perceptions and attitudes about the consumer experience, and how they influence customer satisfaction and loyalty, were added to the same process, planting the roots for the CRM. Since 1980, services are gaining more importance and come the need to evaluate them through the identification of essential elements for their success, arising for the first time the need to map the client's journey, betting on relationship marketing with

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CRM programs (2010s). The use of these programs made it possible to detect specific elements of the customer's journey, allowing an immediate action, placing the customer in the centre of all decisions. According to Schmitt, Brakus, and Zarantonello (2015) every service exchange leads to a customer experience, regardless of its nature and form, so it's indispensable planning a customer experience.

Digital transformation and digital customer experience in most of the cases go hand in hand through the businesses. The suitable management of customer experience can turn customers into advocates, states a long-term competitive advantage and profitability can be reached (Smith & Wheeler, 2002).

Lemon and Verhoe (2016) claim that customer experience can be viewed from multiple perspectives: from the customer's point of view (Schmitt, 2011), from the firm's point of view, with the firm essentially designing and crafting an experience for the customer to receive (Stuart & Tax, 2004); or from a co-creation perspective, in which the customer experience is deemed a culmination of a customer's interaction with other actors in a broader ecosystem, while recognizing the customer's role in the co-construction of the experience (Chandler & Lusch, 2015).

Actually companies recognized the role of customers in the experience and value co-creation between all parts, considering the customer engagement as the most important fact in this marketing era. Since 2010 customer engagement concepts become more relevant to predict or explain specific consumer behaviours related to loyalty and satisfaction. The concept assumes greater relevance, in contexts typified by highly dynamic consumer experiences, often interactive, and co-created by companies and consumers. Involving the client through their active participation in delivering experiences between the two parties produces a positive relationship, becoming a revenue-generating source throughout the client's life cycle (Hollebeek, 2015). Any exchange between a company and the consumer, translates into an experience for the client, regardless of its nature and form (Schmitt, Brakus, & Zarantonello, 2015). Consumer experience must relate to customer engagement as it is a creator or destroyer of value through its influence on online social networks, word of mouth, and referrals between consumer groups (Libai, Bolton, Bügel, De Ruyter, Götz, Risselada, & Stephen, 2010).

Digital channels have been introduced as an essential part of marketing and communication plans to promote brands, products, and services through websites and applications, seeking to provide useful and value-creating experience. Sharing experiences has become more natural with the advent of new technologies, especially the Internet and the progress of mobile devices along with exponential growth of social media platforms like Facebook, Instagram, Whatsapp and others.

With this openness to markets, competition has increased in all areas. There is a need for companies to involve the consumer in their activities and for this, he decides to map his route in order to develop the contact points necessary to involve him in a unique and memorable experience, whether offline in his products, services, and stores, whether online on their websites, applications and social media profiles, always engaging with relevant content and the correct touch points. Searching, buying and selling products or services, and even information, over the Internet becomes mainstream, and ecommerce develops on this ground.

In the current retail environment, as in other environments, online is gaining increasing importance in the consumer dispute, through the existence of a larger number of stores in this format and may even increase satisfaction and loyalty, functioning as a customer retention platform (Zhang, Jie, Farris, Irvin, Kushwaha, Steenburgh, & Weitz, 2010). The suppression of time and place, interactivity, and adaptation to the behaviour of all the actors in the sales process, in real time, explains the success of this channel. Sales through e-commerce totalled more than $1.3 billion (2014) in 2014, being $2.3 billion in 2017 and plan to be over $4.8 billion in 2021. This rapid growth requires companies to adapt quickly, either

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

because the market is increasingly global and with more competitors, or because of the users' desire to achieve greater customer experience from brands, through all the touch points.

Customers are changing the way they connect with brands and buy products and services on this technological era. They are using new devices and channels in the so-called purchase funnel, and according to Rapp et al (2015) due to this, brands have much less control of the customer experience trough the journey. This control of the journey touch points has become more gradually complex for companies, and requires firms to incorporate marketing, information technology, service operations, logistics, human resources, and even external partners, in creating and delivering positive customer experiences. Market leaders and early adopters have already embraced the shift, and creating a strong experience is now a leading management objective for companies like Google, Ebay and Amazon who start creating job positions like chief customer experience officers or customer experience managers responsible for this customer centric goal and for designing the customer journey mapping. This journey is becoming more complex because new customers, like the millennial, now interact with brands through numerous touch points in multiple channels and media. They have 3 key mindsets: the know me (expect that firms know their desires, needs and preferences); the Empower me (want to interact and to buy what they want, wherever they want, whenever they want trough their devices); and the Wow me (they want to be surprised with an excellent service and products that anticipate their needs, and they want to share it with their network). Prioritizing the customer over the product is where more companies are, and a good customer experience is essential. But it requires a constant search for ways to adapt communications with the customer journey. The static PDF bills, functional website or electronic payments are not enough to satisfy consumers. A bigger level of personalization is needed to surprise and engage them.

PART II: TRENDS AND TOOLS TO DEVELOP CLOSE RELATIONS WITH CUSTOMERS

Trends in Customer Experience Journey

In this next section is presented a broad view concerning some of the most emerging trends and experienced tools. As we state, digitalization is increasing the significance of customer care in acquiring and retaining new and actual customers. To face this scenario, customer care teams are promoting new technology tools to enable their service teams to engage with customers on web, mobile, social channels and leverage cross-channels. Below is listed some trends that companies can observe and use aimed at mapping the customer journey for creating a worthy customer experience:

1. **Responsive Design in all Digital Touch-Point:** Because customer can use smartphone, tablet, or other device like smart watches and should be able to navigate, search information, use and make transactions in a secure and useful mode. Every piece of content must shape to the proper device and give the best user experience in every browser. The browser issue should not be responsible for having a poor experience. Companies must adapt to the different web browsers regardless the user location and language option. Companies should not emphasis the omnichannel but focus on delivering a unique response regardless of the channel the customer is. This means that this experience must be transcend to all business process, from top to down and right to left.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. **Original and Adjustable Content:** Consumers want original, organized and interactive content to consume and share in multiple ways. This mean that companies should be ready for users that want to re-publish this contents in various formats, like blogs, forums and social media profiles.
3. **Search Engine Optimization:** Or search engine optimization is the process of making a website more visible to search engines like Google, Safari, Yahoo! or Bing (each with its own algorithm) so that it appears in the first results of this research on predefined themes, through on-page (internal) or off-page (external) optimization, generating more traffic and conversions (Fishkin & Høgenhaven, 2013). SEO is defined as an organic and free technique of positioning the website (the natural ordering of pages is not possible to be purchased). Authors like Jerath, Ma, and Park (2014) report that 95% of all searches performed on search engines are organic links, and that consumers search on average for 2 to 3 pages of results. An optimized site is more likely to appear in early search results (higher PageRank) influencing its success (Zilincan, 2015). To achieve this positioning in the first places, SEO managers manipulate more than 200 factors that influence the navigation algorithm, among which: creating a website with a user-friendly design, fast, intuitive and organized information layout; a structure of domains and url's correct, without navigation errors or broken links and with included metadata; existence of a map of the website; alt attributes in images and other elements, with terms that identify the site in question; keyword density, and use of keywords in elements such as body text, titles, descriptions and files; link building; have relevant content that provides a correct response to searches conducted by Internet users; and submission to search engines (Davis, 2006). There is a set of tools that can be used to measure and optimize these processes, such as Woorank, Pingdom, SEMrush, Google Analytics, Google Tag Manager, Google Optimize, and Experiments, among others, that can be tried for free (BackLinko, 2017).
4. **Online Advertising:** The Internet, as has already been said, has changed the way users look for and generate information. The volume of data increases day by day, and it is necessary to organize them so that consumers can find what they are looking for. Search engines took on the role of intermediaries, and they also started selling information, data, ads, matching advertisers and consumers. There is a new phenomenon in purchasing behaviour, the ROPO (Research Online, Purchase Offline) effect in which consumers search for products online and then buy offline, changing their research habits (Figueiredo, 2015). The search engine advertising or advertising in search engines came about around the year 2000 when Google launched a tool called Google Adwords that revolutionized the company, and the online advertising industry itself. This tool uses the keyword concept and is divided into 2 formats: Search and Display ads (banners on Google partner sites such as Youtube) running on computers, tablets, and smartphones. Consumers, when conducting a search for a particular keyword, receive a set of sponsored results allowing companies to advertise their services, products or content (Jansen, 2007). Unlike SEO, here the ads have a cost that can be evaluated by PPC (pay per click), CPC (cost per click) or CPM (cost per thousand impressions) always working in an auction scheme where the advertiser sets a value maximum for the ad.

In addition to the bid value influencing the position of the ad, Google always takes into account a quality score, aiming to improve ad positions and reduce costs. This index consists of elements such as account history, ad performance, the importance of keywords, geographic information, devices used, relation to, the landing page among others (Langville & Meyer, 2011).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

5. **User-Friendly Purpose:** User experience must be one of the priorities when companies design her own experiences. The true experience goes far beyond offering customers what they say they want, or providing a check-list of features. Interfaces with bad design have significantly more costs due to hard execution and time consuming for both parts (sometimes it even requires long training periods) and, for sure, a poor experience. For designing customers experiences some professionals use personas to establish a set of consumer profiles.

A Persona lies in the elaboration of a fictional character, with its own name, characteristics, needs, desires, motivations and illustrative environments of a group of consumers, based on actual data collected from existing clients or market insights. Personas contribute to the optimization of the experience because it is a consumer-centric element; it is elaborated in its image, defining the channels that he uses in the customer journey. According to Pruitt and Adlin (2010) this tool has been incorporated in the design of experiences for the consumer. Questionnaires, personal interviews, field observation, among others, can be techniques used for the elaboration of the Persona, searching for references, specific vocabulary, gestures, discussion points, emotional triggers, styles of clothing, music, occupation, hobbies, personality, etc. In the end it becomes necessary to give a sense, a life to this whole set of data, to realize, from the consumer point of view, what is the process that can lead to the contact with the company, and possibly buy a product or service (Christensen, Anthony, Berstell, & Nitterhouse, 2007). In terms of online shopping behaviour, it is necessary to identify elements such as: what words, terms or research topics, what electronic equipment they use, what browsers they use, what time they search: what formats they like most (video, podcasts, info graphics, articles, whitepapers, audio blogs) to determine what kind of content they are looking for (Nielsen, 2014).

6. **A/B Test:** first introduced in 1908 by William Sealy Gosset as Z-test, they are suitable for comparing, under strict conditions, normality and a known standard divergence, having first been used in the online world by Google in 2000 (already recognized as A/B Test) to determine the number of optimal results to be presented in a search engine, but it had a catastrophic result, as it considerably increased page load time and turning the customer experience, worst! However, in 2011 it was already a success, having Google performed more than 7000 tests successfully. According to Chaters (2011) these types of tests have two versions of the same item (for example a landing page) called A and B, one being the control (A) and the other the controlled experiment (B), using a different variable for analysis, which can be: colour, layout of an element such as page header, action button, differentiated offers, amount of text (short vs. long) position of a given piece of text, price of the different product, and then delivering that content to the consumers, randomly through a division that can result in a 50/50, 20/80 or other percentage according to the purpose, and then observe the results. Through these results, the company can choose to change its version in order to increase its performance and improve the user experience.

Chaters (2011) identifies another version of these tests, called Multivariate Test, where multiple versions with multiple test elements of the control version are applied, being more complex and requiring the implementation of JavaScript code in the pages to be controlled.

Kohavi and Longbotham (2015) present in their work a case study conducted in a controlled environment in the Bing search engine, where a difference in the advertisement they published by modifying a link directly to the general site (A) for a set of links directly to each service (B) generated revenue in extra

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tens millions dollars, due to the greater acceptance of version B. Chopra (2010) refers to several examples: 37signals decided to test a new header (B) on its page price, highlighting the offer of 30 days of free use in all accounts, resulting in an increase of registrations of more than 30% to the version without offer (A). In Care Logger's case, changing the colour of the newsletter subscription button, from green (A) to red (B), resulted in a plus 34% (B) conversion. Sony used the Optimizely tool (nd) for an A/B/C test on a banner (A) of their products, featuring two variations of the original version: the first (B) focused on the campaign objective (computer customization) and the second (C) focused on the promotional part (referencing the temporary offer). The results showed that the first version resulted in a click-through rate increase of 6%, as well as 21.3% of users who came to the shopping cart page against the original banner. The second version still had a click-through rate of 1.8% but with a conversion of less than 2.9% over the original. Having said this, Sony opted for version B, given the higher conversion rate. This use of A/B testing is based on the assumption that sometimes professionals in the field understand that their ideas are good for their clients, and most of the times they are not. According to Kaushik (2006) 80% of the time, these managers think they are correct about what the consumer wants, but deep down they are wrong. So, this A/B tests are a useful tool for companies to test their products, services, promotions, communications and others versions with analytics data to confirm their choices.

7. **Shift From Engagement to Experience Using Analytics:** Digital transformation brings some analytics tools to companies and professionals to use, to get a better customer experience. They can track every click, every contact with a touch point, every action related with that product or service. All this data helps to understand the relevance of the customer journeys and give insights that validate decisions. Digital world is a data world, and analytics assists managers shift from engagement to experience. It can be use to deliver real time experiences and to create personalization in the exact context, increasing relationships by delivering bigger relevancy at the right moment that reinforces customer loyalty and adds to brand authenticity
8. **Transparency Policy:** Users can find who did what or look at anytime to something they had written or done, like a complaint, in a easy way, without barriers. This step strengthens compliance and a positive relation with the corporation.
9. **Social Media:** Social Media had a huge growth in the past 10 years. People spend more and more time on social networks, looking at Facebook, we can see that is one of the networks that have achieved more success in the last decade with more than 2,13 billion users (1.40 billion daily active users) that spent about 20 minutes per day, making it a showcase for any business and an excellent online communication tool (Weforum, 2018) if it were a country it would be the 1st in the world, bigger then China. This social network, as well as YouTube (+1 billion users), Whatsapp (1.20 Billion users), Instagram (600 million users), Twitter (317 million users), Snapchat (301 million users and Linkedin (106 million users) allows a huger brands visibility and notoriety in a global scenery allowing the entry into new international markets, a new clients opportunity and the creation of a two ways communication channel. But this bilateral communications brings along the new opportunities, new challenges. Companies must adapt to the different kinds of the distinctive publics that interact with. According to Chen et al (2017) social media can give the stimulus necessary for a purchase, online or offline, because consumers are using it to get information to assist them in the buying process. Different information from distinctive social media channels might be critical in driving consumer's behaviors and perceptions when they buy online and help them to be less vulnerable to potential offerings offline.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ever then ever, people are online, and they are buying more and more, but its necessary to understand what are Social Commerce and Ecommerce. They are distinctive but both are on this digital transformation, and can, should, be used by companies that want to be leaders in the actual market.

Social commerce is one of the most important piece in this digital transformation because involves offline and online backgrounds. Social commerce is a way of commerce that uses Social Media where users can give product recommendation to a friend, a review, enter a discussion board. This environment promotes social knowledge and experiences that support them on the purchase process decision. Ecommerce relies in surrounding factors like the quality of the market place (like website design, website speed, reliability, information relevance) or the product or service value.

Goals like establishment a strong network, sharing information and collaboration are the Social Commerce primary focus, shopping is second. In Social Commerce users interact with others users, sometimes creating communities around one brand, and they can express feeling and information with each other's. Ecommerce focus on sales by optimizing strategies like one-click buying and using some analytics data from past shopping behaviour from customers delivering virtual catalogues, recommendations and refined searches. Usually consumers interact independently and typically in a one-way direction without sharing information with other customers (Shanmugam, Sun, Amidi, Khani, & Khani, 2016).

So what companies could do? First they need to understand how to communicate with their actual and potential clients. They should assign more resources to creating forums and communities to put, and to gather, relevant information. With 90% of online consumers reading reviews prior to purchase and about 83% believing that online reviews influence their decision-making, turned Online reviews as a valid resource information, so companies must control the ratings and reviews on their own channels, like websites and social media profiles, or exterior platforms like Yelp, TripAdvisor, Amazon, always in a factual and responsible way.

Tools to Develop Close Relations With Customers

In this next section we present a selection of some of the best tools to improve the customer journey satisfaction in digital era.

1. **Live Chat:** This is one of the best ways to get instant communication with a company and strength the relation with the target – it the highest satisfaction rates among customers. According to study – US Wireless Customer Care Full-Service Performance (2013), the online chat feature has become the leading contact source, as 42% of full-service customers indicate using a live online chat feature vs. email (23%) or other social media forum (16%). Moreover, online satisfaction is highest among customers who use the chat feature. For customers, the main convenience is that they can continue browsing and chatting while viewing online contents. On the other hand, for companies, live chat operator will have direct access to each customer's history and many other helpful tools. With access to better tools, companies are able to provide more relevant and efficient support to customers. Customers are more demanding and typically, they want to have answers and help right away, when they are in the middle of a transaction, for example. But, even before engaging with live chat, having "Live Chat" button at the website, enhance confidence. Customers like knowing that they can get immediate help at anytime. Using live chat as a tool to support and engage with customers is a "win-win" relation for both customers and companies. "According to a poll by

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Andersen Consulting, almost 62% of Internet consumers said they would purchase more products online if live customer support was available."

2. **Instant Messages - Use of Messenger Apps:** With cheaper handsets, more affordable data connections reaching further around the world and with mobile-oriented services like WhatsApp, WeChat and Facebook Messenger, we can see that mobile is increasingly dominating the digital world. Our digital behaviour is now converging around mobile devices. There has been an intense shift in the way customers want to communicate with brands and companies - they want the interactions to take place in their lives in a flexible and casual manner. With 85%, instant messaging, is the most commonly performed activities online and is becoming more important with more options like sending money to friends, order a taxi, pay for purchases, renew passport, book medical appointments, order food delivery, read web articles and news, donate to charity, pay municipal charges & fines, play games and to communicate with everyone trough the app.

This is important for companies because through more active communication with visual elements such as text, images, videos or audio, these can increase its effectiveness thus providing better customer service. Companies can use these applications to interact with their customers at all times of contact during the customer journey and in real-time with low cost budget. Even for international communications, this is a better choice because of roaming taxes and others costs associated with the service. With more than 465 million users Whatsapp has becomes one of the preferred instant messaging app. Another important facts, according to Aberdeen's CEM Executive's Agenda 2017, it says that 1.4 billion people around the world send over 80 billion messages each day to communicate with one another. In addition, WhatsApp and Messenger have over 1 billion monthly active users each and WeChat around 900 million. Messaging as a conversation and interaction interface has fundamentally shifted how we communicate with one another, and it is about to shift how people communicate with your company.

3. **Skype Video Call:** It was launched in August 2003 and has over than 4.9 million active users daily (Digital Marketing Ramblings, 2015). Originally, Skype's name was intended to be Sky Peer-To-Peer, and later, developers decided to named it Skype (Price, 2011). Skype was founded in 2003 by a Swede software writer Nicklas Zennström and Dane Janus Friiswhose in cooperation with Estonian group (Ahti Heinla, Priit Kasesalu, and Jaan Tallinn). In 2006, Skype developed the new function - the Video calling - that allows communication between users all over the world with a low delay (Xu, & Yang, 2013). The feature video is growing in popularity as a mainstream channel, and Skype can give to businesses the edge to offer a better customer experiences in real time. This tool can dismiss the resistance that some customers have with technology, because it allows them to speak and see someone that is real. In August 2017, Delta Air Lines introduced video chat as part of a their customer service strategy and starting with a test at Ronald Reagan Washington National Airport. They placed five kiosks with "interactive screens" and phone receivers have been arranged to allow a two-way conversation with Delta operators about flights and reservations. However, there are some others platforms providing video chats with calls to support customers. Video chat is becoming central and strategic to companies. Around 400 million people use Facebook Messenger each month to make voice and video calls, while WhatsApp's 2 billion users are making over 55 million video calls a day. WhatsApp recently announced that WhatsApp users are spending a lot of time on video calls, and 1.2 billion users are spending more than 340 million minutes a day making more than 55 million video calls.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. **Chatbots:** This new feature is a conversational operator which conducts conversations via text or voice commands and its main purpose is provide content, give assistance to a purchase or simply connect with customers. It's clearly a marketing tool to boost customer engagement. These applications are very useful to perform basics and standard tasks and to start a communication with the customers. They will progress in the future, as the Microsoft CEO Satya Nadella recently stated that "People-to-people conversations, people-to-digital assistants, people-to-bots…that's the world you're going to get to see in the years to come". According to a study from Gartner - an American Research Consultant Group, artificial intelligence will amount for 85% of customer relationships by 2020. For Will Wiseman, chief strategy officer of PHD U.S., "Chatbots will replace the search window". Is important to notice that this service seems particularly suited for the new generations like Millennials and Z's, who grew up using all of these on-demand technologies in the day life.
5. **Bot's Integration:** Each smart device is able to smartly communicate with other connected things and make concerted decisions due to the user data accumulated. Software robots like Bots use natural-language processing to interact with users based on deep-learning pattern recognition. Devices like Amazon Echo with their virtual assistant Alexa are selling millions every year and companies must realize that this is a new way of ordering and getting information. Alexa is a virtual robot that can listen and react to user voice command. She can order toys, music, food, toilet paper and other products and services, she can answer to user questions, control other devices like air-conditioned, windows and lights and even record the sound environment. These open exciting opportunities for selling to customers in this virtual environment because of the nature of the user perception.

According to Purington et al. (2017) they are particularly relevant because Alexa has a human generated voice and users love this feature and feel a stronger social presence when they communicate with this machine-generated profile. Another great example, the tech giant Uber, has integrated a bot into Google Maps features. This bot knows where you want to travel and show the ride option without the need to download the app. And more, it also integrates the bot into social media via FB Messenger.

6. **Emoji and Stickers Power:** The actual communication process goes beyond simple speech or writing, as it is known that there are other ways of conveying a message. In the age of the Internet and the digital world new forms of communication have emerged in recent years through the use of graphic elements called emoticons, intensified through MSN Messenger. According to Pompeu and Sato (2015) the emoticons were developed in platforms of dialogue in which the text calls the form of interaction as a way to compensate for the absence of the physical person at the moment, thus adding some emotionality to the moment. Currently emoticons multiply themselves in elements like stickers, gifs, memes and emojis, considered in 2015 the word of the year by Oxford Dictionaries. At this moment, a total of six billion emoticons or stickers are being use around the world every day on mobile messaging apps. Companies have slowly adopted this type of communication, but it is now possible to verify their use in systems for evaluating the quality of service through POS machines, voting products or services through social networks such as Facebook where the user chooses his/her preference through an emoji, through online satisfaction surveys, or through online communication systems.

PART III: CHALLENGES FOR THE FUTURE

Issues, Controversies and Problems

Consumer buying behaviour, something addressed since the beginning of the twentieth century, has changed, and the current consumer lives in a digital world, seeking for meaningful experiences and not just the simple acquisition of products or services. Sharing experiences has become more natural with the advent of new technologies, especially the Internet and the progress of mobile devices. With this openness to markets, competition has increased in all areas. There are a lot of tools, software's, platforms, devices, but there is no one-size-fits-all solution for companies that wish to implement a digital transformation approach. Perceptions of experiences and customers' expectations are a complex and diverse subject. In order to create the conditions for improved customer experiences in digital era, company culture is at least as important as strategy. Depending on the customer's context and expectations, a customer experience can create or break a business relationship.

Another important issue is that cultural change is the top barrier to implement a digital transformation process worldwide (McCuaig, Enright, Rossi, Macdonald, & Hansen, 2016). According to Chris Davis, a member of Russell Reynolds Associates' Digital Transformation Practice says:

Digital transformation's greatest barrier is organizational ambiguity. Many companies are struggling to coordinate the roles played by core digital teams, IT, and marketing. Successful digital strategies require an integrated approach with clear delineation of governance and decision rights, and the institution of joint metrics across shared areas of oversight. (Kane, Palmer, Phillips, Kiron, & Buckley, 2015)

Also digital transformation can fail when leaders start creating new competencies and forces them to integrate into an organization with strong legacy cultures and complex operating models (Libert, Beck, & Wind, 2016). All the business perspectives must be integrated.

Is being crucial for companies to manage the customer experience across various digital touchpoints with a consistent customer experience and value creation. Thinking about tools to manage the customer relationship, some businesses have products and services that match best with email support, phone support, or other traditional support channels.

For example, a live chat platform is perfect for most, but it's not a good fit for everybody. Older generations in some countries, for example, will probably prefer typically a phone call when they have a problem instead of starting a live chat. Businesses need to really know their customers habits and what type of support best fits their needs. This maybe is the principal challenge that companies face when deciding which tools fits better the market and knowing their preferences is ambitious. Is also needed to look for cultural issues and social/physical interactions that characterize people. Traditional channels, like the phone and email, still play an important role in customer support operations. However, these traditional channels normally require that consumers start the contact and wait on the line for the resolution. By contrast, instant messaging allows customers to send a message to an organization and receive support in real time, without "holding" the line.

Some of the tools mentioned are still improving their features in terms of innovation and disruptive approach. For example, Microsoft did not make initially Skype for Business to work as a contact centre solution. Specifically, it lacks the multichannel capabilities required to control resources in a modern contact centre, the interface purpose and reporting capabilities need improvements.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Are all these new tools that separate people from social relationships?

We are social human's beings and this is an intrinsic characteristics from the nations, but some of them have more ability to be technological, but deep in the question, we need to move forward and keep abreast of innovations and the benefits to the market and business. For example, chatbots are beneficial for both parties: implementing a chatbots is cheaper than training and hiring a human customer support, and customers often prefer to start a mobile interaction over talking with someone, holding the line in call center. In fact, chatbots are incredible efficient for users and brands, mainly because they cut costs for companies, decreasing interactions with traditional call agents and they are easy to use and more convenient for customers, streamlining interactions. But, it always depends on the product but more important it depends on the type pf customer. The Canadian mobile messaging app *Kik* reports that 60 percent of bot users are between 13 and 19 years old, with more females than males, clearly the Millennial and Z generation. For Generation X, with members that are not digital natives, it remains much harder to target with chatbots.

In the case of social media platforms, things may get trickier. Customers can use their own social media and talk about their bad experience and this can reflect negatively on the business and modify the impression of the brand on the market. The best thing to do in this type of situation is to professionally manage the company social media account regularly, understand customer concerns and reply to them with appropriate answers, in the shortest time.

Websites were originally designed to increase the company's presence on the Internet but were often overlooked in annual communication plans. The website were implemented and later updated in terms of design and sometimes content. Currently the website is seen as the centrepiece of a digital presence strategy functioning as a channel for sales, communication and distribution of relevant and meaningful contents for the consumer, and even for internationalization.

To fall into the drafting of a website is often to miss the opportunity to increase awareness and sales through this channel. We have seen in a number of business sectors a neglect of this medium, perhaps because of its lack of potential or lack of capital to invest. However we believe that companies should invest in this field because of its potential. This can be a great way of people getting information and establish relationships with the company staff and others clients, creating sometimes events in physical facilities where people get to know who's behind the platform. Digitalization doesn't mean isolation or breaking true relationships and going for virtual relationships. We believe that this could be a natural process and with good sense, everything can coexist in the same place.

Solutions and Recommendations

With the advent of new technologies, especially the Internet, and the progress of digitalization, competition has increased in all areas. There is a need for companies to involve the consumer in their activities and for this he decides to map his journey in order to develop the touch points necessary to involve him in a unique and memorable experience, whether offline in his products, services and stores, whether online on their websites and applications.

To empower the relation between customers and brands/companies is important to reshape how companies collect data from customers and all the metrics and analysis that need to be done. Companies must invest in CRM solutions and collect all the correspondence, customer history and habits to offer a consistent customer support. Is also important to invest in staff training and personal skills to deal with customer's issues. Another thing is related to cloud solutions when concerning to be agile and meet

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

customer demands in real time, and also update the latest tools features. Companies must consider having an omnichannel strategy and approach, considering how to tie all the digital channels and front-offices in order to provide a consistent and user-friendly customer experience.

Corporate culture must integrate these digital points, adapting their solutions, and training their professionals, to the challenges that new technologies pose daily, by offering an integrated solution and focused on the total satisfaction of their current and potential clients. The focus should not be 100% on the technology but on the consumer behaviour, that today is more digital than ever. With new customer's behaviours, there are new products and services, and new ideas in action. This mean for us: Innovation, and sometimes this means investment and companies should have this in mind. There are always the two sides of an innovation and the pro and cons must be analysed from the point of view of the company and the customer, the real benefits. But companies that don't innovate, usually don't grow at the same pace of the markets needs and this could be dangerous. Companies who don't want to integrate this digital era are becoming more exposed to the market and prosumers. Corporations should start for looking solutions for customer's behaviours and this occasionally means cooperation and working with another companies from, or out of, the sector where they are in. Sometimes for going abroad, these alliances can give more dimension and capacity of delivering and producing the goods. Sometimes it means an online platform than can serve everyone interested like www.marcasportuguesas.pt that has all Portuguese brands in one place.

Companies can also aggregate know-how from all the departments and partners to develop a combined solution and use digital tools, like Basecamp or Slack, to communicate and discuss ideas. And sometimes these solutions are freemium so companies can try and evaluate this approach.

The digital transformation and the customer experience must be supported at an executive level. That is the only way to succeed, which requires strong collaboration from all company leaders and departments. We also advice that not only technology, digital tactics and IT tools drive to a successful digital transformation, leadership and strategy are core concepts. Is necessary to clearly define the business direction, organization's vision, digital strategy, digital culture and a broad roadmap. Afterwards, to use the tools to support your approach to the market, the recommendation for business is simply: try it. Given the easiness of implementation, and the cost, of some of the tools covered in this chapter, this will be the best option. New solutions are emerging on the market at competitive prices that justify, at least, the consideration of their use. Digital brought a huge set of metrics that can be used to verify the return of some action, being this one of its main advantages. Trying should be the watchword in current companies led by managers who are risk averse and willing to innovate. This may be the best solution for the topic covered in this chapter. And there isn't a good moment to start, because everything is moving. So start today, starts now.

Companies need to implement a strong CRM process and build a common system of customer information or a single integrated digital platform to store data and knowledge. CRM solutions can reduce the communicating costs with customers, optimise work flows as a result of integration with other data systems, and facilitate the market segmentation and leverage customer interactions, relationship and personalisation opportunities (Adehanjo, 2003). The major benefits of CRM is to link every operation in a business that can positively affect the customer experience.

Companies need to take risks and learn from mistakes in order to keep up. So, we strongly recommend any company or organization to bring the customer experience to the early stages of the implementation of a new tool. Give to all stakeholders, including the customers, the opportunity to see, touch, experience and use the new touchpoint so they can provide feedback and get involve. This should be done several

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

times before the new tool or device is ready to go to market. This will ensure a very good customer experience and reinforce the customer commitment.

We also advice companies to have consistency across tools and processes to offer a successful customer experience. It's crucial to consider not only the different interfaces and digital touchpoints, but also the user's motivations and goals. Also, the power of a digital transformation process is related not only to digital tools but, mainly with scope and objectives. Sometimes less digitally companies tend to focus on individual technologies and have strategies that are particularly operational in focus. Digital transformation in most organizations must be developed with an eye on first transforming the all business.

CONCLUSION

Although experience is something transverse and everywhere, this field of customer experience in contemporary management is still a recent development.

The actual consumers are highly mutants with quickly transformations and always seeking the most appropriate solutions for their needs, often in real time. Digital evolution has introduced new hardware and software that has transformed the current way of living.

In today's fast-moving business environment, people are always connected and companies are forced to seriously consider implementing a digital transformation strategy to take advantage in the market.

When they connect to the online world, their lives change and they immediately begin to leave their digital footprint. This footprint allows organizations to use one of the greatest weapons ever: information. Compiling, managing and adapting all these data is a procedure that can bring voluminous results, allowing the experience customization and contact trough different channels.

Digital transformation offers organizations an opportunity to engage and reinforce customer experience and deliver value regardless of channel or place. Is crucial for companies to implement the digital transformation, as it is hard to have a great customer experience without an on-going digital transformation process.

And, sometimes more important and urgent is not the front-end experience, the design, the app to have a great customer experience, is the company culture to deal with the challenges and society transformation. Companies are made of human, and interactions between them, so first of all, companies should know who are their customers and define which tools best suit their preferences and which digital trend they are facing. Customer care teams should not make the mistake of waiting for stability or to see others companies strategy. Leaders must develop and continuously look forward for new opportunities.

Many say that this will be the Future; we believe that this is already the present. Disregarding these consumers characteristics, is to ignore reality and, consequently, to fail.

Building a good experience today is one of the greatest challenges for all professionals in all areas. Today the consumer can destroy a brand through online and new technologies, but can also leverage and generate high value for it.

Today, brands have to work together with consumers; they have to listen to them, to talk, to establish a strong relationship to gain recognition. The tools discussed in this chapter are essential to generating this relationship over time. This part of the chapter is called "conclusion" but we think that this is the "beginning" for a new way of management and methods of doing business.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Digital transformation is a key issue, a very complex process that leads many business leaders to uncertainty. It is advisable that leaders fight through that and take solid steps to go through the culture, processes, and technology that will enable their business to compete in the digital age.

The author's perspective for this future work is to go deep in the subject, conducting an exploratory research to explore the motivations and drivers to use the tools presented in the chapter from the customer length and to compare with companies length. The goal is to find common touchpoint and different perspectives from this important players in the market – companies and customers and how digital transformation is taking part from strategy to customer experience.

KEY TERMS AND DEFINITIONS

Chatbot: Is a computer program that attempts to simulate the conversation or "chatter" of a human being via text or voice. A user can ask a chatbot any question or make a command, and the chatbot responds or performs the requested action.

Customer Experience: The entirety of the interactions a customer has with a company and its products. Understanding the customer experience is an integral part of CRM. The overall experience reflects how the customer feels about the company and its offerings.

Customer Focus: The orientation of an organization toward serving its clients' needs. Having a customer focus is usually a strong contributor to the overall success of a business and involves ensuring that all aspects of the company put its customers' satisfaction first. Having a customer focus usually includes maintaining an effective customer relations and service program.

E-Commerce: Is the process of buying and selling products, services and even information over the internet, between business-to-consumer, business-to-business, consumer-to-consumer, or consumer-to-business.

Online Advertising: Use of internet as an advertising medium where promotional messages appear on a computer screen. Since the communication software (browser) reveals sufficient information about the site's visitors, online advertising can be custom-tailored to match user preferences.

Search Engine Optimization (SEO): Refers to the process of improving traffic to a given website by increasing the site's visibility in search engine results. Websites improve SEO by improving content, making sure that the pages are able to be indexed correctly, and ensuring that the content is unique.

Transformation: In an organizational context, a process of profound and radical change that orients an organization in a new direction and takes it to an entirely different level of effectiveness. Unlike 'turnaround' transformation implies a basic change of character and little or no resemblance with the past configuration or structure.

Chapter 96
Transhumanism and Innovative Leadership:
A Question of Quality

Ebba S. I. Ossiannilsson
ICDE OER Advocacy Committee, Sweden

ABSTRACT

Rethinking leadership at all levels is required to reach the goals of learning and education in 2030 through which learners will take the lead in orchestrating the process and manner of their own learning and in choosing their personal learning journeys. The fourth industrial revolution will continue to change the ways we act, perform, live, work, and learn. Therefore, there is a need for a social revolution that includes the understanding of transhumanism and its effects. The term "cutting edge" does not concern technology as much as it concerns humans. Accordingly, transhumanism is crucial for a sustainable ecosystem of learning with and through technology and digital transformation, which encompasses all levels of institutions—macro, meso, and micro. This chapter is focused on future trends, issues, and challenges in management and leadership as well as on issues and challenges in communication, which is essential in both leadership and smart learning.

INTRODUCTION

Transhumanism, which is often abbreviated as H+ or h+, is an international philosophical movement that advocates the transformation of the human condition by developing widely available sophisticated technologies that greatly enhance human intellect and physiology (Boström, 2005). Advocates of transhumanism study the potential benefits and dangers of emerging technologies that could overcome fundamental human limitations as well as the ethical limitations of using such technologies. Emerging technologies are those perceived as capable of changing the status quo. These technologies are generally new, but they include older technologies that are still controversial and relatively undeveloped in their potential. Rotolo, Hicks, and Martin (2015) considered that emerging technologies are characterized by

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

radical novelty, relatively fast growth, coherence, prominent impact, uncertainty, and ambiguity. They argued that emerging technologies could be defined as having a certain degree of coherence that persists over time as well as the potential to exert considerable influence on the socio-economic domain, which is observed in the composition of actors, institutions, and the patterns of interactions among them, including the associated processes of knowledge production. The predominant influence of emerging technologies, however, lies in the future; therefore, in the emergence phase, they are still somewhat uncertain and ambiguous. O'Reilly (2008) argued that emerging technologies include a variety of technologies, such as educational technology, information technology, nanotechnology, biotechnology, cognitive science, psychotechnology, robotics, and artificial intelligence. In short, the link between transhumanism and emerging technologies promises us freedom from the biological limitations inherent in our nature. It aims to enhance the physical, emotional, and cognitive capacities of humans, thus opening up new possibilities and horizons of experience.

Sisman-Uğur & Kurubacak (forthcoming) argued in the call and outline of this book, that:

[T]transhumanism must advocate the moral right to use technologies to extend individual capacities, to surpass natural limits, and to improve humans not only physically and psychologically but also educationally. In other words, cutting-edge technologies must be used to improve humans by enabling them to live longer, healthier, and more intellectual lives. At this point, transhumanists must be progressive, advocating the use of emerging technologies to improve not only human lives, including cybernetics, artificial intelligence, social networks, space colonization, cryonics, and curing aging but also human learning. Transhumanism, therefore, must be a sound philosophy by valuing scientific facts, reason, and logic above spiritual principles as well as viewing humankind as controlling its transformation and promoting rational thinking, freedom, tolerance, democracy, and concern for human beings. Improving human learning means improving the human organism so that it can transform beyond its natural and biological limits.

In contributing to this book, this chapter considers a futuristic view of how transhumanism can achieve sustainability in the context of human learning to promote human intelligence in the future. The objectives of this chapter are to emphasize the need for a social revolution in response to the influence of transhumanism and the fourth industrial revolution, which is much more than a technical and digital revolution. The fourth industrial revolution and its accompanying social revolution will change the way we act, perform, live, work, communicate, and interact with each other and society, and hence the way we learn. The term "cutting edge" does not concern to technology as much as it concerns humans. Accordingly, the influence of transhumanism is crucial in a sustainable ecosystem of learning with and through technology and digitization. The digital transformation encompasses all levels of institutions—macro, meso, and micro. This chapter is focused on future trends, issues, and challenges in management and leadership as well as on issues and challenges in communication, which is essential in both leadership and smart learning. Rethinking leadership at all levels is required to reach the goals of learning and education in 2030 through which learners will take the lead in orchestrating the process and manner of their own learning and in choosing their personal learning journeys. This chapter is informed by the author's research and experiences in this field as well as by the relevant current literature. This chapter delineates a position rather than providing case studies, although some models are presented.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the following sections, the concept of transhumanism is described, followed by a discussion of current and future trends related to the needs of transformation of education. Next, the model of substitution vs. transformation (SAMR) is discussed as well as the concepts of digitization and digital transformation. Thereafter, challenges in management and leadership related to future trends are discussed. The issues in smart learning are then discussed. The chapter ends by considering future research directions and offering conclusions.

BACKGROUND

The rise of transhumanism has become obvious during the last two or three years. One major reason is that transhumanists advocate new approaches, methods, and techniques that have influenced and will continue to influence social, political, ethical, and spiritual issues. However, there are some major dilemmas within this philosophy, and it is not clear how to identify the global values, norms, and ethics that are related to the diverse needs of learners in the digital era. Therefore, it is urgent to establish appropriate learning modalities (i.e. methods, processes and procedures) for humans in addressing future priorities and needs and to predict future issues and challenges for transhumanism in the near future.

Transhumanism is defined as the use of technology for the improvement of humans. Moreover, transhumanism is a way of thinking about the future. The transhumanist movement has developed gradually over the past two decades, based on the rapid digitalization of global society in recent decades. Therefore, transhumanism can be viewed as an extension of the concept of humanism. As a movement, transhumanism aims to improve the human body through science by constantly pushing back biological limits by using cutting-edge technologies to repair and improve the human body beyond its natural abilities, such as in learning. In this context, new and emerging communication and information technologies will be ways to help human transformation. Hence, learning about technologies, with technologies, and for technologies is one of the most important focuses of transhumanism (Boström, 2005).

This new era in human development is being enabled by extraordinary technological advances (Rotolo, Hicks and Martin, 2015). Moreover, Schwab (2017) and Schwab, Davis, and Nadella (2018) argued that the fourth industrial revolution will continue to fundamentally change the ways in which we live, work, learn, and relate to one another. It has been argued that the fourth industrial revolution concerns more than technology-driven change and technological opportunities (World Economic Forum, 2017). It must also be aligned and integrated with a social revolution. Accordingly, the digital revolution must involve a social revolution that is based on the needs of humans and how they respond proactively in this new era. Thus, encompassing both digital and social revolutions, the fourth industrial revolution will affect the ways in which humans relate, interact, and communicate with each other. In addition, it has been argued that this revolution concerns not only technological innovation but also human empathy, collaboration, emotions, attitudes, competences, and values. Consequently, because the fourth industrial revolution is aligned with a social revolution, and the transhumanism movement will radically change human habits, including learning practices, it will change the ways in which we live, work, learn, and relate to one another.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CURRENT AND FUTURE TRENDS

As argued above we stand on the brink of both a technological and a social revolution that fundamentally will alter the way we live, work, and relate to one another. In its scale, scope, and complexity, the transformation will be unlike anything humankind has experienced. Although it is not yet clear how it will unfold, the response to it must be integrated and comprehensive, and it must involve all stakeholders in the global polity—from the public and private sectors to academia and civil society (Schwab, 2017; Schwab, Davis, Nadella, 2018; World Economic Forum, 2016 2017).

The United Nations Educational, Scientific, and Cultural Organization (UNESCO) Sustainability Goals (SDG), specifically SDG4, have emphasized and fostered global, lifelong, and life-wide learning. UNESCO's mandate stipulates that education should be available to all at anytime, anywhere, and through any device (UNESCO, 2015a, 2015b, 2015c). Its SDG4 goals are designed to empower and ensure inclusion, equity, equality, and quality in education. These goals are designed to be achieved through access, democracy, affordability, efficacy, and lifelong or ongoing learning (S. Järvelä, personal communication, October 25, 2018). In brief, the SDG4 are aimed to ensure inclusive equality, equity, quality education for all, and lifelong learning.

In Europe, the digital single market (2018) emphasized the global challenges, as globalization, demographic changes, technology, and digitalization. Furthermore, the digital single market stressed that global changes include speed and scale. In addition, they underlined the importance of investing in the future and of embracing and empowering digital citizens. Although knowledge, infrastructure, attitudes, and mindsets are of utmost importance, the main issue concerns digitalization or marginalization. A different approach is to become mainstreamed to ensure a competitive Europe. This approach should, according to the digital single market, build on a "rock and roll" way of working, which means accelerating the process of marketization, forming and collaborating in partnerships, destroying silo thinking, executing all means, including "walk the talk," that is, putting ideas into action. The digital single market also emphasized the importance of freedom, diversity, user-centeredness, and entrepreneurship. Thus, solutions need to build on technological development, investment in human resources, and user experiences. Thus, any solution should be comprehensive and consumer-oriented. In January 2018, the European Commission adopted the Digital Education Action Plan, which includes three priorities and 11 initiatives to support technology use and digital competence in education (European Commission, 2018). The three priorities and the11 initiatives are elaborated below in the discussion on issues related to leadership:

Priority 1: Making better use of digital technology for teaching and learning
Priority 2: Developing digital competences and skills
Priority 3: Improving education through better data analyses and foresight

Other challenges in education and society include the influence and use of emerging technologies, such as block chain, 3D, the Internet of Things, cloud computing, artificial intelligence, learning analytics, robotization, and other developments in technology-enabled social and mobile learning (Rotolo, Hicks, & Martin, 2015). These challenges affect issues concerning transhumanism. Additionally, education is now facing a growing trend toward micro-credentials and the need for microlearning in workplaces and in continuing professional development. Hence, there are urgent calls for modern governance, as well

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

as extensive and agile university reforms with dynamic, proactive leadership and management as well as innovative and inclusive open pedagogical approaches (Digital Single Market, 2018).

The following section presents selected models to consider for the digital and transhumanist transformation.

THE SUBSTITUTION VS. TRANSFORMATION MODEL

In the 21st century, a new era of technology has been reshaping everyday life, facilitating outdated processes, and giving rise to entirely new business sectors (Schwab, 2017; Schwab, Davis, & Nadella, 2018; World Economic Forum, 2016 2017). Some common catchphrases used to refer to this era are digitization, digitalization, and digital transformation. However, they are used synonymously, and there has been persistent confusion regarding the differences between them are significant and should be taken into account in discussing the kinds of changes that business is, or should be, making. Bloomberg (2018) provided an overview. Because the excitement about the digital transformation continues, the terms digitization and digitalization have only added to the confusion. In reality, these three terms have distinct meanings depending on the context in which they are discussed. However, this confusion is more than a question of semantics. In reality, these terms are confused in ways that do not consider the power and importance of the digital transformation, thus putting the very survival of the organizations in peril. In the context of transhumanism, is it worth elaborating these distinctions.

Digitization is a straightforward term and refers to encoding analog information into zeroes and ones so that computers can store, process, and transmit it. According to the *Gartner IT glossary* (2018), digitization is the process of changing from analog form to digital form. Hence, converting handwritten or typewritten text into digital form is an example of digitization, such as converting the music from a long-playing record (LP) or a video from a Video Home System (VHS) tape. Digitization is the process of making information available and accessible in a digital format. In contrast, digitalization is the application of digitized information in practice for the benefit of humans, such as customers. Finally, in the digital transformation, digitalization is used to create completely new business concepts. Because of digitization and digitalization, data are easily accessible for use across various platforms, devices, and interfaces. The digital transformation is the process of devising new business applications that integrate all digitized data and digitalized information. Consider the example of Netflix; once films were digitized, the path was paved for a completely new business model, such as movie streaming. Films have been the biggest "game changers" in the digital transformation. Definitions of digitization, digitalization, and digital transformation are provided in Table 1.

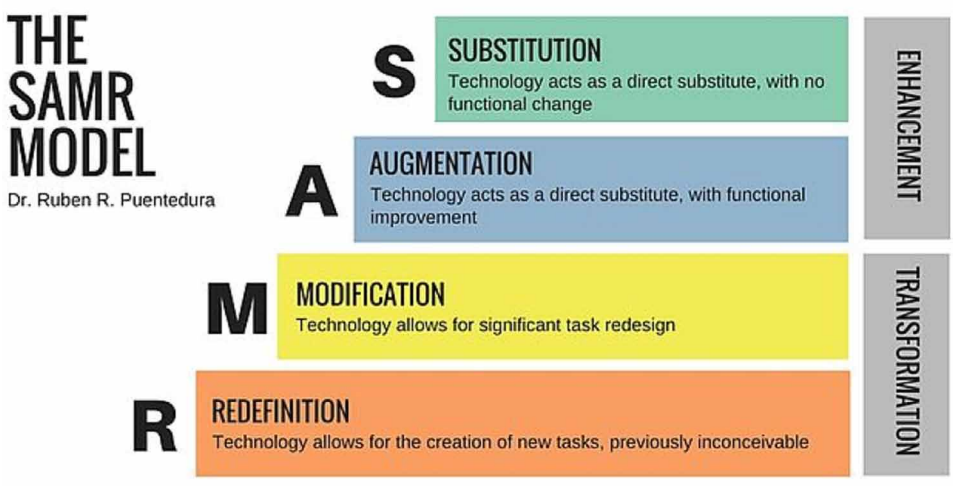

Table 1. Definitions of digitization, digitalization, and digital transformation

Concept	In short
Digitization	Refers to encoding analog information in zeroes and ones so that computers can store, process, and transmit it
Digitalization	The application of digitized information in practice
Digital transformation	Taking advantage of digitalization to create completely new business concepts

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The distinctions between digitization, digitalization, and digital transformation are more than semantic. Parallels can be drawn between these distinctions and Puentedura's (2012) SAMR model. The SAMR model is the abbreviation of the four different stages of implementing technology in education: substitution, augmentation, modification, and redefinition (see Figure 1).

Figure 1. The model of four different stages of implementing technology in education
Source: Puentedura (2012)

The four stages are described as follows: Substitution (S) occurs when technology acts as a direct substitute with no functional change (e.g., digitization is a move from analog to digital). Augmentation (A) occurs when technology acts as a direct substitute but with functional improvement. Hence, they are both correlated to enhancement. Real transformation requires modification (M), which occurs when technology allows for significant task redesign. Finally, redefinition (R) occurs when technology allows for the creation of new tasks that were previously inconceivable.

In relation to transhumanism, it is thus a question of what technology brings in the stages of modification and redefinition. As mentioned above in the discussion of future trends, the influences and uses of emerging technologies, such as block chain, 3D, the Internet of Things, cloud computing, artificial intelligence, learning analytics, robotization, and other developments in technology-enabled and social and mobile learning, influence the issues in transhumanism. Therefore, the main concerns are whether they serve as substitutions or transformations. According to Schwab (2017), Schwab, Davis, and Nadella (2018), and the World Economic Forum (2016), emerging technology will change the ways in which we live, work, learn, and relate to one another. Aligned with the social revolution, the application of emerging technology will change human habits, attitudes, communication, interactions, relationships, and mindsets. Accordingly, it makes sense not only to empower and embrace this development but also to be critical in anticipating its consequences.

Transhumanism must therefore advocate the moral right to use technology to extend human capacities, to surpass natural limits, and improve human lives not only physically and psychologically but also educationally. In other words, cutting-edge technologies must be used to improve human lives by

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

enabling them to be longer, healthier, and more intellectual. At this point, transhumanists must be progressive. They must advocate the use of emerging technologies to improve not only human lives including cybernetics, artificial intelligence, social networks, space colonization, cryonics, and curing aging, but also human learning. Transhumanism, therefore, must be based on a sound philosophy by that values scientific facts, reason, and logic above spiritual principles as well as seeing humankind as controlling its transformation. It must promote rational thinking, freedom, tolerance, democracy, and concern for all human beings. Human learning will be improved by transforming the human organism beyond its natural and biological limits. Accordingly, learning about technologies, with technologies, and for technologies must be one of the most important focuses of transhumanism. Transhumanism can radically change both human habits and learning practices. Therefore, it is also crucial to foresee that transhumanism can achieve sustainability in the context of human learning to promote human intelligence in the future. The foundation of a revolutionary transformation of human learning will be established by social networks. Thus, transhumanism must be sustainable in transforming humans in the contexts of ecological learning environments. In particular, senior management and leadership have a crucial role in this development and in agile processes in not only sustainability, policies, strategies, incentives, financing, and professional development but also in human resource-related issues and concerns. In the following section, the challenges of management and leadership in relation to future trends will be elaborated.

CHALLENGES OF MANAGEMENT AND LEADERSHIP IN RELATION TO FUTURE TRENDS

The main purpose of this handbook is to identify, discuss, and scrutinize the future trends, priorities, and needs of learning in the age of transhumanism. According to the editors (Sisman-Uğur & Kurubacak, forthcoming), the scholarship on learning in the age of transhumanism should address several issues and challenges arising from future trends, such as the following: management, communication, pedagogy, technology/computing, evaluation, and sociological/intelligent social networks. The challenges for leadership and management will be elaborated in this section.

In previous research by the Ossiannilsson (2017a, 2017b, 2018a, 2018b, 2018c), the next generation of leaders in the digital era must be in the forefront of responding to the rapid global change due to emerging technologies and to the digital explosion in societies. This need has been pointed out in the United Nations Sustainability Goals, especially SDG4 (2018), Education for All 2030, and the European Digital Education Action Plan 2020 based on the upcoming requirements of the fourth industrial revolution (Ossiannilsson, 2017a, 2017b, 2018a, 2018b, 2018c). Education and learning should, according to UNESCO SDG 4 for 2030 (UNESCO, n.d.) be available for all, at any time, from anywhere, and through any device. In this global, lifelong, and lifewide perspective, learners take the lead in orchestrating the process and manner of their learning, thus choosing their personal learning journey in its widest interpretation. There have been calls for modern governance arrangements and dynamic, proactive leadership and management (UNESCO, 2016). The Director-General of UNESCO (UNESCO, 2016 n.p) argued the following:

[A] fundamental change is needed in the way we think about education's role in global development because it has a catalytic impact on the well-being of individuals and the future of our planet…. Now, more than ever, education has a responsibility to be in gear with 21st-century challenges and aspira-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tions and foster the right types of values and skills that will lead to sustainable and inclusive growth and peaceful living together.

The fourth industrial revolution, as argued above, has changed the ways we act, perform, live, work, and learn today (Schwab, 2017; Schwab, Davis, & Nadella, 2018; World Economic Forum, 2016). The consequences are that the digital transition encompasses all levels of an educational institution. Therefore, rethinking leadership and management is needed at all levels: macro, meso, micro, and nano (Ossiannilsson, 2018a, 2018b, 2018c).

Learning technologists and instructional designers have often taken responsibility for developing and merging technology and pedagogy for their mutual enrichment. Hence, these individuals are in an ideal position to influence institutional strategies. However, the often self-imposed role has not always been supported, recognized, or understood by senior leaders. Next-generation leadership involves staff at all levels in the institution in playing a strategic role in enabling, supporting, and facilitating effective institutional change. In open education, leadership is also a shared responsibility. In the Opening up Education framework, developed by the European Commission's Joint Research Institute, leadership is so crucial that it is an own, and one of the four transversal dimensions of open educational practices in higher education institutions (Inamorato dos Santos et al., 2016). The framework includes in total 10 dimensions of open education. In this framework, there are four transversal dimensions, and six core dimensions. The transversal dimensions are leadership, technology, quality, and strategy. The six core dimensions are pedagogy, recognition, collaboration, research, access, and content. Leadership affects all the other dimensions, and not only the other transversal dimensions but also each one of the core dimensions (see Figure 2).

Figure 2. Smart learning is disruptive
Source: Inamorata dos Santos et al. (2016)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Leaders at all levels can foster sustainable open education activities and initiatives through transparent top-down and bottom-up approaches. They can pave the way for creating openness by inspiring and empowering people. The greatest challenges probably are related to mindsets and attitudes because systemic changes are required. Hence, human capital is crucial for cultural change, which includes ownership, inclusiveness, and participation. Thus, a key issue for leaders is to promote a culture that allows people to grow, take responsibility, and build trust throughout the organization as well as to promote a culture of passion and persistence (Ossiannilsson, 2017a, 2017b, 2018a, 201b). The cultivation of a culture of quality is crucial. Moreover, it must be in the interests of everyone (i.e., the nano level), and it must be encouraged by leaders (Ossiannilsson, 2017a, 2018a). Rethinking the culture of quality as it applies to open pedagogy, situated learning, and self-directed learning requires rethinking quality assurance. Recognized international quality models of open online education take a holistic approach that includes an ecosystem, focusing not only on the learning and teaching processes but also on policy, strategies, curriculum, course design, course delivery, infrastructure, and support for staff and students (Ossiannilsson et al., 2015). Quality dimensions also relate to efficiency, learner and faculty satisfaction and engagement as well as short- and long-term outcomes. In addition, the work and study conditions of learners and staff must be considered. Gulliksen, Lantz, Walldius, Sandblad, and Åborg (2015) argued that the consequences of competitive advantage, meeting student expectations, reorganization, and continuing professional capacity building for staff are often neglected. Thus, because it is neglected, digital transformation in working places usually fails. Digital tools are often not incorporated in a well-planned manner, and most are used as substitutions or augmentations (Puentedura, 2012). Many problems could be minimized or prevented if leaders and managers had insights and knowledge of the benefits of digitalization.

To promote, realize the potential, and be at the forefront of the digital transformation, the European Commission launched the action plan for Europe (2018), which has three priorities, setting out measures to help European member states to meet the challenges and opportunities of the digital age (European Commission, 2018):

Priority 1: Making better use of digital technology for teaching and learning
Priority 2: Developing digital competences and skills
Priority 3: Improving education through better data analyses and foresight

Achieving these priorities in the European Single Market (2018) requires strong senior leaders and managers who have insights into the development, potential, and consequences of transhumanism. Being a transhumanist leader requires planning and financing learning in the transhumanist age, not only assets and equipment but also continuous professional development, infrastructure, and research in the field of transhumanism, taking into account its potential and limitations. The following are some recommended actions for implementing the three priorities according to the European Commission (2018):

- Making better use of digital technology in teaching and learning (Actions 1 to 3)
  - **Action 1:** Connectivity in schools
  - **Action 2:** Self-reflection tool and mentoring scheme for schools (SELFIE)
  - **Action 3:** Digitally-signed qualifications
- Developing digital competences and skills (Actions 4 to 8)
  - **Action 4:** Higher education hub
  - **Action 5:** Open science skills

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

  - **Action 6:** EU code week in schools
  - **Action 7:** Cybersecurity in education
  - **Action 8:** Training in digital and entrepreneurial skills for girls
- Improving education through better data analysis and foresight (Action 9 to 11)
  - **Action 9:** Studies on ICT in education
  - **Action 10:** Artificial intelligence and analytics
  - **Action 11:** Strategic foresight

In addition, the D-transform project in Europe emphasized the crucial importance of senior management and leadership for the digital transformation to succeed. Hence, D-transform training programs for leaders in European universities were developed and implemented to focus on the major role played by emerging digital technologies and transhumanism in the necessary transformation of their institutions.

The premise is that e-education (digital pedagogy and training) can become a strategic tool for European universities, enabling them to be pedagogically more effective, more cost-effective, more attractive and able to meet the needs of the professional world with regard to youth training and life-long learning (D-transform (n.d)).

Cöster, Ekenberg, Gullberg, Westelius, and Wettergren (2017) emphasized that increased digitization, digital transformation, and change allow organizations to have better conditions than ever to succeed. However, they need to understand and utilize the potential of the digital era. Some are successful, but others not; digitalization is not an easy process. However, Cöster et al. explained how organizations could create value in the context of a digitized reality. They focused on what an organization is, what it needs, and how digitization could be a solution instead of a means. Their suggestions included goals, business models, strategies, organizations, decisions, and projects. They emphasized structure, efficient decision-making, and successful project implementation.

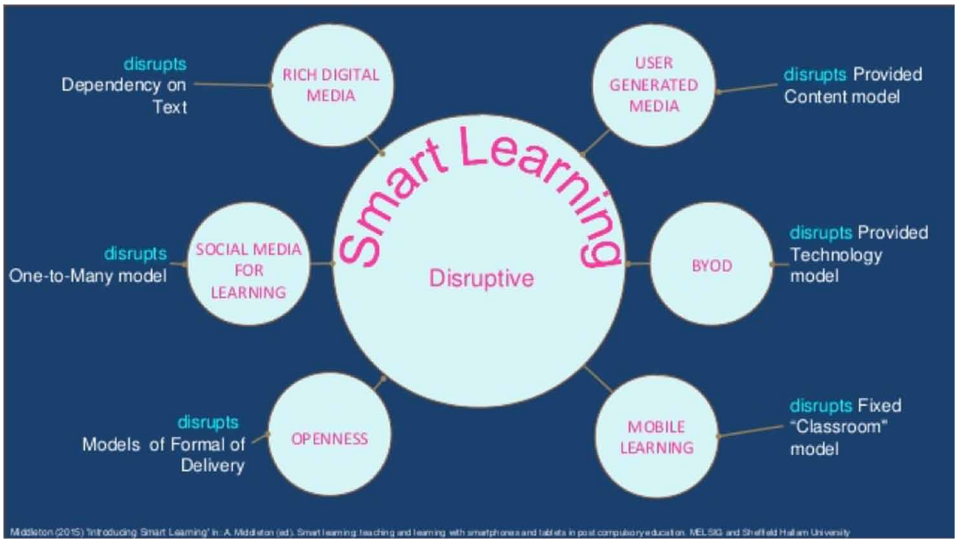
Experts in academia, the international organizational community, and industry are currently focusing on the real-world practices of digital transformation. For example, they are engaged in discussions on the ways in which artificial intelligence (AI), the Internet of Things, and even robotization could bring value to this evolution. It is therefore essential to clearly identify the values, norms, and ethics in relation to transhumanist approaches to learning. It is also essential to examine the qualifications and expectations of learners in the transhumanist age and how to support learning by technology.

Smart environments and smart cities are developed by empowering the potential of transhumanism. Hence, there are needs to live, work, perform, communicate, interact, relate, and learn in smart ways in an information and knowledge society. In the following section, smart learning will be elaborated with regard to its role in smart cities and smart environments. A framework for the ecologies of smart learning, smart learning environment and smart cities is also presented.

SMART LEARNING

The revolutionary transformation of human learning take place through social networks, and transhumanism can be fostered in ecological learning environments. Therefore, ecological learning environments should be agile, resilient, and sustainable. This new era in human development is being enabled

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use



by extraordinary technological advances. However, the fourth industrial revolution concerns more than technological opportunities; it also involves a social revolution (Schwab, 2017; Schwab, Davis, Nadella, 2018; World Economic Forum, 2016). The literature on smart learning environments indicates that previous research has focused on technology and pedagogy, and only a few studies have considered the citizen's learning perspective. Therefore, there is a need to define the elements, functions, and scenarios of smart learning environments, which could be addressed in models of smart learning environments and in best practice and case studies that build on the existing research. In both education and learning, the real opportunity is to look beyond technology to a systemic change in education and the ways in which smart learning spaces can foster and encourage the ecologies of smart learning for smart citizens in smart cities in the 21st century. A smart city is a place where traditional networks and services are made more efficient by the use of digital and telecommunication technologies for the benefit of its inhabitants and businesses. With this vision in mind, the European Union is now investing in information and communication technology (ICT) research and innovation, and it is developing policies to improve the quality of life of citizens and increase the sustainability of cities. The concept of the smart city goes beyond the use of ICT to reduce resource use and emissions. It extends to smart urban transport networks, upgraded water supplies and waste disposal facilities as well as efficient ways to light and heat buildings. It also encompasses an interactive and responsive city administration that ensures safe public spaces and meets the needs of an aging population (Digital Single Market, 2018). Figure 1 shows a framework for smart learning and its disruptions. Disruptive innovation, which is an artistic term coined by Clayton Christensen (1997), describes a process in which a product or service takes root initially in simple applications at the bottom of a market and then relentlessly moves upward in that market, eventually displacing established competitors. Several issues affect the growing number of reasons that smart learning is crucial both in the digital era and for transhumanism. In addition, there is a huge rise in the number of disruptions in several areas (see Figure 3). First, in response to the increasing development of openness in education, a large variety of delivery models have been proposed, such as Inamorata et al.'s 2016) framework, which is described above. Second, the use of social media in learning has disrupted the common communication model one to many. In addition, social media allow cross action spaces (Jahnke, 2017). Hence, it will be established via transhumanism, and it will affect learning. Third, the development of rich digital media will disrupt the dependency on texts. Fourth, user-generated media will disrupt models of provided content. Fifth, "bring your own device" (BYOD) will disrupt models of provided technology. Sixth, the rise of mobile learning will disrupt the fixed learning model.

In education and learning, real opportunities will arise in meeting the challenges of looking beyond technology to how smart learning spaces can foster and encourage smart learning in the 21st century. Smart learning environments will have positive effects on both personal and collaborative learning in smart cities and in communities. The educational sector will be challenged in implementing and adapting to the SDG4 goals, which are designed to empower and ensure inclusion, equity, and quality education. These goals will be achieved through access, democracy, affordability, efficacy, and equality. In addition, learners will be challenged in taking the lead in orchestrating the process and manner of their own learning and in choosing their personal learning journeys according to the widest interpretation of education (Hwang, 2014; Kinchuk et al., 2014; Koper, 2016, Traxler & Kukulska-Hulme, 2016).

The terms future learning environment, smart classroom, learning spaces, smart campus, and technology-enhanced learning are synonymous with smart learning environments. All these terms refer to utilizing information technology to build a personalized and adaptive learning environment. According to Hwang (2014), technology-enhanced learning can be perceived as a smart learning system. In smart

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

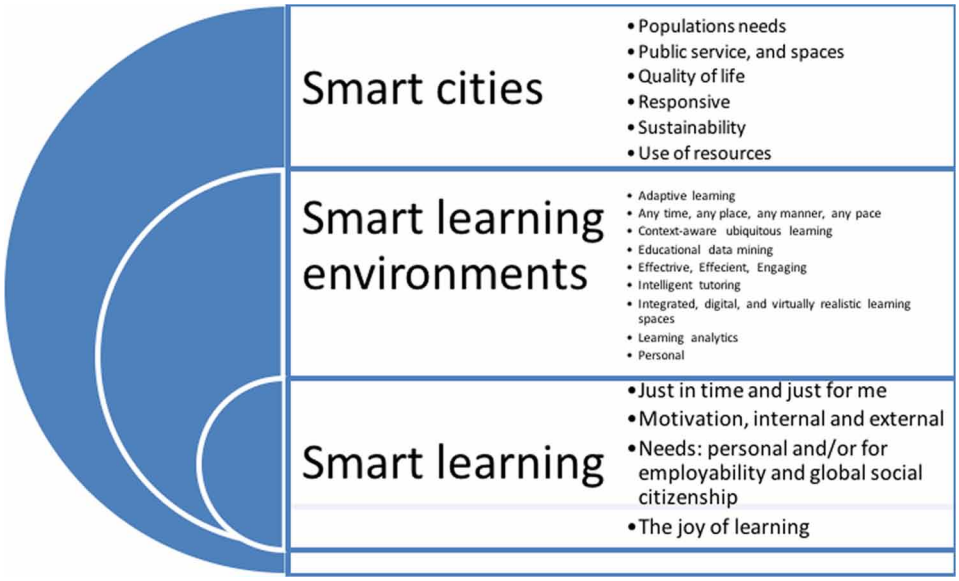
Source: Ossiannilsson (2018)



learning environments, several systems are integrated and combined, such as intelligent tutoring, learning analytics, educational data mining, adaptive learning, and personalized learning (Yang et al., 2015). However, the literature on smart learning environments indicates that previous research has focused on technology and pedagogy, and only a few studies have considered the citizen' s learning perspective. Therefore, there is a need to define the elements, functions, and scenarios of smart learning environments based on the integration of formal and informal learning in physical and virtual spaces in community learning contexts. These needs could be addressed by focusing on models of smart learning environments models and by presenting best practice and case studies based on research. Based on the current literature review, informed by the author's research and experiences in this field and by the relevant literature, a the proposed framework for the ecologies of smart learning, smart learning environments, and smart cities is presented in Figure 4.

Innovation in educational systems, which is understood as the adoption of new services, technologies, and competences by educational organizations, can help to improve learning outcomes, enhance equity, and improve efficiency. Innovation is the most effective and sustainable when it is embraced by well-trained teachers and embedded in clear teaching goals. Further research is needed on how to best use digital means to reach educational objectives. Education can benefit by opening classrooms to real-life experiences and projects and by applying new learning tools, materials, and open educational resources. Learners can be empowered by online collaboration. The access to and the use of digital technologies can help reduce the learning gaps between students from high- and low-socioeconomic backgrounds. Personal teaching can result in the increased motivation of individual learners (Downes, 2016). However, the progress in integrating technology in education remains limited.

Digital advances have brought new challenges for pupils, students, and teachers not only in Europe but also worldwide. The algorithms used by social media sites and news portals can be powerful amplifiers of biased or "fake" news" moreover, data privacy has become a key concern in the digital society. Both young people and adults are vulnerable to cyber bullying and harassment, predatory behavior, and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. The ecologies of smart learning, smart learning environment and smart cities
Source: Ossiannilsson (2018)

disturbing online content. The daily exposure to digital data that consist of inscrutable algorithms creates clear risks, which requires critical thinking and the ability to engage positively and competently in the digital environment. The constantly evolving need for media literacy, the wide mix of digital skills and competences required to ensure the safety, security, and privacy of the public and private sectors remains a challenge.

The ecologies of smart learning, smart learning environments, and smart cities empower the potential of global, lifelong, life-wide learning, ongoing learning, and education available to all, at anytime, anywhere, and through any device, according to the UNESCO SDG4. These goals, which were designed to empower and ensure inclusion, equity, and quality education, could be achieved through access, democracy, affordability, efficacy, and equality. Cöster et al. (2017) examined the use of technology by government agencies to collect and secure data, make intelligent decisions for personal service while considering ethics, legality, soft and hard infrastructures, human resources, and capacity building among others. They emphasized that citizens' experiences are a key driver in this journey.

Wheeler (forthcoming) argued that a rapidly growing area of technology that will significantly influence the future is AI and its potential effects on the future of learning and technological development. He and others believe that this subject must be explored. According to Wheeler, there are several philosophical debates about the nature of intelligence and the ways in which human intelligence differs from machine intelligence. One of the sources he cites is Tegmark's book, *Life 3.0* (2017), in which the author presents some compelling arguments for the future of AI. According to Wheeler, Tegmark argued that the benefits of AI will surpass the threats provided they are aligned with human intentions. One of the greatest concerns was not that computers might become sentient, or "evil," but a scenario in which the goals of "competent" AI would become misaligned with ours. His key argument is that the debate about whether computers will attain consciousness or emotional capability is spurious (Tegmark, 2017). The future co-existence with technology will be premised on the ability of computers to make

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

life better for humanity, not to "out-think" us. For Tegmark, intelligence, whether human or artificial, is the ability to accomplish complex goals (good or bad). He argued that intelligence ultimately relies on information and computation, not on flesh and blood or on metal and plastic. Therefore, he reasoned, because of the exponential developments taking place in the world of technology, there is no barrier to computers eventually attaining and even surpassing human intelligence. However, Wheeler noted that regardless of whether the arguments are supported or not, it is interesting to note the comparisons between humans and machines. Arguably, all the above attributes, such as free will, emotion, abstract thinking, and intuitive action not only make us who we are but also create a permanent and unbridgeable divide between humans and computers.

FUTURE RESEARCH DIRECTIONS

Currently and in the near future, further research should be conducted on transhumanism, particularly in relation to leadership and quality. In addition, research should be conducted on emerging trends related to the digital transformation and their effects on individuals and educational systems as well as the ways we work, live, and learn in a smart global world. It is worth emphasizing that times are changing faster than ever today. Statistics have shown that business is also changing faster than ever. However, many people neglect important aspects of change, which include decision-making and disruptions in almost every sector. It is significantly more difficult to make a decision in a time of change than in a time of stability. In the latter, one can learn from the successes and failures in previous experience. In times of change, previous experiences cannot be applied to the situation because the landscape has changed. Clark (2015) recommended the following rule for navigating change in uncertain circumstances: do not apply the first solution that occurs. She meant that it is fine to accept the initial solution when the conditions are unchanged, and "two plus two still equals four." However, under conditions of change, relying on the same assumptions and action plans could be a damaging mistake. Instead, she recommended a framework for making smarter decisions in times of change and in smart environments. This simple framework consists of three steps:

Step 1: What worked previously?
Step 2: What has changed?
Step3: What solutions have others found to related problems?

According to Clark (2015), decision-making is critical in times of rapid change. By answering the questions in Clark's three-step framework, other solutions might become apparent. In order to innovate, mental agility must be cultivated. Accordingly, although everyone is responsible for the cultivation of his or her mental agility, leaders and senior managers have a crucial role in ensuring that its development is aligned with the fourth industrial and social revolution in the 21st century. Furthermore, leaders and senior managers have crucial roles in meeting the SDG as well as the SDG4, which are designed to empower and ensure inclusion, equity, equality, and quality in education through access, democracy, affordability, efficacy, lifelong learning, and ongoing learning.

CONCLUSION

The research and the issues discussed in this chapter on transhumanism and innovative leadership clearly concern the question of quality. My research on the next-generation leadership's role in achieving the goals of Education for All 2030 has revealed the urgent need for not only the modernization of the approach to education but also effective organizational leadership in the digital era. Leaders and managers can make a difference to higher education offers, services, processes, quality, and consequences. The cultivation of a culture of quality is critical. It must be in the interests of everyone, and it must be empowered and encouraged by leaders (Ossiannilsson, 2017a, 2017b, 2018a, 2018b); Innamorata dos Santos et al., 206; Wheeler, forthcoming).

To succeed in the era of new trends and emerging new technologies, a trusting relationship should be focused on the return on investment. The following measures are recommended to survive data breaches, emerging technologies, and new platforms:

- Understand the audience.
- Review the social media marketing strategy.
- Allocate time and budgets for new tools and technologies such as software and hardware as well as professional development and evaluation.
- Focus on what works.
- Strive to build trust with users in every campaign.

To meet the challenges of transhumanism, there is an urgent need for people who have the knowledge, abilities, competences, and attitudes to lead the process as well as to analyze and evaluate digital work environments by applying appropriate methods to analyze complex digital environments. Moreover, there are needs to analyze and evaluate the consequences of transhumanism and digital work environments by using appropriate methods to analyze the influence of complex digital environments on society.

ACKNOWLEDGMENT

This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

KEY TERMS AND DEFINITIONS

Artificial Intelligence (AI): The simulation of human intelligence processes by machines, especially computer systems. These processes include learning (i.e., the acquisition of information and rules for using the information), reasoning (i.e., using rules to reach approximate or definite conclusions), and self-correction.

Digital Transformation: Digital transformation is the process of devising new business applications that integrate all digitized data and digitalized applications. Taking advantage of digitalization to create completely new business concepts. Because of digitization and digitalization, data are easily accessible for use across various platforms, devices, and interfaces.

Disruption: Disturbances or problems that interrupt an event, activity, or process. Events, activities, or processes are often used or understood differently than they were at the beginning. Disruptive innovation, which is an artistic term coined by Clayton Christensen, describes the process by which a product or service is initially offered in simple applications at the bottom of a market and then moves relentlessly upward in the market, eventually displacing established competitors.

Innovative Leadership: The innovative leader's focus is on the big picture and on working with creative thinkers who contribute to enhancing that vision. The innovative leader needs to be able to communicate her/his vision and generate enthusiasm for it. The leader's team needs to be able to see the vision and be willing to invest their time and resources into making it happen. Innovative leaders know that leadership by demand is far less effective in encouraging creativity and innovation than leadership through motivation and inspiration. The innovative leader needs to have confidence in her/his team and their ability to work together to achieve the vision.

Internet of Things (IoT): The network of devices, vehicles, and home appliances, such as electronics, software, actuators, and connectivity, which allows these devices to connect, interact, and exchange data.

Quality in Open Online Learning: In education and learning, quality is usually defined as teaching methods that successfully help learners develop the knowledge and skills they will require in the digital age. the short answer to the question of quality in open online learning. A longer definition requires

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

examining, at least briefly, institutional and degree accreditation, internal (academic) quality assurance processes, differences in quality assurance between traditional classroom teaching and online and distance education, the relationship between quality assurance processes and learning outcomes, and quality assurance that fits the purpose, all of which are necessary for meeting the goals of education in the digital age.

Smart Learning: Learning anytime and anywhere based on individual cognitive ability. It takes place by using an advanced electronic device. Smart learning is also called advanced distributed learning, e-learning, online leaning, hybrid learning, and blended learning.

Transhumanism (H+ or h+): An international philosophical movement that advocates the transformation of the human condition by developing and making sophisticated technologies widely available for the enhancement of human intellect and physiology.

Chapter 97
Exploring the Impact of Flexible and Permeable Work–Life Boundaries in a Mobile World

Donna Weaver McCloskey
Widener University, USA

ABSTRACT

Work-life boundaries are often studied on a segmentation-integration continuum, which fails to consider that boundaries can be multidimensional. A flexible boundary allows work to be completed at different times and locations, whereas a permeable boundary allows for the integration of work and personal demands. This chapter examines boundary flexibility, home boundary permeability, and work boundary permeability as separate constructs, positing eight possible boundary configurations. In this exploratory research, differences in demographics, technology usage, work-family conflict, and work and life satisfaction for 65 knowledge workers who maintain different levels of boundary flexibility and permeability are examined. This research offers a new boundary configuration framework, which should guide future research and organizational policy.

BOUNDARY FLEXIBILITY AND PERMEABILITY

In the past the line between work and home was defined by time and location. During work hours and in the office, employees were in their work role and outside of that time/place, were in their personal life. The advent of mobile technology has all but eradicated those temporal (time) and physical boundaries. The transportability of computing means that work activities can now be done at alternate times and locations. Likewise, the ubiquitous nature of communication means that personal demands can be made while working. With the breech of temporal and physical boundaries, the psychological boundary that individuals maintain between their work and personal lives becomes more important. This research seeks to further define those boundaries and explore the impact of boundary decisions on work-family conflict as well as work and life satisfaction.

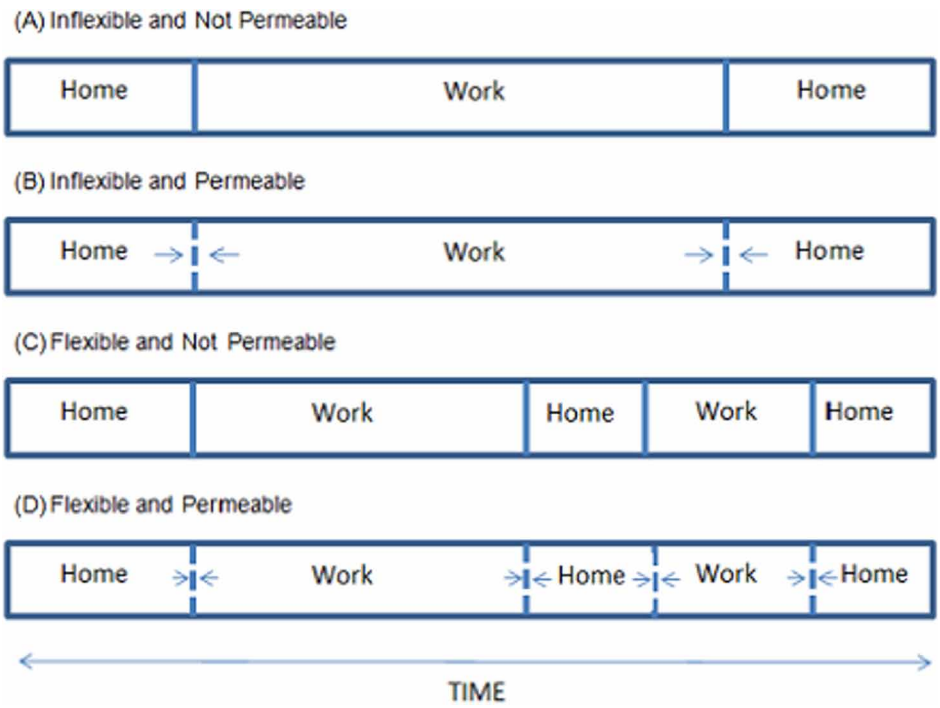
The vast majority of the boundary literature utilizes a segmentation-integration continuum, positing that employees have preferences for either keeping their work and personal life separate or allowing them to overlap (Ashford, Kreiner & Fugate, 2000; Bulger, Matthews & Hoffman, 2007; Kossek, Ruderman, Brady & Hannum, 2010; Tremblay & Genin, 2008). This construct may be too simplistic. Boundaries can be flexible without being permeable and vice versa. The failure to separate flexibility from permeability has contributed to difficulties in reconciling and integrating research results (Den-Nagy, 2014). Recently researches have acknowledged that flexibility and permeability of boundaries should be examined as distinct constructs (McCloskey, 2016; Methot & LePine, 2016). This research does that by examining differences in demographics, technology use and work and personal outcomes based on boundary flexibility and the permeability of the work and home boundary.



One dimension of the work-life boundary is flexibility. The concept of flexibility is how much control the individual has over when and where work is completed. Work schedule flexibility can be a formal program, such as flex-time or telecommuting, or an informal ability to adjust work hours as needed. Work flexibility has been found to be negatively related to forms of work-family conflict (Carolson, Grzywacz & Kacmar, 2010; Kattehbach, Demerouti & Nachreiner, 2010; Porter & Ayman, 2010) since it allows employees to balance conflicting demands.

Permeability is another dimension of the work-life boundary. Boundary permeability is the extent to which we integrate the obligations of one role when in the other role. Permeable boundaries allow one to be physically located in one domain and psychologically or behaviorally involved in another role (Olson-Buchanan & Boswell, 2006). Mobile technology and the ability to communicate anytime, anywhere has made the work-life boundary even more permeable. Whether responding to a client's email at the school's chorale concert or watching the concert via Skype while in the office, technology offers employees the ability to continually cross boundaries. Researchers have addressed the issue of boundary permeability and have found that using technology to do work outside of the traditional work time to contribute to increased work-family conflict (Boswell & Olson-Buchanan, 2007; Olson-Buchanan & Boswell, 2006). Conversely, individuals with strong (i.e. non-permeable) home and work boundaries experience less work-family and family-work conflict (Hecht & Allen, 2009).

Figure 1 provides a graphical depiction of four combinations of flexible and permeable boundaries. Scenarios A and B represent inflexible borders between the work and home domain. In these scenarios there is a set, defined time for work that cannot be altered. From day to day, these employees know when they need to be in their work role and cannot readily alter their schedule. There is, however, a difference in the permeability of the borders. In Scenario A the borders between work and home are not permeable; there is little to no personal contact or tasks during work time and, likewise, little to no work contact or tasks during personal time. Conversely, in Scenario B while the work and home hours are set, there is a significant amount of communication or tasks that infringe from the other domain. Scenarios C and D represent flexible boundaries between the work and home domain. In these scenarios individuals have some control on when work is done. Called split-shift or flextime, employees can take time during the day to meet personal or family obligations and then make that time up, whether at work, home or an alternate location, at another time. In Scenario C the boundary between work and personal time are not permeable. So although the timing of work and personal tasks may shift, when engaged in one role, there are boundaries in place to limit the interference from the other role. Scenario D represents the flexible and permeable boundaries depicted by Ashford, et al. (2000) which constitutes a high level of integration. The timing of work and personal tasks may shift and due to the permeable boundaries, individuals can change their focus from one role to another.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Combinations of flexible and permeable boundaries

The number of scenarios increases when we consider that there can be directionality to boundaries. Boundary flexibility is not directional. When the work boundary shifts it, by definition, shifts the non-work boundary as well. But permeability can be established for both home and work boundaries (Eagle, Icenogle, Maes and Miles, 1998; Kasper, Meyer & Schmidt, 2005). Having a work permeable boundary but a non-permeable home boundary, or vice versa, adds a layer of complexity to the scenarios depicted in Figure 1. Instead of the four scenarios, there are actually eight possible combinations of boundary flexibility and work/home boundary permeability. Table 1 presents the eight combinations of boundary flexibility and work and home permeability and offers descriptions, illustrative examples and potential mobile technology usage to support those boundaries.

EXAMINING THE EFFECT OF BOUNDARY FLEXIBILITY AND PERMEABILITY

Mobile technology offers workers the benefit of flexibility in completing work, which can be viewed as having positive outcomes on stress and satisfaction. But mobile technology also allows for work to intrude during personal time and for personal issues to intrude during work time. This conflict can cause stress and have a negative impact on satisfaction. This research examines the impact of boundary flexibility and home/work boundary permeability on technology usage, work-family conflict, job satisfaction and life satisfaction.

Work-family conflict (WFC) is when the stress or demands from one role interferes with the other and is comprised of three dimensions: time, psychological and behavioral. Our examination includes both the directionality and dimensions of this construct. The time based dimension of WFC is when

Table 1. Overview of boundary configurations with regard to flexibility and work/home permeability

	Description	Illustrative Example	Potential Technology Usage to Support Border Flexibility and Permeability
Inflexible, home and work non-permeable	At the far extreme, work and personal life are compartmentalized and work and personal times are set. Work is not done during personal time and personal demands are not met during work time	A knowledge worker has set working hours. When s/he is working, s/he does not engage in personal tasks such as personal calls/emails/texts or social media. Likewise, when not working, s/he does not engage in work activities such as work calls/emails.	Because work and non-work times are set and rarely change, it is likely someone with an inflexible boundary would maintain separate work and personal calendars. Due to non-permeable boundaries, it is likely this person maintains separate email and mobile devices for work and home. Work devices would be shut off during personal time and vice versa.
Inflexible, home not permeable, work permeable	Work and non-work times are set and rarely altered. Home life is considered sacrosanct. While personal needs may be addressed during work time, generally work is not done during personal time.	A manager has set hours for working. Personal demands, such as a phone conference with a teacher, shopping for a birthday gift or scheduling personal appointments may happen during work time. When s/he arrives home, s/he does not check work email nor engage in work activities.	Separate work and personal calendars (see above). The home boundary is not permeable so it is likely someone with this boundary has a separate work phone/mobile device which can be turned off when not working. The work boundary is permeable so work email address may be used for personal correspondence and/or personal accounts/devices are checked while working.
Inflexible, home permeable, work not permeable	Work occurs during scheduled time. Work life is protected with a non-permeable border. While work may intrude on personal time, the opposite does not happen.	A surgeon has set hours when s/he must be at the hospital and does not deal with personal issues while at work. Work demands may intrude during personal/family time	Separate work and personal calendars (see above). Because the home boundary is permeable, this employee may use their personal email or mobile device for work communication or checks their work device while not working. Because the work boundary is not permeable, personal email/communication likely does not come to work accounts/devices.
Inflexible, work and home permeable	Work and non-work times are set and rarely altered. Permeable boundaries for both work and home means that work activities are sometimes done at home and personal activities are sometimes done at work.	A supervisor may be required to be at the work location M-F from 8a – 6p. Permeability in boundaries means s/he can perform personal tasks such as a phone conference with a teacher, shopping for a birthday gift or scheduling personal appointments during work time. Likewise, work task can be done during personal time.	Separate work and personal calendars (see above). Because both the work and home boundaries are permeable, someone with these boundaries may use one mobile device and email account for both work and personal needs.
Flexible, home and work not permeable	Work and personal life are compartmentalized but the timing of work can be shifted to meet changing demands. Although time may shift, when working only work tasks are done and when not working only non-work tasks are done.	A manager can leave the office at 3 to attend after school sports but can make up those hours by working in the evening. (This is sometimes referred to as a split shift.) The work and home boundaries are not permeable, so the employee is neither responding to work emails when at the sporting event nor watching the game online while in the office.	Because work and non-work time can shift, it is likely that someone with flexible boundaries would use an integrated calendar. Because work and non-work tasks are compartmentalized, this employee may have separate work and personal email accounts as well as separate mobile devices. Personal emails/texts are not dealt with when working and work emails/texts are not dealt with when not working.
Flexible, home not permeable, work permeable	The time when work is done may shift but the home boundary is firm and work is not done during personal time. The work boundary is permeable so personal tasks may be done at work.	A manager can leave the office at 3 to attend after school sports but can make up those hours by working in the evening. S/he would not check work email while at the sporting event but may follow a youth sporting event online while in the office.[1]	Integrated calendar (see above). The home boundary is not permeable so it is likely someone with this boundary has a separate work phone/mobile device which can be turned off when not working. The work boundary is permeable so work email address may be used for personal correspondence and/or personal accounts/devices are checked while working.
Flexible, home permeable, work not permeable	The time when work is done may shift but the work boundary is firm. While work tasks may be done during personal time, personal tasks are not done during work time.	This is perhaps the category for the stereotypical workaholic. A manager can leave the office at 3 to attend after school sports but can make up those hours by working in the evening. Because the home boundary is permeable, s/he would check work email while at the sporting event. The work boundary is not permeable to s/he would not follow a youth sporting event online while in the office.	Integrated calendar (see above). Because the home boundary is permeable, this employee may use their personal email or mobile device for work communication or checks their work device while not working. Because the work boundary is not permeable, personal email/communication likely does not come to work accounts/devices.
Flexible, home and work both permeable	This combination offers the most work-life integration. The timing of work can shift and demands from one role are allowed to intrude when in the other role.	A real estate agent has flexibility as to when work is done. But having permeable boundaries means work calls are taken during family time (like dinner or a concert) and family needs (like homework help or scheduling/carpool coordination) are dealt with while working.	Integrated calendar (see above). Because both the work and home boundaries are permeable, someone with these boundaries may use one mobile device and email account for both work and personal needs.

there are pressing demands that must be met during the same time. Researchers have suggested that work-family conflict should be looked at from both sides of the relationship, the extent to which work interferes with family (work→family conflict) and the extent to which family interferes with work (family→work) (Frone, Russell & Cooper, 1992; Judge, Boudreau & Bretz, 1994). This was not done in this study for the time dimension of work-family conflict. The very concept of schedule flexibility negates directionality in this time based dimension because it assumes that there is a structured work time and non-work time. Directionality implies that a family commitment during the eight hours per day in which the employee works is family→work conflict and work commitments during "non-work" time (nights and weekends) is work→family conflict. Mobile computing and flexible scheduling allows employees to be very flexible concerning when work is completed. With the elimination of the 8-hour "shift", it is much harder to establish directionality. This research will examine the time dimension of work-family conflict but will not look at directionality of this measure.

Another dimension of work-family conflict, psychological interference, can be more insidious since it is not as obvious or as easily managed. Psychological interference is when you are physically present in one role but are distracted or consumed with needs from the other role. This conflict, which we will call the strain dimension of work-family conflict, taps into the permeability of borders and the ability to control the interference from one role when you are in the other role. The strain dimension of work-family conflict will consider the directionality of conflict, work interfering with family (work→family conflict) and family interfering with work (family →work conflict).

The third dimension of work-family conflict has to do with the different ways be behave in our work and home lives. For example, the decision-making style used in the workplace may be different from the one employed for personal decisions. While the blurring of work and home boundaries may cause increase the speed of transition, it would not eliminate it. This dimension has received much less attention in the literature and was not examined in this research.

Work-family conflict has been shown to be a contributor to many negative outcomes including depression (Frone, et al., 1992), low organizational commitment (Greenhaus & Beutell, 1985) and poor physical health (Carlson, Grzywacz & Kacmar, 2010). Since we are examining the impact of boundaries on the conflict between work and personal lives, we will also examine the resulting impact on job and life satisfaction.

Boundary flexibility refers to the degree to which the time boundary between work and personal roles can shift. Employees who maintain flexible boundaries are able to change when and where they do their job. As offered in illustrative examples in Table 1, it is likely that someone with a flexible work-life boundary would maintain one integrated calendar so that time can be managed holistically.

H1: Respondents who have flexible boundaries will use one, integrated calendar.

Researchers have found that the ability to vary work time is negatively related to work-nonwork conflict (Bulger, et. al. 2007; Carlson, et. al, 2010; Kattenbach, Demerouti & Nachreiner, 2010). Porter and Ayman (2010) found work flexibility to be negatively correlated with work interference with family measure, which is the extent to which work demands conflicted with family life. Diaz, Chiaburu, Zimmerman and Boswell (2012) found that mobile technology offered more flexibility which contributed to reduced work to life conflict. While flexibility provides agility in reducing time-based work-family conflict, it can also contribute to less strain-based work-family conflict. Knowing that we can adjust the timing and location of work to meet personal needs reduces the stress we would encounter with structured,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

set time boundaries. Boundary control is positively correlated with the ability to balance work and family and negatively correlated with psychological stress (Kossek, et.al, 2012). Thus, our expectation is that boundary flexibility will contribute to the reduction in the three studied forms of work-family conflict.

H2a: Respondents who have flexible boundaries will have less time based work-family conflict than those who have inflexible boundaries.

H2b: Respondents who have flexible boundaries will have less strain based work→ family work-family conflict than those who have inflexible boundaries.

H2c: Respondents who have flexible boundaries will have less strain based family→ work-family conflict than those who have inflexible boundaries.

When we're not in balance and the strain of not meeting needs in one domain conflict with another, we tend to be dissatisfied with both our job and our life (Netemeyer, Boyles & McMurrian, 1996). As prior research has supported, reduced work-family conflict contributes to other positive outcomes such as higher work and life satisfaction (Carlson, et al., 2010).

H2d: Respondents who have flexible boundaries will have higher job and life satisfaction than those who have inflexible boundaries.

Flexibility is about when and where work is completed but permeability is about the integration of work and home. As presented in Table 1, employees can maintain different levels of permeability for work and home. If an employee is interested in keeping firm boundaries, s/he would be more likely to have separate work and personal cell phones and email accounts so that those domains can be kept separate. Conversely, employees who want to integrate their work and personal life would be more likely to use one cell phone and email account for both work and personal needs.

H3: Respondents who have permeable boundaries will use one, integrated cell phone and email account.

Generally, when employees are able to establish barriers or limits between work and family, they experience less work-family conflict (Hecht and Allen, 2009) and more integration results in greater work-family conflict (DeSrochers, Hilton & Larwood, 2005). Prior research has not addressed how permeability could impact the components of work-family conflict (time, strain work→ family and strain family→ work) differently. While we hypothesized that schedule flexibility is what allows employees to minimize time-based work family conflict, perhaps permeability has an impact as well. The ability to communicate to meet a personal need, such as talking to a doctor or emailing a teacher, during traditional work time may be seen as helping to alleviate the time-based work-family conflict. While flexibility provides the ability to go somewhere during traditional work time, permeability provides the ability to communicate during traditional work hours. Because employees are able to communicate in a timely manner (i.e. not waiting until after work to return a call), they may feel a reduction in their time-based work-family conflict.

H4a: Respondents who have a permeable work boundary will have less time based work-family conflict than those who have a non-permeable work.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

However the potential benefit of permeability comes at a price. Generally, integration is seen as stressful. Greater work-family integration, interruptions of one domain when in the other domain, has been associated with greater work-family conflict (Desrochers, et. al, 2005; Kossek at al., 2012) and stress (Koay, Soh & Chew, 2017). Moving from one role to another involves a rite of transition (Ashford et al., 2000). Traditionally, the commute to work or home is the transition time in which we decompress and 'change channels' from the role we are leaving to the one we are entering. Those with permeable boundaries are not afforded the time to make these transitions and must move from one role to another quickly. Hecht and Allen (2009) used a measure called boundary strength which was, in essence, the concept we are calling boundary permeability. They examined both the strength of the boundary that "protected" work from outside interference and found greater work boundary strength was related to less family→ work conflict.

H4b: Respondents who have a permeable work boundary will have more strain based family→ work conflict than those who have a non-permeable work.

When the work boundary is permeable, personal demands can intrude during work time, this leads to more strain based family→ work conflict. Increased work-family conflict is associated with negative impacts on job (Diaz, at. al, 2012) and life satisfaction (Eagle, et al., 1998).

H4c: Respondents who have a permeable work boundary will have lower job and life satisfaction than those who have a non-permeable work.

When the home boundary is permeable, work demands can intrude during non-work time. Again, while boundary flexibility is hypothesized to allow for scheduling to reduce this conflict, it is possible boundary permeability can also address the time dimension of work-family conflict. By allowing work to integrate during personal time, the employee may be able to have more personal time. For example, if there is a conference call that needs to occur on the weekend, perhaps it is better to accept that call from home (and enjoy as much of the weekend as possible) rather than scheduling time in the office and losing even more time due to commuting.

H5a: Respondents who have a permeable home boundary will have less time based work-family conflict than those who have a non-permeable work.

But the potential benefit in scheduling is likely lost when considering the strain-based dimension. Just as we argued for the permeable work boundary, when the home boundary is permeable work is allowed to intrude during non-work time. This intrusion during home time can be even more damaging because of the impact it may have on family members. Demands from a spouse or children to be engaged in family life, not just physically present, may contribute to additional strain and reduced job and life satisfaction. Hecht and Allen (2009) examined the boundary strength that "protected" home from work interference and found home boundary strength was related to less work→family conflict. Likewise, home boundary permeability had a positive impact on work-to-life conflict (Olson-Buchanan & Boswell, 2006)

H5b: Respondents who have a permeable home boundary will have more strain based work→ family conflict than those who have a non-permeable work.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Again, since we are hypothesizing home boundary permeability to result in more strain work→family conflict, we would also expect the resulting decrease in job and life satisfaction.

H5c: Respondents who have a permeable home boundary will have lower job and life satisfaction than those who have a non-permeable work.

As outlined in Table 1, there are eight combinations of boundary flexibility and work/home boundary permeability. The first and last combinations represent the segmented and integrated extremes studied by (Ashford, et. al. 2000). The other six boundary combinations have not been empirically studied.

RESEARCH METHOD

This research sought to examine the digital boundaries of professional knowledge workers making the sampling of business alumni an appropriate sampling frame. Through LinkedIn and email, the undergraduate and graduate alumni from a northeastern university were contacted and asked to complete an online survey. Of the 103 responses, 35 were eliminated due to incomplete answers, resulting in a sample of 68 professional employees. Three additional individuals were dropped because they were not full time employees leaving the final sample at 65. A summary of the demographics of the sample are presented in Table 2. While the sample size is small, it was deemed acceptable for the exploratory nature of this research.

Measures

Boundary Flexibility

Boundary flexibility was assessed with a five-point likert scale (1=strongly disagree to 5=strongly agree) on five statements regarding the individual's control over whether work could be completed at different times or on different days. Statements included 'I have flexibility regarding when I complete my work.' and 'Generally, I can control the hours I work.' The responses were coded such that a higher value represents more boundary flexibility (α=70).

Boundary Permeability

Boundary permeability was assessed with a five-point likert scale (1=strongly disagree to 5=strongly agree) on a total of 16 statements regarding how strongly the individual segments or separates their work and personal life. The items were drawn from Hecht and Allen's (2009) work-nonwork boundary strength scales as well as literature recommending work-life balancing strategies (Cousins & Robey, 2015; Friedman & Westring, 2015; Golden & Geisler, 2007; Zheng, Molineux, Mirshekary & Scaparo, 2015). Eight of the items focus on the boundary that protects an employee's home or personal life from work interference, such as 'I often deal with work related issues during my non-work time' and 'I rarely turn off my mobile device so I can be available during work' (α=79). The other eight items focus on the boundary that protects work from interference from personal/home life. Statements are a mix of permeable boundaries such as 'My friends and family contact me when I am working' and non-permeable

Table 2. Demographics of total sample

	Total Sample (n=65)
Gender	Female – 31 (48%) Male – 32 (49%) Not reported – 2 (3%)
Age	20-29 yrs – 6 (9%) 30-39 yrs – 16 (25%) 40-49 yrs – 26 (40%) 50-59 yrs – 16 (25%) 60+ yrs - 1 (2%)
Marital Status	Married – 57 (88%) Divorced – 4 (6%) Widowed – 1 (2%) Single – 3 (5%)
Spouse/ Partner Work Status	Full time – 43 (66%) Part time high (20-40 hrs/wk) – 8 (12%) Part time low (<20 hrs/wk) – 2 (3%) Not employed – 4 (6%)
Parental Status	Parent – 54 (86%) Not a parent – 9 (14%)
Youngest Child	No children - 9 (14%) Infant/baby – 6 (9%) Toddler – 7 (11%) Preschooler – 3 (5%) Elementary age – 10 (15%) Middle school age – 13 (20%) High school age – 6 (9%) College age – 7 (11%) Grown/Indep – 4 (6%)
Eldercare Status	None – 44 (68%) Minimal (1-2 hrs/wk) – 13 (20%) Some (3-6 hrs/wk) – 6 (9%) Substantial (7-10 hrs/wk) – 0 (0%) Major (11+ hrs/wk) – 1 (2%) Not reported – 1 (2%)
Organizational Tenure	11.10 years (9.04 std dev)
Job Tenure	7.33 years (7.24 std dev)
# of Cell phones	1.12 (.31 std dev)
# of Email Accounts	2.75 (1.02 std dev)
# of Calendars	2.02 (.89 std dev)

boundaries such as 'I rarely deal with personal matters when I am working.' (α=78). All items were coded such that higher scores represent a more permeable boundary.

Work-Family Conflict

This research addresses three types of work-family conflict: time work family conflict (8 items), strain work→family conflict (5 items) and strain family→work conflict (5 items). The measures used to examine these dimensions were developed by Kopelman, Greenhaus and Connolly (1983). Time-based work family conflict is when there are pressing demands from both work and family that must be dealt with

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

at the same time (α=79). Sample items include 'My work keeps me from spending the amount of time I would like to on family related activities' and 'My home life interferes with my work responsibilities, for example starting work on time or traveling'. The strain-based component of work-family conflict arises from interference when you are physically present in one role but are distracted or consumed with needs from the other role. Stain-based work family conflict was examined with five items that addressed work→family conflict (α=80) and four items that addressed family→ work conflict (α=79). Examples include 'I am often preoccupied with my job when I am not working' and 'My family life is so demanding that I find myself thinking about family matters while working.'

Job Satisfaction

Job satisfaction was operationalized by a three-item scale developed by Hackman and Oldham (1975). Each item asked respondents to indicate their agreement or disagreement on a five-point scale ranging from (1) strongly disagree to (5) strongly agree. The items were averaged into a composite score with higher scores reflecting greater job satisfaction (α=77).

Life Satisfaction

As others have done (Carlson, et. al, 2010), the life satisfaction measures were modeled after the job satisfaction items. Life satisfaction was assessed by a three-item scale with respondents asked to indicate their agreement or disagreement on a five-point scale ranging from (1) strongly disagree to (5) strongly agree. The items were averaged into a composite score with higher scores reflecting greater life satisfaction (α=76).

Control Variables

This research sought to understand the demographic characteristics and outcomes of knowledge workers with various types of boundaries between work and home. The included demographic variables were directed by prior research and include gender (Carlson, Grzywacz & Kacmar, 2010; Powell & Craig, 2015; Tremblay & Genin, 2008), age (Zheng, et. al, 2015), and family characteristics such as marital status, spouse's work status, parental status, age of youngest child (Tremblay & Genin, 2008) and eldercare responsibilities (Friedman & Greenhaus, 2000). Additionally, job and organizational tenure (in years) were assessed so that we might examine whether boundary alignment varies with job or organizational experience.

RESULTS AND DISCUSSION

Due to the exploratory nature of this research, before addressing the proposed hypotheses, we first sought to examine whether there were differences in the demographic characteristics of those respondents who reported different boundaries. We first examined boundary flexibility. For the total respondents the average reported boundary flexibility was 3.58 with a 3.60 median. The median point was used to split the respondents into low vs. high flexibility groups. There were 40 (62%) respondents considered to have flexible boundaries and 25 (38%) who are considered to have inflexible boundaries. Once grouped into

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

flexible and non-flexible boundaries, we examined whether there were differences in the demographic characteristics. As presented in Table 3, the flexible and non-flexible respondents were similar on gender, age, marital status, spouse work status and youngest child. In fact, the only categorical variable in which there was a significant difference for flexible vs. non-flexible boundary respondents was parental status and eldercare responsibilities. Those employees with less flexible boundaries were more likely to be parents and reported less eldercare responsibilities. There was not a significant difference in the job or organizational tenure of those who reported flexible boundaries and those who reported inflexible boundaries nor were there any significant differences on number of cell phones, email accounts or calendars.

Table 3. Demographics based on boundary flexibility

	Flexible Boundary (n= 40)	**Non-Flexible Boundary (n= 25)**	**Sig**
Gender	Female – 19 (48%) Male – 20 (50%)	Female – 12 (48%) Male – 12 (48%)	No significant difference
Age	20-29 yrs – 5 (13%) 30-39 yrs – 7 (18%) 40-49 yrs – 16 (40%) 50-59 yrs – 11 (28%) 60+ yrs - 1 (3%)	20-29 yrs – 1 (4%) 30-39 yrs – 9 (36%) 40-49 yrs – 10 (40%) 50-59 yrs – 5 (20%) 60+ yrs - 0 (0%)	No significant difference
Marital Status	Married – 33 (83%) Divorced – 3 (8%) Widowed – 1 (3%) Single – 3 (8%)	Married – 24 (96%) Divorced – 1 (4%) Widowed – 0 (0%) Single – 0 (0%)	No significant difference
Spouse/ Partner Work Status	Full time – 24 (60%) Part time high – 5 (13%) Part time low – 1 (3%) Not employed – 3 (8%)	Full time – 19 (76%) Part time high – 3 (12%) Part time low– 1 (4%) Not employed – 1 (4%)	No significant difference
Parental Status	Parent – 32 (80%) Not a parent – 8 (20%)	Parent – 24 (96%) Not a parent – 1 (4%)	*
Youngest Child	Infant/toddler – 6 (15%) Preschooler – 2 (5%) Elementary age – 7 (18%) Middle/HS age – 10 (25%) College/ Indep – 7 (18%)	Infant/toddler – 7 (28%) Preschooler – 1 (4%) Elementary age – 3 (12%) Middle/HS age – 9 (36%) College/Indep – 4 (16%)	No significant difference
Eldercare Status	None – 23 (58%) Minimal – 12 (30%) Some – 4 (10%) Substantial – 0 Major – 0 (0%)	None – 21 (84%) Minimal – 1 (4%) Some – 2 (8%) Substantial – 0 Major – 1 (4%)	**
Org Tenure	11.59 yrs (8.86 std dev)	10.32 yrs (7.80 std dev)	No significant difference
Job Tenure	7.03 years (5.99 std dev)	7.80 yrs (9.01 std dev)	No significant difference
# of Cell phones	1.11 (.31 std dev)	1.10 (.30 std dev)	No significant difference
# of Email Accounts	2.73 (1.01 std dev)	2.65 (.77 std dev)	No significant difference
# of Calendars	2.03 (.89 std dev)	2.05 (.89 std dev)	No significant difference

NOTE: Percentages do not always total 100% due to non-responses.

* Significant at the .10 level; ** significant at the .05 level; *** significant at the, 01 level

Eldercare Status: Minimal (1-2 hrs/wk), Some (3-6 hrs/wk), Substantial (7-10 hrs/wk), Major (11+ hrs/wk) – 1 (3%)

Spouse/ Partner Work Status: Part time high = 20+ hrs/wk and Part time low < 20 hrs/wk

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

While the flexibility of boundaries is not directional, boundary permeability is directional. An employee could maintain a non-permeable work boundary (not letting personal tasks interfere during work time) but a permeable home boundary (letting work responsibilities intrude during non-work time). Therefore boundary permeability was assessed separately for both work and home. For the total respondents the average reported work boundary permeability was 3.29 and a 3.50 median and the average reported home boundary permeability was 3.46 with a 3.63 median. The median point was used to split the respondents into low vs. high permeability groups. Thirty six (55%) respondents are considered to have a permeable work boundary and 30 (46%) are considered to have permeable home boundary.

Once grouped into permeable and non-permeable for work and home boundaries, we examined whether there were differences in the demographic characteristics and technology usage. A comparison of the demographic characteristics of the respondents based on the permeability of their work boundary is presented in Table 4a and home boundary is presented in Table 4b.

Conventional wisdom might suggest there is a difference in the way men and women choose to integrate work and family demands. While there was no difference in the gender composition of flexible vs. inflexible boundaries or permeable vs. non-permeable home boundaries, there is a gender difference with regard to the permeability of the work boundary. Given that women are frequently characterized and depicted as multi-taskers (Powell & Craig, 2015) it was a bit surprising to find those who maintain a non-permeable boundary protecting work time are more likely to be women.

There was also a significant difference in the age of youngest child. While there was no difference on whether they had children or not, those employees who maintain a permeable work boundary tended to have younger children with 31% having a preschooler or younger compared to only 17% for the non-permeable work boundary employees. This may be because once children reach school age the structure of the school day does add a pseudo parent-child boundary. Aside from the occasional illness or school communication, the school day segments the child's day from the parent's. This separation may not occur for younger children who are not in school, thus requiring more work boundary permeability.

We should note there was not a significant difference in the respondents spouse/partner work status. It would seem likely that people who maintain a firm boundary between work and personal demands are able to do so because they have a spouse/partner who is able to deflect those demands. This was not found in the reported sample as there was no difference in the work status of a spouse/partner for those with a permeable versus non-permeable work boundary.

There was also a slight significant difference in the average organizational tenure between the two groups. Those employees who reported having less work boundary permeability have worked for their organizations longer, 13.26 years compared to 9.36 years for the work permeable boundary group. While we cannot assert any type of causality, those employees who keep a firmer boundary between work and their personal lives, were employed longer with their current organization.

As suggested in the vignettes in Table 1, technology can assist employees integrate or separate their work and personal lives. Centralizing all communication on one cell phone number, email account and calendar would be the epitome of integration with both work and home life managed seamlessly. The other extreme would be the setting up digital firewalls by maintaining separate work and home cell phones, email accounts and calendars. It was therefore somewhat surprising to see that there were no significant differences in the use of these technologies based on permeability of the work or home boundary. Neither of the hypotheses regarding the use of technology to support flexible (H1) or permeable (H3) boundaries were supported.

Youngest Child	Infant/toddler – 9 (25%) Preschooler – 2 (6%) Elementary – 3 (8%) Middle/HS – 13 (36%) College/Indep – 2 (6%)	Infant/toddler – 4 (14%) Preschooler – 1 (3%) Elementary – 7 (24%) Middle/HS – 6 (21%) College/Indep – 9 (31%)	**
Eldercare Status	None – 27 (75%) Minimal – 5 (14%) Some – 3 (8%) Substantial – 0 (0%) Major – 1 (3%)	None – 17 (59%) Minimal– 8 (28%) Some– 3 (10%) Substantial– 0 (0%) Major– 1 (3%)	No significant difference
Organizational Tenure	9.36 years (7.75 std dev)	13.26 years (7.99 std dev)	*
Job Tenure	6.02 years (5.54 std dev)	8.95 years (8.75 std dev)	No significant difference
Number of Cell Phones	1.12 (.31 std dev)	1.10 (.31 std dev)	No significant difference
Number of Email Accounts	2.75 (1.02 std dev)	2.62 (.77 std dev)	No significant difference
Number of Calendars	2.02 (.89 std dev)	2.08 (.88 std dev)	No significant difference

NOTE: Percentages do not always total 100% due to non-responses.
* Significant at the .10 level; ** significant at the .05 level; *** significant at the, 01 level
Eldercare Status: Minimal (1-2 hrs/wk), Some (3-6 hrs/wk), Substantial (7-10 hrs/wk), Major (11+ hrs/wk) – 1 (3%)
Spouse/ Partner Work Status: Part time high = 20+ hrs/wk and Part time low < 20 hrs/wk

The first set of hypotheses address whether there are differences in the levels of work-family conflict, job satisfaction and life satisfaction for employees who have flexible boundaries versus those who have non-flexible boundaries. As presented in Table 5, there is no statistical difference between the flexible and non-flexible groups on the examined dimensions of work-family conflict. Despite our belief that flexibility would allow employees to better balance their work and family demands, there does not appear to be evidence that the flexible boundary type reduced any form of work-family conflict. We have

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

no support for Hypothesis 2a, b or c. There was, however, a significant difference in job satisfaction. Those employees who have flexible boundaries were significantly more satisfied with their jobs than employees who did not have flexible boundaries. There is partial support for H2d since flexibility was associated with higher job satisfaction but there was no difference for life satisfaction.

Table 4b. Demographics based on permeability of home boundary

	Permeable (n= 30)	**Non-Permeable (n= 35)**	
Gender	Female – 13 (43%) Male – 15 (50%)	Female – 18 (51%) Male – 17 (49%)	No significant difference

Table 5. Differences in study variables based on boundary flexibility

	Flexible Boundary (n= 40)	**Non-Flexible Boundary (n= 25)**	
Time Based Work Family Conflict	2.48 (.72)	2.54 (.59)	No sig diff
Strain Work→Family Conflict	2.63 (.75)	2.80 (.73)	No sig diff
Strain Family→Work Conflict	1.93 (.50)	2.14 (.66)	No sig diff
Job Satisfaction	3.79 (.76)	3.28 (.73)	**
Life Satisfaction	3.83 (.81)	3.72 (.54)	No sig diff

Mean (standard deviation)
* Significant at the .10 level; ** significant at the .05 level; *** significant at the, 01 level

The next set of hypotheses dealt with the permeability of the work boundary. It was hypothesized that individuals with permeable work boundaries would have less time work-family conflict but more strain-based family→work conflict. The strain component was thought to be so great it would impact both job and life satisfaction. As presented in Table 6, we found that employees with permeable work boundaries did have significantly less time based work-family conflict but there was not a significant difference for strain family→ work nor job and life satisfaction. Hypothesis 4a was supported but there was no support for Hypothesis 4b or c.

Table 6. Differences in study variables based on work boundary permeability

	Work Boundary Permeable (n= 36)	**Work Boundary Non-Permeable (n= 29)**	
Time Based Work Family Conflict	2.35 (.65)	2.69 (.58)	**
Strain Family→Work Conflict	2.05 (.57)	1.96 (.58)	No sig diff
Job Satisfaction	3.67 (.80)	3.49 (.77)	No sig diff
Life Satisfaction	3.88 (.62)	3.67 (.80)	No sig diff

Mean (standard deviation)
* Significant at the .10 level; ** significant at the .05 level; *** significant at the, 01 level

The final set of hypotheses dealt with the permeability of the home boundary. It was hypothesized (H5a) that having a permeable home boundary would decrease the time dimension of work-family conflict. Not only was this not the case, the opposite was significant. Those respondents who reported having a permeable home boundary also reported experiencing higher time-based work-family conflict. We also hypothesized (H5b) that having a permeable home boundary would increase the strain work → family conflict which was supported. As presented in Table 7, despite the increased time and strain work→ family conflict for those with a permeable home boundary, there was not a significant difference in their reported job or life satisfaction, thus there was no support for Hypothesis 5c.

This research posits that flexibility and permeability should be examined as distinct constructs. As summarized in Table 8, we found limited support for the proposed hypotheses. However, the hypotheses failed to address the various combinations of boundary flexibility and permeability. We found that

Table 7. Differences in study variables based on home boundary permeability

	Home Boundary Permeable (n= 30)	**Home Boundary Non-Permeable (n= 35)**	
Time Based Work Family Conflict	2.80 (.59)	2.25 (.57)	***
Strain Work→Family Conflict	2.95 (.71)	2.55 (.71)	**
Job Satisfaction	3.62 (.87)	3.57 (.72)	No sig diff
Life Satisfaction	3.64 (.75)	3.91 (..66)	No sig diff

Mean (standard deviation)

* Significant at the .10 level; ** significant at the .05 level; *** significant at the, 01 level

respondents did report having flexible but not permeable boundaries and vice versa. In fact, of our 65 respondents, we had at least five in each of the eight combinations of flexible, work permeable and home permeable boundary category. ANOVA was used to examine whether there are differences in the three types of work family conflict over the eight boundary combinations. As presented in Table 9, there are significant differences. An examination of the three dimensions of work-family conflict based upon combinations of flexibility and work and home permeability doesn't point to a clear winner but does highlight a losing combination. Individuals who have an inflexible boundary but maintain both permeable work and home boundaries reported experiencing significantly more time-based work-family conflict and strain based family→work conflict. There was also bad news for individuals who have an inflexible boundary but maintain a permeable home boundary and non-permeable work boundary. They reported experiencing significantly more time-based work-family conflict and strain based work→ home conflict. When the home boundary is permeable and work is allowed to intrude, this appears to cause conflict. Conversely, those respondents who have the most separation between their work and home roles by having no flexibility and neither permeable work nor home boundaries, reported the lowest amount of strain work → home and home → work conflict.

ANOVA was also used to examine whether there are differences in job satisfaction and life satisfaction over the eight boundary combinations. The results are presented in Table 10. Despite the significant differences in the studied variants of work-family conflict, there is not a significant difference in the job or life satisfaction based on the eight combinations of flexible and permeable boundaries. Given the amount of prior research that has found such a strong negative impact of work family conflict on satisfaction (Cloninger, Selvarajan, Singh and Huang, 2015; Frone, Russell & Cooper, 1992), this result was unexpected.

DISCUSSION

Like Kreiner, Hollensbe and Sheep (2009), the belief that the work-home boundary is a social construct that can be controlled and reshaped by the individual is the most appealing research question. Understanding boundary types and how their usage may contribute to the work and personal outcomes is the first step in helping employees consciously shape their boundaries to find the elusive work-life balance. While prior research has generally found flexibility to be positive but permeability to be negative, this research posits that flexibility, home boundary permeability and work boundary permeability are distinct

Table 8. Summary of hypotheses

	Result
H1: Respondents who have a flexible boundary will use one integrated calendar.	Not supported
H2a: Respondents who have flexible boundaries will have less time based work-family conflict than those who have inflexible boundaries.	Not supported
H2b: Respondents who have flexible boundaries will have less strain based work→ family work-family conflict than those who have inflexible boundaries.	Not supported
H2c: Respondents who have flexible boundaries will have less strain based family→ work-family conflict than those who have inflexible boundaries.	Not supported
H2d: Respondents who have flexible boundaries will have higher job and life satisfaction than those who have inflexible boundaries.	Partially supported Support for job satisfaction but not life satisfaction
H3: Respondents who have permeable boundaries will use one, integrated cell phone and email account.	Not supported
H4a: Respondents who have a permeable work boundary will have less time based work-family conflict than those who have a non-permeable work.	Supported
H4b: Respondents who have a permeable work boundary will have more strain based family→ work conflict than those who have a non-permeable work.	Not supported
H4c: Respondents who have a permeable work boundary will have lower job and life satisfaction than those who have a non-permeable work.	Not supported
H5a: Respondents who have a permeable home boundary will have less time based work-family conflict than those who have a non-permeable work.	Not supported The opposite was found. Permeable home boundary report significantly higher time based WFC
H5b: Respondents who have a permeable home boundary will have more strain based work→ family conflict than those who have a non-permeable work.	Supported
H5c: Respondents who have a permeable home boundary will have lower job and life satisfaction than those who have a non-permeable work.	Not supported

constructs and should be examined as such. While few of our hypotheses were supported, this research does offer evidence that boundary flexibility and work/home permeability result in different experiences. Although flexibility did not seem to have an impact on the examined dimensions of work-family conflict or life satisfaction, the ability to have some control over when and where work is completed did result in higher job satisfaction.

The findings concerning boundary permeability were a bit surprising. As hypothesized, having a permeable work boundary was associated with less time based work-family conflict however having a permeable home boundary was associated with higher time based work-family. Addressing personal issues during work time allows individuals to balance their time demands however addressing work issues during personal time contributed to more time stress. Similarly, a permeable work boundary did not contribute to more strain based family→work conflict but a permeable home boundary did contribute to more strain based work→ conflict. It appears that the greater source of stress comes from permeability of the home boundary. It should be noted that we examined whether boundaries were permeable but did not measure the frequency or intensity of non-role interference. It is possible that personal interferences during work time, such as a call with a teacher, were less frequent or required less time than the type of work interferences during personal time. In addition to examining work and home boundary permeability as separate constructs, future research should examine the frequency and intensity of the intervening activity.

Although the sample was small, we were able to examine differences in the eight combinations of flexibility, work permeability and home permeability boundaries. Those respondents with inflexible and

Table 10. ANOVA Results on Job and Life Satisfaction Based on Boundaries

	Job Satisfaction	Life Satisfaction
Not Flexible, Home – Not permeable Work – Not permeable (N=11)	3.92	3.88
Not Flexible, Home – Not permeable Work – Permeable (N=12)	3.67	4.11
Not Flexible, Home – Permeable Work - Not permeable (N=8)	3.58	3.50
Not Flexible, Home – Permeable Work – Permeable (N=9)	3.96	3.67
Flexible, Home – Not permeable Work – Permeable (N=5)	3.53	3.70
Flexible, Home –Not permeable Work - Not permeable (N=8)	3.42	3.65
Flexible, Home – Permeable Work - Not permeable (N=6)	3.17	3.33
Flexible, Home – Permeable Work – Permeable (N=6)	3.00	4.22

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

both permeable work and home boundaries reported experiencing the highest time and strain home→work conflict. Those respondents who resist the boundary breeching offered by mobile technology and have neither flexibility nor permeability in their home and work boundary reported some of the lowest strain-based work→family and family→work conflict.

While this research offers evidence that flexibility and work/home permeable boundaries result in different outcomes, the limited sample size negated more in-depth analysis regarding boundary configurations. Surprisingly, technology use in the form of number of cell phones, email accounts and calendars did not vary by flexible or permeable boundary. Future research should examine the actual technology usage and the technology fit of individuals with these boundary configurations. In addition to replicating this research with a larger sample, researchers may also want to incorporate the extent to which an individual's particular boundary fits their boundary preference. While an employee may prefer work-home segmentation, their job, supervisor or organizational culture may demand a level of integration, which may contribute to negative outcomes. Other researchers have addressed boundary fit (Adkins & Premeaux, 2014; Daniel & Sonnentag, 2016; Derks, Bakker, Peters & van Wingerden, 2016; Kreiner et al. 2009; Piszczek, 2017) but have not used the expanded boundary constructs suggested in this research. Future research should address boundary fit and the impact on work and personal outcomes.

This research suggests that future work on work-home boundaries should incorporate both the permeability of the home and work boundary as a separate construct from flexibility. Permeability can also be further refined. Integrating work and home can be in the form of multi-tasking (handling tasks simultaneously) or time fragmentation (switching between tasks) (Powell & Craig, 2015) and theses forms may contribute to different stress outcomes for different individuals.

While this study and the vast majority of the boundary research has focused on the individual, there are also organizational, legislative and regulatory dimensions to the work-home interface (Piszczek & Berg, 2014). While employees may have preferences for boundary controls, their role, organization, supervisor and/or customers may have different expectations. While practitioners have given flexibility attention, the organizational perspective on permeable boundaries has not been examined. Whether through policy, cultural norms or training, organizations have the potential to help individuals use technology in a way that helps them balance work and personal responsibilities.

Mobile technology has changed the way we work and live. By eliminating temporal and physical boundaries, it is up to employees to manage their own psychological boundaries. This exploratory research offers a new work-home boundary framework. Unlike prior research, we need to think of both flexibility and permeability in our boundaries and recognize that permeability may vary for work and home. Although there were limited differences in the demographics of professionals with different boundary types, there were significant differences in their work-family conflict. Understanding and consciously choosing to right boundary configuration is a critical area of inquiry in a mobile world. The eight configurations of flexibility and work/home permeability identified in this paper should help direct future research and our continuing quest for work-life balance.

Chapter 98
Future of Education in Industry 4.0:
Educational Digitization – A Canadian Case Study

Rania Mohy El Din Nafea
Seneca College, Canada

Esra Kilicarslan Toplu
Seneca College, Canada

ABSTRACT

With the developments in technology and innovation, the manufacturing, workforce, training, and educational systems were affected. Facing the fourth industrial revolution, academics are researching the possible changes that might arise in education and skills of the future workforce. As the workplace develops, new competencies will surface. With this context in mind, the authors initiated this research. A detailed questionnaire was prepared as a pilot study to comprehend students' views on the use of technology in classrooms and its impact on their learning experience and engagement. Knowledge of their views allowed the authors to draw inferences as to the skills and competencies of future students and whether they would match Industry 4.0. Furthermore, a gap analysis was conducted, whereby the existing situation at a Canadian higher educational institution was compared to the desired situation, and recommendations were put forward.

INTRODUCTION

Industrial revolutions were affected by the developments in technology and innovation. The 1st revolution was caused by mechanization, the 2nd was caused by the usage of electrical energy, and the 3rd industrial revolution was caused by electronics and automation (Benešová and Tupa, 2017, p.2195-2196). With these industrial revolutions not only were manufacturing systems affected, but also the workforce, training & educational systems.

Currently, industry is transforming to a fully digitized manufacturing system, and we are facing the 4th industrial revolution, Industry 4.0. With this new industrial revolution, the workforce and the training & educational systems will be impacted. This led academics to research the possible changes that might arise in the education and skills of the future workforce. Future workforce who are today's students will encounter a more globalized, automated, virtualized and networked world (Motyl et al., 2017, p.1502). As the workplace changes rapidly, new competencies will surface, rendering them essential skills for student competitiveness and employability in the near future. With this context in mind, the authors decided to initiate this study, whereby those new competencies and skills will be researched, and recommendations given as to the required changes in the higher educational system.

INDUSTRY 4.0

Developments in both technology and innovation are the main factors affecting industrial revolutions, and these revolutions have brought about significant changes in our way of working and living. Throughout history there have been three industrial revolutions and we are currently undergoing a transformation towards the fourth industrial revolution.

Industry 1.0 exchanged the human power with the power of steam. When James Watt introduced the steam engine in the 18th century, with the mechanization, production and the transportation systems transformed. Consequently, there was an important increase in productivity.

Industry 2.0 was caused by the electrical energy and the mass production about a hundred years later. When Henry Ford introduced the assembly line, with the mass production and the usage of electrical energy, there was a significant decrease in costs and a further increase in productivity.

Industry 3.0 was in the 1960s and came with the introduction and usage of computers, which introduced the world to a faster and more capable form of processing capability. This marked the beginning of the information technology era for industry.

Industry 4.0 refers to the next developmental stage in the manufacturing industry, and was first introduced by the initiative made by academics, industrials and the German Government. Its aim is 'to strengthen the competitiveness of manufacturing industry in the country by computerization' (Baena et al., 2017, p.74).

With this high-tech strategy, which converges the industrial production and information and communication technology (ICT), industry is going through a transformation to full digitization and intelligent production. In this concept, the Internet of Things (IoT), the 'Industrial Internet', 'Cloud-based Manufacturing' and 'Smart Manufacturing' are stated as the drivers of Industry 4.0 (Erol et al., 2016, p.13).

Hermann et al. (2016) defined Industry 4.0 as: "Industry 4.0 is a collective term for technologies and concepts of value chain organization."He further explains that; within the smart factories of Industry 4.0, cyber physical systems (CPS)will monitor the processes, and make decisions while communicating and cooperating with other cyber physical systems and humans in real time. In addition, with the Internet of Services (IoS), both internal and cross organizational services will be utilized by participants of the value chain (Rossit et al., 2018, p.1).

Similarly, Gilchrist stated that "businesses will build global networks to connect their machinery, factories, and warehousing facilities as cyber-physical systems, which will connect and control each other intelligently by sharing information that triggers actions" (Gilchrist, 2016, p.195). These cyber-physical systems will then generate the enhancements in the manufacturing processes as a whole, through engi-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

neering, material usage, supply chains and product lifecycle management which is called the horizontal chain. According to Gilchrist; "the vision held is; embedded horizontal systems are integrated with the vertical business processes, (sales, logistics, and finance, among others) and associated IT systems" (Gilchrist, 2016, p.196). As such, Industry 4.0 will not only change the manufacturing processes, but also the entire value chain, including the suppliers, the manufacturers, and the associated workforce.

Erol et al. (2016) advises that to identify their actions or projects in order to adapt to the changing environment, companies need to know where they are, identify their current situation with regard to Industry 4.0, but companies usually face problems in determining their state. Based on different research sources, there are some models and roadmaps that have been suggested. Schumacher et al, (2016) discussed the German Government's model for assessing Industry 4.0. There are nine dimensions which include; strategy, leadership, customers, products, operations, culture, people, governance and technology. Additionally, as Tortorella and Fettermann (2018) quoted from Chukwuekwe et al. (2016), the vital drivers of Industry 4.0 are suggested as; cloud computing, 3D printing technology, CPS, Internet of Things (IoT), Internet of Services (IoS) and big data. To move forward with Industry 4.0, companies should comprehend what these concepts mean to their business and how they might lead to a total transformation through a step-by-step analytical approach.

Now, there is worldwide effort and progress to improve the efficiency and productivity in manufacturing processes by integrating the latest developments in information and communication technology (ICT). Initiatives to link the ICT in the industrial manufacturing systems are being carried out in some of the most advanced economies (Baena et al., 2017, p.75). Despite all of Industry 4.0's promise, a highly skilled workforce has been the key factor to countries' and companies' success for decades, whereby significant challenges are being faced in hiring and retaining the necessary skilled workforce. Organizations understand that the changes that are associated with Industry 4.0 also alter the competency requirements of the highly skilled workforce. Many government institutions have started to evaluate the impact of adopting the aforementioned technologies on their countries. The result is a concern for the many challenges and changes in the future training needs and education of the workforce.

SKILLS NEEDED IN INDUSTRY 4.0

When talking about the 4th industrial revolution, it is said that factories are becoming more intelligent and flexible, and different sub-systems will be linked to each other (Wermann et al., 2015, p.1). Machines will be connected to the factory IT systems, which will in turn be linked to other parts of the value chain such as plants, fleets, networks and human beings, and will continually share information about the level of stocks, troubles, difficulties or faults encountered, and/or modifications in the orders. This means there will be full traceability which will bring about the possibility of improving the overall product and service quality (Deloitte, p.8).

Based on the changes in the manufacturing processes, various jobs will disappear and many new jobs will emerge. Industry will face the extinction of physically demanding positions as these jobs will be replaced by machines (Benešová and Tupa, 2017, p.2200-2201).Erol et al. stated that future employees will focus on creative, innovative and communicative activities rather than routine activities, as routine activities including monitoring duties, will all be performed by machines (Erol et al., 2016, p.14). Consequently, the key factor in the success of these intelligent factories will be the skills and the qualifications of their workforce.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hecklau et all. categorized the competencies in Industry 4.0 into four main groups; (i) technical competencies (state-of-the-art knowledge, technical skills, process understanding, media skills, coding skills, understanding IT security), (ii) methodological competencies (creativity, entrepreneurial thinking, problem solving, conflict solution, decision making, analytical skills, research skills, efficiency orientation), (iii) social competencies(intercultural skills, language skills, communication skills, networking skills, teamwork skills, negotiation skills, ability to transfer knowledge, leadership skills) and (iv) personal competencies (flexibility, ambiguity tolerance, motivation to learn, ability to work under pressure, sustainable mindset, compliance) (Hecklau et al.,2016, p.4).

Motyl et al. categorized the skills of engineers into two categories; (i) hard skills (including numerical and higher mathematical knowledge; problem solution skills, creativity and design skills; researching and experimenting skills, information processing, computer programming, and know-how of using specific software, awareness of industry standards, and comfortable with using computers) and (ii) soft skills (strong analytical thinking, communication, teamwork and leadership skills)(Motyl et al., 2017).

According to Erpenbeck and Rosenstiel, Erol et al. categorized the workforce competencies for the future production systems like; (i) personal competencies (solution-oriented attitude; creativity, out-of-the-box thinking), (ii) social/interpersonal competencies (teamwork skills; negotiation skills, role taking and making skills), (iii) action-related competencies (problem analysis and solving; data analysis and interpretation; method, tool selection and use) and (iv) domain-related competencies (application of lean thinking and methods in manufacturing; application of conceptual modeling methods, e.g. data flow, material flow and process modeling; application of Information and Communication Technology for material tracking and worker tracking) (Erol et al., 2016, p.14-17).

In the World Economic Forum (WEF) "The Future of Jobs" report, ten key skills which will be in demand by future companies were listed. The qualifications were not classified but most of them are soft skills, the skills listed are: complex problem-solving, critical thinking, creativity, people management, coordinating with others, emotional intelligence, judgement and decision-making, service orientation, negotiation and cognitive flexibility(WEF, 2017).

Moreover, as technological developments are evolving at a very high-speed, it is certain that digital literacy will be the key skill that everyone should consider as an asset in the era of Industry 4.0. As a matter of fact, in addition to all these skills and qualifications listed, many researchers have stated that digital literacy will be an essential and primary skill for the future workforce (Motyl et al., 2017, p.1502-1503).

Digital literacy consists of all the skills that are related to the digital world. After a review of existing literature, Do & Huynh (2017) described digital literacy as "capabilities ranging from technical skills (such as those used in coding), to digital citizenship, to the ability to identify fake news". Cain & Waller (2018) also suggested that future workforce must have 'digital dexterity' which is defined as 'the ability and desire to use existing and emerging technologies for better business outcomes'. While the digital literacy and digital dexterity demanded from the workforce will certainly differ across the sectors and the professions, as people have been the heart of all digital business transformations, only the most digitally dexterous will thrive.

Rapid digitization has made digital literacy essential for today's and tomorrow's workforce. This means that both current workers whose jobs will be automated and may become obsolete, and also today's students who will be the future workforce will be affected. Many new jobs will be generated and many will adjust to include a greater degree of interaction with digital technologies. It is anticipated that a basic level of digital literacy will be necessary for the majority of the workforce, and demand for advanced level of digital literacy will rise (Huynh & Do, 2017, p.9).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In a time of precipitous change due to heightened technological developments, Huynh and Do further explain that, digital literacy can be recognized as an economic necessity (Huynh & Do, 2017, p.9). Developments in technology are leading industries to redesign their operations, their markets, their products, and their way of doing business, and even for low-level jobs, a basic level of digital literacy will be expected.

There is an increasing reliance on digital technologies across a wide range of industries, which will result in a broad range of career paths for the qualified workforce equipped with technical and digital skills.

According to all the researches and studies, it is definite that Industry 4.0 is more than the technology it is bringing. As workforce is a critical element in digital transformation, the skills and qualifications of the human capital will become increasingly eminent. Today's students, which will be the future workforce and the human capital for companies, will be working in a more globalized, automated, virtualized and networked world (Motyl et al., 2017, p.1502), and their digital literacy and dexterity will be the main mechanism that will empower organizations to utilize these critical digital developments.

As stated above, because the key factor will be the skills and the qualifications of the workforce, organizations will compete to hire the best and strive to find the right people with well-suited skills. The demand for these skills and qualifications will undeniably be higher when compared to the present. This will result in the need for changing and adapting the existing curricula and the tools used in the existing educational system to create a new format (Benešová & Tupa, 2017, p.2196) or blueprint, which will equip students with the essential employability skills required to remain competitive in industry 4.0.

FUTURE OF EDUCATION

Education is regarded as an essential prerequisite and a foundation to reforms in any country (Nafea & Kilicarslan Toplu, 2018, p.156). Education evolves in response to changes in both society and industry, providing the valuable human capital that organizations need to thrive in the future. As such, upgrading and modernising educational systems through revisiting the essential employability skills is imperative. Interestingly enough, this upgrade is long overdue and has been called for since the late 90s when researchers realized that school systems, public and private, are lagging behind the transformation in learning that is evolving outside them (Ives & Jarvenpaa, 1996, p.33).

Analyses and predictions about the future of work mostly put forward the impact of automation and new types of jobs, and not just routine jobs, both blue-collar and white-collar jobs will be affected and redesigned by an automated workplace. Apparently, today's students should be prepared for the careers that do not exist yet. This means that with new challenges arising in a changing environment, there will be proliferating demand for new skills and qualifications (Enke et al., 2018, p.272). As Erol et al. stated in the last decade, lean management was the most prominent subject that was taught, however, for the future prospective digitalized and intelligent production systems' focus should be on the demanded skills and qualifications (Erol et al., 2016, p.13). In order to meet the qualifications and skills of Industry 4.0, educational systems need to evolve, and consider several promising trends like Elbestawi et al. listed: "opportunities to learn at diverse times and places; personalized learning based on student's capabilities; use of new learning devices, tools and resources; remote engineering labs; implementation of project-based and problem-based learning approaches; use of experiential and collaborative learning; student involvement in curriculum design; and increased mentoring approaches" (Elbestawi et al., 2018, p.252).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

With the new improvements and developments in technology and the expected changes in the workplace, there is also a shift toward more practical and skills-based education. Many higher education institutions try to prepare their students for the change through emphasizing the ability to use theoretical knowledge in practice by bringing real-world experience into the higher education experience and by providing access to the tools, environments and work methods that students will use when they graduate and start working (Morgan & Thayer, 2018). Yet the question remains, is this theoretical knowledge sufficient to induce the required change and instil the needed skills?

When Industry 4.0 is taken into consideration, future engineers need to enhance their professional, social, methodical and personal competencies. According to Simons et al. "they need an interdisciplinary understanding of systems, production processes, automation technology, information technology, ergonomic principles and business processes" (Simons et al., 2017, p.83). While future engineers will have a broad view and comprehensive knowledge about complex production systems, they also need to develop the skills needed for cooperation and communication in interdisciplinary groups. Although there are different approaches like seminars, business games and case studies where students meet the managers to solve existing problems, learning factories have been advised by many researchers (Enke et al., 2018, p.267-268; Chryssolouris, 2016, p.46-47; Mavrikios et al., 2013, p.475-478; Schallock et al., 2018; p.28).

Learning factories can be accepted as forms of real factories which are used for education and training purposes. When the possibilities of practical application of manufacturing principles are evaluated, learning factories have been a vital facility for educating students and professionals. As Baena et al. (Baena et al., 2017, p.74) quoted, learning factories are highly complex learning environments, which allow the advancement of competences (Tisch et.al, 2015), that are linked to training, education and research in favour of Industry 4.0 (Abele et al., 2015).

The aim of learning factories has been stated as modernizing the learning process and bringing it closer to industrial practices. They are an important way to practice technical knowledge and have been used for educational purposes, training and research. They allow learning of the fundamentals of industry 4.0 such as cyber-physical systems, smart factories, robotics, artificial intelligence, and internet of things (IoT) (Elbestawi et al., 2018, p.250). As technological developments speed up, learning factories are being used at a more rapid rate by higher educational institutions that are constantly struggling to find new ways of connecting theoretical knowledge to practical implications by using real cases and onsite technology (Mourtzis et al., 2018, p.130).

As an example; the learning factory at the W. Booth School of Engineering Practice and Technology at McMaster University in Canada provides students, industry employees, and researchers; an experiential learning laboratory that allows and empowers its users to understand, learn and apply modern manufacturing approaches such as Industry 4.0, IoT, and additive manufacturing (Elbestawi et al., 2018, p.254).

Education and training the workforce for industry 4.0 is something that has to be addressed across all levels of education. As technology is rapidly shifting the way industries and companies interact and function, higher education institutions should also alter the way they train and teach students in preparation for the future. Instead of focusing on theory, educational practices should emphasize application and experiential learning. The competences required to succeed in industry 4.0 should become part of vocational education. Also, it can be expected that degree apprenticeships and co-op programs with internships will become more and more attractive in the future. Higher education institutions at large are urged to respond much more quickly to the pressing need of preparing tomorrow's workforce (WEF-2017, p.8-9).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Having said that, according to recent studies, although there are many skills that have been put forward by many researchers, the most vital and primary skill seems to be digital skills. Future workforce must be highly proficient in digital literacy skills in order to understand, manage and work in the system. The future workplace will require extensive and continual encountering with technology. With this in mind, technology should be embedded throughout the educational experience. Besides the basic digital literacy skills, educational institutions should aim to go the extra mile and coach students on how to apply and innovate using technology so they can play an active role in shaping the tools of the future (WEF-2017, p.8-9).

Preparing the future workforce for the digital world with advanced knowledge and requisite skills must be the future plan for all educational institutions across the world. Canada's continued economic growth will also require a digitally literate workforce for both technical and non-technical jobs. That's why the Information and Communications Technology Council (ICTC) defined five key technologies which will steer change in the Canadian economy: (i) virtual and augmented reality, (ii) fifth-generation mobile technology, (iii) 3D printing, (iv) blockchain, and (v) AI. Citing from ICTC 2017, Walker et al. (2018) stated that many of these mentioned, recent technologies are well on their way to transforming industries like transportation, financial services, manufacturing, retail, robotics and e-commerce etc. (Walker et al., 2018, p.5154).

Technological advancements are leading industries to change their operations, their markets, their products, and their ways of doing business. In order to adapt Canadian graduates to work effectively across these industries, equipping them with a range of digital skills is critical.

RELATIONSHIP OF TECHNOLOGY TO WORKPLACE READINESS

Literature suggests that there is a strong relationship between technology and workplace readiness. Several countries have realized this connection and have been preparing their students accordingly for the past decade now. In a research based in the USA by Piliouras et al., the authors wrote about their experiences that they learned by using and teaching technology at the Academy of Information Technology (AITE) High School. AITE is a public high school that offers its students a technology-rich learning environment. The researchers refer to a large-scale survey of employers conducted by the US. Department of Labour in 1989 to find the most important workplace skills and competencies. They identified three skill types and five attributes as essential competencies. These attributes included technology proficiency, which they defined as "the ability to use a variety of technologies to solve problems, and to select, use, troubleshoot and maintain technology related software, hardware and systems". Using these results, the authors expanded their research model to include Information Literacy, Media Literacy and Information and Communication Technology (ICT) literacy. Based on the directives released by the US Secretary of Education in 2010, the report identified five goals that need to be addressed at a national level to recreate the education system. One of those cornerstones was "infrastructure: access and enable, which states that all students and educators must have access to a comprehensive infrastructure for learning when and where they need it" (Piliouras et al., 2014).

The article (Piliouras et al., 2014), goes on to provide empirical evidence on the use of technology as a learning tool in a high school in Stanford, Connecticut that serves around 650 students. The school provides a dynamic preparative environment that incorporates 21st century learning expectations based on the National Education Technology Plan (NETP) of the USA. The research documents teacher's and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

students' experiences with the use of technology throughout high school and concludes with a series of 'key lessons' including that technology is essential because it helps students access information in a faster and quicker way, making them more efficient and effective. It can also aid students in choosing future careers and envisioning possibilities in technology-related disciplines. It can "significantly improve communications between teachers and students." Finally, they concluded that "when directed towards a common goal, technology experiences can help students develop soft skills – such as helping others, teamwork, collaboration, and group research. Peers can teach each other difficult subject matters using strategic learning [and] schools can encourage learning after-hours by supporting technology clubs and activities that develop technology and work readiness skills".

The research also stresses the importance of having a learning management system (LMS) from an early age and its role in facilitating the on-going assessment of learning outcomes. More importantly, LMS provides a virtual learning environment that makes it easier to reach a larger and more diverse audience, thereby creating a respectful online culture, which allows students to express themselves freely and without judgement. This has several advantages when compared with the traditional, physical setting, where students are more conscious of their surroundings and each other's behaviors, which may present a distraction to their learning process. Although the paper supports the use of technology in education and provides evidence that this model is followed by other high schools in the US as steps are being taken to achieve the National Education Technology Plan, it fails to outline how technology is used by students with certain disabilities and if measures are being taken for their accommodation.

In Germany, the situation is slightly different. A research conducted in the University of Oldenburg to gain an understanding of the situation in Higher Education institutions is presented. Bond et al. (2018), have examined student's (n=200) and teacher's (n=381) perceptions on the use of digital tools, in light of the importance of digitization recognized by German policy makers. Bond et al., state that nearly all (99.4%) of German school students have a computer at home. On average weekdays, students spend 114 minutes using technology at home, but they only spend 14 minutes using technology at school per day, which is lower than the OECD average. The authors provide evidence that the German government seems committed to the digitization of the Higher Education sector through their allocation of a hefty budget and commitment to a national digital agenda from 2014 to 2017. Authors also inform that digitization is accepted as a way to facilitate knowledge sharing and innovation in science by the federal government. In addition, the federal government also expects its citizens to be digitally literate to fully participate in education and society (Bond et al., 2018).

The university being researched was established in 1973 and houses over 15,600 students and more than 1,900 faculty. University top management believe in an institution-wide implementation of digitization to enhance on campus learning. The researchers used two separate surveys addressing the same issues to collect data from both students and teachers. Similar to our research, the results were descriptive in nature and were not compared statistically. The teacher research was conducted over 6 different faculties / colleges using a Likert scale similar to ours. Results showed that the use of learning management systems and related discussion forums was the predominant form (80%) of technology used on campus. Other tools, including, collaborative reference management software (61%), video-conferencing tools (52%) and institutional cloud storage (62%) were moderately used. On the other hand, student perception showed a different truth… Use of computers off campus and Stud.IP on a daily basis accounted for 84% of students. Yet, other tools, such as instant messaging and lecture recording were found to be used rather irregularly. According to the authors this shows that; tools like virtual seminars, online exams and professional networks are not used frequently. They also state that; with the data collected, it is not

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

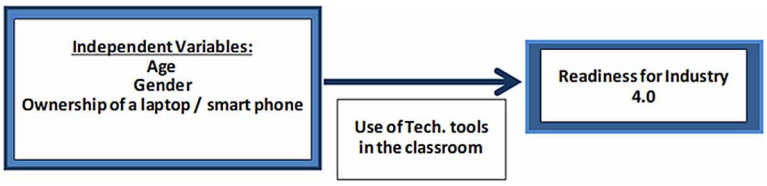
possible to say why these tools are not being used. It may be because of not wanting or not being able to use the tools (Bond et al., 2018). Findings show that the use of technology is centered around the use of 'logistics in university study' rather than content creation or collaboration activities. Students were found to be ill-prepared for working in collaborative environments.

This aligns with findings from another study by Margaryan et al. (2011), which focused around the use of educational technology by university teachers in the UK. The results reveal three main issues: "a lack of digital skills, systematic problems, and a reluctance to change". Accordingly, recommendations in both researches seem to be similar… Ongoing professional development sessions must be made available to faculty to learn and experiment with the applications and benefits of new technology. Forums should be held where faculty members can discuss their experiences with new tools, learning lessons and tricks. This will encourage knowledge transfer between faculty members and create a network of shared experiences and best practices. This can also be done through the creation of forums where constant, on-going, unfacilitated discussions can take place. Finally, educational institutions need to provide incentives for the use of technology tools in classrooms to create a more advanced and digitized learning experience for students. Finally, top management support is imperative for these initiatives to succeed. Digitization needs to be part of the strategic outlook of colleges and universities. It needs to be transformed into the core competency of higher educational institutions.

RESEARCH ANALYSIS AND FINDINGS

With the afore-mentioned literature in mind, it was obvious that the external stakeholders of educational institutions including industry partners and suppliers are demanding a more digital and competent workforce. As such, it was imperative that the authors understand and gauge the viewpoints of the internal stakeholders of the educational process – namely students. Accordingly, a detailed questionnaire was prepared as a pilot study to comprehend students' views on the use of technology in classrooms and its impact on their learning experience and engagement. Knowledge of their views can allow the authors to draw inferences as to the skills and competencies of future students and whether they would match industry 4.0. Furthermore, a gap analysis between the employability skills and the current situation can be conducted, whereby the existing situation at Canadian educational institutions can be compared to the desired situation and recommendations can be put forward.

Parts of the questionnaire used were extracted from the 'Technology Implementation Questionnaire'. This questionnaire is part of a project conducted by the Centre for the Study of Learning and Performance (CSLP) at Concordia University in Montreal, Quebec in collaboration with the Eastern Townships School Board and the Sir Wilfred Laurier School Board. Studying classroom processes in cooperation with the teachers, the students and the administrators, is one of the goals of the CSLP.



The questionnaire compiled by the researchers was distributed to 112 students in a higher educational institution in Toronto, all pursuing a 4-year bachelor program in the area of International Business or Commerce. The sampling method used was a convenient sample since the population sampled was accessible by the authors given their profession as university / college professors in Toronto, Canada. Nevertheless, there was minimal interference by the researchers in the data collection phase. A detailed information letter, and consent form were prepared for student review and approval. Participants were made aware that participation was on an anonymous and voluntary basis. The questionnaires were linked

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

with an alpha-numeric code to a master list safekept with one of the primary researchers. All data was transformed into digital format and hard copies have been destroyed for security and anonymity reasons.

The questionnaire was divided into two parts. The first part was designed to collect some primary information about the respondents including their age and gender, followed by four questions designed to gauge the respondent's familiarity with the use of different types of computer and information technology hardware and software as well as some terms associated with technology. Since this is a pilot study that might be redefined in the future based on the results of the current questionnaire, the authors have decided to use 'Readiness for Industry 4.0'as the only dependent variable to be studied with the use of technology tools in the classroom as the moderating variable and three main independent variables as shown in Figure 1.

Figure 1.

The age of the respondents ranged between 20 – 40, with 67% (75 students) of the participants within the age of 20 – 30 years and 33% (37 students) between 30 – 40. The gender distribution of the convenient sample was 72% women (80 students) and 28% males (32 students), which may be an indicator that females are more proactive and seize the opportunity to get their voices heard. More inferences will be made between gender and age and the moderating and dependent variables mentioned above as the questions are analyzed in detail. The first question asked students to indicate which of the given devices (desktop or laptop; smart phone; tablet; e-book reader; MP3 player; video game console; other) they owned. It was important to understand the level of technology students and millennials deal with on a daily basis and are exposed to. This will give us an indication as to their comfort level with technology.*90% of participants (100 students) indicated they owned a desktop / laptop, 100% of students own a smart phone, 36% (40 students) own tablets, only 9% (10 students) indicated that they owned readers and finally 24% (27 students) indicated their ownership of a video console game of some sort. It is worth noting that all 27 students were males!* No female participants indicated ownership of a video console.

Following this knowledge, participants were asked which activities they perform regularly by checking all that apply. Activities were listed as: Sending an e-mail; Using Office applications (Word, Excel, PowerPoint, …); Reading and downloading documents from the web; Doing web/ internet research; Managing a website, wiki or blog; Using collaborative and sharing application like Google drive, Dropbox, Skype; Using social networks (Facebook, Twitter,…); Other (please specify one or more activities).

According to a report issued by Contact North in November 2015, understanding the current and future dynamics of the higher education system is important, especially for those leading the system or developing the policies which guide it. The report discusses seven trends and patterns which will impact the future for colleges and universities by 2030. The report discusses changes in Canadian higher education in the context of changing global education trends as student recruitment and retention pat-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

terns change and become more competitive. According to David Agnew, current President of Seneca College, and Chair of Colleges Ontario, one of the factors impacting the shift in higher education is the enhanced implementation of technological developments. In his speech, he identified that in the past "the barrier to accelerated adoption of such technologies was the willingness of faculty members and instructors to utilize them", while now there is a competitive necessity that students are exposed to such forms of technology for their survival as well as the institution's. *All 112 students indicated that they regularly perform all of the above activities except managing a WIKI, Blog or Website, where only 22% (25 students) indicated they engage in this activity.*

Since we are focusing on industry 4.0, the researchers added a few more questions to discern the importance of technology for participants. As such, questions 3 and 4 addressed the level of importance participants attribute to interaction with their teachers, even during class, using personal digital devices. *90% of students felt it was very important, while the remaining 10% chose important*. The final question pertaining to section 1 included a list of 15 "digital innovations", where students had to identify, using a five-point Likert scale (Yes, often; Sometimes yes; Seldom; Very Rarely; Never), if they had ever heard about these terms before. The terms asked were: Virtual Realty; Augmented Reality; Mixed Reality; Rapid Prototyping; 3D Printing; FABLAB; Industry 4.0; Smart factories; Artificial Intelligence; Internet of Things; Industrial Internet; Cloud-based Manufacturing; Augmented Reality; Cyber-physical Systems (CPS); Big Data and Analytics.

These innovations are in line with President Agnew's speech, where he stated that technology will continue to evolve in such a way to make learning more personal, affordable, effective and accessible. In the future, institutions will respond by more rapid adoption in line with student behaviour. *It is important to note that all students stated that they had heard of 8 of the above terms 'often'*. This is imperative when one examines Ontario employability skills #6 and #7, to locate, select, organize and document information using appropriate technology and information systems; to analyze, evaluate, and apply relevant information from a variety of sources respectively. For students to be competitive in a dynamic world, their education needs to provide a solid foundation for them to discover, learn and grow.

The aim of the above question was to ensure students were current and had heard of some / majority of the above terms in school, whether it was through class lectures and discussion or perhaps assigned class readings. *It is worth mentioning that the 2 terms that were marked as 'very rarely' or 'never' heard by everyone were FABLAB and Cyber-physical systems*. Perhaps this was due to the technical nature of the terms and the fact that they were more related to the engineering / manufacturing disciplines as opposed to the business field. In a paper titled "Effective communication in higher education", the author discusses some of the problems faced in communicating with the millennial generation. Howard states that since the millennial generation is entering the workforce, this specific group will be looked upon as a possible reason communication in higher education is lacking at the moment (2014, p.3). Howard explains that students have grown accustomed to dealing with technology and a virtual world that they may lack the proper etiquette when communicating with others in an organizational setting. She postulates that this may lead to organizational culture issues in the future and may also be the reason why communication in higher education institutions is not where it should be today.

The latter reason is an interesting observation. From personal experience, educators feel that millennials have a false sense of 'entitlement'. Although their education style is different and more advanced compared to 20 years ago, technology has facilitated the education process and made information available 'on demand'. Accordingly, most students do not dedicate enough effort and commitment to their educational experience and simply 'cruise by'. This is why the researchers included questions 5-32 to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

investigate the use of technology in classrooms and draw some conclusions about its impact on the educational process and its readiness for education 4.0 through a gap analysis.

The questions were divided into three distinct sets, and a five-point Likert scale (strongly agree, slightly agree, neutral, slightly disagree, strongly disagree) is used. The first set pertains to student opinions regarding the effectiveness of computer technology as a tool in the classroom including its impact on factors such as academic achievement, collaboration, communication, instruction and value. These factors should be compared to the Essential Employability Skills (EES) dictated by the Ministry of Higher Education and Skills Development as skills that should be reliably demonstrated by the end of a student's program that are essential for success in the workplace, everyday living, and for lifelong-learning. The employability skills have been divided into six main skill categories; namely communication, numeracy, critical thinking and problem solving, information management, interpersonal and personal.

We can see from below, that the first set of questions relates to communication (questions 4, 5 & 6), critical thinking and problem solving (questions 1, 2 &3), information management (questions 2 & 7), personal (question 8), interpersonal (question 4). Questions are:

The use of technology in the classroom…

1. Increases academic achievement (e.g. grades).
2. Results in students neglecting important traditional learning resources (e.g., library books).
3. Is effective because I believe I can implement it successfully.
4. Promotes student collaboration.
5. Makes classroom management more difficult.
6. Promotes the development of communication skills (e.g., writing and presentation skills).
7. Is a valuable instructional tool.
8. Is too costly in terms of resources, time and effort.

Interestingly enough, the results for all of the above questions, except for 2 and 8 *show that 70% (79 students) of participants agree with the above statements while only 30% (33 students) slightly agree*. These results are in line with the generational differences chart (http://www.wmfc.org/uploads/GenerationalDifferencesChart.pdf), which outlines millennials as a technologically savvy generation who are individualistic yet simultaneously group oriented. The above results show that participants value academic achievement in addition to collaboration and peer interaction. The chart also characterizes millennials, otherwise named 'Generation Y', as high achievers that like personal attention, which is why most of them agree that technology makes classroom management more difficult. They understand that although technology gives them an edge and additional skills before joining the workforce, it deprives them of a more focused attention by virtue of larger class sizes. Students mostly agreed that they can implement technology successfully (question 3) because they are 'a techno generation and high-speed stimulus junkies' that need to constantly be engaged and challenged in order to perform.

Question 2 seemed to provide a controversy, whereby 50% (56 students) responded that they strongly / slightly agree, 15% (17 students) were neutral, while 35% (39 students) seemed to strongly / slightly disagree with the statement. The researchers think that the difference in answers to this question stem from 2 factors… culture / ethnicity and gender. Culture is NOT a factor included in this research and will require further probing in future research, where ethnic origin is identified in the research parameters. Yet, since this is a convenient sample, the researchers hypothesize that students from Eastern origins are more accustomed to using traditional learning resources, perhaps due to their educational systems or the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

lack / delay in a technology infrastructure as opposed to Western nations. In terms of gender, analysis shows that 60% of those that slightly / strongly disagree with this statement are females. This might be associated with females having a greater attention to detail and hence their desire to read books / notes in further detail than males. *Question 8 shows that 100% of participants slightly / strongly disagree with the fact that technology is expensive in terms of time and / or effort*. If we relate this to the characteristics of millennials in the workplace, it seems to agree with their sense of entitlement, their need for creativity and flexibility and their willingness to take risks and make mistakes. If we cross-examine this with characteristics of technology at large, we will find a perfect fit. The use of technology in classrooms allows for flexibility since it entails working alone and in groups. It also allows room for error since it is based on 'learning by doing'.

The second set of questions focuses on the stakeholders involved in the use of technology – students, teachers and parents. Questions are:

The use of technology in the classroom…

1. Is successful only if teachers have access to a computer at home.
2. Makes teachers feel more competent as educators.
3. Is successful only if there is adequate teacher training in the uses of technology for learning.
4. Gives teachers the opportunity to be learning facilitators instead of information providers.
5. Is successful only if technical staff regularly maintains computers.
6. Demands that too much time be spent on technical problems.
7. Is successful only if there is the support of parents.
8. Is an effective tool for students of all abilities.
9. Is unnecessary because students will learn computer skills on their own, outside of school.
10. Enhances my professional development.
11. Is effective if teachers participate in the selection of computer technologies to be integrated.

For questions 1 to 6, 90% (101 students) of participants indicated that they strongly / slightly agree with the proposed statements, while the remaining 10% (11 students) either slightly disagree or are neutral. It is worth noting that there is a gap between the desired situation as indicated by students and the current reality. Given that both researchers are professors in the Ontario College system, it must be noted that a majority of instructors do not have adequate technology training, in large part due to their age and due to the lack of time dedicated to new technology training. With a heavy administrative and teaching course load, instructors are not always well prepared for the use of technology, which might explain why students agree that too much time is spent on technical problems. Although a large budget is spent on IT funding in Ontario Colleges, the influx of students is large, which sometimes causes the system to slow down. This justifies why students agree that technical staff need to regularly maintain and update computers.

Question 7 asks students about the support of parents in their technological education. Although parents are an important stakeholder in the educational process, given the financial support they provide and their role as secondary / primary decision makers in the schools and/or programs chosen by their children, it seems that participants do not feel that they have an impact when it comes to technology. *55% of participants (62 students) either slightly / strongly disagreed with this statement, while 45% (50 students) were neutral*. It is worth noting that gender did not have a bearing on the results of this question. It is worth noting that all participants in the convenient sample did not have any learning disabilities /

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

difficulties, hence the researchers feel that the answers to question 8 are not representative and would be best tested in further detail with a larger, more inclusive sample. *100% of participants indicated that they either strongly / slightly agree with technology being an effective tool for all participants*. As College educators, the researchers disagree with this since most of the technology used is not customized to students with learning difficulties, this includes basic tools such as office, MS project and more complex tools such as simulations. All of the aforementioned are not designed according to inclusive learning and universal design standards. This includes simple add-ons such as captioning, audio guides, larger fonts etc. Hence, it is safe to say that there is a large gap in this regard.

When asked about the importance of technology in classes and whether or not it is a skill that can be acquired outside, participants' responses varied. 35% (39 students) indicated that they strongly / slightly agree, 10% (11 students) felt neutral, while 55% (62 students) stated that they strongly / slightly disagree. Given this disparity in responses, we analyzed the role of gender to find that of the 62 students that agreed with this statement, 53 were females (66% of the female sample). This correlates with the results of question 2 in the first set of questions when students were asked if technology would result in the neglect of traditional learning resources. *Researchers can draw a preliminary conclusion that females are believers in the traditional educational institution with the role of teachers and learning resources, be it technology and / or books, in providing new knowledge and laying the foundation of learning*.

Questions 10 and 11 show overwhelming agreement with the statements; 100% of participants strongly agree that the use of technology enhances their professional development. This is line with the characteristics of millennials, which indicates that Gen Ys prefer to learn in networks and teams using multimedia and digital media. They are also characterized as entrepreneurs with a high sense of responsibility, which explains why participants unanimously think that teachers should choose the technology to be integrated in their classrooms and courses. This is directly related to questions 1, 2 and 3 pertaining to teacher's competence, training and ease with the technology chosen.

The final question set, comprised of nine questions, deals with student's learning and interpersonal skills, as part of the Essential Employability Skills. Questions are:

The use of technology in the classroom…

1. Helps accommodate students' personal learning styles.
2. Motivates students to get more involved in learning activities.
3. Could reduce the number of teachers employed in the future.
4. Promotes the development of students' interpersonal skills (e.g., ability to relate or work with others).
5. Will increase the amount of stress and anxiety students experience.
6. Is effective only when extensive computer resources are available.
7. Is difficult because some students know more about computers than many teachers do.
8. Is only successful if computer technology is part of the students' home environment.
9. Improves student learning of critical concepts and ideas.

Questions 1 and 2 are important topics around which there has been a lot of buzz in the past decade. According to Dunn& Griggs (2000), "a learning style is the way students begin to concentrate on, process, internalize and remember new and difficult academic information". It is "a biologically and developmentally determined set of personal characteristics" grounded in cognitive style theory and brain lateralization theory". According to the VARK learning model, there are four main ways by which stu-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

dents learn – Visual, Aural, Read-Write and Kinesthetic. Technology falls into the kinesthetic domain, whereby students learn by doing. This includes real-life scenarios, case studies, group presentations (using office) and simulations. Technology is also part of the visual category, which includes maps, charts, graphs, diagrams, brochures, flowcharts, highlighters, different colors, pictures, and different spatial arrangements. The use of a variety of learning styles in class and during assessments motivates students to get more involved in learning activities. *100% of participants indicated that they strongly / slightly agree with both statements*. Although this is theoretically valid, the real-life situation in saturated classrooms, with no support provided from teaching assistants, is different. Teachers often do not have time to integrate different activities in their classes, rendering them dull and monotonous. As such, there has been an increase in the amount of complaints to higher management about teacher's performance, as millennials seek a challenging and dynamic educational environment. In this regard, there is a gap between the actual and desired situation.

Question 3 can be considered one of the concluding questions of this research. As a result of the use of technology and new instructional models such as hybrid and online courses, participants are asked whether they think technology could reduce the number of teachers employed in the future. Interestingly enough, the answers to this question were varied. *35% (39 students) of participants indicated that they either strongly / slightly agreed, 25% (28 students) felt neutral, while 40% (45 students) strongly / slightly disagreed with the idea.* Accordingly, the responses were analyzed based on gender. Again, of the 45 students that disagreed with the statement, 40 were females, which accounts to 50% of the surveyed female population. This finding seems to support our previous conclusion about female believers in traditional education.

Questions 4, 6 and 9 showed that 100% of participants either strongly / slightly agreed to all statements. Students feel that technology promotes the development of student's interpersonal skills, which may be related to the characteristics of millennials discussed earlier and their strive for independence. Question 6 relates to Employability skill #6 'Locate, select, organize, and document information using appropriate technology and information systems' part of the information management skill set where students expect the abundant existence and accessibility to computers. This is required to apply their knowledge and practice newly acquired concepts. This is related to question 9, which states that technology improves student learning of critical concepts and ideas. This is similar to Employability skill #7 'Analyze, evaluate, and apply relevant information from a variety of sources.' In a dynamic, global environment students expect immediate access to technology. It is worth noting that there is a gap between the actual and desired situation. Although Ontario Colleges have an abundance of computer labs and advanced infrastructure, this competitive advantage is currently under depletion with the increase in class sizes and cuts to education funding, causing a strain on technological resources. This sometimes causes students to access their learning management systems, simulations and assignments through their smart phones, which although convenient, may not be conducive to the learning process.

Finally, when asked if technology will increase the amount of stress and anxiety students experience 90% (101 students) of participants indicated that they strongly / slightly agree, while only 10% (11 students) indicated that they strongly / slightly disagree. Question 7 is related to teacher training and their confidence and practice with the technology used in class (questions 1, 2 & 3 of set 2). *It is worth noting that the answers showed a similar distribution, with 100% of participants indicating that they either strongly / slightly agree with the statement*.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

Industry 4.0 is more than the technology it is bringing. As workforce is a critical element in digital transformation, the skills and qualifications of the human capital will become increasingly eminent. There are many skills and qualifications that will be needed in the era of Industry 4.0, but as stated in the literature review, digital literacy and digital dexterity will be essential and primary skills for the future workforce. Digital literacy is defined as "capabilities ranging from technical skills (such as those used in coding), to digital citizenship, to the ability to identify fake news", digital dexterity is defined as 'the ability and desire to use existing and emerging technologies for better business outcomes'.

Today's students' digital literacy and dexterity will be the main mechanism that will empower organizations to utilize upcoming critical digital developments. The demand for these skills and qualifications will undeniably be higher when compared to the present. This will result in the need for changing and adapting the existing curricula and the tools used in the existing educational system which will equip students with the essential employability skills required to remain competitive in industry 4.0.

In the research, a detailed questionnaire was prepared as a pilot study to comprehend students' views on the use of technology in classrooms and its impact on their learning experience and engagement. Knowledge of their views allowed the authors to draw inferences as to the skills and competencies of future students and whether they would match industry 4.0. Parts of the questionnaire used were extracted from the 'Technology Implementation Questionnaire'. Research results show that that there is a gap between the existing situation in the Ontario College in which the research was conducted and the desired situation where employability skills are adhered to and technology savvy graduates are populating the workforce.

Although the research findings are all preliminary and need to be retested within a larger sample, including several Ontario colleges in multiple locations, it seems that the results do confirm the original hypothesis. 'There seems to be a gap between the desired employability skills and the current situation within Ontario Colleges'. This may be due to a variety of factors including large class sizes, the inability to train teachers on the use of new technology given large administrative and course loads and teacher's age.

Age does not seem to be a variable impacting the adoption of technology by students. Yet, gender does have a bearing on the results of this research. Preliminary results show that females are more traditional learners and believe in the traditional brick and mortar learning institution, including the role of teachers in disseminating knowledge. Given the fact that not all employability skills are being achieved, it seems that students are not ready for industry 4.0. For students to be better prepared for the future workplace and the use of technology, the higher educational sector needs to be streamlined with a more rigorous approach towards teacher training, student accessibility to technology, reducing class sizes and dedicating a hefty budget to technological infrastructure and tools. If this is done, the employability skills will fall into place, leading to a technology savvy workforce.

The Canadian Ministry of Higher Education seems dedicated to the use of employability skills as a determinant for graduates' workplace readiness. Although this is unique to Canada, other countries, including the USA and Germany, presented in this chapter as comparable examples, have not identified the skill set / competencies that graduates need to possess. This raises an important question… Are employability skills the correct means to gauge workplace readiness? Should they be substituted by another indicator / set of indicators? The researchers feel that both employers and teachers are important stakeholders in this decision. They should have an opinion as to their employees' performance and readiness for further challenges / promotions in the workplace. Hence, based on the above research and our recommendations

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

for the future, employers should be a definite part of the cycle. Since we have determined that students *think* they are ready for industry 4.0, but colleges are failing in their preparation, employers need to be added as a moderating factor / variable.

Since colleges are focused on providing applied knowledge to their students, it is important to engage employers who can shed additional light on required skills that they see necessary from work within their specific industries / fields. This may include knowledge of specific ERP systems, project management systems or simple tools. This will entail hiring teachers with this knowledge, updating and revamping the existing curricula to include these subject matters and other technology / non-technology skills, and making sure that the course learning outcomes are updated and well-written to match all of the above. Again, this is all linked to teacher's readiness to do this extra work with the existing workload, increasing class sizes and decreased funding dedicated to education and colleges. This shows that this is a vicious cycle in which all the variables are interrelated. With the rise of globalization and graduates aspiring to be mobile, this model has been adopted in some countries with a smaller workforce like the Nordic block. Yet, in Canada this is not the case. This is where this research proves essential since it raises multiple questions that need to be answered and tries to bridge a gap in the theoretical data available about the education industry in Canada – Ontario.

FUTURE RESEARCH

The research findings stated above are all preliminary and need to be retested within a larger sample to ensure generalizability, perhaps as a joint initiative within Ontario colleges in multiple locations. It would be considered as a multi-site project, in which data from business schools in Ontario Colleges would be collected. As a further step, one could also look into the use of the questionnaire in other schools as well including early childhood education, engineering, aviation, etc… This would provide a wealth of data, which could be used to determine with accuracy the readiness of Ontario College students to industry 4.0 and whether or not they possess the necessary employability skills. As a further initiative, Colleges could contact their graduate Alumni who can answer questions regarding their experience with industry 4.0 and if they feel they had been prepared in colleges enough for the workplace. Not only would this require a different questionnaire, but also a large-scale research which involves multiple researchers and commitment from Ontario Colleges to answer the hypothesis at hand.

On another level, if the research results from Ontario were then compared to other provinces across Canada, one could end up with statistics from across the country. These findings could then be submitted to the government as recommendations for the Ministry of Higher Education and Training. If Canada wants to be competitive in the field of Higher Education to attract foreign students to its higher education institutions, it must ensure the employability of its graduates compared to other developed countries, including the USA and Germany that have found evidence to support the importance of technology skills as a prerequisite to workplace readiness. Hence, investing heavily in this area, not only in higher education, but also since school years.

Finally, for this research to be truly effective, a comparison with other cultures might add an additional lens to the research. It would provide the researchers with a wealth of data to compare if the issues outlined above are universal or unique to the Canadian higher education sector in specific. Moreover, it would answer questions like 'does culture impact the propensity to use technology', 'does culture value

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the use of technology in the higher education system'. These are imperative questions which should be answered to comprehend the readiness of Generation Y worldwide to industry 4.0 in light of globalization.

KEY TERMS AND DEFINITIONS

Digital Dexterity: Is a student's/employee's ability and desire to use existing and emerging technologies for better business outcomes.

Digital Literacy: Is a student's/employee's ability to find, analyze, and present clear and concise information, either through writing or the use of technology tools.

Essential Employability Skills (EES): These are skills compiled by the Canadian Ministry of Higher Education in Ontario. They include a list of 11 skills divided into 6 categories, which include numeracy, communication, critical thinking and problem solving, information management, interpersonal and personal skills.

Future Skills: Skills that Generation Y are expected to possess to ensure their employability. These constitute/are synonymous with essential employability skills.

Future Workforce: Generation Y millennials that are expected to hit the workforce within the next decade. They are the technology-savvy graduates that will cause the industrial revolution 4.0.

Higher Education: Refers to post-secondary education. This is education following high school of grade 12 in several countries.

Learning Management System (LMS): A technology tool launched within the last decade where students and teachers can communicate. The system is a logistical hub, allowing teachers to share notes, slides, and assignments, create tests, forums, and discussions with students.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Technology in Education: The ability to use technology tools in education. These include, but are not limited to, Microsoft Office, simulation, ERP systems, wikis, discussion boards, forums, and learning management systems.

VARK Learning Model: Research that postulates that students learn/absorb information in different ways including visual, auditory (listening), read-write, and kinesthetic (learning by doing).

Workplace Competencies: Key skills and attributes required to secure a position in the workplace. These may include technology skills, critical thinking, and analytical skills.

Chapter 99
Liquid Workforce:
The Workforce of the Future

Manish Gupta
IBS, IFHE University, India

ABSTRACT

The main objectives of this chapter are to define liquid workforce, describe its characteristics, and outline its implications. This chapter would help readers understand the need for studying liquid workforce and appreciate its importance in the contemporary world. Moreover, it provides a detailed outline of the ways and means that organizations can use to build such a workforce. It highlights the steps an organization can take to enhance the effectiveness of its liquid workforce. In addition, it explores certain best practices in the industry to illustrate how well the fluidity of the workforce can be managed without compromising on organizational goals.

INTRODUCTION

Creating an efficient and effective workforce has been the top priority of the HR function for decades (Sidibé & Campbell, 2015). However, to catch-up with the ever-changing business needs and dynamic corporate environment, the ways of managing workforce have undergone a sea-change since the pre-classical era (Hoang, 2015). Organizations in the modern era are digital, extremely competitive, global, and highly result oriented. In such a scenario, managing the workforce effectively is the best way to retain competitive edge and remain globally relevant (La Rosa, 2016). Whereas the digitization of most of the HR activities has made HR function simpler and efficient, it has also necessitated a turn-around of the current HR practices to address the dynamism in today's workforce (McFarland & Jestaz, 2016). This chapter mainly describes the concept of liquid workforce and how organizations can embrace the dynamic work environment by using their workforce.

Need for New HR Practices

A survey report 'Technology Vision 2016' by Accenture using a sample of more than 3,100 business and IT executives revealed that 33% of the participants feel that the world economy is already affected by digital revolution (Accenture, 2016). It also reported that 86% of the respondents predict a sharp rise in the pace of technological changes over the next three years and organizations are increasingly investing in the tools that help organizations adapt to the dynamism of the digital era. Automation is increasingly taking over manual tasks and a whole lot of millennial are changing the current workforce with their digital insights (Zaino, 2005). Some startling facts also reaffirm the urgent need for embracing these changes. For example, around 43% of the current US workforce is likely to be freelance by the end of 2020 (Neuner, 2013). Practitioners across the globe find its remedy in developing liquid workforce which has certain inherent ability to adjust itself to the highly dynamic business environment. Four major reasons behind the rise of liquid workforce including a steep rise in the number of freelancers, increasing automation of mundane activities, improving the rate of innovation, and entry of 'millennial' into the workforce (FastTrack Press Room, 2016). These reasons are summarized below:

- Increasing automation of mundane activities: There are certain activities in any job that are too repetitive and labor intensive that can be carried out by the machines. Reducing human intervention in such activities is not only cost effective for the organization but also beneficial to the employees as it helps employees utilize their talent in more productive activities. A recent example is of India's ICICI bank introducing software robotics in 2016 with a target of automating 20% of its transactions by the end of the year 2016. The level of digital war can be smelled from the very fact that this decision by the ICICI bank was preceded by an announcement by HDFC bank that it would use physical robots at its branches (Nair & Gaur, 2016).
- A steep rise in the number of freelancers: As the economies are embracing digitization, there is a growing demand of freelancers who are easily available to work on contract. Hiring a freelancer is a win-win decision for the organization and the freelancer. It is because while freelancer can focus his/her attention only on the particular job mentioned in the contract, the organization would only have to pay for the limited time the freelancer worked and needs not to bear the amount that a full-time employee would otherwise take. Several websites such as 'https://www.freelancer.in' bridge the demand-supply gap between the organizations and the freelancers.
- Improving the rate of innovation: It is no longer sufficient for employers to limit themselves to innovations. Instead, they need to go a step ahead and enhance the pace of innovation to survive and thrive in the intense competition. Recently, cognizant carried out a survey on the future of talent and digital skills using a heterogeneous sample of 422 European and U.S. executives (Cognizant, 2016). The findings revealed that majority of executives believe that there is a digital skills gap from "moderate" or "severe." This gap restrains their organizations from realizing their digital dreams. The report also suggests that innovation can be fostered by linking proprietary platforms to 'talent clusters'. It is the transient workforce that can quickly adapt and add value to business reinvention. The company management needs to come forward to junk the old big-sized talent clusters to lean and small clusters that serve a niche.
- Entry of 'millennial' into the workforce: The term 'millennial' or more specifically 'millennial workforce' generally refers to a set of people which entered the workforce 2005 onward. According to a PWC survey 'Millennial at work: Reshaping the workplace' in the year 2011 using a sample

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of 75 countries, the changing the workplace is all set to change because millennial generation matters (PWC, 2011). It is because the millennial generation is more tech savvy, self-oriented rather than job-oriented, socially connected, anxious for rapid progression, flexibility seeking, and willing to scale new highs. Google and Apple are the pioneers in attracting and retaining most talented millennial because these companies believe in encouraging the employees to think out of the box. To retain such a workforce, processes need to transparent, targets need to appropriate, the doors of opportunities in participating strategic decision making must be opened, strategies should be millennial specific, and regular feedback about the current position and how it can be improved must be preferred over negative feedback (Gilbert, 2011).

It is evident that the way employees work is all set to change yet again. Gig economy, a kind of work environment in which most of the jobs are on short-term contracts, is swiftly taking over the present situation (Goodwill, 2016). Thus, it is of paramount importance to know how the shift from the present 'static' to the next generation 'dynamic' workforce would take place (Simons, 2016). Such shifts are captured in five points including business function to formal online crowd funding platform alignment, ad-hoc to continuous training, segregated to end-to-end workforce management, concentrated to participative innovation, and low to high collaboration as described below:

- From business function to formal online crowd funding platform alignment: Crowd funding is an online collaborative funding from peers. The importance of this platform has also been highlighted by the Forbes magazine, "Unless you've been living in a remote island for the last few years, you've heard about crowd funding or stories of people raising thousands or millions of dollars online" (Barnett, 2013). Some of the crowd funding websites includes Kickstarter, Indiegogo, Rocket Hub, FundRazr, and GoGetFunding (Taylor, 2013).
- From ad-hoc to continuous training: 'Ad-hoc' is a Latin word which means 'for this'. Instead of ad-hoc training which focuses on shaping an employee's knowledge, skills, and abilities for a particular project or job, the dynamism of the demands requires training on enhancing skills that can enable employees to adapt to the changing environment. Giving continuous training is beneficial to the company in many ways. First, it helps employees manage their daily tasks. Second, it makes employee productivity almost immune to the changes in the external environment. Third, it enhances the self-confidence of the employees. Fourth, it helps employees achieve their goals. Continuing Professional Development (CPD) offered by Chartered Institute of Personnel and Development (CIPD) is a flexible process that trains and provides employee feedback online continuously.
- From segregated to end-to-end workforce management: While traditional management tools rely on fragmented workforce management such as tracing the number of hours an employee works and adjusting the pay accordingly, evaluating the availability of staff members and their qualifications for several related HR activities including preparing or revising schedules and distributing these schedules, handling leave applications, and preparing annual HR reports. Such fragmented activities mostly prove to be erroneous, costly, and time consuming. Consequently, it is hard to work on one specific area or issue without any assistance from a tool or management solution. Nevertheless, installing a comprehensive workforce management solution that helps the HR managers to track a particular strand or a sequence of related activities seamlessly from beginning to end without compromising on the efficiency (Amodio, 2013).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- From concentrated to participative innovation: Generation Y (the millennial generation) believes in contributing fresh ideas that can in some way add to the digital revolution. It would be extremely discouraging for this generation if innovative ideas are invited only from a particular department. This generation asks: 'Why not us?' The youngsters want to take part in shaping the company's future. It is something that boosts their self-esteem, makes them happy and gets them the feel of being valuable (Emelo, 2011; Kramer, 2010). The underlying concept is to allow any employee to submit, review, and rank an idea. Companies can encourage participative innovation, for instance, by facilitating a physical / online suggestion box for new ideas (Phillips, 2010). It is equally important for the concerned manager to go through those ideas and appreciate or reward the best one. Not only corporate sector but also governments are increasingly recognizing the potential of participative innovation. For example, a recent initiative of the Government of India to invite innovative ideas through public participation online is: 'https://mygov.in'.
- From low to high collaboration: Businessmen agree that collaboration is the need of the hour as it increases the productivity due to synergetic effects. One way to increase collaboration is by introducing electronic meeting systems (EMS) in the company (Rittgen, 2010). These systems decrease the requirement of attention and increase performance. The two advantages of e-meeting systems over face-to-face meeting are: (1) simultaneity which allows multiple people share their ideas simultaneously and (2) anonymity which means the utterances are not attributed to a particular speaker. Both these qualities coupled with reduction in the hassle of arranging a conventional meeting gives more room to the members to share their ideas which would not have been shared otherwise. With an improvement of 55 percent in group performance, the implementation of EMS in IBM has helped it make better use of its teams (Grohowski, McGoff, Vogel, Martz, & Nunamaker, 1990). IBM found that anonymity was beneficial, number of participants in the meeting increased, the engagement level of participants also increased, and fewer meetings over less time were required, and focus of the participants on the task increased. However, it needs special attention in some areas such as increased importance to pre-meeting planning, distribution of the minutes of the meeting and proceedings after the meeting, requirement of tech-savvy users, flexibility of the software to meet the group application variety, etc.

WHAT IS LIQUID WORKFORCE?

IBM coined the term 'liquid workforce' where "people are hired on an "as-needs" and "just-in-time" basis, for specific projects activities, whether for days, weeks, or months. Beyond, the conventional contractor model, the liquid workforce is underpinned by crowd sourcing, drawing together skills of freelance workers and the task need of organizations" (Bakhtiyari, Barros, & Stewart, 2014, p. 18).

Industry needs a workforce that can be 'seasonally' attached and detached without with ease as per the contingent strategic and operational needs. To deal with contingent requirements, contingent workers can be a critical tool to face the stiff competition and optimize business profits. The underlying idea behind the concept of liquid workforce originates from the belief that technology not only disrupts but enables business transformation. It converts a rigid and docile firm into a change-ready and agile firm. To illustrate, General Electric has recently introduced 'Fast Works', a technique for entrepreneurs for developing "The Lean Startup" (Power, 2014). It focuses on products that ensure fast learning and quick deliverables. It provides more autonomy to the users to swiftly alter direction on projects. Apparently,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

liquid workforce which is also termed as 'fluid workforce' is the need of today and the future. To gain further insights, the next section narrates some of its differentiating features.

THE KEY CHARACTERISTICS OF LIQUID WORKFORCE

Like any workforce, liquid workforce does have a set of defining features. Some of these characteristics are diversity in terms of composition, mobility in terms of workplace, flexibility in terms of working hours, accommodative in terms of inviting different skill-sets, open mindset in terms of embracing change, and ability to quickly learn, multitask, and adjust itself to meet the organizational objectives (Ethos BeathChapman, 2016; Pegasystems, 2016). These are detailed below:

- Diverse in terms of composition: The workforce has variety. Here, variety means different types of workers are included. In other words, the liquid workforce is inclusive as it includes employees other than the full-time staff. These could be part-timers, causal workers, and freelancers. A combination of these diverse types of workers helps companies accommodate dynamism in project demands. At the same time, such heterogeneity increases its efficiency.
- Mobile in terms of workplace: Another defining feature of such a workforce is the flexibility with which work can be handled from anywhere. The work can be completed beyond the boundaries of the office. Mobility of work helps employees strike a balance between their work and their personal life. Recently, ICICI bank has launched the program wherein work from home is allowed. It is beneficial to the company as it reduces a lot of company's office expenses.
- Flexible in terms of working hours: Flexibility in work timing is what millennial want. They would like to enjoy in the free time and work whenever they are like too. Forcing them to work from 9 to 5 does not work.
- Accommodating nature in terms of inviting different skill-sets: The liquid workforce is not rigid and is willing to work with people of diverse skill-sets. It is also an opportunity for the members to adopt their skills as they also need to exhibit multi-task behavior.
- Mindset in terms of embracing change: Members of liquid workforce are highly curious. It is in their blood to continuously learn from the dynamic environment and keep themselves open to extensive learning.
- Ability to quickly learn, multitask, and adjust itself to meet the organizational objectives: All the above qualities makes liquid workforce quick to change and re-direct its efforts towards renewed goals flawlessly.

DEVELOPING THE LIQUID WORKFORCE

Only because liquid workforce relies more on contingent employees does not imply that the management of the company can choose to be rigid and less-responsive to the changing environment. Transformation of conventional workforce into the liquid workforce is a strategic decision and full support from the management is needed to facilitate the process.

Though there could be different ways to develop a fluid workforce, Accenture prescribes a global procedure that can be followed by any type of organization. The specifics of this procedure can be decided

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

by the organization based on the resources available at their disposal. Accenture offers this procedure in the package of 100 and 365-day plans (Accenture, 2016; McGuigan, 2016).

The focus of the 100-day five-step plan is on highlighting the need for change as well as on providing evidence that it works. Each of these five steps is described below -

Step 1: Conducting A Skill - Gap Analysis: The open roles need to be reviewed by the HR. Also, it is important to identify the roles on high priority that are still seeking suitable talent.

Step 2: Formulating A Renewed Training Strategy: A proper strategy needs to be put in place to ensure that organization's training capabilities can be enhanced. For this, the management of the company must decide on the investment required for providing the employees with consistent and effective training across the organizational hierarchy.

Step 3: Developing A Renewed Engagement Strategy: Because millennial have unique requirements, the organization needs to develop a proper engagement plan. The plan must give room to these millennials to work on what they are most passionate about and provide sufficient autonomy to boost their morale. If their roles complement their knowledge, skills, and abilities, the productivity of the employee is likely to improve and the talent can be engaged more efficiently.

Step 4: Preparing Strategy For Engaging The Freelancers: Apart from the full-time employees, the part-time employees (mostly freelancers) also need to be engaged. Therefore, a strategy which distributes the work clearly between these two types of workforce is of paramount importance. The strategy should ensure that there is proper communication between the short and long-term employees wherever necessary.

Step 5: Piloting A Fresh Liquid Project: Transforming the workforce from conventional to liquid is expensive. Therefore, it is advisable for the organizations to predict the possible impact of such kind of transformation on the productivity and explore the possible contingencies to reduce the amount of operational risk involved. In order to conduct a pilot test, a company needs to choose one of the liquid groups and assign it a project that has autonomy and necessary resources for meeting the objective of the project. The results of this step would provide the necessary foundation for the complete workforce transformation.

Unlike the 100-day plan, the focus of 365-day plan is on implanting the pilot liquid project across the organization. The 365-day plan is followed once the 100-day plan is successful and it also espouses five steps. These steps are discussed in the following paragraphs:

Step 1: Putting The New Training Strategy To Work: Analyze the result of the pilot test conducted in the 100-day plan to select the optimum combination of training the different sources such as personalized training, MOOCs, or boot camps. The combination depends on the context a company operates in.

Step 2: Using The Experience Of The Pilot Group: By now, the company has tasted the results of the pilot test and has discovered an optimal combination suitable to its context. The next step is to formulate a plan specific to extending the practices followed during the pilot liquid project exercise across the organization. For this, the company needs to meticulously look into the strengths and weaknesses of the pilot projects, learn from the mistakes, and build a robust plan that can face the dynamic external environment to a greater extent.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Step 3: Planning To Scale Your Liquid Project Practices Across The Whole Company: It is important for the companies to know those areas, ways, and means that can benefit the most from crowd sourcing. In order to accomplish this objective, the company needs to start three projects simultaneously. Each of which has a focus on a different area that can be addressed well by the crowd. The companies should rely on the results of these projects for sanctioning the crowd sourcing projects for the rest of the company or those parts of the company that are likely to be benefitted the most.

Step 4: Integrating HR Analytics With The Organization: The next step is to integrate all the HR activities such as, recruitment, selection, promotion, compensation, retirements etc of the company with the liquid workforce. It can be done with the help of data scientists who can apply HR analytics to gain new insights from these conventional activities. All the gaps must be bridged to attract and retain talent.

Step 5: Formally Introducing Predictive Analytics To One Area Of People Management Strategy: The company should strive hard to develop a proper plan to understand how predictive analytics could enhance existing HR practices. This plan needs to be comprehensive and foolproof to the extent possible.

Aligning Liquid Workforce With Business Strategy

Organizations often find it difficult to face challenges arising out of the mismatch between business strategy and a giant operational shift. It is essentially because of not following a fool-proof alignment procedure that can ensure that the strategic shift turns out to be a success. Specifically, the organization must change on certain parameters before turning its workforce to a liquid workforce. These are as follows (Wells, 2016):

- **Introducing Context Specific Training Across the Organization:** As per the report published by Accenture, the next generation work would be flexible or fluid workforces and to align such a workforce with the business strategy would require business projects with embedded training. This training should not only be relevant to meeting the objective of the project but also of some relevance to the individual learner. For instance, if the company hires an external expert say a freelancer, the company would want to prepare a training program that focuses not only on unique organizational processes but also on industry material. In this way, alignment of the organizational specific processes can be done with the industry. Another important way could be seamless distribution-and redistribution of data and information among the concerned teams or members. For this, the company must grant leverage to how the exchange of content is conventionally done. The company needs to explore cloud-based options to store, retrieve, and exchange data from anywhere by any of the concerned team member. It would reduce a lot of redundancy. Such kind of training is provided by third parties such as Mind flash.
- **Ensuring Collaboration in the Distributed Workforce:** It is indeed difficult to ensure that all the team members cooperate, coordinate, and collaborate to accomplish a common goal. It becomes more challenging when the collaboration has to be done in real-time. The possible way out is to facilitate right communication among the members using right tools. There needs to be dedicated slack channels and spaces for that. Though it would require initial capital investment, a lot of money relating to commuting can be saved once such system is developed and is fully

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

functional. The company can also opt to outsource this activity of keeping all connected to each other and providing the team members a common platform to collaborate.

- **Measuring Team and Project Effectiveness in Frequent but Short Meetings:** Finally, it is equally significant to appreciate the importance of feedback and develop mechanisms to capture and analyze it quickly. It directs the team on time so that efforts and resources are not wasted. It can be done by following 'Agile Scrum framework'. Scrum is a framework that details how a product can be managed. It relies on the philosophy that customers' demands are volatile. This initiative coupled with a 15-minute team meeting on daily basis in which even distantly related or peripheral project objectives can be discussed and the pre-set milestones can be refined further as per the need of the situation. If handled with utmost care and given support from the top management can prove to be a game-changer for the company. Such meetings are called as micro meetings as the time period for each meeting is too small to get bored. A company can also choose to integrate its cloud-based content and learning management system with its customer relationship management (CRM) system. There are companies that implement such high-tech solutions. For example, TruAssets, a national property management company has integrated its course work relating to contractors and results of the quizzes with its CRM portal. Consequently, the company can now trace, handle, and assess its training related results for its several external vendors. General Electric is another big company that has formed Fast Works teams to make the use of liquid workforce. The details of the same are provided in the next section.

LEARNING FROM THE BEST PRACTICES

Though the concept is interesting and has promising outcomes, only a few organizations took the risk of implementing it and others chose to wait-and-watch. One of the few organizations that have set benchmarks of building a liquid workforce successfully is General Electric as detailed in the subsequent paragraphs:

The Case Of General Electric (https://hbr.org/2014/04/how-ge-applies-lean-startup-practices)

Brad Power, a well-known consultant, narrates the story of General Electric. According to him, the company, General Electric (GE), is one of the first companies that begin tapping the potential of agile and fluid workforce. In case of this company, the initiative to align with the dynamic requirements of the customers was taken in the form of 'Fast Works'. It is a framework that helps entrepreneurs develops 'The Lean Startup', an approach for developing fresh products that come out of supple software development and ensure swift deliverables and quick learning. Interestingly, it is not for an information technology (IT) activity. Since GE is a manufacturing company, it wanted to match its operational activities with the quick learning cycles of the customers. In a way, the company wanted to milk its appliances fully before these get obsolete in the minds of the customers and enter in the dog phase for the company. It was a bold decision by the top management to re-formulate the operations strategy completely to suit the requirement of the customers.

GE is a pioneer in taking giant and mostly risky steps to adapt itself to the external world. For example, in the year 2008, GE invested USD 1 billion to transform its existing plants, buy new ones, and recruiting 3,000 new employees. In the year 2013, the Chief Executive Officer (CEO) of the company,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chip Blankenship, challenged his newly formed cross functional team by saying: "You're going to change every part the customer sees. You won't have a lot of money. There will be a very small team. There will be a working product in 3 months. And you will have a production product in 11 or 12 months." What the team was allowed to do is interesting and inspiring.

The team members were given a separate room so that the boding among them can be improved. As a result, it became a tight group. The members used to go down to the factory floor an build the products collectively. Unlike the conventional approach in which the customer or market requirements are given by the sales force, this team was in direct and constant touch with GE customers. The customers were also the participants in the development of the products throughout. Hearing the feedback about the product directly from the horse's mouth (the customers) was a refreshing and exciting experience for the engineers who otherwise work in the back office. However, receiving customer feedback directly was also a challenging task. The team had to bounce ideas and product prototypes off of retail salespeople who wanted to know about GE's products in Louisville, GE's training centre. It also had to visit several product design centers located in Chicago as well as in New York.

The objective of visiting these centers was to learn the details of the products for the respective clients. The feedback wasn't a sweetener to the team members' ears but it laid a concrete foundation of change. The team soon came out with a new idea 'minimum viable product'. The product was a refrigerator with fresh styled doors that is, it opens from the middle. Started in January 2013, the product went through several rounds of corrections based on customer feedback relating to the darkness of the steel, lighting, etc. It was only by August, 2013 that customers actually started liking the refrigerator which was version 6. The team readily started working on the next version i.e. version 7 and decided to come out with improved version every year. It was a radical shift in the strategy of GE as the company earned its fame by introducing a revised product in the market every five year. Till the launch of the revised product, the new product features used to be kept secret. Kevin Nolan was quick to say, "With Fast Works we're learning that speed is our competitive advantage. How do we become much more open and collaborative with the customer base? You can't do that if you want to be secretive."

The company made several changes so that Fast Works can actually function. The company re-worked majorly on three areas namely supplier relations, finance, and roles and responsibilities. Each of these is described below in short:

Supplier Relations: Since GE is a manufacturing company; the suppliers play an important role in delivering the required product to the customer on time. The team was well aware about this fact and decided to approach the suppliers and make them understand what exactly they are doing and how it would affect the supply chain. As expected, the suppliers were extremely grateful to the company that they were given a chance to participate and get involved in such a major exercise.

Finance: In the words of Vic Roos, Lead Purchasing Program Manager: *"We let a finance guy in the room. He helped us challenge the big company mentality. At times we moved much faster than the company would normally allow. At times it drove the materials manager crazy."* It shows the kind of autonomy granted to the finance person and the open-mindedness with which the suggestions of the finance person were heard. Certain findings were shocking such as the company needed to have annual or bi-annual payback but that kind of model cannot survive in the situation when the things are extremely dynamic and the future demands of the customers are uncertain. Obviously, it is extremely difficult to evaluate the cost of such a project. When the company first evaluated the ongoing project, the financial numbers looked really bad. But the team manager decided not

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to worry about what the investments or expenses incurred on the entire program for calculating payback. This take of the manager relieved the team members from financial pressure and they could focus on the execution of the project rather than worrying about the cost it may incur. The opportunity costs relating to speed are not assessed by the traditional financial systems. Such costs are incurred due to not tapping the potential customer who could have otherwise purchased the product if delivered on time.

Roles and Responsibilities of the Leader: Of course, there was a full support not only the financial support but also moral support from the top management. There were instances when there was a mismatch between the expected and actual speed of the project. At that time, the CEO conducted a meeting and resolved the issue. Also, a lot of autonomy was granted to the team in terms of freedom from taking several approvals for pivots. Full autonomy was given to the team to take such decision on its own.

The outcome of this entire exercise has been fruitful to the company. The findings indicate that it could cut the program cost to only a half and could double the program speed. Moreover, the product started selling at more than the double rate of the normal rates. The company is now working on extending these practices to other appliance manufacturing units as well. For instance, GE Appliances hosted 7080 young GE high potentials. Furthermore, 80 coaches were trained and were dedicated exclusively to Fast Works. Around a thousand GE executives were exposed to Lean Startup and another giant step was the launch of over 100 Fast Works projects worldwide.

DIGITIZATION FUELS LIQUID WORKFORCE

Thanks to the last global recession, the companies have realized that keeping only full-time permanent employees is not a sustainable model. It is because liquid workforce facilitates faster change compared to the illiquid one. Not surprisingly, the market of freelancers, part-time employees, and casual workers is all set to thrive. Increased level of digitization across the globe is boosting the prospects of freelancers. It is a way to create one's own job. There are several examples of such freelancing digital marketplaces. These include Fiverr, Etsy, UBER, Threadless, Kaggle, Firefox, Toptal, HourlyNerd, Tispr, Teach Me Now, Engineer it etc. (https://innovationlab.net/blog/freelance-economy-liquid-workforce)

CONCLUSION

Now that the world is increasingly getting digitized, most of the organizations are feeling the need of doing away with the traditional workforce management practices that are no longer relevant and effective. Some of the organizations such as Accenture, Google, and GE have already set the examples of outperforming competition by building liquid workforce, a necessity to build inherent competency of adapting itself as per the dynamic needs of the stakeholders.

KEY TERMS AND DEFINITIONS

Ad-Hoc Training: A customized training that is given only to serve a very specific and unique need.

Crowd Funding: A process in which a large project or venture is funded by raising or pooling money from masses.

Gig Economy: A type of work setting in which positions are mainly temporary in nature and jobs are on contracts that are applicable only for a short-term engagement.

Liquid Project: A platform that work on the idea of facilitating work within society rather than walled offices by providing connectivity to those who look for new projects, inspiration, and insights.

Liquid Workforce: A type of tech-savvy workforce characterized by high flexibility, agility, collaborative spirit, sensitivity to the environmental changes, and inherent ability of adapting itself continuously as per organizational requirements.

Millennial: A term used to refer those people who reached their young adulthood around this millennium that is year 2000.

Predictive Analytics: A type of data mining that predicts occurrence of an event in the future by establishing trends from the past data.

Chapter 100
Distributed Work Environments: The Impact of Technology in the Workplace

Edwiygh Franck
The Greatest You Yet!, USA

ABSTRACT

Technology is making the traditional workplace obsolete. Companies are taking advantage of the myriads of digital resources available to make their processes leaner, cut costs and have a larger presence in the global market through the concept of distributed work environment. In this chapter, the author provides an overview of the distributed work environment, as well as the impact it has on the human condition in the workplace. Although this technology driven work concept can be beneficial, companies have to ensure that it is the right business model for them and their employees. The author looks at different factors that companies need to consider in deciding to adopt a distributed work environment model. Several companies, over 125 of them, have successfully implemented the concept and the author shares some examples on how they were able to achieve success and employee satisfaction.

INTRODUCTION

Technology has had a significant impact on how humans live their lives from entertainment, medicine, education, to family life, dating, and social media. Technology has taking center stage in our lives and have allowed us to achieve things that we would not think possible a decade ago. We are sharing and consuming information at lighting speeding due to the availability and capabilities of technology. Technology has allowed for the development of robotic surgery to enhance the preciseness and accuracy of surgery as well as recovery time for patients. The popularity of online learning has increased tremendously as technology has become readily available for students to learn anywhere and at any time. We have self-driving cars on our roads and we can conduct videos chat sessions with anyone around the world by simply using our cellular devices. In other words, we live in a digital and technologically advanced age and almost everything around us is connected by technology, including organizations and their employees.

As Roper and Kim (2007) stated:

A clear revolution is underway in when, where and how work is accomplished. The workplace of the future will be more physically distributed due to a variety of reasons, such as the high cost of land and buildings in urban areas, air pollution resulting from mass commuting, and changes in the nature of work (p. 103).

In the past two decades the landscape of our workforce has changed dramatically from traditional brick and mortar buildings to distributed work environments because of the advancement of technology. From having all employees in a physical building to having employees spread all over the world in an array of physical locations. By definition, a distributed work environment is an organization structure where "… the vast majority of employees work from wherever they are comfortable and productive. Perhaps most importantly, communication and culture are moved outside the boundaries of a physical location so that everyone is able to be included wherever they live" (Robins, 2014, p. 3). A more technical definition explains the distributed work environment as "… an environment in which a plurality of mobile workers using portable computing devices can gain access to a network via network access stations installed within the work environment" (Cole et al., 2002, p. 1). Both definitions reiterate the idea that traditional company headquarters are gradually changing from one main location to wherever an employee wants it to be.

As we begin to understand the concept of what a distributed work environment is, it is important to also understand what it is not. According to Jeff Robbins (2014), from Lullabot, a strategy, design and development company that has embraced and implemented a distributed work environment for his company, a distributed work environment is not:

- … *One with a prominent central office where the majority of people work most of the time* (Robins, 2014, p. 4)
- *A corporation with multiple locations* (Robins, 2014, p. 4)
- *A company where people are often allowed to work from home* (Robins, 2014, p. 4)
- *A company that takes advantage of outsourcing, freelancers, or subcontractors* (Robins, 2014, p. 4)
- *A co-working space where people freelance on similar projects* (Robins, 2014, p. 4)
- *A single freelancer* (Robins, 2014, p. 4)
- *A department within a large company where most people work from home (for instance, the customer service branch of an airline) – though this may qualify as a distributed team* (Robins, 2014, p. 4)

Robbins (2014) goes on to say that it is also important to understand the difference between a distributed work environment and remote employees. In his words:

…the truth is that in-person communication and activities will always trump virtual/tele/digital communications. After all, humans have been communicating in-person since the beginning of time. It is our default setting. So a company with remote employees begins with the deck stacked against them. It's not an even playing field. It's really going to be a challenge to make remote employees feel like they're

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

part of the team. Resentment and imbalance can build up between those who "get to stay at home" and those who "get to have lunch with the boss every day"(p. 4).

Differentiating between remote employees and a distributed work environment is important, because by confusing them or making them synonymous, the above sentiments begin to be shared by several other companies that are thinking about implementing a distributed work environment. The fear that employees will be disengaged if they are removed from the physical office is real, and it preventing organizations to take the leap forward and try this new concept. However, Robbins (2014) describes what a true distributed work environment is below by saying:

A distributed company doesn't have these problems. Most of its communications happen online and are available for everyone in the company to participate. Whether these are phone conferences, email threads, or message-board and issue-queue posts, it's very easy to be inclusive despite geographical separation (p. 4).

Today's technological advancements are making the traditional brick and mortar headquarters slowly obsolete. Employers are realizing that they have the ability to have a larger top talent pool by having opportunities and presence around the world instead of the country. Josh Kramer (2011), CEO of Full-Stack, a software development company, describes the traditional work environment as a handicap where companies are "Geographically Challenged:"

Your company has probably been operating under a handicap for its whole existence. It's a handicap that has been so common that the vast majority don't even see it as such. The handicap is this: most companies are limited in their ability to find and hire the right people by a fixed geographic radius set up around their central office. We will call these type of companies "Geographically Challenged". Your geographically challenged company may have attempted to overcome this handicap by opening branch offices in multiple cities or paying for a new employee's relocation or maybe even introducing flextime into the mix. Though these steps help the situation, you are only slightly mitigating the root problem (p. 1).

We live a society where we are constantly connected and the cost of staying connected is decreasing everyday due to emerging competitors in the industry. Technology has made it possible for employers and employees to connect with their colleagues across the world in real time to collaborate on projects and expand their business. Employers are catching on to the idea that in order for their employees to perform at their high potential, they need to provide a technological experience in the workplace equivalent to the technological experience that employees have at home. One could further argue that employees have better technology at home than they have in the office, so distributed work environments make sense because employers can take advantage of these advanced technologies by paying for them and decreasing their overhead costs. This sounds like a win-win situation: employees can work wherever they want and be more productive then they would be at the office; and employers are reducing overhead costs and making profits due to the increased level of productivity of the employees and the reduced operating costs. Of course, there are no perfect systems, so this chapter will explore some of the benefits and downfalls of this logic later in the chapter.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

THE CONCEPT OF DISTRIBUTED WORK ENVIRONMENT

An Overview

The economy is changing, so it only makes sense that organizations would be looking at strategies to improve and streamline their processes and services to reduce their operating costs and maintain or gain competitive edge. This change is mainly because of the rise and refinement of technology where information is being shared at an unprecedented speed and industries that were once human driven, are now technology driven. Once example of that is the newspaper industry. Long gone are the days of having a paper boy (or girl) ride on a bicycle to deliver newspapers; news is readily available the minute we open our eyes in the morning, on our cellphones, tablets and computers. Due to this technology boom, the nature of running a business has to change in order to keep up with all of these changes. One option many organizations are looking into or implementing is the concept of distributed work environment. Such a work environment is attractive to companies because it yields many benefits such as the rapid growth of affordable telecommunication technology, a decrease in overhead costs, as well as linkage to improved employee retention, more efficient use of office space, improve productivity and greater staffing flexibility (Holman, 2003).

As companies look to examine the landscape of the workforce, more and more they are looking closely at the distributed work environment concept as a way to preserve their existence and sustainability through the use of technology. In a book titled, *The Distributed Workplace: Sustainable Work Environments* (Harrison, Wheeler, & Whitehead, 2004), the authors expressed the concern that most companies have had on their minds in the past decade:

The relationship between sustainability and the build environment has always been a tortuous one: close but not warm. They're an uneasy pair Sustainability with its sometimes conflicting imperatives: ethical, practical, physical, economical. The built environment—a work of will masquerading as a force of nature. Perhaps as clash of fact and value. But at least, in certain key aspects, fixed. No longer (p. 1).

The above phenomenon is faced by companies around the globe and they have to strategically think about how they will tackle this issue as a competitive edge is harder and harder to get due to the changing market and workforce. Harrison et al. (2004) continue on the matter of sustainability by adding:

…Sustainability, once a simple matter for better resource use—difficult but achievable—now claims its rightful place at the shifting centre of all the issues raised by globalization. And the built environment—particularly the work environment- loses its monolithic status to stand revealed as a mercurial participant in the new economy. It is evident that the workplace is evolving in a distributed form to deal with these changed circumstances. It is equally evident that the fluidity of the distributed workplace will set society some urgent problems—not least in the field of sustainability (p. 1).

The authors described the issue that is in most CEO and executive teams' minds and narrows it down to sustainability. Staying relevant in this ever changing economy means that companies have to understand the true meaning of sustainability as it pertains to the barriers that have been broken down by the advancement of technology. Companies have to actively seek out strategies and solutions that

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

will work for their organizations and employees while being financially responsible. As the authors of *The Distributed Workplace: Sustainable Work Environments* (2004) explain:

Sustainability needs to be seen as a dynamic process, not a fixed and attainable state. It is rather like the mathematical concept of a limit—an end point that does not exist as such, and cannot be reached, but represents the hypothetical end point of a tendency (p. 3).

Companies are constantly looking for ways to improve their practices on all aspect of the business: human and operational. Trying to stay ahead of the curve to maintain their competitive edge is a difficult task. As technological advancements continue to happen, and employee needs continue to evolve companies need to respond accordingly or it will cost them in the long run. Many organizations are either taking steps or making provisions to enter the distributed work environment community, or they are thinking about it as a strategic move for them to meet the needs of their talent pool and to ensure their survival. They understand that they are operating in a digital and knowledge age, and the "business as usual" concepts are no longer valid. Organizations need to keep up with the changing work patterns, which can be difficult, and at times, almost impossible to do. In a research paper titled *Successful Distributed Work Arrangements: a Developmental Approach* (2007), the authors explained that, given these economical and workforce circumstances, implementing a distributed work framework can look attractive to organizations, especially large organizations, because of the potential financial benefits; however they need to be sure that it is the right move for their organizations (Roper & Kim, 2007). As executive teams are turning toward distributed work environments, experts suggest that there are four factors surrounding this concepts that companies need to examine to make an informed decision: the organization, the employee, the work, and the support system that is needed to sustain such an environment (Roper & Kim, 2007).

First off, companies have to align their goals, objectives and culture as a whole to determine if a distributed work environment would work for them. They need to ensure that all three of these components are in sync and will not create any disadvantages for all or some of their employees, as well as the organization. In addition, they have to look at their current financial structure to ensure that they have the funds or can strategically locate funds to finance this major change in infrastructure. Further, they have to spend time determining if this change will positively or negatively impact their processes and productivity (Roper & Kim, 2007). Next, they have to examine the work that their companies perform to determine how conducive such an environment would be for that work. Distributed work environments work best with work that requires minimal interaction, such as programming, graphic design copy-writing, etc. (Roper & Kim, 2007). These types of work require only periodic interaction with team members and clients, as opposed to positions that need frequent interactions with others to complete their work: managers, and customer service representatives, as examples. Having a clear understanding of the work that is produced in the organization will guide an educated decision. Lastly, they have to examine how the work is completed. Roper and Kim (2007) referred to the concept of sequential and mutual work processes. Sequential work processes refer to "…process that reflect a one-way work flow and do not need frequent information exchange among workers to accomplish tasks" (Roper & Kim, 2007, p. 106). Mutual work processes refer to a "…work process that has a complex work flow and needs frequent and fast information exchange, frequent coordination and team-work" (Roper & Kim, 2007, p. 106). Understanding these type of processes support the decision making process as organizations can determine whether they can fully, partially or not venture out in the distributed work environment depending on if

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

it makes sound business sense to them. Although technology advances allow for both processes to occur virtually, being comfortable that it will give the organization a competitive advantage is key.

Organizations need to also review the types of employees who are part of their organizations. Although technology can connect us in ways that we could not imagine, employees who need constant interactions with others whether because of the nature of their work, or need assistance in completing their work may not be the best candidates for distributed work environments. If the majority of the organization's employees fit in that category, then this concept may be detrimental to the company instead of helpful. Organizations with self-directed, self-motivated and disciplined employees who hold positions that do not require a high level of interaction would be ideal for the distributed work environment as they would be able to self-manage and thrive. Organizations have to be comfortable with the fact that not all employees are cut out for a distributed work environment. As Roper and Kim (2007) explain that organizations need to look for two attributes when analyzing if their employee base would be a good fit for a distributed work environment.

The two attributes to consider, according to Roper & Kim (2007), are the employees' work setting preferences and their ability to work in a distributed work style. Some employees would welcome the idea of work schedule flexibility, which in turn would allow them to take care of family obligations; on the other hand, there are workers who prefer the consistency of coming to and leaving work at a specific time and working in a specific office location (Roper & Kim, 2007). Organizations also need to look if the employees can effectively handle the level of flexibility and self-directedness that comes with a distributed work environment. Roper and Kim (2007) explained that:

Some workers need a high degree of face-to-face interaction and direct communication to effectively undertake their work, whereas other professional and knowledge workers usually a high degree of choices available to when, where, and how their work is undertaken. The former type of worker might need a permanent work location and the latter type of worker would be better for DWA [distributed work arrangements] (Roper & Kim, 2007, p. 107).

Further, organizations need to assess the level of employee engagement and motivation to determine if a distributed work environment would be beneficial to the employees and the company. Because of the rise of the distributed workplace, companies have had to deal with a concept called cyberslacking (O'Neil, Hambley & Chatellier, 2014). Cyberslacking refers to "…a phenomenon in which employees are distracted by non-work Internet browsing when they should be accomplishing work tasks" (O'Neill, Hambley, & Bercovich, 2014). This is an issue that has been present in the office environment and has transferred over to a larger scale into the distributed work environment due to the flexibility and autonomy provided to employees. This can be caused by the idea that the employees feel less engaged by virtue of being removed from a physical office location (O'Neill, Hambley, Greidanus, MacDonnell, & Kline, 2009). O'Neil et al. (2014) went on to explain that:

…we treat both cyberslacking and engagement as indicators of distributed work effectiveness, given that these are top-of-mind issues for employees and their managers in distributed contexts. Moreover, this suggests that advancing knowledge of the antecedents of distributed work effectiveness could be valuable for theory building and practical application (2014, p. 152).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

As a result, employers need to assess employee personalities to determine if they would thrive or fail in a distributed work environment. The trait activation theory (Tett & Burnett 2003) suggests that employee effectiveness and performance level are high when there is a strong fit between the employee and the job duties that he needs to complete. O'Neil et al. (2014) furthers this concept by stating "specifically, person-job fit theory posits that employee attributes need to match the job environment to create high effectiveness levels, and distributed work may contain unique conditions that affect personality-job fit levels." This suggest that employers need to pay close attention to these traits to either conduct organizational restructuring to place employees in the right fit before moving them into a distributed work environment, or be selective about who participates in a distributed work environment versus who stays in a physical office. The most extreme case, if an employer wants to go 100% in the distributed work space, would be to let go of the employees who are not a great fit and hire new employees to fill the gaps.

Finally, organizations have to ensure that they have the necessary technology and other resources that will support the distributed work environment infrastructure. They have to make sure that workers can easily gain access to equipment and resources to be able to complete their work. The access to important data requires resources such as laptops, internet connectivity, wireless phones, satellite, cable, etc. which are all directly connected to technology (Roper & Kim, 2007). Without the necessary equipment and resources, distributed employees will not be able to perform their work which may be construed as them not doing what they are supposed to be doing, instead of the fact they cannot actually do their work because they do not have the needed tools. Organizations have to take a serious look at their technological infrastructure and assess their capabilities to determine if, in fact, they have the necessary platform to support a distributed work environment.

DISTRIBUTED WORK ENVIRONMENT IMPACT ON THE HUMAN CONDITION

Influencing Factors on the Human Condition

Employment in general has positive and negative impacts on the human condition. On the positive side, it allows employees to earn a living, care for their families, and save for retirement. In contrast, there are instances where employment has interfered with family life, caused undue stress and sickness, and fostered unhealthy environments filled with conflict and lack of trust. Distributed work environments comes with positive and negative impacts as well, some similar to the above listed, but manifested in different ways.

Distributed work environments provide employees with many potential benefits such as: "more flexible working hours, more time for home and family, reduced commuting, greater job autonomy, less disturbance whilst working, and the chance to remain in work despite moving home, becoming ill or taking family care roles" (Holman, 2003). As well, this type of work environment also brings societal benefit which include increases entrepreneurial activities, less pollution, increased community stability, and more efficient use of energy resources (Cascio, 2000).

In contrast, there are some negatives impacts that may emerge in a distributed work environment such as fewer chances for development and promotion, increased conflict between work and home; and social isolation (Holman, 2003.) However, to truly understand the impact of a distributed work environment on the human condition, there are social and individual factors that need consideration. Social factors that may determine the feasibility, success or failure of employees in this type of work environment include:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the socialization of distributed workers, communication between distributed workers and traditional office workers, decision making and communication within virtual teams (Holman, 2003). In regards to individual factors, some determinants of feasibility, success or failure of employees include the connection between personality, competencies and the distributed work environment, employee motivation and the psychological contract in which they enter, the connection of job characteristics and the well-being of employees, and the home and work interface (Holman, 2003).

Social Factor 1: Socialization of Distributed Workers

Employees need to be able to socialize with their colleagues and managers in order to build rapport and trust, which in turn fosters highly effective and cohesive teams and a healthy work environment. Distributed workers need this socialization even though they are not physically present in a physical traditional office. These employees do not have the natural opportunities to interact with other employees as they would if they were in the office on a regular basis, which then affects their immersion in the organizational culture. Of course if the organization starts off on a distributed work environment platform, this problem is lessened as no organizational culture has been created with the walls of an officer, but they still need to address this issue. This socialization issue may impact distributed workers differently depending on their level of intra-organizational contact within the organizations. Employees with high intra-organizational contact will have an easier time socializing virtually with other virtual employees or their office counterparts, and employees with low intra-organizational contact will have a harder time dealing with this issue. As Holman (2003) expresses:

…teleworkers with high intra-organizational contact, or who regularly use real-time communication media (e.g. telephone, [instant messaging]) are more likely to be socialized through natural processes. In contrast teleworkers with low intra-organizational contact and that use non-real time telecommunications (e.g. E-mail), are less likely to be socialized through natural means (2003, p. 205).

Therefore, especially for the workers with low intra-organizational contact, organizations who engage in distributed work environments must intervene and ensure that they are putting in place socialization mechanisms, using technology, of which distributed workers can take advantage to stay connected and feel part of the organization. Interventions such as regular virtual weekly meetings, minimum office presence requirements, social programs participation and off-site social events are all good strategies to use and tackle this issue (Holman, 2003) are all good strategies to use to tackle this issue. Such interventions prevent employees, especially the ones with low intra-organizational contact, from feeling isolated from the rest of the organization and begin to be disengaged and de-motivated, which then will lead to larger issues.

Social Factor 2: Communication Between Distributed Workers and Traditional Office Workers

Effective formal and informal communication is key to the success of an organization. It is often difficult to ensure that all lines of communication in an organization are being utilized effectively, and it can be even harder within a distributed work environment where workers are spread across the country and around the globe. The types of communication that occur between employees and managers within

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

one physical office naturally are going to be different from the types of communication that occur with distributed workers. As well, group communication will be higher in the office than in the distributed work environment.

However, organizations have to mimic the office type communications as much as possible for the distributed workers in order to keep them informed and engaged in a timely manner. Using technology, they need to recreate the office communication experience for the distributed workers so that the lines of communication stay open and the distributed employees feel part of the team no matter how far away they are. Technologies such as instant messaging, voice-over IP phones, online meeting platforms, are just a few ways to mitigate this issue. Obtaining these technologies is the first step, but organizations have to ensure that the implementation and communication on the use of these technologies are thorough so that employees understand what, why and how to use them. Such communication integration will help both the employees with high and low intra-organizational contact within the company. Another aspect of communication integration, if these all of these technologies are not accessible, is to be comfortable with a lower level of communication among office workers and distributed workers, and most importantly ensure that employees being assigned to distributed work are comfortable with that level of communication and that it will not hinder their job satisfaction, productivity and quality of work. Holman (2003) summarizes this idea by saying:

Whilst teleworkers with lower intra-organizational communication requirements to perform their work tasks may experience fewer problems with task-related communication … communication can have an important function beyond direct facilitation of work. Therefore, it is important to be sure that managers and co-workers are happy with low levels of intra-organizational communication, a separate "cyberspace" subculture based on mutual support and information sharing may be beneficial to teleworkers (2003, p. 206).

Communication can have a large impact, positive or negative, on distributed workers' engagement and motivation; therefore, it behooves organizations to invest time and technological resources into ensuring that communication is not a barrier for their employees.

Social Factor 3: Decision Making and Communication within Virtual Teams

Decision making is a normal part of the work environment and team members often need to communicate in order to ensure that everyone is on the same page to make decisions on how to approach and complete projects. Although distributed workers are virtually located, they are not exempt from team decision making. In fact, is it crucial that these employees stay in communication with their team members and are included in the decision making process so that they can effectively make their contributions to the projects. Often distributed workers report that the quality of the information that received, related to performance feedback, organizational politics and organizational strategy is reduced (Holman, 2003). This is often due to the subpar quality of the technology infrastructure of the organizations. They are not taking into account the impact of technology, or the lack thereof, can have on the productivity and motivation of employees when it begins to interfere with their work.

As a result, organizations are encouraged to create channels where the virtual employees can participate in the decision making process. Research has shown that opportunities to take part in decisions have decreased for distributed workers due to the remote access of their job, unless they are in high

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

"extra-organizational" positions where they are in constant contact with their office counterparts and/or clients (Holman, 2003). Therefore, companies have to find viable solutions to include these workers in making decisions. Some examples of channels could be attending meetings at the office, online meeting tools with video capabilities, etc. However the organizations choose to address this issue to up to them; but the bottom line is to continue to foster a psychologically healthy work environments, employees need to feel vested in the organization through the decision making process.

Individual Factor 1: Connection between Personality, Competencies and Distributed Work Environment

Not all employees are suited to be distributed workers. Some employees thrive in the traditional office environment, but may not thrive as much in a distributed work environment. The same goes for some people whose performance will increase if they have an opportunity to participate in a distributed work environment, assuming that they have the proper technological resources to effectively completer their work and communicate with their virtual colleagues. One way to determine if an employee would be best suited for the office or a distributed work environment is to analyze employee personalities through the five basic dimensions, also referred to as the "Big Five" (Holman, 2003). These dimensions include extraversion, emotional stability, agreeableness, conscientiousness, and openness to experience (Holman, 2003). Evaluating employees using these dimensions can shed light and give a fairly accurate indication on whether or not they will do well in a distributed environment. If some employees score low on these dimensions, it may be an indication that they would do better in an office environment because they will have the needed interactions to help them develop these dimensions over time. On the other hand, employees who score high on these dimensions may be well-suited, and probably would even perform at a higher level because of their self-directedness and motivation level.

According to Holman (2003), personality plays a big role in making the determination of who would be best suited for distributed work especially in the case of manager feedback. In the distributed work environment manager feedback is either minimal or non-existent. Therefore, if employees require regular feedback to validate their performance, then it is best that they remain in an office environment because they will have direct contact with the manager. Holman (2003) goes further to make the point that:

… the characteristics associated with conscientiousness, such as persistence, care, capacity for hard work, and being responsible have been shown to influence the accomplishment of tasks. We would also expect that people who work with high levels of intra and/or extra-organizational communication are likely to be successful if they are higher on extraversion, agreeableness, and openness to experience (2003, p. 207).

In addition, personality plays a role in the way employees acquire knowledge. In terms of the employees' preferred learning medium, personality can be an indicator of potential success or failure in a distributed work environment. Some employees are not comfortable with using technology to complete their work or to learn new concepts. These employees who are more comfortable and learn better in a classroom environment and would be better suited for the office environment where they can attend training sessions being offered through the organization's training department or attend other outside face-to-face trainings. Their learning preference does not necessarily fit into a distributed work environment platform, as, due to the various locations, distributed workers usually attend online training and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

courses to further their knowledge. They require minimal supervision and are self-directed to complete the course or training at their own pace, and they are comfortable with using technology as an avenue through which their learning opportunities are administered. Consequently, having high levels of extraversion, openness to experience and conscientiousness would be important to have because they relate to how well people perform in training programs (Holman2003). Research has indicated that intelligence is directly and positively related to work performance, which furthers the idea of learning preferences and also be an indicator of how well employees will perform as distributed workers in terms of success in training programs, knowledge retention and application (Holman 2003).

Finally, personality also affects how individuals interact in teams. Employees in distributed work environments still need to have and practice the traditional teamwork skills such as collaboration, effective communication, performance orientation and goal clarity (Holman, 2003). However, they have to find new ways to perform these skills since they no longer have the office environment where a meeting can be called at any given time and all team members gather in a room to discuss a project. Given this fact, researchers have established the below list of personality competencies that employees should possess in order to be effective distributed team members. The competencies have been grouped into four major categories (Holman, 2003, p. 208):

1. Personal competencies, such as self-discipline, self-direction, self-motivation, capacity for self –assessment, tough-mindedness, tenacity, personal integrity and self-confidence
2. Inter-personal competencies, such as strong verbal and written communication skills, negotiation skills, trusting others and assertiveness
3. Generic task competencies, such as organization skills, practical orientation, basing decisions on facts, flexibility, ability to take independent decision, time management skills, and possessing consistent, productive and organized work habits
4. Technical competencies, such as information and communications technology literacy, and good subject-matter knowledge

Although further research needs to be conducted on the connection of personality, competencies as they relate to a distributed work environment, employers and employees can use the above practices as means to determine fit. Interacting in a distributed work environment is an extensive undertaking; therefore, using all available avenues to make the right decisions is imperative as the impact is great both on the organization and employees in terms of business success, employee engagement and job satisfaction.

Individual Factor 2: Employee Motivation and the Psychological Contract

The landscape of human resources in organization has evolved over the years and has shifted from offering employees stability and predictability in their work to asking employees to be intrinsically motivated and take control of their role in the workplace. Holman (2003) expresses it as such:

…there has been a movement away from the traditional psychological contract where employers have offered career and employment stability. Instead, the emerging psychological contract emphasizes flexibility, mobility, where employees should expect to be flexible in their work practices, be prepared to take responsibility for their own training and career development, and be prepared to move jobs regularly (2003, p. 208).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Due to this shifting philosophy, employee motivation and commitment are affected because they no longer have the guarantee that as long as they perform their job tasks satisfactorily, they will remain stable in their jobs. Such uncertainty pushes employees to always be looking for the next job as they do not know if they will be able to fulfill the future demands of their current jobs. In terms of distributed workers, this can cause problems due to the isolation factor that exists with working virtually. Components such as an office network, counseling services and unions are not readily accessible to them, so they may see it as psychological contract violation on the part of the organization (Holman, 2003). Therefore, to attempt to remedy this issue and promote successful distributed work environments, organizations need to present "…clear career paths and training opportunities [which] may encourage employee retention and motivation without necessarily affecting the establishment of a mutually beneficial flexible psychological contract" (Holman, 2003, p. 208).

Individual Factor 3: Connection of Job Characteristics and Employee Well-Being

Just as traditional work environments can be psychologically healthy or toxic and harmful, distributed work environments are no exception. Researchers have explored this topic and have identified that psychologically healthy jobs generally include …"greater skills use, greater variety of work, greater opportunities for control through task discretion or participation in decisions, balanced demands from work, performance feedback and job security, high clarity concerning tasks, better physical working conditions, higher wages, greater social value accorded to the nature of the work and more support and contact with others" (Holman, 2003). Depending on the type of job within the distributed work environments, it is likely that task discretion, variety in work and skill usage may decrease. For example, this can be in jobs that have low knowledge intensity due to established output control and monitoring mechanisms given the routine nature of the work. In that case task discretion variety and skill usage are decreased, taking away from the psychological health of the job. One way to resolve this issue by allowing distributed workers, whether in low or high knowledge intensity positions, to have the autonomy over their work schedule and task completion. Technology plays a big role in accomplishing this because it has the capabilities to provide the employees with a sense of autonomy and support their success if organizations invest in the right technological resources for these employees. This will give them a sense of ownership and responsibility to the work that they do.

To enhance employee well-being, organizations have to take steps to ensure their distributed workers have psychologically healthy jobs. Researchers have suggested several ways in which employers can accomplish this task. One strategy, is to ensure that the employees have access to all of the technology needed to successfully complete their work, as they would have access in a traditional office. Another strategy is to establish clear goals and objectives for the workers and help them identify the important role that they play (Holman, 2003). Another strategy is to ensure that employees have readily access to information and channels of communication to discuss and clarify the information if needed. This practice can also help in the reduction of the social isolation that distributed workers too often experience due to the non-existent office experience (Holman, 2003). To reduce the risk of poor physical working conditions that may occur in low knowledge intensity jobs due to low wages and the routine nature of the work, companies need to ensure that they are providing the necessary resources to those employees, in addition to sharing information. These employees are more likely to experience isolation and burn out due lack of resources, where they have to perform additional steps to complete tasks that can be

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

streamlined with the proper resources and equipment. Finally, offering appropriate training opportunities to not only training on job function, but on maintaining a healthy distributed work environment. Knowing steps they can take to improve their work conditions promotes autonomy and higher levels of job satisfaction and fulfillment.

Individual Factor 4: Home and Work Interface

Working from home comes with its set of benefits and challenges. As previously mentioned in this chapter, employees enjoy work flexibility and autonomy, as well as more time to spend completing family obligations. However, distributed workers who work from home face certain issues whether or not they have families. For employees without families, they struggle with creating an environment that is conducive to productive work by restricting distraction from neighbors, community activities, friends, and other social activities. For workers with families, they struggle with setting boundaries of work and home especially if there are family members present during their self-set work hours. The idea of separating work from family for a period of time as in a traditional office environment is non-existent for remote workers as their office is also home. The idea of work and family conflict arises and creates a certain level of stress on both the worker and family members (Holman, 2003).

These issues are sure to have an impact on work performance and job satisfaction if not handled appropriately. As organizations work with distributed workers to help them create a healthy and productive work environment, considering and being emotionally intelligent to the family and home demands placed on these workers can help. Training managers to be sensitive to these demands and structuring their work using a project based format with milestones and deadlines may be a positive alternative that supports flexibility and autonomy. In turn, employees' stress level will decrease, and they will be better positioned to deliver quality work and have high levels of job satisfaction and vested interest in the organization.

MANAGEMENT AND DISTRIBUTED WORK ENVIRONMENTS

Distributed workers require a different kind of manager than traditional office employees. To begin with, based on the earlier explanations of social and individual factors associated with distributed work environment, selecting of remote employees and their managers need to be a systematic process that goes beyond just matching job duties to personal candidate characteristics (Omari & Standen, 2000).

Given the nature of distributed work, management style matters in that specific, sometimes non-traditional and unconventional, strategies have to be employed to support the needs of the remote worker. Managing based on outputs may not be the best approach. As stated by Holman (2003) based on the work of Sparrow and Omeeren (2000) "Consequently, the usual adage of managing teleworkers by outputs—in of and by itself—may prove inappropriate for teleworkers, possibly leading to problems such as reduces well-being, reduced trust and low quality work." Holman (2003) suggests that managers need to play close attention to the social aspect of remote work due to the removal of the traditional office, they need to make a conscious effort is developing social networks, support systems, open channels of communication and establish trust in order to create environment where organizational learning can take place (Tregaski & Daniels, 2000). Further, human resources has an important role in identifying the organizational culture that currently exists and ensure that proper matching of managers and employees,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

as well as providing appropriate trainings occur to promote culture integration in the distributed work environment. As summarized by Holman (2003):

…human resource managers should be aware of the cultures and contexts in each area of their organization and should endeavor to ensure that telework schemes, workers and managers suit those cultures and contexts (since changing the cultures and contexts to suit teleworking is a longer-term strategy) (2003, p. 212).

One final important aspect of management involvement in distributed work environment is the training of distributed workers. Training and development of remote workers is just as important, if not more important than traditional office workers due to the added circumstance of distance. Holman (2003) suggests that there are several areas where training can be beneficial to remote workers, such as communication, self-management, corporate values, time management, off-site health and safety requirements, company cyber security policy, legal and tax requirements related to working from home, computer operation and maintenance, and job-specific trainings. Managers need to work with distributed workers to facilitate access to these trainings and create a communication system that will allow them to monitor the application of knowledge gained from these trainings. As well, they need use different methods of training delivery such as face-to-face, online learning, webinars, online instructional manuals, etc. to ensure that the employees have all the resources and training they need to perform at their highest potential. In addition, managers of distributed workers also need to attend trainings to prepare them for the different aspects of distributed work compared to the traditional office environment, as well as company policies and procedures of distributed work, communication and socialization needs, and support systems (Tregaskis & Daniels, 2000).

Properly selecting and preparing managers to support distributed workers is a crucial function, as they can determine the success or failure of the remote work process. If understanding, empathy and mutual trust and respect do not exist between managers and employees, then the odds of a positive, productive and long term working relationship are slim to none.

EXAMPLES OF IMPLEMENTING DISTRIBUTED WORK ENVIRONMENTS USING TECHNOLOGY

In researching the popularity of distributed work environments, over 125 companies have adopted this method of doing business, some of them are in their first or second year in the adoption, and others have been employing this method for over 14 years, and from the looks of it seems to be working for them. A company named FlexJobs, which provides services to candidates seeking flexible schedules, telecommuting, freelance and part-time jobs and as well as a distributed work environment company itself, keeps track of other companies that have fully or partially adopted the distributed work environment (Shin, 2016). The list of companies that they provide has grown 26 companies in 2014 to 76 companies in 2015, and in 2016 the list grew to 125 companies (Shin, 2016). These companies range for HR/recruiting and education to IT/computer. Based on these increases, Flexjobs is estimating that by the year 2020, 50% of employees will work remotely (Shin, 2016). Included in that list are:

Articulate which is a company that develops web, mobile, and desktop applications for online learning space that are rapidly growing, and for which it has won awards. Articulate has been a distributed work

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

environment company for over 14 years, and the management team has found the method successful for both their employees and the business. According to their founder and CEO, Adam Schwartz, all 150 employees work 100 percent of the time from home and their productivity level and quality of work is exemplary. Schwartz (Reynolds, 2015) added "We've always been fully distributed, so it's in our DNA. Because working remotely requires a lot of trust, you have to put people front and center. Ours are smart, kind, fun, and results-oriented, which makes Articulate a pretty magical place to work." Schwartz further expressed ""Being able to choose where and when we work empowers us to be more productive, more engaged, and more balanced in every aspect of our lives. After 14 years as a fully remote company, we're convinced a distributed environment isn't just good for our employees. It's also one of the key reasons we've been so successful as a company" (Shin, 2016).

Mozilla, a not-for-profit organization and the developer of Firefox, also support a distributed work environment, as well as remote workers around the world. They accommodate employees who want to work from home or in one of their remote offices in 30 countries around the world. The company explains "We have 13 global offices and people working in more than 30 countries. If you work best from home, that's not a problem. We can support you anywhere" (Reynolds, 2015).

Equation Research, is a strategic research company working with clients on brand equity and strategy, concept testing, advertising testing and tracking, and community panels (Reynolds, 2015). Its business model is quite impressive and the way they deliver services to their clients is quite unconventional. The CEO, Mike Travis commented and said "When we launched back in 2000, we set out to build and grow a company that NEVER HAD AN OFFICE. It was not a fear of the old food in the back of the refrigerator that drove us—it was the inspiration of building a different kind of experience for the people that shared in this adventure. It was part of the innovation we craved" (Reynolds, 2015).

Varsity Tutors, a private tutoring company that provides virtual and in home tutoring services, or where ever it is convenient for their clients. They provide one-on-one tutoring, they have over 20,000 instructors and a 24/7 online learning platform. The company prides itself in the "no commuting time" concepts as their instructors do most of their work using the online learning platform (Reynolds, 2015).

The list of these companies continues to grow and from the initial response to this movement, it is highly unlikely to see a decrease in this growth anytime soon.

In looking at the list of over 125 companies implementing the distributed work environment model, it begs the question: how do they do it? What strategies have they use to ensure that their employee and business needs are being met? In looking at companies that have been leading the way in distributed work environments, three main strategies have helped them be successful with this method and have grown their companies substantially over the years. These three main strategies are open communication, adequate resources and equipment, and promoting work/life balance.

Open Communication

In researching these companies, open communication, as a key to their success, was a recurring theme. Without having a strong communication system, these companies would most likely crumble as most or all of their employees are located across the country and the globe and not in central locations. Being a remote employee who feels that he/she is missing out on important information and discussions because the avenues of communication are not as robust as they need to be can be a very scary and demotivating position to be in. As a result, these companies employ several communication methods to keep their employees informed, engaged and productive. Let's take Automattic, for example. Automattic

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is the company that created WordPress.com and several other services for WordPress.com customers. They have over 400 employees spread across 40 countries to help to power companies' websites and their website needs (CloudPeeps, 2015). In their business model, to promote open communication, they have chosen to not use email. Instead they have worked on streamlining their communication channels to ensure that it is open and engaging. To replace the use of email, Automattic employees use an instant messaging chat system and an internal blog system, called P2, which comes with its own Google alert system so that employees are notified whenever new content has been posted on the blog (CloudPeeps, 2015). Automattic is also using an unconventional way of communicating with potential employees. Instead conducting traditional or virtual initial interviews, their process includes the following (CloudPeeps, 2015, p. 2):

1. The CEO screens all resumes
2. The hiring lead sends quality candidates a note
3. The hiring lead then pings them on Skype – and has a Q&A via Skype chat
4. The candidate completes a paid trial project on their own time
5. The CEO has a final review chat on Skype with the candidate

Even more unconventional is that there have been times when new hires have been brought on board without ever having a single voice interview (CloudPeeps, 2015). This method seems to be working for Automattic because it has seen 100% employee retention in its design and growth department (CloudPeeps, 2015). The CEO supported this process by saying "This has been amazing for the company in that we can attract and retain the best talent without them having to be in New York or San Francisco or one of the traditional tech centers" (CloudPeeps, 2015).

Another example is with Zapier, the company that creates software that connects applications (apps) that are used for the automation of tasks and leveraging more out of exciting data. Zapier takes communication very seriously with its remote teams, and it uses a series of communication apps across the company that are specific to each department and its functions. For example, when a new hire comes on board in their marketing team, he/she is provided with a list of communication apps, such as the one shown below to get them acquainted and equipped to engage in the open communication platform (CloudPeeps, 2015, p. 5):

1. Slack for ongoing chatter in their designated channels
2. Trello Editorial Calendar board for discussion around individual blog posts
3. Google Docs for Weekly Marketing Meeting notes
4. Google Calendar for keeping up with each other's schedules, including out of office
5. Async (their internal blog modeled after Automattic's P2 mentioned above) for Friday Updates and Monthly Marketing Updates
6. The team@zapier.com email for Daily Recaps (automated), hiring decisions, hiring announcements, time-sensitive news or questions

The above tools and several others have kept the employees engaged and productive, which in turn has made the company successful.

Another method of open communication being using is called "daily standup meetings. A company named Groove, known for its exemplary story telling approach to present website content for their cus-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tomers, values communication and understands its importance to keep a remote team productive and engaged. Groove also supports the idea of employees working during the times they are most productive; in other words, they do not have the expectations for employees to be at their desk at home or wherever at all times. This provides great flexibility for the employees and allow them to produce their best work every time. However, Groove also understands that, with this type of flexibility, having a good grip on what everyone is working on is crucial to keep projects moving and delivered; therefore, they instituted "daily stand up meetings" where everyone comes on and shares with the rest of the team what they are working on for the day, have weekly team calls, share their quarterly and annual goals, as well as ask or answer any questions, as well as have weekly meetings calls to discuss projects and any other issues that may have arisen throughout the week (CloudPeeps, 2015). Groove is able to provide such flexibility to its employees because of the strong culture of trust, principle and habits that they have engraved in their company. They are selective in their hiring practices; they look for candidates that will fit in their culture and move their mission forward. As they are screening potential employees, they look for specific qualities in the candidates such as (CloudPeeps, 2015, p. 6):

1. Have they worked remotely before or ran their own small business
2. Are they mature decision maker, meaning they can make the best decisions for customers and manage their energy on their own
3. Are they extraordinary communicators

A combination of these attributes is hard to find, but when it is found, Groove is confident that the employee will be a valuable asset to company and contribute to its success.

Companies like Automattic, Zapier and Groove, along with many others, have found that one key component of having a successful distributed work environment is open and streamlined communication. Keeping up with employees across the globe and not at a specific central location can be a difficult task; however, they seem to have figured a system that works for them, that just may work for other companies who are thinking about moving in the distributed work environment direction.

Adequate Resources and Equipment

Another strategy that companies in the distributed work environment have employed is ensuring that their remote employees have adequate resources and equipment to do their work. These companies realize that without the appropriate resources, employees will get frustrated and not perform to their highest potential. In addition, having remote employees means low overhead costs as these companies do not usually have headquarters or central locations. Therefore, they are able to invest in top of the line equipment and resources needed. On example of this strategy comes from Automattic. They ensure that they provide everything that the employees need to be comfortable and do their best work. Some examples of the resources that Automattic provides to its employees are (CloudPeeps, 2015, p. 2):

1. The best equipment for doing their jobs
2. A stipend for improving their home offices
3. Allowing any team to meet wherever they want for a "hack week"
4. Once a year, the entire company gets together for a "grand meetup" in a beautiful location
5. Employees make their own schedules

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Another example comes from a company called Buffer, which provides services to clients to help them drive traffic to their website, increase fan engagement and save time through social media. They too understand that they need to provide the best resources and equipment to their employees. Being present around the globe means that their employees have to be available to clients at different time zones. Therefore, employee satisfaction is key as these employees interact directly with the clients and need to provide impeccable customer service. As a result, Buffer ensures that its employees have Kindles, laptops, software such as Timezone.co, used to know when and where team members and clients are; Speak.io, used to provide fast video conferencing; and Hipchat, for regular chat communication among team members (CloudPeeps, 2015). Buffer, like Automattic, also puts on gatherings in a nice location for all of its employees to meet face-to-face, networking and engage in team building activities (CloudPeeps, 2015).

Providing these resources motivate employees to do their best because they see that the companies invested in them and understands the value they bring to the team. So many times, employees do not have the adequate resources to do their work; they have to get creative and make do with what they have. After a while, they get frustrated and demotivated and end up leaving the company. This is an issue for companies as these employees who leave, take with them vast amount of knowledge that was not transferred and companies basically have to scramble to get the work done. So it behooves all companies, remote or headquartered to be sure and invest in providing the necessary resources to their employees as the companies mentioned above have, to ensure productivity, job satisfaction and success.

Promoting Work/Life Balance

Another aspect of distributed work environment is the work/life balance concept. Chances are that being remote employees most likely means that they work from home where their families live. Therefore, it is important to ensure that a balanced work/life environment exists where there is a precise amount of time set aside for work and a precise amount of time set for family. This way employees can enjoy their work and their family lives and not feel that they have to choose one over the other. Companies who are part of the distributed work environment community understand the importance of this concept and take steps to support their employees in maintaining that crucial balance.

One example involves a company called Baremetrics that provides data mining services to companies. They strongly believe in the work/life balance concept and have created an environment where employees are able to achieve the balance while performing at their highest potential and spending quality time with their families. One thing that they recognize as a priority is self-care, and they encourage employees to practice self-care by providing them with these tips (CloudPeeps, 2015, p. 7):

1. Have set work hours and stick to them
2. Exercise every single day
3. Alternate between sitting and standing
4. Eat well
5. Take frequent breaks

They feel that by following these tips, employees are less likely to burn out and their job satisfaction level will continue to increase.

A second example comes from a company called Help Scout, that leads the help desk software support industry. At Help Scout, they understand the anxiety that new employees face especially of they are

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

remote employees. As a result, they have developed a buddy system that is solely there to support the new employees when they first get on board, and ease the stress and anxiety that comes with starting a new job. One of their marketing team members had this to say about the buddy system:

We figure being new at work isn't so far removed from being the new kid at school. Wouldn't it be nice to make a friend on the first day? For every new Help Scout teammate, someone who's been on board for a while steps up and becomes their go-to guy/gal who shows them the ropes. Work friends matter, and although they naturally form over time, feeling settled in shouldn't wait… A new buddy is especially important for remote work because you're not meeting a ton of people face-to-face your first few weeks. With so much to take in, now is not the time to let things get quiet (CloudPeeps, 2015, p. 10).

When new employees come onboard, team members have a list of activities that they can engage in with their buddy. Some of these activities include (CloudPeeps, 2015, p. 10):

1. Check-in every couple of days to see how things are going
2. Share a story from the team retreats, or what it's like to hang out in Boston
3. Share "unwritten rules," like the subtle difference between the #general and #offtopic channels in Slack
4. Have a video chat over Appear.in or Skype
5. Give them the run-down on who to ask for what

Such a system allows the new employees to get engrained in the Help Scout culture and be part of the family. Alleviating the stress of a new job in this way allows the new employees get on boarded at a much faster pace, which reduces the backlash that stress can have on their own families. Employees from this company and others mentioned above have written and expressed gratitude for the care they have been afforded through these companies which has allowed them to live happier and more fulfilled lives due to the unconventional way they work.

CONCLUSION

As presented in this chapter, the landscape of the work environment is changing due to the advancement of technology and more companies are considering or implementing distributed work environments. This type of work environment can be beneficial to organizations and employees if implemented correctly, using the right technology with the right employees and managers. In contrast, they can come at the detriment of organizations and employees if proper human and technological systems are not put in place. Over 125 companies in 2016 have fully or partially implemented the concept of a distributed work environment. They all have had their lessons learned, but they are pushing forward with the concept and are seeing positive results for their companies and employees.

As we examined the concept of a distributed work environment, we focused on the reasons why companies are entering this realm. The main reasons are for sustainability and having a competitive edge. In addition, companies have to respond to the needs of a new generation of employees who are looking for flexibility and autonomy in how, when and where they complete their work.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In implementing a distributed work environment, organizations have to consider several things, such as aligning their goals, objectives and culture as a whole so that they can clearly see if a system as a distributed work environment would work for their business and employees. They have to ensure that they have a robust technology infrastructure to support such an environment. They also have to look at the types of work and services that they provide to ensure that the same level of service and productivity or higher can be accomplished through a distributed work environment. In addition, companies have to examine the types of employees they have to determine if they would be a good fit for such a work environment. They need to figure out, based on what they know and have observed about employees, if they would thrive in a remote work environment. Looking for behaviors like self-directedness, self-motivation, time management, to name a few, are key to a successful distribute work environment employee integration. Further, employers need to make sure that they have the necessary resources, equipment and systems to support the distributed work environment infrastructure to promote business and employee success.

As with any system, distributed work environment have a definite impact on the human condition. As a result, careful considerations must be made to ensure that a distributed work approach is the best course of action for their employees. To make this determination, companies and employees need to pay attention to social and individual factors that surround the distributed work environment concept. The social factors include socialization, communication between remote and office workers, and decision making and communication with virtual teams. Individual factors include the connection that exists between personality, competencies and distributed work environments; employee motivation and psychological contract; the connection that exists between job characteristics and employee well-being; and the home and work interface. Failure to examine all of these factors to determine the best course of action on deciding on distributed work environments, will put organizations at a disadvantage because they will not have a clear picture of how their employees measure up against these factors in order for them to make sound decisions.

We also looked at the management of distributed work employees and how it differs from managing traditional office employees. Managing remote workers is not an easy task; therefore, human resources professionals have to ensure that they match the right employees and managers together for such a work environment as the communication, socialization and resource needs for these employees are different from the needs, for the most part, of traditional office employees. In addition, human resources and managers have to ensure that adequate training opportunities are available for both managers and employees to become familiar with the components of distributed work environments.

Finally, we looked at some examples of companies that have implemented a distributed work environment and how they have managed to make it successful. In reviewing these companies, there were three main practices they had in common that seem to be integral parts of their success: open communication, adequate resources and equipment, and promoting work/life balance. These three components seem to resonate with employees at these companies, and have allowed them to become stronger teams.

In the end, although distributed work environments need to be further researched both on the organizational and human aspects, the concept seems promising to companies as long as it makes sense for them. Given the continued rise of the digital age, distributed work environments may become the norm in the near future; therefore, it behooves organizations to be proactive and take the necessary steps to prepare their employees and organizational infrastructure for a possible change in that direction.

KEY TERMS AND DEFINITIONS

Self-Motivation: Initiative to undertake or continue a task or activity without another's prodding or supervision.

Teleworker: Employees who work from home or satellite locations for an organization.

Socialization: A continuing process whereby an individual acquires a personal identity and learns the norms, values, behavior, and social skills appropriate to his or her social position.

Intra-Organizational: The level to which an employees has built strong relationships with their colleagues within an organization.

Self-Directed: The ability to guide, manage or regulate oneself without supervision.

Communication: The process of imparting or interchange of thoughts, opinions, or information by speech, writing, or signs.

Virtual Teams: A team of employees working together from different remote locations. The majority of their collaboration occurs online.

Personality: The sum total of the physical, mental, emotional, and social characteristics of an individual. The organized pattern of behavioral characteristics of the individual.

Chapter 101
What Does the Future Hold for Innovation Management Education?

Pia Jääskeläinen
South-Eastern Finland University of Applied Sciences, Finland

ABSTRACT

Education often struggles to keep up with the pace of changes in the global economy- and technology-driven world. This issue can be seen especially in the education of innovation management. Even if the current pace with which education in general is adapting to these changes remains the same, the intensifying change dynamics imposed by accelerating technological development, labor market changes, population aging, and environmental challenges will simply outpace the education system's adaptability. This chapter aims to identify and describe emerging trends that will most likely put additional pressures on innovation management education in the short- and mid-term. Based on the presented change-driving trends, a concept of a future-oriented innovation management course will be presented. Additionally, the hypothetical implementation of the innovation management course concept will be presented. In the conclusion, the challenges that innovation management education should address will be outlined and discussed.

INTRODUCTION

Education often struggles to keep up with the pace of changes in the global economy- and technology-driven world. This issue manifests especially in the rapidly developing field of innovation management education. Even if the current pace at which education in general adapts to changes remains the same, the intensifying change dynamics imposed by accelerating technological development, labour market

changes, population ageing, and environmental challenges will simply outpace the education systems' adaptive potential.

This chapter aims to identify and describe emerging trends and developments that will most likely place additional pressures on educational systems in the short- and mid-term. Based upon the presented change-driving trends, a concept of a future-oriented innovation management course is proposed.

Since the aim of this chapter is to inform readers of current and expected future developments in the field of education—more specifically, the education of innovation management—the analysis of context is based upon the context and integrative review (Neuman, 2011, p. 112) of semi-scholarly professional publications and online newsmagazines from the fields of interest (education, technology), observing the general principles of the trend analysis (Rescher, 1998). The proposed concept of a future innovation management course suitable for the outlined changing conditions is the result of a thought experiment built upon the authors' experience with emerging technology in an educational setting.

Following its aim, this chapter first outlines emerging generic societal trends that will most likely put additional pressure on educational systems as being currently recognised by the education (management, developers) community. The observed time horizon for trends is limited to the next five years, since the timeframe to develop and pilot the proposed innovation management course falls under a short- to medium-term scope. The detected trends will be described following the distinction from general to specific. Thus, we first focus on the trends that represent external pressure on education systems and later present more specific short-term developments within the education sector. Next, by taking into consideration the limitations of predicting trends (i.e. trend analysis), we deduce and describe cornerstones and main challenges that the proposed concept of a future-oriented innovation management course should address. In the next section, the introduced concept of an innovation management course will also be presented through a description of its hypothetical implementation. We conclude the chapter with a discussion of the most notable challenges that education systems should address in the mid-term future.

GENERAL SOCIETAL TRENDS MOST LIKELY TO SHAPE INNOVATION EDUCATION IN THE MID-TERM FUTURE

Although appealing, predicting trends (i.e. trend analysis) as practice of collecting information and attempting to spot a pattern is difficult, as historical data may not give a true picture of an underlying trend (Rescher, 1998). Predicting trends involves identifying turning points, but it is difficult to tell in the moment whether one observes mere aberrations or the beginning of a new trend. In addition, long-term projections need more data to support them, which may not always be available. The further out in time one forecasts, the greater the possibility of error, as the passage of time will inevitably introduce new variables. Because trend analysis is based on historical data, both the accuracy and reliability of such forecasts suffer when the environment changes or when one mistakes cyclical trends for long-term influences (Merkgraf, 2017). Despite those limitations, the inherent need to forecast future developments and anticipate problems is important and appealing in a dynamic and uncertain environment, and in higher education, change will be a constant state of affairs in the foreseeable future (Fagan, 2017).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Economic Pressure

Market pressures constantly push institutions to reduce the cost of education (Agrawal, 2017; Fagan, 2017), deliver more value (Fagan, 2017), increase access, and optimize the education system (Agrawal, 2017). In that sense, information technology (IT) innovations offer the possibility of making education more cost-effective and affordable, lowering the overhead costs of institutions, reducing completion times, improving the quality of (online) courses and increasing enrolment, and maximizing the number of students universities can admit (Agrawal, 2017). On the other hand, the societal role of educational institutions has shifted over the last years due to economic pressure and changes in the higher education environment towards a multi-acting innovator in an ecosystem rather than an inter-disciplinary science institution in a global society (Steinbuch, 2016).

Additional forces in the business environment, like market power shifting to the customer, globalization pressure, and new forms of partnership, also contribute to the emerging trend (Kamath, 2015)—observed for now only in the U.S.—of public colleges and universities offering online education programs or courses that rely on external companies. The services of these companies—so-called online program managers—range from simply supplying the online platform through which university affiliates interact with students to all-inclusive distance-learning programs rebranded under the institution's name (Mattes, 2017). While in the U.S. the online program managers are shaping the educational world in the long run, on a global basis, a similar change is increasingly taking place through education export programs. For example, Education Finland (2017), a national education export program run by the Finnish National Agency for Education, is aiming at offering Finnish educational knowhow and learning solutions on a global basis from early childhood and basic education to higher and vocational education, as well as corporate training.

A strong drive for universities to work in a more inter-disciplinary way, focus on entrepreneurs, and determine how to create value is evident. In an environment in which linear thinking and linear processes are desired to be replaced by exponential growth, using the power of platforms (i.e. networks) and circular processes, increased pressures arise for universities to network and open channels to industrial, entrepreneurial, and societally engaged individuals, customers, and partners (Steinbuch, 2016). According to the OECD (2017, 70) institutional collaboration and alliances have occurred recently, but the literature on institutional collaboration remains limited, and going forward, the most weight should be put on the impacts of collaboration and consolidation initiatives to determine the outcome of these activities. In addition, universities are experiencing a proliferation of alternatives to supplement and customize classic education programs and courses, such as Massive Open Online Courses (MOOCs), programming boot camps, and nanodegree programs. Or, as McNeal (2016) puts it: "As Napster 'unbundled' music albums, EdTech start-ups are unpacking the degree."

Technological Pressure

Since the beginning of the information age, we have witnessed general trends of an exponentially increasing amount of data and the development of IT and the number of devices able to handle it. There is a growing awareness that technology will play a positive role in the future of higher education, but some technologies will be more important than others (Kelly, 2017). Additionally, IT technology provides an answer to students' diverse learning needs in academic and work-related environments.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The increasing number of technologies that can be easily adapted to solve problems in the education sector has recently caught the interest of IT innovators and entrepreneurs (for instance, the Bill and Melinda Gates Foundation and Mark Zuckerberg's Chan Zuckerberg Initiative). Currently emerging IT technologies that will continue to develop in the future include artificial intelligence (AI), big data, and the Internet of things (IoT), which aims to connect multiple electronic devices. Without AI, it would not be possible to manage the massive amount of data available and learn from it to make business decisions, solve perception problems, organize knowledge, or make machines to learn and move. In addition, with increasing computing power, visual time representation of complex data exposed to multiple people in collaborative interaction are also gaining in importance (Cardoza, 2017). However, with the increasing pervasiveness of AI, challenges of security emerged as well (Kleindienst, Land, & O'Meara, 2017). In addition, we should not forget that technology has never been the sole driver of social changes (Edgell, 2011; Watson, 2017). The conference "AI and the Future of Work," hosted by MIT's Computer Science and Artificial Intelligence Laboratory, showed that experts generally agree that AI will have a major impact on jobs and the very nature of work. But, for the most part, these experts viewed AI as mostly augmenting rather than replacing human capabilities, automating the more routine parts of a job and increasing the productivity and quality of workers (Wladawsky-Berger, 2017).

The growing reliance on and usage of mobile devices, along with improved connectivity, the growing need for work-life flexibility, and the growing pressures on higher education institutions to improve graduation rates, pave the way for online classes to retain or grow their popularity. The online education market is forecasted to grow at a compound annual growth rate of 20 percent until 2020 according to a market study released by Technavio (Online Higher Education Market in the US - Forecasts and Analysis by Technavio, 2017), though the European Union (EU) is still lagging behind in this respect (European Union, European Commission, & Directorate-General for Education and Culture, 2016), despite policy efforts to open education ('Opening up Education through New Technologies - Education and Training - European Commission', n.d.).

Labour Market Pressure

Despite mixed reports and opinions on the impact that technological development will have on the future of work (Edgell, 2011; Watson, 2017), one thing remains certain: For now, employers will continue to complain of the insufficient or outdated skills provided by the education system, which are made obsolete by fast technology development and changing business demands. As a consequence, educational institutions will remain under pressure to refine curricula to meet employers' needs, make higher education more accessible, and recruit top employees (Fagan, 2017). In addition to academic skills, non-academic skills should be taken into consideration when defining future curricula (Kamenetz, 2015). The future business world desires not only strong substance skills, but also flexible skills and knowhow—for example, regarding entrepreneurship, marketing, strategic management, collaboration, and innovation. To keep up with the pace of change, close cooperation between businesses and educational institutions is integral.

According to the Hays Global Skills Index 2017 (2017, p. 4), the three major drivers in future global labour markets will be innovative working patterns, diverse working places with well-educated migrants, and digitalization. More and more employers and workers will adopt innovative working patterns, such as freelancing and temporary or on-call jobs. This will have a major impact on the versatile skills future employees (and employers) must be equipped with to succeed in business life. Another important finding of the report is that migrants are increasingly well educated and will increasingly enter the business

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

world on a global basis. Owing to this, working places will become intercultural, requiring entirely new skills from future employees. Finally, digitalization, according to the report, includes AI, big data, online platforms, and computers communicating with each other with little or no human intervention. Digitalization will move up or down the skills spectrum, creating entirely new work roles due to greater efficiencies and lower costs. There are many non-academic skills that will play a major role in the future workplace, but in this context, skills such as critical thinking, collaboration, communication, creativity, and information, media, and technology skills should be highlighted. How to act in the online world with increased awareness of the various items going on around oneself will be in an important part of media skills in the future.

HOW WILL THE OUTLINED TRENDS CHANGE INNOVATION EDUCATION IN THE NEAR FUTURE?

How will the outlined (external) trends change the near future of innovation management education? Can we identify specific education trends shaped by the external pressures? After all, when venture capitalists and seasoned IT innovators and entrepreneurs invest in ideas aimed at disrupting the education sector, one should expect some changes in the near future. But first, according to some observers (Bhalla, 2017) one can also expect a slow but steady downfall of lecture-based or unidirectional learning engagements. However, since all developments and changes also generate some counter-reactions, the second part of this section is dedicated to presenting some pending issues that the described developments will most likely generate.

Data Analytics, Artificial Intelligence, and Personalized Learning

Although often criticized, personalized learning that flies on the wings of improved data analytics supported by AI, big data, and the IoT is certainly hot topic—in the U.S, if nowhere else (Bogardus Cortez & Salcito, 2017; Herold, 2017; Newman, n.d.). The data utilization trend at the university level has shifted from collection and display to real integration. Data systems powered by AI can help create trend insights and projections. Using AI, universities will be able to establish a foundation to use data to drive efficiencies in many aspects of campus life, from learning to infrastructure and management (Bogardus Cortez & Salcito 2017). Learning analytics also promise to support adaptive learning programs (Bogardus Cortez & Salcito, 2017). Data can increase student success and retention, while AI can support the personalization of learning (Bogardus Cortez, 2017e). In a survey of IT decision-makers in higher education, Unit4, a leading global enterprise applications provider for student educational services in higher education institutions, (2017) found that the importance placed on data analytics programs was a driving force of investments in these programs, with 60 percent of surveyed universities in the U.S. using data automation to inform them of at-risk students and provide real-time learning feedback.

Millennials bring an interesting point of view to the table when discussing AI, analytics, and personalized learning. As they were born with the technology at their fingertips, most of them are more comfortable learning from technology than from people (Kelly, 2017b). That said, the technology (AI and personalized learning) should be exploited in a new manner to combine the human touch with technological platforms. In Japan, there are many robots used in the business world (hotels, retirement homes, food deliveries) already taking care of lower level, transactional duties.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Augmented Reality/Virtual Reality/Mixed Reality

Virtual solutions are expected to receive more attention both from education technology (EdTech) developers and from users of this technology (Newman, n.d.), moving beyond existing systems of visual data exploration in biology, math, engineering, visual arts, and digital humanities and making large and complex data sets even more intuitive. We expect that augmented reality (AR) will get more attention than virtual reality (VR) because of its more appealing mix of immersive and personalized virtual learning (Bhalla, 2017). According to Bogardus Cortez (2017c), AR blends real-world interactivity with an immersive video game world, letting students interactively engage with topics of space, human anatomy, and architecture. Medical schools are already looking into how AR and VR can play a role in training future doctors and surgeons. There is also already AI and game-driven training available for criminal justice students examining a crime scene and answering questions (Bogardus Cortez, 2017b).

Reality-based solutions play a key role in getting students (future employees, employers, and entrepreneurs) ready for business life. Reality-based platforms are the only way for students to exercise and practice real-life situations—possibly failing and trying again—in a safe environment. In virtual surroundings, the emphasis of the real-life situation should be in focus, but the user interface and overall usability of the platform naturally plays a role too. Without a user-friendly interface—especially today, thanks to well-developed game and virtual reality environments—the student will find it difficult to focus on the main challenge thrown in his/her direction.

Gamification

Closely related to emerging trend of AR, VR, and mixed reality protruding into the realm of education is the emerging presence of gamification (Newman, n.d.; Reynard, 2017). Graphical, technological advancements have pushed gaming forward and integrated it into learning contexts (Reynard, 2017). Gamification enables (Bhalla, 2017) immersive physical experiences in project-based, social activity-based, and hands-on learning experiences coupled with the ability to record and measure learning improvements while students work on various kinds of projects or tasks. Therefore, in this respect, hardware, sensors, and associated AI merge into physical educational solutions that enable the possibility of evaluating the progress towards educational goals (Teyssier, 2016). Gamification also increases engagement through concepts like accrual, levelling, competition, and rewards. Games also provide students a safe environment in which to fail and try again (Lynch, 2017a).

Increased Collaboration and Networking

Another area of education in which we can expect intensified development in the near future is collaboration and networking (Bogardus Cortez & Salcito, 2017). With the increasing pressure on colleges to prepare students for today's workplace, collaboration tools offer an appealing opportunity to close skill gaps. A more institution-wide approach to collaboration that mimics work environments for students can be developed by opening universities to industry representatives, entrepreneurs, societally engaged individuals, and customers. Challenge-based learning will continue to grow in importance for students because they must be able to make clear connections between their coursework and the real world and realize how the new knowledge and skills will impact their future work (Cortez, 2017a). According to Reynard (2017), connections between communities of learners from various cultures and in various

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

subject areas are also expected to increasingly develop. Some gamification projects have already been coordinated to include participants from around the world, addressing global issues such as poverty and hunger. Indeed, The World Government Summit of 2016 gave attention to gamification and the future of education.

Lynch (2017b) identifies makerspace areas as essential to innovation. This space indicates a creative space in communities, schools, and public and academic libraries that enable collaboration. These makerspaces increase innovation because of the hands-on work done in cooperation with others. Traditionally, these have been labs or working areas in the physical environment, but with digitalization, makerspaces will be available more and more in online and virtual surroundings. Makerspaces provide students with crucial and diverse collaborative experiences, which in business life could be frequently experienced though project-based work, in which people come and go, knowledge is shared among the project team members, and everyone is working towards a common goal in a results-oriented manner. Especially in smaller educational institutions, collaboration and an experiment-focused culture play key roles in success (Garrison, 2017). All educational institutions must become more agile members of the community and society and more innovative partners in the ecosystem, providing added value to the network.

Blended Is Here to Stay, at Least for Now

As already mentioned (Cortez, 2017a), technology will be used to create environments of more flexible learning that blend class time with digital tools. This study has indicated that digital tools can help expand the reach of educators and introduce expert voices to students. Emerging technology like VR will also continue to help facilitate blended learning. Taking into consideration vocal critics of the expansion of AI into realms of education—especially personalized learning (Herold, 2017; Watters, 2016, 2017)—it becomes obvious that at least in the mid-term future (Agrawal, 2017) EdTech solutions should be built to enhance proven processes and help them transition into the digital age. When educational institutions use AI-powered online environments, they should use the AI predictive modelling to create a trajectory for learning that can be shared with the students to support the creation of a learning path (Cortez, 2017d). To ensure widespread success in this use of AI, the precise models and algorithms that educational institutions use cannot be locked up in proprietary systems. They must be challengeable, peer-reviewable, and transparent, so that pedagogical decision-making is done by the people who usually make those decisions.

If you're going to be successful in an online environment, it has to be about putting people first, not tools. The platform and courseware are important—but we will lose a huge portion of students if we don't keep the human connection. (Cortez, 2017b)

Pending Issues Accompanying the Outlined Trends

All developments and changes also generate some level of counter-reaction. Accordingly, all the AI/automation/IoT hype is also building rather strong opposition among humanist-focused people. Every action generates some reaction, and those reactions should be taken into consideration as well.

A lot of the literature focuses on discussing automation, AI, and their impact on future jobs. With all the hype around automation, it seems that on a global basis, automation will disrupt entire industries and put millions of people out of jobs. In fact, up to 45 percent of existing jobs can be automated using

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

current technology (Bidshahri, 2017). How can lecturers know what lies ahead in the future of work? Lecturers and educational institutions were not able to predict the birth and blossoming of the Internet. Yet, educational institutions and their teachers have still managed to enable their students to survive in the Internet-driven business environment (McNeal, 2016). With the growing number of AI-driven devices and robots and increasing automation, will the human touch be minimized in or entirely eliminated from the future business world? Learners must prepare for careers that employ uniquely human traits like self-regulation and communication. Creativity, complex problem-solving, and coordinating with others are among the skills that will become increasingly important for workers to develop by 2020, according to the World Economic Forum (2018). At the same time, future jobs will require multi-skilled employees who are fluent with technology and devices, have their heart and mind in the right place (human touch), and provide additional value to customers. The power remains with humans, not machines. Technological devices will remain platforms and enablers to augment human work performance.

Without a doubt, automation will also shape education and the future work of teachers. After a detailed analysis of more than 2,000 work activities in over 800 occupations, a report by McKinsey and Company stated that of all the sectors examined:

The technical feasibility of automation is lowest in education. Effective education involves more than just transfer of information from a teacher to a student. Good teaching requires complex social interactions and adaptation to the individual student's learning needs. An effective teacher is not just responsive to each student's strengths and weaknesses, but is also empathetic towards the student's state of mind. It's about maximizing human potential. Furthermore, students don't just rely on effective teachers to teach them the course material, but also as a source of life guidance and career mentorship. Deep and meaningful human interaction is crucial and is something that is very difficult, if not impossible, to automate. (Bidshahri, 2017)

All this, along with the strong professional record of accomplishment of teachers, is something AI cannot offer. After all, robots are "only" programmable talking heads. According to McNeal (2016), most adaptive software focuses on knowledge acquisition instead of helping students learn to think and function in modern society.

Siri and Alexa, AI-powered chatbots, proved to be commercially viable, but are they pedagogically viable? That remains an open question. According to Waters (2017), nobody actually wants to talk to a bot. That seems to be a rather crucial observation often overlooked when hyping the capabilities of AI. To be fair, no one actually wants to talk to a human either in many of the scenarios in which bots are utilized—in customer service, for example, in which, whether conducted by human or machine, interactions are highly scripted, and there is always a human behind the scene writing the scripts. Despite the recent hype around advances in AI, we do not have thinking machines. We certainly do not have caring machines. Yet we continue to build teaching machines that reduce pedagogy to its most instrumental form. We continue to build pedagogical agents that reduce helping to the most mechanical and scripted gestures. In addition, according to McNeal (2016), Rory McGreal, a professor in the Centre for Digital Learning at Athabasca University says that you "can't be an adaptive learner if you don't know anything." He says learners need to master content and skills before they can move on to "higher-order" functions like creative thinking.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to Herold (2017) leading researchers also claim that their work does not support the most enthusiastic claims being made by supporters of personalized learning, raising numerous questions about the implications of personalized learning for teaching and learning. First, many critics think that personalized learning is all about kids working on their own in front of the computer, a way of working, which ignores the essential social characteristics of learning and puts teachers to the role of "facilitators". Due to the fact, that so many different approaches can be called with the term "personalized learning," it is challenging to say how often this criticism is right on point. Second, some aspects of personalized learning highlight a "reductionist type of education" which divides learning into smaller bits and pieces of various skills, disconnected from an inspiring, overall learning experience and swiping away from students the control over their learning experience (Herold, 2017). Third, tailored learning's experience on enabling different content and study paths to students individually could open the door for watered-down and fewer expectations, greater unfairness, and more challenges holding schools accountable. Forth, rather than advancing human potential, many EdTech companies and universities are perpetuating the status quo (McNeal, 2016). In the meantime, when machine-based, automated learning is obviating the need for students to remember content and improve routine skills, existing EdTech solutions still aims at helping students develop these capabilities. Instead, they should drive learners to sharpen their unique human traits—the ones that will enable them survive and succeed in an ever-increasing automated world. Fifth, many critics are concerned that the term "personalized learning" is just a set up for a disruptive push by the EdTech industry to change education into a massive data-mining program utilizing the IoT and AI-controlled teaching. We are sacrificing our children's privacy and allowing corporations to make potentially life-changing decisions about our kids (Herold, 2017).

Educational institutions, like any other businesses, face enormous market pressures. One must keep an eye on cost, bring more value to the customers (students and government), and reduce completion times. Optimization is key in the game of survival. The roles of educational institutions have changed and will continue to do so in the future. However, there is much literature (scientific and commercial) available to companies of all sizes on re-shaping businesses for the future. The boldest studies propose that companies create their own blue ocean strategies and continuously re-evaluate the business environment and the value they bring to customers (Kim & Mauborgne, 2017). Similar guidance is not available for educational institutions, at least considering the extent of the literature. One could even say that educational institutions should grow gradually with students and not make any major, revolutionary changes in their operations even when the changes around the institutions are clearly more radical. In these cases, is this dramatic change a revolution, or is it only an evolution of the Internet revolution? Educational institutions had to change revolutionarily when the Internet became dominant and changed the way teachers do their jobs. Herold (2017) refers in the publication to Larry Cuban, who is the Stanford University Professor and author of many online learning publications, said he was surprised to find "meaningful, incremental improvements in how teachers organize and teach a lesson"—but not a revolutionary new model of education (Herold, 2017). With all these trends of change in mind and an eye on the future, does the education world really face a major change, or is this just another storm in a teacup?

THE CONCEPT OF A FUTURE-ORIENTED INNOVATION MANAGEMENT COURSE

Course Foundations

If we try to summarize the discussion of the emerging (education) trends presented above, there are some elements that stand out, pointing to what should be (in general) integrated when developing future business management courses and (more specifically) the proposed concept of a future-oriented innovation management course. Those courses should incorporate the following fundamental cornerstones.

First, the essence of the courses should revolve around scenarios integrating real-life situations with elements of simulation (in hypothetical cases). The real-life situations or real-life cases should be taken as the starting point for scenario development. For instance, the scenario could include either realistic innovation challenges (already existent and addressed, such as the development of an existing market product or service) or human resource management situations (such as the case of recruiting the computer numerical control (CNC) technician within a small or medium-size enterprise (SME) in the automotive sector under tight labour market conditions). These real-life cases and scenarios would allow a lecturer to inject his/her pedagogic methods (such as prior readings, group discussions, etc.) with corresponding teaching content (theory) into the script and simulated situation.

Second, the course should take place in a virtual environment with an integrated gamification component—i.e. a scripted story forming the backbone of course activities as described above (for instance, a virtual company set up in Second Life and expanded with gamification, AI, and blended learning elements). In this virtual context, the stakeholders would take on different roles mimicking real-life situations, like developing the new product, conducting employee performance evaluations, firing employees, etc. In general, students or learners in business management courses would take on the managerial roles, while the teachers or company representatives would take on the roles of either senior management, customers, or teachers (monitoring the simulation progress), depending upon the simulated situation. It is important to stress that the greatest value of the proposed concept lies not in its virtual component, but in its gamification element. For the course to be effective, the scripting of many possible courses of action that the simulation can take is of utmost importance for providing an experience that is as realistic as possible.

Third, as just outlined, the element of blended learning simultaneously integrating different stakeholders (as many as possible) into the scripted simulation is essential for providing as realistic a teaching experience as possible. It must be stressed that group initiatives with diverse teams (such as a project team including experts from various fields of expertise to solve common challenges) can also be integrated into simulated scenarios. After all, future experts need to understand the big picture, not just their own narrow area of expertise. HR managers, for instance, must understand what is going on in the company in general and how different actions impact different items. With respect to providing a holistic and realistic experience, this concept also enables the integration of co-teaching, allowing knowledge transfer from different yet complementary fields of science. For instance, mastering the first phases of the innovation process requires an understanding of its technology or research, development and innovation (RDI) aspects, financials, marketing, and leadership. The authors of this manuscript propose naming this concept BLURNING, denoting the notion that the borders between learners and other stakeholders in the education/training process are blurring, even more so when the scripted VR scenarios allow for different roles to be taken (played) interchangeably. Multichannel communication with the parties

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

involved could take advantage of social media (crowdsourcing), games, etc. being integrated into a learning platform (i.e. Second Life or other VR/gamification platforms). However, it is essential that face-to-face elements (F2F) remain an integral part of the process to avoid the known limitations and problems of "pure" online learning. The key role remains embodied in the teacher. The teacher with his/her substantive and pedagogical knowledge provides a strong mentoring role (almost that of a big brother), overseeing the whole process and providing information on the expected simulation progress and outcomes, as well as the learning outcomes. The ultimate goal of the virtualized simulation would then be to complete the simulated scenario, with the student applying the knowledge passed to him/her along the way (knowledge application) by solving the challenges experienced in a realistically framed situation (close to realistic experience) focused on achieving specific goals (goal achievement).

The fourth and final cornerstone of the proposed concept is using AI to integrate external contextual elements into the scripted simulation. AI is essential for providing a realistic learner experience and personalizing learning with real-time learner-specific feedback. More specifically, AI integrating realistic external business environment factors like labour market conditions, stock exchange values of certain raw materials, changing market shares, etc. improves the realness of the experience and introduces the uncertainty factor characteristic of the business world. In addition, AI will be employed alongside the gamification evaluation tools to provide individualized (360°) feedback to learners. As students make choices during the simulation responding to the simulated scenes, the evaluation will be generated from those choices. Each of their choices will have consequences for the next scene in a real, branching-scenario approach. In addition, by adapting known education methods like report writing, self-assessment, and peer evaluation at the end of or during the simulation, every learner will be promptly provided with his/her results on each analysis criterion with customized feedback provided by AI and complemented by the teacher/mentor. The strongest personalized-learning models offer the best of what both conservatives and progressives want: high-quality standards and content for students with opportunities to apply that knowledge via self-directed projects, all supplemented by human mentors and technology tools that help students keep track of their own learning (Herold, 2017).

The Hypothetical Implementation of a Bachelor or Masterclass Innovation Management Course

The initial idea is to structure a bachelor or masterclass innovation management course around the eMIPS method (e-supported mass identification of problems and solutions); eMIPS is a meta-method for supporting the first phases of the innovation process, in which a series of specific innovation methods and tools could potentially be used (e.g. Ishikawa diagram, problem mining, innovation cube, etc.). This method is a somewhat extreme open innovation (OI) method, in which the first phases of the innovation process are directly supported and managed by external experts. The concept also puts an important focus (alongside the ideation phase) on the pre-invention phase—i.e. problem identification. The eMIPS method is a sort of "umbrella methodology" that can be dynamically adapted to various SME challenges integrating an organization's employees, external collaborators, and a group of skilled eMentors. The eMIPS method thus offers knowledge on the first phases of the innovation process (i.e. FEI management) and provides tangible results with regard to innovation problems, opportunities, and ideas. The proposed innovation management course concept would take the initial eMIPS idea and transfer it to VR and expand it with gamification scripts and AI tools.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

First, a virtual company will be set up in a VR world. There is also the alternative option of setting up a virtual (university, techno-parks) incubator. Within this virtual company, students would take on the role of a product manager leading a product development team and could interchangeably take on the role of team leader or team member. The innovation management teacher, or in this case mentor, would take on the role of the teacher/mentor (being a sort of big brother to the whole simulation) or the company owner (CEO). Since we assume the possibility of introducing the co-teaching method, one of these roles could be given to the other participating teacher—for instance, a marketing or economics teacher. External companies (i.e. specific SMEs selling certain products or services) would provide innovation challenge and take on the role of an angel investor. There is also the potential to include the suppliers of this external company in the simulation.

For the purposes of the simulation, different viable scenarios would be developed, taking into consideration possible changes in the external environment (different amounts of funding available, availability of specific expertise, different readiness levels of competitors, different company characteristics, etc.). AI would be integrated into scripting, providing some viable scenarios (with viable context limitations).

Within this broad context, the students would take on the tasks and activities dictated by the innovation process by following the eMIPS method, stepwise applying different innovation tools. Before taking on these specific tasks, they would need to attain the required knowledge, which would be provided by the teacher either through video conferencing or assigned readings. As in the real world, students would also need to engage in active communication with the company (i.e. representatives of the company supplying the innovation challenge, taking on the role of the angel investor), suppliers (i.e. representatives of the supplier company), and the market (the role assigned to groups of students or representatives of consumer organizations).

The course can be divided into three phases: preparatory activities, the innovation process, and the course conclusion with the evaluation activities.

The preparatory activities (1) take place in the introductory workshop and include the following sub-activities: a) introductory workshop; b) identification of the main innovation challenge, and; c) definition of teams and roles. The introductory short format workshop: (a) primarily serves to introduce the course (i.e. the simulation) to the participants, provide the initial motivational impetus, and familiarize the participants with navigation and functioning in the VR world. Next, (b) the main innovation challenge will be presented. However, it is important that a basic problem be clearly defined. Even though it is not an obvious pre-condition, it is also useful to check whether the problem is too narrow (potentially dealing with very specific technical details) and if it offers possibilities for teamwork. Next, a great deal of importance is also placed on selecting participants (c), assigning the roles to be taken in the simulation, and explaining the roles and clarifying their borders. The presentation is intended to give involved participants a realistic picture of the envisaged activities and expected results and benefits.

The problematization and ideation phase (2) presents the core of course activities to be carried out in VR. Here, students take their assigned roles and assume the task of navigating through the innovation process, focusing on the given innovation challenge and being exposed to different possible scenarios, guided by the AI and gamification scripting elements running in the background. Following their own assigned roles, teachers provide students both support and an overview of the simulation process. Other stakeholders play their assigned roles as well. The problematization and ideation phase consists of additional sub-phases wherein students apply the knowledge attained through compulsory reading in interactions with other stakeholders,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Identification of Innovation Problems/Opportunities (a). If the company has one serious problem, it might be useful to redefine or decompose the problem into smaller and clearer sub-problems. The result of this phase is a collection of the most important problems or roots of the basic problem. The other option is to focus on the 'mass' detection of problems/innovation opportunities within certain departments or in the whole company. The result of this phase is a clearly defined basic problem or set of problems. Evaluation of Problems/Opportunities (b). If many (sub)problems are identified, those with high potential should be selected. Regarding the basic problem and the company's needs, an appropriate method and selection criteria should first be defined, according to which the selection process is performed. Simply put, these are the problems for which resolution could have significant benefits. The result of this phase is a collection of the most relevant and serious (sub)problems. Next, for each of the selected problems, ideas for solutions (c) should be found. The result is most often a huge repository of ideas, which, of course, should be evaluated. The idea selection process (d) consists of the appropriate method and criteria selection. It is important to stress that the criteria should be chosen according to the initial innovation challenge, the company's specificities and some other relevant factors. The result is a set of the best ideas for solutions to the initial problem(s). The final phase of the course consists of (e) making an implementation plan, taking into account the most important issues of project management at the same time tightly integrating the angel investors and subcontractors into the process. The result is a clear and realistic plan ready for implementation.

After concluding the first cycle of problem identification, problem selection, idea generation, and idea selection, the cycle can be repeated with a different set of methods or with students assigned to different roles. If required (due to observed social dynamic specifics), some problematization and ideation phase activities may take place in face-to-face meetings.

It is important to note that the simulation, more specifically the scenario scripting, can enable different modularities on top of the previously mentioned limitations stemming from the external environment (different amounts of funding available, availability of specific knowhow, different readiness levels of competitors, different company characteristics, etc.). Innovation challenges can either be selected by the teacher, by the students, or by participating companies. Students can either be involved in competing innovation teams within one virtual company or in competing companies within one (university, technoparks) incubator. It is also possible to integrate into the simulation students attending other courses or students from different study fields (faculties)—e.g. chemistry, marketing, management, etc. For instance, entrepreneurship students can, by taking up the role of a different company department, work on feasible business plans, and marketing students can provide realistic market research analysis. In such cases, the simulation involves more teachers (further exploring the opportunities for co-teaching), each of them supervising one aspect of the innovation project. This approach is based on very intense inter-departmental, inter-faculty, and inter-student collaboration. A teacher can also organize the scripting to provide some typical cases of real innovation challenges and then divide students into different groups that each has its own separate role—e.g. companies A, B, C, D, E, a municipality, a natural park administration, a tourist agency, etc. Students within each group then jointly work on finding appropriate solutions to the typical innovation problems by using different methods of innovation/creativity while taking into consideration (at least to some extent) the specifics of their assigned roles (interests, behaviors, norms). The goal of this joint group collaboration is to develop and upgrade the proposed initial solution(s) to the level of a potentially applicable service/product for the market.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

As already mentioned, the final part of the course deals with the assessment of learning outcomes, which will be provided with an eye to many different aspects, giving individualized (360°) feedback to learners. Of course, there is the potential give a classic quiz to evaluate learners, but the main evaluation can be conducted throughout the game by automatically evaluating the decisions taken by the learners. That said, by accommodating the existing educational methods such as report writing, self-assessment, and peer evaluation at the end of or in the middle of the simulation, every student will be provided with his/her results on each analysis criterion with personalized feedback provided by AI and complemented by the teacher/mentor.

CONCLUSION

The title of this chapter is "What Does the Future Hold for Innovation Management Education?" First, the various external trends affecting education in general, such as economic, technological and societal trends, were introduced and discussed. The trends discussed may put additional pressure on education or, alternatively, open new avenues to implement education in the future and build new networking and collaboration bridges between educational institutions and businesses using recent technological advances. In this chapter, the authors propose a new concept of an innovation management course that is in line with emerging changes and is built around the needs and requirements of students (future employees, employers, and entrepreneurs) and business life. The proposed concept of an innovation management course is based on a virtual environment with integrated gamification components, orchestrated by a scripted story forming the backbone of course activities, and the use of AI to integrate external contextual elements. Moving away from the traditional classroom environment and utilizing a scripted, virtual, and AI-powered environment with changing external factors, the students are able to experience real-life business challenges and innovation situations working closely with different target groups. To enable them to gain real business experience, the students are mentored and guided by external business experts and teachers with different areas of expertise to exploit blended learning. The team of experts from various areas provides valuable insights for the students to see and experience the ways in which many details and aspects impact the final decision-making process. Finally, in this proposed concept, the students work in diverse teams (such as project teams) utilizing multichannel communication opportunities. All in all, the new innovation management concept is to be tested in real-life situations combining broader innovation aspects.

The new innovation management course concept also sets certain challenges to the parties involved. Teachers have a key role, orchestrating the concept in its multichannel format and in close collaboration with external business representatives and other teachers. This concept clashes strongly with the notion of "teacher autonomy" and poses tremendous challenges with respect to technology mastery. One can assume that the required IT knowledge is rather high, as is the reliance upon other stakeholders (company participants, suppliers, other teachers). The need to cooperate in co-teaching is still unusual. Additionally, the ability to innovate and adapt to changes is required from all teachers involved in the proposed concept (for instance, design thinking, big-picture thinking going beyond the narrowness of a specific theme [marketing], and responding to changing external factors).

The dependence on IT specialists required to master VR, AI, and the gamification components opens the question of the economic viability of the development of such education programs by regular teaching staff within the university environment. Most likely, one can expect that such courses would

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

be developed by specialized companies backed by companies within a certain industry sector (i.e. the automotive cluster) and then (in later stages) offered in a modified form to the higher education sector. In addition, the initial input required to develop such courses and the complexity of their development would require financial backing. This would come either from the private sector using known entrepreneurial mechanisms or through support from program funding if the development initiative is to stem from the educational realm.

The involvement of industry representatives (external stakeholders with real-life innovation challenges and a positive attitude towards open innovation) is certainly essential to this concept. The question of to what degree the external stakeholders will be willing to participate in the development of such programs remains open. The notion of open innovation is already wide-spread and accepted, but if courses are not specific enough for companies to recognize their benefits, the industry will be reluctant to participate. Even if backed by program funding, the wider adoption beyond the development phase depends to a large extent on the attractiveness of this concept to the industry. Only after this condition is fulfilled will transferring it to general higher education business management programs become viable.

This new concept works strongly to students' advantage. The only challenge from their perspective would be their reluctance to play the learning game (real-life simulation) and deliver in that surrounding. Competitions between the teams, which would require proactive attendance from all students involved, could be a challenge for some individuals.
